Consider Barry Lopez’s evocation of icebergs in the far north, pages of delicate description devoted to trying to capture the subtle and shifting color, the shape and texture of these massive structures. And the difficult challenge of trying to talk about the light reflecting off these giant shards of ice, and how it affects one to stand in the presence of such light. The struggle to notice and describe it fully and accurately (the light itself and one’s response to the light) leads, for Lopez, to an unexpected comparison – between the light radiating off of the icebergs and the light pouring through stained-glass windows in medieval cathedrals. It would not be fair to say that Lopez, in making this comparison, “baptizes” the icebergs. He respects their mysterious presence too much to allow any such reduction of their meaning. But he does engage the question of meaning, in particular what it means to us to stand in the presence of these icebergs, with the help of a tradition of art and theology and spirituality that comes from another world entirely, that of medieval Christendom. To really see anything, suggests Lopez, one must be prepared to risk an imaginative leap, an unexpected metaphorical association – in this case, the association between the theology and spirituality through which medieval Christians expressed the wonder and beauty and magic of light and the luminous light of icebergs. Such a rhetorical move can be understood, I think, as part of a discipline of attention and imagination aimed at cultivating a sense of mystery, of the sacred in the natural world. That Lopez uses Christian images and symbols to grasp the presence of mystery in a northern landscape does nothing to limit or circumscribe the meaning of this landscape. Rather, it opens it up to be discovered anew. In turn, given the reciprocal manner in which metaphors always work, such a meditation on those cathedrals of ice may well lead readers to reflect differently on the Christian spiritual tradition that gave rise to the medieval cathedrals. Here we see a process of reflection that has the potential to fire the imagination to see and encounter the natural world and the world of Spirit with new eyes – not unlike the process of contemplative prayer described by those who stood gazing up at the light of the medieval cathedrals.

Still, the natural world is not only light and beauty. Nature writers and poets who have been shaped by the Christian tradition reveal an extraordinary sensitivity to the reality of suffering and evil in the cosmos. Annie Dillard’s famous description in *Pilgrim at Tinker Creek* of a frog being devoured alive by a water bug is more than a casual allusion to “nature red in tooth and claw”; it is an entrée into a sustained and harrowing inquiry into the moral shape of the universe, into the question of God’s justice. When toward the end of *A River Run’s Through It*, Norman Maclean asks about the meaning of his brother’s sudden and violent death, his love affair with Montana’s Big Black Foot River takes a turn toward a question as old as it is intractable: What kind of world is this, where death

and suffering crush us with such seemingly random and careless power? The work of Czeslaw Milosz, a native of Lithuania who has long struggled with the Catholic tradition in which he was raised, echoes similar concerns in his work – the undeniably sacramental beauty of the world vying in the poet’s imagination with the darkness and sheer weight of nature (and history) upon our existence, the tension between them being (finally) irresolvable.

To see and experience the living world through the lens of the Christian spiritual tradition is, for writers and poets such as these, a continuous moral, aesthetic, and spiritual struggle. It is an opportunity to see the world transfigured; but it also imposes certain obligations, the most important of which may well be to bear the wounds of a broken but still luminous cosmos.

Christian Theology and the Fall

The Christian doctrine of the Fall, heavily inscribed onto the text of Genesis, first exalts and then denigrates nature. Many find the garden itself a positive image of earthly existence: God plants Eden with an abundance of beautiful trees, good food, and rivers; humans are created out of the Earth to tend to the Garden. After Adam and Eve eat the forbidden fruit, however, nature becomes corrupt and humans sinful, as they are introduced to hardened labor, shame of their nakedness, and knowledge of their eventual death. The original harmony between nature, humans, and God is broken, leaving a transcendent God, a sinful humanity, and a degraded Earth in a state of mutual alienation.

As there is no concept of “the Fall” in the Hebrew scriptures, there remains a question as to its origin. The “Fall” interpretation of Genesis first appeared during the

intertestamental period, an era of political oppression and internal conflict for the Jewish people which contributed to the apocalyptic belief in a corrupt world. In the apocalyptic Jewish text 1 Enoch (2 B.C.E.–1), a tale of angelic “watchers,” based on Genesis 6:1 is invoked to describe a cosmic descent into sin. The watchers, or satans, are angels who rebel against God and literally “fall” to Earth from heaven. They mate with women who give birth to the nephilim, “fallen ones,” who bring evil into the world. Enoch claims that humankind was created immortal, pure and righteous, but because of human knowledge, taught to them by the leader of the satans, Azazel, humanity became unrighteous and subject to death (54:6; 8:1).

The Jewish conceptions of fallen angels emerging at this time hint of a Hellenistic dualism that valued heavenly immortality over mortal earthly existence. In the *Phaedrus*, Plato describes immortal heavenly beings who lose their wings, falling to the Earth into mortal bodies.

The Christian Jew Paul blends both apocalyptic and Platonic conceptions into his cosmic Fall based upon a dualism of flesh and spirit, physical and spiritual, Earth and heaven. “The first man was from the Earth, a man of dust; the second man is from heaven” (1 Cor. 15:46–47). Paul directly couples Adam’s sin with death; from the human capacity for evil stems all mortality (Rom. 5:12–21). Ultimately, the cosmos as a whole is “subject to its bondage to decay” while awaiting its liberation into the immortal celestial body (1 Cor. 15:35–50).

Church Father Irenaeus avoids a cosmic Fall, limiting Pauline sin to the human realm. Irenaeus suggests that nonhuman creatures continue to obey God’s will: nature retains its goodness even after the Fall. Augustine further intensifies an anthropocentric interpretation of the Fall that indirectly exonerates the nonhuman creation. For him, the creation is full of goodness and beauty which demonstrates the nature of the Creator, who is beauty itself. Human choice is the origin of the Fall. The curse blemishes human life alone: suffering and death are inherited by all humans (original sin) as punishments from God.

Throughout rabbinic literature, the notion of any original Fall remains only peripheral. Nor does Islam espouse original sin: the expulsion, caused by Satan’s deception, was pardoned, having no ramifications for the rest of humanity or the natural world.

By the period of the Reformation, the Christian view of the Fall turned decisively against nature: originally created by God for the service of humanity, nature became cruel, ugly, and painful, after the Fall. Eden was a joyful reflection of God’s blessing, for John Calvin, but afterwards “the inclemency of the air, frost, thunder, unseasonable rains, drought, hail or whatever is disorderly in the world are the fruits of sin” (Calvin 1948: 177). Similarly, Martin Luther asks: “And what of thorns, thistles, water, fire, caterpillar, flies, fleas, and bedbugs? Collectively and individually, are not all of them messengers who preach to

us concerning sin and God's wrath?" (Luther in Kinsley 1996: 112). Whereas for Luther, the despair of nature can motivate us to seek redemption in Christ, for Calvin, the will of God manifests in all of nature, in each drop of rain, so that despite the fallen aspects of nature, the glories of God's providence rules all things for the benefit of the saved. At the time of the Reformation, belief in the Fall also contributed to early modern attempts to discipline unruly nature. Elaborating on his Calvinist upbringing, Francis Bacon claimed that science and technology can correct nature's fallenness and regain the dominion over creation that humanity had in Eden.

In the twentieth century, the Fall remained an important theological category. In the tradition of Calvin, German Theologian Jürgen Moltmann found a perfect "primordial" knowledge of God in paradise that "now only exists in rudimentary form" due to the problem of sin and a corrupted natural world. However, these "traces of creation-in-the-beginning" anticipate the deathless and sinless perfection of the glory of the world to come. Reinhold Niebuhr rejected his Lutheran tradition by accepting death as inevitable to our status as creatures. Evil is not in nature but results from human freedom, for Niebuhr. The fall of Adam and Eve symbolizes human freedom to wield both creative and destructive powers or good and evil in the world. Sin arises, for Niebuhr, when humankind makes destructive use of its freedom due to self-centered attempts to become godlike and overcome human finitude.

Christian Ethicist Max Stackhouse represents a contemporary strain of the reformed (namely Calvinist) tradition, endorsing the notion of a fallen natural world harboring evil. Though creation does embody an original goodness, all of nature, for Stackhouse, has indeed fallen and requires human constraint. Echoing Bacon, he argues that human intelligence and technology must be used to cure nature's brokenness and bring fallen nature nearer the intent of the Creator. In contrast, eco-theologian John Clateworthy condemns such attempts to "fix" nature, rejecting the idea that it is "fallen," and emphasizing that science and technology have wrought too many destructive consequences.

Hence, contemporary theologians find the doctrine of the Fall problematic in our age of the ecological crisis. For Rosemary Radford Ruether, belief in a fallen nature has permitted neglect of the planet and rejection of our relational intimacy with plants, animals, and the Earth through a disrespect for the death cycle of life. Brazilian theologian Ivone Gebara believes finitude and tragedy has and will always be a part of life on Earth. Hence, original sin, for her, did not cause a fall into mortality. For Gebara, primal sin comes from the organized attempts of humans to escape mortality and vulnerability, through the monopolization of power over animals, the land, and other humans.

Biblical scholar Lyn Bechtel explores the scriptural underpinnings for such an ecological ethic. The *ha-adama/ha-adam* wordplay – "Then Yahweh God formed the Earth creature [ha-adam] from dust from the Earth [ha-adam]" (Genesis 2:7) – demonstrates an "intimate relatedness" between Earth and earthling based upon the land. Originally united with the Earth, humans are separated from the native ground at birth. Adults work with the Earth, produce food, (2:5; 3:23) and eventually will return to union with the Earth upon death (3:19). Bechtel argues that the Hebrew text, far from implying a doctrine of Fall, suggests an earthly transition of maturation through birth and death.

There are other contemporary theologies that also affirm the workings of nature, but through alternative constructions of the Fall. In process theology, every level of reality has a degree of freedom, giving it the power to turn away from the divine will. Nature is fallen due to the occasions in which God's lure has been rejected.

Process theologian Jay McDaniel, when thinking about how the Fall explains violence and suffering in nature, critiques the anthropocentrism of the traditional doctrine, as well as the assumption that violence and suffering are solely the result of disobedience to divine will. The predator-prey relationship evolved long before humans emerged on our planet. There was no time in existence when the Earth was free from violence. McDaniel gives the example of a grey whale being attacked and eaten by a group of orcas. The death of the grey whale is valuable to the marine ecosystem, giving sustenance to the orcas and other marine creatures feeding off the grey whale's body. Creatures cooperated with God's lure, creating the predatory form of sustenance, dubbed by McDaniel the "fall upward." God lured more advanced forms of life into existence and this involved a risk that creatures would experience increased pain as they increased in opportunities for enjoyment.

A human-initiated Fall, however, does seem to resonate with scholars who liken Eden to the age of the hunters and gatherers. The foraging lifestyle of hunters and gatherers treated nature as home and the Earth as alive and sacred. As there was no sense of separation from the Earth, foraging communities were somewhat innocent, like Adam and Eve. Agroecologist Wes Jackson finds "the Fall" in the very transformation from hunting and gathering to the agricultural mode of life. Human evils such as systematic warfare, patriarchy, slavery, and ecological ruin, arose during this era. Farming, settlements, and population growth rapidly displaced animal habitats, alienating human from nonhuman species.

Korean ecofeminist, Sun Ai Lee-Park, also highlights a distinctive human role in the Fall. For her, the destruction of the rainforest represents the tree of good and evil, which signifies the restrictions and limitations imposed upon humanity against the taking of every tree. The

transgression takes place not just in deforestation, but also by the World Bank who has been taking the Korean people from their land into factory production. The transgression of the tree of good and evil causes death as eco-death, says Lee-Park.

The concept of the Fall arises as either a human or a cosmic event, in both historical and contemporary scholarship. The Pauline notion of “fallen creation” reappears during the Reformation and in the contemporary reformed tradition. Recent scholarship however, also critiques the cosmic fall for encouraging estrangement from Earth ecosystems. Some scholars reinterpret a distinctively human “fall” from harmony with nature, others deconstruct the Fall altogether, so as to affirm natural forms of death and suffering as integral to the process of nature.

Christianity – Eastern versus Western

An examination of the current Eastern Orthodox literature on nature, ecology and the environment will show from the outset a recurrent feature. This concerns the clear demarcation between Eastern and Western Christianity (Roman Catholic as well as Protestant) as entire religious and cultural complexes in relation to these issues. It is believed that the historical development of these two parts of Christendom presented certain differences in theology and ethics, which had an immediate impact upon the way Eastern and Western Christians began to see and to treat nature. Given the fact that monotheistic religions and especially (Western) Christianity have been blamed (L. White) for fostering anti-nature attitudes and for being responsible to a large extent for the contemporary ecological crisis, many Orthodox thinkers tried to dissociate Eastern Orthodoxy from its Western Christian counterparts.

For these Orthodox, the whole problem is closely connected to the rise of the Western worldview in modern times in the wake of the Renaissance, the Reformation, the Scientific and Technological Revolution, the Enlightenment, and the Industrial Revolution. Western Christianity played, albeit in many cases indirectly, an instrumental role in the appearance of this culture, which later acquired almost planetary dimensions. Two main characteristics of this development were individualism and dualism. Individualism saw humans as self-sufficient and static beings without real communion with one another and respect for the surrounding physical environment. The orientations and the needs of the individual held priority in the values system of modernity. Passing into a utilitarian and egoistic society of self-adoration was the normal consequence of this. Furthermore, dualism provided individuals with several Manichean polarities that created a barrier between the spiritual and the material and between

humans and nature. In this context, knowledge of nature was identified with its control and subjection. Nature was desacralized and seen as an inanimate machine working according to standard laws that could be fully explored. Moreover, nature was falsely considered an endless source of wealth for the satisfaction of individual needs and wholesale exploitation. By identifying having with possessing and controlling, and by believing in continuous progress, modern humans began uncritically to exploit natural resources to produce and to consume at a growing rate. This optimism has been largely destroyed in the course of the twentieth century by various serious events including the world wars and the rise of nihilism. The quest for alternative worldviews and more holistic spiritualities (from the Far East) was but only a sign of the many deadlocks of the modern Western civilization.

By contrast, Eastern Orthodoxy offered another understanding of human beings in relation to God and nature beyond individualism and dualism. The ontology of personhood, based on the loving community between the three persons of the Holy Trinity, serves as a prototype for another kind of human existence. The latter is not viewed in a utilitarian and individualistic way, but as a harmonious coexistence with nature, which is the gift of God to humans. The person signifies relationship, nearness and unity, while the individual stands for distance, separation and alienation. From this holistic perspective, humans are the stewards and not the masters of creation. They have to take care of it, to transform it and to give it back to the Creator. This presupposes an eschatological understanding of nature, which is not going to be destroyed but to be transfigured. In this way, humans, as representing a micro-cosmos, are an integral part of creation, which should not simply be subjected to systematic exploitation, utilitarian needs, bare materialism and consumerism.

Furthermore, nature is not an object (i.e., something lying outside of and opposite to humans), which must be thoroughly subjected to human reasoning, power and control. Rather it should be seen as a living organism, the house, in which humans live and work and which deserves particular protection, care and reverence (cf. Gen. 2:15). Knowledge means in this context a loving and holistic union with nature. In order to achieve a harmonious coexistence with nature and to overcome ecological crisis, humans have to articulate a new hierarchy of values toward nature. This implies the development of a new ethos of self-sacrifice toward nature. The latter suffers the consequences of the original sin too, which has destroyed the previous paradisiacal conditions. In the end, nature must be transformed by humans according to the prototype provided by Jesus Christ during his earthly life and symbolized in the sacrament of the Holy Eucharist. In addition, humans must develop a spirit of ecological asceticism by setting a new agenda of life and their real needs beyond self-centered utilitarianism and consumer-

ism. Human control of nature should not be equated with its domination, but with a responsible *diakonia*, a service for the sake of the whole creation. This is the new ethos, the new stance and the new mentality, which Orthodoxy conveys to the modern materialistic global culture and which cannot be simply codified in legal frames and political programs.

This Orthodox understanding of nature and solution to the modern ecological impasse, based mostly on biblical and patristic sources, raises however the question concerning their applicability, namely the extent to which these ideas have really influenced the attitudes of Orthodox cultures toward nature. This is because if one examines these cultures in Eastern and Southeastern Europe, one will realize – curiously enough – that environmental conscience is usually far less developed among Orthodox than Western Christians. This means also that the above Orthodox ideas, apart from being too theoretical, do not accurately depict historical as well as contemporary reality. Although there is enough truth in the argument that the Western world has historically played a crucial role in the present environmental degradation, the way the whole issue is taken up by Orthodox thinkers is misleading. This is because they usually are apologetic toward Eastern Orthodoxy and intend to show its authenticity and consequently its superiority over Western Christianity. Thus, the existing serious discrepancy between theory and practice in this issue, along with other arguments, show the relativity of the sharp demarcation between Eastern and Western Christianity.

Christianity (1) – Introduction

Christianity has been commonly characterized – indeed, demonized – in recent decades as an anti-nature religion that has contributed to ecological indifference and degradation. This ecological complaint against Christianity has some merit, as many Christian interpreters have acknowledged. An adequate introductory overview of Christianity and nature, however, must also explore evidence for ecological sensitivity in Christian history, and conclude with the prospects for the development of ecological consciousness in this religious tradition.

The gist of the ecological complaint against Christianity is best stated in an influential essay by cultural historian Lynn White, Jr., “The Historical Roots of Our Ecologic Crisis” (*Science*, 1967). White argued that Christianity, “the most anthropocentric” of religions, “bears a huge burden of guilt for our crisis,” and “we shall continue to have a worsening ecologic crisis until we reject the axiom that nature has no reason for existence save to serve man.” Unlike many of his imitators, however, White was “a churchman” who called for a reformed Christianity. This essay not only spurred some environmentalists’ reactions against certain alleged Christian “axioms,” but it also provoked ecologically oriented reexaminations of the tradition by Christian theologians and ethicists.

On the one hand, the bulk of the ecological complaint is essentially true. Throughout Christian history, in diverse places, times, and forms, the dominant theological and ethical strains have been oblivious or even antagonistic to nature, especially untamed nature (as opposed to domesticated nature, such as sheep and olive trees). Anthropocentrism and dualism have been prime features of these interpretations of the faith. Often dichotomizing, rather than integrating, the spiritual and the material, soul and body, grace and nature, humanity and nature, the main strains usually have devalued or disdained “the world” as an alien, even demonic, place, and have sought to transcend it for the sake of spiritual elevation and otherworldly salvation. The biosphere has been perceived generally as theologically and ethically trivial – the stage and scenery for the divine-human drama, which alone has redemptive significance. The focus has been almost exclusively on human history, ignoring the reality that human history is rooted in and continually shaped by natural history. Nonhuman nature has been interpreted mainly as a composite of “things” – “raw materials” or “capital assets” – that have instrumental value for human

economic and other needs, without regard for the moral claim that living “objects” are really an astonishing diversity of “subjects” struggling for space and sustenance in complex interdependencies. Humankind has been viewed as an ecologically segregated species, designed for dominion – managerial mastery, including a divinely sanctioned right to exploit nature’s bounty, with the main restriction being the long-term conservation of the resource base for future generations. Indeed, Christians have commonly believed that the Earth – in some versions, the universe – was created solely for “man.” Many also have argued that nature itself is “fallen,” cursed with deformities and asymmetries, not merely abused by the sins of fallen humanity. Consequently, some have suggested, nature should be “converted” to conform to the divine design, which often meant, in effect, technological transformations. These views and values have contributed directly and indirectly to environmental negligence and abuse in Christian history.

On the other hand, the ecological complaint is an overgeneralization. It overlooks the number and significance of dissenting opinions in Christian history, and underestimates the tradition’s capacity for ecological reformation. Christianity is anything but a moral monolith; it embodies multiple strains of thought and practice, often with radically different emphases. The signs of what Paul Santmire calls the “ecological motif,” emphasizing human rootedness in nature and celebrating God’s presence in the biophysical world, are widespread. The varied voices for ecological sensitivity in Christian history are mainly minorities and are often muted and ambivalent, but they are still present, persistent, and sometimes prominent.

The classical voices for Christian ecological consciousness can be heard in many forms – for instance, in prayers, hymns, poetry, protests, theologies, norms, and legends. They include the opposition of Puritans to cock-fighting and bear-baiting, and the resistance of medieval bishops and people to the destruction of ancient forests and fens. They also include poets such as Gerard Manley Hopkins and William Blake and theologians from Irenaeus to H. Richard Niebuhr and Hildegard of Bingen to Joseph Sittler. The virtues affirmed by a religion can also be ecologically revealing. For instance, the norm of frugality, which many modern environmentalists advocate as an essential constraint on ecologically destructive prodigality and as an essential component of sustainable lifestyles, has been a central virtue in nearly all the Christian tributaries, Protestant, Catholic, and Orthodox. Some of the legends of the saints – especially the warm relationships with other animals among the Desert Fathers, the Celtic saints, and St. Francis – also illuminate the values of the saints’ admirers. St. Francis can be regarded as the epitome of Christian love in an ecological context, but he did not exist in a vacuum. He was the foremost of a cloud of

witnesses who preceded and followed him. The heroic figures and their exploits that a people remember and celebrate are not morally irrelevant; they are indicators of the values and virtues to which that people aspire.

Theological affirmations also show some ecological consciousness. For example, the mainstream interpretations of the doctrine of creation have affirmed the goodness of the natural order as the work of a loving God, the imitation of whom requires care for the Earth. In the doctrine of the incarnation, many theologians, especially paradigmatic Orthodox interpreters such as St. John of Damascus, recognized the sanctification of matter. In Christ, God entered into solidarity not only with humanity, but also necessarily with the whole biophysical world of which humans are representative embodiments, the microcosm of the macrocosm. Similarly, the concept of the sacramental presence of the Spirit was understood to confer dignity on materiality, since it implied that the natural world was the holy habitat of God. The Orthodox, prominently, and some Protestant reformers, including John Calvin, Martin Luther, and John Wesley, peripherally, preserved the ancient hope of deliverance from death for all creatures, thereby affirming the ultimate unity and value of all life. Indeed, the idea of resurrection has been understood as the affirmation of the body, of materiality. The biblical idea of dominion has been used by many in the modern era as a religious rationalization for environmental exploitation and manifest destiny, but it was interpreted mainly through most of Christian history as a divine mandate against the tyrannical abuse of the rest of nature and for benevolent care. Wesley and some other divines, for example, interpreted dominion as the mediation of God's blessings to otherkind. Apparently, not all Christian axioms have been part of the ecological problem.

Contemporary Christian environmentalists contend that there is no major obstacle inherent in the Christian faith to the development of ecologically sustaining theologies and ethics. An ecological reformation of Christianity is necessary and possible, they claim, by reinterpreting Christian teachings in the light of ecological wisdom and other cultural borrowings. These claims seem defensible. Moreover, Christian churches have strong precedents and capacities for reevaluating and reforming theologies and ethics. *Semper Reformanda* – Always to Be Reformed – has been a Protestant motto, and similar ideas can be found in other Christian traditions. Indeed, one of the important characteristics of contemporary Christianity is the emergence of an ecological reformation that is building firm foundations for ecological integrity in Christian thought and practice, as many of the Christianity-related entries in this encyclopedia illustrate.

Christianity (2) – Jesus

Since Jesus stressed the authority of the Hebrew Bible (which for Christians became the Old Testament) (Matt. 5:18), he implicitly affirmed its teachings on nature. He did not rescind the ecological ethics of the Law, although he was less strict about ceremonial laws. All foods are clean and do not defile a person (Mark 7:19). He touched the sick to heal them, rejecting ceremonial uncleanness laws found in the Hebrew Bible (Mark 1:40–45; 5:25–34).

Jesus appreciated the beauty of nature (Matt. 6:28–29) and showed respect for nature in his parables, which are rich in nature imagery. Through his upbringing in rural Galilee he learned about God's care for creation by observing fruit trees, flowers, birds and fishermen and by working as a carpenter.

Jesus affirmed the scriptures teaching that God created all things (Mark 10:6; 13:19; Matt. 19:4). The world and matter are not eternal (Matt. 24:21, 25:34; John 17:24). Nature reflects the activity of God and does not operate independently (Matt. 5:45; 6:26–30; Luke 12:6). God is a loving Father who sustains and cares for all creation. God gives life to all beings (John 5:17; 6:33; Luke 24:38) and provides food for animals, birds and plants (Matt. 6:26–30; Luke 12:6). Since he loves all people, he causes the sun to shine and rain to fall on both righteous and wicked people (Matt. 5:45; cf. Ps. 50:11; 104:14, 17). As “Lord of heaven and Earth,” God is worthy of praise and obedience (Matt. 11:25; Luke 10:21). The resurrected Jesus has “all authority in heaven and Earth” (Matt. 28:18).

Nature provides ethical lessons. God's provision of sun and rain for the wicked is a model for loving our enemies (Matt. 5:44–45). Since God provides for the needs of

What Would Jesus Drive?

“What Would Jesus Drive?” began as a slogan on a protest sign in 2001, and within two years had emerged as a full-fledged campaign highlighting North American religious opposition to global warming, perhaps the largest and most visible Christian environmental drive in history.

In the winter of 2001, Boston-based activists centered around the Harvard Divinity School, the Massachusetts Climate Action Network, and the Coalition for Environmentally Responsible Economies (CERES) began organizing a series of small demonstrations against the proliferation of gas-guzzling sports utility vehicles (SUVs). On Sunday, 3 June 2001, in a driving rainstorm, approximately 100 protesters paraded along an “auto mile” in the Boston suburb of Lynn, led by a number of clergy. Dan Smith, associate pastor of Hancock United Church of Christ in Lexington, Massachusetts, carried a sign with the slogan “What Would Jesus Drive?” (Smith and protest coordinator Bill McKibben had concocted the slogan as a play on the widespread admonition among evangelical Christians, WWJD, or “What Would Jesus Do?”). “I hope it will at least encourage folks to think twice, and possibly pray about this decision, as they would about many other hard choices they make,” Smith told reporters. Noting that the parking lot of his suburban church was often filled with SUVs on a Sunday morning, he added “I love the people who drive them, but I feel we could all be better informed about the consequences of our decisions as consumers and Christians” (author’s recollection).

Widespread media coverage, including a full-page account in the *Christian Science Monitor* with the headline “What Would Jesus Drive?” and a feature on ABC News, spread the idea in religion-and-environment circles, and soon it was appearing on handmade buttons. (A protest in western Massachusetts later that summer, convened by the group Religious Witness for the Earth, featured signs reading “What Would Buddha Drive?”.)

A year later, in the fall of 2002, a much larger circle of religious environmentalists embraced the slogan as the centerpiece of their global warming campaign, using the catchphrase in a television organizing campaign that blanketed cities in four midwestern and southern states.

The campaign began with a caravan of nuns driving hybrid electric vehicles, each carrying the slogan on a

bumper sticker, to a meeting with top executives of U.S. automakers and the United Autoworkers labor union. The campaign included participation from the National Council of Churches and, interestingly, the Coalition on the Environment and Jewish Life. The most significant boost, though, came from organizing by Evangelicals for Social Action and the Evangelical Environmental Network. “We have confessed Christ to be our savior and Lord, and for us that includes our transportation choices,” said the Rev. Jim Ball, organizer of the EEN. “Most folks don’t think of transportation as a moral issue, but we’re called to care for kids and the poor, and filling their lungs with pollution is the opposite of caring for them” (*The Guardian*, 14 November 2002).

In a campaign discussion paper prepared by the two evangelical groups, an array of scripture passages were cited in support of the groups’ stewardship message. Particular attention was paid to the scientific prediction that global warming caused by American consumption of fossil fuels will impact most severely many of the world’s poorest people, particularly those in low-lying areas of the tropics.

Some conservative commentators attacked the campaign – one writer at *Forbes.com* declared that Jesus would drive a “4×4 pickup with crew cab” in order to keep his followers safe and negotiate tough Galilean roads. Wags suggested that scripture indicated Jesus might instead favor Hondas (Acts 5:12 – “the Apostles were in one Accord”). But the car companies listened more respectfully than they had to secular environmentalists.

The largest impact of the campaign may be simply that it marked the start of more aggressive, scripturally based environmental campaigning by North American Christian activists. After a decade of bureaucratic resolutions from different denominations decrying global warming and other environmental ills, activists seemed finally to have hit on a slogan that captured the public imagination and crystallized the moral choices inherent in environmental issues.

Bill McKibben

animals and plants, humans should trust God to provide for their material needs and reflect this in prayer for daily bread (Matt. 6:11, 25–33).

Jesus used nature metaphorically. The people of God are sheep that God cares for (Mark 6:34; John 9:36, 10:15) and those who would destroy them are wolves (Matt. 10:16; John 10:12). Jesus is the good shepherd who gives his life for his sheep (John 10). He is the bread that

gives eternal life (John 6:25–40). The Holy Spirit is the water that gives life (John 4:14).

Many parables utilize nature to teach spiritual truth. Parables featuring seeds, weeds, wheat, yeast, fish and trees teach about the kingdom of God (Mark 4; Matt. 13; Luke 13:6–9; 21:29–30). Varied results from sowing seed in different kinds of soils illustrate diverse responses to Jesus’ message (Mark 4:1–8, 13–20).

Jesus used natural objects to illustrate moral and spiritual lessons. Bread and wine were sacramental symbols of the new covenant instituted through Jesus' redeeming death on the cross (Mark 14:22–25). He made an unfruitful fig tree wither as a visual parable of judgment on people unresponsive to God (Mark 11:14; cf. Luke 13:6–9).

Jesus was comfortable with the material world (Mark 2:16), yet he was not consumed by it. One's priority should be to seek God's kingdom (his reign and presence) and righteous character above money and material possessions (Matt. 6:19–24, 33; 13: 22; John 6:27). Material things are not evil in themselves, but the pursuit of possessions is not the highest good. "What profit is there if a person gains the whole world and loses his soul?" (Mark 8:36). If a person trusts God and pursues God's kingdom and righteousness as first priority, God will provide his basic material needs (Matt. 6:33). We should thank God for providing for our material needs (Matt. 14:19; Mark 14:23).

All created things have worth in God's eyes. Nature has intrinsic value whether it provides human benefits (sheep, Matt. 12:11) or has little utilitarian value to humans (grass, sparrows, Matt. 6:26; 10:29–31). Even rocks glorify God (Luke 19:40). God knows what happens to sparrows and provides for them (Matt. 6:26; 10:29–31). Nevertheless humans have greater value than animals and plants (Matt. 6:26, 29; 10:31; 12:12), since humans are created in God's image (cf. Gen. 1:26). Jesus healed many people, but there is no record of his healing an animal. However, he taught the moral imperative of properly caring for animals (Luke 13:15; Matt. 12:11).

Several of Jesus' teachings have indirect implications for environmental stewardship. Leadership involves service of others, not power over others or an excuse for oppression (Mark 10:42–44). Hence human dominion over nature (cf. Gen. 1:26, 28) should be exercised for the good of creation, not the selfish destruction of nature. The parable of the talents and the parable of the wise steward imply the Earth is a stewardship for which humanity is accountable to God (Matt. 24:45–51; 25:14–30). The Earth belongs to God not humanity (Matt. 11:25; cf. Ps. 24:1), and humans will be judged on the condition in which they return God's possessions (Matt. 25:27).

In the Lord's Prayer, Jesus teaches his followers to pray that God's kingdom will reign fully on Earth (Matt. 6:10; Luke 11:2). Although God is Lord of heaven and Earth (Matt. 5:13; 11:25), human and demonic evil cause many things not to be as God intended them (Matt. 4:24; 10:7–18; 12:22; Mark 3:20–27; Luke 13:16). The Lord's Prayer asks that God's purposes be fulfilled in both physical and spiritual realms.

Miracles show Jesus' divine power, glory and authority over nature and encourage faith in Jesus (Matt. 8:23–27; 14:22–33; Mark 2:10–11; 4:37–41; Luke 8:22–25; John 2:1–11; 9:30–38). He performed creation miracles such as multiplying loaves and fish to feed the hungry and trans-

forming water into wine (Mark 6:34–44; 8:1–9; John 2:1–12; 6: 1–13). Simply by speaking a word, he calmed storms (Mark 4:39–41; Matt. 8:23–27), much as God created with a word in Genesis 1. He healed numerous diseases with a touch or word (Matt. 4:23–24; 8:8) and raised the dead, including a man who had been dead four days (Matt. 9:18–25; 11:5; Luke 7:11–15, 22; John 11:38–44).

The return of Christ will be preceded by cosmic disasters, including earthquakes, plagues, famine, changes in the courses of astronomical bodies and the darkening of the sun and moon (Matt. 24:27–30; Mark 13:24–27; Luke 21:11, 25–27). Heaven and Earth in its present form will pass away (Matt. 5:18; 24:35). This does not imply the destruction of the world, but the transition to God's universal reign over creation (Matt. 13:37–43). Although Jesus does not explicitly refer to a new or transformed Earth as do some NT authors, there are hints that there will be a perfected Earth after Jesus' return. The righteous will eat and drink with Jesus in the consummated kingdom (Matt. 26:29; Luke 22:29–30). The humble will inherit the Earth (Matt. 5:5), a broadening of the promise in the Hebrew Scriptures that the righteous will inherit the land of Israel (e.g., Ps. 37:11). The dead will be resurrected bodily to face eternal rewards or punishments (Luke 14:14; John 5:21–29; 11:24–25). This implies the righteous will enjoy some type of physical existence in the eternal age, although different than the present physical life, since there will be no death or need for human procreation (Luke 20:35–37).

Christianity (3) – New Testament

The New Testament (NT) presupposes the Old Testament (OT) teachings on nature and occasionally quotes OT nature passages (Matt. 5:17; Acts 3:21; 7:49; 2 Pet. 3:13; Heb. 1:10; 2:5–8). God created "heaven and Earth," gives life to all creatures and sustains creation. Nature is not to be worshipped. It witnesses to God the creator who alone is to be worshipped. Nature has value because God created it and sustains it. Jesus' incarnation and bodily resurrection show that matter is not inherently evil.

The NT focuses on the reconciliation of humanity with God and the resulting ethical implications. Yet it also promises the final redemption of the material creation. Redemption involves the reversal of the damage caused by the human Fall on both humanity and nature.

Synoptic Gospels

God created all things (Mark 10:6; 13:19; Matt. 19:4; 24:21; 25:34). God is Lord of heaven and Earth (Matt. 11:25; Luke 10:21) and the resurrected Jesus shares this authority (Matt. 28:18). God is actively involved in nature. He gives life to all, lovingly cares for animals and plants, and provides sun and rain to meet human needs (Matt. 5:45; 6:26–33; Luke 12:6; 24:38).

Nature has intrinsic worth, apart from its benefits to humans (Matt. 6:26; 10:29–31). The value and goodness of matter is shown by the narratives of Jesus' birth, which stress his physical incarnation in human flesh (Matt. 1; Luke 1:26–38; 2:1–7; 3:21–37). Jesus used bread and wine as sacramental symbols of his sacrificial death (Matt. 26:26–28; Mark 14:22–25; Luke 22:19–20).

Nevertheless, some aspects of nature are not as God originally intended due to the human Fall and demonic influence. Disease, death and natural disasters are negative aspects of nature that Jesus overcame through miracles (Matt. 4:24; 12:22; Luke 13:16). Jesus' miracles show his divine power and authority over nature and encourage faith in him (Matt. 8:23–27; 14:22–33; Mark 4:37–41; Luke 8:22–25). He performed creation miracles such as multiplying loaves and fish to feed the hungry (Mark 6:34–44; 8:1–9). He calmed storms by speaking a word (Mark 4:39–41; Matt. 8:23–27), much as God created by speaking (Gen. 1). Many miracles are local reversals of the curse from the Fall that brought death, disease and hardship (Gen. 3:14–19). Jesus healed diseases (Matt. 4:23–24; 8:8) and raised the dead (Matt. 9:18–25; 11:5; Luke 7:11–15, 22). The miracles are a foretaste of the new creation, which will have perfect harmony in nature and no death or disease. The multiplication of loaves and fish anticipate the super-productivity of nature in the new creation predicted by the OT prophets (Mark 6:34–44; 8:1–9; cf. Isa. 11:6–9; 25:8; 30:23–26; 66:17–25). Jesus' healings and resurrections of the dead confirm his identity as the Messiah in fulfillment of scripture (Luke 7:18–23; Matt. 8:16–17). By touching the sick, Jesus rejected the Jewish tradition that the diseased are ceremonially unclean (Mark 1:40–45; 5:25–34).

Jesus frequently used nature in his teachings about spiritual truth. He drew ethical lessons from nature (e.g., Matt. 5:44–45; 6:11, 25–33). He used nature parables and metaphors to teach spiritual truth and to call people to faith (Mark 4; 6:34; Matt. 13; 10:16; Luke 13:6–9; 21:29–30). Since God providentially cares for animals, people should trust God for their needs (Matt. 6:25–33; 14:19). Although material things are not inherently evil, they should not preoccupy a person (Matt. 6:19–24, 33; 13:22). The pursuit of God's kingdom and righteousness is the highest priority (Matt. 6:33).

As in the OT, cosmic signs accompany significant redemptive actions of God in history. A divinely appointed star guided the Magi to the newborn Messiah-King

(Matt. 2:1–11). When Jesus died on the cross, there were earthquakes and some righteous dead were resurrected, affirming that Jesus is the Son of God (Matt. 27:51–54). The resurrection of Jesus was accompanied by an earthquake (Matt. 28:2). The return of Christ will be preceded by cosmic disasters, including earthquakes, plagues, famines, changes in the courses of astronomical bodies, and the darkening of the sun and moon (Matt. 24:27–30; Mark 13:24–27).

Jesus was resurrected with a physical body of “flesh and bones” that could be touched, embraced and eat fish (Matt. 28:9; Luke 24:39–43). Yet his body was transformed (Mark 16:12) so it could pass through doors, disappear and sometimes not be recognized (Luke 24:15–16, 31, 36). Jesus' resurrected body was a foretaste of the future transformed physical world and the resurrected bodies of believers. Although heaven and Earth in its present form will pass away (Matt. 5:18; 24:35), some type of future physical creation is implied. After Jesus' return, God's kingdom will encompass the whole Earth (Matt. 13:37–43; cf. 6:10). The righteous will be resurrected to eternal blessing (Matt. 26:29; Luke 14:14; 22:29–30) and will “inherit the Earth” (Matt. 5:5). There will be physical aspects to the kingdom, such as eating and drinking (Matt. 26:29; Luke 22:29–30), but believers' bodies will be transformed since there will be no more death or need for human procreation (Luke 20:35–37).

The Gospel of John

Although John's Gospel and Epistles focus on spiritual life, they do not denigrate the material world. In contrast to docetic and Gnostic views, matter is part of God's good creation and is not inherently evil. Jesus, the eternal Word of God, became physically incarnated in a human body made of flesh (John 1:14; 1 John 4:2–3). John stresses the physical, human aspects of Jesus, including fatigue, tears and hunger (John 11:33, 35, 38; 19:28).

Jesus was resurrected with a physical body that could be touched and could eat fish (John 20:17, 20–28; 21:9–14). Yet his body was transformed to transcend normal human limits so he could pass through closed doors (John 20:26). Jesus' resurrected body is a foretaste of the resurrection bodies of believers, whom Jesus will raise physically to eternal life, yet without disease or death (John 5:28–29; 6:40; 11:24–25). This implies a physical dimension to the eternal life of the righteous.

The eternal divine Word of God created all material and spiritual things (John 1:3; 17:24). The Gospel's prologue (1:1–14) echoes the Genesis creation narrative, where God created by speaking, “let there be . . .” (Gen. 1:3, 6, 9, 14, 20, 24). The Father, the Son and the Holy Spirit all give life, both the physical life of all beings (John 1:3–4; 5:21) and the eternal spiritual, resurrection life of believers (John 5:21; 6:33, 63; 20:31).

Nature metaphors abound in Jesus' teachings. Jesus is

the bread that gives eternal life (John 6:25–40). The Holy Spirit is the water that gives life (John 4:14). God’s people are sheep that Jesus tends (Mark 6:34; John 9:36; 10:15) and those who would destroy them are wolves (Matt. 10:16; John 10:12). Jesus is the good shepherd that gives his life for his sheep (John 10).

Miracles demonstrate Jesus’ power, glory and deity and can build faith in him (John 2:1–11; 9:30–38). Miracles met physical needs, such as hunger (John 2:1–11; 6:1–14), and healed diseases, such as blindness and lameness (John 5:1–11; 9:1–41). Jesus overcame death by resurrecting a man who had been dead four days (John 11:38–44). He demonstrated his creative power by changing water to wine and multiplying bread and fish. Miracles also have symbolic significance: the wine points to the superabundant productivity of nature in the new creation (John 2:1–11). The multiplied bread points to Jesus as the manna that provides eternal life (John 6:31–39, 48–51). The resurrection of Lazarus anticipates the resurrection of the righteous to eternal life (John 11:23–25, 43; cf. 5:28–29).

God’s values strongly contrast with an earthly, materialistic perspective. The command not to “love the world” (1 John 2:15) does not refer to the physical planet, but evil moral values in rebellion against God (1 John 2:16). References to the “world” as the planet are never negative (John 17:15, 18; 21:25). More often, “world” either refers to all people, whom God loves (John 3:16), or to people and values opposed to God (John 14:17; 15:18–19).

Acts

God is creator of heaven and Earth and everything in them (4:24; 14:15; 17:24). God sustains nature, directs its operation and gives life to all creatures (14:17; 17:25, 28). Nature witnesses to the existence of God and shows that only God the Creator should be worshipped (14:15–17). He designed Earth as a habitation for humanity and provides human physical needs through nature (17:26).

God is Lord over all creation (7:49; 17:24). Christ ascended to heaven and reigns as Lord over all things (3:21). When Christ returns, all creation will be “restored” as promised in the prophets (3:20–21; cf. Isa. 11:6–9; 65:17–25; 66:22). Nature will not be destroyed but the damage from the Fall will be removed.

The Apostle Paul

Although he never met Jesus during his earthly lifetime, the Apostle Paul wrote many letters to the Churches he was helping promote his understanding of the meaning of Christianity. By so doing, he became the most influential theologian of the biblical writers. His thought is rich with reflection about nature and how it fits into God’s work.

God created all things (Rom. 1:20; 11:36; Eph. 1:4; 3:9; Col. 3:10; 1 Tim. 4:3–4). God gives life to every creature and sustains creation (Rom. 11:36; 1 Tim. 6:13). All things

exist to bring glory to God and Christ (Rom. 11:36; 1 Cor. 8:6; Col. 1:16).

Paul’s view of creation, nature and the material world is Christocentric. Christ is the agent of creation, the source of life and the sustainer of all things (1 Cor. 8:6; Col. 1:16–17). Christ, who is the fullness of deity and existed prior to creation (Col. 1:15, 17, 19), created all material and spiritual things (Col. 1:16). All things were created for Christ (Col. 1:16) and his power “holds everything together” (Col. 1:17).

The resurrected and ascended Christ reigns as Lord over all things (1 Cor. 15:25–27; Phil. 3:21; Eph. 1:18–23) and is supreme above all creation (Col. 1:18). One day, all created beings in heaven and Earth will acknowledge the lordship of Christ (Eph. 1:10; Phil. 2:10–11). In the end, death will be destroyed and all creation will be subjected to God (1 Cor. 15:25–28). Paul expands Isaiah’s vision that every knee will bow to God (Isa. 45:23; 66:23) to include the entire created order. There is no barrier between the material and spiritual creation, since everything is under the rule of God and Christ, who sums up all things in himself (Eph. 1:10; 4:10; 1 Cor. 15:28). Paul is not negative about the physical world, including the human body. Through the incarnation, God’s eternal Son took on a real physical body, while fully retaining his deity (Rom. 1:3; Phil. 2:5–8; Col. 1:19, 22; 2:9). This affirms that matter is not evil. Each part of nature, including plants, animals and astronomical bodies, has a unique glory consistent with God’s design (1 Cor. 15:38–41). Nothing is unclean in itself, including all foods (Rom. 14:14, 20; cf. 1 Cor. 6:12). The Lord is for the body and the physical body should be used to honor God, since the Holy Spirit indwells Christians, whose bodies belong to Christ (1 Cor. 6:13–20; Rom. 6:13). Hence fornication, gluttony and other bodily sins dishonor Christ (1 Cor. 6:15; Phil. 3:18–19). Paul’s negative references to “the flesh” do not refer to the material body, but to the sinful nature inherited from Adam, which inclines all people toward evil (Rom. 5:11–21; 7:18; Gal. 5:19–21). Setting one’s “mind on things above rather than things on Earth” (Col. 3:1–2), means focusing on moral and spiritual values rather than sinful desires (Col. 3:5–17; cf. Phil. 3:19–20). The “earthly members” that believers are to consider dead are evil desires, greed, pride, etc. (Col. 3:5–17; cf. Rom. 6:1–14; 13:14).

Paul asserted that nature reveals the existence of God and basic aspects of his being (Rom. 1:19–20). Reflection on nature suggests that the world was created and that God alone should be worshipped. There is a clear distinction between the Creator and creatures. To worship any created thing is to deny God the glory that is his due as Creator (Rom. 1:21–23). Worshipping any aspect of nature or images of birds, animals or humans is to give created things the place the Creator rightfully deserves in human hearts (Rom. 1:21–32). Nature gods are really demons and should not be worshipped (Rom. 1:23, 25; 1 Cor. 8:5;

10:19–22; Gal. 4:8). When anything is substituted for the transcendent God, the basis for ethics is also undermined (Rom. 1:24–32), Paul believed.

Since God is to be honored above all else, the spiritual takes priority over the physical dimensions of life. Idolatry is more than merely worshipping animal carvings. It includes anything that becomes the supreme focus of life other than God (Phil. 3:19; Eph. 5:5; Col. 3:5). One should discipline the body (1 Cor. 9:25–27) and not be mastered by physical desires (1 Cor. 6:12–13). Material things are not evil, but the love of money and material things should not consume a person, lest they replace God as the basis of security (1 Tim. 3:3, 8; 6:9–10, 17; 2 Tim. 3:2). No food or drink defiles (Rom. 14:2, 6), but preoccupation with food is imbalanced and Christian dietary freedom should be exercised with consideration for others (Phil. 3:19–20; Rom. 14:14–22; 1 Cor. 8:1–13). Sex is God’s good gift to be enjoyed within marriage and practiced with self-control (Rom. 13:13; 1 Thess. 4:3–7; Gal. 5:19). The physical life has value, but it must be subject to the Spirit since people are not merely animals dominated by biological drives.

The Fall brought significant changes to nature. Nature no longer functions as God originally intended, due to human sin. Both physical and spiritual death came from Adam’s sin (Rom. 5:12–14, 17; 8:20–21; 1 Cor. 15:21–22; cf. Gen. 2:17; 3:8ff.). As a result of the Fall, creation was “subjected to futility” (Rom. 8:20), an allusion to the curse on the ground and pain in childbirth (Gen. 3:16–19;). Nature is now in bondage to corruption, decay and death (Rom. 8:21). Nature is not fallen, but it is a victim of human sin. Creation groans and suffers, longing to be set free from bondage to decay (Rom. 8:19–21).

Through his death on the cross, Jesus conquered sin and death so those who believe in him will have eternal life (1 Cor. 15:22, 57; Col. 1:20–22; 2 Tim. 1:10). Yet death will not be finally vanquished from creation until Christ returns (1 Cor. 15:23–26, 53–56). Jesus took away the sting of death (1 Cor. 15:54–56), but neither nature nor redeemed humanity have yet experienced the full implications of Christ’s death. Through the cross, Christ will reconcile both spiritual and material things to God (Col. 1:20–22). The reconciliation of humanity to God is part of God’s larger work of reconciling all things to himself (Col. 1:20–22). All things will be restored to the proper functioning that God intended (Rom. 8:19–23).

The credibility of the Christian message rests on Jesus’ resurrection in a physical body, not as an apparition (1 Cor. 15:4–8, 14–17). Jesus’ resurrected body is a fore-taste of the redeemed creation and the resurrection bodies of redeemed people (1 Cor. 15:20, 45–49; 2 Cor. 4:14; Phil. 3:21). Since believers are united with Jesus’ resurrection, they too will rise from the dead (Rom. 6:5; 1 Cor. 15:21; Phil. 3:11). At Jesus’ return, God will transform the bodies of believers into imperishable bodies like Christ’s resur-

rected body (Phil. 3:21; 1 Cor. 15:50–57; 2 Cor. 5:1–5). Like Jesus’ resurrection body, the resurrection body of believers will be physical, yet with a spiritual origin and character, glorious and eternal, and not subject to death and decay (1 Cor. 15:42–44; 2 Cor. 5:2, 4; Phil. 3:21; Rom. 8:18–19). This “spiritual body” (1 Cor. 15:44) will be suitable for dwelling in a creation set free from bondage to decay (Rom. 8:21). The eternal state of believers will not be a disembodied soul dwelling in heaven (2 Cor. 5:4). The entire person will be saved, not just the soul (1 Thess. 5:23).

The present form of this world will pass away (1 Cor. 7:31) and a new age will come (Eph. 1:21), in which creation will be perfected. Christian hope includes the deliverance of creation from bondage to corruption and futility (Rom. 8:20–21; cf. Gen. 3:15). The present suffering of creation is like birth pangs bringing a more perfect world (Rom. 8:22). Nature eagerly awaits the resurrection and glorification of the children of God at Christ’s return (Rom. 8:19), when the entire creation will be set free from bondage to decay and will share in the glorious liberty of redeemed humanity (Rom. 8:21, 23).

Although believers are a “new creation” in Christ and have a transformed inner character (2 Cor. 5:17; cf. Eph. 2:10; 4:24), the culmination of the new creation is still future. Nature will be transformed (Rom. 8:20–21), believers’ will be resurrected to glorious, imperishable bodies (Rom. 8:23; 2 Cor. 5:4), and death will cease (1 Cor. 15:20–24, 54–55). God gives the Holy Spirit to believers now as a guarantee of this glorious future (2 Cor. 5:5).

Paul sees solidarity between nature and humanity. Since God gave humanity dominion over the Earth (Gen. 1:26, 28), nature suffers when humanity is not rightly related to God and nature will be perfected when humanity is redeemed. The human Fall enslaved all creation to corruption and death (Rom. 5:12–14; 8:20). When the redeemed children of God are glorified at the end of history, nature will share in this glory (Rom 8:19, 22–23).

Peter

Since God is the creator of the world (1 Pet. 1:20; 2 Pet. 3:5), he seeks its purification and perfection. The “day of the Lord” will bring a “new heavens and Earth,” in which nature will be perfected and righteousness will abound (2 Pet. 3:10–13). “The heavens will disappear with a roar, the elements will be burned up and the Earth . . . will be laid bare” (2 Pet. 3:10, cf. 12). There are two ways to understand this: (1) This world will be destroyed and God will create a new, perfect world. (2) The present heavens and Earth will be renewed, purified and perfected. Several factors support the second interpretation: Burning is a frequent biblical symbol of judgment and purification (e.g., Matt. 13:20, 40; Luke 3:17). The passage uses similar destruction and re-creation language concerning the Flood (2 Pet. 3:5–7). Both the eschatological fire and the

Flood bring judgment on ungodly humans. In this sense the world was “destroyed” by the Flood and a new world was formed (vv. 5–6). Jewish apocalyptic writings also use similar new Earth/age language to refer to the perfection of creation. The new creation is “new” in its moral perfection and harmonious operation. In either interpretation, nature will be transformed and perfected.

Hebrews

God created everything (1:10; 3:3–4; 4:3; 11:3). He did not fashion the material universe from preexisting matter (11:3). The agent of creation was the Son of God and the word of God (1:2, 10; 3:3–4; 11:3), an allusion to Genesis 1 (cf. John 1:1–3). Jesus sustains and upholds creation by his powerful word (1:3).

Humans are exalted above nature (8:7), although materially they are part of nature. The author cites Psalm 8:4–6 (which echoes Gen. 1:26, 28), to show that God placed nature in subjection to humanity (Heb. 2:5–9). Yet sin corrupts the human relationship with nature and makes the dominion over nature flawed and incomplete (2:8). But Jesus, the first of a new race of humans, was exalted and has subjected creation to himself (2:9). The Son of God became fully human (“flesh and blood”), yet without sin (2:14, 17; 4:15).

Although Hebrews emphasizes spiritual salvation in heaven (11:10, 16; 12:22–23; 13:14), it looks forward to a redeemed nature and a restored human relationship with nature. In the “world to come” (the new Earth), the human relationship to nature will be perfected and the ideal of Gen 1:26, 28 and Psalm 8 will be fulfilled (2:5). In eternity, redeemed humans will not be merely glorified spirits, but will also have resurrected bodies (6:2; 11:35).

Revelation

God created all things in heaven, on Earth and in the sea (4:11; 10:6). God is “Lord of the Earth” (11:4). Every creature was made to glorify and worship God. John foresees the time when all creatures will worship God the Creator and Jesus Christ. Every creature in heaven, on Earth, and in the sea will join humans and angels in worshipping God and Christ (4:11; 5:13). The prophetic promise that all humans will bow before God (Isa. 45:23; 66:23) is expanded to include all creatures.

Nature is frequently used symbolically in the apocalyptic vision to describe Christ, God’s presence in heaven, extreme forms of evil, divine judgments, and the eternal blessings of the righteous (e.g., 4:5–7; 5:6; 6:1; 10; 13; 21–22).

Revelation focuses on eschatology. Due to the extreme evil of people who rebel against God in the last days, God will bring judgment through disease and environmental disasters, such as earthquakes, storms, intense heat, plagues and famine (16:1–21; 18:8). The OT shows a similar pattern of divine judgment on sin through nature

(e.g., Gen. 6:5–8; Ex. 7–12; Isa. 10:16–18; Jer. 14). Since humanity was given dominion over nature (Gen. 1:26), God’s judgment on human sin affects nature.

At the climax of history, the righteous will be bodily resurrected to reign with Christ, never again to experience death (20:5–6). After Christ’s return and the Final Judgment, God will create a new heaven and Earth (21:1). He will remove the damage caused by sin to the created order. Although it is difficult to determine whether some aspects of nature in the apocalyptic vision are symbolic (e.g., 21:1, 23), nature plays a part in the new creation. There will be a new Earth with rivers, springs and fruit trees with year-around productivity (21:1, 6; 22:1–2). All creatures will worship God (4:11; 5:13). There is some ambiguity about whether certain aspects of nature will be in the new creation. For example, there will be no sea (21:1, probably symbolic), yet sea creatures will praise God (5:13). God will “make all things new” and perfect nature (21:4–5). Death, disease, pain and suffering will not be a part of the new order (20:14; 21:4), since the curse on nature from the Fall will be removed (22:3). There will be a return to the ideal conditions of nature in the Garden of Eden and redeemed humans will have unrestricted access to the tree of life and water of life (21:6; 22:1–5, 14, 17, 19).

Christianity (4) – Early Church (Fathers and Councils)

The early Christian tradition expresses a profound ambivalence regarding the natural world. On the one hand, it affirms continuously the goodness and spiritual significance of the natural world, an affirmation rooted in two central convictions – that the world as created by God is good, and that the Incarnation of God in the person of Jesus Christ has transfigured all created matter. On the other hand, the early Christian tradition expresses genuine suspicion regarding the dangers of the wrong kind of attachment to the things of this world. At times, this suspicion expressed itself as a fear of, even revulsion toward material reality, toward embodied existence, toward the cosmos as a whole. However, there were also times when this suspicion of the world was understood in broader, more symbolic terms, a way of articulating the need to resist values believed to be antithetical to the Gospel. Much early Christian theological reflection, as well as the liturgical and spiritual life of the community, was affected by this deep-seated sense of ambivalence toward the living world.

Early Christian theological reflection unfolded within a highly charged climate of debate in which one's sense of God was directly and deeply affected by one's sense of the world and vice versa. Irenaeus of Lyons, for example, who in the second century articulated one of the early Christian world's most emphatic and systematic expressions of the

created world's goodness and value, was responding in part to the work of certain Gnostic thinkers who held to a deeply pessimistic view of the created world and of the malevolent demiurge who was understood to be responsible for having created it. According to Irenaeus, the Christian doctrine of the incarnation allowed no such pessimistic view of the world. For Irenaeus, the incarnation or enfleshment of God in Christ meant that the entire material world had been transfigured and was a kind of sacrament through which the eyes of faith could see the very light of God. In the process of affirming this truth, Irenaeus preserved for Christians not only a sense of the goodness and integrity of the created world, but also the goodness and integrity of God who created and sustains it.

Another kind of conversation, between Christianity and Greek philosophy, also affected how the early Christian community viewed the world and God's relationship with the world. For well-educated, philosophically sophisticated Christians such as Clement and Origen of Alexandria, the integration of Christianity into a Platonic philosophical framework was necessary if the Christian faith was to be seen as coherent and meaningful within the Greek-speaking world of Late Antiquity. But their brilliant synthesis also meant accepting certain aspects of Platonism's hierarchy of values and its *de facto* dualism (material realities, being corruptible, occupied a lower place in this hierarchy than non-material or spiritual realities, which through their kinship with God, the supreme Spirit, were seen as having eternal value and significance). The result was a profound and creative new articulation of Christian theology and spirituality. But it came at a cost. The suspicion of or aversion toward the physical world that one often senses in these and other writers leaves one uncertain about how successful they were at incorporating a fully incarnational Christianity into their thought-world and practice.

Contemptus Mundi

How did Christians come to feel suspicion, even aversion, toward the world? Christians have always felt slightly uneasy in the world. "Our true homeland is in heaven," claimed St. Paul. Christian eschatological hopes ensured that at least part of a Christian's attention would always lie beyond this world. Still, the doctrine of the Incarnation – God's enfleshment in matter in the person of Jesus – meant that at root Christians viewed the world as charged with God's presence and therefore sacred. For all this, Christians often expressed something bordering on revulsion for material existence, a sense that the phenomenal world is so deeply flawed that the best hope for one seeking intimacy with God is to reduce the pull of the world on one's soul. One sees this in the practices of Christian ascetics, who fled the world (*fuga*

mundi) in the hopes of discovering the presence of God on the borders of society and who subjected their bodies to severe physical privation in the hopes of reducing the sheer weight and power of matter's power over spirit. In its most extreme forms, such as seventeenth-century Jansenism, contempt for the world became a violence against the self and the world, a desperate attempt to free the spirit from the prison of its body. But in its more moderate forms, which can be said to characterize many elements of Christian spirituality, *contemptus mundi* often suggested something else: a struggle to understand how, in the midst of a complex and ambiguous existence, one could discover and live in the presence of the Spirit.

Douglas Burton-Christie

Augustine of Hippo (354–430), writing in Latin, largely accepted this Platonic dualism of matter and spirit as part of his understanding of Christian theology and employed it to articulate two important ideas that had vast influence upon the subsequent Christian tradition. The first was that the spiritual life has to do primarily if not exclusively with the interior life of the human being, an idea that effectively relegated the nonhuman phenomenal world to secondary status. The second was his deeply pessimistic attitude regarding human nature and the physical world (rooted, some have argued, in the influence of Manichean thought and its radically pessimistic attitude toward the physical world), an attitude that made it difficult for him to affirm what for Irenaeus had been axiomatic: that the world and everything in it is good.

This pessimism also manifested itself in Augustine's complex attitudes toward human embodiment and sexuality. As Peter Brown has demonstrated so clearly, this was a pessimism, or perhaps one should say ambivalence, shared by many early Christians. Part of this ambivalence had to do with what one might describe as a failure of the imagination – an inability (from our point of view) to incorporate sexual desire fully into an understanding of a life oriented toward God. Or to use the terms that Margaret Miles employs in her creative re-reading of Augustine's *Confessions*, one could say that this ambivalence had much to do with the way Christians came to understand pleasure. For Augustine, the only “true pleasure,” the only pleasure that lasts, is found in God. This necessitated casting a suspicious eye upon all desires and objects of desire less than God. Augustine was not the first to articulate these ideas. Nor can one lay at his feet all the worst excesses of later Christian ascetic ideas and practices. But his brilliance in articulating a powerful but narrowly circumscribed notion of pleasure became part of the very pulse of subsequent Christian thought for centuries to come, contributing to the Christian tradition's ongoing ambivalence toward “the things of this world.”

The synthesis of Christian and Greek philosophical thought also contributed significantly to the Christian community's ability to articulate how and in what ways God's presence could be felt and encountered in the world, to the development of a distinctly Christian cosmology. Central to this Christian cosmology was the idea of the *logos* or Word of God. The prologue of the Fourth Gospel had already expressed clearly the idea that Christ the *logos* had played a crucial role in the creation of the cosmos: “When all things began, the Word already was. The Word dwelt with God, and what God was, the Word was . . . Through the Word, all things came into being” (John 1:1). Tertullian (ca. 160–225), Clement of Alexandria (ca. 150–215), and other early Christian thinkers took this idea and, drawing upon the Stoic's profound sense of the *logos* as the very animating principle of the cosmos, developed it into a coherent Christian cosmology. Responding to those

who claimed that God is remote from the created world, Tertullian cited the Stoics who, he said, remind us “that God [through the *logos*] permeates the world in the same way as honey in the comb” (Tertullian in Colish 1990: 19). Elsewhere, Tertullian addresses the question of how the divine *logos* can be said to permeate the sensible world without losing its divinity: it is like the sun's relations with its own rays, he says, which are a portion and extension of their source. Both analogies draw upon the idea of *logos* as a generative principle immanent in the cosmos. According to Clement of Alexandria, the *logos* has three distinct but related dimensions. It is utterly transcendent, being identical with the totality of the ideas or powers of God. It is also the principle or pattern of everything that has been created. And it is the *anima mundi*, or world soul, the law and harmony of the universe, the power which holds it together and permeates it from the center to its most extreme boundaries.

Such ideas contributed significantly to the capacity of Christians to believe in and experience God's presence in the created world. Nor were such ideas limited to the sphere of philosophical and theological reflection. They reached into nearly every aspect of Christian life and thought, including art and architecture, biblical commentary, mystical experience, ascetic practice, music, and poetry. In the *fiat lux* of the Genesis creation account and in the luminous gold background of ancient Christian and later Byzantine mosaics, *logos* comes to expression through light. According to Irenaeus, the word that speaks through the cross also gestures forth across the cosmos:

because [Christ] is Himself the Word of God . . . who in His invisible form pervades us universally in the whole world, and encompasses its length and breadth and height and depth . . . the Son of God was also crucified in these, imprinted in the form of a cross on the universe (Irenaeus in Ladner 1995: 99).

One finds exquisite artistic expression of this idea in the Mausoleum of Galla Placidia in Ravenna. There, the cosmic cross appears on a dark blue shallow dome in the midst of stars arranged in concentric circles, an image whose diminishing size toward the center gives one the impression of gazing into a heavenly vault.

The same *logos* that sustains the cosmos rises up to meet us, suggested Origen of Alexandria (ca. 185–254), in the most intimate depths of religious experience. For Origen, one of the privileged places of such encounter was the reading of scripture. Here the *logos* comes as an ardent lover who kindles within us a passionate love for the world: “If a [person] can so extend his thinking as to ponder and consider the beauty and grace of all things that have been created in the Word,” he claims, “the very charm of them will so smite him, the grandeur of their

brightness will so pierce him as with a chosen dart . . . that he will suffer from the dart Himself a saving wound, and will be kindled with the blessed fire of His love” (1957: 29). Here is a sensual, palpable *logos*, present to us, says Origen, much as touch, fragrance, sound, vision, and taste are present to us.

Within the Christian monastic tradition, tasting and chewing upon the *logos* became a way of life. For the monks of the Egyptian desert, the *logos* arose from the silence as a powerful and numinous presence. To ruminate, digest and absorb such a word into the very marrow of one’s being was to be brought into the very presence of the Holy One. Nor was the natural landscape of the desert itself an insignificant part of this process. According to Athanasius’s *Life of Antony*, the Word of God not only beckoned Antony to withdraw into the desert, but called him to a particular place – a wild and beautiful spot in the remote Arabian desert known simply as “the inner mountain.” Such a powerful pull did it exert upon Antony’s imagination that, upon seeing it for the first time, he “immediately fell in love with the place.” The entire subsequent Christian tradition of monastic stability, or devotion to place, owes much to this early sense that places are alive with the power of the *logos*, that they do indeed speak to us with a particular voice, that rumination upon the word and the spirit of the place are integral elements in the larger rhythms of the spiritual life.

Still, as a whole, the early Christian tradition remained ambivalent toward “the world.” Early Christians clearly lived with a profound sense of the world’s goodness and beauty and some of their most creative theological work reflects the desire to understand their relationship to a God who is present to them in and through the things of this world. Yet, they also knew themselves to be “strangers” in this world, not entirely of this world. Clearly the development of this sense of life in the world as a kind of exile owes much to Platonic, Manichean or Gnostic influences; but at its root, it is a principle arising out of the Gospels themselves. And in that context, at least, it had more to do with allegiances than with a sense of the inherent evil of the world. Jesus’s disturbing question to his followers, “God or Mammon?” had a lasting effect upon the Christian imagination. To become a disciple of Jesus was to struggle with the question of to what or whom one was to give one’s allegiance, to consider carefully what or whom was deserving of that allegiance. It was to raise questions not so much about the inherent goodness of the world (in the sense of God’s created order) but about the problematic and deeply compromised character of existence (the order governed by “principalities and powers”). In that sense, the Christian notion of being “strangers” to this world carried within it the seeds of a healthy and necessary skepticism regarding the ordering of power in the world. But it also carried within it the seeds of a different and more problematic orientation: a suspicion of created matter and

a commitment to a radical interiority that made it difficult if not impossible to cherish the created order as spiritually significant. The legacy of this problematic denial of the world within early Christianity is still very much with us. Any honest evaluation of the ancient Christian tradition needs to reckon with it seriously. But we must also be prepared to acknowledge the creative cosmological vision found within early Christianity. Whatever suspicions the Christian community may have felt toward the world, it also expressed a profound and enduring love for the living cosmos and a sense that its sustaining energy was rooted in the Word of God.

Christianity (5) – Medieval

Medieval Christian thought has been routinely criticized for its pervasive theme of human dominance over nature. A perceived split between nature and supernature results in a sharp dichotomy between biophysical reality and a

transcendent, spiritual reality. Furthermore, the latter is identified with the image of God in human beings, often to the exclusion of the body. However, closer attention reveals a tragic ambivalence that begins with Augustine and continues in the scholastic tradition of Thomas Aquinas. Theologians within the Eastern Christian Church, like John Scotus Eriugena, wrestled with the distinction between nature and grace to the extent that they adopted Western premises. Of course, medieval Christianity also includes individual mystics whose piety included an intimate reverence for nature. Francis of Assisi (1182–1226) will be examined as representative, although female mystics like Hildegard of Bingen (1098–1179) and the nuns of Helfta (thirteenth century) deserve to be heard as well. Despite the medieval opposition between creation and Creator-God, the synthesis of God, nature, and man was tenuously retained until the late Middle Ages. What began as an expression of reverence for nature ended in nature's availability for divinely ordained human disposition.

The roots of Western medieval Christianity are found in Augustine of Hippo (354–430) in North Africa. His wonder at the drama of the natural world was interpreted through the Neoplatonic notion of divine immanence. His awe and wonder at the world's beauty was expressed in terms of the Greek notion of the One pouring itself out into the world. Thus, God's presence in the universe affirmed and sanctified nature rather than transcending and negating it. Augustine broke from Origen's heresy (condemned by the Fifth Ecumenical Council in 553) that the natural world "fell" into its physical/material state by the sin of Adam and Eve. Indeed, Augustine writes of the beauty and grace of nonhuman things. Augustine's understanding of nature was not, however, consistent. In an argument against the Pelagians, who thought that good works led to the City of God, he contradicted himself. At stake were the issues of human self-sufficiency and divine omnipotence. Augustine took the position that human nature was wounded by the sin of Adam and Eve, and divine intervention was required to restore right relationship with God. Additionally, Augustine's background in Manicheism (a Persian ascetic sect with strong dualistic tendencies) contributed to an emphasis on the salvation of the human soul alone. Augustine did not posit the dichotomy of pure nature and supernature, which would be prevalent in Christian thought. However, his concept of grace as a cure for sin and his concern for the human soul were enough to initiate this later split.

John Scotus Eriugena (ca. 810–877) combined Augustine's medicinal notion of grace with an otherwise Eastern Christian theology. (Eastern Christianity tends to see creation and salvation as a seamless movement, unbroken by the Fall. Dualism between nature and supernature is a Western problem.) Eriugena's text *The Division of Nature* retained the Neoplatonic concept of theophany, God's self-

manifestation in the world. In his detailed discussion of animals, birds, and plants, he evinces an understanding of nature as a wondrous display of God's very self. However, for him, theophany tends to be formal. Divine self-manifestation occurs primarily in the eternal reasons or forms of things rather than in their actual material existence. Eriugena echoed Origen in seeing the physical embodiment of all things as a result of human sin. Deification was available only to the human spirit and to the ideal essences of nonhuman things.

Francis of Assisi's life (1182–1226) was a celebration of nature's sacredness. The divine presence in nature, including human nature, was best accessed by a life of poverty and renunciation of the self. His *Canticle of the Sun* called on the heavenly bodies to praise the Lord. His sermon to the birds, his "little sisters," instructed them in God's abundant love. For Francis, the divine and the natural worlds were not at odds; nature and scripture were one. Nature was infused by divine grace and the idea that the natural world could exist in isolation from God's fecund goodness was foreign to him. For Francis himself, nature was God made visible.

Yet, Francis is known primarily through Bonaventure and Dante. In their interpretations, the hierarchical overflowing of the divine into the natural world does lead to a privileging of humanity. Bonaventure, especially, views humanity as the exemplar of nature and as alone destined for reunion with God. Nonhuman creatures find their perfection in humanity, whose spiritual nature, alone, will return to God.

Such ambiguity is continued in the scholasticism of Thomas Aquinas (1225–1274) who developed Augustine's view of nature and the divine as a united reality. Nature is fulfilled by and oriented to God. God's goodness and abundance is manifested in the natural world. Given his Aristotelian background, it was no accident that Aquinas was the author of five proofs of the existence of God from natural theology. Reasoning from the causality, existence, motion, complexity, and design of the natural world, he believed God's existence was a rational conclusion. His arguments expressed his conviction that only an omnipotent, omniscient, good God could create such a world. Nevertheless, Aquinas combined the Aristotelian premise that nature could be studied in abstraction from God with the Augustinian interpretation of Christ's incarnation as a cure for sin. Together, these two themes contributed to the growing distinction between nature as "pure nature" and the supernatural. The biophysical world was, at least in theory, separable from the spiritual world. Later scholastics, such as Duns Scotus (d. 1308), allowed for the possibility of the actual existence of pure nature, distinct from and unfulfilled by supernature.

The nominalist William of Ockham (1285–1349) brought this nascent division to full bloom. Out of reverence for God's infinite transcendence, he distinguished

between God's absolute power (*potentia Dei absoluta*) and the actual created order as willed by God (*potentia Dei ordinata*). Because God had the power to create anything and any truth he wanted, nature was no longer anchored by divine rationality. Practically speaking, this meant that knowledge was gained through observation of what was actually there; the presupposition of a harmony between divine reason and the natural order was annihilated. Nature was irrevocably severed from God. For the first time, "pure" nature was seen as a completely separate reality from the divine. With the evacuation of sacredness from nature, Thomas Bacon was able to justify human dominance as God's original intention for humankind. Thus, medieval theology set the stage for Enlightenment figures like Galileo, Descartes and Newton. These thinkers continued the reduction of reality to extension and its expression to mathematical formulation. Human knowledge of and approach to nature had fundamentally changed. The world only existed insofar as it was forced into quantifiable categories, its meaning dependent on human action.

Medieval wonder at the natural world contains the seeds of the misguided justification of human dominance over nature. Christian theologians like Augustine, Eriugena, Aquinas, and Francis of Assisi articulated the awe they experienced in the only concepts available to them: concepts of creation, hierarchy, and the classical concept of God. The tragedy lies in that the logical development of their thought, particularly in Ockham's nominalism, resulted in a world devoid of sacredness and available for unrestrained human consumption.

Our contemporary interaction with nature is irrevocably shaped by a religious and cultural history so pervasive that it cannot be simply jettisoned. A deeper understanding of medieval Christianity may allow us to understand ourselves, constructively reinterpret the tradition, and face a future fraught with ecological dangers.

Christianity (6a) – Roman Catholicism

With approximately one billion adherents at the turn of the twentieth century, Roman Catholicism is the largest branch of Christianity. Catholicism's history has been marked by shifting emphases regarding God's and humanity's relationships to the natural world. From its Hebraic origins, early Christianity affirmed the goodness of all of God's creation and understood humanity both as a part of the community of creation and as its very apex and crown. However as Christianity spread across the Mediterranean world, it encountered and accommodated itself to potent Platonic and neo-Platonic philosophical systems emphasizing the transcendence of the spiritual realm over the world of embodied reality. The cosmological model of emanation pictured creation coming from God's being and goodness overflowing into a "great chain of being," and dominant streams of early Christian theology adopted this model.

On the one hand, this world-picture affirmed the rich relationality – the chain's "links" – between God, humanity, and the rest of nature. It emphasized that humanity is a part of the community of creation and it affirmed that even the "lower levels of creation" are graced, precious, sustained in being by God, and contribute in their own way to the "perfection of the universe." It affirmed an "ontology of participation" in which God alone is "necessary being" and all of creation is understood as sustained in existence by its participation in, and dependency on, God's energy and goodness. This view helped foster across the centuries Catholicism's rich sacramental sensibility. On the other hand, this world-picture emphasized the hierarchical ordering of the diverse levels of being in the universe and viewed humanity as the apex of creation, enjoying God's grant of "dominion" over the rest of nature. Historically this stress on hierarchy supported affirmations of God's transcendence, humanity's unique creation in the *imago Dei*, and humanity's rights to use the rest of nature to serve its ends. Often the stress on hierarchy became so dominant that balance was lost and the traditional understanding of humanity as a part of creation became attenuated. Nonetheless, because dominant traditions of patristic and medieval theology placed such a stress on God's creation and governance of the universe, a potent creation-centered frame for understanding human life was retained even if the emphasis on

hierarchy pulled toward the enunciation of a strong anthropocentric ethical focus.

One can see this ambivalent construal of the natural world in the flowering of Catholic theology in the medieval period. A wide number of theologians, monks, and mystics gave expression to a strong sense of God's presence amidst the world of creation, and yet this cosmological frame of thought was joined to a strongly hierarchical view of the order of being which in turn supported a stress on the distinct role and value of the human. A wide range of important medieval thinkers placed an emphasis on creation. John Scotus Eriugena (810–880), for example, translated the Pseudo-Dionysian corpus, and in his own work, *On the Division of Nature*, gave an extensive elaboration of the Platonic world-picture. Hildegard of Bingen (1098–1179), a German Benedictine abbess, integrated cosmology, creation and the incarnation, and the Celtic Saints preached extensively about God's grace in nature.

Down through the centuries the Church's monastic orders have functioned as important reminders to the broader church community of God's presence in nature. The monastic orders stretch back to the founding of the Benedictine order by Benedict of Nursia (ca. 480–547). Even though monasticism is popularly associated with austerity, ascetic practices, and an other-worldly ethic, the monks' typical retreat from urban centers often led them to establish their monasteries in rural or wilderness areas. While serfs typically did the bulk of the agricultural work required to sustain the community, the monks themselves frequently participated in agricultural labor.

Indeed, Benedict's Rule, which shaped the practices of his and many other orders, called for integrating prayer and daily labor. This rhythm tended to balance the other-worldly tendencies of monastic spirituality with an inner-worldly appreciation of the gardening, land-clearing, forestry management and sustainable agricultural practices required to sustain the communities. While clearly affirming an other-worldly stance, Catholic monasticism also has sustained a deeply respectful engagement with the fields, woods, gardens, animals, and surrounding countryside – and a sense that humanity and the rest of creation are partners in a common project of honoring the Creator. Many Catholics continue to find inspiration in the strong affirmations of the goodness of the natural world now voiced by many of today's monastic communities.

Two giants of the Medieval Church – Francis of Assisi (ca.1181–1226) and Thomas Aquinas (1225–1274) – deserve special attention because their life work and writings continue to shape Catholic reflection about God's and humanity's relationships to the natural world. The stories of Francis' rejection of his father's wealth and conversion to a life of poverty, of his irrepressible joy, his charity, his preaching to birds and animals, his stigmata,

and his founding of the Franciscan Order all continue to inspire. Francis was a nature mystic who felt deeply the intimacy of God's presence throughout nature and stressed humanity's kinship with the animals, fish, and birds. He was committed to a life of preaching and he drew on scripture, especially the Psalms, for vivid and concrete language about birds, animals, stars, and planets. He emphasized the close bonds between humanity and the rest of creation by invoking personalistic and familial terms of address – “Brother Sun,” “Brother Wolf,” and “Sister Mother Earth.” The various orders that have branched off from the original Franciscan trunk have been generally energetic in recent years in promoting ecological responsibility. Pope John Paul II in 1979 called attention to Francis' example by naming him the patron saint of ecology.

Thomas Aquinas' works are also read today with interest by Catholics concerned about ecological degradation. His *Summa Theologia* and other works well display the “chain of Being” model's affirmations that God is manifest throughout the order of creation and that the human and all other living entities participate in the common good of the universe. Thomas' works hold unique authority in modern Catholic thinking because Pope Leo XIII (1878–1903) in his encyclical *Aeterni Patris* (1879) officially adopted Thomism as the foundation for theological education in Catholic seminaries, colleges and universities. Likewise Leo, in his encyclical *Rerum Novarum* (*The Condition of Labor*) (1891), drew on Thomas' understanding of the natural law to address the sufferings of the poor and exploitation of working people occurring in the industrializing countries of Europe and North America. Leo condemned with equal vigor the unfairness and meanness of unfettered capitalism and the revolutionary excesses of socialism's call for the abolition of the private ownership of property. Leo appealed to the natural law heritage to argue for a “middle way” between capitalism and socialism that affirmed both the priority of the common good over that of the individual and the existence of certain natural rights, like the right to own property, to join in workers associations, and to receive a just wage for one's work. *Rerum Novarum* is generally credited as a major advance in the papal social encyclical tradition.

Leo's endorsement of Thomism as the Church's “official” theological vision encouraged a revival of interest in Thomas' works. While neo-Thomists have long focused on Thomas' hierarchical stress of human superiority over the rest of nature, increasing attention is now being directed to his use of a second organizing principle in his thinking, one that focuses on the “whole community of the universe” (Aquinas 1948: 2:996; *ST*, 1a, 2ae, q.91, art.1). Whereas the dominant interpretation has given a human-centered reading of Thomas, his writing on creation develops a second scale of value in which the individual is subservient to the good of the species, and

that good is likewise held as subservient to the common good of creation. God is the ultimate common good of all existent entities, but the next highest good is the good of the universe as a whole, a good that surpasses that of any one species including the human. Thomas accepts that the human is uniquely created in the *imago Dei*, but he holds that all other creatures also bear a “likeness” of their Creator (Aquinas 1948: 1:231; *ST*, 1a, q.44, art.3). Thomas rearticulates the neo-Platonic principle of plenitude that holds that because God is maximally good and powerful, God pours out God’s being into a maximally rich universe characterized by a maximal diversity of levels of being. For Thomas, the diversity of species is a mark of God’s sovereign grandeur and expansive generosity. As he put it: “[T]he principal good in things themselves is the perfection of the universe; which would not be, were not all grades of being found in things” (Aquinas 1948: 1:124; *ST*, 1a, q.22, art.4). Increasingly these passages are being read as providing a theological condemnation of human practices that promote habitat destruction and species extinction. To kill off a species is to tear the fabric of God’s creation.

Even as Pope Leo XIII appealed to the Thomistic natural law heritage to affirm a distinctive Catholic social ethic critical of the excesses of both capitalism and communism, dominant streams of Catholic thinking in the twentieth century became influenced by existentialist and phenomenological currents of thought stressing humanity’s unique subjectivity, freedom, and historical agency. Many French thinkers, like Emmanuel Mounier, Jacques Maritain, and Etienne Gilson, and Germans, like Dietrich von Hildebrand, gave shape to an emerging Catholic movement known as “Personalism” which centered ethical reflection in the distinctive worth and unique value of the human person. Likewise Karl Rahner, Bernard Lonergan and others called for a “turn to the subject” and away from Thomistic metaphysics and notions of the natural law. Lonergan called on Catholic thinkers to shift from the “classicist worldview” and embrace “historical mindedness.” In rejecting metaphysics and ontology, increasing numbers of Catholic thinkers came to accept a sharp dualism between humanity and the rest of nature. Many Catholic thinkers in recent decades meant that the “turn to the subject” also functioned as a turn away from nature and the order of creation. But in falling silent about nature, much modern and contemporary Catholic thinking too easily accommodated itself to accepting the ruling understanding of nature as a “thing” or a “field or resources” that is sustained by the dominant consumptive and productive practices of industrially advanced society.

Pope John XXIII (1958–63) called the Second Vatican Council (1962–65) to help the Church respond more adequately to the “signs of the times.” Many wanted the Church to ease its traditional condemnation of artificial birth control and John XXIII called a commission to study

the issue. After John’s death the commission recommended to Pope Paul VI that he end the condemnation of birth control. Paul, however, sustained the traditional condemnation in his encyclical *Humanae Vitae* (*On Human Life*) (1965) and this triggered an ongoing controversy. The Pope relied heavily on biologically-based, natural law reasoning to condemn artificial birth control as a violation of the natural end or purpose of intercourse and to affirm that the rhythm method of natural family planning is permissible because it involves no impediment to “natural processes” and is in accord with the natural cycles of women’s fertility. Many who rejected the Pope’s conclusion likewise came to reject the natural law method used to reach that conclusion. They felt it reductionistically read ethics directly from the physical ordering of biology or nature. Many liberal thinkers sought to revise Catholic ethics by centering moral attention on persons in their full relationality with other persons, not on the physical structure of the sex act.

John Paul II became pope in 1978 and his distinctive personalist ethical emphases have long had a powerful influence on Catholic thinking. Before his rise to the papacy he received his doctorate in philosophy and was strongly influenced by Edmund Husserl’s and Max Scheler’s phenomenological perspectives. While John Paul II continued to appeal to the natural law tradition to justify his continuation of the condemnation of birth control, his main critique of birth control drew its energy from his phenomenological account of the human person. He held that birth control’s wrongness lies primarily in the intent to block the “full donation” of persons in the act of love. Its wrongness, then, lies more in its violation of relationality between persons than in some violation of the “order of nature.” Thus, while sharp disagreement continues between those who condemn and those who would accept birth control, many in both camps shifted away from natural law reasoning and embraced a focus stressing God’s relationship to persons and their responsibilities to each other.

With both conservatives and liberals “turning to the subject,” it is not surprising that there emerged a general turning away from nature and creation. The heightening of the intensity of the focus on the human often was accompanied by an attenuation of an appreciation of our embodied animality as members of a species dependent, like all other species, on the well-being of the Earth’s ecosystems. Though some Catholic liberals and conservatives continue to invoke the natural law tradition, they generally see it as based in principles drawn from “human reason,” not some “order of nature.” In this fashion, the dominant view in the last three decades of the twentieth century understood the tradition as human-centered, not creation-centered.

Pope John Paul II’s 25-five year pontificate, for example, marked a clear progression from an early

endorsement of a flat-out domination of nature, to an acceptance of a dominion ethic, and finally to an acceptance of a more ecologically informed, stewardship approach. Even if one wished the pace had been quickened, he will be remembered as the pope who first addressed ecological issues. Long accustomed to focusing on social justice issues, the Vatican found it difficult to integrate ecological sustainability into its long-standing social justice agenda. While many environmentalists' voices have been raised in concern about rising global population and its impact on ecosystems, the church hierarchy's response was to argue that overconsumption by rich societies is the key ecological problem and that increased development of poorer societies is the best path toward global population stabilization. While there is some merit in the Vatican's view, still it seems that the Vatican came to ecological issues with hesitation, due both to its controversial position against birth control and because of the Pope's personalist perspectives. By the early twenty-first century, the clash between the United Nations' population agenda and the Vatican lessened, however, as the United Nations began to emphasize the expansion of girls' educational opportunities and the promotion of families' and women's healthcare as the most effective means of achieving reductions in average family size over time. While the Church and the United Nations remained in confrontation over the latter's encouragement of birth control, this new approach, stressing education and healthcare, was one that most in the Vatican could embrace as a matter of social justice.

John Paul II's encyclical *Laborem Exercens (On Human Work)* (1981) illustrates both his personalist philosophical agenda and how it tends to polarize the human sharply from the rest of nature. He celebrated the dignity of human work, but did so by contrasting human agency and subjectivity over against nature's passivity and "objectivity." Through work humanity "subdues" and "dominates" the Earth and thus fulfills the mandate of Genesis. The Pope held technology as an almost unqualified "ally" in humanity's transformation and domination of the natural world. Repeatedly the nonhuman world is depicted as a sphere of resources. John Paul II did acknowledge, however, that "the heritage of nature is limited and that it is being intolerably polluted." But this was a passing point that failed to check his general celebration of the ongoing domination of nature (Pope John Paul II 1981: 7).

John Paul II's 1987 encyclical *Sollicitudo Rei Socialis (On Social Concern)* was the first encyclical to give more than a mere passing reference to emerging ecological problems. In this encyclical his main agenda was to call for the social and economic development of peoples, but he did acknowledge limits to humanity's dominion over the Earth. He noted that we have "a certain affinity with other creatures" and that we were placed "in the garden with the duty of cultivating and watching over it" (John

Paul II 1987: 52 [sec. 29]). But he failed to break out of an anthropocentric focus and repeatedly insisted that the "goods of creation" were meant to serve the good of all of humanity (secs. 39, 42, 76, 86). While this encyclical marked an important turning point, still the Pope repeatedly depicted the natural world as a field of resources waiting for human transformation and use.

The Pope's fullest articulation of concern for emerging ecological threats was promulgated in January 1990 in an address titled: "The Ecological Crisis: A Common Responsibility." In it he moved from a stress on dominion to articulate clearly the importance of recognizing strict stewardship obligations. Catholics have a "serious obligation to care for all of creation" (Pope John Paul II 1989: 13), he stated, adding that the ecological crisis is a moral issue and a "common responsibility" of all peoples. He strongly condemned the overconsumption of the industrialized rich societies and asserted that this is the primary cause of ecological degradation.

Bishops' Conferences in many nations built on the Pope's early steps and promulgated an array of important pastoral letters on ecological concerns. Most move beyond the Pope's generally human-centered ethical perspective and articulate a stewardship ethic rooted more deeply in an acknowledgment of humanity's participation in, dependency on, and responsibilities owed to, creation. In 1988 the Filipino Bishops wrote an important letter that noted many connections between human suffering and ecological degradation. They held that the defense of the Earth is the "ultimate pro-life issue" and called on the Church to overcome its "neglect" of the "ecological crisis" (Bishops of the Philippines 1996: 317). Likewise the American Bishops in 1991 wrote "Renewing the Earth" in which they drew on the Hebrew Scriptures to remind us that we inhabit a "sacramental universe" in which God's presence sustains all creation. They called on Catholics to acknowledge their "kinship with all that God has made" (US Catholic Conference 1996: 229). They sought to expand the traditional notion of the common good to include the "planetary common good" even as they argued that the "love of neighbor" now requires that we "extend our love to future generations and to the flourishing of all Earth's creatures" (US Catholic Conference 1996: 239).

In addition to these magisterial calls for caring for the Earth, there are many other Catholic movements that are focusing on the plight of creation. Most seek to engage the medieval theological heritage and correlate its pre-modern sense of nature as a living community with post-modern ecological thinking about nature. Even many non-Catholics find Francis of Assisi's life and views inspirational. Additionally there is a fledgling movement referred to by some as "eco-Thomism" that is exploring helpful correlations between Thomas' stress on conforming human action to the natural law and ecologists' findings that human communities must likewise conform

to the limits and “laws” of the natural ecological order (see LeBlanc 1999: 293–306; and Schaefer 2001: 23–52). Some eco-Thomists fear that the subject-centered turn in theology and the reduction of the natural law tradition to claims drawn from the “order of reason” often constitute a too easy accommodation to the ruling anthropocentric assumptions that dominate modern Western societies. They seek to swim against the stream and recover a natural law approach rooted in an ecological understanding of “order of nature.” Eco-Thomists note that Thomas employed the best science of his day – Aristotelianism – in his theological analyses and suggest that his example should empower the Church to draw deeply from the best scientific account of the world today, namely the one offered by the ecological sciences. Eco-Thomists accept that the concentration on the human subject has enriched Catholic thinking, but they argue that any account of the human person that misses our embodiment, our evolutionary history, and our dependency on natural ecosystems – in short, any account of the person that is not ecologized – is simply inadequate.

Catholicism has long supported distinct traditions of spirituality but in the last three decades Thomas Berry, Matthew Fox, and others have sought to ground spirituality in a celebration of God’s presence in the materiality of the natural world. “Creation-centered spirituality,” as their movement is dubbed, pulls mystical reflection from an other-worldly direction into an engagement with an ecologically sound, sacramental view of nature. Fox aims to draw attention to God’s “original blessing” given in creation. Berry holds that contemporary science offers us the remarkable spiritual gift of a new and inspirational creation story that vividly discloses the grandeur, complexity and beauty of God’s gift of creation. For Berry, caring for the planet must become our generation’s top priority, our “great work” to which we are called.

Liberation Theology is another movement that encourages Catholics to consider the ways that oppression of the poor tends to go hand in hand with the degradation of the Earth. Liberation thinking arose in Latin America and first focused on human oppression and on God’s liberating action in history. Over time, however, many liberationists concluded that environmental degradation hits the poor the hardest and that genuine human liberation requires social justice, sustainable development and the protection of natural ecosystems. Leonardo Boff, a Brazilian and former Franciscan, and Enrique Dussel, an Argentinian, and others have helped many to see these linkages. Liberation thinking is being enriched too as the Church begins to appreciate the popular piety and practices of the laity in a wide range of cultures that draw upon their indigenous cultural heritages. For example, in parts of Guatemala, Catholic ecological sensibility is being enriched by tapping into the peoples’ traditional Mayan

reverence for the sacredness of the rain, the soil, and the corn and bean crops that sustain life. Often when Catholicism comes into contact with indigenous peoples, the latter’s sensitivity to nature heightens Catholic ecological sensibilities. The Eurocentric intellectual base of Catholicism is now engaging and being engaged by important insights and sensitivities from a more culturally diverse, global Catholic community.

Similarly Catholic feminist theology is helpfully exploring the interconnections between the oppression of women and the domination and degradation of nature. Feminist thinkers provide a “hermeneutic of suspicion” that unmask ideological justifications for sexism and for anthropocentric ethics, which objectify the nonhuman natural world as having only resource value. Rosemary Radford Ruether has been a major Catholic feminist leader who has long promoted an ecofeminist theological vision. She has argued that Christianity contains two distinct traditions – the covenantal and the sacramental – that can help instill an appreciation for the sacredness of the natural world and for our need to care for the Earth.

In conclusion, it must be remembered that the lived piety of Catholicism is rich in a host of embodied liturgical and sacramental practices and that these play a big role in giving shape to the ethos and perspectives of the community. The US Bishops’ Conference and those in other countries are appealing to Catholic parishes around the world to think of ecological concerns when they develop their year-long liturgical plans. The feast days of Saints Francis and Isidore (the patron saint of farmers), and Rogation Days, the three days before Ascension Thursday, are being identified as special occasions where parishes can help people engage theological reflection with ecological concerns. In such ways ancient liturgies, feasts, and sacramental traditions are being reshaped to offer a set of associations to help encourage a deeper appreciation for the sacramental character of the natural world.

Catholicism’s rituals, sacraments, and rich sacred calendar serve to sustain a thick sense of a “sacred cosmos.” These practices and holy days, at their best, function as channels mediating a sense of the sacred into the everyday world of the believer. The sacred calendar with its numerous holy days and seasonal ceremonies offer regular communal reminders of a sacred history that joins individuals into a greater intergenerational narrative. This sense of a community across the generations is also sustained by the ancient belief in the “communion of the saints.” These ritualized rememberings of one’s connections to past generations may well be a potent emotional and moral resource for helping to promote greater sense of identification with, and felt obligation toward, our planet’s future generations.

Christianity (6b1) – Christian Orthodoxy

In a historical exploration of the concept of nature in Orthodox Christianity, there are three preliminary points that must be made: first, the notion of the natural world as distinct from the human part of creation is in fact classical Greek in origin; second, the Judeo-Christian tradition does not consider nature as something separate or subordinated to human creation. Thus, nature is never either "divine" (since it is not God, but merely created by God) or "profane" (since it is always and closely connected to the creation of the human person in the image of God). Finally, the brief outline that follows examines the historical understanding of nature as this emerges in certain key thinkers and certain fundamental principles of Orthodox Christian theology.

An Orthodox Christian perspective on nature begins with the creation of the world through the Word of God, as described in the opening chapters of the Book of Genesis. Following the Judeo-Christian tradition of thought, Athanasius of Alexandria (d. 373) emphasized two particular factors of the creation story in his classic treatise *On the Divine Incarnation*: the creation of the world out of nothing (cf. II Macc. 7: 28) and the creation of humanity in the image and likeness of God (Gen. 1:26). Creation out of nothing implies the creation of the universe by an act of free will and in a movement of love. Creation of humanity in the divine image and likeness implies that we are endowed with similar freedom but that, like the rest of creation, we too are contingent and dependent on God. Both concepts require careful exegesis, inasmuch as the "nihil" out of which God made the world is not considered to be something outside of the scope of the divine energies, while the creation of Adam and Eve complements the first concept and underlines the close connection between humanity and the natural world. John Chrysostom (d. 407) describes creation as a form of doctrine. Indeed, in the mind of Anthony of Egypt (d. 356), nature is an open book revealing the truth of God. Indeed, to detach oneself from matter is to cease to be human (Gregory of Nazianzus, d. 390).

A part of the original creative plan, the Incarnation of the Word of God is not perceived simply as a result of human failure but in fact constitutes an essential and natural characteristic of God. In this respect, the Incarnation is to be seen as related to the creation of the entire world and not limited to the creation of humanity. Thus, Gregory of Nyssa (ca. 395) describes the mystery of Incarnation as a normative, and not an exceptional movement in the relationship between God and the world. Thus Christ appears as the center and focus of all things (cf. Col. 3: 10–11), revealing the original beauty and restoring the ultimate purpose of the world. The entire world is likened to the extended human body, believed Origen of Alexandria (d. 254); and it is especially likened to the Body of Christ.

In the thought of the early Fathers, the Church as the Body of Christ is the experience of a new heaven and a new Earth (cf. Rev. 21:1), whereby the heavenly penetrates and transforms the earthly. In this light, the emphasis in Orthodox thought has been on the “last times,” on the *eschaton* or the kingdom of God. By contrast with Western theologians who underlined the significance of history from the time of Tertullian (d. 225), Eastern theologians have emphasized the role of the metahistorical, the eternal or spiritual in the world. Thus, the world around has always been appreciated in light of the heavens above; and the Eucharist became the criterion by which the value of the natural world was determined. The “last times” expressed the conviction of the early Christian Church about the lasting value of all things. The human person stands, as it were, between two worlds – between heaven and Earth – and serves as a microcosm and a mediator that seeks to manifest and reconcile the spiritual through the material.

Created in the image and likeness of God, the human person is called to bless God for the entire creation as well as to bless the entire creation in returning it to God. In this respect, human beings are performing a royal and priestly function. The vocation of humanity is not to exploit nature but to transform it, not to dominate or destroy it

but to cooperate with and sanctify it. The human person is to make connections, to draw bridges between the natural environment and the kingdom of heaven. Leontius of Cyprus (seventh century) noted the way in which we offer worship to God “through all creation visible and invisible,” as well as of the way “the moon and the stars glorify God through us” (*Apologetic Sermon on Icons*: 93).

Although the writings of Dionysius the Areopagite (ca. 500) establish a notion of hierarchy within the heavens and the created order, he admits that “God moves outside of the divine realm in an act of extreme erotic love, approaching the world burning with goodness” (*On the Divine Names* IV: 12). Human potentialities are more complex and varied than even those of angelic beings; and the implications of our actions are more manifold and mysterious for the natural environment than we could ever imagine. One of the tasks before us as human beings is to preserve the integrity but also the diversity of God’s creation. No one among us has the right to reduce the scope of God’s presence in the natural world; rather, each one of us has the responsibility to embrace the breadth of God’s grace in every person, every animal, and every plant.

The para-priestly character of the human person in relation to the natural environment raises the concept of

Eastern Orthodox Monasticism

Given its otherworldly orientation, Orthodox monasticism might at first glance appear – at least to a contemporary mind – as marginal, perhaps even an aberrant phenomenon of minor importance to modern ecological concerns. The etymological origin of *μοναχός* or *μοναχή*, the Greek terms used for monk or nun respectively, is found in the word *μόνος* meaning “alone,” separate from all worldly concerns in an unceasing communion with God. The emphasis is indeed on the contemplative, interior life of the individual and his/her personal relationship with the divine, resulting in an extreme spiritualization of one’s own bodily existence and a total renunciation of the material universe as a source of temptation and evil and an obstacle to spiritual ascent.

Yet there is almost always a tension between the ideal and the real in Orthodox monastic life and this can especially be seen when we deal with monastic attitudes toward nature. Such attitudes can be almost perceived as a form of dualism being both positive and negative at the same time. Thus, on the one hand, Orthodox monastics have exhibited a “renunciatory” attitude toward the world and on the other hand a “reverential” one, defending the goodness of nature, which must be loved and restored to a new unity with God. Contrary to the rationalistic and anthropocentric view of Western Christianity stressing the mastery of humans over nature, in Orthodoxy this partaking of the natural cosmos in the

universal plan of salvation is achieved only through the mediation of humans, who are themselves the union of material and spiritual elements. The human being assumes, thus, a priestly vocation. The Orthodox view of nature is a “liturgical” one and its foremost expression is found in the Eucharist. In its nature, in the form of bread and wine, is offered to God and is received back transfigured as the Body and Blood of Christ. In this way nature is humanized and humans are deified.

Orthodox monastics from early on have sought this harmonious relationship between humans and nature in the adoption of an ethic of self-offering and self-sacrifice in their effort to achieve a foretaste of paradise on earth. Nature was not seen as fallen, but rather as embodying the image of God. There have been indeed countless cases of early ascetics, but also of contemporary monks, who have developed what may be regarded as an unusual relationship of friendship and mutual understanding with wild and dangerous animals. From Anthony the Great in fourth-century Egypt up to Seraphim of Sarov in nineteenth-century Russia, the true Orthodox saint has treated nothing as alien and hostile in God’s created universe. In this way he recognized that what was offered to him was a gift of God and that one must live following God’s commandment to “till and look” after the Garden of Eden (Gen. 2:15).

Continued next page

This “ecological asceticism” is also, up to a certain degree, apparent in the liturgical and everyday lives of present day Orthodox monks and nuns. Their vigorous fasting and the avoidance of meat eating shows not only a sparing use of resources and respect for other creatures, but also an appreciation of the simplest of foods, which help to sustain the greatest gift of all, that of life. Furthermore, material substances such as water, oil, seeds of wheat, bread, grapes or certain plants are blessed and thus purified. In this way, they become loci of divine strength conferring grace on the individual. The whole nature through purification is elevated and becomes the *οἶκος* (house) of God. Moreover, through the old monastic virtues of *ψιλοξενία* (hospitality) and *ψιλανθρωπία* (charity), offered both to humans and to the animal kingdom, the alienation of humans from the rest of the creation is overcome. Even the monastic virtue of chastity and the voluntary limit of one’s own reproductive capabilities may be viewed as contributing to the resolution of the present ecological crisis. Orthodox monastic life follows a cyclical time in accordance with the rhythm of nature, since it follows the sun’s cycle and alters with the seasons. Finally, Orthodox monastic architecture embodies this ecological ethos by adjusting and not imposing to the surroundings and by exhibiting a variety and a creativity exceeding functionality, thus creating a mystic effect in which the image of God is revealed in everything present.

Yet, in today’s society even monastics did not manage to avoid the effects of modernity, particularly as they relate to the environment. The era of Orthodox monasticism when human beings were said to have lived in innocent harmony with nature tends to be a thing of the past. Nowhere is this more apparent than on Mount Athos (Greece), the spiritual center of Orthodoxy ever since the tenth century. The destructive effects of modern day civilization may be seen in the huge deforestation of the Athonite peninsula resulting from the more intensive use of the physical resources, such as

wood, for trade purposes in order to cover the increasing spending costs of the monasteries, as these attempt to modernize their facilities. The opening of roads with no apparent planning for the mechanized transportation of pilgrims has also contributed to this effect. The old paths, which had been used to connect the monasteries a few decades back and formed an integral part of the inward and outward journey of pilgrims, have nowadays fallen into neglect. Pilgrims have been turned into tourists, as Mount Athos became in the last decades a fashionable place to visit among the political elite, intellectuals, nationalists looking for the lost glory of Byzantium and agnostics searching for religious gurus. The introduction of modern technology on Mount Athos in the form of telecommunications, road networks, networks for water supply and construction work have forever changed both the unique flora and fauna of the locality. The disappearance of wolves and of the variety of wild trees in favor of chestnuts for the exploitation of their produce attest to this. The ethos of ecological asceticism is losing more and more ground, endangering also, as many argue, the state of inner spiritual tranquility.

the iconic or symbolic dimension of the world. Creation brings us to a vision of God; *physike* leads to *theoria*. For Evagrius of Pontus (d. 399), the contemplation of the physical reality involves the recognition of God’s presence in nature. Each place and each moment is a sacred space and time; each can serve as a window into eternity. Then each human being can discern his or her role within the natural order. Then we are able to move through the creation to the Creator, and “wherever we turn our eyes, we shall see God’s symbol” (Ephrem the Syrian, d. 373, *Hymns on Paradise* XXX: 2). This does not signify the adoration, but only the veneration of creation. An icon does not imply an idol. John of Damascus (d. 749), the champion of icons, taught that “we do not worship

creation in place of the Creator; we worship the Creator who assumed creation for our sake” (*On Holy Images* IV: 4, 16).

By the fourteenth century, the relationship between the transcendent God and the immanent world was described in terms developed by Gregory Palamas (d. 1359) who articulated the earlier teaching of the Church by expounding the doctrine of the distinction between divine essence and divine energies. The fundamental dichotomy in Judeo-Christian thought was not between matter and spirit, but only between the sinful and the redeemed. Through the distinction between essence and energies in God, the Eastern Christian Church defined the relationship between God and creation by affirming that creation was

Orthodox Spirituality

In the Christian Orthodox tradition, there are three particular principles that play a significant role in understanding our role in and responsibility for the environment. These include icons (the way creation is perceived), liturgy (the way creation is celebrated), and asceticism (the way creation is treated). *The beauty of the icon* offers new insights into reality. It reveals the eternal dimension in everything. Icons remind us of another way and another world and offer a corrective to the culture that gives value only to the here and now. The icon articulates with theological conviction our faith in the heavenly kingdom. The icon does away with any objective distance between this world and the next, between matter and spirit, body and soul, time and eternity, creation and divinity. The icon reminds us that there is no double vision, no double order in creation. It speaks in this world the language of the age to come.

In icons, God assumes a face, a beauty that is exceeding (Ps. 44:2), a “beauty that can save the world” said Dostoevsky. In Orthodox icons, faces – whether of Christ, or of the saints in the communion of Christ – are always frontal. Profile signifies sin, a rupture in communication. Faces are eternally receptive to divine grace. “I see” means that “I am seen,” which in turn implies that I am in communion.

The entire world is in fact an icon and a point of entry into a new reality. Everything in this world is a seed. “Nothing is a vacuum in the face of God,” wrote Irenaeus of Lyons in the second century; “everything is a sign of God” (*Against Heresies* IV: 21). And so in icons, rivers assume human form; the sun and the moon and the stars and the waters assume human faces; all acquire a personal dimension.

What the icon does in space and matter, *the world of the liturgy* effects in praise and time. If we are guilty of relentless waste, it is because we have lost the spirit of worship. We are no longer respectful pilgrims on this Earth; we have been reduced to mere tourists. The Eastern Orthodox Church retains a liturgical view of the world, proclaiming a world imbued by God and a God involved in this world.

Liturgy means dynamism and creativity, not merely ritual. The world is neither static nor eternally reproduced, as the classical worldview proposed. It is movement toward an end, toward a sacred goal. It is neither endless nor purposeless, but relational. In an icon, every part is required for the picture to be complete. If we move (or remove, or destroy) one part of the picture – whether a tree, or an animal, or a human being – then the entire picture is affected. We must always think in terms of connections. All ecological activities are measured ultimately by their effect on people, especially upon the poor. Anyone who does not love trees does not

love people; anyone who does not love trees does not love God.

Liturgy is a celebration of this connection and communion. When we enter this interdependence of all persons and all things – the “cosmic liturgy,” as St. Maximus the Confessor called it – then we may understand and resolve issues of ecology and of economy. In the breadth of the liturgical worldview, we recognize that the world is larger than our individual concerns. The world ceases to be something that we observe objectively, and becomes something of which we are a part personally.

The world in its entirety constitutes the liturgy. God is praised by the trees and by the birds, glorified by the stars and the moon (cf. Ps. 18:2), worshipped by the sea and the sand. When we reduce religious life to our concerns, we forget the function of the liturgy is to implore God for the renewal of the whole cosmos. Our relationship with this world determines and defines our relationship with heaven.

A radical reversal of perspectives and attitudes is required to alter the situation. There is a price to pay for our wasting. The environmental crisis will not be solved simply by expressions of regret. Only a *spirit of asceticism* will lead to the rediscovery of wonder and beauty. Unfortunately, asceticism carries with it the baggage of dualism and denial, developed over centuries inside and outside Christianity. Yet this is not the vision of wholeness that Orthodox Christian spirituality intimates through its ascetic dimension. The connection is intimate between the human body and the environment. In the third century, Origen of Alexandria believed that: “The world is like our bodies. It too is formed of many limbs and directed by a single soul” (*On First Principles* II: 1–3). And if the Earth is our flesh, then it is inseparable from our destiny.

The ascetic person is free, uncontrolled by attitudes that abuse the world, uncompelled by ways that use the world, characterized by the ability to say “enough.” Asceticism aims at refinement, not detachment or destruction. Its goal is moderation, never repression. It looks to service, not selfishness. Without asceticism, none of us is authentically human.

One important example of asceticism in Orthodox practice is fasting. Orthodox Christians fast from dairy and meat products for almost six months, itself an effort to reconcile one half of the year with other, secular time with the time of the kingdom. Fasting is integrating body and soul, remembering the hunger of others, feeling the hunger of creation itself for restoration, hungering for God, remembering that we live not by bread alone, being reconciled with one another and the world. It is affirming that the material creation is neither under our control nor to be exploited selfishly, but to

Continued next page

faces or icons, and the earth as the countenance of God. The discipline of fasting inspires a sense of wonder, of goodness, and of godliness, enabling one to see all things in God, and God in all things.

charged with divine energy, that nothing was outside the embrace of God. Thus, the presence of God in the world is neither one of illusion (a-theistic) nor one of identification (pan-theistic). Orthodox Christianity would instead espouse a doctrine of pan-en-theism, regarding God as embracing the world and the world as being in God.

In more recent centuries, Christian Orthodox theologians have developed the concept of divine Wisdom in an effort to understand and proclaim the unity of heaven and Earth that is most uniquely personified in Jesus Christ as the eternal creator who assumed creation. A single blade of grass should remind us of God, says Basil of Caesarea (d. 379). And, for the ascetic tradition represented by John Climacus (d. 649), each animal too bears the wisdom of the Creator and testifies to God. Everything is seen to bear the seed, the sign, the reason (or *logos*, as Maximus the Confessor [d. 662] called it) of the divine *Logos* or Word. The wisdom of God is the creative and unitive power in all things (cf. Wisdom of Solomon 9:1).

Now within the doctrine of the creation of the world by God, Orthodox Christianity proposes three fundamental principles that together comprise the vision of nature: (i) The world is good and beautiful. This means that no part of the natural world may be divorced from the loving care of God and the environmental concern of the Christian; (ii) The world is fallen or sinful. As a result of human failure, the process of cosmic transformation is incalculably costly and creation "travails" in expectation of deliverance (cf. Rom. 8: 22). Without freedom, there would be no sin. Yet, without freedom there would also be no love; finally, (iii) The world is redeemed. This means that nothing is intrinsically evil and everything has received the first fruits of transformation through the crucifixion and resurrection of Christ.

Christianity (6b2) – Greek Orthodox

Ecological endeavors have been at the heart of Greek Orthodox activities for more than 15 years and are undertaken by various official bodies such as the Ecumenical Patriarchate of Constantinople and the autocephalous Church of Greece. Given the wide attention to environmental issues on the part of many religions across the globe, such an interest is hardly surprising. The greater sensitization of the major world religions for environmental problems was largely effected after the inter-religious meeting of Assisi (26 October 1986). In these endeavors, an attempt is usually made to articulate the *differentia specifica* of the Orthodox contribution to environmental issues in contrast to other Christian traditions and religions.

Beginning with the Ecumenical Patriarchate of Constantinople, this interest was manifested by Patriarch Dimitrios I (1972–1991), who intended to render this traditional center of Orthodoxy a place of prayer for the creation. After a relevant proposal issued by an environmental congress held on the island of Patmos in September 1988, he declared in 1989 that each first day of September (i.e., the beginning of the new ecclesiastical year), should be kept as a day for the protection of the environment. In addition, the official hymnographer of the Church, the monk Gerasimos Mikragiannanitis from Mount Athos, was entrusted with the composition of a service for the environment and all creation to be celebrated always on September 1st, which he did in 1990 (published in Thessaloniki 1997). Patriarch Dimitrios was active in many other related endeavors, such as the organization of an inter-Orthodox conference (5–12 November 1991) in the “Orthodox Academy of Crete” in collaboration with the World Wildlife Fund, in which the basic tenets of the Orthodox position toward the ecological crisis were articulated. It is in this Academy that an “Institute of Ecology and Theology” was created too as a concrete response to the related initiatives of the Patriarchate of Constantinople.

But the one who has identified himself fully with the cause of environmental protection is his follower, Patriarch Bartholomew I (since 1991), who rightly has been given the nickname “the Green Patriarch.” During his numerous visits to Greece and abroad he has almost always exhibited publicly his ecological sensitivities. Among his major activities was the founding of a non-governmental organization “Religion, Science and the Environment” (RSE) in 1994, based in London and in Athens, which seeks to provide common ground between science and religion in order to help local communities to protect their environment and to raise awareness concerning its ongoing degradation (e.g., the plight of world’s waters). Within this framework, some environmental summer seminars were organized at the Orthodox School

of Theology on the island of Halki in cooperation with the WWF, as in 1994 (“The Environment and Religious Education”), in 1995 (“The Environment and Ethics”), and in 1997 (“The Environment and Justice”). Since 1999 a special “Halki Ecological Institute” has been active there too.

Further activities of RSE, which have achieved significant outcomes for some regions of Europe, include the international water-based symposia on religion, science and the environment. These have taken place under the auspices of Patriarch Bartholomew with the participation of noted religious and political leaders and public officials, as well as scientific and environmental figures. The first one with the theme “Revelation and the Environment A.D. 95–1995” took place in September 1995 aboard a ship on the Aegean Sea on the occasion of the 1900th anniversary of the writing of the Book of the Apocalypse. The second one entitled “The Black Sea in Crisis” was dedicated to the protection of the natural environment of the Black Sea and took place in September 1997 under the patronage of the European Commission on board a ship that carried the participants along the Black and the Aegean Sea. The third floating symposium entitled “Danube: River of Life” took place in October 1999, again under the patronage of the European Commission, and included a 2,800 kilometer voyage down the Danube from Passau (Germany) to the Danube Delta in Romania and the Ukraine; the symposium aimed at highlighting the river’s many problems and war damage. The fourth environmental symposium entitled “The Adriatic. A Sea at Risk, a Unity of Purpose” was held in June 2002, again under the patronage of the European Commission, and focused on the Adriatic Sea’s environmental challenges. After visiting five Adriatic countries the symposium was concluded in Venice, where Patriarch Bartholomew and Pope John Paul II, joined by a video link, signed an important declaration together on protecting the environment. Afterwards Patriarch Bartholomew flew to Oslo, where on 12 June he was awarded the Sophie Prize by the Norwegian Sophie Foundation for his consistent efforts in protecting nature. Patriarch Bartholomew’s campaigns for drawing attention to environmental problems in European waters are planned to continue in the following years, including a floating symposium in 2003 on the Baltic Sea.

Given this wider interest in environmental issues, it is not accidental that one eminent Greek theologian of the Ecumenical Patriarchate, who is also a regular participant and contributor to the above activities, Metropolitan of Pergamon Ioannis Zizioulas, has been especially active in developing an Orthodox theology of the environment and has been at the forefront of relevant ecological endeavors. His book κτίση ως ευχαριστία: θεολογική προσέγγιση στο πρόβλημα της οικολογίας (*Creation as Eucharist: A Theological Approach to the Problem of Ecology*; Athens 1992) has become a classic text and a welcome Greek contribution in this area, following the work of Russian

theologian N. Zabolotskij, who had dealt with such issues in another context in the 1970s.

Analogous sensitivities for the protection of the environment including lectures, meetings, conferences, publications and other activities have been demonstrated by the Church of Greece under the auspices of Archbishop Serapheim (1974–1998), especially since 1987, the international year for the protection of the environment. The same interest has been occasionally shown at a lower level in the various dioceses, in which several metropolitans exhibited a vivid interest in local ecological problems (e.g., on the Ionian islands for the protection of the longerhead sea turtle *Caretta caretta*). In addition, due to the demand of relevant Greek organiza-

tions, Saint Modestos, celebrated on the 16th of December, has been officially declared the protector of animals by the Church. Finally, another service for the protection of the environment has also been instituted by the Metropolitan of Patras Nikodimos (Vallindras); following the decree of the Holy Synod on 10 January 1992, it is celebrated every September 1st. Similar interests in ecological issues are also exhibited by the new Archbishop Christodoulos (since 1998), and there is a special “Synodal Committee for Divine and Political Providence and Ecology.”

The greater involvement of the above sister Churches in ecological endeavors is certainly a recent phenomenon, but it is not one without a precedent. The protection of the

Common Declaration on the Environment: Common Declaration of John Paul II and The Ecumenical Patriarch His Holiness Bartholomew I

Editor's Note: On 10 June 2002, in a video hook-up between Rome and Venice, Pope John Paul II and the Orthodox Patriarch of Constantinople, Bartholomeos I, issued a landmark joint declaration on the environment. It illustrated not only an intensification of environmental concern, but also how our environmental predicaments can provide a common ground for reconciliation among religious groups with previously strained relations.

We are gathered here today in the spirit of peace for the good of all human beings and for the care of creation.

At this moment in history, at the beginning of the third millennium, we are saddened to see the daily suffering of a great number of people from violence, starvation, poverty and disease. We are also concerned about the negative consequences for humanity and for all creation resulting from the degradation of basic natural resources such as water, air and land, brought about by an economic and technological progress which does not recognize and take into account its limits.

Almighty God envisioned a world of beauty and harmony, and He created it, making every part an expression of His freedom, wisdom and love (cf. Gen 1:1–25).

At the centre of the whole of creation, He placed us, human beings, with our inalienable human dignity. Although we share many features with the rest of the living beings, Almighty God went further with us and gave us an immortal soul, the source of self-awareness and freedom, endowments that make us in His image and likeness (cf. Gen. 1:26–31; 2:7). Marked with that resemblance, we have been placed by God in the world in order to cooperate with Him in realizing more and more fully the divine purpose for creation.

At the beginning of history, man and woman sinned by disobeying God and rejecting His design for creation. Among the results of this first sin was the destruction

of the original harmony of creation. If we examine carefully the social and environmental crisis which the world community is facing, we must conclude that we are still betraying the mandate God has given us: to be stewards called to collaborate with God in watching over creation in holiness and wisdom.

God has not abandoned the world. It is His will that His design and our hope for it will be realized through our co-operation in restoring its original harmony. In our own time we are witnessing a growth of an ecological awareness which needs to be encouraged, so that it will lead to practical programmes and initiatives. An awareness of the relationship between God and humankind brings a fuller sense of the importance of the relationship between human beings and the natural environment, which is God's creation and which God entrusted to us to guard with wisdom and love (cf. Gen. 1:28).

Respect for creation stems from respect for human life and dignity. It is on the basis of our recognition that the world is created by God that we can discern an objective moral order within which to articulate a code of environmental ethics. In this perspective, Christians and all other believers have a specific role to play in proclaiming moral values and in educating people in ecological awareness, which is none other than responsibility toward self, toward others, toward creation.

What is required is an act of repentance on our part and a renewed attempt to view ourselves, one another, and the world around us within the perspective of the divine design for creation. The problem is not simply economic and technological; it is moral and spiritual. A solution at the economic and technological level can be found only if we undergo, in the most radical way, an inner change of heart, which can lead to a change in lifestyle and of unsustainable patterns of consumption and production. A genuine conversion in Christ will enable us to change the way we think and act.

Continued next page

First, we must regain humility and recognize the limits of our powers, and most importantly, the limits of our knowledge and judgment. We have been making decisions, taking actions and assigning values that are leading us away from the world as it should be, away from the design of God for creation, away from all that is essential for a healthy planet and a healthy commonwealth of people. A new approach and a new culture are needed, based on the centrality of the human person within creation and inspired by environmentally ethical behavior stemming from our triple relationship to God, to self and to creation. Such an ethics fosters interdependence and stresses the principles of universal solidarity, social justice and responsibility, in order to promote a true culture of life.

Secondly, we must frankly admit that humankind is entitled to something better than what we see around us. We and, much more, our children and future generations are entitled to a better world, a world free from degradation, violence and bloodshed, a world of generosity and love.

Thirdly, aware of the value of prayer, we must implore God the Creator to enlighten people everywhere regarding the duty to respect and carefully guard creation.

We therefore invite all men and women of good will to ponder the importance of the following ethical goals:

1. To think of the world's children when we reflect on and evaluate our options for action.
2. To be open to study the true values based on the natural laws that sustain every human culture.
3. To use science and technology in a full and constructive way, while recognizing that the findings of science have always to be evaluated in the light of the centrality of the human person, of the common good and of the inner purpose of creation. Science may help us to correct the mistakes of the past, in order to enhance the spiritual and material well-

being of the present and future generations. It is love for our children that will show us the path that we must follow into the future.

4. To be humble regarding the idea of ownership and to be open to the demands of solidarity. Our mortality and our weakness of judgment together warn us not to take irreversible actions with what we choose to regard as our property during our brief stay on this earth. We have not been entrusted with unlimited power over creation, we are only stewards of the common heritage.
5. To acknowledge the diversity of situations and responsibilities in the work for a better world environment. We do not expect every person and every institution to assume the same burden. Everyone has a part to play, but for the demands of justice and charity to be respected the most affluent societies must carry the greater burden, and from them is demanded a sacrifice greater than can be offered by the poor. Religions, governments and institutions are faced by many different situations; but on the basis of the principle of subsidiarity all of them can take on some tasks, some part of the shared effort.
6. To promote a peaceful approach to disagreement about how to live on this earth, about how to share it and use it, about what to change and what to leave unchanged. It is not our desire to evade controversy about the environment, for we trust in the capacity of human reason and the path of dialogue to reach agreement. We commit ourselves to respect the views of all who disagree with us, seeking solutions through open exchange, without resorting to oppression and domination.

It is not too late. God's world has incredible healing powers. Within a single generation, we could steer the earth toward our children's future. Let that generation start now, with God's help and blessing.

environment has been an issue for the Church occasionally in the past too (cf. an encyclical of the Church of Greece against those burning and destroying forests in April 1845). While it is true that the involvement of the Church in environmental issues has its critics, these endeavors perform many other functions on a domestic as well as international level. The adoption of the ecological cause, for example, by the Patriarchate of Constantinople has enhanced the Church's broader role and reputation worldwide, as it is no longer considered to be a beleaguered relic of Byzantium.

Christianity (6c1) – Reformation Traditions (Lutheranism and Calvinism)

The two major Protestant Reformers of the sixteenth century, Martin Luther and John Calvin, inherited traditions of theological reflection about nature which were in large measure shaped by a *spirit-matter dualism*, the idea that the material world is in some fundamental way, in itself, an obstacle to the life of faith, something that the believer should aspire to rise above. At the highest levels of theological sophistication, this spirit-matter dualism had been given expression in terms of an ontology of the Great Chain (Hierarchy) of Being. This was the theological perspective: theologians and mystics and many other people of faith thought of the world as if they were situated in a valley, contemplating a towering mountain. The goal of the spiritual life, from this perspective, is to ascend from this material world, higher and higher spiritually, through various stages of material and spiritual being, to God at the top, who is pure spirit. According to this perspective, then, the question of loving nature and caring for nature would rarely, if at all, have to be taken seriously: because the whole purpose of human life would be understood to be ascending *above* nature (the world of the flesh) to be with God – and using or even abusing nature along the way was morally unproblematic.

In contrast, some pre-Reformation theologians and mystics, such as Irenaeus in the second century, the mature Augustine (with some ambiguities) in the fifth century, and Francis of Assisi in the thirteenth century, eschewed that kind of spirit-matter dualism in favor of a more integrated vision of the world. Although they may have thought of the world in terms of a Great Chain of Being, they were variously captivated by the thought of the Divine Goodness – or the Divine Fecundity – *overflowing*, from the apex of the hierarchy to its lowest regions. They took for granted the idea that an eighteenth-century Lutheran theologian, F.C. Oetinger, was later to champion: that “corporeality is the end of the ways of God.” Which is to say: the purpose (the “end” in this sense) of God and the presence of God are to be discerned and encountered *within* the material world, *not above or beyond it*. This was the perspective: not contemplating the world as if looking up at a towering mountain, but rather envisioning the world as if one were stationed at the peak of such a mountain looking out at the vistas of the slopes and valleys below and all around.

Luther and Calvin were surely very much aware of the theological traditions of the ontological and hierarchical reflection about nature that they had inherited. But these traditions were not the primary intellectual context they self-consciously chose for their own theological reflection about the created world. The Reformers as a matter of course regarded their own theological work primarily as interpretation of the Scriptures. And there they found, and gave voice to, a rich theology of nature. As they interpreted the Bible afresh, moreover, they broke dramatically with the spirit-matter dualism they had inherited.

“In every part of the world, in heaven and on Earth,” Calvin wrote, in a typical utterance,

[God] has written and as it were engraven the glory of his power, goodness, wisdom and eternity . . . For the little singing birds sang of God, the animals acclaimed him, the elements feared and the mountains resounded with him, the river and springs threw glances toward him, the grasses and the flowers smiled.

Calvin even suggests that when we contemplate the wonders of God in nature “we should not merely run them over cursorily, and, so to speak, with the fleeting glance, but we should ponder them at length, turn them over in our mind seriously and faithfully, and recollect them repeatedly” (Calvin in Wendel 1963: 34). Luther had a similar view of the glories of God in the whole creation and of creation’s marvels. “If you truly understood a grain of wheat,” he once wrote, “you would die of wonder” (Luther, *Werke*: 19: 496). In his Genesis commentary, Luther even imagined Adam and Eve, before the fall, enjoying a common table with the animals. In the same spirit, both Reformers thought theocentrically about human interactions with nature: God and his righteous will, they believed, set very real limits for the reaches of human pride and arrogance. The created world, the Reformers held, belonged first and foremost to the Creator. Yes, in keeping with the teaching of the Book of Genesis, the Reformers affirmed that humans were mandated by God to exercise dominion over the Earth, but, for the Reformers, especially for Luther, that dominion was understood to be a restoration of Adam’s and Eve’s lives as caretakers or gardeners, “before the Fall,” not as a license for exploitation.

Further, both Reformers affirmed the immediacy of God in nature. For them, God was not detached from the world, far above in some spiritualized heaven. On the contrary, as Luther often said, God is “in, with, and under” the whole created world. For Luther, God is “with all creatures, flowing and pouring into them, filling all things” (Luther in *Weimarer Ausgabe*: 10: 143). Indeed, God is so near, according to Luther, that if he were to withdraw his hand, the whole creation would collapse:

The sun would not long return to its position and shine in the heavens, no child would be born; no kernel, no blade of grass, nothing at all would grow on earth or reproduce itself if God did not work forever and ever (Luther in Pelikan 1957: 26).

This view of nature as divinely given and divinely charged came to its completion, for the Reformers, in their teachings about “last things” (eschatology). Both theologians strongly emphasized the traditional Christian teaching about the resurrection of the body. Both also, Luther perhaps most vividly, projected a view of the end of the world as a cosmic consummation, the coming of the “new heavens and new Earth” announced in biblical traditions. Nature itself, the Reformers believed, would be “saved” and consummated at the very end. Then, they believed, with the Apostle Paul, God would be “all in all” (1 Corinthians 15:28).

In retrospect, Luther and Calvin can thus be seen to be champions of the idea of the overflowing goodness, the fecundity, of God. The Reformers rejected the theme that the way to find God is to rise above nature. For them, in this sense, “corporeality is the end of the ways of God.” God is always to be encountered, when he is encountered, immanent in the material world.

Fatefully, however, the issues that preoccupied Luther and Calvin had to do not with God and nature, but much more so with God and human salvation. Their theologies, accordingly, took on a kind of anthropocentric character, by way of emphasis. “Justification by grace through faith alone” was the theological teaching that most occupied their attention. Furthermore, presupposing his own idea of the justified Christian’s life of active sanctification, Calvin accented the responsibility of Christians to change the world for the better. In Calvin’s thought, accordingly, the theme of human dominion over the Earth tended to lose the contemplative character it had for earlier theologians who had celebrated the overflowing goodness of God and take on, instead, more active, interventionist meanings.

The theological heirs of Luther and Calvin, especially in the nineteenth century and thereafter, took the Reformers’ measured anthropocentrism as a given, but tended to abandon the Reformers’ rich teaching about God and the natural world. As a result, Protestant theology after Luther and Calvin tended to become much more exclusively anthropocentric. There were many reasons for this marked shift of emphasis, not the least of them being the rise of Newtonian mechanistic science and Darwinian evolutionary science, and the felt need by many post-Reformation theologians to root religious faith in the intangible human spirit or human subjectivity, so as to leave the objective world of nature, as it were, to the natural scientists, and also to protect faith from the attacks of some scientists and scientifically informed philosophers. This anthropocentric dynamic also made it easy – intended or not – for both

theologians in particular and Protestants of every walk of life to be swept along by the dynamics of industrial society, which were publicly predicated on the exploitation of the Earth for the sake of human progress.

It was a profound historical irony, then, that the Reformers’ rejection of the theme that humans are called to rise above nature, a theme which they had inherited with the spirit–matter dualism of the Great Chain of Being ontology, was contradicted by many of their own theological heirs. “Humans rising above nature” was to become one of the central themes of nineteenth- and early twentieth-century Protestant theology, above all through the influence of the nineteenth-century theologian, Albrecht Ritschl. The theme was given new life in the middle of the twentieth century by the Protestant New Testament scholar, Rudolf Bultmann, whose existentialist interpretation of Christianity presupposed a view of nature as a mechanistic, “objective” world, which, Bultmann believed, those who chose “authentic existence” should rise above. Even the great Karl Barth, said to be the Thomas Aquinas of the Protestant tradition, whose works dominated Protestant theological discussions in the middle of the twentieth century, refused to develop a theology of nature and, along the way, almost by default, set forth ideas about nature in instrumental terms that posed no real challenge to the ideas of rising above nature espoused by thinkers like Ritschl and Bultmann.

This whole situation began to change in the second half of the twentieth century. A number of theologians writing in the tradition of Luther and Calvin began to take issue with the whole direction that Protestant thought about nature had taken in the nineteenth and early twentieth centuries. Paul Tillich reached deeply into what for him was the nature-mysticism of Martin Luther, in order to reaffirm nature as a theological theme in its own right and nature itself as having sacramental value. In a stirring address to the World Council of Churches meeting in New Delhi in 1961, Joseph Sittler called the attention of the churches of the world to the “cosmic redemption” theology of St. Paul and pleaded that the theology of grace that was so critically important for the theologies of Luther and Calvin be extended to comprehend, and no longer exclude, the world of nature.

Presupposing such trends and drawing still more deeply on newly discerned ecological teachings of the Bible, Jürgen Moltmann projected a grand theological schema of cosmic, as well as historical, redemption, predicated on a new and compelling appreciation for biblical eschatology. Moltmann developed a “theology of hope” that claimed liberation not just for humans, above all the poor and the oppressed, but also for all the creatures of nature. He also developed a new and deeper understanding of God’s immanence in the whole created world – in nature, as well as in spirit – than many of his nineteenth- and early twentieth-century theological forebears had

done, reminiscent of the sensibilities for nature that the Reformers took for granted. In this sense, Moltmann's thought represents a decisive rejection of the hierarchical spirit-matter dualism that dominated much of the theology inherited by the Reformers and much of the theology espoused by the heirs of the Reformers in the nineteenth and early twentieth centuries.

Moltmann also went beyond the teaching of the Reformers, whose thought had been anthropocentric in emphasis. Moltmann developed a theology of "cosmic redemption" through Christ and a theology of the creative Spirit of God that integrated and extended the Reformers' rich apperceptions of nature, precisely in terms of a comprehensive, cosmic theology of grace, a theological theme which, for the Reformers, had been mainly focused on issues relating to human salvation. Moltmann likewise transvalued post-Reformation teaching about human dominion over nature, which presupposed the theme of human mastery, even domination. Instead, Moltmann espoused a theology of the integrity and the rights of nature.

But Moltmann's was by no means the only Protestant voice to address the theology of nature positively and creatively in the wake of the pioneering work of Tillich and Sittler. John Cobb, a thinker deeply influenced by the process philosophy of Alfred North Whitehead, focused much of his innovative theological writings on the global environmental crisis, which by the end of the twentieth century had been widely recognized by theologians as well as by scholars in other fields to be *the* challenge of the future. Protestant theologians such as H. Paul Santmire and James Nash also studied the historical and ethical dimensions of the crisis. In addition, a wide variety of Protestant Old and New Testament scholars began to explore the theology of creation espoused by biblical traditions in new and suggestive ways. Further, the critique of the hierarchical ontology of the Great Chain of Being imagery was voiced with increasing poignancy and power by feminist theologians such as Sallie McFague. Building, in part, on the sacramental insights of Luther, McFague, for one, argued that the whole creation is the "Body of God," that the love of nature is in fact, in this sense, the love of God. Global ecological and ethical concerns were addressed imaginatively, as well, by Larry Rasmussen, whose work reflected the growing interests in cultural diversity and religious pluralism that emerged in some strains of Protestant thought toward the end of the twentieth century.

Alongside of and integrated with their theologies, all these late twentieth-century thinkers also took for granted the same kind of passion for social justice that had been voiced most prominently by Moltmann. This ethical accent on nature represented a relatively new development in the unfolding of the Reformation tradition, whose concerns had hitherto focused mainly on issues pertaining

to humankind's status before God and, later, on the theoretical relationship between faith and the natural sciences.

This is not to say that all Protestant theologians in the second half of the twentieth century were committed to the projection of new and imaginative theologies of nature, sensitive to the issues of justice for all creatures. Numerous Protestant thinkers in that era were preoccupied with other issues. Some, following Karl Barth, viewed any kind of interest in the theology of nature with suspicion. Still, in many thoroughgoing ways, by the beginning of the twenty-first century, the tradition of Luther and Calvin, which had begun with a rich theology of nature of its own, had been expanded and deepened. It had become a profoundly ecological tradition, shaped by concerns both for human liberation and for the liberation of the whole creation.

Christianity (6c2) – Calvin, John (1509–1564) and the Reformed Tradition

The core concern of the Protestant Reformation was salvation for human beings. While "nature" was not

central to the concern of the early Reformers, the distinctive theocentric matrix of the Reformed tradition shaped a common ethos in understandings of nature that emerged within it. This ethos had four main features. First, an emphasis on the unique glory of God and hence on the distinction between Creator and creature. Second, an emphasis on the pervasive sovereignty of God and hence an attempt to bring God and creation into as close a proximity as possible. Third, an emphasis that the purpose of creation is the glory of God and hence that nature, in diverse ways, demonstrates the character of God. Fourth, an emphasis on the vocation of human beings to glorify God in all areas of life leading to an activist and world transformative spirituality.

Many of the diverse features of the tradition have roots in John Calvin's interpretation of creation. For Calvin the act of creation was the free and gracious act of the triune God who desired to give existence and life to the created universe. While humanity is the focus of God's creative and providential activity, God exercises a fatherly care over all creatures. As a consequence the entire creation bears witness to God's goodness and power, becoming a magnificent theater that displays the glory of God.

The Reformed Tradition in its Own Words

John Calvin

In Calvin's theology of creation, nature's continued existence, vitality and life is a product of God's constant activity and in particular the work of the Spirit. In his summary of Christian theology, *The Institutes of the Christian Religion*, he thus argues:

[I]t is the Spirit who, every where diffused, sustains all things, causes them to grow, and quickens them in heaven and on earth. Because he is circumscribed by no limits, he is excepted from the category of creatures; but in transfusing into all things his energy, and breathing into them essence, life and movement (1960: 138).

In a similar manner he comments on Acts 17:28, stating:

God Himself distinguishes Himself from all creatures so that we may realize that strictly speaking He alone is, and that we truly subsist in Him, seeing that He quickens and sustains us by His Spirit. For the power of the Spirit is diffused through all parts of the world, to keep them in their place; and to supply the energy to heaven and earth which we see, and also movement to living creatures. This does not mean the way that

crazy men talk nonsense about all things being full of gods, and even the very stones being gods, but that by the wonderful activity and instigation of His Spirit God preserves all that He has created out of nothing (1966: 119–20).

As a consequence of this understanding of God's activity in creation, Calvin portrays nature as demonstrating the character and glory of God. He thus comments on Psalm 104:1,

... although God is invisible, yet his glory is conspicuous enough. In respect of his essence God undoubtedly dwells in light that is inaccessible; but as he irradiates the whole world by his splendour, this is the garment in which He who is hidden in himself, appears in a manner visible to us ... That we may enjoy the sight of Him, He must come forth to view with His clothing; that is to say, we must cast our eyes upon the very fabric of the world, in which he wishes to be seen by us (1949: 145).

A similar thought is expressed in his "Preface to Olivétan's New Testament."

[God] has raised everywhere, in all places and in all things his ensigns and emblems, under blazons so clear and intelligible that no one can pretend

The created order, by virtue of its creaturehood, is inherently precarious. The Fall intensifies this precarious character. Creation is thus always on the point of descending into chaos. The continued existence, order and beauty of creation are the product of God's constant activity in sustaining creation and restraining evil. As the natural order is the consequence of God's constant activity, it is thus "the clothes" in which God appears. Human beings were created with the ability to perceive God through creation; this ability has been removed by sin but could be restored by regeneration. Christians are called to exercise all their senses in contemplating creation not only to apprehend the character of God revealed through it but also to contemplate its intricacies and beauty. Nature thus becomes a meeting place between God and humanity.

Calvin emphasized the presence and activity of God to such an extent that he struggled to define the role of secondary causation, yet he equally emphasized that creation was not in any sense divine. In order to guard the unique glory of God and to reject all idolatry the distinction between Creator and creature must be maintained. His theology thus rejected any divinization of creation and emphasized its integrity as creation. This is exemplified

in his insistence that Jesus Christ retained his authentic humanity after the ascension. Creation maintained its genuine creaturehood even when it was brought into as close as possible proximity with deity.

Calvin never resolved the tension between the proximity and the distinction between God and creation. He emphasized one or the other depending on the context. He posited a Trinitarian and pneumatological theology (a branch of theology that deals with the Holy Spirit) in which the Spirit is understood as the creative source of life and energy in the universe. This has the potential of addressing this tension, but it remained undeveloped in Calvin's theology.

God created the Earth for the good of human beings and it is to be received by them with thanksgiving. As such human beings are to act as good stewards of creation, caring for it, treating otherkind with justice and adopting a frugal lifestyle. Human sin is the ungrateful rejection of God that has brought catastrophe to the created order. Salvation is God's action to restore creation to its original purpose through the transformation of human beings. Regenerate human beings are called to act to advance this restoration by working for the reformation of all of life.

ignorance is not knowing such a Sovereign Lord, who has amply exalted his magnificence; who has in all parts of the world, in heaven and on Earth written and as it were engraved the glory of his power, goodness, wisdom and eternity . . . For the little birds that sing, sing of God: the beasts clamour for him; the elements dread him; the mountains echo him; the fountains and flowing waters cast their glances at him; and the grain and flowers laugh before him (1958: 59–60).

This characteristic of creation means that nature can become a meeting place between God and humanity. Calvin thus states: "[T]he skillful ordering of the universe is for us a sort of mirror in which we can contemplate God, who otherwise is invisible" (1960: 52–3).

It thus places humanity under an obligation to appreciate the wonders of nature; thus in summarizing the significance of the account of creation in Genesis, Calvin argues:

We see indeed, the world with our eyes, we tread the Earth with our feet, we touch the innumerable kinds of God's works with our hands, we inhale a sweet and pleasant fragrance from herbs and flowers, we enjoy boundless benefits, but in these very things of which we attain some knowledge, there dwells such an immensity of divine power, goodness and wisdom, as absorbs all our senses (1948: 57).

God's constant activity in the universe is an expression of God's love for creation; he thus comments on Psalm 104:16 that "no part of the world is forgotten by [God], who is the best of fathers, and . . . no creature is excluded from his care" (1949: 160).

Human beings are called to express a similar concern for God's creation; commenting on Genesis 2:15 he states:

. . . the custody of the Garden was given to Adam, to show that we possess the things which God has committed to our hands, on the condition, that being content with a frugal and modest use of them, we should take care of what shall remain. Let him who possesses a field so partake of its yearly fruits, that he may not suffer the ground to be injured by his negligence; but let him endeavour to hand it down to posterity as he received it, or even better cultivated. Let him so feed on its fruits, that he neither dissipates it by luxury, nor permits it to be marred or ruined by neglect. Moreover, that this economy, and this diligence, with respect to the good things which God has given us to enjoy, may flourish among us; let every one regard himself as the steward of God in all things he possesses. Then he will neither conduct himself dissolutely, nor corruptly by abusing those things which God requires to be preserved (1948: 125).

Continued next page

The eschatological redemption of humanity will result in the cleansing and restoration of creation. In this renewed creation, God will indwell all creatures and not only humanity.

The debates of post-Reformation Reformed scholasticism placed an even greater focus on the salvation of humanity and neglected the nonhuman creation. To the extent that the subject was addressed, most of Calvin's emphases were followed. The only changes were in attempts to give greater precision to the understanding of the relationship between first and secondary causation. The concept of the eschatological redemption of the Earth became a subject of debate with some theologians rejecting the idea. Calvin's incipient Trinitarian approach to creation was neglected.

The American revivalist and theologian Jonathan Edwards (1703–1758) provided the first significant development after Calvin in the understanding of nature as he attempted to relate Reformed scholasticism to developments in science and the experiences of the Great Awakening. Edwards had a deep appreciation for the natural world. This was combined with his relational, dis-

positional and occasional ontology, which opened the way for a more dynamic understanding of the relationship between God and creation. Edwards rejected an understanding of reality as composed of substances; he proposed instead that reality is composed of law-like dispositions or habits which are actualized in response to divine activity, hence reality is dynamic. Further, for Edwards, habits are inherently relational. Hence, an entity is what it is by virtue of its relationships. Furthermore, for Edwards, creation is radically dependent on God, who is constantly creating it out of nothing. Central to Edwards' understanding of God was God's disposition to communicate Godself. This disposition was fully actualized in the relationship between the persons of the Trinity among themselves. Yet it is further actualized outside the Trinity in the creation of the universe, which is a finite repetition of the divine being. Edwards argued that beauty is constituted by relationships, hence God as Trinity is the ultimately beautiful one. As creation is the repetition of divine being, its beauty is a reflection of God's beauty. Regeneration enables humans to perceive the natural world in a new manner. It is now perceived in relationship to God and

Jonathan Edwards

In his delightful observations of a spider Edwards praises the "exuberant goodness of the Creator, who hath not only provided for all the necessities, but also the pleasure and recreation of all sorts of creatures, even the insects" (1980: 161).

Abraham Kuyper

In his discussion of the Spirit's role in creation Abraham Kuyper argues that:

God's glory in creation appears in various degrees and ways. An insect and a star, the mildew on the wall and the cedar in Lebanon, a common labourer and a man like Augustine, are all creatures of God; yet how dissimilar they are and how varied their ways of glorifying God (1975: 23).

For Kuyper, the Spirit gives dynamism and life to the universe, he thus comments,

We observe . . . in the host of heaven a life material, outward, tangible which in thought we never associate with the Holy Spirit. But, however weak and impalpable, the visible and tangible has an invisible background. How intangible are the forces of nature, how full of majesty the forces of magnetism! But life underlies all. Even through the apparently dead trunk sighs the imperceptible breath. From the unfathomable depths of all an

inward hidden principle works upward and outward . . . And what is this quickening and animating principle but the Holy Spirit? (1975: 25–26).

hence in its true beauty as providing images of divine realities. Here again nature becomes the meeting place between God and regenerate human beings. The new perception of creation in relation to God provides new insights into God's concern for creation, so that Edwards can argue that God is even concerned about the enjoyment experienced by spiders! Yet paradoxically Edwards argued that the eschatological destiny of the Earth would be destruction and God would bring about out a new, radically reconstructed creation.

The German theologian Friedrich D.E. Schleiermacher's (1768–1834) reworking of the Reformed tradition in the aftermath of the Enlightenment, and under the influence of Romanticism, brought a greater identification of God with nature. He so emphasized that God was the cause of all things that the distinction between Creator and creature almost disappeared. Schleiermacher argued that God is experienced as the infinite unity that underlies and brings wholeness to the diversity of finite things. Thus the sense of absolute dependence on God, which was for Schleiermacher the essence of religion, is no different from the sense of the determination of all things by nature. Nature in turn provides numerous diverse stimulations to the sense of absolute dependence.

After Schleiermacher the Dutch neo-Calvinist theologians Abraham Kuyper (1837–1920) and Herman Bavinck (1854–1921) returned to and developed Calvin's incipient Trinitarian approach to creation. The origin of creation is from the Father, the Son arranges and specializes creation, and the Spirit perfects, individualizes, energizes and gives life to creation. This Trinitarian perspective forms the basis of an organic rather than a mechanistic understanding of nature. As with Calvin, the neo-Calvinists argued that the present creation has been broken and distorted by the Fall and will be renewed and restored at the return of Christ. While they emphasized the continuity between creation and new creation, this was not understood as a mere return to paradise but as a transformation of creation into something far more wondrous. In the mid-twentieth century Gerrit C. Berkouwer followed Kuyper and Bavinck in rejecting creation-negating theologies. He proposed a holistic anthropology that rejected the division of human beings into two distinct parts, soul and body, and further argued that the doctrines of the resurrection of the dead and the new heaven and new Earth were to be interpreted as affirmations of the body and earthly life. Some followers of Kuyper and Bavinck developed a creation-centered philosophy, theology and ethics in which ethical norms could be derived from an examination of nature through the spectacles of scripture. Christians were called to a stewardship of all spheres of life in order to transform them in accordance with these creational norms. This creation-centered theology has provided an important basis for the development of an ethic of care toward creation by some neo-Calvinists and conservative evangelicals.

Nature played a minor role in Karl Barth's (1886–1968) renewal of the Reformed tradition. In response to the role played by nature in theological liberalism and in theological support of Nazism, Barth rejected the idea of natural revelation or of a natural point of contact between humanity and God. While his doctrine of creation emphasized that creation was a product of the intra-Trinitarian relationship between the Father and the Son and the co-creaturehood of human beings with otherkind, the focus was almost exclusively on humanity which was elect in Christ. The nonhuman creation was merely the stage for the drama of salvation enacted by God and the human creature.

The second half of the twentieth century produced a number of Reformed perspectives on nature that used a Trinitarian perspective to respond to the corrosive forces of modernity. The German theologian Jürgen Moltmann integrated ecological themes into all the interdependent dimensions of his theology thus portraying ecological concern as integral to Christianity. Among his contributions is a Trinitarian panentheism in which God indwells the world and the world indwells God. In this model the Spirit is the source of individualization and life as the indwelling presence of God. At present, creation experiences finitude and suffering but its destiny is to be transformed into a radically new creation that will be the home of God. This understanding is interrelated with his rejection of the traditional notion that humanity is the crown of creation for which Earth and heaven were brought into being. In contrast he argued that creation was brought into being for the glory of and indwelling by God. He thus interprets the first creation story in Genesis as portraying the Sabbath, which prefigures the eschatological indwelling of God with creation, and not human beings as the crown of creation.

The British theologian Colin Gunton has also developed a Trinitarian perspective on creation in response to modernity's monistic and homogenizing tendencies that have resulted in the modification, exploitation and degradation of Earth. He argued that this is a consequence of a portrait of humanity based on an inversion of the traditional monistic and despotic portrait of God. The neglect of creation in Christian theology is a consequence of such monistic understanding. In contrast he argued for a Trinitarian understanding of God and creation in which the Spirit is the source of the diversity of creation and its interdependence, yet in such a way that the distinction between Creator and creature is preserved. Gunton has emphasized the continuity between creation and new creation and argued that the Spirit acts as an Other who draws creation to its eschatological transformation. The relationship between humanity and other creatures must arise out of a respect for their Spirit-derived diversity, particularity, interdependence and their eschatological destiny.

Wesley Granberg-Michaelson, an American Reformed

church leader, theologian and former World Council of Churches staff person has made a significant contribution to mobilizing churches and Christians in the struggle for eco-justice and to ecumenical theological reflection on ecological issues. In focusing his theology on the struggle for eco-justice he has brought to the foreground the idea of God's concern for all creation that is implicit within the Reformed tradition. He has rejected the traditional doctrine of *creatio ex nihilo* (creation out of nothing) as overemphasizing the distinction between God and creation and proposed that it be replaced by an emphasis on God as the source of creation and creation as an expression of the life of God. He has also rejected the idea of creation as "fallen" arguing instead that death and the predator-prey relationships are part of God's purpose for creation. However the nonhuman creation is affected by human sin. God's purpose for creation is its comprehensive well-being (designated by the Hebrew word *shalom*); human sin breaks the relationship between God, humanity and the nonhuman creation, resulting in oppression of humanity and the exploitation of nonhuman creation. Hence, rebellion against God, social injustice and ecological destruction are dynamically and reciprocally related. Salvation in Christ restores these relationships and hence the struggle for eco-justice is central to the identity and mission of the Church.

The American ethicist James M. Gustafson has proposed an alternative retrieval of the Reformed tradition by relating its theocentric dimension, contemporary scientific portraits of the universe and an understanding that the knowledge of God is mediated through our experience of reality, including nature. God is the powerful Other whose ordering activity can be perceived in the complex interdependencies of the natural world. Gustafson rejects any concept of God's ordering the universe for the good of humanity or for that matter the good of any other creature. Humanity is just one species among many others that participates in nature. God's ordering of nature makes human good possible but does not ensure it, which provides both limitations to and opportunities for the exercise for human activity. Human beings are called to responsible action based on a respectful contemplation of the complexities of nature that arise from a sense of awe before God who has ordered it.

Historic Reformed confessions of faith have been anthropocentric with little if any reference to the non-human creation. Some recent confessions, notably *The New Confession* of the Presbyterian Church in the Republic of Korea (1972), *The Confession of Faith* of the Presbyterian and Reformed Church in Cuba (1977), *The Song of Hope* of the Reformed Church in America (1974), *A Declaration of Faith* of the Presbyterian Church of the USA (1976), *The Confession of 1967* of the United Presbyterian Church in the USA and *A Brief Statement of Faith* of the Presbyterian Church (USA) (1991), have to varying

degrees affirmed that God cares for all creation, that the exploitation and degradation of creation is a form of sin, that humanity has a responsibility to care for creation, and that salvation embraces the nonhuman creation.

Christianity (6c3) – Anabaptist/Mennonite Traditions (Reformation Traditions)

The Anabaptist/Mennonite tradition, the "left wing" of the Reformation (ca. 1525), protested the conflation of the Church and state (i.e., the "corpus Christianum"), rejected the late medieval church's sacramentalism, and resisted coercion in matters of faith and practice. It has emphasized the ethical dimensions of the Christian Faith, obedience to Christ, strict congregationalism and rejection of hierarchical authority structures.

The relationship of Anabaptist/Mennonites to nature has been very intense. Violent persecution by Roman

Catholic and Protestant “state churches” forced the Anabaptists to develop a unique theological and cultural ethos. They settled in isolated areas and introduced innovative farming and conservation practices. Their formal theology of nature and creation remained undeveloped, but nevertheless they worked out their understandings of Christian existence in the world based on their fundamental theological starting point, the nature of Christ’s “new creation” in the midst of the old.

In the place of the “sacramental theology” which included the “created order,” influenced considerably by the “Chain of Being” philosophy in the late medieval church thinking, early Anabaptists preached the “new creation” and accepted an implicit philosophy and theology that moved the creation to a more peripheral status in practice. Placing highest importance on the “new creation,” Mennonites tended to downplay the “fallen creation” as insignificant in God’s redemptive plan.

David Kline on Amish Agriculture

David Kline is an Amish farmer in Holmes County, Ohio. He and his family run a diversified family farm – the same farm he was born on. Kline writes regularly for the Amish magazine *Family Life*, and his essays from that publication have been collected in two books, *Great Possessions: An Amish Farmer’s Journal* and *Scratching the Woodchuck: Nature on an Amish Farm*. He writes about the plants and animals he encounters on his land and in his neighborhood, about agricultural and natural cycles, and about Amish community and family life.

What are the lessons, if any . . . to be learned from our way of farming? Is it a way of farming that preserves the soil, the water, the air, the wildlife, the families that work the land, and the surrounding communities? In other words, are we proper caretakers or stewards of God’s Creation? Are we in harmony with God and nature?

To write about Amish agriculture is to write about traditional agriculture, and agriculture dating back to eighteenth-century Europe, handed down from generation to generation and yet with innovations and improvements constantly added along the way. The Amish are not necessarily against modern technology. We have simply chosen not to be controlled by it (Kline 1990: xv).

Much of Kline’s work celebrates the details he notices while plowing with a team of horses or walking his orchard or woodlot. He is a keen observer and passionate celebrator of the intricacy and beauty of the natural world.

It is amazing that the huge green cecropia larva on our apple tree, with its many segments and legs, could spin itself inside a cocoon, and while doing so already begin to shrink in size – to reappear ten months later, without having eaten a bite, a fully developed insect with three segments and three pairs of legs, one of the most beautiful creatures in God’s Creation. I can’t comprehend a change so complex and so complete. When I think of it I feel like Ezra: “And when I heard this thing,

I rent my garment and my mantle, and plucked off the hair of my head and my beard and sat down astonished [amazed, astonished]” (Kline 1990: 127).

Kline also reflects on the contribution made by traditional Amish agriculture to both human and natural communities, and the contrast between this way of life and that of most North Americans. He “began to realize what community is really all about,” he writes, when he moved to the city to start his conscientious objector service during the Vietnam War. (The Amish, like most Anabaptists, are committed pacifists.) After finishing his term of service,

I returned to a community that choose to work with their hands, believing manual labor is close to godliness. A community where technology is restricted and “book learning” is frowned upon. Where even the hymns are passed on without the notes being written down. In this culture, you learn from a master. There is always someone who possesses the arts and skills you need (Kline 1997: 194–5).

In this community, labor is supplied by draft animals and humans, children working alongside parents, neighbors along neighbors. This makes it possible not only to make a living with a minimal amount of machinery and fossil fuel but also to work, on many occasions, “beyond the grips of the money economy” (Kline 1997: 204). In his writing, Kline offers a gentle, religiously grounded critique of many aspects of industrial agriculture and society, while celebrating a thriving, yet largely hidden, alternative society.

The Anabaptists developed an ethical dualism of the “two kingdoms”: the “fallen kingdom of this world,” comprised of rebellious human beings and structures, and God’s kingdom, composed of those who lived under God’s rule in the “new Kingdom.” The Mennonites have been less clear, however, about nature’s place (GOOD) as part of God’s creation and the coming “Kingdom of our Lord.” Some early Anabaptist leaders understood nature as part of God’s cosmic plans, but later Mennonites tended to include nature in the fallen and rebellious kingdom, viewing it as in need of redemption. This derived partly from the classical medieval church, which, in turn, was derived from the Apostle Paul in Romans 8:11–23, and other of his epistles.

Four theological emphases have, however, kept Anabaptist/Mennonites tied to the created order. First they believed that Jesus of Nazareth was truly and fully human yet God’s true son; thus, through Christ, God was eternally joined with creation. Creation is not, therefore, to be rejected or ignored, but included in the purposes of God. Second, as Jesus by God’s grace lived the existential realities of first-century Palestinian culture, so also do his followers of every age recapitulate by faith and the character of their discipleship, his life, death, resurrection. Third, they believed that in the mystery of God’s providence, God was somehow present in all things including the movements of nature and moral life. Fourth, God’s redeeming grace is experienced most fully when it is embodied in sacrificial love through peace and justice for all God’s creation.

Nevertheless, the Mennonite view of nature developed ambiguously – “The problem was that the ‘rebellious world’ and the natural nonhuman world were not conceptually or existentially separated, and thus, in the process, nonhuman creation became identified with the evil in the world from which the pure were to abstain” (Ackley-Bean in Redekop 2000: 184). The Mennonite tradition was thus not equipped to see nature as part of the creation that God cared for and loved. Consequently, the positive role that nature would play in the redemption of creation and humankind has only recently been explored, and human responsibility for the care of nature as a requisite for human redemption has not been fully developed.

Nature, defined as the totality of material reality, including the terrestrial universe and planet Earth, therefore has had relatively little influence on Mennonite theology and philosophy. Nature (biblically defined as “the Creation”) would be redeemed at the day of the *Resurrection* and *Last Judgment*, as would the human race. More recently, especially due to influence by evangelical/fundamentalist theology, the theological significance of nature has declined. Moreover, focusing on nature came to be associated with the mysticism of the Catholic tradition (Martin), with secularization, or even worse, with

paganism or pantheism (i.e., the worship of the created rather than the Creator [Paul in Romans]).

The Mennonite theological reflection on nature has been minimal. Nature was seen as a practical requisite for humans, which provided the basis for building the kingdom of God, who would glorify and honor him. Ironically, however, most if not all of the confessions begin with God’s first acts in the creation.

The Mennonite active relation to ecology is complex. The earlier European Mennonites and the Old Orders (e.g., Amish and Old Order Mennonites), who retain an agrarian life, have remained close to the land and view it almost as sacred. Hence agricultural attitudes and practices are oriented to enriching the soil and conserving and preserving natural resources, in order to guarantee future life in its fullness.

But as Mennonites became more acculturated into the economic and social mainstream, farming practices began to reflect more the “extractive” modes of contemporary agri-business. Research has shown that even the “Plain Peoples” were more extractive than restorative in their practices. In the non-agricultural economic sphere, as Mennonites modernized, beginning with Dutch Mennonite commercial corporations already in the early eighteenth century, they became hardly different from the prevailing commercial/free market capitalistic society.

But significantly, because of increasing pollution and the environmental movement, the Mennonite community has begun to become aware of nature, and has begun to promote awareness and action in response, including petitions to governmental entities. A “theology of nature” is beginning to emerge.

The most promising channel by which Mennonites will increase their commitments to and leadership in the environmental movement will be via its historical commitment to nonviolence, peace and justice, which by implication includes nonviolence to nature. Although this has been almost totally undeveloped, its awakening is illustrated by Walter Klaassen’s, “Pacifism, Nonviolence and the Peaceful Reign of God,” which maintains

The visions of the “peaceful reign of God” in Isaiah 11; Romans 8 and Revelation 21 and 22 offer a lot of specific details: peace within the animal kingdom, the total absence of injury and destruction [to nature]; [and] the liberation of the creation from entropy (in Redekop 2000: 148).

The increasing activity of the Mennonite community in promoting nonviolence, peace and justice will increasingly include nature. Mennonites increasingly realize that nonviolence, peace and justice cannot ignore nature, because in some ways it is the foundation or basis of all

other levels of reality. It may be here that Mennonites will make their greatest future contribution.

Christianity (6c4) – Anglicanism

The late twentieth century saw an increasing fascination with Irish and Hebrideic Celtic Christianity among Anglicans, a trend that rekindled the memory of that Irish tradition's merging of lore, locale and nature with Christian elements. The Celtic Christian tradition employed numerous natural images for theological concepts, such as the shamrock as an image of the Trinity. Irish traditions, such as those of St. Patrick, St. Columba, and St. Brigid have been claimed as sources and inspiration for Anglican spiritualities and theologies, specifically as a resource for ecological spirituality. These texts emphasize kinship with nature, creaturehood, and expose belief in a sacramental universe. Other Hebrideic traditions with significant naturalistic theological imagery include Julian of Norwich's writing. Over time, the forest as the counterpiece of city, town and village lodged itself into much of poetic and pious imagination, revived and recontextualized continually.

The concept and position of nature is distinct in English reformation thought. For Richard Hooker, nature is the voice of God, an instrument and teacher of humans.

Hooker's reading of natural law, which relates to Catholic texts, as well as to Protestant reformers' Paul-centered reading of natural law, portrays reason as a resource and tool of nature that allows humans to discern the law of God in creation. God's wisdom is visible in the laws of nature and in the doings of natural agents (Hooker 1907: Book I, VIII). Hooker's continuity with the Catholic natural law tradition was controversial in his time and he was accused of promoting "Romish doctrine" in conflict with the Thirty-Nine-Articles.

During the early colonization of the so-called "new world," a number of Anglican clergy developed a rhetoric that supplied colonialists with a theology that justified the appropriation, use, and ecological invasion of the colonized lands, animals and plants. Thus Anglican divines such as geographer Richard Hakluyt, Samuel Purchas and poet John Donne justified the disruption of ecological systems by appealing to a divine plan of salvation, arguing that colonization would hasten the coming of the kingdom. Hakluyt's promotion campaign of English settlements along with Purchas' rhetoric helped establish myths of superiority that served to create habits and thought structures of exploitation perceived as salvation through the spread of a superior culture and (Protestant) faith. The contemporary Anglican Communion is an ecclesial structure that has grown with the expansion of British and U.S. cultural and economic imperialism. Notions of cultural and religious superiority over and against colonized peoples and nature pervade colonial British literature.

At the same time, there are clergy, missionaries, theologians and poets whose writings represent early sources of emerging modern as well as contemporary environmental concerns. Thus the Anglican divines and metaphysical poets Thomas Traherne, John Donne, George Herbert, Henry Vaughan and Nicholas Ferrer continued to see (paradisical) nature as a location of divine revelation and provided sources for later British romantic writers, who merged theological and spiritual quests with explorations of nature. Strong imagery is also used to read into nature the state of human "fallenness" and impermanence. The British Romantic poets, though their writings hailed relatively cultured and managed picturesque British park landscapes rather than the remaining wilderness of colonized lands, can be seen as early antecedents of contemporary environmental movements. Whereas for the mystical poets nature was symbolic of divine forces beyond the human world, in romantic writers such as Blake, Wordsworth and Coleridge nature inhabits space in the poetic imagination no longer as consistently expressive of orthodox theological sentiment. The Romantic poets also critiqued Enlightenment efforts to master nature, searching for a symbiosis of mind and nature that challenges the mercantilism and commercialism of Western societies. Denise Levertov and others have continued in this tradition of Anglican natural poetry.

The growth of the environmental movements in the late twentieth century is manifested, among others, in the Episcopal Church, USA, whose Episcopal Ecological Network, a subdivision of the Episcopal Church's Peace and Justice Ministries Office, was designed to help the Church's grassroots groups preserve the sanctity of creation. Local centers are the Cathedral Church of St. John the Divine in New York City and Grace Cathedral in San Francisco. St. John the Divine emphasizes environmental stewardship, celebrating annual Gaia masses and St. Francis Day celebrations. St. John also headquarters the National Religious Partnership for the Environment (NRPE). San Francisco's Grace Cathedral houses *Episcopal Power and Light* and *The Regeneration Project*, helping churches to use renewable energy sources. As the Anglican community increasingly begins to listen to Anglican voices from former colonies, the environmental and economic destruction of the Anglican colonial past will have to be constructively addressed.

Christianity (6c5) – Methodism

The Methodist tradition traces its roots to the preaching, hymnody and small-group organizational ministry of brothers John (1703–1791) and Charles (1707–1788) Wesley, both of whom remained dedicated to the Church of England throughout their lives. The Methodist movement, then, was intended by the Wesleys to serve as a source of renewal within Anglicanism and beyond to other Christian bodies.

The Wesleys' social location within eighteenth-century Anglicanism makes it unsurprising that they tended uncritically to inherit medieval notions of spirit-matter dualism and a "great chain of being" in which the human being, as a composite of body and soul, occupies the middle place. In this traditional body-soul dualism, the soul has inevitably received almost all of the attention,

often to the neglect or even despising of the body and all things material.

Given this inheritance, it is noteworthy that in his sermons and other writings John Wesley moved toward affirmations of the goodness of creation and bodily existence, God's radically immanent presence in the world, and the inherent value of all living things. In his five-volume natural philosophy, *A Survey of the Wisdom of God in the Creation* – admittedly inspired (probably to the point of what today would be considered plagiarism) by the work of German philosopher Johann Franz Budde (1667–1729) – Wesley marveled at the intricate beauty and complexity of our world, arguing that "by thus acquainting and familiarizing ourselves with the works of nature, we become as it were a member of her family, a participant in her felicities." On the other hand, remaining ignorant of the vast world around us is to be "strangers and sojourners," "unknowing and unknown" within our very home (Wesley 1823: vol. 1, viii).

Wesley also became increasingly convinced that God's saving work through Jesus Christ was of a holistic and even cosmic nature. For him, salvation truly was a process of *salving* or healing of all dimensions and relations in human existence, and indeed of all creation. The most dramatic expression of this idea is undoubtedly his 1782 sermon "The General Deliverance," a literary piece widely cited in contemporary ecotheological writings. In this sermon, based on Paul's vision of a redeemed and liberated creation in Romans 8:19–22, Wesley pressed the following themes: 1) that the love and compassion of God extend to each and every sentient creature; 2) that the suffering of all creatures, including of course that inflicted by human beings, matters to their Creator, who "will make them large amends" in the world to come; 3) that all creatures therefore will somehow participate in a general resurrection from the dead; and 4) that these considerations should "enlarge our hearts towards those poor creatures" (Wesley 1984: vol. 2, 449) such that human beings might more adequately and authentically reflect God's infinite love toward all of creation.

Wesley's vision of a salved world – a world being progressively healed by the love of God through Jesus Christ in the sanctifying power of the Holy Spirit – had several practical implications. In his evangelistic travels he gathered local remedies for common ailments and illnesses, publishing *Primitive Physick: An Easy and Natural Method for Curing Most Diseases* in 1747. Virtually all of nearly 300 "cures" in this collection would qualify today as homeopathic. The quaint little volume also recommended a vegetarian diet, and evidence suggests that Wesley himself adopted vegetarianism at roughly the same time *Primitive Physick* was published. He also followed with interest Benjamin Franklin's experiments in electricity, and even fashioned a rudimentary electro-shock

therapy instrument for the benefit of others and himself. Wesley clearly was interested not only in the future healing of God's creation, but in the healing properties of nature in the present.

Meanwhile, John Wesley's brother Charles was creating a body of hymns by which to guide Methodists in their worship, for both Wesleys took seriously the educational and formative role of hymnody. One of Charles Wesley's most remarkable hymns is a celebration of the intimate relation between God and all creatures. One of its verses, for instance, reads:

Thou art the Universal Soul,
The Plastick Power that fills the whole,
And governs Earth, Air, Sea and Sky,
The Creatures all Thy Breath receive,
And who by Thy Inspiring live,
Without Thy Inspiration die (in Lodahl 2004: 15).

The Methodist movement after the Wesleys, however, tended not to sing such songs nor to follow very near the Wesley brothers' willingness to describe God as "the soul of the universe." The Wesleys' theological heirs of the nineteenth century were embroiled largely in debates with Calvinists over the issue of the role of human agency in the process of salvation, and thus rarely moved beyond anthropocentric concerns. That situation did not improve – and may have worsened – with the ascendancy of personalism as the predominant school of philosophy in Methodist higher education and religious instruction in the late nineteenth and early twentieth centuries. Promulgated especially at Boston University and the University of Southern California, both Methodist institutions, but widely influential in most Methodist circles during the era, this philosophy found ultimate reality and value in the ontological category of "person." This was a category in which God and human beings shared – as opposed to, and in distinction from, everything else in reality. Nothing else but "person," in fact, was deemed to be ultimately real. Nature was seriously devalued if not entirely ignored, and personalistic reflection upon human existence assumed a distancing from, and generally a triumph over, the world of nature.

Only with the ascendancy of the ecological crisis did Methodist theological reflection begin seriously to turn toward the world. United Methodist minister and teacher John B. Cobb, Jr., raised the question in 1972 with *Is It Too Late? A Theology of Ecology*, but did not offer an explicitly Wesleyan answer. Indeed, it was not until 1995 that Cobb, in *Grace and Responsibility: A Wesleyan Theology for Today*, consciously drew upon his Methodist heritage to reflect upon ecological issues. He argued persuasively that "Wesley's teaching . . . calls for respect for all creatures, recognition of the importance of biodiversity and complex

ecosystems, and working together with God for the benefit not only of human beings but of all other creatures as well" (Cobb 1995: 53).

Similarly, Methodist theologians such as James Nash, Jay McDaniel and Theodore Runyon have argued that attentiveness to John Wesley's vision for a new creation, centered in the universal love of God, has potent implications for contemporary eco-theology and practices. Nash's and McDaniel's references to Wesley have tended to be piecemeal, drawing mostly on the sermon discussed above, "The General Deliverance." Runyon, however, in his 1998 work *The New Creation: John Wesley's Theology Today* has offered a thorough portrait of Wesley's preaching and ministry that readily undergirds responsible ecological practices. According to Runyon, Wesley understood the biblical teaching that human beings are created in God's image to imply a responsibility to care for God's creation, to re-present to the world the compassion and love of the Creator. "Thus," Runyon comments, "humanity is the image of God *insofar* as the benevolence of God is reflected in human actions toward the rest of creation" (Runyon 1998: 17).

It was this impetus toward a new creation "renewed in love" (to borrow a favorite phrase of John Wesley) – a renewal made possible as human beings are restored through Christ toward becoming responsible bearers of God's image as "pure, unbounded love" (in the hymnic phrase of Charles Wesley) – that undoubtedly moved the United Methodist Church's Council of Bishops to issue their 1986 joint statement, *In Defense of Creation: The Nuclear Crisis and a Just Peace*. Written in the face of the imminent danger of the destruction of much, if not all, of the life on planet Earth by nuclear war, the pastoral letter charged United Methodists

to become evangelists of shalom, making the ways of Jesus the model of discipleship, embracing all neighbors near and far, all friends and enemies, and becoming defenders of God's good creation, and to pray without ceasing for peace in our time.

Such counsel is true to Charles Wesley's hymnic prayer that God might be: *Pleased to restore the ruined Race, / And new-create a World of Grace. / In all the Image of Thy Love* (Wesley in Lodahl 2004: 15).

Christianity (7a) – Theology and Ecology (Contemporary Introduction)

The systematic effort by modern Christian theologians to review traditional doctrines in light of a growing ecological awareness has been called *environmental theology* or *eco-theology*. Such ecological revisioning involves Christian teachings about (1) God, (2) Creation, (3) the Fall, (4) the Covenant, (5) Christ, (6) the Church, and (7) Eschatology.

(1) *God*. Since the fourth century, Christians have held that their God is a Trinity of Father, Son, and Holy Spirit. At a general level, eco-theologians affirm the relational aspect of this model of God, noting that it fits well with an ecological worldview's emphasis on interconnectedness (e.g., Jürgen Moltmann). They also affirm the traditional emphasis on the Trinity's creative, redeeming, and sustaining relationship with the world. However, eco-theologians typically recast several specific attributes of the Persons in the Trinity. Instead of the traditional emphasis on the transcendence and omnipotence of the Father, eco-theologians propose a greater appreciation for immanence and divine invitation, which suggests the appropriateness of the metaphor of Mother (e.g., Sallie McFague). Similarly, they look beyond the anthropocentric significance of the Son as the divine link with humankind to his universal connection (as Logos) with creation as a whole. The Holy Spirit is often interpreted as the inspirational source behind an ethic of hope as well as nature-centered spirituality.

(2) *Creation*. Without exception, eco-theologians continue to affirm the traditional divine attribute of goodness and its reflection in the fundamental goodness of the world, which they variously interpret as the work or the body of God. Eco-theologians especially appreciate the diversity and complexity of this world, attributing

intrinsic value to all creatures and the intricate natural systems to which they belong. Some see human beings as no more special than other creatures; their main ethical challenge is to fit in (e.g., Elizabeth Dodson Gray). Others continue to affirm the traditional tenet of Christian anthropology that human beings are created in the image of God, with unique gifts of reason and will and matching responsibilities toward the rest of creation. This mainstream view implies an ethic based on the agent as steward or co-creator (e.g., Thomas Sieger Derr, Pope John Paul II).

(3) *The Fall*. While all eco-theologians are acutely aware of the imperfections of a world riddled with environmental and social problems, not all attribute these to the fundamental distortion of the original goodness of creation through a combination of evil powers and human transgression. Critics of the traditional doctrine of the Fall note that the concept is neither biblical nor consistent with an ecological appreciation for the necessary functions of disturbance, death, and decay (e.g., Anne Primavesi). Other eco-theologians continue to affirm the doctrine, noting its potential to uncover the full depth of structural evil and human pride, as well as the pervasiveness of the resulting alienation between people and nature (e.g., Steven Bouma-Prediger).

(4) *The Covenant*. A main theme in Christian eco-theology is God's promise that the entire creation will be liberated from its environmental and social suffering. Inspired by biblical covenant traditions (e.g., Gen. 9:8–17; Ex. 20:1–17), this promise provides a basis for hope amidst widespread destruction. In response, the faithful are expected to uphold newly interpreted covenant obligations. For example, they should not steal from future generations (sustainability; cf. Ex. 20:15), nor covet unnecessary material goods (sufficiency; cf. Ex. 20:17). Also, as in the ancient Sabbath tradition, they should respect land, animals, and people by allowing them to recover from intensive production (cf. Deut. 5:12–15; Lev. 25:1–7).

(5) *Christ*. Ultimately, however, liberation does not come through human obedience but through divine grace. Eco-theologians discern grace in the Incarnation through which God chose to participate in the world's struggles. This act of solidarity is evidenced in the life and teachings of Jesus of Nazareth, whose inclusive concern for the poor, the sick, and the outcast is interpreted as a model for ecojustice (or, in the language of process theology, as a persuasive expression of divine love, beckoning us to respond in kind with compassion for humanity and nature). Similarly, eco-theologians highlight the significance of Jesus' death on the cross as the ultimate act of self-sacrifice for a broken creation. In the resurrected Christ, they see a symbol of the life to come, in which all creation will have a share (e.g., Sallie McFague). Finally, mystically oriented eco-theologians point out that the ancient "cosmic Christ" tradition helps us to see how

the creative love of Christ fills the entire universe and becomes manifest in human compassion (e.g., Matthew Fox).

(6) *The Church*. Until the promised end time, the Christian community is called to live fully in the world, yet without selling out to its destructive ways. In doing so, the Church is assisted by the Holy Spirit. Eco-theologians have recast the traditional “gifts of the Spirit”: proclamation (*kerygma*) spreads the message of hope amidst environmental destruction; celebration (*leitourgia*) rejoices in the material gifts of creation, such as water and bread, and in sharing these according to need; service (*diakonia*) includes attending to the cries of the nonhuman world; and participation (*koinonia*) implies a simple, needs-based communal life.

(7) *Eschatology*. Rather than interpret the current environmental crisis as part of a series of predicted apocalyptic events that will inaugurate the end of the world, eco-theologians typically say that the world is groaning in travail as it awaits its liberation from pain and suffering (cf. Rom. 8:22). Many eco-theologians express the strong hope that this final transformation will usher in a kingdom (or “kindom”) of justice and peace in which all of creation will participate, fulfilling the prophetic vision that the wolf and the lamb will eat together (cf. Isaiah 11:6). Some, however, find hope in the very endlessness and chaotic processes that mark our universe (e.g., Catherine Keller).

In short, increasing awareness of the contemporary ecological crisis has precipitated many new trends in Christian theology. Eco-theology promises to remain an area of creative theological reconstruction in years to come.

SP Christianity (7b) – Political Theology

The new “political theology” grew up in Germany after the Second World War. The shock of Auschwitz, and the shock too at the failure of the churches during the Hitler dictatorship, made resolute political responsibility on the part of Christians a necessity. In modern society religion may be “a private affair,” but the Christian faith is not a private matter. For Christ’s sake, Christians take the part of the humiliated and the oppressed, and set themselves against the perpetrators of violence. Christians are critical of political religions and ideologies of power, because they live in remembrance of the crucified Christ and, in a culture of forgetfulness, keep alive the recollection of suffering. Political theology is also called *public theology*, because it raises a critical voice in society’s public questions, and does not confine itself to the churches. When liberation theology came into being in Latin America, political theology in Europe joined forces with it, because “the preferential option for the poor” and hope for the kingdom of God in the world were common to them both.

In 1972 the first report of the Club of Rome on the condition of nature appeared. With this date, awareness of the ecological crises began to penetrate public consciousness. For political theology and liberation theology, tormented nature became theology’s third subject, side by side with politically humiliated and economically exploited men and women. The ecological crisis is a crisis of modern scientific and technological civilization as a whole; it is not confined to the foundations of that civilization’s natural life. It denotes not only a moral crisis of humanity but a religious crisis too. The *ecological theology* which is developing is an attempt to find a new cosmic mysticism, in which God is revered in nature and nature in God. This theology is critical of the modern culture of rule over nature, and strives for a *community* of culture and nature which will be viable and sustainable. It tries to achieve a caring environmental policy and, not least, attempts to liberate nature from inhumane

oppression. Political theology began with talk about God in the face of a catastrophe in the political world; it now directs its talk about God toward the ecological crisis of the modern world.

The modern culture of rule and the ecological crises which are the result arose from Christianity in its Western form. So is the Christian faith itself a factor in this crisis? Four points are discussed in this context:

1) The biblical destiny laid upon human beings to “subdue the Earth” (Gen. 1.28) is made responsible for the boundlessness of the human will for power.

2) The biblical destiny laid upon human beings to be the image of God (Gen. 1.26) sets them apart from all other creatures and above the earthly community of creation. Whereas in other beings only “traces of God” can be detected, the human being is supposed to be God’s “image” and his representative on Earth. So human beings are not just part of nature; they are set apart as persons with unique dignity. According to modern interpretation, this dignity lies in their quality as determining subjects: only human beings are the subjects of understanding and will – all other created beings can be made their objects. With this, the subjugation of nature and the instrumentalization of their own bodies are laid in the hands of men and women.

3) Both these biblical destinies have contributed to the total anthropocentrism of Western and modern civilization. This anthropocentrism drove out the cosmocentrism of the ancient world. And today the Asian and African ordering of human culture into the wisdom of nature is also falling victim to this Western culture of domination.

4) The most enduring influence of all was exerted by Jewish and Christian monotheism: God is the transcendent Creator and Lord of the world; the world is robbed of all divine mystery, and nature is stripped of its magic and secularized. In Western culture, the divine is seen in the spiritual not the material, in the soul not the body and, not least, on the side of the male not the female.

If it is these ideas in the Christian tradition which are responsible for the degradation of nature, it is here that the necessary reformation must begin.

1. Modern monotheism has stressed God’s transcendence and suppressed his immanence. But according to the biblical idea, God is present through his Spirit and his Wisdom in all created things. It is the Trinitarian idea of God which is alone able to bind together God’s transcendence and his immanence. God the Father, the Son, and the Spirit live with each other and in each other in a unique community (*perichoresis*); and in an analogous way God is present in creation, and creation in God. This divine fellowship fills the world. “No creature is so far from God as not to have him within itself,” said Thomas Aquinas. Some people talk about “the sacramental presence of God in nature”; other people say that nature is

“a parable of God”; still others read nature as “the book of God’s Wisdom,” and from this idea arrive at a new *natural theology*. The reverence for life which Albert Schweitzer talked about is caught up into reverence for God. Reverence for God also embraces reverence for the divine presence in all created beings. All natural things have a transcendent inner side. Because of that inner side, our experiences of them can become experiences of God: God awaits us in all things.

2. Together with the perception or recognition of nature as creation in the Trinitarian framework of the doctrine of God, a new *cosmic Christology* has also developed. In the ancient world, human beings were dependent on uncomprehended forces or powers of nature; and so at that time the theme of cosmic Christology was “Christ and the powers.” In the postmodern world, with the spreading destruction of nature by human beings, the theme of cosmic Christology is “Christ and the cosmic catastrophe.” Modern theology had reduced salvation to the salvation of human beings, and in human beings to the salvation of the soul. This led to the neglect both of the human body and of nature. But if Jesus is the divine Savior, his saving and healing power reaches as far as the bounds of God’s creation. According to the Epistles to the Ephesians and Colossians, “all things on heaven and Earth” are therefore reconciled in him. In him creation also finds its deliverance – the creation which Paul describes in the Epistle to the Romans (8.19ff.) as “groaning” under the burden of transience and unfreedom. For the Church of Christ, this means a cosmic orientation. The Church represents the whole cosmos before God, and represents God before the whole cosmos. The destructions of nature on Earth are therefore the Church’s sufferings too. The Church’s hope is also the hope of the world for the new creation of all things into their enduring form (Rev. 21.4–5). The apocryphal Gospel of Thomas lets Christ say: “I am the universe. The universe has come from me. The universe returns to me again. Cleave a piece of wood: I am there. Lift up a stone: you will find me” (Logion: 77).

3. With this, the position of the human being in the cosmos changes too. A *non-anthropocentric anthropology* becomes necessary. The turn to anthropology in the modern world was the result of a cosmology gone wrong and a surrendered theology: people no longer found any meaning in the cosmos, and God was held to be a projection of the human imagination. Consequently human beings have to construct their world for themselves. The technosphere replaces the biosphere, and the human being becomes the Lord and God of the world.

This provokes the fateful question: is the modern world inescapably the end of nature, or do we have to adapt the human world to the living conditions of the Earth? Are we rebuilding the planet into a huge spaceship for the existence of genetically adapted men and women, or do we find our place and our role in the nature of the Earth as

it is? Logically speaking, every anthropocentric anthropology founders on the simple fact that nature was there before human beings, and will still be there after the human race has disappeared; for human beings are a late product in the evolution of life, and their era in the cosmos is certainly limited. Consequently the human race with its civilizations must adapt to the living conditions of nature if it is to survive – and this is true for modern and post-modern civilization too. If the human being is not the center and measure of all things, then it is wrong to talk about nature as “our environment” and Earth as “our planetary home.” Nature is an interwoven fabric of many living spaces for many different living things, which human beings have to respect if they want to survive in the community of creation.

A fundamental idea of *ecological politics* is that this community of creation should be seen as a community under law. According to biblical tradition, God makes the covenant with Noah so that the Earth may survive “with you and your descendants after you, and with every living creature” (Gen. 9.9–10). Human rights, the rights of future generations, and the rights of nature belong together in a single covenant. So “every living creature” is a partner in the covenant together with human beings, and has its own dignity and its own rights. According to this federalist view of nature, animals are the “fellow creatures” of human beings, and this is the way they are defined in the German Animal Protection Act of 18 August 1986. According to biblical tradition, the sabbath laws apply to human beings and animals (Ex. 20.10), and to the land too (Leviticus 25). Earth also has the right “to celebrate its great sabbath to the Lord” every seven years, and in that year is to be free of human exploitation. Following this ancient Hebrew ecological policy, we today need to integrate the United Nations Declaration of Human Rights of 1948 and the Covenants on Human Rights of 1966 with the World Charter for Nature of 28 October 1982. Every declaration on human rights begins with a recognition of human dignity. Is this dignity unique or – as the preamble to the Charter for Nature says – are human beings “part of nature?” Politicians who follow the declarations on human rights want to classify the protection of nature under the heading of individual human rights: human beings have a right to an unharmed “environment” just as they have a right to freedom from bodily harm. Nature is to be protected for the sake of human beings. In contrast, the Charter for Nature says: “Every form of life is unique, warranting respect regardless of its worth to man. . .” (U.N. World Charter for Nature: Annex). It is only when human rights are based on the dignity of all created things, not solely on the dignity of human beings, that they lose their anthropocentric character, which is hostile to nature, and minister to our common life. We need a legal framework for the community of all living things on Earth. There are proposals for enlarging the Universal Declaration of

Human Rights, so that it becomes a declaration of the rights of future generations and the rights of nature (Vischer 1990). Today crimes against humanity can be brought before international courts of justice, and in the same way crimes against nature must also one day be indictable in these courts.

Christianity (7c) – Liberation Theology

Liberation theology emerged in Latin America during the late 1960s as a theological and religious movement among Roman Catholic clergy and laypeople. The following decades saw the swift spread of its method among both Roman Catholic as well as Protestant Churches, especially in less affluent, southern hemisphere countries. These diverse practitioners were attracted by the specific approach and method of liberation theology, which can be defined as nondualistic, biblical-based praxis rooted in the experience of the poor. This theology was consciously developed in reaction to traditional European theology that focused on intellectual challenges to religion and both spiritualized the Gospel and romanticized poverty. The term liberation is drawn directly from the record of Jesus’ first sermon in Luke 4:18–21, where the text states that Jesus had come “to liberate those who are oppressed.” Here the text recounts acts of salvation that encompass both the spiritual and the material dimensions of existence.

This new theological movement found its manifesto in the book *Theology of Liberation* by the Peruvian Roman Catholic theologian Gustavo Gutiérrez. In this book Gutiérrez focused on trends emerging both from Latin American socio-political realities and from the experiences of Church renewal initiated and theologically legitimated through the Second Vatican Council (such as the renewal in Catholic biblical studies), and the Episcopal Conference of Latin America (CELAM). This new approach to theology was spread by Roman Catholic theologians including Hugo Assmann, Leonardo Boff, Clodovis Boff, José Comblin, Virgil Elizondo, Ignacio Ellacuría, Francis Hinkelammert, João Alberto Libânio (Frei Betto), and Jung Mo Sung, and the Protestants José Míguez Bonino and Rubem Alves.

Liberation theologies stress the example of Jesus going first to the poor and oppressed and emphasize doing theology in specific social, political, and economic contexts, contrasting this approach with theologies that prioritize the formulation of abstract doctrine. The methodological priority on the poor was, liberation theologians claimed, what both the example of Jesus in the Gospels and the Latin American Bishops Conference (CELAM) insisted upon at its meetings in Medellín, Colombia in 1968 and Puebla, Mexico in 1979. At Puebla this priority was called the “(preferential) option for the poor.” The basic theological method was provided by the three-step practical prescription developed by the Belgian Joseph Cardijn (who later became cardinal), in Catholic Action, and was summed up in the slogan “see, judge, act.” The Brazilian theologian Clodovis Boff transformed these terms into liberation theology’s three methodological phases of the “social analytical,” the “hermeneutical” and the “practical-pastoral” mediations, respectively. The first mediation is probably the most striking, in that it proposed to use not the traditional theological partner of philosophy, but rather the social sciences, and in particular Marxist sociology. It was thought that this social science better described the actual material condition of the poor under capitalist economies in the Third World. After analyzing the actual sociological condition of the poor, the scriptures would be examined, their message interpreted in the light of the current situation, and then applied.

Liberation theologies’ stress on the social, economic and political dimensions of religion reflect the influences of European political theology on its first articulators, Gutiérrez and Leonardo Boff, both of whom completed graduate work in Germany. Political theology emerged roughly a decade earlier than liberation theology, in post-World-War II Europe, and reflecting that situation, stressed the public nature and political relevance of religion. Hope for a better future became a central feature of both the Catholic theologian Johan Baptist Metz and the Protestant theologian Jürgen Moltmann, whose respective works *Theology of the World* (1967) and

Theology of Hope (1964) became widely influential. While liberation theologians drew on political theology’s emphases on the social and material dimensions of spirituality, they criticized it for its critique of the present that did not offer concrete political alternatives. They pointed out that without specific political choices, political theology remained as abstract and theoretical as the Western European Church situation it criticized. Therefore liberation theology claimed to make not only an option for the poor but also one for socialism and socialist political platforms as approaches most likely to offer justice in the social and economic realms. This focus on the economic and political dimensions, and the centrality of Marxist social analysis, was to change over the next two decades. First, liberation theologians recognized that traditional Marxist analysis had failed to recognize other forms of oppression outside of the economic and political, such as sexism, racism, and that of nature. Second, the dramatic collapse of existent socialism in 1989–1991 (and with it the Cold War) threw the political left into crisis, given the collapse of practical socialist alternatives.

Consequently, by the early 1990s the concept of liberation as only a historical, social and political process had been reconceptualized as part of a broader paradigm that included liberation not only from material poverty, but also from all forms of discrimination. The close involvement that these theologians had with the urban and rural poor brought to the fore the environmental degradation caused by poverty and the consequent effects on all humans and living beings. This experience led liberation theologians to recognize not only the similarities between the poor and nature, but also the interdependence of both and the necessity of common action. The issue of mass poverty thus became not only a political and religious issue but also a pressing ecological issue. The importance of ecology in Latin America and the prominent role of religion and voluntary associations were highlighted in 1992 when Rio de Janeiro hosted the United Nations Conference on the Environment and Development.

Ernst Haeckel in 1866 coined ecology as “the study of the interdependence and interaction of living organisms (animals and plants) and their environment (inanimate matter).” This definition refers not just to nature and humans, but also to varying levels of human and non-human interactions. To put this even more concisely, Leonardo Boff, who draws on Haeckel’s work, states “everything that exists, co-exists.” At the human level, this “nature of things” calls us from narrow disciplinary foci to interdisciplinary study, from a narrow class-based politics to those based on alliances. Such an approach comes from an awareness of the interconnectedness of all things, as Boff states, “ecology has to do with relations, interaction, and dialogue of all living creatures . . . among themselves and with all that exists” (Boff 1995: 8). This awareness is expressed in diverse ways by differing

liberation theologians: Leonardo Boff, drawing on the work of Haeckel and Jan Smuts, speaks of a “holism,” and José Ramos Regidor of a “profound ethical ecology.” Liberation theologians and ecologists emphasize the ethical, political, and social dimensions of the ecological crisis. In much of Latin America, this recognition has provided a point of contact for alliances between civil servants unions, workers unions, religious groups, human rights organizations, student groups, minority groups, feminist and women’s organizations, and indigenous groups. As ecology is a shared concern of all people, it can serve as a bridge between activists from many groups and regions.

Perhaps not surprisingly, since Brazil comprises over half of the South American landmass and includes the Amazon basin and rainforest, the most significant work on liberation theology and ecology has come from Brazilian theologians, the (ex-) Franciscan Leonardo Boff and the ecofeminist Ivone Gebara. This is not to diminish the significant work done by other Brazilian theologians such as José Comblin, by others on the continent such as the Uruguyan Eduardo Gudynas of the Franciscan Institute in Montevideo, by José Ramos Regidor in Italy, or by others in Africa or Asia. However they generally follow these Brazilian theologians.

As early as 1976, Leonardo Boff applied the political interpretation of liberation to the ecological issue in an article relating Franciscan spirituality to the ecological crisis. In this article Boff declared that humans are faced with the choice of relating to things as “over things” or as being “with things.” In choosing the latter option he argued for a unitive and relational mysticism with all things, based on an Augustinian relational model of the Trinity or Christian concept of God. By the 1990s, Boff sought, in a series of works on ecology, “to connect the cry of the oppressed with the cry of the Earth” (Boff 1997: xi). In his understanding, an ecological liberation theology is a multi-dimensional project, including the Western technological, political and social projects (in liberal or socialist forms), related in turn to the ethical, intellectual and spiritual dimensions. His work, outside of the theological, draws upon two major streams of thought. One is the evolutionary biology of Ernst Haeckel, whose definition of “ecological” Boff utilizes. The other is the concept of holism, coined by the South African statesman and philosopher, General Jan Christian Smuts. According to Boff, the science of ecology is the recognition that humanity is part of the intricate web of life, and that men and women are its custodians and so responsible for the ongoing evolution of all life.

Boff’s approach is described fully in his 1995 work entitled *Ecology and Liberation*. He relates ecology, defined as “the art of relations and of related things,” to the Christian understanding of God as Trinitarian, understood thus as the paradigm of the relational. Adopting the

holistic perspective already described, he links ecology and global consciousness and proceeds to argue for a new society that assumes the worth of every person and being. Participatory democracy as a universal value is the only polity that can ensure such rights and participation. Such a polity ensures that the material and social rights of the poor and of the ecological systems are addressed. Without this, environmental balance is not possible. Boff thus widens the scope of the “option for the poor” to include the environment. Humans need to recognize, he notes, that they are a center, not *the* center of creation, which comprises many living beings with diverse ends. Humans then have an ethical responsibility to recognize that they are a part of a greater whole, a recognition that in turn implies the reciprocity and complementarity that exists among all things. Boff’s conception thus expands liberation theology’s utopian social vision through a profoundly holistic conception of the interrelatedness of all being. Finally, spirituality for Boff is that attitude which places life at the center and defends and promotes life against reductionism and death in all its forms.

The writings of Ivone Gebara, the Brazilian feminist theologian, arise out of her experiences with people in the more rural and underdeveloped Northern states of Brazil. She argues that while liberation theology has certainly raised the critical question of how God is understood in the midst of human poverty and misery, it has failed to address the patriarchal presuppositions upon which much of Roman Catholicism rests. Drawing on the works of numerous Latin and North American writers, including Thomas Berry and Sallie McFague, Gebara questions liberation theologians almost exclusive focus on justice and economic issues, which fails to recognize the links between patriarchy and oppression, between the conditions of the environment and the poor. She seeks to widen the scope of liberation theology’s conception of the poor, and to draw new connections to traditional theological doctrines such as the Trinity. In a move similar to Boff’s, she argues for a broader concept of life, for a holistic paradigm that includes her ecofeminist principles. Liberation thus includes a commitment to ending poverty as well as patriarchy. The ending of economic poverty, she argues, should go together with restored gender and social relations and the ending of ecological degradation. Gebara views liberated humans as the agents of such transformation, not as the masters of Earth, but rather as the Earth’s conscious reflection upon itself. This self-consciousness is then related to Gebara’s study of the Trinity. She understands this doctrine as the Christian way of describing the interconnectedness, communion and diversity evident in all life. The distortions of such relations are evident in poverty, ecological degradation, and violence.

Although liberation theology did not begin with an ecological concern for the Earth, later works (as exemplified by those of Leonardo Boff and Ivone Gebara) recognize the

basic interrelatedness of all reality. They thus call for a holistic paradigm that includes all the projects and dimensions of life. In addition, Boff has democratized the ecological question and argues for a planetary ecological and social democracy that comes with a salutary warning to critically evaluate the ecological effects of the process of globalization. This holistic and relational paradigm advocated by many liberation theologians, while powerful, can only succeed by avoiding the nostalgic search for community that cannot exist (at least in traditional forms) in the social conditions of late modernity. The (paradox or tragedy) of modernity is that precisely the advance of globalization is destroying those very links that make for holism and a viable planetary ecology for the future. In their attempt to situate the ecological issue within the context of the poor, liberation theologians indicate the mutual interactions between the social systems and the ecological systems, and since we cannot separate social justice from ecological justice, we must continue as human beings, related to all other life, to be the voice for the voiceless.

Christianity (7d) – Feminist Theology

In her seminal work *Sexism and God-Talk: Toward a Feminist Theology* (1983) Rosemary Radford Ruether defines the critical principle of feminist theology:

Theologically speaking, whatever diminishes or denies the full humanity of women must be presumed not to reflect the divine or an authentic relation to the divine, or to reflect the authentic nature of things, or to be the message or work of an authentic redeemer or a community of redemption . . . what does promote the full humanity of women is of the Holy, it does reflect true relation to the divine, it is the true nature of things, the authentic message of redemption and the mission of redemptive community (1983: 19).

She continues by connecting feminist ideas with all other forms of chauvinism, including humanocentrism or "the making of humans the norm" (1983: 20). Feminist theology connects all power structures to each other and to the various degradations of culture and nature. Its roots are both ancient and recent.

From the late nineteenth century through the beginning of the twenty-first century, feminist theologies addressed predominantly patriarchal Christian traditions. Reformist, revolutionary, radical, liberation, "third world," and ecological feminist theologies, to name but a few, challenge androcentric norms of Christian belief and institutional structure from myriad perspectives. Language, liturgy, hierarchical establishments, hermeneutics, translations of sacred texts, composition of communities and re-telling of histories (sometimes called "herstories" by feminist theologians) all comprise significant parts of the range of feminist theologies.

While particular glimpses of feminist ideas emerged throughout Christian history, it is anachronistic to apply the term feminist to these concepts from a twenty-first-century perspective. Nonetheless, the roots of feminist thought provide a foundation for its eventual emergence in the nineteenth century since much feminist thought reacts to and rethinks these roots.

Such a sketch usually begins with the creation texts in Genesis 1–3, texts adopted from Jewish traditions by emergent Christianities. Interpretations of these texts have yielded different perspectives, but the figure of Eve (Genesis 2) is blamed by patriarchal Christianity for the fall of humanity (and for all of creation, other-than-humans included) out of a state of paradise and into a state of sin. She grew to symbolize the assumed weak and sinful state of females. In addition to the centrality of Eve for feminist theological discussion, the Genesis creation stories have been interpreted as foundational for human (primarily male) dominance over the rest of

the natural world. This aspect figured prominently as feminist and ecofeminist thought developed in the twentieth century.

Though evidence from the early Jesus movement points to the potential empowerment of women, and several early Christian forms suggest that women held prominent roles as teachers or healers, within the first generations of Christianity the place of women is problematized. As Christianity became the dominant religion of the Roman Empire, the Church established exclusively male, priestly hierarchies. Simultaneously the Church carefully replaced pre-Christian, nature-based pagan traditions, sometimes led by women, with the new orthodox, state-sanctioned, male-dominated Christianity.

Still, throughout the Middle Ages various female mystics proposed alternative theological ideas, some with more success than others. For example, Hildegard of Bingen (1098–1179) wrote complex theological, medical, and liturgical texts, while simultaneously leading a religious order and preaching throughout Europe. Her focus on the “greening” power of God suggests the roots of Christian ecofeminism.

One of the primary examples of the increasing hostility of patriarchal Christianity to both women and to nature is the *Malleus Maleficarum* (an inquisitional manual published in the late fifteenth century) and the witch trials that hailed from it. Women, particularly those who were traditional nature healers and midwives, were the primary target of the witch hunts in Northern Europe. Women’s bodies, considered more susceptible to evil, and women’s herbal healing practices, considered the work of the devil, were marked for destruction.

Eventually Christian sects emerged that provided empowering space for women. In the seventeenth century the Society of Friends, or Quakers, formed. Women such as Margaret Fell and Rebecca Travers were among the early leaders. They wrote theological tracts, served as preachers and missionaries, and reinterpreted biblical texts. The earliest “feminists” came from Quaker and abolitionist connections in the nineteenth century. Sarah and Angelica Grimke, along with Lucretia Mott and Elizabeth Cady Stanton, are often hailed as the first Christian feminists. In the 1890s Stanton, along with a team of female scholars, composed *The Woman’s Bible*. This text, among the most historically critical of its time, rewrote the Christian Bible deleting any sections that denied the full humanity of women. These religious thinkers comprise part of the “first wave” of the feminist movement.

The second half of the twentieth century, and “second wave” feminism, witnessed an explosion of Christian feminist theologies. First in North America and Northern Europe, then in Africa, South America and the Pacific Rim, feminist theologians challenged, reformed and transformed Christian theology, liturgy, ethics, structure, and community. By the 1960s feminist theologians increased

in prominence. Mary Daly, Delores Williams, Rosemary Radford Ruether, Sallie McFague and Ada Maria Isasi-Diaz are among the most influential feminist theologians to nurture, publish and distribute their ideas to Christian communities worldwide.

Daly, raised in the Catholic tradition, earned doctorate degrees in theology and in philosophy. In *The Church and the Second Sex* (1968), she analyzed the marginalized position of women throughout the history of Christianity. Though she retained her teaching position, with tenure, at a Jesuit institution, Daly decided that Christianity was irredeemable for women and called for the women’s movement to be anti-Church. In her 1973 publication *Beyond God the Father*, Daly stated “that if God is male, then the male is God” (1973: 19). In her later theological works, including *Gyn/Ecology* (1978) and *Quintessence* (1998), Daly directly connected female-centered reality with nature and the goddess.

Ruether confronted language and its connections to myriad other issues in *Sexism and God-Talk*:

This emotional hostility has deep roots in the Judeo-Christian formation of the normative image of transcendent ego in the male God image. The underside of this transcendent male ego is the conquest of nature, imaged as the conquest and transcendence of the Mother (1983: 47).

If the primary language used for the divine is masculine and hierarchical (king, lord, almighty, father), then the norm for individuals and the goal of human culture also becomes masculine and hierarchical. Ruether continued this ecofeminist theological discussion in her book *Gaia and God* (1992). Here she focused on both historical analysis of “western” religions and their impact on the human/nature relationship, and on the possible integration of Gaia and God, even in a Christian belief structure. According to Ruether, a religious transformation that recaptures biophilic mutuality is essential if the biosphere is to survive.

Womanist theology expanded the definition of interlocking systems of oppression, critiquing the predominantly white feminist movement for its lack of expressions of racism and classism. Williams, a leading womanist and author of *Sisters in the Wilderness: The Challenge of Womanist God-Talk* (1993), analyzed these various oppressions, including a discussion of the biblical figure Hagar whose experiences she found parallel to women of color. She also challenged the concept of the “surrogacy” role interpreted onto the figure of Jesus. Williams questioned the role of a “surrogate” (Jesus) to carry the burden of sins when systems of forced “surrogacy” abused black women for centuries (as nannies, surrogate sex partners, etc. . .). Her theological ideas extended to issues

of ecological justice when she reinterpreted the figure of Jesus from a womanist perspective:

Jesus conquers the sin of temptation in the wilderness (Matt. 4:1–11) by resistance – by resisting the temptation to value the material over the spiritual; by resisting death; by resisting the greedy urge of monopolistic ownership. Jesus therefore conquered sin in life, not in death (Williams 1993b: 12).

The call of womanists to take all bodies seriously, including the body of Earth, is a powerful one.

Voices from Hispanic, Asian and African communities – many of whom are postmodernist and postcolonial feminists – reject the universals that white feminists often articulate and embrace. Related to the liberation theologies of their various communities, these theologians added a feminist perspective, thus reshaping liberation theologies. For example, Isasi-Diaz worked with other Hispanic theologians to develop *mujerista* perspectives. In her book *En La Lucha: Elaborating a Mujerista Theology* (1993), Isasi-Diaz focused on the communal method of Hispanic feminist theological praxis.

Finally, Christian ecofeminist theologians, such as McFague, have brought environmental concerns even more to the forefront of feminist theology. New areas of exploration, such as apocalypticism in Christianity and its impact on ecological worldviews, have formed a central component of ecofeminist theology. Catherine Keller, for example, has pondered why apocalyptic thought figures so centrally in both Christianity and radical environmental movements. She contends that apocalypticism, with its inherent violence and binary characterization of reality, is a central feature of patriarchal systems:

The dispirited readily turn to apocalypse, seeking vitality amidst the violence; the complex demands of the present flee before the single, deafening word; smoke and fire fill the screen, and beasts strip the great whore. Wherever overtly apocalyptic hope has been literalized it has been proven *wrong*; the normative hope, however, cannot be falsified. It can be named: hope for mutual respect in proximate and in political relations, for justice and mercy upon the land and within the city, for transnational, trans-species healing and renewal (Keller 1996: 308, her italics).

Keller and other feminist eco-theologians have been arguing for a rethinking of future possibilities away from apocalyptic trends.

As feminist theologies continue developing, a this-worldly emphasis on justice, creation, bodies and diverse positions is emerging. Christianity's foci on the cross and suffering, on afterlife and apocalypse, on Jesus' maleness

and patriarchal hierarchical organization, all come into question. Feminists respond and recreate Christian theology in myriad ways including: an elevation of bodies (human and other-than-human) and of life on Earth rather than an elevation of souls and afterlife; a radical egalitarianism for all of life; new language for the divine and for humanity; eschatological visions that assume ecological justice, but without assuming violence and destruction. Because of their continuing inquiry into all systems of domination, feminist theologians necessarily address human abuse of the Earth. Such destruction denies life to all, but particularly to those who are already most oppressed. These radical new ways of envisioning Christianity comprise feminist theologies in the twenty-first century, linking Christian theologians with a pluralist, feminist religious dialogue.

Christianity (7e) – Creation Spirituality

Creation Spirituality is where Christian mysticism meets global indigenous traditions, social justice, the “new science,” feminism, and environmental commitment and concern. Situated at the heart of the contemporary “greening of religion” phenomenon, the Creation Spirituality movement aims to reinvigorate Western religious traditions through a spiritual consciousness keenly attuned to the cosmic and earthly created order. Most clearly articulated by its founding father, former Roman Catholic priest and current Episcopal priest Matthew Fox, Creation Spirituality embraces all of creation as “original blessing” (as opposed to original sin) and emphasizes a worldview that conceives of the divine in all things (pantheism) and all things in the divine. In the tradition of Thomas Aquinas, Creation Spirituality sees God’s revelation as present both in the Bible and inscribed into the natural world.

Matthew Fox argues that the tradition of Creation Spirituality (sometimes referred to as “creation-centered spirituality”) can be found in the ancient Wisdom traditions, in the Earth-based traditions of indigenous cultures, but also in the stories of the biblical prophets and of Jesus (whom Fox recasts as the “Cosmic Christ”). A rich tradition of creation-centered consciousness, according to Fox, can also be found in the “green theologies” of the great medieval “Rhineland” Christian mystics – figures such as Hildegard of Bingen (1098–1179), Julian of Norwich (ca. 1342–1415), Mechtild of Magdeburg (1210–1280), and Meister Eckhart (ca. 1260–1327). The work of these four mystics, says Fox, is steeped in an ecological consciousness that communicates six key points: 1) the goodness or blessing of creation, 2) the goodness or blessing of the Earth itself (including human bodiliness), 3) cosmic consciousness, 4) a theology of pantheism, 5) the motherhood of God, and 6) compassion understood as interdependence and justice making.

Fox founded the Institute of Culture and Creation Spirituality (ICCS) at Chicago’s Mundelein College in 1977, where (with others) he increasingly explored the spiritual implications of contemporary scientific understandings of evolution and cosmic origins. No longer sworn enemies, religion and science became for Fox intertwined sources of mysticism and revelation. In 1983, Fox moved the Institute to Holy Names College in Oakland, California, where ICCS would be able to draw upon the booming science and technology community in the Bay Area for programming resources and faculty. In the mid-1990s, Fox transformed the ICCS into the “University of Creation Spirituality” (UCS), a master’s degree and doctorate-granting institution independent of Holy Names College.

Curriculum at UCS places a strong emphasis on what Fox identifies as the seven principles of Creation

Spirituality: cosmology, feminism, liberation, compassion, prophecy, creativity, and community. Coursework includes workshops on liturgical renewal, including experiments with the genre of “techno cosmic masses.” These masses, which combine body-active worship with rave music, video screens, and various forms of technological art, are more often than not dedicated to Earth-honoring themes, the most repeated mass being one dedicated to “Gaia Our Mother” (1997, 1998, 1999, 2000, 2002). In the period between 1996 and 2003, other mass themes have included topics such as: “The Sacred Cosmos,” “Hildegard of Bingen,” “Kinship with Animals,” “Celebrating Nature’s Power,” “Resurrecting the Green Man,” “All Our Relations,” and “Cosmogogenesis.” These experimental masses can be placed within the context of the broader dynamics of ongoing “green liturgical renewal” across a variety of religious communities in North America (Jewish, Catholic, Protestant, and Buddhist).

In response to Fox’s work promoting Creation Spirituality, the Vatican silenced him from teaching or writing during the period of 1988 to 1989. In 1993, Fox was formally dismissed from the Dominican order and stripped of the priestly right to perform the sacraments (although he still technically remained a priest). In 1994, Fox joined the Episcopal Church and was ordained as an Episcopal priest, a decision that was devastating to some of Fox’s Catholic supporters who felt abandoned in their efforts to reform the Church from within.

Matthew Fox’s struggles with institutional authority and orthodoxy points to the complicated challenges faced by those engaged in the work of “greening” religion. Many of those who are committed to remaining firmly within their religious institutions face a delicate balance between pressing for an increased degree of ecological consciousness and confronting accusations of “heresy.” Developing ways to negotiate this balance without being ousted from one’s religious community or without severing institutional ties can be a tricky challenge, to say the least – one that reformers will continue to deal with in various degrees as ecological spirituality, green liturgical innovations, ideals of “creation care” and of “stewardship” become more deeply embedded in the religious landscape.

Christianity (7f) – Process Theology

“Process theology” is a name for various theological perspectives that have been developed by many different philosophers and theologians since the mid-twentieth century. Most process theologians are Western and Christian, but some are Jewish, Buddhist, Hindu, and Muslim. Their commonality lies in a common indebtedness to the cosmology of the late philosopher and mathematician, Alfred North Whitehead, whose vision of the universe as an interconnected and evolving whole, of which humans are a part, provides a framework for articulating their distinctively religious perspectives.

Among Christian process theologians, the most influential is John B. Cobb, Jr., whose Whitehead-influenced understanding of Christianity led him to become one of the first Christians in the United States to call for an ecologically-minded Christianity that emphasizes the intrinsic value of all living beings, the relational character of all existence, and the necessity for Christians and others to embrace a holistic ecological ethic. Numerous students and colleagues of Cobb’s, including David Ray Griffin, Marjorie Suchocki, Charles Birch, Mary Elizabeth Moore, and Jay McDaniel have learned from and amplified Cobb’s seminal approach.

Process theology approaches connections between religion and nature at three levels: theology, social ethics, and spirituality.

Theology

At the level of theology, process theology advocates twelve ideas concerning religion and nature, many of which bear affinities with Asian and indigenous religious points of view, even as they have been used by members of Abrahamic faiths, especially Christians, to interpret core Christian teachings.

Nature as Creative. The first is that nature itself, as understood through evolutionary biology and quantum theory as well as many forms of religious experience, is a continuously creative process, with galactic as well as terrestrial dimensions, of which humans are an integral part.

Nature as Visible and Invisible. The second is that nature includes invisible as well as visible dimensions, as exemplified in feelings and other conscious states of mammals (invisible) and the human brain (visible), and that both of these dimensions are expressions of the same kind of creative energy and in this sense “natural.”

Intrinsic Value and Pan-Experientialism. The third idea is that each living being on Earth (and anywhere else) is a

subject for itself not just an object for others, such that the living being has intrinsic value and some capacity for experiencing its environment (consciously or unconsciously) from its own unique point of view. Here the word “living” includes God (see below) and carbon-based forms of life such as single-celled organisms and animals. “Living” more generally means any being of any sort that has subjectivity of any kind, on the basis of which it can take into account its surrounding environment in a conscious or non-conscious way, creatively responding in novel ways. When combined with Whitehead’s view that nature includes many planes of existence, not just the three-dimensional plane of space as evident to the vision, this understanding of “living” opens up the possibility, characteristic of many indigenous societies, that there are forms of actuality (spirits, living ancestors) that are part of the larger ecology of a community. It also opens up the possibility, emphasized by empirical studies in parapsychology, that the human self (and perhaps other forms of life) undertake a continuing journey after death, which likewise widens a sense of “ecology” in a way that resembles Chinese emphases on an ecological trinity of heaven–Earth–human relations.

Two Kinds of Wholes. The fourth idea is the view that inorganic materials – mountains, for example – are aggregate expressions of subatomic forms of energy that are, if not living in a biological sense, then at least possessive of some capacity for non-conscious prehending of their immediate environments. The idea that all actual entities have capacities for taking into account their environments, either consciously or non-consciously, is called pan-experientialism or pan-psychism. In order to avoid the idea that this implies that macroscopic entities (rocks, for example) are experiencing subjects in their own right, process theologians draw a distinction between two kinds of natural wholes: wholes that have unified subjectivity on the basis of which they have reality for themselves (living cells, animals) and wholes that are aggregate-expressions of energetic phenomena with non-conscious prehending capacities, but that lack unified subjectivity (rocks).

Interconnectedness. The fifth idea is that all living beings have their existence and identities in relation to, not apart from, all other living beings, which means that the very identity of a living being, including each plant and animal, is partly determined by the material and cultural environment in which it is situated. Process theology goes further, in a sense reminiscent of Buddhism, to say that each entity is “present in” every other entity, such that interconnectedness implies inter-being or inter-containment. This means that all entities are thoroughly ecological in nature, and that human beings are themselves ecological in being persons-in-community, not persons-in-isolation. In a process context, “community” includes the entire web of life in which a human (or other

living being) is nested. The means that respect for the intrinsic value of individual living beings cannot be separated from considerations of the instrumental value, positive or negative, that these beings have for others in their biotic communities.

Teleology. The sixth idea is that the universe as a whole, over vast periods of time, has evolved toward heightened degrees of intrinsic value, which are equated with heightened capacities for richness of experience, as evident in the capacities of animals (humans included) to respond to new situations in unpredictable and creative ways, experiencing both the joys and sorrows of mortal existence.

God in Nature. The seventh idea is that the whole of nature is embraced by a divine reality – a One-embracing-many variously named God, Allah, Amida, Heaven – who is influential throughout nature in a continuous way as an indwelling lure toward satisfactory survival within individual living beings, and as a more generalized lure toward new forms of order and novelty within evolution as a whole.

Non-Supernaturalism. The eighth idea is that this divine lure does not interrupt the causal operations of nature as understood in physics and chemistry, which means, among other things, that it is best understood as ultra-natural rather than super-natural. This leads some process theologians to speak of process theology as a form of naturalistic theism.

Divine Empathy. The ninth idea is that the One-embracing-many is not only influential throughout nature in a non-coercive way, but also acted upon by nature in a continuous way, such that it empathically shares in the experiences of all forms of existence and in the joys and sufferings of all living beings.

Tragedy in God. The tenth idea is that, by virtue of this empathy, the One-embracing-many is enriched not only by the experiences of individual living beings, but also by the diverse kinds of lives that inhabit the planet, such that an unnecessary depletion of biological diversity is a tragedy, not only for the Earth, but also for the divine life itself.

Sin as Unnecessary Violence against Creation. The eleventh idea is that, because nature is itself creative at all levels, there are things that happen in evolution itself, and in human interactions with other living beings and forms of existence, that are tragic, even for God. This leads process theologians to define sin as unnecessary violence against creation, from which even God suffers.

Co-creativity. The twelfth idea is that human beings, as creatures among creatures can help prevent these tragedies by cooperating with the divine lure toward the fullness of life, and that this kind of response is their true vocation in life. In process theology the whole of nature is historical or evolutionary, and the future is not pre-ordained, not even by God. What happens in the future

depends on decisions made in the present by human beings and other living beings, moment by moment.

Social Ethics

All twelve ideas have implications for social ethics. The idea that all living beings have intrinsic value entails the view that humans have moral obligations to other creatures – animals, for example – under human domestication and in the wild. It simultaneously means that economic institutions and policies ought to take as their aim the promotion of human well-being in an ecologically responsible context, rather than economic growth for its own sake, and that human communities reach fruition when they live in fruitful cooperation with other forms of life and natural systems, and when they are limited in scope, making space for the habitats of other living beings. This does not imply that any living being, including even human beings, have absolute rights to life; but it does imply that respect and care for the community of life (to borrow language from the Earth Charter) is the defining characteristic of healthy human community. The idea that there are degrees of intrinsic value entails the view that it is more morally problematic to inflict violence on a gazelle than to take the life of a bacterium, even though both the gazelle and the bacterium possess subjectivity. The idea that God is enriched by biological diversity, and harmed by violence against creation, means that ethical relations with nonhuman forms of life cannot be separated from faithful relations to God. And the idea that humans are co-creative with God means that the very will of God, that nature itself flourish in its fullness, depends for its realization on human responsiveness.

Spirituality

Process theology recognizes that religious life is more than theology and ethics; understanding and moral behavior. It includes prayerful states of awareness that are sensitive to the intrinsic value of each living being; forms of ritual that help awaken people to the mystery and grandeur of landscapes, waterways, and galactic vistas; inner journeys toward integration between consciousness and the energies and archetypes that well within the unconscious, some of which are encoded within human genes; and humble acknowledgment that humans are small but included in larger wholes that far transcend their finite concerns. In process theology, all of these forms of spirituality are natural and part of nature understood in general terms.

Moreover, the philosophy of Whitehead is open to the possibility that there can be forms of empathic connection, not only between humans and other humans, but between human and nonhuman forms of life; and that the very journey toward peaceable selfhood, toward which all living beings strive in their own unique ways, may well continue after death, until wholeness is realized. Should

such connections and continuation prove to be true, they, too, would be part of nature broadly understood.

Finally and importantly, from a process perspective it is wrong to think that spirituality as such begins with human beings. Each living being has its own unique relationship to God, and all living beings, indeed the whole of the cosmos, are embraced within the larger and divine whole. How other living beings experience this embrace is a mystery to humans. But that they are part of this embrace is central to process theology. Spirituality begins, not with formal belief or even with social ethics, but with non-verbal attunements to the divine embrace. This embrace takes the form of an indwelling call to survive with satisfaction relative to the situation at hand. For many creatures in nature, humans much included, the simple desire to survive with satisfaction, even amid sometimes insurmountable odds, is a form of spirituality.

Criticisms and Responses

Process theology is not without its critics, all of whom raise important questions for the process perspective. Three kinds of criticism are illustrative.

First, inasmuch as process theology speaks of degrees of intrinsic value in accordance with degrees of sentience, some environmental thinkers argue that this approach privileges sentient beings, perhaps especially those with a highly developed nervous system, over ostensibly insentient beings, such as mountains and water. Indeed, process theology offers what might best be called a biocentric approach over a geocentric approach, proposing that while ostensibly inorganic realities do indeed contain intrinsic value, their value is best understood in terms of their instrumental value to living beings.

Second, inasmuch as process theology is open to the possibility of continued existence for all living beings after death, it opens up, but fails to answer, the difficult question of whether, in a journey toward peaceable selfhood, impulses toward predation, which seem natural and necessary in life on Earth, would be transcended. This seemingly speculative question bears upon the deeper question of whether predator-prey relations on Earth are unambiguously good, as some deep ecologists might suggest, or whether or not they contain an element of tragedy as well, as process theologians aver. In the latter respect process theology has sympathy with classical traditions, ranging from Jainism to Judaism, that see something tragic in the more violent dimensions of nature. Whereas some environmentally oriented traditions see the evolutionary unfolding of creation as divine will, process theology sees this unfolding as partly the result of divine influence and partly the result of nature's own creativity, which itself can unfold in ways both beautiful and tragic.

Third, and finally, classical theists in the Abrahamic traditions, while appreciating the process image of God as one who shares in the joys and sufferings of all living

beings, nevertheless prefer to think of this sharing as something that God chooses to do, as if God could choose otherwise. Process theology proposes by contrast that even God is an exemplification of metaphysical principles, one of which is the ecological principle that, to be actual at all, one must be affected by other realities and partly composed of other realities. Thus process theology speaks of the universe as the very body of God. This means, not only that God must dwell in relation to a universe in order to be fully divine, but also that divine power is limited by the power of the universe itself, such that it cannot be unilateral or one-sided. Classical theists often criticize process theology for offering a view of God that denies omnipotence in the classical sense; and process theologians respond that, only through such a denial, can theists make sense of the unnecessary violence in creation, and also the goodness and beauty of creation, so much of which results from the creativity of the universe itself, as inspired but not manipulated by the divine lure. Among Christian and Jewish process theologians, it is as important to recognize that the intrinsic value of all living beings, while appreciated by God, is not reducible to God. This respect for otherness – even on God's part – is a key feature of process theology.

Christianity (7g) – Womanism

The African-American novelist Alice Walker defined the term womanist in 1983 as a black feminist or feminist of color. The term is derived from the black folk expression, “You’re acting womanish,” as in “grown up” and “in charge.” It is “the opposite of girlish.” A womanist desires healing and wholeness for entire communities, male and female. A womanist is not heterosexist but loves men and women, sexually and non-sexually. She loves food, the moon, and roundness. She loves the Spirit. A womanist is connected to creation and to her own body, loving the folk and herself, regardless. She describes the colored race as a flower garden with every color in it.

For Walker, a womanist is to feminist as purple to lavender. This analogy contrasts black women’s social-historical experience of struggling for freedom of entire communities around interlocking issues of oppression with the activism of those feminists who focus on sexism as a single issue. It is a reference to differences in women’s experience of oppression as struggles against racism, classism, colorism and heterosexism further complicate struggles against sexism. Walker’s analogy extends a challenge to white feminists to recognize interlocking systems of oppression, even as it recognizes that purple and lavender are shades of difference belonging to the same family.

Black feminist scholars in religion and in other academic disciplines quickly identified with the term “womanist.” Part of its appeal is that there is no qualifier before “feminist.” The term honors black women’s experience as freedom fighters who are women and black in one body. This is a proactive response to unrealistic demands that black women choose either black liberation or women’s liberation. Walker’s definition of “womanist” alludes to Harriet Tubman’s commitment to freeing her mother and more than 300 other slaves. Tubman was an abolitionist and a feminist. Some writer-activists, like Audre Lorde and Bell Hooks chose to retain the term “black feminist” to emphasize solidarity with other feminists. Others employ the terms interchangeably. Womanists reference a variety of historical black women in their definitions. Walker refers to black Shaker leaders Rebecca Cox Jackson and Rebecca Perot. Jacquelyn Grant, a systematic theologian, turns to the narrative of Sojourner Truth. Truth is famous for her sermon, “When I Found Jesus,” and for her “Arn’t I a Woman” speech.

Delores Williams, a womanist theologian of culture, offers social-historical analysis of the “violation and exploitation of the land and of women’s bodies” which has

“led to the destruction of natural processes in nature” (Williams 1993: 26). Williams analyzes assaults upon nature, the human spirit, and the divine spirit, describing the “defilement of nature’s body and of black women’s bodies,” particularly of workers in industry, as sin (Williams 1993: 29). She examines the correlation between disrespect for the peoples of the Earth, particularly African bodies, and disrespect for the Earth. Shamara Shantu Riley, a political scientist, writes on “The Politics of Emergent Afrocentric Ecowomanism,” observing that “womanism and ecology have a common theoretical approach in that both see all parts of a matrix as having equal value” (Riley 1993: 194). “There is no use in womanists advocating liberation politics,” she writes, “if the planet cannot support people’s liberated lives” (Riley 1993: 194). It is “equally useless to advocate saving the planet without addressing” social issues that determine human structural relations (Riley 1993: 194). To advocate both sets of concerns is necessary for survival. Riley employs West African traditional spiritual principles in her analysis alongside black feminist theory, historical analysis, and environmental studies resources from Black women’s organizations.

Emilie Townes is a theo-ethicist who examines the importance of loving black women’s bodies and all bodies in relation to the environment. Considering Robert Bullard’s sociological study of environmental racism in relation to Toni Morrison’s novel *Beloved*, Townes engages in social-ethical analysis of the environmental crises that poor black people in rural, particularly Southern, communities face in the United States. In these streams Karen Baker-Fletcher has provided a collection of prose essays, poems and meditations on environmental justice and environmental racism. Her work is grounded in a creation spirituality that considers what it means to be created as dust and spirit, resisting violence with the rest of creation, in a world fraught with environmental abuse.

Christianity (7h) – Natural Theology

Natural theology in its most general sense refers to the study of God and God's attributes as these can be interpreted from the study of God's "works." Natural theology emerges from the medieval theological distinction between "nature" and "revelation" (including revealed scripture) as the two primary means of knowledge of the divine. In Catholic thought, this distinction is preserved in the "natural law" tradition, which is understood to be complementary to, but not to be separate from, the tradition of revelation.

Natural theology in its fundamental sense does not originally refer to theology "about" the physical world, but rather, to the epistemological distinction between what may be known through revelation (in the Bible or through divine miracles) and what may be known through "natural" means (the application of human reason). But because human reason is directed toward the physical world, as well as toward human nature, and because investigating the physical world and the human self are both means of gaining further knowledge of the divine, "natural theology" has often come to refer not only to the way of knowing (using the "natural" faculty of human reason), but also to one of the primary objects of inquiry (the natural, physical world).

In the Euro-American context in which it developed, natural theology came to be understood to be a scholarly discipline of its own (this was resisted by Catholics and some Protestants in earlier periods, in part out of concern that natural theology could lead to the rejection of revelation, or worse, to skepticism and atheism). With roots in earlier centuries, natural theology flourished in the seventeenth and eighteenth centuries, particularly with the publication of John Ray's *The Wisdom of God Manifested in the Works of Creation* (1691), William Derham's *Physico-Theology* (1713), and, later, Archbishop William Paley's popularization of Ray's and Derham's work in his *Natural Theology* (1802). More broadly, the importance of natural theology in demonstrating the "reasonableness" of Christianity was elaborated and popularized in the essays of John Locke. These works all sought to illustrate the intelligence, wisdom and beneficence of God through a close analysis of the systematic workings and perfectly ordered beauty of the natural world.

Among scientific works that might also be included in

this category are the "Bridgewater Treatises" (1831), a series of eight treatises authored by prominent British scientists, and, earlier, Linnaeus' essay "The Oeconomy of Nature" (1749), which gave its European and American audience an early picture of hydrological cycles and ecological niches. While intended as a scientific treatise, Linnaeus' work set out also to illuminate the essential orderliness of the natural world and to reason from such order the intelligence and perfection of the divine Creator. At the same time, it established the scientific groundwork for what would later become the field of "ecology" as it was coined by Ernest Haeckel in 1866. In contrast to Linnaeus, Ray and Paley saw themselves primarily as theologians, but they encouraged the study of nature as a way to map the mind of God.

As a field of study in the emerging Enlightenment, natural theology demonstrated the extent to which the intellectual preoccupations of scientists and theologians were deeply intertwined. At the same time, however, the increasing popularity of natural theology also anticipated the development of secular science and secularization more broadly, by encouraging the rational study of natural laws and by employing metaphors of nature as a mechanized system. Such dominant metaphors and approaches to study would later be perpetuated by scientists without reference to a Divine Intelligence as the creator of such orderly systems.

The ecological legacies of natural theology are also complex and mixed. On the one hand, Ray's and Paley's work encouraged the close study and appreciation of nature as a significant aspect of the cultivation of a virtuous Christian life. Such encouragement also included an emphasis on human humility with respect to other wonders of God's creation. The importance of studying nature as an aspect of a responsible Christian life has been emphasized by contemporary ecologically oriented theologians such as Sallie McFague and James Nash.

Sallie McFague's theological work, for instance, emphasizes the importance of attentiveness toward nature and argues that learning about natural theology can return Christians to an ancient theological tradition in which nature played an important role in Christian spirituality. While emphasizing natural theology in its medieval forms (rather than in Enlightenment, more mechanistic, articulations) McFague sees natural theology as an important counterbalance to the anthropocentric aspects of the Christian tradition.

James Nash argues that the natural law tradition (of which natural theology is a part) has been focused historically – and ironically – on human nature, but now must be extended to include nonhuman nature as a source of moral insight and guidance. He suggests that the natural law tradition of "following nature" can be used effectively today when "ecosystemic compatibility" is used as a norm from which to derive ethics.

Similarly, the call for humility and a check of human control of nature has been articulated, not only by Nash and McFague, but also by Dieter Hessel, Rosemary Ruether, Calvin DeWitt, Gordon Kaufman, Larry Rasmussen and Drew Christiansen, as well as philosophers, Holmes Rolston, III and Paul Taylor. Whether intentionally or otherwise, these authors have drawn on the natural theology tradition, albeit with less of a sense of Enlightenment optimism than we find in earlier periods. Changes in our scientific knowledge have also contributed to skepticism with respect to the fixed “laws of nature” and the need to make more modest claims.

The legacy of natural theology, then, includes an appreciation of nature as a means of knowing the divine and a commitment to studying nature that goes beyond the pursuit of knowledge for knowledge’s sake. While the link between natural theology and Christian theology is not always direct – and sometimes the term “natural theology” is used without a sense of its philosophical history – there remain important family resemblances between this older theological tradition and contemporary ecological theology.

On the other hand, with the increasing use of technological metaphors for the physical world (nature as a clock or a system of gears) and the corresponding confidence in human reason as a divinely provided key to “unlock” nature’s secrets, natural theology also has played a role in the cultural development of Enlightenment models of the domination and mastery of nature for human use. To the extent that the Enlightenment fostered skepticism with respect to religion and a human sense of mastery over nature that was soon to be articulated in the rise of technology and industrialism, natural theology, ironically perhaps, has played an intellectual role in utilitarian readings of nature and, to a certain extent, has indirectly influenced destructive practices. In contemporary ecological theologies today, however, the potentially problematic legacies of natural theology are largely muted and the natural theology tradition is often being rehabilitated for ecological use.

SP Christianity (7i) – An Evangelical Perspective on Faith and Nature

Evangelicalism is a branch of Protestant Christianity that holds that the Bible and its 66 canonical books are vital for faith and practice and the authoritative source for defining how rightly to live on Earth. Its adherents believe that the good news of the Bible should not be selfishly kept, but proclaimed, this reflecting the Greek derivation of “evangelical,” from *eu* (true) and *angelis* (a messenger, or bearer of news). This news is *good* and it is *good* for every creature. It is *good* because it brings restoration and reconciliation of all things, countering and undoing human-wrought degradation. The reach of this gospel is as great as is human-wrought degradation; its blessings flow “far as the curse is found.” The restorative reach of the second Adam (Jesus Christ) is as great as the damaging reach of the first Adam, evangelicals believe.

At the heart of the good news proclaimed in evangelicalism is salvation. Salvation is a saving from degradation offered to those who are willing to follow in the footsteps of Jesus as savior and reconciler. Those who believe this good news bring joyful service to humanity, to every creature, and to all creation. It is service that works to fulfill the eager expectation of the whole creation for the coming of God’s children. Evangelicals – the bringers of good news in the footsteps of Jesus – are honest in describing the way things really are, are visionary toward the way things ought to be, and are followers who bring food and the means of its production to the hungry, heal the sick and bring the means of healing, and work to restore degraded aspects of creation, engaging with others to reconcile all things. While evangelicalism usually is associated with specific churches and denominations, evangelicals can be found in nearly every Christian denomination.

A distinctive feature of evangelicalism is that it distrusts human authority and societal hierarchy. This distrust is reflected in its congregations and institutional polity, with many congregations operating as independent entities, others loosely organized in associations, and some joined together in denominations with very limited hierarchy. Many in the United States are associated with the National Association of Evangelicals, but not all. In evangelicalism there is no “word from above” from prelates or pontiffs. Instead there is the Word – the Bible. Consequently evangelicals engage in serious and continuing Bible study, individually and in fellowship with others, to discover biblical teachings and apply them to their lives, society and the rest of creation. This fear of earthly authority sometimes is associated with limited

knowledge of the Bible, science, and society, including little awareness of biblical teachings on environmental stewardship or of environmental degradation. With growing knowledge on various topics, however, evangelicals are a powerful influence. They are assisted in gaining knowledge by publications such as *Christianity Today*, and by numerous evangelical colleges, universities, and seminaries that convey knowledge through professional and popular writing, preparing pastors and teachers, and educating social, scientific, medical, legal, business, and environmental professionals. Some sixty of these colleges and universities gain depth in study of creation and Christian environmental stewardship through partnership with the Au Sable Institute. They also are provided numerous opportunities to practice their faith worldwide through Christian organizations and agencies dedicated to medical services, disaster relief, development work, food production, environmental restoration, and holistic ministries. These organizations have formed the Association of Evangelical Relief and Development Organizations (AERDO) to aid in this work, and organizations engaged in environmental stewardship are networked through the Evangelical Environmental Network (EEN) from which came a successful effort in 1996 to prevent the U.S. Congress from weakening the Endangered Species Act and a highly regarded “Evangelical Declaration on the Care of Creation” that is the subject of an important book edited by Professor R.J. Berry of the U.K.’s John Ray Initiative.

Evangelicalism’s commitment to taking the Bible seriously has important implications for its contributions to understanding God, abundant human life, and the caring of creation. Since evangelicals measure their faith and practice against biblical standards and believe in continuous adjustment, correction and conversion in response to wherever they fall short of biblical requirements, they are a potentially powerful force in addressing care for creation and environmental degradation. Contrary to what one might first expect, their adherence to the centrality of the Bible, often identified with the phrase *sola Scriptura*, does not close the window on learning from society and creation. On the contrary, it is the open window through which the world and God’s creation are seen. This window, on the “book of God’s creation,” produces what sometimes is called a “two books theology” – one that reveals God both through the Bible and creation. As one expression of this, the Belgic Confession states “By What Means God is Made Known to Us” in Article II: We know God by two means –

First, by the Creation, preservation, and government of the universe; which is before our eyes as a most elegant book, wherein all creatures, great and small, are as so many characters leading us to see clearly the invisible things of God, even his everlasting

power and divinity, as the apostle Paul says (Romans 1:20) . . . Second, He makes Himself more clearly and fully known to us by his Holy and divine Word, that is to say, as far as is necessary for us to know in this life, to His glory and our salvation.

The consequences of learning both from the Word and the world means that an evangelical perspective on locating a city and its churches on the flood plain of a river is one that does not expect God to alter creation to prevent flooding. Neither does this mean that consuming carcinogens will bring God to render these chemicals powerless. At base in evangelicalism, knowledge of God’s word must be accompanied by knowledge of God’s world. Knowledge of the Bible must be accompanied by knowledge of creation.

At evangelicalism’s heart is the Bible. And at the heart of the Bible are Jesus’ teachings to do God’s will on Earth – how rightly to live on Earth based upon a love and respect for God’s will. Its aim is to follow Jesus with a passion to live rightly in the world and spread right living. Such passion, of course, is not confined to evangelicalism, nor even to Christianity generally. The Jewish scholar, Joseph Klausner, shows for example, that Judaism also seeks to live rightly in the world out of a sense of God’s calling to do so. And he describes Jesus as heir of the Jewish vision of God’s plan for the salvation of people and creation, thereby saying that Jesus is in the lineage of David, a product of Jewish faith and culture. In the evangelical view, Jesus does not oppose the Bible and Jewish Law. Instead, Jesus comes to fulfill this Law. And as a fulfiller of the Law, Jesus is central to evangelicalism, with this having a profound significance for the relationship of evangelicals to creation, to Christianity, to Judaism, and to the faiths of other peoples.

The primacy of scripture for evangelicals needs to be seen in light of the belief that without the testimony of the Bible and its being put into practice, human beings will exercise their capacity to destroy the Earth. Evangelicals take seriously God’s judgment and particularly the Last Judgment described in the book of Revelation, including the proclamation given at the sounding of the last trumpet, “The time has come for . . . destroying those who destroy the Earth” (Rev. 11:18). Followers of Jesus, taking seriously this proclamation, are committed to turn away from participating in Earth’s destruction, and they are deeply concerned that others do the same, for their own salvation. Putting this positively, they would work to direct the attention of any and all who would listen to Matt. 6:33: “Seek ye first the kingdom of God, and these other things will be added unto you.” In evangelical and biblical perspective, “Looking out for number one,” is not seeking oneself. Instead it is “Looking out for Number One,” namely God – who created the heavens and the Earth through Jesus Christ, by whom also the whole

creation is held together with integrity and through whom the whole creation is reconciled to God (Col. 1:15–20).

Christianity (8) – Ecumenical Movement International

Ecumenical social thought, with growing attention to signs of planetary degradation, is the focus of the treatment here. This is a new development. In particular, the condition of “nature” and “creation,” and the place and activity of human beings as part of them, occupies a place in ecumenical thought and practice that they were not accorded for the first three-quarters of the twentieth century.

The activity of the World Council of Churches is instructive. Among the churches, it gave significant leadership, some of it in close cooperation with the Roman Catholic Church. The language of “sustainable society” itself seems to have been initiated by a group of demographers, physical scientists, economists and theologians at a WCC world conference on science and technology in Bucharest, Romania, in 1974. By 1975, the WCC had proposed a program on the “Just, Participatory and Sustainable Society” at its general assembly in Nairobi, Kenya. Yet the decisive attention to human development and nature’s endangered sustainability as integral one to another came at the next general assembly, in 1983 in

Vancouver, Canada. Delegates voted for the engagement of WCC member churches “in a conciliar process of mutual commitment to justice, peace, and the integrity of creation” (JPIC). “Conciliar process” signaled the desire for a widespread, decentralized process in which resisting social and ecological degradation was regarded as a matter integral to Christian faith itself. The moral and confessional tasks were seen as one. Both the Lutheran World Federation, in 1977, and the World Alliance of Reformed Churches, in 1982, had declared resistance to the social policy of apartheid as a fundamental matter of faith itself, so the link of “social righteousness to the integrity of the faith as such” had already been made by significant confessional bodies. (The WCC’s Program to Combat Racism, begun in 1968, shared this ethos.) Now much the same was being done ecumenically around the eco-crisis and a new theological factor identified as “the integrity of creation.” That is, from the point of view of Christian faith, all creation has standing in and before God. Human beings are not the center of all value and the reason for the existence of the rest of nature. Justice and peace cannot be pursued, then, by human beings as an ecologically segregated species. Realizing justice and peace requires attention to creation as living and as imposing requirements of its own. Moreover, even from a strictly practical point of view, a just and peaceful order is only sustainable if it respects the integrity of creation.

This new chapter in ecumenical social thought came to a certain climax in the World Convocation on JPIC, convened in Seoul, Korea, in 1990. Four “covenants” were adopted, promoting: 1) a just economic order, including debt release of heavily burdened Two-Thirds World countries (interest owed to the World Bank, International Monetary Fund, international banks and nation-states); 2) security for all in nonviolent cultures; 3) cultures that live in accord with creation’s integrity; and 4) an end to racism and discrimination. Ten ecumenical “affirmations” were also adopted, affirming that

all exercise of power is accountable to God, God’s option for the poor, the equal value of all races and people, male and female as created in the image of God, truth as the foundation of a free community, the peace of Jesus Christ, the creation as beloved of God, the earth’s is the Lord’s, the dignity and commitment of the younger generation, and human rights as given by God.

These affirmations in turn became the core themes for a series of case studies conducted around the world in a subsequent WCC program under the rubric of the “Theology of Life.” The effort was to see how, concretely, churches and other organizations in a given locale were addressing compelling issues in ways that built up the whole Community of Life. Differently said, the endeavor

was to discern how justice and peace might be pursued in a manner that respected the integrity of creation as a whole.

Ecumenical social thought at the outset of the twenty-first century, then, has expanded its circle of ongoing concern to the whole “household of life.” While every issue has been and continues to be the site of moral contestation, the inclusion of nonhuman nature in ecumenical moral frameworks has been done without erasing or neglecting the justice and peace issues of previous decades.

Christianity (9) – Christianity's Ecological Reformation

The multidimensional ecological crisis, covering a range of problems from species' extinctions to climate change, has created a theological and ethical crisis in contemporary Christianity. During the last half-century, ecologically aware theologians and ethicists discovered that the conventional theological and ethical interpretations of the faith often did not fit ecological realities. They found that some traditional interpretations were not only irrelevant but harmful in facing the ecological crisis, even contributing to that crisis. As a consequence, they were pressed by these perceived irreconcilable differences into an ecological reformation of Christian thought and practice – a reformation that has meant re-visioning classical affirmations of faith and trans-valuing inherited values and virtues to cohere with ecological data. The ecological reformation of Christianity – and of other major religions, too – may be one of the most significant, though least noted, religious events of this age.

The ecological reformers, however, are not a majority and their movement is not a dominant one in Christian settings. Today, for the majority of Christians – theologians and ethicists as well as faithful church members – ecological consciousness is weak and most environmental concerns are secondary issues. As has been true historically in Christianity, the dominant strains of thought and practice remain largely anthropocentric and dualistic – focused on human interests and segregating humanity from the rest of nature. Indeed, many theologically and politically conservative Christians view environmental causes as anti-Christian. Nevertheless, the reformers have exercised an influence disproportionate to their numbers. In theology and ethics, they have forced some important debates and have developed some creative alternatives to prevailing paradigms. Christian environmental activists, moreover, have enabled some churches to affirm ecological values as Christian mandates and to support environmental causes.

The ecological reformers do not represent a theological and moral monolith. On the contrary, the diversity in types and thought forms is notable, in everything from methodologies to ecclesiologies. They are Orthodox, Catholic, and Protestant, from various parties in each tradition and from many national and ethnic identities. The movement incorporates practitioners from many disciplines, including liturgy, biology, cosmology, and economics. It includes a variety of causes, such as ecofeminism and animal rights. The reformers represent a broad range of theological perspectives, from evangelicals to post-modernists. Some have proposed so-called “radical” theologies that critics see as the abandonment of basic themes in the tradition. Others have been content with modest revisions and extensions, such as extending the norm of love to include human relationships with otherkind. Some reformers focus on probing scripture and tradition for hidden treasures of ecological wisdom, while others turn to the natural sciences as a prime source for theological and ethical reflection. Disagreements are common. Yet, the reformers are united in sharing a concern for ecological integrity and a commitment to reinterpreting Christian symbols in ways that enhance that integrity.

When many of the ecological reformers first tried to incorporate ecological concerns into their theological and ethical systems, they were looking mainly for an additive – something to supplement, not subvert, established systems. They discovered, however, that an ecological consciousness could not be limited to supplemental effects. It functioned, instead, as a mutational power that internally altered the basic elements in their worldviews. They were encountering what economist Herman Daly and theologian John Cobb called “wild facts” – the ecological dynamics that confounded conventions and seemed to compel re-visions. These mind-altering facts are critical

to understanding much of the ecological reformation in contemporary Christian theology and ethics.

Five fundamental facts about ecological realities have fostered the fundamental features of the Christian ecological reformation. Not all of the ecological reformers have been shaped by all of these five, and some have been shaped by other factors. Yet, these five seem to be the most influential factors in the reformation as a whole. These facts are not rare or obscure; they are rather ordinary and evident features of human interactions with the rest of the biosphere. Contrary to the popular myth about the conflict between religion and science, moreover, the main features of this reformation are rooted substantially in a serious engagement of religion with the sciences, especially the biological and ecological sciences. The influence of the environmental movement as a whole is also evident.

The five fundamental facts and their reformative features outlined here are: evolutionary fecundity, biological kinship, universal relationality, biophysical boundaries, and human dominance.

1) *Evolutionary Fecundity*. Most of the ecological reformers stand in wonder and reverence before the astonishing fecundity on this planet – life in wild profusion, probably tens of millions of species, from algae to elephants, in almost every conceivable habitat or niche from microorganisms in the boiling water of volcanic vents to ice worms in glaciers; species generating an abundant breadth of environmentally adaptive strategies for every bodily function from reproduction to mobility; and new life forms radiating from existing ones in a process of continually creative evolution. For Christian reformers, this fecundity has been revelatory. If, as the British biologist Lord Haldane noted, the abundance of beetle species on the planet suggests that God has “an inordinate fondness for beetles,” then the prolific fruitfulness of the planet suggests also that God has an extraordinary devotion to biodiversity. Furthermore, while humans, as the ethical animal, may be called the *moral* images of God, the whole of nature and all its parts are the *ontological* images of God – incarnations or representations of ultimate power, wisdom, and grandeur.

It is not an exaggeration to say that the ecological reformation of Christianity has been born, nurtured, and empowered in encounters with evolutionary fecundity and other ecological marvels. For most of the reformers, the Earth is a sacramental event, revealing the glory and mediating the grace of God. Much of contemporary Christian ecospirituality, a movement of nature-oriented prayer and worship within the ecological reformation, is rooted in these revelatory experiences and seeks to re-enact them liturgically.

For a wide range of Christian thought, from process theology to evangelical exegesis of scripture, the experience of evolutionary fecundity has also been an encounter with value – intuitions of the intrinsic value of creatures

and intimations of the Creator's valuations. The goodness of creation has been a central affirmation of faith in the ecological reformation (though many Christians reformers add, given the theological problem of natural evil inherent in a predatorial biosphere, that the good creation is being brought to fulfillment by a good God). The Earth was not created solely for humans in this view; it is part of an ongoing process of cosmic and biotic, not merely anthropic, love. It is a habitat to be shared fairly among all creatures. The “world” is not to be despised or abused; it is to be valued in response to the rich and abundant values encountered in diverse life forms, which are also manifestations of divine values. Ethically, from the reformers' perspective, fidelity to God implies loyalty to divine affections for biodiversity. Sin, accordingly, is defined not only socially but also ecologically, covering human moral offenses against the biosphere and all of its inhabitants.

2) *Biological Kinship*. Humans are linked in biological solidarity with all other forms of life through our common beginnings in one or more living cells and through our subsequent adaptive interactions. All life forms have the same genetic structure and significant genetic overlap. These forms even share elements with the stars and every other celestial entity. Consequently, claim the ecological reformers, we can no longer talk about humans *and* nature. Humans are not a biologically segregated species, but rather interrelated parts and products of nature.

The idea of common creaturehood – from one source and a shared substance – is not new in Christian reflection. The ecological reformation, however, has enhanced its ethical implications. The fundamental fact of biological kinship, from the perspective of the reformers, points to a fundamental fault at the roots of the ecological crisis: the failure to respond benevolently and justly to the biological reality that humans are relatives of every life form. Thus, they argue, one of the essential tasks of ecologically reformed Christian ethics is to develop standards of responsible human relationships with otherkind. A key-note of the ecological reformation is the inclusion of otherkind within the network of moral relationships.

Many of the reformers are intent on grounding human responsibilities to otherkind not only in kindness and generosity but also in concepts of distributive justice. Some even have argued for “biotic rights” – the *prima facie* moral claims on humans for the imperative conditions of well-being for other species and their members. These claims demand moral justifications for human harm to otherkind and a limitation of such harm only to the extent that it can be so justified. These rights are rooted not in sentience and similar criteria that apply only to highly evolved animals, but rather in basic biological being, which advocates regard as a minimally sufficient status for moral claims.

But whether or not the language of rights is used, the

concern for justice to otherkind is widespread among ecological reformers. Generally, biotic justice means recognizing that other species, given their intrinsic values, are entitled to “fair shares” of planetary goods, especially healthy habitats for sustaining viable populations until the end of their evolutionary time. Defining “fair shares” is extremely difficult, of course, particularly when humans must destroy other life forms in order to survive and create in a predatorial biosphere. Still, say the reformers, the struggle to define fair shares is an essential moral task to control human imperialism. Most argue also that humans have used far more than any reasonably defined fair share of the world's goods, and should henceforth limit economic production and sexual reproduction to allow much more room for the thriving of wildlife in wildlands, along with the thriving of human communities.

3) *Universal Relationality*. This fundamental fact of social and ecological interdependence is closely linked to biological kinship; it is separable only for analytical purposes. Everything is connected with and has consequences for everything else. Biological existence is coexistence. Being is being in interdependent relationships. This basic reality is deeply imprinted on the ecological reformation.

For the reformers, a consciousness of relationality helps correct another of the fundamental faults at the roots of the ecological crisis: the failure to recognize the intricate and interdependent relationships involving humankind and the rest of the ecosphere – the connections, for example, between the dynamics of the global economy and climate change, or the profligate use of synthetic chemicals and population declines in species. Relationality, the reformers say, undoes the atomistic thinking that has caused countless social and ecological problems.

The influence of relationality is apparent also in a norm that is prominent in the ecological reformation. It is often called “eco-justice,” the integration of social justice and ecological integrity. The two are intimately linked and should be pursued in tandem. Eco-justice is an effort to prevent the compartmentalization of these two primary areas of concern, and to prevent solutions to environmental problems at the expense of social justice, or vice versa. The implicit moral mandate in eco-justice is: Act in ways that solutions to social problems do not cause or aggravate environmental problems, and vice versa – and, indeed, in ways that solutions to one contribute to solutions in the other.

Relationality enables also a broader understanding of humans as social *and* ecological beings – an understanding that is evident in the writings of many of the reformers. Contrary to the exaggerated individualism in some modern cultures, humans are not self-sufficient moral hermits, living as isolationists and entering into minimal contractual alliances for self-protection. Instead, humans are internally relational creatures – dependent from cradle

to grave on the cultural *and* ecological conditions that shape all their perspectives and possibilities. They are parts and products of collectives – not only of family groups and communities but also of ecosystems. Humans are social animals, as mainstream Christian traditions have always understood, but they are also ecological animals, as the traditions rarely noticed. The reformers are intent upon discerning the theological and ethical implications of this insight.

4) *Biophysical Boundaries*. One of the elementary lessons of the natural sciences, including ecology, is that the planet is a finite, essentially self-contained sphere, except for solar energy. There are no infinite bounties, no inexhaustible resources, no limitless systems. Appeals to the lesson of limits are common among ecological reformers. They see it as a corrective response to another of the fundamental faults at the roots of the ecological crisis: the failure to recognize and respect the limiting conditions of life – the carrying, regenerative, and absorptive capacities of the ecosphere.

The prevailing assumption in affluent cultures is that the rest of nature is a warehouse of abundant supplies for human prosperity. Many of the ecological reformers, however, have concentrated on puncturing this illusion of inexhaustibility. Humans face limits everywhere, they insist, from the number of people the planet can support securely to human technological capacities for extending biophysical limits. Everything material can become scarce – if it is not so inherently – by abuse or overuse. Thus, a fundamental “law of nature,” as the reformers often argue, is that humans must stay within the bounds of nature, or face the effects of their folly.

As a means of respecting planetary limits, sustainability is a major norm in the ecological reformation, as it is in the contemporary environmental movement as a whole. Sustainability is living within the bounds of planetary capacities indefinitely, for the sake of future generations. It seeks a just distribution between the present and future.

For an increasing number of Christian ecological and social reformers, moreover, the revival of frugality as morally constrained production and consumption is a necessary condition of sustainability. A major challenge to modern societies is how to produce, and fairly distribute, sufficient goods, services, jobs, capital, pensions, revenues, and other benefits that will enable human communities to flourish, while at the same time ensuring sustainability and ecological integrity. These goals are not achievable, many reformers argue, without frugality as a personal virtue and social standard. Prodigal societies, the reformers claim, need to learn what the world's religious traditions at their best have long understood: the fullness and richness of life will not be found in the abundance and luxuriousness of possessions. Rather, genuine joy is found in justice and generosity to ensure that all – humankind

and otherkind, present and future – have enough to thrive together.

5) *Human Dominance*. A prominent feature of planetary existence is that humans exercise dominion – in the popular sense of a controlling power over the planet's future. Whether in popular or theologically sophisticated senses, however, the concept of dominion recognizes a basic biological fact: humans alone have evolved the necessary rational and moral capacities, and, therefore, the creative and/or destructive powers, to represent divine blessings or demonic curses to the rest of the planet's biota. Humans alone have the talents and the tools to protect or incapacitate the biosphere, even to the point of altering climates and disrupting creative fecundity.

Human dominance – especially in the form of “technocratic dominionism” that exaggerates human technical powers to manage nature and reduces the value of other-kind solely to instruments for human welfare – has been a central nemesis for the Christian ecological reformation. The reformers have encouraged humility as an antidote to arrogance. In their interpretations, humility recognizes human capacities for error and evil. It avoids overconfidence in technical fixes and undervaluations of other species. Humility knows that human societies depend on managerial interventions in the rest of nature, but it denies the aspiration of some to be the Masters of Nature. It stresses instead self-mastery and self-management, keeping ourselves in check for the good of the biosphere.

Not surprisingly, given the role that “dominion” has played in modern Christian history as a rationalization for environmental exploitation, the ecological reformation has given considerable attention to the concept. Some reformers have abandoned the word, but others have reinterpreted it, with support from biblical studies. In these reinterpretations, dominion is not a divine right to plunder with impunity. It is rather a responsibility to represent God's benevolence and justice, to fulfill the human vocation of being the moral image of God. Moreover, when dominion is interpreted in the light of the New Testament understanding of Christ as the perfect image of God, dominion becomes the serving love of Christ. In a great reversal, dominion is now not destroying but rather nurturing nature.

The ecological reformation is firmly established in contemporary Christianity. It has the potential to prosper. Whether it will succeed, however, in actually reforming Christianity to the point that ecological sensitivity will be the dominant paradigm in this faith tradition is unclear. That will depend on a number of factors, including the reformers' capacities to make theologically and ethically compelling cases for their cause, their strategic skills in influencing Christian churches, and their persistence in the hope and affections that first inspired this movement.

Christianity and Animals

The creation story contained in Genesis 1 was pivotal in shaping Christian thought concerning the relationship between humans and animals. The Genesis story made two critical claims: first, that all creation, including animals, is good (Gen. 1:20–25). A second claim concerns the status and role of humans in nature, who were reportedly created in the *imago dei*, or God's image (verse 27), and given power over all the other species:

God blessed them and God said to them, “Be fruitful and multiply, and fill the earth and subdue it, and have dominion over the fish of the sea and over

the birds of the air and over every living thing that moves upon the Earth" (Gen. 1:28, NRSV).

Despite a common foundation in the Genesis creation story, both historical and contemporary Christian thought has contained a diversity of opinions concerning animals. In his historical survey of Christian environmental perspectives, Paul Santmire identified two competing theological motifs that can provide a framework for thinking about Christianity and animals. On the one hand, Santmire found evidence for a spiritual motif that emphasizes spiritual salvation in such a manner that the physical environment and animals become unimportant for the drama of human salvation. On the other hand, Santmire also identified an ecological motif that acknowledges "the human spirit's rootedness in the world of nature" and understands the life of faith as occurring within the context of the whole biophysical order (Santmire 1985: 9). Santmire argued that these two theological metaphors are apparent throughout the history of Christian thought, from the early Church Fathers, to the medieval theologians, through the reformers, and even into contemporary thought. The diversity of Christian perspectives concerning the relationship between humans and animals is well illustrated by two historical thinkers and their understanding of the *imago dei*.

The medieval Catholic theologian Thomas Aquinas exemplified the spiritual motif concerning animals. For Aquinas, the human-animal relationship was part of the Great Chain of Being, a hierarchy of being that included both spiritual and material beings. At the top of this hierarchy were spiritual or immaterial beings, most notably angels. At the mid-point of the hierarchy were humans, who held both spiritual and material properties. At the bottom of the hierarchy were material beings, beginning with animals, followed by plants, and, finally, non-living material.

While they share some material similarities, Aquinas held that the *imago dei* profoundly distinguishes humans from animals. He identified the *imago dei* with human rationality – a characteristic and capacity that humans share with no other animal. For Aquinas, human rationality was teleological in nature. "The end and good of the intellect is truth. Therefore the ultimate end of the whole man and of all his actions and desires is to know the first truth; namely God . . . man's ultimate end is to know God" (Aquinas, *Summa Contra Gentiles* III: 25). Humans were incapable of knowing God during their earthly life, but Aquinas held that this *telos* could be achieved at the eschaton, or end-time: "Final perfect happiness can only come from the vision of the divine essence" (Aquinas, *Summa Theologiae* I-II: 3, 8). This vision of the divine essence represents a return to God by humans, who are now understood to be purely spiritual creatures. As Aquinas summarized his own position,

Man's ultimate happiness consists in the contemplation of truth for this operation is specific to man and is shared with no other animals . . . In this operation man is united to higher beings [substances] since this is the only human operation that is carried out both by God and by the separate substances [angels]. Through this operation too man is united with those higher beings by knowing them in a certain way (Aquinas, *Summa Contra Gentiles* III: 37).

Santmire concluded that Aquinas offered "... a theology that both affirms nature and denies nature..." (Santmire 1985: 94). Thomas affirmed the goodness of all creation, as claimed in the Genesis 1 creation story. However, his understanding of the *imago dei* created a profound gulf between humans and animals. Whereas the *telos* of humans is spiritual union with God, the rest of creation, including the animals, will cease to be at the end-time.

John Wesley, who was the English founder of the Wesleyan movement that led to the creation of several Protestant denominations including the Methodist and Nazarene Churches, exemplifies Santmire's ecological motif. For Wesley, the *imago dei* was best understood as a special relationship between God and all created beings. Non-human animals could also have a special relationship with God, albeit to a lesser degree than the relationship shared by humans with God. For Wesley, these differences in relationships turned primarily on the greater capacity humans have to enter into relationship with God. In his sermon, "The General Deliverance," Wesley said: "We have no ground to believe that they [animals] are in any degree capable of knowing, loving, or obeying God. This is the specific difference between man and brute – the great gulf which they cannot pass over" (Sermon 60 in *The Works of John Wesley*).

Like Aquinas, Wesley also perceived a hierarchy in which humans were above animals. To appreciate Wesley's understanding of this hierarchy, however, one must apprehend his understanding of the Creation-Fall-Reconciliation motif in Christianity. At the time of creation, Wesley believed that humans and animals lived together in perfect harmony in a pain-free paradise. In this state, animals lived in loving obedience to humans and "... all the blessings of God in paradise flowed through man to the inferior creatures." However, with the temptation and fall of Adam and Eve, the relationship between humans and animals changed: the flow of blessings through humans to animals was interrupted and animals now lived in fear of humans. Through sin and the Fall, humans have fractured relationships, not only with God and other humans, but with animals as well. Wesley believed that these relationships would be reconciled and healed through the new creation in Christ at the end-time. In his sermon, "The General Deliverance," Wesley

concluded by speculating that – at the end-time of reconciliation – God may choose to increase animals' ability to be in relationship so that they may experience God more fully than before the Fall.

In response to the emergence of serious ecological crises, such as the rapid loss of animal biodiversity, several late twentieth-century Christian thinkers worked from the ecological motif to reexamine the relationship between humans and animals. James Nash, for example, proposed “loving nature” as a controlling metaphor for thinking about the relationship between humans and animals. He wrote, “. . . love is the integrating center of the whole of Christian faith . . . [Thus] a Christian ecological ethic is seriously deficient – if even conceivable – unless it is grounded in Christian love.” Out of his understanding of Christian love, Nash proposed eight biotic rights owed to animals:

1. The right to participate in the natural competition for existence.
2. The right to satisfaction of their basic needs and the opportunity to perform their individual and/or ecosystemic functions.
3. The right to healthy and whole habitats.
4. The right to reproduce their own kind.
5. The right to fulfill their evolutionary potential with freedom from human-induced extinctions.
6. The right to freedom from human cruelty, flagrant abuse, or frivolous use.
7. The right to redress through human interventions, to restore a semblance of the natural conditions disrupted by human actions.
8. The right to a fair share of the goods necessary for the sustainability of one's species (Nash 1991: 186–9).

Sallie McFague also used “loving nature” as the controlling metaphor for Christian thinking about animals. Writing from an ecofeminist theological perspective, McFague replaced the traditional subject–object dualism with a “Subject–subjects model,” in which “everyone and everything is somewhere on the subject continuum.” For example, humans would “. . . recognize that the wood tick is not merely an object in *our* world . . . but a *subject in its own world*.” Viewed from this perspective, Christians should love animals – as well as other humans and God – as subjects (McFague 1997: 97, 109).

Andrew Linzey would agree with the emphasis that Nash and McFague put on “loving animals.” However, he pushed beyond love to say that Christians are also called to be the servants of animals: “According to the theological doctrine of animal rights, then, humans are to be the servant species – the species given power, opportunity, and privilege to give themselves, nay sacrifice themselves, for the weaker, suffering creatures” (Linzey 1998: 39).

In conclusion, special note should be made of the historical figure Saint Francis of Assisi, who referred to animals as brothers and sisters. For many twenty-first-century Christian thinkers working from Santmire's spiritual motif, Saint Francis provided the ideal paradigm for understanding Christianity and animals.

SP Christianity and Nature Symbolism

In the main, Christianity understands the divine reality as a Sky God. In nursery rhymes, sermons, hymnody, iconography, and theological teachings, God is pictured as a bodiless, immaterial being who inhabits an invisible, heavenly realm far beyond the vicissitudes of life on Earth. Of course, in the person of Jesus Christ, God did become an enfleshed life form in ancient history. But the Incarnation of God in Christ is generally understood to be a long-ago, punctiliar event limited to a particular human being. The incarnation does not carry the promise that God, in any palpable sense, is continually enfleshed within the natural world as we know it. Rather, for the better part of church history, the divine life and the natural world have been viewed as two separate and distinct orders of being. Whatever else God is, God is not a nature deity captive to the limitations and vagaries of mortal life forms. God is not bound to the impermanent flux of an ever-changing Earth. It is for these reasons, according to majority opinion, that biblical religion forbids the fashioning of graven images as representations of the divine life: God is

not a bull or a snake or a lion. On the contrary, so the majority argument goes, God abides in an eternally unchanging heavenly realm where bodily suffering and death are no more and every tear is wiped dry for the privileged believer who dwells there.

The counterpoint to the mainstream opinion is the historic biblical and theological depictions of *God as Earth Spirit*, the benevolent, all-encompassing divine force within the biosphere who inhabits Earth community and continually works to maintain the integrity of all forms of life. In this formulation, God is the Earth God who indwells the land and invigorates and flows with natural processes – not the invisible Sky God who exists in a heavenly realm far removed from earthly concerns. God as Spirit is the enfleshment of God within everything that burrows, creeps, runs, swims, and flies across the Earth. Here, God is *carnal*: through the Spirit, God *incarnates* Godself within the natural order in order to nurture and bring to fruition every form of life. The Nicene Creed in 381 named the Spirit as “the Lord, the Giver of Life.” To make sense of this ancient appellation by re-envisioning the Holy Spirit as God’s invigorating corporal presence within the society of all living beings is the burden of this article.

Granted, the terms “Holy Spirit” or “Holy Ghost” (a mis-translation of the term “Spirit” in Old English versions of the Bible) does conjure the image of a disembodied, shadowy non-entity in both the popular and high thinking of the Christian West. But many Christian theological and biblical texts stand as a counter-testimony to the conventional mindset. The Bible, for example, is awash with rich imagery of the Spirit borrowed directly from the natural world. The four traditional elements of natural, embodied life – *Earth, air, water, and fire* – are constitutive of the Spirit’s biblical reality as an enfleshed being who ministers to the whole creation God has made for the refreshment and joy of all beings.

Numerous biblical passages attest to the foundational role of the four cardinal elements regarding the biocentric identity of the Spirit:

(1) As *Earth*, the Spirit is both the divine dove, with an olive branch in its mouth, that brings peace and renewal to a broken and divided world (Gen. 8:11; Matt. 3:16, John 1:32), and a fruit bearer, such as a tree or vine, that yields the virtues of love, joy, and peace in the life of the disciple (Gal. 5:15–26). Far from being the “immaterial substance” defined by the standard theological lexicon, the Spirit is imagined in the Bible as a material, earthen life form – a bird on the wing or a flowering tree – who mediates God’s power to other Earth creatures through its physical presence.

(2) As *air*, the Spirit is both the vivifying breath that animates all living things (Gen. 1:2; Ps. 104:29–30) and the prophetic wind that brings salvation and new life to those it indwells (Judg. 6:34; John 3:6–8; Acts 2:1–4). The nouns for Spirit in the biblical texts – *rûach* in Hebrew

and *pneuma* in Greek – mean “breath” or “air” or “wind.” Literally, the Spirit is pneumatic, a powerful air-driven instrument analogous to a pneumatic drill or pump. The Spirit is God’s all-encompassing, aerial presence in the atmosphere that envelopes the whole Earth; as such, the Spirit escapes the horizon of human activity and cannot be contained by human constraints. The Spirit is divine wind – the breath of God – that blows where it wills (John 3:8) – driven by its own elemental power and independent from human attempts to control it – refreshing and renewing all broken members of the created order.

(3) As *water*, the Spirit is the living water that quickens and refreshes all who drink from its eternal springs (John 3:1–15; 4:14; 7:37–38). As physical and spiritual sustenance, the Spirit is the liquid God who imbues all life-sustaining bodily fluids – blood, mucus, milk, sweat, urine – with flowing divine presence and power. As well, the water God flows and circulates within the soaking rains, dewy mists, thermal springs, seeping mudholes, ancient headwaters, swampy wetlands, and teeming oceans that constitute the hydrospheric Earth all life inhabits. The Spirit as water makes possible the wonderful juiciness and succulence of life as we experience life on a liquid planet sustained by complicated and necessary flow patterns.

(4) Finally, as *fire*, the Spirit is the purgative fire that alternately judges evildoers and ignites the prophetic mission of the early church (Matt. 3:11–12; Acts 2:1–4). Fire is an expression of God’s austere power; it is viewed biblically as the element God uses to castigate human error. But it is also the symbol of God’s unifying presence in the fledgling Christian community where the divine *pneuma* – the rushing, whooshing wind of God – is said to have filled the early church as its members became filled with the Spirit, symbolized by “tongues of fire [that were] distributed and resting above the heads of each” of the early church members (Acts 2:3). Aberrant, subversive, and creatively destructive, God as fire scorches and roasts who and what it chooses apart from human intervention and design – like the divine wind that blows where it wills.

But fire can and should be pressed into the service of maintaining healthy Earth relations. Fire is necessary for the maintenance of planetary life: as furnace heat, fire makes possible machine economies and food preparation; as controlled wildfires, fire revivifies long dormant seed cultures necessary for biodiverse ecosystems; and when harnessed in the form of solar power, fire from the sun makes possible safe energy production not dependent on fossil fuel sources. The burning God is the God who has the power to incinerate and make alive the elements of the life-web essential for the sustenance of our gifted ecosystem.

God as Spirit is biblically defined according to the tropes of Earth, wind, fire, and water. In these scriptural texts, the Spirit is figured as a potency in nature who engenders life and healing throughout the biotic order.

The Earth's bodies of water, communities of plants and animals, and eruptions of fire and wind are not only symbols of the Spirit – as important as this nature symbolism is – but share in the Spirit's very nature as the Spirit is continually enfolded and embodied through natural landscapes and biological populations. Neither ghostly nor bodiless, the Spirit reveals itself in the biblical literatures as an earthen life form who labors to create and sustain humankind and otherkind in solidarity with one another. Living in the ground, swimming through the oceans, circulating in the atmosphere, God, as Earth Spirit, is always afoot and underfoot – the quickening life-force who seeks to bring all denizens of our sacred Earth into fruition and well-being.

Christianity and Sustainable Communities

Christianity's concern for sustainable community and sustainable development has historical roots in what numerous observers refer to as "the social question" or "the modern social problem." The reference is to the final third of the nineteenth century, when progressive social theorists in Europe and North America joined popular movements of reform, especially workers' movements, to protest the exploitative character of rapidly developing industrial society. In giving voice to brutalizing social conditions, reform-minded clergy and laity of the Social Gospel movement, labor leaders and workers, and academic students of society developed an extensive critique of the capitalist industrial order and of political and economic efforts to govern it. In varying ways and degrees, they pointed to class suffering (especially poverty and dangerous working conditions, inequality and unemployment) as these were compounded by race, gender, ethnic, and

cultural discrimination. And they undertook organized responses to "the modern social problem" (various protest movements with political economic platforms, including both religious and secular socialism). Present Christian concern for sustainable development and community draws on the fact that the social question persists as these have, in many ways, gone global.

In the final third of the twentieth century, the social question was joined by "the ecological question." The language of "sustainability" itself arose here, with some of its first uses in the ecumenical movement. ("Sustainable" as applied to society, and not simply the yield of forests or fisheries, was a mark of the 1975 World Council of Churches program "Toward a Just, Participatory and Sustainable Society.") While the causes are many, the ecological question, too, chiefly arises from the destructive downside of the organization and habits of modern industrialized society, whether in the form of corporate capitalism, state socialism, or the competition of these two over decades around the modernization and alignment of non-industrialized or "developing" nations.

In a word, what has given rise to concern for sustainable development and sustainable community on the part of Christianity is the unending transformation of nature knit integrally to the unending transformation of society as these together have degraded land, sea, air, and human communities in the very process of yielding the benefits of modernity. Few seriously propose a return to pre-modern worlds. Yet the present course is itself considered unjust and unsustainable.

Two broad streams of response have followed. One is the search to understand the roles Christianity has played in the travail of society and nature together in the modern period. Sometimes attention is given to roughly the last five centuries, beginning with the onset of colonization, conquest, and conversion on the part of Christian Europe, while other times the attention is on the last two centuries especially – the industrial era. The other search is for concrete, constructive Christian responses to the "eco-crisis" as that has been given voice from the 1970s onward. Christian-identified groups have often joined other "NGOs" in this (non-governmental organizations).

The internal critique has been extensive. Most of it turns on the complicity of dominant streams of Western Christianity in the making of the modern world. Religiously sanctioned racial, cultural, and gender stratification and oppression are pointed to, together with callousness about the fate of the land and neglect of the requirements of Earth itself for its own flourishing. Christian habits that combine anthropocentricity with assumptions of the superiority and forms of Western Christian civilization are the subject of detailed analysis. In this worldview, God has been separated from nature and the purposes of divine action (salvation, redemption) have been relocated in human history. Humanity itself has been

separated from the rest of nature as a unique creation and set in history as a specifically divine/human domain. And throughout, pervasive dualisms of nature and society have been reinforced by church teaching and practice (men are set over women, the rights of humans over the rest of nature, and the dominance of Western technologies and cultures over subjugated peoples, their religions, cultures and lands).

The response to self-examination on the part of Christianity is ongoing. The last decades of the twentieth century have seen the rise of numerous "eco-theologies"; the broadening and deepening of multiple analyses of Christianity's place in the making of the modern world that go beyond analyses of dominant mainstream Western Christianity to emphasize the resistance to it in the Christianity of indigenous and other subjugated peoples and perspectives; and the explosion of Christian participation in both faith-based and NGO efforts to address socio-environmental maladies around the world.

This last-mentioned item – constructive, on-the-ground organized Christian efforts – achieved a certain focus with the United Nations Conference on Environment and Development in Rio de Janeiro in 1992. That conference, the largest gathering of heads of state to that date, with parallel participation by the largest gathering of NGOs, gave rise to the specific language of "sustainable development" – the capacity to meet the needs of present generations without jeopardizing the capacity of future generations to meet theirs. "Sustainable development" has since become common discourse amid the international efforts to address the social and ecological questions together.

Yet sustainable development as a shared agenda has encountered dissent from the outset, some of it from Christian communities and some of it already in view at the Earth Summit. Many active participants among environmental NGOs regard sustainable development as yielding too much to economic globalization's efforts to integrate local, regional, and national economies into a single global economy as led by corporate capitalism. For these dissenting groups – prominent at international meetings of the World Trade Organization, World Economic Forum, and the "G7" (advanced industrial) nations from Seattle to Davos to Genoa to New York in the 1990s and the first decade of the twenty-first century – greening global capitalism so as to render both the environment and the economy "sustainable" does not truly address social inequities or root causes of environmental degradation. The dissenters' point of departure asks instead what it is that makes for healthy community. They then seek to wrap both economy and environment around that, on successive levels (local, regional, transnational), all the time being aware that Earth's requirements are fundamental. The human economy is a subset of the economy of Earth. "Sustainable community," as distinct from

"sustainable development," thus tries to preserve or create some mix of the following: greater economic self-sufficiency locally and regionally, with a view to the bioregions themselves as basic to human organization; agriculture appropriate to regions and in the hands of local owners and workers using local knowledge and crop varieties, with ability to save their own seeds and treat their own plants and soils with their own products; the preservation of local and regional traditions, language, and cultures and a resistance to global homogenization of culture and values; a revival of religious life and a sense of the sacred, vis-à-vis a present way of life that, because it reduces life to the utilitarian, has little sense of mystery and the sacred; the repair of the moral fiber of society on some terms other than material consumption; resistance to the commodification of all things, including knowledge; the internalization of costs to local, regional, and global environments in the price of goods and services themselves; and the protection of ecosystems and cultivation of Earth as a "commons." All this is viewed, in the eyes of its advocates, as global democratic community rather than nativist localism. It is global by virtue of its planetary consciousness and the impressive networking of citizens around the world made possible by electronic globalization. Yet its orientation is first of all local in that the key question for sustainable community advocates is how cultural wealth and biological wealth, together with economic well-being, are sustained in the places people live, together with the rest of the community of life.

Christian groups have been active participants in the quest for sustainable community and in the debates about sustainable development. They have joined the search for ways of living that meet the norms of genuine sustainability, norms such as participation as the optimal inclusion of all involved stakeholders in socio-ecological decisions; sufficiency as the commitment to meet the basic material needs of all life possible; equity as basic fairness across generations and across the Community of Life; accountability as the structuring of responsibility in ways that prize "transparency" (decision-making structures and processes that are clear and public); material simplicity and spiritual richness as markers of a quality of life that includes bread for all but is more than bread alone; responsibility on a scale that people can handle (i.e., commensurate with workable community); and subsidiarity – resolving problems at the closest level at which decisions can be taken and implemented effectively, beginning with local resources and talents.

In addition to joining the quest for sustainable practices, Christian groups have also responded to the critique of their own past by undertaking the retrieval and transformation of Christian faith traditions and practices that are explicitly Earth-honoring. They have sought to uncover or to create Earth-positive traditions and practices that address socio-ecological questions in ways

resonating with faith as it has been expressed over millennia. Varieties of ascetic, mystical, sacramental and prophetic-liberative practices are all involved.

Christianity in Europe

Christians understand "nature" as "creation," the world and life that in its origin and development as well as in its transience exists due to its relation to God. God is regarded as the creator of everything between heaven and Earth, and classical theology has interpreted God's work as a making, preserving and fulfilling of nature. The doctrine of creation offers the horizon for the whole understanding of Christian faith, even if it historically has often been opposed to the doctrine of salvation. A general challenge for Christian theology therefore is to relate God's creation and God's salvation to each other. Are human beings as "images of God" placed above or among creatures? Are nature and man/woman in need of liberation?

The view of nature and the use of it have undergone several changes in the history of Western civilization. In ancient and medieval times, the notions of "physis" and "natura" signified everything that existed, and the so-called "natural theology" (e.g., of Thomas Aquinas), shaped the path for modern science by investigating God's being through studying nature and by explaining the world from the image of God. The view of nature changed markedly in the nineteenth century. Humans and nature were distanced radically from each other and the human identity was no longer understood as divided between divine-spiritual and natural-bodily spheres of reality.

The "roots of our ecological crisis" cannot be identified in one single historical period in the history of Judaism and Christianity. Instead one needs to understand a complex historical process of almost 2000 years where the present problems were developed and accumulated in

different "waves" and regions. The anthropocentrism of Western European Christian theology in its mainstream formulations has contributed to this process, legitimating a sense of superiority over nature and a consumerist life-style, even if undercurrents such as mysticism tried to resist the historical reductionism of creation spirituality.

In time, with the progress of secularization and modernization, the change of life-systems, for example in climate, revealed with increasing clarity a human regime over nature through reason and technology. Human codes of knowing about, and acting in, nature are out of balance with the codes of nature. Older natural theology no longer addresses this situation, and late modern theology is challenged to reconstruct the traditions of creation theology and to interpret in a new key the God who acts in, with and for a world threatened by human beings who God once created in his/her own image.

Since the 1970s, churches and theologians in Europe have addressed the ecological challenge in three ways. First, the environmental crisis has been regarded simply as a reason to reformulate conventional doctrines of faith. Second, elements from ecological science have eclectically mixed with selected elements from Christian tradition. A third way has sought for critical-constructive mediations of ecological insights and interpretations of God. In the latter, theology works as a part of a larger ecological discourse and asks for specific Christian reconstructions and represents the mainstream of creation theology in Europe in the second part of the twentieth century. The understanding of God itself is challenged by the suffering of nature caused by men and women who are supposed to be images of God the Creator. Methodologically, one can discern two modes of doing theology: one dogmatic in a direction from faith to environment (ecological doctrine of creation) and another contextual, departing from the state of nature and moving toward the reflection on God (theological ecology).

While process philosophy offered an important background for eco-theology in the United States, European theologians have met this with a far more skeptical attitude. German biologist and theologian Günter Altner (from 1974) was the first to interpret environmental degradation in the light of a Christian theology of the cross, in which nature revealed a civilization in crisis. Altner proposed a dialogue with environmental science and worked out an influential ethics of dignity in widening Albert Schweitzer's approach.

Another among the pioneers of eco-theology, German physician and theologian Gerhard Liedke (1979) profiled the clear challenge to the churches and theology. He focused on the conflict between humans and nature in creation, using the Norwegian peace researcher Johan Galtung's theory. Liedke argued for minimizing the violence constituted by an asymmetry in the relation of humanity and nature. This claim was made into an

obligation for the ecumenical movement and its church bodies (the international, interdenominational church movement founded in 1925 to promote reconciliation and cooperation, and represented most prominently by the World Council of Churches). Several theologians related the conflict between humans and nature to the conflicts between different classes, regions and people, and also to the conflict between the sexes, and a wide-open perspective of liberation and reconciliation was brought into the heart of ecumenical social ethics after 1970.

One of the first extensive and influential re-interpretations of Christianity was offered in 1985 by Jürgen Moltmann in his “ecological doctrine of the creation.” Different themes from Christian tradition were loosely linked to new insights in ecological science and green social movements in order to work out the relevance of Christian faith for finding ways out of the contemporary crisis of society and nature. Disciples from different confessional traditions tried to respond to the ecological challenge, even if they did not always succeed in finding synthetic correlations with the fathers of their traditions and the challenges of the new situation. The question, for example, of whether Karl Barth’s neo-orthodox theology of God’s revelation can contribute to a positive understanding of the creation and its spirituality is highly controversial because of Barth’s dependence on the dualistic thinking of his times and his tendency to develop theology as a preaching monologue.

After the widening of the academic eco-theological discourse from the first to the third and fourth world in the 1990s, the vision of an ecological theology of liberation emerged. German-Swedish theologian Sigurd Bergmann developed such a normative approach, one in which soteriology and ontology are interpreted in the notion of “God’s liberating movement in creation.” This approach was developed in a constructive correlation with early church theology, especially the Greek Orthodox traditions on the Trinity and the Holy Spirit. The four issues of sociality, motion, suffering and the life-giving Spirit occur as main problems in late antiquity theology as well as in the ecological discourse and in late modern eco-theologies. By an ecological widening of the criteria of contextual and liberation theology, this approach develops an eco-theology of liberation that focuses on the trinitarian view of God, a new theological thought of motion, the theology of the cross of nature and humankind, and a topologically shaped spirituality. The theme of the whole “Creation set free” is contained in this approach, at the center of which is God’s acts and Christian theology reflecting upon those acts.

The ecological challenge was taken up by theologians from all confessions. From the beginning, eco-theology was an ecumenical affair in Europe. The Eastern Orthodox contributions to the new discourse on nature were developed in the institutions and in the conferences of the

ecumenical movement, especially in the World Council of Churches (WCC) and the Conference of European Churches (CEC). It was due to the Orthodox representatives at the WCC assembly in 1983 and especially to the Syrian Orthodox theologian and church leader Paulos Mar Gregorios that the WCC “Programme on Justice, Peace and the Integrity of Creation” (JPIC) was enriched with the environmental issue so that the main agenda for ecumenical social ethics since that time has been focused on peace, justice and ecological problems as the most highly prioritized challenges for Christians. Orthodox theologians enriched the sometimes limited perspectives of Protestant and Catholic thinkers with themes like sacraments, liturgy, Trinity and beauty. A breakthrough for ecumenical eco-theology in Europe adopted by the churches took place at the Concilium in Basel in 1989. For the first time after the schism between Eastern and Western Europe, all churches met in one common conference, and they were even able to come to a strong consensus on the need for a more just and ecological order of world economics. The heritage of this strong ecological commitment in the European churches is developed in the “European Christian Environmental Network” (ECEN). The European Ecumenical Forum of Christian Women has a sub-group on Ecofeminism and Ecology.

While ecofeminism has made significant inroads in the United States, it is only slowly being addressed in Europe. Catharina Halkes, Dorothee Sölle, Anne Primavesi and Mary Grey have from different feminist angles produced alternative visions of humanity’s encounter with nature. Ecofeminism highlights the link between women and nature, for example, in the model of analogy, where the idealization of the feminine and nature on the one hand is related to the suffering of both on the other hand.

With academic vitality and multifaceted reflection, the best of this discourse was found in the British journal *Ecotheology*. The ecumenical movement in Europe, consisting of both many independent Christian groups and networks and of institutionalized church bodies, constitutes a strong and sustainable basis for the further development of ecologically constructive and critical theology and praxis. This development is not only about ideological reconstruction, but also about the reacting and renewal of Christian community-life and mission. Alternative church banking, forests and land owned and used ecologically by churches, green parish economy, and Christian church aid for women preserving nature are just a few of many examples where eco-theology and eco-praxis are in mutual exchange. The dignity of the question where and how God acts in the ecological destruction and reconstruction of nature is increasing in accordance with the increasing environmental problems.

Chuang-tzu – See Zhuangzi

Church of All Worlds

The Church of All Worlds (CAW) officially incorporated in 1968 in Missouri and has since claimed the mantle of the oldest federally recognized Pagan Church in the United States. Its origins, however, go back earlier to a friendship formed in the early 1960s between Westminster College students Lance Christie and Tim Zell (later Otter, then Oberon Zell). Christie and Zell, both deeply taken with Robert Heinlein's science fiction novel *Stranger in a Strange Land*, founded a community, which they called Atl, based on spiritual and social ideas from that novel. Atl split in the summer of 1967, with Zell leading what became CAW. CAW began publishing its journal, *Green Egg*, in 1968 and through it made contact with the emerging American Pagan community. CAW grew in membership during the 1970s and on Labor Day of 1970, Tim Zell had a "cosmic acid vision of the Goddess," which

he articulated in the pages of *Green Egg* over following years. This vision was of the Earth as a conscious entity, and following the publication of James Lovelock's Gaia hypothesis, the Church began to identify this goddess with the name "Gaea" (later changed to Lovelock's more popular spelling, "Gaia").

With his marriage to Morning Glory, Tim Zell moved to California in 1975. With the move, CAW became centered in northern California where Morning Glory and Tim Zell lived as caretakers for a parcel of land north of Ukiah, California. Through the late 1970s and early 1980s, CAW developed primarily in northern California. Publication of *Green Egg* ceased in 1976. While many important developments occurred for CAW during this time, including acquisition of its sacred land, Annwn, by the late 1970s it was no longer the primary entity in the national Pagan scene that it had been during the early publication of *Green Egg*. Minutes from a Board of Directors meeting of CAW in June of 1986 show a call for revitalization. In the following years, CAW reemerged as a national entity and began publication of *Green Egg* once more in 1988.

The idea of the Earth as a living, potentially conscious organism that was first articulated by Zell in the early 1970s remains the dominant motif in CAW's spiritual narrative. The stated mission of the Church is "to evolve a network of information, mythology and experience to awaken the divine within and to provide a context and stimulus for reawakening Gaea and reuniting Her children through tribal community dedicated to responsible stewardship and the evolution of consciousness." CAW members have frequently participated in activist environmental movements, like Earth First!; and as a whole CAW has positioned itself strongly in alliance with environmental movements, most specifically with Deep Ecology. CAW's vision of Gaia has always included an evolutionary principle of progressive development. As a result, members of CAW have sometimes clashed with other environmentalists because of CAW's positive view of technology and science and its validation of human potential.

The second idea emphasized in the mission statement, the divinity of individual humans, shows the continued importance of Heinlein's *Stranger in a Strange Land* on the spiritual imagination of CAW. In addition to its articulation of a concept of immanent divinity, Heinlein's book inspired for the Church the basic structure of local bodies (nests), the central ritual of water-sharing, and the idea of polyamory. CAW is comprised primarily of locally defined "nests," which range from extended group families to bodies defined in a more traditional congregational structure. Water-sharing, a simple ritual in which human bonds are affirmed through a formal sharing of water, provides the basic context for the Church's continued emphasis on human relationships as the basis of the spiritual

community. CAW has also participated in redefining sexual and love relationships through articulating a relationship philosophy termed “polyamory,” which advocates multiple adult, committed love relationships. This exploration of human relationships has been extended by many CAW members to active participation in cooperative living movements.

Although membership in CAW has remained relatively small, with its continued publication of *Green Egg* until 2000, its presence at major Pagan gatherings throughout the country, and its network of nests (local bodies), CAW continues to be a major contingent of the contemporary Pagan community. Additionally, because of its wider participation within “Gaian spirituality,” CAW has reached beyond the immediate Pagan community to work within larger environmental and spiritual communities. *Green Egg* has featured a number of interfaith issues emphasizing building common bonds between Christians, Buddhists, Jews, Hindus, and Pagans. The culture of CAW emphasizes immediate experiential religion and visionary and imaginative ideas of divinity – an approach which has undoubtedly contributed to the radical transformations it has undergone during its short history.

Church of Euthanasia

The Church of Euthanasia (CoE) proclaims itself “the world’s first anti-human religion.” This radical religious group believes humanity has fallen irredeemably “out of balance” with the larger biosphere. Using shock tactics

(called “Dada Actions”), their publications, website and public protests are directed at awakening a guilty populous to the “Ecocide” which is annihilating species, ecosystems, and everything else that does not serve human progress.

CoE emerged in the summer of 1992 when Chris Korda, who goes by the title “Reverend Korda,” had a “vision/dream” of being “visited by an alien consciousness.” This alien consciousness, referred to as “The Being,” warned Korda that the planet is in peril. “Save the Planet, Kill Yourself” was the most direct message that Korda received and has become the guiding slogan for CoE.

Korda also recognizes a non-historic time called the “Age of Magic.” Remnants of this age are found in traditionally oral and “magic-based cultures.” While certain people have remained in contact with this “timeless realm of mystical experience,” the eclipse of the Age of Magic and alienation from its vitality is due to the onset of the “Industrial Age.” To participate in the Magical Age requires “sensitivity and ‘oneness,’” attributes that Industrial Society “must ruthlessly seek out and destroy, in its effort to create passivity and ‘sameness.’”

As a “visionary,” Korda remains in contact with this realm. Living in the Industrial Age, however, she is forced to adapt these visions into the “laws of mass communication.” The tension that Korda struggles with exists between communicating her “irrational vision of Absolute Truth” within a world that is overly rational and lacking spirit “not only in the people, but in the language itself.”

Ideologically, CoE has one main commandment, “Thou Shalt Not Procreate.” Along with this vow there are an additional four “pillars”; Suicide, Abortion, Cannibalism and Sodomy. The commandment and pillars are both prescriptive and symbolically descriptive of the fundamental problem of human overpopulation that is taxing the Earth.

Death, suicide, phalluses, cannibalism, and hatred of babies are prominent themes at protests and on their web site. These themes combined with terminology such as “Church,” “Reverend,” “commandments,” and Korda’s own ambiguous gender are tactics designed to disorient and confront people with rejected elements of a dominant culture steeped in anthropocentrism and biblical monotheism. Through public display of disturbing images, banners and artwork, CoE’s mission is to penetrate everyday assumptions and allow unpleasant “truths” about the ugliness of humanity to enter consciousness.

Undergirding their transgressive identity, paradoxical message, shocking tactics, nihilistic beliefs about human nature and their anti-human stance, lie ethical and religious beliefs that life has a purpose: for life itself to flourish. For CoE, as long as humans destroy the opportunity for this diversity of life to continue, then humanity is “anti-life.” “So its kind of a humorous thing” states Korda, “but I often say that the Church of Euthanasia is a true pro-life religion.”

Two sister organizations, the Gaia Liberation Front (GLF) and the Voluntary Human Extinction Movement (VHEMT), each believe that the death of humans is the only feasible option to restore balance. Proclaiming in their central slogan, “Live Long and Die Out!” VHEMT remains dedicated to “voluntary extinction” by refusing to procreate, while GLF supports “involuntary” acts of extinction. According to GLF humans are “genetically programmed” to destroy the Earth, thus only through the complete eradication of the human species will the Earth be able to heal.

CoE claims 300 members in large cities within the United States and smaller numbers in Europe and South America. The majority of CoE members are young and male. Although they call themselves a church (with tax-exempt status as an educational foundation) they do not own buildings nor engage in activities commonly associated with churches. Rather, most of their protests, selling of merchandise, and newsletters are organized via the internet.

Dedicated to their mission, CoE has received national and international attention. They have appeared on the Jerry Springer Show and performed and protested in the United States, Germany, Spain, Bosnia and South America. They have established a website, an e-magazine, a merchandise catalogue, and distributed fifty thousand “Save the Planet – Kill Yourself” bumper stickers.

Church of Jesus Christ of Latter-day Saints

Joseph Smith, the founding prophet and president of the Church of Jesus Christ of Latter-day Saints (the Mormons) taught that all of God’s creations, humans, animals, plants, and the Earth have eternal spirits. Rejecting the doctrine of *ex nihilo* creation, Smith taught that God took these eternal spirits, combined them with indestructible matter, and organized them into living beings.

We do not know how God created each, except that he used the power of the priesthood. In the cases of human beings, however, a revelation to Joseph Smith said that our Father in heaven is a being with a body and a spirit. A statement of the Church’s First Presidency in 1909 said that humans have “heavenly parents,” and Mormon tradition calls one of them our Mother in heaven. The difference between humans and other creations is that human spirits are the literal children of God, the Father, and our Mother in heaven. We are created in his image.

The relationship of these creations to the Creator has implications for their treatment by human beings. Since

the essence of the Earth, animals, and plants has existed eternally and independent of God, he could not in justice grant humans permission to abuse any of them. Nevertheless, since he organized each of them, he gave humans, the only entities created in his image, the responsibility of caring for his creations.

Revelations to Joseph Smith and commentary by Mormon theologians clarify the biblical account in Genesis. Instead of “subdue” these revelations use the word “till” to refer to treatment of the Earth. Mormon theologian Hugh W. Nibley has written that the word “dominion” means that humans have the responsibility of caring for God’s animal creations for him. Abuse of the Earth, Nibley says, is part of Satan’s effort to thwart God’s plan for salvation by drawing men and women away from God and making nature their enemy.

Moreover, revelations received by Joseph Smith in 1832 and clarified by Brigham Young in 1862 clarify that Christ’s atonement, the resurrection, and salvation reach all of God’s creations, human, animal, vegetable, and mineral. In contrast with humans who sin regularly, however, nonhuman creations obey God’s commandments. A revelation that Joseph Smith received in November and December 1830 linked moral and environmental pollution. The revelation says that the Earth “the mother of men” is “pained” and “weary because of the wickedness of my children. When shall I rest, and be cleansed from the filthiness which is gone forth out of me? When will my Creator sanctify me, that I may rest, and righteousness for a season abide upon my face.”

Smith’s successor, Brigham Young, elaborated on the teaching.

The soil, the air, the water are all pure and healthy. Do not suffer them to become polluted with wickedness. Strive to preserve the elements from being contaminated by the filthy, wicked conduct and sayings of those who pervert the intelligence God has bestowed upon the human family (Young 1861: 79).

Although the teachings of prophets like Smith and Young admonish the Mormons to care for God’s creations as they would for their own morals, like most people they have not always done so. In 1834 while Joseph Smith led a volunteer militia group from Kirtland, Ohio to Independence, Missouri members of the party found three prairie rattlesnakes. They intended to kill the snakes, but Joseph urged them to leave them alone. “Men must,” he said, “become harmless, before brute creation; and when men lose their vicious dispositions and cease to destroy the animal race, the lion and the lamb can dwell together,” and in an allusion to Isaiah 11:6–8, he said “the sucking child can play with the serpent in safety” (Smith 1948: 71).

Clearly, however, these leaders did not oppose killing animals or plants for sustenance. They did, however,

counsel as Young put it that Mormons should not take “any more” than needed for subsistence. Nevertheless, in some cases, Young, himself, and others in the pioneer companies that came to Utah beginning in 1847 killed predators apparently in an attempt to protect their food and crops.

Consistent with the ideal of caring for God’s creations, Joseph Smith and his counselors proposed a plan for an ideal city designed to exert a minimal impact on the land and its resources and to promote environmental democracy. These cities were to provide a pleasant environment in which people could live in relative equality, raise gardens, and keep a few domestic animals. As they laid out the cities on a grid pattern with central blocks reserved for public buildings, planners placed the larger farms outside the town boundaries. After the cities reached 15,000 to 20,000 those who wanted to live in a city were to move beyond the farmlands surrounding the city and build a new one. When the Mormons settled in Utah, they used the city plan that Smith had proposed to lay out many of the cities, but they did not limit the city growth to 20,000 people.

After the Latter-day Saints settled in Utah, they linked the concept of multiplying and replenishing the Earth found in Genesis 1:28 to the importation and nourishing of a wide variety of plants and animals. In 1862, Heber C. Kimball, Brigham Young’s first counselor, taught church members that they should help the Earth “multiply and increase her productions, vegetation, fowls, animals and all manner of creeping things” (Kimball 1862: 337).

Wilford Woodruff, then a member of the Quorum of the Twelve Apostles and later church president, experimented with imported plants during the 1850s. In September 1855 he joined with others to organize the Deseret Horticultural Society. Members of the society planted and grafted a wide variety of fruits to determine which would flourish in Utah’s climate and soil.

In 1856 the territorial legislature chartered the Deseret Agricultural and Manufacturing Society. DAMS imported animals and plants and seeds for fruits, grains, and vegetables from other parts of the United States and from Europe and Australia.

As Mormon immigrants continued to pour into Utah, they transformed the land. Along the Wasatch Front they founded communities with families, homes, churches, and schools. They also changed the lush grassland they found there into verdant fields and orchards. With considerable difficulty and a number of failed efforts, between 1847 and 1890 they established more than 500 settlements, the majority of which have persisted to the present.

Although the settlements generally flourished, the Mormons also caused the eradication of some wildlife and environmental damage to their pasturelands. Populations of various species of wildlife such as bears, wolves,

mountain sheep, elk, rattlesnakes, fish, and crickets declined or disappeared under predator eradication, harvesting, and competition from domestic crops and animals. By 1865, recognizing the destruction of pastures caused by overgrazing, leaders like Orson Hyde, then serving as president of the Quorum of Twelve Apostles, the second highest governing body in the church, chided members for destruction of land and vegetation.

In spite of such admonitions, the expansion of Mormon participation in the market economy during the 1880s led to the introduction of increasingly large herds of cattle and of sheep. Overgrazing by these animals caused extensive watershed damage in the uplands in northern and central Utah. Such destruction denuded the land and led to summertime rock-mud floods that further eroded the land as they caused millions of dollars worth of property damage.

As watershed destruction mounted, after the turn of the twentieth century church leaders began to reemphasize the principles of stewardship and care of God’s creations that nineteenth-century leaders had taught. Declaring, “As children of God, it is our duty to appreciate and worship Him in His creations” (Handley 2001: 195), President Joseph F. Smith denounced the “wicked” destruction of wildlife (Smith 1963: 265).

Consistent with this view, he favored watershed protection. As the federal government encompassed timber stands and watersheds into national forests, under Smith’s direction, church priesthood leaders voted on 7 April 1902 to urge the federal government to withdraw from the market for protection of all public lands in the watersheds above Utah cities.

Continued overgrazing and flooding, however, led to the appointment by Utah Governor George H. Dern of a committee headed by MIT engineering graduate and church Presiding Bishop Sylvester Q. Cannon to determine the reasons for the damage. The committee attributed the damage to extensive overgrazing and urged measures to reduce the number of livestock on the mountain watersheds. This report led directly to Forest Service grazing reductions and range rehabilitation projects.

Other early twentieth-century church leaders set examples of caring for God’s creations. Reed Smoot, a member of the church’s Quorum of the Twelve Apostles, served as a Senator from Utah from 1903 to 1933. He actively supported the conservation programs of Theodore Roosevelt and Gifford Pinchot. Among other things, he favored the designation of National Forests and opposed the Hetch Hetchy dam slated for construction in California’s Sierra Nevada Mountains. After Smoot had introduced legislation for the organization of the National Park Service in previous congressional sessions, in 1916 he served as Senate sponsor for the act introduced in the House by California Congressman William Kent to create and fund the NPS. In 1920, as chair of the Senate Public

Lands and Surveys Committee, he co-authored the Mineral Leasing Act, which serves as the basis for federal leases of minerals such as petroleum and phosphates. He also sponsored legislation to establish Zion and Bryce National Parks.

In the meantime, Latter-day Saints worked to deal with other environmental damages. In 1904, farmers in central Salt Lake valley secured an injunction against nearby smelters for polluting the air and destroying crops. A number of the offending smelters closed and other remained open only by installing pollution control equipment. John A. Widtsoe, University-of-Göttingen-educated member of the Quorum of Twelve Apostles, conducted experiments to make irrigated and dry farming more productive and environmentally sensitive.

In Salt Lake City, Latter-day Saint leaders worked to improve the physical environment. Sylvester Cannon, then serving as a stake president, worked to protect and maintain the city's watersheds and parks. As city engineer, Cannon, and George W. Snow, the director of the city's Mechanical Department, fought against air pollution. Prominent Mormon women like Leah Eudora Dunford Widtsoe, Susa Young Gates, and Emily L. Traub Merrill worked on civic improvements in Salt Lake City during the first decades of the twentieth century, especially to control air pollution.

During the 1930s and 1940s, Latter-day Saints in various localities worked to stabilize and beautify the environment. In 1936, a number including Robert H. Stewart of Brigham City, William Lathum of Wellsville, and Bishop John O. Hughes of Mendon organized the Wellsville Mountain Watershed Protective Association. Collecting money from depression-strapped farmers, they purchased land in the foothills of the Wellsville Mountains on the boundary between Cache and Box Elder Counties. Then they lobbied Congress to extend the boundaries of the Cache National Forest to encompass the land, which they donated to the Forest Service for watershed protection.

As Secretary of Agriculture during the Eisenhower Administration, Ezra Taft Benson, a member of the Quorum of Twelve Apostles and later church president, advocated watershed rehabilitation. Although J. Reuben Clark, then a member of the church's First Presidency and a rancher, criticized Benson, the agriculture secretary nevertheless supported the efforts of the Forest Service to reduce numbers of livestock in grazing allotments and restore the land and its vegetation. In addition, he spoke out in favor of reverence for life and "for the resources God has given man." "The outward expressions of irreverence for life and for fellowmen," he said, "often take the form of heedless pollution of both air and water" (Hirschi 1995: 3).

Recent church presidents have also spoken out on the need for environmentally friendly attitudes. "We recom-

mend," Spencer W. Kimball said in November 1974, "to all people that there be no undue pollution, that the land be taken care of and kept clean, productive, and beautiful" (Hirschi 1995: 2). "This Earth is [God's] . . . creation," Gordon B. Hinckley said in April 1983, "When we make it ugly, we offend him" (Hirschi 1995: 3).

In recent years, environmental ethicists have concerned themselves with population growth. Unfortunately, it is much easier to find official statements on population control than to provide accurate statistics on the Mormon population. This is in part because the church does not compile such statistics, only about 14 percent of all Mormons live in Utah, and fewer than 50 percent of all Mormons live in the United States. Nevertheless, the *Church Handbook of Instructions* an official directive for local leaders offers the following: "The decision as to how many children to have and when to have them is extremely intimate and private and should be left between the couple and the Lord. Church members should not judge one another in this matter" (Church of Jesus Christ of Latter-day Saints 1998: 158).

In spite of the small representation of Latter-day Saints and the fact that the sample includes fewer than half of all Mormons, using data from surveys in the United States, Brigham Young University sociology professor Tim Heaton has estimated that Mormon couples both expect to and do have more children than average. Statistics from the General Social Survey indicate that an average LDS family in the United States has 2.63 children compared with a national average of 1.99 children. Moreover, Mormons say that an ideal family should consist of 3.89 children compared with a national average of 2.89 children. Both the larger family size and the larger reported ideal probably derive from Mormon belief in the eternity of the family and in the importance of providing bodies for God's spirit children. Moreover, the statistics show that Mormons use contraceptives at the same rate as other Americans.

On the matter of the attitudes of the church leadership toward caring for God's creations, the church's Public Affairs department has published a general packet including a statement of policy. Among other things, the statement says, "The Church does not, institutionally, endorse specific environmental crusades, but instead encourages its members, as citizens, to join with their fellow citizens in supporting worthy programs that will make their communities better places to live and raise their families" (Hirschi 1995: 1).

Although vestiges of the teachings of Joseph Smith and Brigham Young have appeared in the thought and actions of church leaders like Joseph F. Smith, Spencer W. Kimball, Ezra Taft Benson, Gordon B. Hinckley, Reed Smoot, and Sylvester Q. Cannon, many members have forgotten the teachings on the relationship between humans, animals, plants, and the Earth. Some scholars and

others have begun to remind the current membership of these teachings, but many are unaware of them today.

Church of Nazareth Baptists (KwaZulu-Natal, South Africa)

The Church of Nazareth Baptists is a prominent instance of the "Zion City" strain within the prophetic-charismatic African independent churches ("AICs") of southern Africa.

Originating among the Zulu and today led by a descendant of the founder, its focus is thaumaturgic healing and empowerment, and the reconciliation and incorporation of ancestors. The name “Nazareth” is taken from Numbers 6, the vow of the Nazarites – Yahweh’s ascetic warrior elite in the struggle against Canaanism.

In recent decades (1980–2000) the church has grown beyond KwaZulu-Natal, primarily among Zulu-speakers in Gauteng, but also in the Eastern Cape and Swaziland, and the Nguni-speaking areas of neighboring states (Mozambique, Zimbabwe).

The church was founded in early twentieth century Natal, South Africa, by a syncretizing healer-prophet following a revelation and covenant on a “cosmic mountain” – now the site of an annual pilgrimage. Oral traditions show that Isaiah Shembe (ca. 1870–1935) was also a nature mystic whose legacy represents an exception to the AIC tradition, in which human concerns are paramount and a “theology of power” prevails. A majority of the present membership remains unaware of the founder’s writings, in which his concerns for animals and environment are preserved, but consciousness of this aspect of his legacy is sustained by oral traditions. As one elder avowed, “According to our religion, no beast is caught and killed without weapons by breaking the neck” (a Zulu quasi-military custom).

The Nazareth Church’s founder was remembered as “a compound of gentleness and severity (who) loved all living things.” An expert horseman and judge of cattle in his youth, he needed just a day to bring an ox to the yoke. He seems also to have had “green fingers,” and later in life, at his citadel/commune headquarters Ekuphakameni, would tell his sons not to sever tree branches, asking: “How if I were to cut one of the fingers from your hand?” He was seen to address tree saplings, and made their names known. Certainly no tree could be cut without permission and good reason. One of his praise-names was “flat-crown tree of Mayekisa (his father).”

Birds were close to God, therefore to be attracted rather than killed: At Ekuphakameni fresh water was put out for them daily, and doves were hand-fed. Followers were ordered to exterminate stray cats preying on them, and they became so numerous that during service in the great temple, open hymnbook pages would be spattered with droppings.

Church legend records Shembe’s command over inanimate nature, in the calming of surf before baptisms, and the turning back of floodwaters. His prophet’s power of Edenic communication with wild creatures is heard in his hymnal (the only instance in the history of hymnology in which animals speak), and their surpassing holiness is extolled. In one hymn Adam, the defiler of Eden, is expelled at the request of its other creatures, who ask “Where shall we go today? We are separated from our Father . . . Help us God, expel Adam.”

One poignant incident was commemorated in another hymn so as to keep people mindful of animals’ sentience: a captive baby monkey appealed to Shembe, who bought it and told the captor to release it where it had been caught. The final verse chastises humanity with a reminder of the spiritual superiority of other creatures: “Awake, it is dawn! / When shall you awaken? / You have been surpassed by the monkeys / In seeing the Lord.” Conversely Shembe also mediated human claims to wild animals: when monkeys raided one temple’s gardens, he entreated them to remember that while God had given them forests for their food, people had to grow their own. How would they live if their food was stolen? There were no more thefts after this.

By Nguni (Zulu and related) tradition, certain snakes are reincarnations of persons – Shembe himself being known by some as “the horned viper of grace”. Once when a mamba appeared on Ekuphakameni dance-ground, the men asked if they could kill it, but Shembe warned that this was in fact a person. His request to the snake was immediately obliged: “If you want to do God’s work, go to that tree and stay there, you will be disturbing us here.” Likewise, he could call upon water snakes to vacate pools in which he wanted to baptize. His followers believe themselves immune from snakebites, since he had prayed for this privilege on the Holy Mountain; accordingly anyone who killed a snake was fined.

Among domestic animals too, “some are people”; cattle and goats as well as dogs were given names, and bulls were adorned for the July festival dances. After a day’s dancing, a ceremony followed, designed as “an object lesson in the care of animals”: the feeding of Shembe’s old grey horse, “almost as famous as himself” since it responded in kind when converts danced around it. Rules were made against any callousness or cruelty toward domestic animals. Declaring that “people are like children,” Shembe cautioned them against causing misery to donkeys by not using a load-support, or roping a milk cow through the nose (since she steps on the rope as she walks). Prayer rather than charms was prescribed for ill cattle and horses, since God had compassion for all living things. Householders who killed their dogs to avoid having to pay the colonial dog tax should be penalized by having to pay it for five years thereafter, and any chief who avoided imposing this penalty would be guilty before God. Those who killed their dogs for impregnating the dogs of others were asked “Why not castrate the dog if it had to live without a bitch? . . . One cannot keep a bull where there is no cow.”

Although Shembe’s own position on sacrifice was biblical (sacrifices are “a form of gratitude to Jehovah, they hold people together by blood, (and open) the Gate of Heaven”), he is remembered as having disapproved the killing of animals. Just before one sacrifice, he sent the message “This beast has just come to me to say that it

is too young to die.” At Ekuphakameni only purchased animals were slaughtered, never the home herd, and only virtuous followers were apportioned the meat. No doubt to ensure humane slaughter, Shembe himself wielded the spear. Said to have been fond only of sorghum, he once cast to the ground some meat prepared for him, then took it back, shook off the dirt, and ate, saying “I only do what I have been told . . . When you seek the way of God, you do not make the search a pleasant affair.”

On the communal farms he established throughout Natal, Shembe pioneered rational and humane treatment of livestock. Rich stockfeed was planted, bulls of good breed were bought, and the tenacious Zulu “cattle cult” discouraged, as followers were persuaded to keep a few good milk cows rather than many scrub cattle. Cattle being the cultural measure of wealth, this challenged some fundamental precepts, but was critical to curbing overgrazing and erosion of the already barren lands on which Africans had been confined by colonial legislation, and which by the turn of the nineteenth century barely supported rapidly expanding populations. Followers whom Shembe settled on his purchases were governed by a strict Protestant-style work ethic and enjoined to become as productive and self-sufficient as the Indian ex-plantation workers-turned-market gardeners alongside whom the Nazarites lived at Ekuphakameni.

Though many Nazaretha now live in urban areas, nostalgia among older members for life on the land takes most back to their rural family smallholdings for performance of weddings and all domestic ceremonies that require ancestral sanction.

Cihuacoatl – Aztec Snakewoman

The Aztec goddess Cihuacoatl, or Snakewoman, controlled naturally destructive forces that shaped and sustained births, wars, and city life. This old patroness of agricultural fields, matronly advisor, and warrior woman controlled these forces by counseling both women engrossed in the battle of childbirth, and warriors or rulers about to go off to battle. Her powers were needed because all of Aztec life was an ongoing war of opposing forces. To modern sensibilities, the mythical equation of war’s destruction with life’s creations might seem strange, but it is not so strange when one remembers how much nature structured Aztec life. The closeness with which the Aztecs lived with nature underlay a combative metaphor that fed all existence. Cihuacoatl represented that metaphor.

In the early sixteenth century, the Aztecs (known then as the Mexica) controlled much of Mesoamerica, an area that stretched roughly from what is now northern Mexico into modern-day Nicaragua. But they did not control all, and often had trouble keeping what they did claim under control. For centuries, Mesoamerica had been dominated by shifting alliances among urban centers, cities that were at once religious, political, and social centers. A patron deity governed each city, which gave it life and strength, thereby creating a ritual center and destination for pilgrims. Each city also constituted a complex, stratified yet flexible society of many groups of people ranging from governing elite, to religious professionals, warriors, traders, educators, healers, craftspeople, and farmers. These urban centers often competed for power. Sometimes cities allied with one another, at other times they fought each other in an effort to gain the upper hand; and when one did, they captured their enemies’ patron deities and burned the gods’ temples to claim their power. The Aztecs had gained the upper hand over many urban centers throughout Mesoamerica, although they found themselves in almost constant warfare to sustain their hegemony. As for many preceding centuries, war kept Mesoamerican religious, political and social bodies alive.

The Aztec capital city Tenochtitlan packed approximately 250,000 people onto an island ringed by fertile farmlands rising out of the surrounding, rich wetlands. This was not modern-day Mexico City, whose concrete structures now sprawl across what once was Tenochtitlan, covering up both the old island, and almost all of the ancient wetlands. Tenochtitlan’s human masses lived cheek by jowl, not with concrete, but with corn, beans, tomatoes, chilies, and squash; and thousands of water birds, frogs, salamanders, turtles, and fish. Nature was not banished from this city’s life.

This cheek by jowl existence with natural beings echoed a common symbolic equation among humans, nature, and gods. Humans constituted just one more set of

natural beings in an already teeming cosmos. Moreover, gods took the form of natural beings. Mountains, rocks, trees, plants, streams, lakes, all manner of animals, and humans alike could all gain life from godly powers; and no god existed that did not bear the shape or shapes of beings and objects found normally in nature. As Snakewoman, Cihuacoatl was one such deity, probably having arrived in Tenochtitlan as patroness of recently conquered agriculturally rich cities. Some people called her “Edible Heron Herbs” (Quilaztli).

Cihuacoatl, in part, helped control an eating and feeding cycle that sustained all life. To sustain life, one must kill something so that the living have something to eat; this became a root metaphor for Aztec religious thinking. People ate animals like deer, who munched on corn in farmers’ fields. The corn, also living beings, ate the rotting loam, dead fish, and human excrement with which people fertilized their fields. And that excremental fertilizer came from the digested deer, corn, and fish that people killed to eat. Life was one big cycle of eating and being eaten. Gods ate people (without whom they would starve); in return, the gods watered people’s fields so they might eat, helped them produce children, and fed strength to their cities. Sacrificial rituals, human and otherwise (for nonhuman offerings far outnumbered the human) fed the various godly forces so that life’s many forms would be nourished. Cihuacoatl helped people fight successful battles, which religiously created and sustained life, just as war sustained political and social bodies.

Cihuacoatl helped Quetzalcoatl, the Feathered Serpent, create people by grinding their bones as one grinds corn for tortillas. According to one sixteenth-century story, Quetzalcoatl captured the bones from the Underworld by overcoming the Lords of Death. Taking them to the Western Tree, the home of Cihuacoatl and other female deities, he gave them to her to grind. The water required to make the dough came from his own male member, which he sacrificially bled onto the ground cornflour. And so people were born of sacrifice, and Cihuacoatl molded them into tortillas for the gods.

Snakewoman also gave good advice and power to people traveling on the warrior’s path. Midwives invoked her powers to help young mothers through the battle of birth, especially difficult ones. They exhorted their charges to have the courage of Cihuacoatl, and used her powers to carefully plan the strategy required for successful campaigns. Another sixteenth-century source tells how a woman who died in the battle of birth turned into one of the Eagle Women or honorable mythic women warriors who, each noonday, captured the sun from dead male warriors. These women took the sun to their western house. There, people from the Land of the Dead captured it at dusk, keeping it in the Underworld until dawn when the male warriors captured it back from them. If the woman won the battle and lived, she received much fortune from

Cihuacoatl, perhaps even the capture of twins who were said to come from the goddess.

This same source says that young male warriors also sought Cihuacoatl’s powers. They battled the families of women who had died in childbirth in order to capture the dead women’s middle fingers and hair. They attached these potent trophies to their shields to make them valiant and paralyze their opponents’ feet. Snakewoman herself was depicted wearing the eagle plumes belonging to the great warrior god, Mixcoatl, and she carried a shield and wielded a weaving batten like a weapon. The Tlacaellé, a governor who controlled the internal affairs of Tenochtitlan and frequently counseled the ruler who managed external affairs, dressed ceremonially in the goddess’ clothes in order to acquire her skills in warrior strategy.

However, stories tell us that Cihuacoatl also could bring bad news about death and destruction. Normally, she wore her hair tied up in a matronly manner, but occasionally she was shown wearing it down, dirty and tangled in the manner of mourning. At such times, she also wore the jawbone of the Lords of Death. Dressed like this – so the tales say – she appeared at night crying warnings for all to hear. Cihuacoatl delivered such a warning twice to the Aztecs just before the Spanish Conquest of Tenochtitlan in 1521. Then she wailed: “Dear children, soon I am going to abandon you! We are going to leave you!” So she and the other gods did, for the Conquistadors brought both a new society and religion to the land.

P Circle Sanctuary

Circle Sanctuary, also known as Circle, is one of America's oldest and most prominent Wiccan churches and nature spirituality resource centers. Founded in 1974 by senior minister and high priestess Rev. Selena Fox and others, Circle Sanctuary serves nature religion practitioners worldwide through its networking, websites, events, healing work, education, and publishing ministries. Circle Network, founded in 1977, consists of thousands of individuals and groups, and hundreds of paths of contemporary Paganism and related forms of ecospirituality, including Wicca, Druidism, Animism, Teutonic Paganism, Unitarian Universalism, Daoism, Pantheism, ecofeminist spirituality, and multicultural Shamanism. In serving this network, Circle Sanctuary publishes and distributes books, recordings, and periodicals, including its quarterly *CIRCLE Magazine* and annual *Circle Guide to Pagan Groups*.

Circle Sanctuary is headquartered on a 200-acre site, Circle Sanctuary Nature Preserve, which is located in the rolling forested hills of southwestern Wisconsin near the village of Mt. Horeb and the Blue Mound, an ancient Native American holy place. At its preserve, Circle Sanctuary engages in forest and wetland conservation, prairie restoration, songbird research and preservation, environmental education, and ecospiritual activities. Science and religion converge at Circle Sanctuary Nature Preserve. It not only is a place dedicated to the preservation of wildlife and ecosystems, but is also a place of spiritual nature communion, where the divine is viewed as multifaceted and immanent in all of nature. Those associated with Circle Sanctuary view environmental activities at the preserve and elsewhere as sacred work. Through ecological projects as well as through rituals, meditations, and other forms of religious practice, Circle Sanctuary members endeavor to cultivate and sustain harmonious relationships not only with other humans but also with the rest of the greater Circle of Life on planet Earth and in the universe. Among the many ceremonial sites at the preserve are the Stone Circle dedicated to planetary healing, Brigid's Spring which is a spiritual healing shrine, and Spirit Rock, an ancient Native American vision quest place. Circle Sanctuary also engages in public education and media interviews to help improve public understanding of nature religions people and practices. Through its Lady Liberty League (LLL), Circle Sanctuary is in the forefront of civil rights and religious freedom endeavors on behalf of Wiccans and other Pagans, and has helped win victories in the United States and elsewhere. LLL helped defeat US federal anti-Wiccan legislation in 1985 and in

1999, and has aided successful court battles involving land use, job discrimination, and other issues. Circle Sanctuary ministers serve as consultants on Pagan religious accommodation to chaplains and administrative staff in hospitals, corrections, the US military, and educational institutions, and Circle Sanctuary is the first Wiccan church to put forth a US military chaplain candidate. In addition, Circle Sanctuary is active in regional, national, and international interfaith organizations and conferences, including the Parliament of the World's Religions, and through this work has developed networking alliances with leaders and practitioners of traditional and contemporary nature religions in many countries. Circle Sanctuary also engages in and supports nature religions research. Rev. Fox and her husband, Dr. Dennis Carpenter, Circle Sanctuary research director, helped found the Nature Religions Scholars Network associated with the American Academy of Religion. They founded this network in order to promote communication and collaboration among those engaged in the emerging interdisciplinary field of Pagan studies. Circle Sanctuary maintains one of North America's largest libraries and archives of books, periodicals, recordings, and other materials on contemporary Paganism. Circle Sanctuary sponsors a variety of activities, at its headquarters and elsewhere. Communion with the divine in nature is a common underlying theme in Circle Sanctuary festivals, classes, passage rites, and seasonal celebrations. The largest event sponsored by Circle Sanctuary is the international Pagan Spirit Gathering, a weeklong conference and summer solstice celebration held at a nature preserve in Ohio. The spiritual foundation of Circle Sanctuary is the Circle Craft tradition, a form of the Wiccan religion that is a blend of old European Pagan folkways, transpersonal psychology, multicultural shamanism, and nature mysticism. Staff and volunteers active in the Circle Sanctuary Community carry out the multifaceted work of Circle Sanctuary throughout the year.

Coalition for Environmentally Responsible Economies

The Coalition for Environmentally Responsible Economies (CERES), a non-profit coalition of investors, public pension funds, labor unions, religious and public interest groups, works in partnership with companies toward the common goal of corporate environmental stewardship.

In March 1989 a group of social investors, including the Interfaith Center on Corporate Responsibility (ICCR), gathered to look at ways to use investment capital to change the environmental actions of corporations. In September 1989 CERES announced the Valdez Principles, changed in 1992 to the CERES Principles. The ten Principles called for continual environmental improvement within the framework of the Principles and an annual environmental report. The Principles address Protection of the Biosphere, Sustainable Use of Natural Resources, Reduction and Disposal of Wastes, Energy Conservation, Risk Reduction, Safe Products and Services, Environmental Restoration, Informing the Public, Management Commitment, and Audits and Reports.

From the beginning, religious groups in ICCR were primary drivers of CERES, filing shareholder proposals with dozens of companies to endorse the Principles. CERES provides a vehicle for ICCR groups to give expression through the Principles to many environmental issues on their agenda. CERES represents a way to bring the more comprehensive issue of public accountability for environmental action before companies with the support of other parties including public pension funds, labor unions, and social investors.

Early endorsers of the CERES Principles included many small, socially conscious firms but no major public corporations. In 1993 Sunoco became the first large company to endorse the Principles through negotiations led by National Ministries of the American Baptist Churches USA. A year later General Motors endorsed them, again with negotiations led by religious shareholders. Other large endorsers now include Bethlehem Steel, Ford Motor Company, PPL, Baxter International, IIT Industries, Interface, Bank of America, Polaroid, Coca Cola, Nike and American Airlines.

In 1998 CERES convened an international gathering to develop a global environmental metric and in March of 1999 announced the Global Reporting Initiative (GRI). The GRI developed a set of guidelines for international standardized reporting that covers environmental, social and economic impacts. In 2002 the GRI is scheduled to

become a separate organization with its own governing structure.

CERES plays a unique role in developing partnerships with business around a set of independently established principles that provide public accountability through reporting and dialogue. This accountability is a distinctive expression for religious groups within ICCR of stewardship. Corporations often use the term stewardship as a description of their environmental program, yet most fail to recognize the theological roots of the word or the connection with economics, a transliteration of the Greek *oikonomia* from which stewardship is derived.

For religious groups, ongoing relationships with corporations through dialogue with CERES also provide an expression of the tension between justice and reconciliation. Most actions of ICCR are justice-oriented, seeking particular changes in corporations viewed as unjust adversaries. The dialogical partnership in CERES between corporations and CERES members allows reconciliation to occur within the framework of accountability for just action provided by the Principles.

Cobb, John B., Jr. (1925–)

John Cobb is Emeritus Professor, Claremont School of Theology and Claremont Graduate School, and was a co-winner of the Grawemeyer Award of Ideas Improving World Order in 1992. As founding co-director of the Center for Process Studies, Cobb is a leading proponent of process theology and its implications for ecological and economic ethics.

John Cobb's early work in process theology (from 1959–1969) gave little consideration to ecological ethics. This changed when he underwent a "conversion" in 1969, after his son introduced him to the drastic proportions of the ecological crisis. In 1972, Cobb published *Is It Too Late? A Theology of Ecology* where he began to develop his ecological ethic.

Cobb accepts the analysis of thinkers like Lynn White, Jr., who argue that Christianity's traditional emphasis upon humanity as being made in God's image and having dominion over the Earth has led to the ecologically harmful view that only humans have intrinsic value, while all other creatures merely have value insofar as they serve human interests. Cobb points out that this anti-ecological perspective is neither truly biblical, nor theologically necessary. Nonetheless, Christian theology needs to be creatively transformed; hence, he turns to process theology to discover a perspective that is truly

SP The Making of an Earthist Christian

Scholarly Protestant theology in the nineteenth century became primarily anthropology; that is, it focused on the human condition as understood in the Christian tradition. This resulted from the general lack of confidence in theoretical reflection about God, caused in part by the breakdown of the earlier deism and in part by the rejection of metaphysics in the extremely influential philosophy of Immanuel Kant. This move entailed the virtual disappearance of the natural world from consideration. Where it did appear, as in Albrecht Ritschl, it represented the sphere over which human beings were to exercise their mastery.

Popular Protestant piety and its conservative theological expressions did not go so far in this anthropocentric direction. The deistic argument from the order and beauty of the world to God as supreme personal will still played a large role. This piety, however, received a major shock from evolutionary theory. By the twentieth century, in the British and American spheres, the controversy over evolution split the Church between those who appealed to the Bible in a literalistic way as trumping science, and those who adjusted their theology, more or less, to scientific thinking. Most of the latter solved the problem in Kantian fashion, by sharply distinguishing the world of science from the historical world to which theology applied.

Another response played some role in the English-speaking world. One might try to develop a larger vision in which the data of biological evolution along with other sciences and the historical understanding of human beings were brought into coherent unity. This required challenging the mechanistic worldview underlying almost all scientific formulations of the time. It required the rejection of supernaturalist theism and appeals to revelation that presupposed this. It took evolution seriously, but understood it to mean that some of the characteristics of the human sphere must have been present also in pre-human creatures.

I attended the Divinity School at the University of Chicago, which was one of the few centers of this kind of thinking in the mid-twentieth century. To avoid complete isolation from the dominant discussion, we emphasized the anthropological implications of our vision. Existentialism was the most challenging form of this anthropology, and the one most congenial to us. Hence, we were likely to accent this aspect of our tradition of "neo-naturalism."

The piety I brought with me to the University of Chicago was shattered by my first year of study in the Humanities Division in a program called the Analysis of Ideas and the Study of Method. I entered that program precisely to expose my Christian faith to the acids of modernity. I shifted to the Divinity School because I realized that the faculty there had come to terms with

those acids without abandoning their faith. I needed to understand how. I had glimpsed this possibility in a course I had taken with Charles Hartshorne in the Philosophy Department, and I wanted to learn more about it. Hartshorne had introduced me to the thought of Alfred North Whitehead, and it was to this that I was most drawn.

Most of Whitehead's work was about the natural world. That was important to me chiefly as assuring me that what he said about humanity and God was coherent with a responsible science. The Protestant theology that shaped my questions did not direct my concerns to nature as such. In 1965 I published a book entitled "A Christian Natural Theology" in which I wrote about God and human beings based on Whitehead's philosophy and said almost nothing about the rest of the natural world.

It was in the summer of 1969 that my conversion occurred. One of my sons, Cliff, urged me to read *The Population Bomb* by Paul Ehrlich. It was at the time a best seller, and it was one of the major influences on Earth Day 1970. Ehrlich was wrong on many particulars, but I was convinced then, and am convinced now, that he was right in his fundamental vision. Population growth combined with rising rates of per capita consumption is on a collision course with the Earth's capacity to sustain us.

Abruptly, the separation I had been making between human history and the changing condition of the planet became impossible. The fate of the natural world became a consuming concern. I re-thought my vocation. I laid aside a manuscript I had almost completed on explanation in history and wrote *Is It Too Late? A Theology of Ecology*. I led in organizing a 1970 conference on "The Theology of Survival." And I spoke here and there in all too alarmist ways.

My new vocation was to critique the Protestant theology that had led me, and so many others, to be blind to the dependence of human life on the wider ecological system. We Protestants had much responsibility for the blindness of our whole society. We were called to repent.

I was certainly not the first to recognize the error of the dominant tradition. I realized that some of my own teachers, including Hartshorne, had been deeply concerned and had worked for change. Joseph Sittler had made an important speech at the Delhi meeting of the World Council of Churches calling for a renewal of concern for the whole of creation. Most helpful to me, Lynn White, Jr., a Presbyterian layman who taught the history of technology at UCLA, had presented a speech on "The Historical Roots of the Ecological Crisis" in which he had explained how the anthropocentric reading of the Bible in the West had provided the underpinning for the Western ideal of dominating nature. My work depended on all of these.

Continued next page

My work depended, even more, on the thought of Whitehead. Suddenly whole dimensions of its implications became important to me. For Whitehead, human existence is continuous with all other forms of existence. Every momentary event is an occasion of experience, and every occasion of experience is of value to itself as well as to others. Among the others, the Consequent Nature of God, to which all else contributes its value, is supremely important. The idea that only human experience is of value is totally erroneous.

Furthermore, I was convinced that on these points Whitehead was closer to the Bible than the anthropocentric theology that dominated the Western tradition and had been intensified for Protestants by Kant. Quite apart from the relation to human beings, the creation story asserts that God saw that the creation was good. The Jewish scriptures celebrate the land and understand nature to glorify God. Jesus speaks of God's providential care for plants and birds. Even Paul envisions the day when the whole creation is freed of suffering. The narrowing of focus on God and the human soul, so pronounced in Protestantism, is a distortion of the Bible.

It has been a source of joy to find that fairly rapidly other Protestants have moved in the same direction. Already in 1975 at Nairobi, the World Council of Churches added to its vision of a just and participatory society the idea that it must be sustainable as well. Although this is still anthropocentric thinking, it opened the door to seven years of worldwide reflection on the importance of the natural world. At Vancouver in 1982, the Council shifted to the phrase "the integrity of creation," a much less anthropocentric term. Similar changes took place in many denominational statements. The Protestant churches took the Bible seriously and began the long and difficult task of repentance.

Repentance is not easy. Deeply entrenched habits of thought and sensibility continue to dominate even after one has recognized the need for change. This is certainly true of large institutions. It is also true for individuals like me. I published in 1975 my most important theological book, *Christ in a Pluralistic Age*. It sets the issue of Christian belief in Jesus Christ in the context of religious and cultural pluralism. The larger natural context is virtually absent. I am glad to say that after a long period in which I found it necessary to segregate my work in interreligious dialogue from my concern for the fate of the Earth, the two have now merged. My dialogue partners deeply share this passion.

Despite my failure to integrate my concerns in the seventies, I was not inactive on the issue of what we humans are doing to the rest of the world and the Church's responsibility. Shortly after the conference on "The Theology of Survival" I became convinced that there was little likelihood of change unless there were some positive images of what we should change to.

Some students worked with me to find thinkers who took the crisis seriously and then went on to propose ways of ordering our lives that could be both sustainable and rewarding. In 1972 we held another conference on "Alternatives to Catastrophe." The quest for an alternative to the continuing course of events has been central to my quest to this day.

Of all the denominations, it was the American Baptists who took the need for change most seriously. This was due chiefly to the leadership of one man, Jitsuo Morikawa. He had been my pastor during my student days at Chicago, and we reconnected. I had the privilege of working with him on several conferences in the seventies.

The man who played the largest role in bringing the urgency of sustainability before the Nairobi WCC Assembly was an Australian ecologist, Charles Birch. Birch had been influenced by Whitehead and admired Charles Hartshorne. These shared interests had brought us together in the sixties. In 1976 he suggested that we write a book jointly. This took some time, but in 1981 we published *The Liberation of Life*. It employed a Christian ecological perspective to deal with life at several levels and to draw forth the implications of this vision for public issues.

The greatest challenge I felt to my Christian approach was from a colleague in the Claremont Colleges, Paul Shepard. I first worked with him on conference in the mid-seventies on "The Rights of Nature." The conference heightened my awareness of the danger of "rights" language, although it did not persuade me to abandon it. Talking with Shepard then and subsequently, I felt the superficiality of much of my own work. I also recognized how deep was my assumption that civilization was something positive, despite all its problems. I had celebrated the Christian contribution to civilization and to the development of science and technology, despite their ambiguous role.

Paul's view was that the abandonment of the hunting and gathering society had been a disaster and that all supposed "progress" since then had driven humanity further into madness. Much that I had taken as supportive of the positive role of Israel and Christianity (as well as the other "higher" religions) was presented by him as reason to reject them and attempt to recover the basic ethos and sensibility of primal religions. For Paul, the self-transcendence that enables us to be self-critical and to repent is itself a mark of our deep alienation. Several times we taught seminars jointly, and I was often overwhelmed by the depth and richness of his scholarship and the creative originality of his vision. Nevertheless, I have remained convinced that whatever the values that might have been retained had our ancestors never turned to agriculture and herding, today our hope lies in

Continued next page

the capacity to repent, that is, to intentionally change the direction of thought and action, which, Paul agreed, the prophetic tradition of the Hebrews most effectively introduced into history. I pointed out to Paul that he was playing the prophetic role, much as he opposed it.

By the early eighties I had become convinced that the church's repentance, however important, would not change the course of events. The world was run on economic principles, not Christian ones. If there were to be any possibility of redirection, these principles would have to be challenged. I began to offer occasional courses on theology and economics in order to educate myself. I became convinced that one major problem was that economic well-being was typically gauged by Gross National Product, whereas I was convinced that increases in GNP had little or no connection to actual human betterment. A group of students worked with me to study existing alternatives to the GNP, better correlated to actual economic gains. None were quite satisfactory, and none were being kept up. Accordingly, we went on to construct our own tables for the United States. The latter task was finally carried out by my son, Cliff. We called our measure the Index of Sustainable Economic Welfare. It has been developed subsequently by Redefining Progress into the Genuine Progress Index. Similar statistics have now been compiled for eight other countries. Quite consistently it turns out that at the present time growth as measured by GNP (or GDP) does not indicate any real improvement in the economic well-being of the people.

Of course, there is much more to economics. I turned to Herman Daly, who had presented his vision of a stationary state economy at our conference on "Alternatives to Catastrophe," suggesting that we write a book together. We undertook to critique the theoretical assumptions of modern economic thinking, to propose alternative assumptions, and to indicate the practical implications that would follow from these. In 1989 we published *For the Common Good*, which has touched the economic community only at the fringes but has exercised some influence in a wider circle of those interested in public affairs. Working on this book confirmed for me a thesis Birch and I put forward in our earlier book: that the policies that destroy nature are also destructive of human beings, especially the weak and poor.

This work has given me lenses with which to observe the still growing dominance of economics in national and world affairs. I have lectured and written on current events and collected some of these essays in *Sustaining the Common Good*. I have grown increasingly distressed about the dominance of the market in education.

I have written a book locating the development of theory and practice in the World Bank in the context of a theological periodization of history, moving from the

age of Christianity through nationalism to the current age of economism. I note the emergence of a new vision and commitment that I call Earthism and see how this is challenging the dominance of economism in the Bank, partly from within, but mostly from without. The book is entitled *The Earthist Challenge to Economism: A Theological Critique of the World Bank*.

It is very hard to remain hopeful, but hope is a theological virtue not to be abandoned because of discouraging circumstances. The corporate domination of the world for purposes of rapid exploitation of both the poor and natural resources is accelerating. It is supported by both of the major US political parties, by the universities, by the media, and therefore by the public. Yet resistance is rising. Labor and environmentalists are putting aside their differences to recognize the commonality of their interests. Repentance is advancing in the churches and other religious communities are joining in. It is too late, much too late, to prevent many of the catastrophes that were still preventable when I wrote *Is It Too Late?* in the summer of 1970. But there is much of value that could still be saved if we change direction now. Sadly, there is less every year. We cannot afford to relax our efforts.

Christian and fully capable of grounding a strong ecological ethic.

Cobb's process theology understands God panentheistically (i.e., as both present in and more than the world). As present in and experiencing all existence in its fullness, God values all things. Put differently, everything that exists contributes to the experience of God. Moreover, process theology understands each existing thing – or “actual occasion” – as capable of some level of experiencing, even if in a relatively trivial way (e.g., the experience of an electron). Consequently, as a subject of experience, each thing has some degree of intrinsic value – the greater the capacity of experience, the greater the intrinsic value of the creature. Thus, all things have value in themselves, and value for God, over and beyond their instrumental value to humans. On this basis, Cobb develops a comprehensive ecological ethic that rejects anthropocentrism. This ethic has found its most extensive treatment in *The Liberation of Life: From the Cell to the Community*, co-authored with Australian biologist Charles Birch.

Cobb's process relational perspective has also led him to examine the relationship between ecology, social justice, and economics, arguing that a truly ecological ethic will strive to promote a society which is just, participatory, and sustainable. In short, Cobb argues that economic justice, political participation, and ecological sustainability are not competing goods, but rather require each other. The fruit of his expanded vision can be seen in *For the Common Good: Redirecting the Economy Toward Community, Environment, and a Sustainable Future* (written with economist Herman Daly), which proposes the use of an “Index of Sustainable Economic Welfare” as an alternative to Gross National Product for measuring economic well-being that accounts for ecological health and justice for the poor.

SP Cognitive Ethology, Social Morality, and Ethics

Cognitive ethology is the comparative, evolutionary, and ecological study of animal minds and mental experiences including how they think, what they think about, their beliefs, how information is processed, whether they are conscious, whether they are self-aware, and the nature of their emotions. Species and individual differences are of interest in these studies. Cognitive ethology traces its beginnings to Charles Darwin. A natural historian at heart, Darwin emphasized the importance of evolutionary mental continuity among animals, noting that behavioral, cognitive, and emotional variations among different species are differences in *degree* rather than difference in *kind*. Shades of gray, rather than absolute differences, link different species.

One area in which the interests of cognitive ethologists merge with those of theologians and religious leaders concerns the evolution of social morality: Do animals other than humans have codes of social conduct that regulate their behavior in terms of what is permissible during social interactions? Do they cooperate and behave fairly? Are they capable of empathy? Many researchers agree that if social morality is to be found among nonhuman animals, it will be the Great Apes and perhaps other primates who are capable of moralizing. This is a narrow speciesist view that discounts the possibility that some non-primate social species, such as grey wolves in which individuals live in cohesive packs that depend on cooperative and coordinated behavior, might be composed of moral beings.

The study of the evolution of cooperation and fairness is closely linked to science, religion, theology, spirituality and perhaps even different notions of God, because ideas about continuity and discontinuity (the possible uniqueness of humans), individuality, personal identity, and freedom are involved. Such efforts help us come to terms with who we are in this awe-inspiring universe. Many have been moved to be more humble and less anthropocentric and more biocentric in their views of the world when they compare humans to other animals who depend on us, as the voices for their very existence. Animals offer much in terms of spirituality and love, and also show us what we have lost in our own evolution.

While there is little doubt that the animal roots on which human morality might be built are not identical to animal morality, continuity among different species is likely. Linear scales of evolution that portray some species as “higher” or “better” than others are simplistic views of current work in evolutionary biology. Tool-use, language, self-awareness and self-consciousness, culture, art, rationality, and perhaps even the having of religious experiences no longer can reliably be used to draw species boundaries that separate human from all other animals.

Humans are viewed as a part of the animal kingdom, and not apart from it.

Some animals may also be viewed as “persons.” Among the criteria used to designate a being as a “person” are included: being conscious of one’s surroundings, being able to reason, experiencing various emotions, having a sense of self, adjusting to changing situations, and performing various cognitive and intellectual tasks.

Studies of social play and the cooperation that is needed to maintain play provide insights into animal social morality. The emotions associated with play, joy and happiness, drive animals into becoming at one with the activity. As Darwin noted in his book, *The Descent of Man and Selection in Relation to Sex*, “Happiness is never better exhibited than by young animals, such as puppies, kittens, lambs, etc., when playing together, like our own children.”

Concerning the evolution of social morality, the notion of “behaving fairly” has received much attention. “Behaving fairly” centers on the notion that animals often have social expectations when they engage in various sorts of social encounters, the violation of which constitutes being treated unfairly because of a lapse in social etiquette.

Playtime usually is safe time – mistakes are forgiven and apologies are accepted by others, especially when one player is a youngster who is not yet a competitor for social status, food, or mates. Individuals must cooperate with one another when they play. They must negotiate agreements to play. The highly cooperative nature of play has evolved in many species. Detailed studies indicate that individuals trust others to maintain the rules of the game. Cooperation is not merely a by-product of tempering aggressive and selfish tendencies or combating “selfish genes.” Cooperation and fairness are needed for play to occur. It might even feel good to be nice to others, to cooperate with them and to treat them fairly.

In many different species, social cooperation and behaving fairly facilitate the formation of groups (communities) based on individuals agreeing to work in harmony with one another. Individuals of many species fine-tune ongoing play sequences to maintain a play mood and to prevent play from escalating into real aggression. While play in most species does not take up much time and energy, researchers agree that play is very important in social, cognitive, and/or physical development, and may also be important for training youngsters for unexpected circumstances. The absence of play can have devastating effects on social development, rendering an individual incapable of interacting with other species members.

During social play, while individuals are having fun in a relatively safe environment, they learn ground rules that are acceptable to others – how hard they can bite, how roughly they can interact – and how to resolve conflicts. Play cannot occur if the individuals choose not to engage

in the activity and the equality (or symmetry) needed for play to continue makes it different from other forms of seemingly cooperative behavior (e.g., hunting, caregiving). This sort of egalitarianism is thought to be a pre-condition for the evolution of social morality in humans. These codes of conduct likely are important in the evolution of social morality. Behaving fairly evolved because it helped young animals acquire social (and other) skills needed as they mature into adults.

Without further research, we cannot dismiss the possibility that social play played a role in the evolution of fairness, social morality, and environment-related mores, or that animals other than human and nonhuman primates are unable intentionally to choose to behave fairly because they lack the necessary emotional – empathic – capacities. Even if nonhuman primates do not seem to play fairly, this does not justify the claim that individuals of other species cannot play fairly.

How we view ourselves in relation to other animals informs how we interact with and treat them. If we view animals as “lower” than ourselves we treat them accordingly. Studies of animal cognition stress that it is important to ask the question “What is it like to be another animal?” and to try to answer this question from the point of view of the animals themselves. When we assume the animals’ points of view, it becomes obvious that they are subjects of a life, and not merely objects. Many animals have complex cognitive and emotional lives and experience pain and suffering. They are intelligent beings with feelings and individual personalities. Thus, they deserve moral standing that protects them from being used by humans merely for our own ends.

Current research in cognitive ethology is transforming many researchers’ spirituality and ethics. The detailed study of animal cognition, emotions, and morality makes it increasingly difficult to argue convincingly for dichotomies juxtaposing “them” (nonhuman animals) versus “us” (human animals), and there are movements away from this sort of arrogant and self-serving human-centered polarization. Mainstream journals are beginning to publish essays on science, nature, spirituality, and heart. Rather than arguing speciesistically for the existence of “higher” and “lower” species, evolutionary continuity is emphasized. Accepting continuity leads to various conceptions of a community in which all beings share similar standing based on *who* they are, a community of subjects rather than a mere collection of objects (to paraphrase Thomas Berry).

Much more research is needed on a wider variety of species, and this research must be ethically defensible. This is among the reasons why Jane Goodall and I formed the organization Ethologists for the Ethical Treatment of Animals/Citizens for Responsible Animal Behavior Studies. Our purpose is to develop and to maintain the highest of ethical standards in comparative ethological

research that is conducted in the field and in the laboratory. We urge researchers to use the latest developments from research in cognitive ethology and on animal sentience to inform discussion and debate about the practical implications of available data and for the ongoing development of policy concerning the treatment of nonhumans animals by humans.

Columbia River Watershed Pastoral Letter

The first bioregional statement authored by Catholic bishops was the landmark environmental pastoral letter, *The Columbia River Watershed: Caring for Creation and the Common Good*. The pastoral letter, international in scope because the watershed area includes the U.S. states of Washington, Oregon, Idaho and Montana, and the Canadian province of British Columbia, integrated Catholic faith, community well-being and ecological responsibility, as it discussed issues of ethics, economics and ecology in the region. The letter weaves together a sense of the sacred, creation care, and the common good of watershed communities.

The Columbia watershed encompasses 259,000 square miles. Its major lifeline is the twelve hundred miles of the Columbia River, which emerges in British Columbia and is fed by tributaries in Montana, Idaho, Washington and Oregon as it winds its way to the Pacific Ocean. The

area includes a textured topography – mountains and meadows, forests and lakes – in which cities and towns, farmers and fishers, and loggers and miners all owe their existence and their livelihood to regional natural capital. Diverse ethnic groups inhabit the area: Canadians and Euro-Americans mingle with Native Americans ("First Nations" in Canada), African Americans and Asian Americans. Although diverse native peoples inhabit this region, those most directly a part of the Columbia watersheds are the Wanapum, the River People. Their name is derived from "Che Wana," the "Great River" later called the "Columbia" by Captain Robert Gray when he sailed his ship of that name in an exploratory journey to the region in 1792.

The pastoral letter process began in 1997 with the formation of an international Steering Committee whose members represented the watershed's Canadian and U.S. Catholic dioceses, colleges and universities. The committee, headed by Bishop William Skylstad of Spokane, Washington, selected John Reid as Project Manager and John Hart as Project Writer, and named the faith-based environmental effort the "Columbia River Pastoral Letter Project." A series of "Readings of the Signs of the Times" was held in Washington, Oregon and British Columbia in which representatives of diverse constituencies – industry, agriculture, fishing, education, community and environmental organizations, and native peoples – presented their perspectives on regional needs. A draft based on their ideas was enlarged and enhanced by suggestions from consultants that included natural and social scientists, theologians and church representatives. A website was established which described project activities, published pertinent biblical quotes and presentations from the "Readings" sessions, and invited comments from the general public. These activities led to the release on 12 May 1999 of an exploratory document, "The Columbia River Watershed: Realities and Possibilities – A Reflection in Preparation for a Pastoral."

The "Reflection" noted environmental degradation and human injustice in the watershed, citing pollution, including pollution from the Hanford Nuclear Reservation; salmon species extinction; U.S.-dam-caused extreme variations in Canadian river levels, disruptive of agricultural and commercial enterprises; violations of native peoples' rights; low working people's wages; and discrimination against ethnic minorities. The bishops' draft document proposed concrete steps to improve watershed ecological and social conditions, including Church pledges to reduce gold use and to strive to eliminate pesticides and fertilizers on Church properties (the latter exemplary actions, and strong advocacy of salmon conservation, would be dropped from the final document because of concerns about alienating some watershed stakeholders).

The "Reflection" catalyzed numerous comments, the

vast majority positive, from across the U.S. Members of several Christian traditions noted their particular appreciation for the terms “sacramental universe,” cited from the U.S. bishops’ national environmental letter, and “sacramental commons,” originating in the environmental theology work of the Project Writer (the latter concepts would be eliminated from the final pastoral letter, because some of the region’s bishops did not want to extend the idea of “sacramental” to an experience other than that of the Church’s seven ritual sacraments).

After the release of the “Reflection,” bishops in Montana, Oregon and Washington hosted “listening sessions” which generated ideas that were incorporated by the Project Writer into subsequent drafts of the letter. Under the leadership of Bishop Skylstad, the bishops then finalized the letter and issued it on 8 January 2001 as *The Columbia River Watershed: Caring for Creation and the Common Good*. The final document was much reduced in content from its predecessor “Reflection.”

The pastoral letter has an introduction, “Caring for Creation, Community and the Columbia,” and four major sections: historical perspectives on the rivers, which promote in turn analysis of the current situation, reflections on regional history and religious ideals, formulation of a vision for the future, and proposals for concrete actions to realize that vision. The document appended a poem, “Riversong,” authored by the Project Writer.

In the introduction, the bishops expressed their hope to use the pastoral letter as the basis for an effort “to develop and implement an integrated spiritual, social and ecological vision for our watershed home, a vision that promotes justice for people and stewardship of creation” (*Columbia River* pastoral, 1). In balance with the ordinary Christian focus on the *transcendence* of God from creation, the bishops referred to the *immanence* of God in creation, observing, “The watershed, seen through eyes alive with faith, can be a revelation of God’s presence, an occasion of grace and blessing. There are many signs of the presence of God in this book of nature” (*Columbia River* pastoral, 2). The bishops advocated concern for the common good and intergenerational responsibility: “The common good demands a proper respect for the land, the air and the water to assure that when we have passed through this land it remains habitable and productive for those who come after us” (*Columbia River* pastoral, 2). They quoted approvingly Pope John Paul II’s statement that “Christians, in particular, realize that their responsibility within creation and their duty toward nature and the Creator are an essential part of their faith,” (*Columbia River* pastoral, 3), affirming thereby that environmental concern and caretaking are not “add-ons” to Christian conduct but a vital aspect of Christian life. This idea has been a significant contribution to Catholic environmental thought and action.

Part I, “The Rivers of Our Moment,” focused on current

positive and negative aspects of the watershed environment, human relationships and activities, and human interaction with regional ecosystems. The bishops recognized human responsibility to build community and to care for creation: “We are called to relate to people as our neighbors and to our shared place as our common home . . . We are responsible to God and to the community and we are responsible for the creation around us” (*Columbia River* pastoral, 5).

Part II, “The Rivers through Our Memory,” summarized regional history and reviewed Catholic religious traditions. Its focus was on the stewardship of creation, concern for the common good of the human community, and the promotion of “living water” – biblically, this means water flowing free and pure – in the watershed. This idea is, symbolically and concretely, a prophetic stimulus for restoring and conserving the rivers network. The bishops urged people to be in “service to God and to creation” (*Columbia River* pastoral, 7). This notion of *service to creation* expressed a new understanding with profound implications for human conduct. In this section the bishops returned to the theme of God-immanent, paralleling the idea of a “sacramental universe” expressed by the U.S. bishops in their 1991 pastoral letter, *Renewing the Earth*, and implying a new concept of a “sacramental commons”: “As the whole universe can be a source of blessing or revelation of God, so also the commons of a local place can be revelatory” (*Columbia River* pastoral, 8).

The pastoral articulated the Church’s position that Earth’s goods are to be distributed equitably, because God intends the Earth “to provide for the needs of peoples as they live in complex and diverse ecosystems”; people should “distribute property and goods justly” (*Columbia River* pastoral, 8), ensuring that all humans’ needs are met.

Part III, “The Rivers of Our Vision,” proposed that the watershed should be conserved and cared for and its constituent communities – human and biotic – should live in balance. The bishops expressed the hope that “people will recognize the inherent value of creation and the dignity of all living beings as creatures of God” (*Columbia River* pastoral, 11).

Part IV, “The Rivers as Our Responsibility,” suggested ten steps to be taken by individuals and communities to make religious ideals and regional realities congruent in the future:

1. Consider the Common Good
2. Conserve the Watershed as a Common Good
3. Conserve and Protect Species of Wildlife
4. Respect the Dignity and Traditions of the Region’s Indigenous Peoples
5. Promote Justice for the Poor, Linking Economic Justice and Environmental Justice
6. Promote Community Resolution of Economic and Ecological Issues

7. Promote Social and Ecological Responsibility among Reductive and Reproductive Enterprises
8. Conserve Energy and Establish Environmentally Integrated Alternative Energy Sources
9. Respect Ethnic and Racial Cultures, Citizens and Communities
10. Integrate Transportation and Recreation Needs with Sustainable Ecosystem Requirements (*Columbia River* pastoral, 13–17).

These proposed ideas and actions, which are being widely disseminated, have a potential to promote care for creation not only in the bishops' bioregion but in other areas around the globe.

In the watershed itself, however, some individuals and groups strive to privatize public lands such as national forests and wilderness areas, advocating virtually absolute personal and corporate rights to hold and use private property in whatever way they desire. The bishops directly addressed such beliefs: "In the concept of the common good, community and individual *needs* take priority over private *wants*. The right to own and use private property is not seen as an absolute individual right; this right must be exercised responsibly" (*Columbia River* pastoral, 13). Private property is a trust from God to the civil owner for the benefit of the entire community.

When they advocated meeting the needs of the economically dispossessed, the bishops declared that the Church exercises an "option for the poor," a term which originated in the Latin American bishops' 1979 "Puebla Document," and was used subsequently in U.S. bishops' national pastoral letters such as *Economic Justice for All: Catholic Social Teaching and the U.S. Economy* (1986) and *Renewing the Earth*. The Church is called to help the poor to acquire "justice, respect, and an inherent sense of dignity, and to participate in transforming economic and political structures to create a just society and a sustainable environment" (*Columbia River* pastoral, 14–15). In response to harm caused by pollution from mining industry operations and agricultural chemicals runoff, the bishops declared that "People . . . have a right to a clean and healthful environment" (*Columbia River* pastoral, 15), borrowing an expression found in the Montana Constitution.

In the Conclusion, the bishops called for transformation of the region "through community commitments to concrete historical projects" (*Columbia River* pastoral, 18). The bishops declared thereby that ideals should be realized through the considered actions of concerned citizens.

The document received significant public attention, including national media coverage in the U.S. and Canada, and was recognized with a number of awards, including a "Sacred Gifts Award" from the Alliance of Religions and Conservation (ARC) and the World Wide Fund for Nature

(WWF). It has stimulated ongoing watershed educational activities, including an elementary school curriculum module, presentations of project videos to parish groups and civic organizations, and distribution of the pastoral letter to members of state legislatures.

The Columbia River Watershed pastoral has made a significant contribution to Catholic Church teachings on issues of environmental caretaking and economic justice. It stimulated ongoing discussions and debates among diverse constituencies in the watershed, and some of its insights will remain part of the enhanced body of Catholic Church environmental teachings. Even sections that were part of the "Reflection" but not included in the final document are a source of reflection and proposals for action among members of the clergy and the laity, possibly signaling future developments in Catholic environmental thought and action.

Commons and Christian Ethics

The "commons" designates a shared place as well as an ethics of relation within and accountability for that public or civic zone (i.e., "the common good"). Such designation as "the commons" can be applied to various scales of communitarian affiliation – from the town square or "green" to the oceans, atmosphere and planet as "the commons" of all kind. While the concept of the commons does not preclude a sense of territoriality or various

administrative strategies, it does tend to preclude proprietary relationships, especially those of an individual or private interest group. Evocation of the commons attempts in various ways to account for the land or other resource as a living system of reciprocal exchanges and as a community of creatures with and beside human interests. Likewise, the commons extends human ethical accountability beyond private, individual interests and asserts a holistic versus aggregate communal sensibility. Ethically speaking, the concept of the commons has been asserted to argue for the basic right of subsistence sustenance for all creatures. Hence, as an interdependent community, the planet – including Earth’s arteries of air, water, and energy – is the life source of all kind, whether human, plant, animal or insect; since all life depends upon sharing the common or basic elements of life (e.g., fresh water, habitat, and food sources), human interaction with these commons must be maintained with respect “for the common good.” Christianity has often evoked an ethics of the commons, especially as an ideal of resistance to world regimes, though the concept does not inherently purport a means of governance or an essential economic pattern thereby.

Historical Views

In the religious sensibilities of ancient Israel, it was said that “the Earth is the Lord’s” (Ps. 24:1); humanity did not possess the land, but held it in sacred trust. For practical management purposes, the land of Israel was divided among tribes and households. Legal provisions were established in this settled agricultural milieu which periodically occasioned the forgiveness of indebtedness and the release of humans from any indentured position into which they had been economically pressed, so as to redistribute the resources of the land (See: SABBATH-JUBILEE CYCLE). Levitical codes insisted that “[t]he land shall not be sold in perpetuity, for the land is mine [Yahweh’s]; with me you are but aliens and tenants. Throughout the land that you hold, you shall provide for the redemption of the land” (Lev. 25:23–24). Later prophets likewise condemned those who “add house to house and join field to field until everyone else is displaced” (Isa. 5:8). Such legal provisions restored what the priests construed as a sacred trusteeship, a distribution pattern which was apparently intended to guarantee general human access to life sufficiency and accountability for soil management. While the mention of the commons and the common good date back in biblical texts to the reconstruction of the Second Temple (Neh. 2:18), references become more frequent in intertestamental literature (2 Macc. 11:15, Wis. 7:3) and in the literature of the first century (Acts 2:44–45, 4:32 in addition to what follows). The Jesus movement of the first century was generated in reaction to the effects of the combined colonizing tendencies of the ancient Hasmonean reign, the Herodian Temple state, and the Pax Romana upon the region of Galilee. Invoking “the kingdom of God” or the

God-governed commons as a material resistance strategy to the hegemony of empires, Jesus compared the economic flow of divine providence – construed by him as the flow of natural light without architectural direction as in a sanctuary; living or naturally free-flowing water, unconstrained by aqueducts; wild foods outside of the systems of tithing and taxation; bodies outside of patri-lineage; the exchange of wisdom without rabbinic oversight or instruction – to the economic patterns created by the imperial rule of Herod Antipas, who was in collusion with Rome and its multinational systems of trade and oversight. Positioning “God’s Great Economy” against the “big economy” of the Pax Romana and its Herodian collaborators not only challenged the presumptive totality of its world scale; Jesus also thereby created an economic circulation among the displaced which exited the imperial structures – if not wholly, at least in ways that resisted the flow of imperial goods. This movement created a new kingdom within, but also a subversion of the prevailing world empire.

Others of the Jesus movements appealed to the ancient ethic of freedom for debt-slaves so as to decolonize the land fallen under the impress of Rome – the first society not to cancel debts. So the author of the Gospel of Luke, for example, later in the first century, framed the practice of Christian ministry, figured in and through the person of Jesus, as that of a Jubilee, as an act of land redemption (Luke 4:18–19).

Paul, another early first-century apostle with the Jesus movements, asserted a certain ethics of living in community (*koinonia*) when instructing Corinthians who were divided by class differences: since all are interrelated, all should act “for the common good” (1 Cor. 1:9, 12:7). Yet if Athenian democracy presumed the common good to be well dispensed from the headquarters of propertied and educated males and wealthy Corinthians were somehow imitative of such an hierarchy, Paul eschews their somatic governance model (1 Cor. 12:14–26). Paul’s resistant evocation of *koinonia* suggested that the adjudication of the common good proceed rather by inverting the value hierarchy: value should be given to the constituents of “the body” generally conceived to be of low status, the so-called “weaker” and less honorable and less beautiful members of the body.

While the Christian Church itself was, from the third century on, numbered among landowners, significant Christian voices throughout late antiquity (e.g., the patristic theologians Basil the Great, Clement of Alexandria and Ambrose) maintained the moral, philosophical teaching of the commons. The fourth-century theologian Ambrose, Bishop of Milan, declared that “God has willed this Earth to be the common possession of all and its fruit to support all.” Indeed, “God has created everything in such a way that all things be possessed in common. Nature is therefore the mother of common right . . .” (in Avila 1983: 74).

Basil dispensed the philosophical conviction that distinguished *ta koina*, the environment of labor, which individuals had no right to own, from *ta idia*, that which was a product of one's labor (e.g., ornament, craft, tool, etc.). Further, where the rich become richer and the poor poorer, John Chrysostom – building specifically upon the Pauline commitment to *koinonia* – surmised that two interrelated conditions occasioned economic injustice: 1) private ownership of land, which began under the aegis of Roman law, and 2) the enslavement of laborers, which he considered an inherent tenant of private ownership of land. While Christian ascetic discipline limited the number of personal goods (cloak, staff, clothes on your back, food bowl, etc.), the philosophy of the commons named the “theatre” of land, water, the winds, rain and sun, for which no one – Basil insisted – could claim the labor of origination (Avila 1983).

Christian movements, like the seventeenth-century English Diggers and early North American utopian experiments, which presumed shared land as the basis of community, leaned back into this sensibility of the commons. During the seventeenth-century enclosure of the English commons by feudal lords, the philosophy of the commons was considered a lower-class heresy. Gerard Winstanley, a failed tradesperson, had a vision telling him to publish abroad that “the Earth should be made a common treasury of livelihood to the whole [of hu-]mankind, without respect of persons” (in Hill 1991: 112). Known as “the Diggers,” his community actively opposed the aristocratic conscription of the commons by cultivating and settling St. George's Hill. Making manuring of this commons a sacramental act, those dislocated by royalist enclosure of the lands there set up an agrarian community of the dispossessed. An act repeated throughout southern and central England, the Diggers reclaimed the commons of forests and cultivated agricultural fringes. By 1650, they added the demand that church land be turned over to the poor. Equating private property with “the original cause of sin” and commenting on Romans 8, Winstanley wrote: “They that are resolved to work and eat together, making the Earth a common treasury, doth join hands with Christ to lift up the creation from bondage and restore all things from the curse” (in Hill 1991: 129). For Winstanley, true religion was founded upon the egalitarian state of nature and true freedom developed as an extension of the social relations of the commons.

In his assessment that human “covetousness” held the Earth in bondage, Winstanley echoed the Reformer Martin Luther's notion of the “covetous imagination.” Frederick Engels, a reader of Luther, suggested that such covetousness infected not just the human heart, but was built up into perduring social patterns. Engels in his classic outline of human social evolution, *The Origin of the Family, Private Property, and the State*, associated private property with the economic development of animal husbandry

and the familial development of father-to-son inheritance, giving this genealogy of patrilineal exchange of private property something of the connotation of the classic Christian doctrine of “the Fall.” Marxist communism, a hybrid reading of philosopher G.W.F. Hegel's Spirit-enthused idealism infused with Native North American tribal philosophy of the commons, might be understood as one recent historical attempt at encouraging the reemergence of the commons. Even as it must be admitted that the communist experiment failed because of authoritarian, state control thereof, that philosophical Marxism was a tool of liberation theology, for positioning its contention of God's preferential option for the poor, may indicate that liberation theology too shares in the spirit of this claim to the commons.

Recent Christian Theological Evocations

Contemporary invocations of “the [global] commons,” a refrain of Christian eco- and liberation theologians among others, pose a moral, ethical and philosophical challenge to the prevailing Roman legal model of private property, which undergirds global capitalism and the extension of “property rights” into the domains of knowledge, seed stocks and human genomes, air waves, space and cyberspace. With the inception of the Roman legal system, private property became the legally defined and protected land ethic, a norm which spread with colonization and therefore in the company of Western Christianity. Enclosure of the global commons has been particularly detrimental to indigenous peoples, who claim a tradition of relating to the land as commons (Weaver 1996; Charleston 1998), and to women who, according to United Nations statistics, own less than 1 percent of the planet's arable land.

Often today evoked as a political wager and religious warrant to create alternative civic pockets and alternative circulatory systems for resource distribution, the metaphor of the commons exists within theological circles as principally that – namely, as a fertile symbol which, like a buoy, marks a philosophical ideal that has not yet been carefully reworked into contemporary theological teaching or a practical ethic, but hopes to be materialized here and there as subversions to economic imperialism. Such an ethical commitment is ritually enacted in Christian circles where the eucharistic sacrament or “communion” is defined as a “sharing of the common elements.” Frequent references to *koinonia* (“community”) within Christian practice (ancient as well as contemporary) and theo-ethical reflection around the notion of “the common good” carry within them remembrance of “the commons” submerged within Christian spiritualities. Inasmuch as Western Christians have inherited an Augustinian revulsion at the level of need and necessity as tying one to the Earth and the mind to practical affairs, resurfacing the theology of the commons returns basic

matters of survival and sustainability to the theo-ethical agenda.

Sri Lankan theologian Tissa Balisuriya in his work *Planetary Ecumenism* has charged the Western world with land apartheid, for enclosing – through immigration law – the most productive agricultural land of North America, while conscripting the mass of humanity to marginal lands. Larry Rasmussen’s evocation of planetary “ecumenacy,” in his book *Earth Ethics, Earth Community*, can be seen as analogically parallel the notion of “the commons.” Leonardo Boff, agreeing with the conviction that “poverty is our main environmental problem,” critiques the way in which power has decided access to necessities and proposes a new model of society, which finds the supreme good in earthly and cosmic integrity. Interpreting the Trinity as a symbol of the communion of the God-hood, Boff urges Christian spiritual mysticism to take up the practical labor of reconstructing patterns of sharing and living within nature’s systems of reciprocity. Sun Ai Lee-Park reads the biblical story of the Tree of Life at the center of the Garden of Eden to support the contention that “the source of life” – that is, the vital and basic systems of life exchange (food, water, shelter) – need to be kept open to all creatures. Genesis Farm – recognizing that as more and more life interchanges are forced through the monetary system, the human social community experiences greater chasms of inequality – has planted a hillside with an orchard that allows persons in its agricultural cooperative as well as visitors to its educational center to “Come eat, without money . . .” (Isa. 55:1–2). This orchard, literally a “free for all,” helps the human community remember the organic, material ideal of the land commons.

Wielding prophetic critique, Christians evoke the commons so as to generate legal and political moves to withhold entities and knowledge from the market, to open value outside of the tide of economic commodification. Engels ended his essay on the history of private property with the conclusion – more hope than historical observation – that “[a] mere property career is not the final destiny of [hu]mankind” (Engels 1972: 166). “The commons” as a communitarian land ethic, as a philosophical and symbolic ideal, has had various material incarnations as well as a long history of political resistance to world-totalizing regimes. Calling upon this powerful political valency, contemporary assertions of “the commons” attempt to evoke a new human relationship to various unclaimed or non-patented though threatened life regions. Rolling the discontent of global economic injustice around ancient and reconstructed memories, the concept of the commons yearns toward a new moral ethic, if not a new economic model, which promises access to a sustainable livelihood for all kind.

Community Supported Agriculture

Agricultural practices worldwide in the past four decades have moved away from community-based, diversified farms toward a globally integrated industrial food system. This has been especially true of the industrialized nations of the North. One result of this is that fewer and fewer

people know where or how food is produced and what kinds of agricultural practices are involved. Community Supported Agriculture (CSA) emerged originally in Japan and shortly thereafter in several European nations in the late 1960s and 1970s in response to these trends. In Japan, groups of consumers concerned about food production began to approach agricultural producers with the proposal that they buy directly from the producers in exchange for having the food raised using sustainable agricultural practices and no artificial chemicals. By the mid-1980s, two farms in the eastern U.S. began practicing Community Supported Agriculture. Today there are over 1000 CSA projects in the U.S., and the numbers continue to grow.

A key feature of Community Supported Agriculture is building direct partnership between the farmer and the consumer. The farmer or organizing members plan a budget that includes costs of production, salary, distribution, administration and organizational costs. This determines the number of members that a CSA can support and the price of a membership or share. Consumers buy a share in the CSA and receive the return on their "investment" in the form of weekly portions of food during the growing season. In this way consumers share the risk of farming sustainably with the farmer: in good years bountiful harvests provide greater quantities of food to members, while in poor years, consumers and farmers share in the loss of any particular crop. The producer receives payment at the beginning of the season, which prevents the need for springtime operating loans and provides a guaranteed income for the farmer's labor.

Community Supported Agriculture fosters the integration of several important dimensions of an ecological ethic:

- CSAs serve to link rural and urban dwellers in a particular region through sustainable food production. They counter the trend toward centralized and concentrated food systems and social systems that cause damage to both local ecosystems and the human communities within them. They consciously seek to produce food for humans by working within the natural rhythms and capacities of the land. They strengthen local communities by allowing farmers to live on the land while linking the land and food production to the rest of us. Many CSAs stress education about sustainable food production and either invite or require some participation of their members in the farming practices so that the knowledge base about food and its production increases. The importance of *culture* in agriculture is retained and strengthened.
- CSAs stress that everyone invests time and money in food consumption; *where* this investment goes and *who* and *what* practices support it can either foster an ecologically aware and sustainable relation to the land

or further human alienation from the land and ecologically viable lifestyles.

- An integral part of the CSA ethic is a spiritual dimension. One CSA in Iowa includes in its description of CSAs this phrase: "CSAs seek to reconnect people with the Earth, the rhythms and beauty of nature, and the physical and spiritual rewards of direct contact with the soil." Many CSA producers and consumers cite spiritual or religious commitments as among the reasons why they are involved in CSAs. The frameworks or spiritualities tend to group broadly into two categories: stewardship convictions rooted in the Judeo-Christian tradition that humans are to be loving stewards of God's gifts of creation, and more Earth-based spiritualities that discern a sacred dimension in the Earth and its rhythms itself, and try to farm in ways that are harmonious with these energies.

Complexity Theory

Also known as chaos or catastrophe theory, complexity theory is primarily a development of the Santa Fe Institute in New Mexico that focuses upon the predominant non-linear processes of change operating in economics, physics, biology, computer sciences, social dynamics and the cosmos in general. The sciences of complexity are primarily concerned with the emergent principle of spontaneous self-organization in which the whole becomes something more than the simple sum of its parts.

At present, complexity science as developed by the likes of Murray Gell-Mann, Kenneth Arrow, Ilya Prigogine, Daniel Stein, Arthur Brian, John Holland, Stuart Kauffman, Christopher Langton, Doyne Farmer and Philip Anderson among others has been applied essentially to mechanics and social and political theory, but in principle it is equally applicable to understanding spiritual and green consciousness as products of natural evolution as well as possible reasons behind successful anti-environmental efforts. From the perspective of nature and religion, the Gaia principle of James Lovelock, and the notion of increasingly complex fields of consciousness as spontaneous consequences of uncorrupted and balanced natural development, conform to the explicative dynamics offered by complexity theory. To date and in general, the theory has yet to influence significantly “green” ways of thinking. But it retains potential in providing motivation, spiritual resource or rationale for deployment toward nature conservation.

In both the natural and behavioral sciences, the ability to predict greater than chance has been the bedrock of traditional scientific methodology comprising observation, logical/mathematical analysis, hypothesis and experiment, but with the increased recognition of complexity within both the natural and social worlds, complexity theory argues that, rather than forecast accurately the likely shapes of future development, it is more if not only possible to retrodict (determine causality *ex post facto*) from a situation that has already occurred on how that particular event came to pass. In essence, complexity theory is predicated upon 1) Einstein’s demolishing of Newton’s concepts of absolute space and time; 2) Heisenberg’s understanding of indeterminacy as a fundamental principle that disallowed Laplace’s contention that one could know simultaneously both the position of a particle and its velocity; 3) quantum theory that extends the perception of light as sometimes functioning like waves and sometimes like particles to other fields of physics; and 4) the ideas of deterministic chaos that refute the basis of macroscopic determinism, namely, that even with a small number of objects, their fundamental physics makes long-term prediction impossible.

Consequently, complexity theory comprehends nature both with our terrestrial planet and throughout the universe as not only extremely complicated but also highly adaptive, undergoing sudden phase transitions or upheavals at the edge of chaos, nonlinearly dynamic, spontaneously self-organizing and emergent. This comprehension, however, undermines science in general and the social sciences in particular by challenging the laws of cause and effect as the foundational basis for a means and method of explanation. Spontaneous self-organization working with ever-increasingly complex building blocks leads to new and unpredictable properties – with a resultant totality that exceeds any understanding of its

individual components. Because the significant factor in natural processes is iteration or repeated feedback allowing any given system through multiple folding back onto itself to have both the range and time to exhibit new properties and organizational forms, Frederick Turner (Eve, et al. 1997: xv, xxiv) adds nonlinear dynamic modelling as a new fifth tool of complexity science along with observation, analysis, theorizing and demonstrable testing.

According to Charles Jencks (1995: 37), the complexity understanding sees that the universe is ever increasing in information or negentropy. This production of negative entropy counters the second law of thermodynamics that holds instead that information (including heat or energy) will disappear rapidly as entropy inevitably increases to maximum. Nevertheless, along with such concepts as increasing returns, unpredictability and the immense historical consequences understood possibly to result from tiny events (e.g., hurricanes in Florida following from the flapping of butterfly wings in Saudi Arabia), complexity theory also embraces the notion of lock-in, namely, the entrenched establishment of a less advantageous situation that becomes the norm. Examples of negative feedback patterns of lock-in include the QWERTY/AZERTY keyboard layout, the VHS videotape format over the Beta design, gasoline-powered internal combustion over the steam engine, and light-water reactors over gas-, heavy-water-, or liquid-sodium-cooled nuclear power systems.

Even in cases of lock-in, however, the retrodictable explanation is one that makes sense, and for complexity theorists this in turn is part of the process of emergent properties and new forms of organization that can be understood in terms of freedom. Complexity freedom differs from the existential freedom of gratuitous chance and capricious fancy. Instead, the freedom of unpredictability is both the underlying simplicity of turbulent self-organizing feedback and the natural survival advantage inherent in redundant proliferation of unintended backup systems. In understanding complexity science as the cybernetics of effective organization, and in the face of realizing time to be irreducible, irreversible and asymmetrical, a new catalogue of forms emerges: irregularity, discontinuity, tendency toward fragmentation, self-similarity, scaling symmetries, infinite depth within a bounded domain, a three-dimensional look and a characteristic “style.” Complexity theory refers to these collectively as the basic “strange attractor” or fractal form embedded in any nonlinear feedback process. It is the strange attractor that allows systemic “free choice” as well as the understanding that nonlinear historical processes are primary – with the abstract laws of science being generated *from* the iteration of dynamic processes rather than the operations necessarily having to conform to pre-established scientific patterns.

Complexity theory, therefore, comprehends nature as

an unbounded and perpetual feedback process of self-organization. Consciousness itself is understood as an emergent property of nature rather than a transcendent originator beyond space and time. The teleological emergence of both functional structure and sentience from inert matter is expressive of a spontaneous generative inclination inherent in physical reality. Some complexity theorists have recognized this creative tendency as an incipient inclination toward spiritual development that is internal to nature. In other words, the spiritual is a natural development, a built-in feature, integral to the energy-matter matrix that is our cosmos. It comprehends how we as human beings become something more than merely the sum of our bodily parts, how our planet emerges as a self-regulating biosystem and even that a collective consciousness such as is currently being monitored by the Princeton Institute might increasingly become an apparent operative.

Composting

"All my life I had waited for an inspiration, a manifestation of God, some kind of a transcendent, magic experience that could show me my place in the universe. This experience I made with my first compost," the American singer Bette Midler replied when she was crowned as the "queen of compost" in Germany in 1994.

Compost is a mixture of decomposed vegetable or animal matter that is collected in an open or closed container in order to transform "dead" matter into fertilizing

substance. While Midler found in it her place in the universe, many environmentalists use it as a central symbol for the cycle of nature.

In earlier agriculture, composting was a natural part of the recycling of substances, while late modern green spirituality, especially within the Green Death Movement, also includes the notion of humans as being between birth, death and rebirth in the cyclical worldview represented by the compost container in the garden or the flat. Critiquing modern society, compost also serves for the revaluing of garbage, shit and waste that are turned into nearly sacred artifacts representing the flow of nature. Environmentalists sometimes even wish to be buried in their compost, resting in Mother Earth.

Pre-modern religions include differentiated understandings of the planet's surface (e.g., the Earth as mother), while modern worldviews have forgotten or eliminated these. A look at biblical and classical traditions in Christianity shows that the Earth was regarded as in cooperation with God in regard to the history of salvation. The Earth took care of the dead bodies until their final resurrection. Ancient beliefs in the goddess Gaia were transformed by the early church into an understanding of the Earth as a holy element of the Spirit's life-giving. The modern culture of composting in rich and poor countries alike should be regarded as a strong religious symbol for a new cyclic way of understanding life in general and the human bodily self concerning it. The cycle of life, from birth to flourishing to a death which gives new conditions for furthering life, could easily be experienced as a transformative material, social and religious praxis.

Composting is strongly encouraged and legitimized through green ideologies in many nations' environmental policies. Composting can reduce garbage volumes up to 80 percent. Through the practice of composting, the diminishing layer of productive Earth for farming could again be increased, especially in the Third World. Pedagogical programs for the education of teachers and children have been developed around composting. Christian churches in East Germany, Finland and Sweden, for example, have developed a "com-post-modern theology" (a term coined by S. Bergmann) where gardeners, priests and politicians have reflected on and renewed the material flow in various parishes.

Confucianism

Confucianism has conventionally been described as a humanistic tradition focusing on the roles and responsi-

bilities of humans to family, society, and government. Thus, Confucianism is identified primarily as an ethical or political system of thought with an anthropocentric focus. However, upon further examination and as more translations become available in Western languages, this narrow perspective needs to be reexamined.

Some of the most important results of this reexamination are the insights that have emerged in seeing Confucianism as not simply an ethical, political, or ideological system. Rather, Confucianism is being appreciated as a profoundly religious tradition in ways that are different from Western traditions. This may eventually result in expanding the idea of “religion” itself to include more than criteria adopted from Western traditions such as notions of God, salvation, and redemption. Moreover, Confucianism is being recognized for its affirmation of relationality, not only between and among humans but also with humans and the natural world.

The Confucian worldview might be described as a series of concentric circles where the human is the center, not as an isolated individual but as embedded in rings of family, society, and government. This is especially clear in the ancient text of the *Great Learning (Daxue)* which is a chapter from the *Book of Rites (Liji)*, one of the Confucian classics compiled over 2000 years ago. All of these circles are contained within the vast cosmos itself. Thus the ultimate context for the human is the “10,000 things,” nature in all its remarkable variety and abundance.

Historical Development

We can identify four major periods of Confucian thought and practice. The first stage is that of classical Confucianism, which ranges from approximately the sixth century B.C.E. to the second century before the Common Era. This is the era of the flourishing of the early Confucian thinkers, namely Confucius and Mencius. The second period is that of Han Confucianism when the classical tradition was shaped into a political orthodoxy under the Han empire (202 B.C.E. – 220 C.E.) and began to spread to other parts of East Asia. The Han period saw the development of the theory of correspondences of the microcosm of the human world with the macrocosm of the natural world. The third major period is the Neo-Confucian era from the eleventh to the early twentieth century. This includes the comprehensive synthesis of Zhu Xi in the eleventh century and the distinctive contributions of Wang Yangming in the fifteenth and sixteenth centuries. The influence of both Confucianism and Neo-Confucianism as an educational and philosophical system spread beyond China and shaped East Asian societies especially Korea and Japan, along with Taiwan, Hong Kong, and Singapore.

In the twentieth century a fresh epoch of Confucian humanism has emerged called “New Confucianism.” This represents a revival of the tradition under the influence of

scholars who came to Taiwan and Hong Kong after Mao’s ascendancy in 1949. Mao felt that Confucianism was essentially a feudal tradition, anchored in history, and that for his ideas to flourish a radical break must be made with the past. The anti-Confucian campaigns during Mao’s rule were virulent, especially in the Cultural Revolution of the 1960s and 1970s. However, after Mao’s death, there was a resurgence of interest in Confucian values, some of this encouraged by the government. Indeed, the International Confucian Society held two major conferences in Beijing and in Confucius’ birthplace, Qufu, to explore the future of the Confucian Way in 1989. These conferences were held to commemorate the 2540th anniversary of Confucius’ birth and marked a renewed interest in Confucianism to balance the unsettling effects of the rapid industrialization and modernization of China.

Major Thinkers and Texts

The acknowledged founder of the Confucian tradition was known as the sage-teacher Kongzi (551–479 B.C.E.). His name was Latinized by the Jesuit missionaries as Confucius. Born into a time of rapid social change, Confucius was concerned with the goal of reestablishing political and social order through rectification of the individual and the state. The principal teachings of Confucius are contained in his conversations recorded in the *Analects*. Here he emphasized the cultivation of moral virtues, especially humaneness (*ren*) and the practice of civility or ritual decorum (*li*), which includes filiality (*xiao*). Virtue and civility were exemplified by the noble person (*junzi*) particularly within the five relations, namely, between ruler and minister, parent and child, husband and wife, older and younger siblings, and friend and friend. The essence of Confucian thinking was that to establish order in the society one had to begin with harmony, filiality, and decorum in the family. Then, like concentric circles, the effects of virtue would reach outward to the society. Likewise, if the ruler were moral, it would have a ripple effect on the rest of the society and to nature itself, like a pebble dropped into a pond.

At the heart of this classical Confucian worldview was a profound commitment to humaneness and civility. These two virtues defined the means of human relatedness as a spiritual path. Through civility, beginning with filiality, one could repay the gifts of life both to one’s parents and ancestors and to the whole natural world. Through humaneness one could extend this sensibility to other humans and to all living things. In doing so one became more fully human. The root of practicing humaneness was considered to be filial relations. The extension of these relations from one’s family and ancestors to the human family and to the cosmic family of the natural world was the means whereby these primary biological ties provided a person with the roots, trunks, and branches of an interconnected spiritual path. Humans, nature, and the cosmos

were joined in the stream of filiality. From the lineages of ancestors to future progeny, intergenerational connections and ethical bonding arose. Reverence and reciprocity were considered a natural response to this gift of life from parents and ancestors. Analogously, through reverence for Heaven and Earth as the great parents of all life, one realized one's full cosmological being and one's place in the natural order.

Confucian thought was further developed in the writings of Mencius (ca. 385–312 B.C.E.) and Xunzi (ca. 310–219 B.C.E.), who debated whether human nature was intrinsically good or evil. Mencius' argument for the inherent goodness of human nature gained dominance among Confucian thinkers and gave an optimistic flavor to Confucian educational philosophy and political theory. This perspective influenced the spiritual aspects of the tradition as well because self-cultivation was seen as a means of uncovering this innate good nature. Mencius contributed an understanding of the process required for self-cultivation. He did this by identifying the innate seeds of virtues in the human and suggesting ways in which they could be cultivated toward their full realization as virtues. Analogies taken from the natural world extended the idea of self-cultivation of the individual for the sake of family and society to a wider frame of reference that also encompassed the natural environment. This can be described as a path of botanical cultivation. In addition to his teachings on personal cultivation, Mencius advocated humane government as a means to promote the flourishing of a larger common good. His political thought embraced appropriate agricultural practices and proper use of natural resources. Mencius taught:

If the agricultural seasons are not interfered with, there will be more grain than can be eaten. If close-meshed nets are not allowed in the pools and ponds, there will be more fish and turtles than can be eaten. And if axes are allowed in the mountains and forests only in the appropriate seasons, there will be more timber than can be used . . . this will mean that the people can nourish their life, bury their dead, and be without rancor (in DeBary and Bloom 1999: 118).

In particular, he urged that the ruler attend to the basic needs of the people and follow the way of righteousness not profit.

Xunzi contributed a strong sense of the importance of ritual practice as a means of self-cultivation. He noted that human desires needed to be satisfied and emotions such as joy and sorrow should be expressed in the appropriate degree. Rituals provided the form for such expression in daily human exchange as well as in rites of passage such as marriage and death. Moreover, because Xunzi saw human nature as innately flawed, he emphasized the need for education to shape human nature toward the good.

Finally, he had a highly developed sense of the interdependent triad of Heaven, Earth, and humanity that was emphasized also by many later Confucian thinkers. He writes: "Heaven has its seasons; Earth has its riches; humans have their government." (Heaven was understood as the guiding force of the Universe and Earth as the natural world within which humans lived and flourished.)

Confucianism blossomed into a Neo-Confucian revival in the eleventh and twelfth centuries that resulted in a new synthesis of the earlier teachings. The major Neo-Confucian thinker, Zhu Xi (1130–1200), designated four texts from the canon of historical writings as containing the central ideas of Confucian thought. These texts and Zhu Xi's commentaries on them became, in 1315, the basis of the Chinese civil service examination system, which endured for nearly six hundred years until 1905. Every prospective government official had to take the civil service exams based on Zhu Xi's commentaries on the Four Books. The idea was to provide educated, moral officials for the large government bureaucracy that ruled China. The influence, then, of Neo-Confucian thought on government, education, agriculture, land, and social values was extensive. Views regarding nature, agriculture and management of resources were derived from Neo-Confucian understandings of the importance of humans' working to cultivate and care for nature as a means to fulfill their role in the triad of Heaven and Earth.

Zhu Xi's synthesis of Neo-Confucianism was recorded in his classic anthology, *Reflections on Things at Hand (Jinsilu)*. In this work Zhu formulated a this-worldly spirituality based on a balance of cosmological orientation, ethical and ritual practices, scholarly reflection, and political participation. The aim was to balance inner cultivation with outward investigation of things in concert with the dynamic changes of the natural world. Zhu Xi affirmed these changes as the source of transformation in both the cosmos and the person. Thus Neo-Confucian spiritual discipline involved cultivating one's moral nature so as to bring it into harmony with the larger pattern of change in the cosmos. Each moral virtue had its cosmological component. For example, the central virtue of humaneness was seen as the source of fecundity and growth in both the individual and the cosmos. By practicing humaneness, one could effect the transformation of things in oneself, in society, and in the cosmos. In so doing, one's deeper identity with reality was recognized as forming one body with all things. As the *Doctrine of the Mean* stated: ". . . being able to assist in the transforming and nourishing powers of Heaven and Earth, one can form a triad with Heaven and Earth" (in De Bary and Bloom 1999: 338).

Confucian Relationality and Nature

From the classical texts to the later Neo-Confucian writings there is a strong sense of nature as a relational

whole in which human life and society flourishes. Indeed, Confucian thought recognizes that it is the rhythms of nature that sustain life in both its biological needs and socio-cultural expressions. For the Confucians the biological dimensions of life are dependent on nature as a holistic, organic continuum. Everything in nature is interdependent and interrelated. Most importantly, for the Confucians nature is seen as dynamic and transformational. These ideas are evident in the *Book of Changes* and are expressed in the *Four Books*, especially in *Mencius*, the *Doctrine of the Mean*, and the *Great Learning*. They come to full flowering in the Neo-Confucian tradition of the Song (960–1276) and Ming periods (1368–1644). Nature in this context has an inherent unity, namely, it has a primary ontological source (*Taiji*). It has patterned processes of transformation (*yin/yang*) and it is interrelated in the interaction of the five elements and the 10,000 things. Nature is dynamic and fluid with the movements of (*qi*) material force.

For the Confucians, humans are “anthropocosmic” beings not anthropocentric individuals. The human is viewed as a microcosm in relation to the macrocosm of the universe. This is expressed most succinctly in the metaphor of humans as forming a triad with Heaven and Earth. These relations were developed during the Han period with a complex synthesis of correlative correspondences involving the elements, directions, colors, seasons, and virtues. This need to consciously connect the patterns of nature with the rhythms of human society is very ancient in Confucian culture. It is at the basis of the anthropocosmic worldview where humans are seen as working together with Heaven and Earth in correlative relationships to create harmonious societies. The mutually related resonances between self, society, and nature are constantly being described in the Confucian texts and are evident in art and architecture as well.

For Confucians, nature is not only inherently valuable, it is morally good. Nature, thus, embodies the normative standard for all things; it is not judged from an anthropocentric perspective. There is not a fact/value division in the Confucian worldview, for nature is seen as an intrinsic source of value. In particular, value lies in the ongoing transformation and productivity of nature. A term repeated frequently in Neo-Confucian sources is *sheng sheng* reflecting the ever-renewing fecundity of life itself. In this sense, the dynamic transformation of life is seen as emerging in recurring cycles of growth, fruition, harvesting, and abundance. This reflects the natural processes of flourishing and decay in nature, human life, and human society. Change is thus seen as a dynamic force with which humans should harmonize and interact rather than withdraw from.

In this context, the Confucians do not view hierarchy as leading inevitably to domination. Rather, they see that value rests in each thing, but not in each thing equally.

Everything in nature and society has its appropriate role and place and thus should be treated accordingly. The use of nature for human ends must recognize the intrinsic value of each element of nature, but also its value in relation to the larger context of the environment. Each entity is considered not simply equal to every other; rather, each interrelated part of nature has a particular value according to its nature and function. Thus, there is a differentiated sense of appropriate roles for humans and for all other species. For Confucians, hierarchy is seen as a necessary way for each being to fulfill its function. In this context, then, no individual being has exclusive privileged status in relation to nature. Rather, the processes of nature and its ongoing logic of transformation (*yin/yang*) is the norm that takes priority for the common good of the whole society.

Confucians were mindful that nature was the basis of a stable society and that without tending nature carefully, imbalance would result. There are numerous passages in *Mencius* advocating humane government based on appropriate management of natural resources and family practices. Moreover, there are various passages in Confucian texts urging humans not to wantonly cut down trees or kill animals needlessly.

Indeed, the Confucians realized that the establishment of humane society, government, and culture inevitably results in the use of nature for housing, for production, and for governance. In this sense, Confucians might be seen as pragmatic social ecologists (rather than deep ecologists) who recognize the necessity of forming human institutions – both educational and political – for a stable society. These ideals, however, did not prevent deforestation historically, which increased drastically in the modern era due to rapid industrialization and population growth. Nonetheless, it is clear that for Confucians human cultural values and practices are grounded in nature and part of its structure, and thus humans are dependent on its beneficence. In addition, the agricultural base of Confucian societies has always been recognized as essential to the political and social well-being of the country. Humans prosper by living within nature’s boundaries and are refreshed by its beauty, restored by its seasons, and fulfilled by its rhythms. For Confucians, human flourishing is thus dependent on fostering nature in its variety and abundance; going against nature’s processes is self-destructive. Human moral growth means cultivating one’s desires not to interfere with nature but to be in accord with the great Dao of Nature. Thus the “human mind” expands in relation to the “Mind of the Way.”

In short, for Confucians, harmony with nature is essential, and human self-realization is achieved in relation to nature. The great triad of Confucianism, namely, Heaven, Earth, and humans, signifies this understanding that humans can only attain their full humanity in relationship to both Heaven and Earth. This became a foundation for a

cosmological ethical system of relationality applicable to spheres of family, society, politics, and nature itself.

It is certainly the case that both historically and in the modern period the inevitable gap between ideal principles and pragmatic decisions has caused considerable damage to China's natural environment. In the last fifty years this is due to economic exploitation of resources along with population growth and Maoist ideology that rejected Confucianism and favored modernization at any cost. At present the large-scale industrialization that is occurring in China with few restraints will no doubt cause irreparable damage to China's natural inheritance but will also adversely affect the global commons. With the renewed interest in Confucian thought after several decades of its eclipse under Mao there may be grounds for an indigenous Confucian (and Daoist) approach to environmental protection.

SP Confucianism and Environmental Ethics

Historically, the influence of Confucianism has been significant across East Asia in political thought and institutions, social relationships and ritual exchange, educational philosophy and moral teaching, cultural attitudes and historical interpretation. Indeed, Confucian values still play an important part in East Asian life despite the striking inroads of Maoism, modernization, and Westernization. Although we are concerned here with the potential positive contribution of Confucianism to environmental thought, acknowledgment is made of the inevitable gaps between theories and practices, historically and at present. We are aware that historically the record is quite mixed regarding protection of the environment in China and further research needs to be done in this area. This article will point toward the resources Confucianism holds for values toward nature and environmental ethics. However, in light of the contemporary environmental crisis, viewing Confucianism as a singular tradition is problematic because of its geographic spread, its historical development, and its varied forms, ranging from Imperial State Confucianism to local and familial Confucianism.

Nonetheless, while clearly Confucianism has enormous historical variations, cultural particularities, and national differences, there are certain central ideas and values that have spread across East Asia from China through Korea and to Japan. These ancient values constitute key elements of the tradition that have endured despite historical changes and political upheavals. They are major resources for contemporary environmental ethics in East Asia as well as for an emerging global ethics. These include: a dynamic cosmological context or worldview for promoting harmony amidst change; the embeddedness of each person in concentric circles of relationships and ethical responsibilities; the importance of the family including past, present, and future generations; the function of a hierarchical social system where loyalties to elders and to teachers are critical; the significance of education in cultivating the individual, enriching the society, and contributing to the political order; and the role of government in establishing a political bureaucracy for ruling large numbers of people. These values will be discussed in relation to their potential contribution to environmental thought.

Of singular importance in these discussions is the rich cosmological worldview of Confucianism that promotes harmony amidst change. This is an invaluable perspective for seeing nature as intrinsically valuable and for understanding the role of the human in relation to natural processes as critical. This worldview is characterized by four key elements: an anthropocosmic rather than an anthropocentric perspective, an organic holism of the continuity of being, a dynamic vitalism of material force (*qi*),

and a comprehensive ethics embracing both humans and nature.

By “anthropocosmic” we refer to the great triad of Heaven (a guiding force), Earth (nature), and humans. This idea is central to Confucian thought from its earliest expressions in the classical texts to its later developments in Neo-Confucianism that arose in the eleventh century. The seamless interaction of these three forces contrasts markedly with the more human-centered orientation of Western traditions where personal salvation in relation to a divine figure is central.

By “organic holism” the universe is seen as unified, interconnected, and interpenetrating. Everything interacts and affects everything else, which is why the notion of microcosm and macrocosm is so essential to Chinese cosmology. The elaboration of the interconnectedness of reality can be seen in the correspondence of the five elements with seasons, directions, colors, and even virtues. This type of classification began in the third millennium B.C.E. and resulted in texts such as the *Yijing (Book of Changes)*. This sense of holism is characterized by the view that there is no creator God behind the universe. Chinese thought is less concerned with theories of origin or with concepts of a personal God than with the perception of an ongoing reality of a self-generating, interconnected universe described by Tu Weiming as a “continuity of being.”

“Dynamic vitalism” refers to the basis of the underlying unity of reality that is constituted of *qi*, the material force of the universe. This is the unifying element of the cosmos and creates the basis for a profound reciprocity between humans and the natural world. Material force (*qi*) as the substance of life is the basis for the continuing process of change and transformation in the universe. The term *sheng-sheng*, namely, “production and reproduction” is repeatedly used in Confucian texts to illustrate the creativity of nature. This recognition of the ceaseless movement of the cosmos arises from a profound meditation on the fecundity of nature in continually giving birth to new life. Furthermore, it constitutes a sophisticated awareness that change is the basis of the interaction and continuation of the web of life systems – mineral, vegetable, animal, and human. Finally, it celebrates transformation as the clearest expression of the creative processes of life with which humans should harmonize their own actions. In essence, human beings are urged to “model themselves on the ceaseless vitality of the cosmic process.”

Confucian ethics in its most comprehensive form relies on a cosmological context of the entire triad of Heaven, Earth, and humans. Human actions complete this triad and are undertaken in relation to the natural world and its seasonal patterns and cosmic changes. In this context, humans are biological-historical-ethical beings who live in a universe of complex correspondences and relationships. Cultivation of the land and of oneself are seen as analogous processes requiring attention, care, and con-

stant vigilance. Virtues are described as seeds that sprout through moral practice and flower over time. The ethical vitality of the individual is situated against the backdrop of the dynamic pattern of *qi* in nature. The Chinese martial arts and medical practices reflect this attempt to balance and cultivate one’s *qi* as part of maintaining one’s physical and moral health.

For Confucians health meant not only reciprocity with the patterns of nature but also responsibility for the health of nature as well. It was thus critical for the government to support agriculture through irrigation systems as creating the basis for a sustainable society. Human livelihood and culture was seen as continuous with nature, as the following passage by a leading Han Confucian, Dong Zhongshu (ca. 195-105 B.C.E.; traditionally ca. 179-104 B.C.E.), indicates:

Heaven, Earth, and humans are the basis of all creatures. Heaven gives them birth, earth nourishes them, and humans bring them to completion. Heaven provides them at birth with a sense of filial and brotherly love, earth nourishes them with clothing and food, and humans complete them with rites and music. The three act together as hands and feet join to complete the body and none can be dispensed with (in de Bary 1999: 162).

Within this broad cosmological pattern of Confucian thought the person is seen in relationship to others and not as an isolated individual. The Confucian tradition stresses the importance of cooperative group effort so that individual concerns are sublimated to a larger sense of the common good. In this view, self-interest and altruism for a common cause are not mutually exclusive, and responsibilities rather than rights are stressed. Such a communitarian value system may be indispensable for fostering sustainable communities.

With the Confucian emphasis on the continuity of the family there is a strong ethic of indebtedness to past generations and obligations to descendants. Within this moral framework there is the potential for evoking a sense of self-restraint and communal responsibility toward the environmental well-being of future generations. In other words, the Confucian emphasis on lineage (ensuring continuity from the ancestors to the heirs) may be raised to another ethical perspective, namely, intergenerational obligations toward maintaining a healthy environment.

The hierarchical social system of Confucianism can also be expanded to place humans in relation to the biological lineage of life in the natural world. In this sense, loyalty to elders, teachers, and those who have gone before may be broadened to include respect for the complex ecosystems and forms of life that have preceded humans. Thus biodiversity can be valued. The total dependence of humans on other life forms for survival and sustenance may be

underscored in this scenario. “Loyalty” is thus enlarged from the human world to include the natural world itself.

Confucian education as essentially a form of moral cultivation has been viewed as a means of contributing to the betterment of the sociopolitical order. By extension, ethical restraint toward the unlimited use of the environment can be seen as adding to the social and political stability of the region as a whole. From a Confucian perspective, moral suasion and education are a viable means of evoking communal changes that would promote such stability through personal choice and voluntary measures rather than simply through legislation from above.

Confucian forms of government are generally highly centralized and interventionist. Thus, they can afford to engage in long-range planning with other key sectors, especially the business community. Because this long-term policymaking is not unfamiliar in East Asian societies, it is possible to include environmental issues in these kinds of centralized strategic planning. Rather than only being concerned about immediate goals or quarterly profits, such planning can assist processes of environmental preservation.

In conclusion, this comprehensive cosmological worldview of Confucianism has had an enduring influence in East Asian family and social values as well as educational and political institutions. It still has enormous potential in East Asia for a renewed appreciation of nature as intrinsically valuable and for an environmental ethics that affirms the role of humans in working in conjunction with nature.

Congo River Basin

One of the world’s greatest rivers, the Congo flows for nearly 5000 kilometers from south-central Democratic Republic of Congo (formerly Zaire) north, west, then south, crossing the equator twice before finally emptying into the Atlantic Ocean. With its width spanning in places some 40 kilometers, and its depth reaching 500 meters, the Congo is surpassed in water volume only by the Amazon.

Its hundreds of streams and tributaries reach from Zambia to Cameroon to form the Congo River Basin, which is roughly 3.7 million square kilometers in size, and comprised mostly of tropical rainforest and savannah. The forest itself comprises roughly 15 million hectares and spans more than 3400 kilometers. Sixty million people inhabit this region, with roughly 12 million actually living still in the forest much like they have for hundreds of years. These dwellers of the rainforest, who speak more than 450 dialects, can be divided very generally into two groups: forest peoples like the Mbuti, and river peoples like the Nunu.

Being adjacent to the Rift Valley, which is the cradle of humanity, the Congo Basin has been inhabited since very early in human history, long before the great Central African tropical rainforest expanded after 10,000 B.C.E. The Mbuti are one of several ethnic groups that collectively are called “Pygmies,” who, having lived in the great rainforest of Central Africa for thousands of years, possess one of humanity’s oldest living cultures and still subsist mainly through hunting and gathering. Fed and in places swamped by the Congo River, the Mbuti’s forest is one of Earth’s most biologically diverse places. Mbuti religion is deeply intimate with the forest, which is itself understood as the Supreme Being and benevolent provider of all that people require for happiness. Gratitude for such divine providence inspires in the Mbuti the ecstatic ritual dances that intrigued Egyptian Pharo Nefrikare some 2500 years before Christianity. Still today the communal focus of Mbuti religion, these dance forms sometimes follow the music from a woodwind instrument called the *molimo*. Traditionally made from bamboo, the *molimo*’s sound is the voice of the Supreme, who is the forest itself.

The Congo River Basin underwent significant cultural changes with the arrival of Bantu migrants from the north beginning four to five millennia ago through the fourth century. Having acquired ceramics and developed new trapping, fishing, and agricultural techniques, these migrants pushed deeper and deeper into the tropical rainforest by following rivers and elephant trails. In time, they developed metallurgy and cultivated yams and bananas, which allowed them to become more sedentary and eventually develop large chiefdoms and, later, kingdoms like the Kuba and the Kongo.

With an existence so intensely related to the natural environment, it is not surprising that in Central African forest religion, which is cosmogenically monotheistic, there developed a strong belief in nature spirits. There is a life-force within nature that is understood as powerfully sacred, a belief that has made the wilderness the deepest resource of divinity for the Bantu. Centralized political power, moreover, required popular belief that the chief and his family were infused with the force of and legitimized by such nature spirits. The leopard became the symbol

par excellence of such sacred legitimation, and in a ritual known as *bokapa ekopo* (“dividing the sacred emblem”) the spoils of the leopard hunt were often divided among elite families from neighboring chiefdoms in precolonial Congo.

In addition to nature spirits, people in the Congo River Basin have long believed in ancestral deities, especially mythic chiefs of the forgotten past who intervene on behalf of the living in exchange for worship. Shrines for prayer, offerings, and sacrifice to both ancestral leaders and nature spirits had become a prominent feature of Central African religion long before the introduction of Christianity in the fifteenth century, which is today the dominant religion in the region. Because the Bantu believe that ancestors and nature spirits infuse stones and other charms with their sacred power, ritual specialists emerged in the Congo Basin centuries ago, priests who use charms to influence everything from the forces of nature to the outcome of wars and the eradication of “witchcraft.” Such priests have also developed skills in divination and herbalism, each of which crafts are deeply rooted in the natural world and reliant upon natural spirits for effect.

For the riverine Nunu people of the Congo-Ubangi Peninsula, settlement in the forest and its swamps and intercalary savannahs was predicated upon the successful planting into the Earth of the *nkinda* charm. The Nunu believed that life would be abundant and free of disorder only insofar as the spirits of the forest accepted and empowered the *nkinda*. Normally the *nkinda* charm was an ensemble of leaves, cloth, and sacrificed animals, and it ensured the Nunu’s harvest of the rivers and savannahs in order to prosper. The planter of the *nkinda* was automatically the high priest (*ngeli*) and guardian of the newly settled territory, whose permission was required of all prospective settlers. As settlements increased in size, weaker *nkinda* were planted in sub-settlements and a hierarchy of *ngelis* developed accordingly.

The cosmology of Central African peoples was also strongly shaped by observations of the natural world. Generally speaking, the harvest cycle and the cycle of the sun and the moon inspired meditations into the nature of the universe and of human existence and destiny. The universe is divided into two worlds, or lands, which the Kongo people call *nza yayi* (land of the living) and *nsi a bafwa* (land of the dead). Sunrise represents our birth in *nza yayi*; noon represents the fullness of our life in *nza yayi*; and sunset represents our death in *nza yayi*, but also our rebirth in *nsi a bafwa* as an ancestor. This rebirth is also symbolized by the rising of the moon; midnight symbolizes our fullness of life in *nsi a bafwa*; and dawn marks both our death in *nsi a bafwa* and rebirth into *nza yayi*. The two worlds are conceived of as being separated by a body of water (*nzadi*), across which live our ancestors, who are white, in the forest, under the ground, or under

the water. We are, as it were, our own ancestors reincarnated.

Christianity arrived in the Congo in two waves: 1) in the late fifteenth century the Portuguese established missionary and trade enterprises around the Congo’s Atlantic river mouth; and 2) in the late nineteenth century Belgian Catholic and British Protestant missions were established much farther up river. In both cases, the white foreigners were identified as spirits or ancestors, which readily instilled in Central Africans a sense of awe of both the visitors and their religion. This is surely a main reason for Christianity’s remarkable spread in the Congo River Basin, such that some 90 percent of the region is today Christian. Yet this mass conversion has never meant the disappearance of the traditional Kongolese worldview, which features, in addition to belief in supernatural healing forces, profound belief in supernatural destructive forces (*ndoki*) and sorcerers who control it. The second Christian wave differed from the first in that the horrors of the Belgian rule in the Congo brought Africans to associate Christianity with evil. Soon enough, however, Christianity became widely respected for its healing and exorcising functions and succeeded largely because of its power to combat *ndoki*.

The Congo gained independence from Belgian colonial rule in 1962. Unfortunately, however, post-colonial political culture was dictated by the same endeavor to exploit nature that had driven the Belgians to enslave Africans to extract rubber from the forest in the first place. Belgian colonial rule resulted in the death of over half the region’s population long before independence. The ensuing “kleptocratic” regime of Field Marshall (*Maréchal*) Mobutu Sese Seko, who always appeared in public wearing a leopard-skin hat to give the impression that he was the Congo’s most powerful *ngeli*, lasted over thirty years until a rebellion led by Laurent Kabila ousted the Zairian dictator from power in 1997. Zaire was then renamed the Democratic Republic of Congo (DRC), but a civil war continued to rage, killing over two million people within five years.

The Congolese Civil War cannot be understood without consideration of the 1994 genocide in Rwanda, which left upward to a million people dead and drove tens of thousands of others into the DRC seeking asylum. Religion played an important role in exacerbating the tribal conflict that fueled the genocide, as Belgian Catholic missionaries in Rwanda had promoted an understanding of the superiority of the Tutsi people, whose height and facial features made them seem closer to Europeans than the shorter, broader-faced Hutus. The resultant Hutu hatred of the Tutsis was a major impetus for the genocide, whose consequences for the peoples and environment of the Congo River Basin have been catastrophic, though still largely immeasurable. Rebel factions from the Rift Valley, moreover, have poured into the Congo since the Rwandan

genocide in efforts to control its rich natural resources. Many of them, like the Mai-Mai and the Lord's Resistance Army, use religion as an inspirational and legitimating force for some of the conflict's most unspeakable atrocities, including the crucifixion of their opponents.

Almost from its outset, the war drew no fewer than six other African countries into the conflict, all of them driven primarily by the quest to profit from exploiting the region's extraordinary mineral resources: copper, cobalt, coltan, diamonds, and gold, not to mention timber and ivory. For the victims of "Africa's First World War," hardship has reshaped local religion, as noted by Pulitzer Laureate for Journalism Paul Salopek: "Cults of many types have erupted everywhere in wartime Congo. In hard times, imported Christianity has been whittled and shaped to meet local demand; relief from the suffering and uncertainty of a war the world ignores" (*The Chicago Tribune*, 12/10/00).

Laurent Kabila was assassinated by one of his own bodyguards in 2001 and succeeded by his son, Joseph Kabila. Like many other contemporary African heads of state seeking either to alleviate their people's poverty (the DRC GNP was \$78 in 1999) or to enrich themselves and their minions, DRC President Joseph Kabila values foreign investment in the mining and timber industries much more than the Congo's natural environment. Mining, hunting, and timber regulations have been virtually non-existent since war first broke out in 1996, and over a million refugees from Rwanda and elsewhere have sought haven in the Congolese forest and surrounding regions. An environmental catastrophe is clearly underway in one of Earth's most precious and biodiverse regions. National parks have not been spared: between 1995 and 1999 alone, one park lost a third of its elephants to ivory hunters and hungry miners, and today bushmeat, along with timber, is one of the region's leading exports. Regrettably, the recent UN intervention, ceasefires, and withdrawals of foreign troops are unlikely to be of much benefit to the Congo River Basin's gravely endangered environment: Presently the Kabila regime is orchestrating an economic recovery program with the World Bank that hinges on the exploitation of the nation's natural resources, much like when his father sold off the Congo's mineral resources for self-enrichment and to pay for protection provided by his foreign supporters, namely Uganda and Rwanda; much like Mobutu had done to become one of the world's richest men; and much like the Belgians had done in one of the most atrocious colonial conquests in world history. Meanwhile, the Kimbanguist Church, which was founded by Congolese healer named Simon Kimbangu in the 1920s, continues to grow, as thousands of recent converts await the coming of a black messiah to the Congo.

Conservation Biology

During the late 1970s and 1980s, concerned scientists and resource managers began to shape a new synthetic discipline that integrated scientific knowledge from a variety of disciplines, including the social sciences, with the goal of conserving biodiversity. They called this new field "conservation biology." As the discipline has grown, it has drawn upon the natural sciences (including genetics, population and evolutionary biology, systematics, and biogeography), the agricultural sciences, and the traditional resource management disciplines (e.g., forestry, wildlife, and fisheries management). It has also welcomed the infusion of knowledge from anthropology, economics, and other social sciences, as well as the humanities, illuminating human behavior in a way that can be used to promote biodiversity conservation. The envisioned level of interdisciplinary inquiry has yet to be realized, however, according to Stephen Humphrey, an officer and Board Member of the Society of Conservation Biology from 1990 through this writing). But it is possible, he believes, to see two forces that animate the field: "Biophilia," and a belief that conservation-related "science should be applicable to conservation of biological diversity" (author's interview, July 2003).

Many of conservation biology's most effective visionaries were motivated by one or another form of nature spirituality involving a profound sense of connection to the Earth's living systems. Indeed, the breadth and inclusiveness of conservation biology allowed it to incorporate and build upon ideas emerging from environmental ethics, and provided space for scientists and others to explore the cultural and spiritual dimensions of conservation. Some of its leaders have also been involved with deep ecology or radical environmental movements, giving conservation

biology an audience wider than might otherwise have been the case. A quick look at several early leaders in the field, including the first two editors of its premier journal, shows that conservation science and nature religion sometimes cross-fertilize, and that important hybrids can result.

In 1978 biologist Michael Soulé organized the “First International Conference on Conservation Biology” at the San Diego campus of the University of California, subsequently publishing an anthology that helped to herald the emergence of the new field. According to conservation historian (and long-term board member of the Society of Conservation Biology) Curt Meine, science had for decades been deployed in the conservation cause; in this sense, conservation biology was nothing new. However, conservation biology represented an intensified, self-conscious effort to synthesize “many fields of knowledge around the general goal of protecting and perpetuating biological diversity, which the traditional disciplines had not addressed adequately” (personal communication, June 2003). Soulé organized a second conference at the University of Michigan in 1985 and is credited by many as the leading founder of the Society for Conservation Biology in 1986, which began publishing its flagship journal *Conservation Biology* in 1987.

Interestingly, in between these first two conservation biology conferences, Soulé organized another conference during an extended sabbatical from the academy that he took at the Los Angeles Zen Center. Held in Los Angeles in 1981 and no doubt motivated by his understanding of Buddhist ethics, the conference explored the relationships between religion and ecology. Soulé asked Deep Ecology’s founding philosopher Arne Naess to participate, and the acquaintance spurred a long and close friendship. Soulé invited Naess to give the keynote address at the second conservation biology conference “because I felt he provided a better philosophical foundation for conservation and biodiversity than anybody since [Aldo] Leopold.” Soulé added, Naess “has been a major influence on my life.” (Soulé’s quotes are from author’s interviews, 27 February near Tucson, Arizona or by telephone, 15 July 1997.)

David Ehrenfeld was another key figure in the emergence of conservation biology, and served as the founding editor of *Conservation Biology*. This is of particular interest in that Ehrenfeld’s 1978 book, *The Arrogance of Humanism* was a landmark in the emergence of non-anthropocentric environmental ethics, and is considered a classic by many deep ecologists. It elegantly expressed their melancholy over the extinction crisis and their perception of a defiled world:

We must live in our century and wait, enduring somehow the unavoidable sadness . . . nothing is free of the taint of our arrogance. We have defiled everything, much of it forever, even the farthest

jungles of the Amazon and the air above the mountains, even the everlasting sea which gave us birth (Ehrenfeld 1978: 269).

A third leading figure is Reed Noss, Ehrenfeld’s successor as editor of *Conservation Biology*. As a young man Noss was an early and regular contributor to *Earth First!*, getting involved shortly after hearing a news report of some of its early antics and acts of civil disobedience in the early 1980s. He expressed his early enthusiasm for the movement in an early article written from a “Taoist perspective” claiming that “ecological resistance (including sabotage) is to the ecocentric [individual who views entire ecosystems as having intrinsic moral value] an extended form of self-defense: regrettable but necessary.” Fusing such militancy with deep ecology, Noss called *Earth First!* “the ecological resistance embodiment of Deep Ecology” (1983: 13). His fifth-degree black belt in Shito-Ryu karate (see Noss and Cooperrider 1994: 417) suggests that for him Eastern religions fit well with his love of nature.

Noss withdrew from *Earth First!* by the end of the decade, having become critical of the anti-scientific bent of increasing numbers of its activists. But he continued to promote deep ecology and Naess’ notion of an “ecological self” – a wider-than-human identity that extends the center of moral concern beyond humans to all species. He articulated such views even in his scientific writings (e.g., Noss and Cooperrider 1994: 21–4) and continued to work with Dave Foreman (a co-founder of *Earth First!*) and other radical environmental activists who appreciated conservation biology, many of whom also quit *Earth First!* while retaining their ecocentric value systems, in which nature is considered to be of intrinsic, moral value. Indeed, Noss subsequently served as science-advisor to the Wildlands Project, which was founded in 1991 by Foreman, Soulé, and a number of other prominent conservationists. It articulates a long-term biodiversity strategy for the Americas based on the principles of conservation biology.

It was Noss’ research, however, not his grassroots environmental activism or deep ecology affinities, that led to his becoming the second editor of *Conservation Biology* (a post he held most of the time between 1993 and 1997). This prestigious position was offered in part because in numerous journal articles he had advanced significantly the conceptual foundations of the discipline.

Quite a number of other conservation biologists have affinity with deep ecology and have contributed both to scientific and radical environmental journals. Two who have put such spirituality in writing include Bill Willers and Ed Grumbine. The title of Willers’ edited book, *Learning to Listen to the Land*, reflects its pantheistic (and animistic) ethos, and it includes excerpts from an eclectic group of writers with deep ecological sensibilities. A biology professor who founded the Superior Wilderness

Action Network (SWAN), Willers was unsuccessfully sued in the 1990s, along with his nemesis, the United States Forest Service (USFS), for allegedly violating the religious freedom protections guaranteed in the First Amendment of the U.S. Constitution. The lawsuit by a group of loggers and their conservative allies alleged that the defendants had conspired to establish “deep ecology religion” by protecting forests that the defendants, according to the lawsuit, considered sacred (Taylor and Geffen 2003).

Ed Grumbine is director of the Sierra Institute, an affiliate of the University of California, Santa Cruz, which promotes wilderness experience and research. Like Noss, Soulé, and Willers, he has also written for radical environmental journals. And his book *Ghost Bears: Exploring the Biodiversity Crisis* is laced through with deep ecology themes. In it he cites movement elders, including Aldo Leopold, Arne Naess, Henry David Thoreau, and the poet Robinson Jeffers, and he explicitly endorsed Naess’ notion of the ecological self and defended deep ecology. Praising the Council of All Beings, which he described as an important ritual process that strives to evoke and deepen such an ecological identity, he also confessed that the ritual changed his life (Grumbine 1992: 233, 230–6).

To note that during the late twentieth century some of the key figures promoting the new field of conservation biology were both motivated by and promoted nature religion in no way suggests that their science was compromised. Nor does it prove that other conservation biologists have been similarly motivated; indeed, both Meine and Humphrey think only a small minority of those involved in conservation biology would likely consider themselves to be explicitly or overtly motivated by deep ecological spirituality or other religious sentiments. Indeed, the extent to which conservation biologists are more likely than individuals from other groups to have affinity with deep ecology or other nature-related spiritualities is an as yet unresearched empirical question, worthy of quantitative survey research. It is notable, however, that David Takacs, who in *The Idea of Biodiversity: Philosophies of Paradise* interviewed dozens of scientists whose careers have been devoted to understanding and protecting biological diversity (including Soulé and E.O. Wilson) reported that a spiritual connection to nature was a recurrent theme among them. Qualitative research thus suggests that there may be a significant correlation between the pursuit of careers in ecological science (like conservation biology) and nature spirituality.

For his part, Michael Soulé stressed that conservation biology depends first and foremost on the scientific method and not on spirituality or deep ecological value theory. During my interview with him he worried that a historical overview like the one I have provided here might be used by the enemies of conservation to discredit conservation biology as somehow “pagan.” His perception

was that few involved in conservation biology had interest in Eastern or alternative religions or deep ecology. Based on their own experiences both Humphrey and Meine have reached similar conclusions: most conservation biologists are focused primarily on their scientific work and its application in solving conservation problems. While such a focus does not preclude an interest in, and commitment to, philosophical or spiritual self-reflection, conservation biologists tend to place their scientific commitments first.

This strong commitment of conservation biologists, however, suggests a more complex relationship between their scientific interests and their personal belief systems. Indeed, the role of nature spirituality may be much more prevalent than would be obvious from a cursory review of the everyday experiences of those engaged in conservation biology and its professional organizations. It may be that shedding further light on this matter will depend on devising a way to ask conservation scientists such questions without engendering fear among them that an honest answer would compromise their credibility and thus damage their work and careers. In the twentieth century, as historian Stephen Fox has amply demonstrated, environmentalists often downplayed nature-related spirituality in the interest of not alienating the more traditionally religious publics they need to persuade. An open question is how strong this tendency will be in the twenty-first century among environmentalists and those scientists who are their allies.

Con-spirando Women's Collective (Santiago, Chile)

Con-spirando is a women's collective working in the areas of ecofeminism, theology and spirituality which began in 1991. I am a founding member of this collective. We publish a quarterly journal, *Con-spirando: Revista Latinoamericana de Ecofeminismo, Espiritualidad y Teología*, hold workshops, seminars and an annual summer school on ecofeminist theology, spirituality and ethics, and offer a yearly cycle of rituals.

In our magazine's first issue, we set out our purpose, which more than ten years later still defines what we are about: in the patriarchal culture in which we live, women's contributions are not taken seriously. This is particularly true in the area of theology. Women are absent as subjects doing theology and also as a major subject-matter of this theological reflection. Our lives, our everyday religious practice and our spirituality, are simply not present in current theological reflection. Absent too, are our experiences of suffering, joy and solidarity – our experiences of the sacred. Besides expressing our criticism of patriarchal culture, we also seek to contribute to the creation of a culture that allows theological reflection to flower from our bodies, our spirits – in short, our experiences as women.

We seek theologies that take into account the differences of class, race and gender that so mark Latin America. We hope to open new spaces where women can dig deeply into our own life experiences without fear. These experiences are often negative, even traumatic, in terms of the religious formation we have received. We seek spaces where women can experience new ways of being in community; where we can celebrate our faith more authentically and creatively; where we can rediscover and value our roots, our history and our traditions – in short, to engage in an interreligious dialogue that helps us to recover the essential task of

theology, which is to search out and raise the questions of ultimate meaning.

We are convinced that, to bring about relationships marked by justice and equality, we must celebrate our differences and work toward a greater pluralism worldwide. To this end, we need theologies that unmask the hierarchies in which we live; theologies that, rather than seeking to mediate Mystery, celebrate and explore the Holy without reductionism or universalisms. We call for theologies that question anthropocentrism and that promote the transformation of relationships based on dominance of one race, nationality, gender or age group over another and of the human over other forms of life. Such theologies will have profound political consequences.

Such a feminist perspective based on our diversity of class, race, age and culture must also take up our love as well as our anguish for all life on the planet that we feel is so threatened today. We call this posture ecofeminism. It is within this perspective that we seek a spirituality that will both heal and liberate, that will nourish our Christian tradition as well as take up the long-repressed roots of the native peoples of this continent. We want to explore the liberating dimensions of our experience and imagination of the Holy. To do this, we "*con-spirar juntas*" (*Con-spirando* 1992: 2–5).

Most of the members of Con-spirando come from the Christian tradition, but we are critical of the patriarchal underpinnings of Christian theologies and try to relativize the Judeo-Christian myths and resurface other, more indigenous myths that have been suppressed, while at the same time always remaining vigilant to patriarchal remnants in these myths as well.

Con-spirando is not a purely academic organization, nor are we associated with any church organization, which frees us from the control of both. We are organized as a collective: we are a non-hierarchical, multicultural team that has both Latin American members as well as members from other countries where relations of justice and tenderness are the goal. We are committed to the following:

First, the belief in the wisdom of our bodies and the priority of knowing through our corporeality in relationship. Here, feeling becomes a way of knowing. Second, efforts to search out non-hierarchical ways of being that model "power with" rather than "power over." Third, the sharing of new ways to celebrate, new rituals that nurture our emerging spiritualities and our commitments. Fourth, the reexamination of those foundational myths upon which Western, Christian culture is based in order to relativize them and search for new myths that can water our emerging spiritualities, theologies and ethics. And fifth, an ecofeminist ethic that moves toward the ecological self – my neighbor and I are one. All are my kin, from the folks in the *barrio* (neighborhood) to the animals, the mountains, the rivers.

Origins

We are a collective of women who share a joint interest in feminist spirituality and theology. It was this common thread that brought us together in Santiago, Chile in early 1991 to share “a sacred space and time.” These times together were and continue to be moments of creative ritual, of sharing our experiences of the Holy in our lives.

From these times together, a core group of women emerged: the Con-spirando collective. We have many years of experience working with women at the grassroots level. Some of us have a vast experience of working with our churches in programs dealing with women. Others of us have a long history of participation in the feminist movement. Some of us would still identify ourselves as Christian (indeed, one of us is a Catholic missionary and another is a Lutheran pastor), while others have moved beyond the Christian tradition. Still others of us work in academic settings doing research and teaching in gender studies. Through our time of ritual together, a deep bonding has taken place; in the process we felt the need to become connected with other women who share our same interest in feminist theology and spirituality.

To make those connections and to share our own reflections and experiences, we decided to publish a journal. With the encouragement of key women in other Latin American countries, we launched the first issue of *Con-spirando: Revista Latinoamericana de Ecofeminismo, Espiritualidad y Teología* on 8 March 1992, International Women's Day. That year we published two issues and since 1993 *Con-spirando* has been published quarterly.

Besides the journal, Con-spirando has become a gathering place for workshops, seminars and conversations in feminist and ecofeminist theology and spirituality and in gender studies. These sessions continue to draw women from grassroots groups such as barrio women's centers and Christian base communities as well as women with more academic training. The sessions are highly participative: Included as an integral part of each session is body work, which links the personal body – often broken, violated and in pain – with the Earth's body, which is also being devastated and violated by the system we now openly identify as patriarchy.

From 1996–1998, the Con-spirando Collective – along with our partners Mary Hunt and Diann Neu of WATER (Silver Spring, MD, USA), and Ivone Gebara (Recife, Brazil) – has been the organizer of a very key feminist theology program in the Americas called *A Shared Garden*. As a result of this program (which took place over a two-year period in Santiago, Washington, D.C. and Recife), as stated in our overall objective, each of the three organizers has felt empowered by the more than 135 Garden participants to deepen and consolidate the process of

empowering ourselves, as women, to speak our own theological word, to celebrate the Holy in our lives

according to our deepest intuitions, and to share what it means to live righteously and reverently with Earth and all Earth's children by providing spaces of reflection to grapple with the theological questions we are asking.

Each of the three partners is now committed to carrying forth this process in our own regions and in our own context.

It was with this mandate that Con-spirando initiated an annual Summer School for Ecofeminist Spirituality and Ethics in 2000. This “school” offers, for ten days, a contained space and time where women can ask their theological questions without fear. It is a “safe space” allowing participants to search together for more life-giving theologies, cosmologies and ways of celebrating our emerging spiritualities. It is a space to search together and formulate our own body of thought, study and reflection as Latin American women engaged in the religious debates of our region. Finally it has become a space to begin to build new practices and power relations as we look for ways to sustain ourselves in terms of constructs of meaning both at the personal and at the communal level. This has led us to searching for new stories of meaning, new myths and symbols of the sacred, as well as new rituals. Throughout our history, we have been deeply influenced by the thought of Brazilian ecofeminist theologian Ivone Gebara, who is one of Con-spirando's midwives. Her sharp analysis of patriarchy within the Christian tradition and her proposed “holistic ecofeminism born of everyday life” has shaped our work. We have also been influenced by the writings of Charlene Spretnak, Thomas Berry and Brian Swimme.

Ever since Con-spirando began, we have offered rituals, a “sacred time and space” to celebrate the Earth's cycles and the cycles of our own lives. These celebrations, open to the public, are an essential part of our work in honoring women's experiences of the sacred. Our rituals always include convening a circle, often chanting “*somos un círculo, dentro de un círculo, sin principio y sin final.*” Sensitive to the indigenous roots of Latin America, we have present in the circle's center the four elements and always salute the four directions. Many rituals concentrate on reconnecting with our ancestors and with the broader community of life.

Another key aspect of our work is research. Either as a collective, or in conjunction with others, we have been involved on an ongoing basis with investigating the evolution of women's experiences as they relate to theology, spirituality and ethics.

In the past three years, we have been responding to increased requests for facilitation from women's groups, helping them clarify their identity, vision, objectives and future plans. Requests have come from Catholic women's

religious congregations, evangelical women's groups and gay and lesbian organizations.

Finally, the Con-spirando collective is committed to networking both locally and at a regional/international level with other like-minded organizations, groups and movements who share our vision.

Corrington, Robert S. (1950–)

Robert S. Corrington, a professor at Drew University in New Jersey, has developed an influential philosophical and religious theory of nature which he calls “ecstatic naturalism.” In developing his theory, he claims that nature has no opposite and is all that is. Therefore, for ecstatic naturalism, there can be no God different from or outside nature.

Ecstatic naturalism follows two pragmatic principles. First, everything in the world is seen to be in a complex relationship to something else in the world, but nothing is totally related to everything. These diverse relations form “complexes.” The second rule advocates “ontological parity” and claims that every complex is ontologically as real as any other. The principle of ontological parity is used to refute any worldview which seeks to classify some structures as not real or less true, and honor others as better, more real or true. Thus classical theism, with its belief in an omnipotent and omnipresent God that utterly surpasses the creatures in oneness, truth, and goodness can neither be in accordance with the rule against total access to complexes nor ontological parity.

Ecstatic naturalism views nature as having two dimensions: “nature naturing” and “nature natured” (Averroes, Spinoza, Buchler). Unlike most other naturalist philosophies, ecstatic naturalism is committed to thinking about the sacred in nature. Nature naturing represents the vastness of nature which gives birth to nature natured (i.e., the multiple orders and complexes of the world). Nature naturing is not only the origin of everything else, but a destination as well, a “not-yet” (Heidegger). The ontological difference between the two dimensions of nature is, for ecstatic naturalism, held open by an abyss, which a person must confront in order to gain meaning of the world. Melancholy and ecstasy are the two fundamental attunements of ecstatic naturalism, melancholy giving a human self-understanding of the depth and immensurability of nature naturing, often experienced as the longing for a lost origin, or the maternal (Kristeva); ecstasy being radically open to the future. This tense space between the nevermore and the not-yet is the field of world semiosis, where humans gain understanding both of nature and of how they are shaped by nature.

Corrington has advocated a decentered, divine spirit or spirits in his writings, where the sacred in nature is seen as one of the products of nature naturing, which encounters the human in numerous and numinous ways. His recent moves have been into dialogue with Hegel and the esoteric traditions. Ecstatic naturalism has become more pantheistic, not only viewing some aspects of nature natured as sacred, but also encompassing nature naturing as well. One of the capacities of nature is seen to be an “infinetizing” process, capable of opening up new sacred dimensions for experiencing selves.

SP Cosmology

Cosmology is the object of research by anthropology and physics. Astrophysics studies the evolution of the universe, while anthropology analyzes the cosmologies of all the world's cultures as socio-cultural constructions. In

anthropology, the term cosmology is used as an analytical construct to refer to the overarching cognitive and behavioral templates which are reiterated, transformed and used by a society to comprehend its role within: humanity, life, the world (planet Earth) and the cosmos. A cosmology involves explanations of the past, present and future of a society within these levels of encompassment, and is part of its understanding of cosmo-eco-ethno genesis. It deals with origins as well as with the finality and destiny of humans and of other forms of existence. Anthropology analyzes how these templates of significance exist in rational, scientific, religious, artistic, ethical and emotional and sensorial terms, and how they involve holistic approximations laden with “transcontextual” and multi-experiential meaningfulness.

All cultures have cosmologies, religious or non-religious, as means to interpret a society’s situatedness in the universe, Earth, biosphere, and in humanity. During the twentieth century most anthropological research investigated religious cosmologies among indigenous and traditional cultures. After Griaule’s path-breaking research in the 1930s in Africa on Dogon cosmological myths and their functions which defined collective ways of thinking and behaving, decades of research ensued in other continents. Lévi-Strauss, through structuralist analyses, investigated the socio-ecological and intellectual value of Amerindian cosmologies, and he opened an era of structuralist and post-structuralist research worldwide which inquired about their underlying mechanisms.

At the beginning of the twenty-first century, there are academic debates concerning the relevance of cosmologies as ideational and operational systems in a globalizing world where not all cultures live in a single delimited territorial or communitarian context nor sustain unique identities. As a reaction to evolutionary anthropology and similar approaches which hold that there is a common or universal basis for cognitive and behavioral templates in all humans, a majority of analysts defend instead the paradigm of relativism which insists that all cosmologies are socially constructed designs, manufactured to give meaning to existence. Religious persons hold that such meta-referential parameters involve spiritual parameters where the agency of Gods or divinities are believed to define all forms of existence and surpass mere human socio-historical agency. They believe there is a God and a life after death, and that supernatural architects or authors created and run the cosmos and human destiny. Though analysts having religious and non-religious backgrounds contrast in their reactions to these beliefs, all seek to investigate, ultimately on a cross-cultural bases, the processes involved in cosmology making.

During the twentieth century, research was scarce on industrial societies’ cosmologies in spite of the pioneering research by Mary Douglas who analyzed, for example,

through “grid-group” methodologies, issues such as risk perceptions in techno-scientific institutions. Yet, increasingly researchers have investigated contemporary cosmologies in industrial or post-industrial societies focusing on issues such as habitus among indigenous or academic organizations, scientific and globalized organizations, millenarian and worker’s sects, and ethnic conflicts, among others.

What is clear in all research among a-modern, modern or postmodern societies, is that there can be a single coherent cosmological system prevailing in a given group, especially among indigenous cultures, though in most societies there is no unique, grand cosmological narrative, and several versions exist. Moreover, a common cosmological cosmoscape can prevail but with individual and subcultural variants, according to a person’s rank, expertise, age or gender, and to seasonal and situational contexts.

Religion, Ecology, and Cosmology among Indigenous and Traditional Cultures

Cosmologies of traditional and indigenous societies invoke respect for the sacred and the spiritual essence of all forms of existence, to keep a balanced coexistence among the parts composing the total whole of the cosmos. People, ecosystems, and the geoscape and cosmoscape, are defined as having identities defined with matter, spirit, and mind. These common predicaments imply shared cosmic synergies among all forms of existence, human and nonhuman, biotic or not, who must negotiate with other matter, energy, spirit, and other essences. Humans are to calibrate when to exchange or not exchange these essences and must request permission and compensate other beings or forces for using their resources – for example, when engaged in hunting, gathering, fishing, agriculture, herding, or in making artifacts or settlements, or when people are born or die.

Spirit, matter, and principles of “peoplehood” are said to dwell in artifacts of material culture, and in animals, plants, minerals, as well as in winds, thunder, mountains, river rapids, caves, and in certain ecosystems. Cosmological loci exist in many of these sites, as well as in the cardinal, intercardinal orientations, and in the center, nadir and zenith. The cosmological axes mark the linkages between skies, world and underworlds: for example, in village layouts, or temple or house alignment and design, or in the sacred origin sites of ethnic groups or lineages or clans. They also mark the linkages between the ancestors and the present and future generations, as well as between local existence and a universal and immanent one.

In these sites the specialists, such as priests, shamans or elders, officiate rites to maintain the communicative ethos and manage the exchanges among and between interconnected systems of matter and spirit, and past, present and future. Cosmological rites are performed when people

are born, die, or are initiated, and to deliberate the use of environmental resources, as well as to celebrate seasonal turnover (astronomical cycles, epochs, years, equinoxes or solstices, months, seasons, days etc.). There is a differential use of ritual artifacts which hold cosmological referents (crowns, staffs, masks, sacred stones, stools or chairs, and others) and these usually express differences in knowledge, expertise, age, or gender.

For indigenous cultures, the cosmological loci are used to remind a community that it must correlate its society to the world and universe, relating their biosocial circumstances to climatic, meteorological, astronomical and cosmic dimensions. This connectivity is reiterated not only in the landscape, but also in abodes. It is made in astronomically oriented observatories, temples, and houses. These architectural devices are used in ceremonial and daily practices to signify a dwelling in the cosmos. The symbolism of the house or temple projects the architecture of the universe (for example a multilayered universe composed of skies, this world, and underworlds), while the universe itself is signified as a temple or home.

Calendars correlate the spatio-temporal significance of the changing astronomical, meteorological, environmental and social links which each society considers as the pivotal references. Rituals express in performative modes the significance of these chronotopes; for example, to mark the opening and closing of seasons, or changes in landscape use or population levels, while rites of passage mark changes in collective or individual identity to publicly mediate how these are to resonate within ecosystems and across the world and universe.

It is significant that among indigenous societies which have shamanism as their main cosmological orientation, there is an overt concern regarding the need to minimize negative human impacts on the environment. Shamanism has rituals and strategies that allow calculations for long-, mid- and short-term resource use. It has an overarching retrospective and prospective outlook, or a “looking backwards and looking forwards” template to manage human actions within the context of a balance with the grander whole, and shamans consider their task to be to “help manage and care” for humans, the world, and the universe.

Cultures that have shamanism have ritual cycles to engage individual and collective responsibility to monitor the state of biosocial systems and to redress socio-environmental imbalances. Such individual and group behavior is regulated by cosmological normativity to inculcate environmental resource use and conservation as part of the “proper way” to live in this life and be in the afterlife. Through wise, dignified and austere livelihoods involving the daily monitoring of thoughts, words and actions which reiterate communal life and sound ecosystem use, this shamanic cosmological awareness propels communal responsibility and respect for the sacred bases

of life. Such applied religion is meant to guarantee the greatest good to all while appealing to the conservation of biological and cultural diversity.

Anthropological analyses using the ecosystem approach, cultural ecology, human ecology, environmental anthropology, ethnosciences, and ethnoecology have documented these last decades how indigenous societies engage in sophisticated calculations to correct or avoid negative ecological impacts of human activities. For example, in tribal societies in New Guinea, these imply the use of ritual cycles to manage population levels and de-escalate social conflicts in societies engaged in cultivation and animal husbandry. Among tribal peoples of the Amazon, cosmologies are used by shamans to do long-term environmental assessment to measure resource use for hunting, fishing, gathering or shifting cultivation, or to establish intertribal alliances for regional resource management across rainforest terrains, while similar practices are made by shaman-priests in mountain ecosystems to sustainably manage regions across village networks.

In Asia, among indigenous chiefdoms that practice shamanism but who are confronted with statal (state-based) societies or imposed religions, the struggle to control their socio-ecological systems has implied difficult negotiations. But shamanic superpositions and confrontations of cosmological templates, and ritual contestation has allowed resistance to hegemonic displacement.

Among indigenous shamanistic cultures, the rituals in a person's lifecycle and in group development are made to celebrate, reward, or punish their contribution to the harmonized existence of the socio-biosphere within the cosmos, largely calculated in practical terms. But it is above all the religious dimension which propels a spirituality and an ethics to achieve justice with other forms of life or existence. In rituals of divination, compensation or sacrifice, religious experts seek to redress, propitiate or to calculate the appropriate relations between and among the forces of the universe. Cosmological codes in curative or preventive medicine are attentive to the same laws of harmonized coexistence (though medicinal practices also imply effective phytomedicine and other practical approaches).

Yet, the overall effectiveness of cosmological accountability to maintain biosocial balance and socio-environmental conservation is achieved by harnessing scientific, medicinal, socio-economic, political, religious, musical, philosophical, artistic and performative modes. Thus, while the religious bases of cosmologies foment community and environmental well-being in a cosmos based on sentient spirituality, there is both a rational approximation and an enchanted one to define a society's place in the universe.

In many shamanistic societies the importance of mind-altering exercises, or the intake of substances that allow altered states of consciousness – for example, the use

of hallucinogens – reiterate the cosmological holistic imaginary and experientiality while imbuing people with an intense sense of awe and respect for the linkages between human existence, life and the universe.

Myths and formal narratives, as well as legends, folktales, proverbs, children's stories and songs also express cosmological conventions. Each reiterates heightened forms of socio-ecological awareness toward sustainable use and conservation of resources and are used to consolidate in families, communities and cultures the daily commitment to sustain a sentient socio-ecological balance while achieving a balanced sense of existence within the world and universe.

Anthropological analyses have indicated the sagacious foresight the shamanistic and cosmological systems deploy to resist ethnocidal or ecocidal tendencies, as traditional and indigenous societies are confronted by modernization and by colonization and displacement. It is important to note that this last decade, indigenous representatives themselves are increasingly voicing and defending their own positions in relation to these predicaments in local, national and global forums, while seeking the respect of their rights, cosmologies and worldviews.

There are however differences in the structures and functions of the cosmologies of the world's 400 million indigenous peoples and their interpretation of ethno-eco-cosmic linkages. Those of nomadic bands of hunter-gathers portray egalitarian synergies, those of tribal or chiefdom agricultural, pastoral, or herding cultures portray ranked and hierarchical synergies, while those in statal societies portray stratified and exploitative dynamics. Perhaps in the near future those in post-state and globalized societies may reconsider the value of global interdependencies in a shared biosphere and world, where human creativity could contribute to the celebration and not the destruction of intelligent life in the universe.

There is an urgent task of acknowledging and conserving the heritage of the world's cosmologies and their important lessons, but the extermination of the world's linguistic, cultural and biological diversity continues to accelerate.

Cosmologies in a Globalized World

Though many of the world's indigenous cosmologies have a coherent scaffolding to calculate the impacts of people upon their own and other societies' environments and into the biosphere and universe, as well as upon future generations, and this is important for human survival, it is clear that many of these cultures are being exterminated, displaced or assimilated. Though indigenous people conserve still what are the world's highest areas of biocultural diversity, over 70 percent of this cultural diversity may be exterminated within the next century. Humanity is

witnessing an unprecedented loss of invaluable time-proven cultural and cosmological creativity.

Yet the accelerating socio-economic, political, religious and environmental changes among the world's 6800 or so ethnolinguistic groups, and the increasing exchanges among all peoples and nations, now allow a society to construct hybridized fragments of cosmological systems or superposed templates. Convivial or conflicting criteria involving ethnic, religious or juro-political identities and diverse interpretations and stages of modernization or globalization allow contemporary societies to hold dynamic cosmological versions as they manage them in situational contexts.

Though in this globalized era the need to have cosmological parameters seems to be a high stake for all societies, it appears that cosmologies based on the big religious traditions appeal to more profound or fundamentalist commitments, though many of these exclude alternative cosmologies and worldviews.

As some societies struggle to have single cosmologies while marginalizing, respecting, or exterminating those of others, others increasingly hold cosmological diversity, hybridity, or engage in re-cosmologization by transposing preexisting cosmologies. A main concern of contemporary societies is the redefinition of the meaning of human existence within the world and cosmos, but the pressing issue of recognizing socio-environmental interdependencies and redressing imbalances in these across local and global dynamics is at present at an impasse. Facing these tasks requires cross-cultural cooperation among societies holding diverse and often contrasting conceptions of society, humanity, world and universe, or cosmologies and worldviews, and a necessary communication among and between these frameworks is required to achieve common goals.

Though the frontiers of science and technology contribute data which permit the construction of non-religious cosmologies based upon knowledge of the laws and properties of the universe, world, biosphere and humanity, the majority of people seem intent on holding to cosmologies based on religious or non-scientific bases. If such connectivity between society, environment, world and cosmos necessarily implies a sense of spirituality or of enchantment which in turn relates to the big questions of human existence and attributes meaning to life, death, or justice itself, then cosmologies with a religious base will be determinant in promoting biological and cultural diversity, and with it the possible survival or demise of humanity itself.

This process has begun, because of register-shifts and the upgrading of cosmological referents among concerned environmentalists, and there is an unprecedented expression of creativity engaging new forms of socio-environmental ethics and spiritual ecology during the last decades. The respect for the sacrality of life encompasses a

concern for the well-being of humans who are considered as part of nature and not as opposed entities in a fallacious nature–culture contraposition.

Conclusion

In all historical times, the use of cosmologies to mobilize or immobilize normative directives and social movements indicate their strategic socio-environmental and socio-political and economic functions. The long-term directives of their templates have been, and can be used, to manage identitarian parameters within the interpretation of the evolution of humanity, life, the world, and the cosmos. These parameters guide the overarching imaginaries that relate microcosm to macrocosm, and with it, define the ideological and the practical commitments of each self and society in relation to the rest of humanity, and to the world and cosmos.

Cosmologies that contain viable environmental management systems and socio-economic, political and religious systems, can allow wise use and conservation of biosocial resources, but in a globalized world they can only do so if other societies respect this too. Because the age-proven systems of many indigenous or traditional cosmologies are used to monitor and harness socio-ecological functions and communal well-being, their existence is critical to achieve sustainable development and conviviality among peoples.

Such templates hold important lessons for other sectors of humanity to understand, and to adequately manage key biocultural synergies. It remains to be seen how these will be encompassed in a grander scheme that allows a meaningful sense of human existence and a fulfilled life. As this human situatedness involves a worldview which relates to the dynamics within the world or planet Earth, and a cosmology which encompasses the cosmic dimensions, concatenating humanity, world and universe, the recognition of these multiscale processes may now allow a new form of human consciousness. These imply an acknowledgement of supra-referential parameters to comprehend the distinct orders of magnitude of the spatio-temporal dimensions in the short-, mid- and long-term calculations each society holds to explain its responsibilities therein.

Today as each of the world's cultures, indigenous or not, recreate the specific meaning it gives to the relations between its society and its own and others' biocultural environment, and to the rest of the world and the cosmos, they constitute particular mechanisms to be, or not be, accountable for the interdependencies affecting, for example, other socio-environmental dynamics. Though some cosmologies include this awareness as an "eco-cosmology" which promotes socio-ecological dimensions, or by encompassing this awareness within a grander socio-eco-cosmic consciousness, many modern cosmologies or worldviews may opt for short-sighted, risk-prone, or scapegoating mechanisms. When they do so, they may

opt to forget, silence or ignore the lessons reaped for millennia by cultures that calibrated the impact of their daily practices onto the web of life in order to resonate with the ancient laws of nature, or to echo those of the cosmos.

At present the modernizing and the post-industrial societies in a globalizing world are faced with major challenges for the sustainable conservation of biocultural diversity and for peaceful human coexistence. It is important to reconsider the value of spirituality and the lessons of indigenous cosmologies to foster wise human conviviality and environmental management. It is also important to remember that in this globalized world there is an unprecedented impact of human agency in environmental destruction, climatic change, and in exterminating cultural diversity.

Redressing this may partly occur through international negotiations across peoples, nations or regions, but to truly halt the extermination of biological and cultural diversity, ecologists such as Edward Goldsmith stress that there is an urgency – globally, and among many societies – to uphold relevant worldviews and cosmologies to guarantee a fulfilled sense of existence, and the survival of humanity and life itself.

P The Council of All Beings

The Council of All Beings is a communal ritual in which participants step aside from their human identity and speak on behalf of another life form. A simple structure for spontaneous expression, it aims to heighten awareness of our interdependence in the living body of Earth, and to strengthen our commitment to defend it. The ritual serves to help us acknowledge and give voice to the suffering of our world. It also serves, in equal measure, to help us experience the beauty and power of our interconnectedness with all life.

History

The form originated in Australia in early 1985, when I was on a workshop tour bringing group practices to sustain social and environmental activists. One day after a weekend workshop, John Seed, founder of the Rainforest Information Center, took me to one of the last vestiges of his continent's primordial forests, saved from the timber companies by blockades mounted by John and other local protesters. On that excursion John and I discovered that we shared a passionate interest in deep ecology and the writings of Norwegian philosopher Arne Naess about the "ecological self." As Buddhists, we both resonated with these concepts, finding them close to the Buddha's core teaching on the interdependence of all life. John expressed the wish that my workshops include a "deep ecological" group experience to directly challenge the anthropocentrism of industrial society.

So together, that day, we invented the Council of All Beings. It was introduced shortly afterwards, in the course of the weeklong training that culminated my workshop tour. At a camp north of Sydney, on huge flat rocks by a waterfall, some forty people took part. And soon they were taking the ritual back with them to their local communities.

Within a year, by word of mouth – and through John's and my travels – the Council of All Beings spread to North America, Western Europe, and Japan. From the Grand Canyon to the banks of the Rhine, in redwood groves and classrooms and church basements, people were

gathering to shed their personae as humans and give voice to the plight of the Earth. They spoke as whale and wolf and wind, aspen and marsh and any other nonhuman they felt called to represent.

Articles about the ritual soon appeared in a variety of publications, and by 1988 a book by us both, with Arne Naess and Pat Fleming (*Thinking Like a Mountain: Towards a Council of All Beings*) carried the practice more widely, especially among activists, religious groups, and environmental educators. These publications helped people from different cultures and walks of life to guide the Councils in a recognizably consistent fashion.

Description

As the practice spread, the name “Council of All Beings” came to be used in two ways: to refer to the ritual itself, and also to refer to the workshop or gathering in which it is held, and which includes closely related processes. Since two of these related processes are considered by many to be important, if not essential, to the experience as a whole, they are included in the following description.

The Mourning

The interdependence of all life remains just a mental concept, without power to affect our attitudes and behaviors, unless it takes on some emotional reality. We need to feel it, and our capacity to feel is stunted, if we block out the pain within us over what is happening to our world. Furthermore, if we proceed to take part in the Council *per se*, speaking on behalf of other life forms, without first acknowledging our sorrow for what other beings are suffering at human hands, we risk being superficial, even presumptuous.

Here we use “mourning” as a generic term for the expression of moral pain for what humans are inflicting on the natural world. This pain for the world includes not only grief, but fear, anger, and despair as well. Because these emotions are not encouraged in conventional society, and because they reveal the truth of our interconnectedness with all life, we allow them full play.

For the Mourning, a variety of forms have evolved, in which people feel both safe and free in expressing and releasing their pain for the world. The methods I like best are simple ones: a recitation of the names of endangered species, with drumbeat and pauses for people to name what is disappearing from their lives today. Or the Cairn of Mourning, where, gathered in a circle, people move to the center, one by one, and place a stone. Each stone represents a loss that has occurred or is occurring. As it is brought forward, the loss is described: a family farm replaced by a shopping mall, a fishing stream polluted or paved over, clean air, safe food . . .

Reconnecting us with our capacity to care, such ritual namings of the losses brought by our industrial culture serve as an antidote to the pervasive psychic numbing this

culture incurs. They also serve to awaken us to the interconnectedness of all life forms, our deep ecology. I have come to see deep ecology as an explanatory principle both for the pain we experience on behalf of the natural world, and for the sense of belonging that arises when we stop repressing that pain.

Remembering

Our connections with other life forms are based not only on emotional attachments to places and beings we have loved. They are also organic, woven by shared ancestries, embedded in our bodies. Each atom in each molecule of our being goes back to the beginning of life, and has belonged to far more ancient and varied forms of life than our own. The human form we now wear is just the latest and briefest chapter of a long evolutionary journey. In the Remembering, we consciously own this ancient kinship so that, when the time comes to speak for other life forms, we can do so a greater sense of naturalness and authenticity.

Also known as “evolutionary remembering,” this experiential process guides the imagination while drawing on multiple senses and inner body knowings. It sets our present-day, hurried lives within larger contexts of time. On occasion, the Remembering extends back to the beginning of space and time, drawing on texts such as *The Universe Story* by Thomas Berry and Brian Swimme, and ritual adaptations by such teacher-practitioners as Sr. Miriam MacGillis. But as a preparatory stage to the Council of All Beings, we usually focus on “our life as Gaia”; it is easier to feel with our bodies, and we have already done it in our mother’s womb. Just as, *in utero*, we physically recapitulated the evolution of cellular life, so now we attempt to do it consciously, harnessing intellect and imagination.

Instead of relying on words alone, sound and movement help us to “remember.” A heartbeat on a drum, evoking life’s rhythms, as it pumps our blood, breathes through our lungs, can take us back through time, helping us imagine we can recall the adventures of our four and a half billion years. Our evolutionary journey can also be explored through bodily movement, even the barest of motions. Nosing, crawling, wriggling, pushing up, we imaginatively feel our way into the inner body sense of fish and amphibian and reptile, life stages still embedded in our neurological system.

As your memory improves, as the implications of evolution and ecology are internalized and replace outmoded anthropocentric structures in your mind, there is an identification with all life. Then follows the realization that the distinction between “life” and “lifeless” is a human construct. Every atom in this body existed before organic life emerged. Remember our childhood as minerals, as lava, as rocks? (John Seed)

The expanses of time evoked by the Remembering remind us that the industrial growth society is a temporary episode – and that in order to move beyond it now, we can draw on a more deeply rooted legacy. Respect and gratitude arise for our forebears' capacity to weather adversity and to respond collectively and creatively to enormous challenges. The process helps us to believe that these capacities have not forsaken us, and to draw on them now at this crisis point for life on Earth.

In my years of experiencing and guiding this process, I have seen how it strengthens us to act in defense of Earth and Earth's beings. It helps us act, not from the whim or nobility of our short-lived individual ego, but clothed in the authority of our four and a half billion years. We start learning to act our age.

Speaking for Other Life Forms

This is the Council of All Beings *per se*, enhanced, when time permits, by the preparatory practices described above.

The beings that coexist with us in the web of life are profoundly affected by our actions, yet they have no hearing in our human deliberations and policies, no voice to call us to account. The Council of All Beings gives them a voice – and because it is our own as well, it can change the ways we see and think.

Participants begin by letting themselves be chosen by another life form, be it animal, plant, or natural feature like swamp or desert. We use the passive verb, *be chosen*, in order to encourage people to go with what first intuitively occurs to them, rather than selecting an object of previous study. This way our minds are more receptive and humble, more open to surprise. When out-of-doors, we can wander off alone to happen on the identity we will assume. When indoors, some quiet moments suffice, as we relax and wait with an open, non-discursive mind for the imagined presence of another life form. Then we take time to behold this life form in our mind's eye, bestowing upon it fullness of attention, imagining its rhythms and pleasures and needs. Respectfully, silently, we ask its permission to speak for it in the Council of All Beings.

If time allows and supplies are available, we make simple masks, working together in companionable silence with paper and paints, twigs and leaves. Then, briefly clustering in small groups, we practice taking on the identity of our chosen life form. This helps us let go of our self-consciousness as humans, and become more at ease in imagining a very different perspective on life.

Then, with due formality, the participants assemble in a circle and the Council of All Beings commences. To create a sense of sacred space, prayers and invocations are spoken. Native American practices, such as smudging with sage or cedar, and calling in the blessings of the four directions, are often used here to good effect. When I am the guide, and speaking, of course, as my adopted life

form, I like to begin the proceedings by inviting the beings to identify themselves in turn, a kind of roll call: Wolf is here, I speak for all wolves. I am Wild Goose; I speak for all migratory birds.

Welcoming them all, I thank them for coming, and, with some solemnity, set the theme for our deliberations.

We meet in council because our planet is in trouble; our lives and our ancient ways are endangered. It is fitting that we confer, for there is much now that needs to be said and much that needs to be heard.

The council unfolds in three consecutive stages. First, the beings address each other, telling of the changes and hardships they are experiencing in these present times.

"The shells of my eggs are so thin and brittle now, they break before my young are ready to hatch."

"I'm tightly crowded in a dark place, far from grass and standing in my own shit. My calves are taken from me, and instead cold machines are clamped to my teats. I call and call for my young. Where did they go? What happened to them?"

"As Lichen, I turn rock into soil. I worked as the glaciers retreated, as other life-forms came and went. I thought nothing could stop my work; but now I'm being poisoned by acid rain."

The second stage of the Council begins after most have spoken, and the guide invites humans into the center. Since it is clear that one young species is at the root of all this trouble, its representatives should be present to hear these testimonies. So, a few at a time, the beings put aside their masks and move to sit for a while, as humans, in the middle of the circle. The other life forms now speak to them directly.

"For millions of years we've raised our young, rich in our ways and wisdom. Now our days are numbered because of what you are doing. Be still for once, and listen to us."

"See my possum hand, humans? It resembles yours. From its print on the soft soil you can tell where I have passed. What mark on Earth will you leave behind you?"

"Humans! I am Mountain speaking. For millennia your ancestors venerated my holy places. Now you dig and gouge for the ore in my veins. Clearcutting my forests, you take away my capacity to hold water and release it slowly. See the silted rivers? See the floods? In destroying me, you will destroy yourselves."

The first time I sat in the center, a human in the presence of other life forms, I felt stripped. I wanted to

protest. "I'm different than the logging and mining executives, the multinational CEOs, and the consumers addicted to shopping," I wanted to say. "I am a caring human; I meditate and recycle and teach deep ecology."

But because I was not permitted to speak, these words began to evaporate in my mind. I saw them soon as essentially irrelevant. The deep ecology that had so lured me with its affirmation of our interconnectedness with other species now forced me to acknowledge my embeddedness in my own. If I was linked to the wild goose and the lichen, I was far more linked to the investment speculators and compulsive shoppers. Shared accountability sank in, leaching away any sense of moral immunity.

Then, as the others did, I moved back to the periphery, to see and speak from that wider context. From here I could see more clearly than before the isolation in which humans imagine themselves to exist, and the fear and greed than can seize them.

In the third stage of the Council, the other life forms offer gifts to the humans. Recognizing how dependent they have become on humankind, they would help this young species deal with the crisis it has created. As ritual guide I might cue this stage by saying,

Many humans now realize the destruction they are causing; they feel overwhelmed and powerless in the face of the forces they have unleashed. Yet our fate is in their hands. O fellow beings, what strengths of ours can we share with them, what powers can we lend them?

With this invitation, the beings in the Council begin spontaneously to offer their own particular qualities and capacities.

"I, Lichen, work slowly, very slowly. Time is my friend. This is what I give you, humans: patience and perseverance."

"I, Condor, give you my keen, far-seeing eye. Use that power to look ahead beyond your daily distractions, to heed what you see and plan."

One after another the beings offer their particular powers to the humans in the center. After speaking, each leaves its mask in the outer circle and joins the humans in the middle, receiving the gifts still to be given.

"As Mountain, I offer you humans my solidity and deep peace. Come to me to rest, to dream. Without dreams you lose your vision and hope. Come, too, for my strength and steadfastness, whenever you need them."

"As Leaf, I would free you humans from your fear of death. My dropping, crumbling, molding allows fresh growth. If you were less afraid of death, you would be readier to live."

These gifts reside already in the human spirit, as seeds within the psyche; otherwise they could not be spoken. Their naming brings forth a sense of wholeness and glad possibility. When all of them have been offered, the Council of All Beings is formally concluded. Then the assembled often break into singing, drumming, exultant dancing – releasing energy after the long, attentive listening. Sometimes the group just sits in stillness, silently absorbing what has been learned or writing in journals.

Care is taken to thank the life forms, who have spoken through us, and to dispose of the masks in a deliberate fashion. The masks may be formally burned, or hung on a tree or wall, or taken home with us as symbolic reminders of the ritual. On occasion, at the close of a Council, wanting to stay identified with the other life forms, we fancy that we are putting on human masks, the better to work for them as we reenter the world of the two-leggeds.

Reflections and Applications

The Councils of All Beings, that I have personally experienced, number in the hundreds by now. I can think of nothing I would give in exchange for them – nothing that equals their mixture of laughter, tears, and eloquence, or that can replace the spontaneous insights they engender. Sometimes, as I start to offer the ritual, I fear that people will reject it as beneath their dignity, as childish or a waste of their valuable time. But in each case, when I proceed with quiet confidence, the outcome is similar. Whether in Nebraska or Germany, Russia or Japan, people seem ready and able to step free from their human roles, if only for an hour or two, and give voice to wider, more ancient knowings.

The quality and effectiveness of these rituals vary widely, of course. Because there is no required training for the guide, or "quality control," they can, on occasion, become diffuse, distracted, even boring. Yet, by and large, there is something irreplaceable that happens in the simple act of taking on – or even attempting to take on – the persona and perspective of another life form. It is basically an act of humility and generosity. It moves the self-important ego from stage center, and sheds a fresh light on even the most ordinary elements of life.

According to theologian Thomas Berry in *The Dream of the Earth*, the "shamanic personality," which can understand and speak for other life forms, is essential to our survival. It helps us to break free from our culture's anthropocentrism and dispel the trance of industrial civilization. The life-giving powers shaping creation from the beginning of time are still present within us, Berry writes. They exist as "deep spontaneities," accessible through the imagination.

The Council of All Beings has shown it can evoke these deep spontaneities. Here no fasting or drugs or arduous disciplines are needed to awaken the inner shaman. The Council does not claim to involve channeling or

shapeshifting, or to engage any capacities beyond the moral imagination. All that is required is clear intention; it is like opening a door in the mind and walking through. At times people do experience another voice “coming through” that is beyond any conscious editing on their part. This is not surprising, given the close relation of this work to the shamanic experience.

While the processes described above require a measure of uninterrupted time – a few hours for the ritual circle itself, a full day or two with the related practices – briefer applications have evolved. In church services and celebrations of the mass, abridged versions of the Council of All Beings have, on many occasions, functioned as the sermon or liturgy of the word. As enrichment to environmental education, the Council has occurred in countless settings, from elementary and high school classrooms to graduate schools of architecture and urban planning, where students speak for the flora and fauna affected by a building project they are designing. Inspired by their experience of the Council, concerned citizens in several countries have appeared at public hearings on waste disposal and mining, lumber, and other resource extraction projects; and, with or without masks, they have testified on behalf of the non-human dimensions of life that these plans will affect. People are also choosing to represent our fellow species as listening presences in community meetings, and marchers in town parades. All these current practices attest to our readiness and capacity to break through our society’s anthropocentrism, and give expression to the ecological self.

P Covenant of the Unitarian Universalist Pagans

The Covenant of the Unitarian Universalist Pagans (CUUPs) is a branch of the Unitarian Universalist Association (UUA) dedicated to networking among neo-pagan members of the UUA. Its goals include promoting inter-faith dialogue, developing neo-pagan religious beliefs and practices and integrating them into UUA services. As a

networking group, it has no specific beliefs or practices other than the broad eclecticism and acceptance of spiritual paths characterized by the UUA and by the neo-pagan movement as a whole. In some communities it is seen by neo-pagans as a meeting and recruiting ground for groups as diverse as the OTO and Wiccan covens.

CUUPS emerged in the 1970s as a result of feminists’ critique of what was considered the patriarchal orientation of Unitarian Universalist (UU) spirituality. In response, the UUA General Assembly passed the “Woman and Religion Resolution” in 1977 and introduced concepts such as the goddess and a more Earth-centered spirituality through a class offered in many UUA churches. This movement made connections with the growing neo-pagan movement, as Margo Adler noted in *Drawing Down the Moon* (1979). CUUPS received its charter from the UUA in 1987, and became attractive to neo-pagans who were middle class and professionals and, during the “Satanic Panic” of the late 1980s and early 1990s, were looking for protection and legitimacy from an established religious organization.

CUUPS had a mixed reception in the UUA. Many congregations were heavily influenced by an atheistic movement in the 1960s, and were as opposed to pagan theology as to Christian theology. However, CUUPS has grown rapidly in numbers and influence within both UUA and in the neo-pagan movement. In 1993 it was able to get the UUA to include goddess and Earth-centered spiritual material in its hymnal, and by 1995 convinced the UUA to adopt the following statement as the “sixth source” of UU spirituality: “Spiritual teachings of Earth-centered traditions which celebrate the sacred circle of life and instruct us to live in harmony with the rhythms of nature.”

CUUPS membership appears to have two distinct groups, UU-pagans and Pagan-UUs, based on whether the members started as UUs or as neo-pagans. The UU-pagans tend to be older and more socially integrated while the Pagan-UUs tend to be younger and more countercultural. Pagan-UUs are much less likely to attend regular Sunday services, but rather will focus on evening activities and are more likely to introduce energetic activities when the group sponsors the Sunday service. This is most apparent in the national CUUPS meetings, where Pagan-UUs will be more likely to engage in late-night drumming and dancing while UU-pagans will turn in early.

CUUPS has also had a mixed reception within the neo-pagan movement. It has primarily appealed to the more Wiccan and Earth-centered branches, and to the more socially integrated portion of that branch. It went through a period of instability in the mid-1990s that resulted in a more activist and Pagan-UU leadership. It is currently regarded as one of the larger organizations that constitute the neo-pagan movement.

Cowboy Spirituality

As expressed in poetry and song, cowboy spirituality is a classic example of tension between formal religion and heartfelt spirituality that runs deep in American culture and religious life. Protestant-rooted ideas about the authority of individual conscience, the virtue of plain speech, and disdain for the pretentiousness of ritual and hierarchy characterize cowboy spirituality, as do romantic ideas about nature as a production of God, comparable to the Bible, and belief that awareness of God's hand in nature is far superior to citified churchgoing. On spiritual matters, cowboy verse often combines sentimental, even tear-jerking feeling with gallows humor and honest respect for the grim facts of life. As Allen McCanless wrote in his famous "Cowboy's Soliloquy," first published in 1885,

My ceiling the sky, my carpet the grass.
My music the lowing of herds as they pass;
My books are the brooks, my sermons the stones,
My parson's a wolf on a pulpit of bones.

As the last line of the stanza illustrates, cowboy verse is a peculiar blend of reverence and irreverence that aims to get at the heart of things, often by reference to the earthiness of life and death. Cowboy verse is also forthright about interpreting people and imagery in the Bible, as if they existed, in a kind of eternal way, in the cowboy culture of the American West. Thus another stanza of McCanless' "Soliloquy" reads,

Abraham emigrated in search of a range,
When water got scarce and he wanted a change.
Isaac had cattle in charge of Esau
And Jacob run cows for his father-in-law;
He started in business down at bedrock,
And made quite a fortune by watering stock.

One of the most complicated and important aspects of cowboy spirituality is the cowboy's relationship to nature. Respect for the power and grandeur of nature is a recurrent theme, as is cowboy pride in a close working companionship with natural forces. At the same time, however, companionship with the forces of nature turns

easily into violence, both in imitation of nature's ways and in efforts to conquer her. This aspect of cowboy spirituality fits Richard Slotkin's thesis that the mythology of the American frontier centers on the embrace of violence as a means of generating vitality, and thus helps place cowboy culture in the larger context of American mythology of the West. As interpreters of American culture often argue, the ideal of the frontier West exists in opposition to stereotypes about the effete and artificiality of urban life. The ideal of the rugged, cowboy West serves as an antidote to the anti-ideal of enervated life in polite society. In this respect, the violent aspects of cowboy culture – bull riding, shoot-outs, drunken brawls – are sometimes presented as part of the rough morality of nature. McCanless defended cowboy justice by appealing to the big lives of biblical heroes:

If I'd hair on my chin, I might pass for the goat,
That bore all sin in ages remote;
But why this is thusly I don't understand,
For each of the patriarchs owned a big brand.

In recent years, disagreements about appropriate use of rangelands pitted environmentalists against ranchers and cowboys, and contributed to the strength of the Republican Party, which often opposed restrictions on rangeland in Western states and capitalized on local hostility to federal government intervention. Ranchers and cowboys have not been immune to concerns about the environment, however. Overgrazing has taken its toll on the arid and fragile ecosystems of the West, water is often scarce, and some ranchers and cowboys have started running bison because they need less grass and water than cattle. And for a number of these cowboys and ranchers there is not only a practical reason for running bison, but a belief that it is morally right to prefer native species such as bison over those imported from other continents.

The main difficulty in defining cowboy spirituality lies in understanding the relationship between cowboy mythology and the lives of real people who actually rode (and still ride) the range. On one hand, "cowboy" is a metaphor for high-testosterone, just-do-it behavior that is just as appropriate in the city or suburbs as out on the high plains under a big sky. In this respect, the term "cowboy" can even be used as a verb – as in " 'cowboy' that door shut" or " 'cowboy' that jar open." Tommy Lee Jones flying a space ship with reckless dexterity in *Space Cowboys* and then propelling himself to the moon in a heroic act of self-sacrifice that enables his buddies to reach Earth in safety is another example of the expansive use of the term "cowboy," and one that reflects the emotional and gritty ethics of cowboy spirituality. On the other hand, real cowboys lived, and still live today, working long days in the saddle, punching cows for little pay in all kinds of weather. As

members of a proud but often desperately marginal sub-culture, real cowboys often have lives that are considerably sadder and less romantic than the mythology of cowboy culture would suggest. Still, these real men and boys, and some women as well, write and resonate with the poetry that idealizes their culture.

Creation Myths of the Ancient World

Creation myths in Egypt, Mesopotamia, and Greece generally express the idea of the creation and defense of an ordered cosmos from out of primordial chaos. Many connections can be made among these different mythic traditions in their attempts to make sense of the natural world. For example, the idea of water as the primordial source of life can be found in all of these traditions. Moreover, water is then used by the gods to punish and purify in the Gilgamesh epic of Mesopotamia (ca. 2000–1600 B.C.E.), in Greek stories of Zeus (the weather-god), and even in the Hebrew story of Genesis. Here we see myth struggling to comprehend the moral purpose of the destructive power of nature. There are many other connections among mythic motifs, including the bull as a symbol of fertility and power, stories about the struggles of the sun-god to maintain the order of day, and stories about the divine origin of the cycle of the seasons. One must be careful, when undertaking such a synthetic approach, however, because these mythological traditions each have their own integrity. And even within a single tradition there are conflicting stories and rival cosmogonies.

Mesopotamia

The complexity of the mythologies of Mesopotamia reflects the linguistic and political diversity of this region. Two of the better-known and more recent texts in this

tradition are the epic of Gilgamesh and the *Enuma Elish* (ca. 2000–1200 B.C.E), the Babylonian creation epic. But there are other creation stories, which make use of the same or similar gods and goddesses. Older Mesopotamian cosmogonies focused on various nature gods including: An or Anu, the sky-god; Enlil, the wind-god who originally separated sky from Earth; and Ea or Enki, the creator god who came from out of the primordial waters to create life on land. This pantheon also included the sun-god, Shamash, and the mother-goddess, Ninhursaga. These older Sumerian stories tend to make the creation event a natural occurrence in which the primordial abyss, Apsu or Abzu, was opened and the world was created according to principles of natural order. That these gods represented order and justice in the cosmos is illustrated by the sun-god, Shamash, who gave Hammurabi his famous code of laws (ca. 1700 B.C.E.). A recurrent theme in these early myths is the struggle of the gods of order against chaotic monsters who rise out of Apsu's abysmal depths. The standard interpretation traces this struggle of cosmos against chaos in Mesopotamian myth to the unpredictability of the Tigris-Euphrates river system.

The cosmogony of the *Enuma Elish* presents a creation story in which this struggle against such violent destructive forces predominates. In this story we find the triumph of a younger god, Marduk, in his struggle against the chaotic primordial waters, the male Apsu, now representing fresh water, and the female Tiamat, who represents the salt water. The other gods arise from out of Tiamat who is impregnated by Apsu, in a symbolic representation of the deposition of silt in the delta. In the course of this story the noisy and active younger gods anger the static tranquility of Apsu and Tiamat. A cycle of violence ensues and finally Marduk, the noisy young upstart, leads the gods in a final decisive battle against Tiamat. Marduk defeats Tiamat and splits her body, creating heaven and Earth. Along the way Marduk also slays Kingu, Tiamat's champion. Marduk ordains that human beings are to be created out of Kingu's blood. In one version, when Tiamat is slain, her body is opened and the waters flow out through various orifices. The Tigris and Euphrates flow out of her eyes and her body becomes the mountains from which these waters flow. The danger of her overflowing flood is always present and religious rituals are used to prevent this threat of chaos.

The moral of these Mesopotamian myths is that the human being is a minor and inconsequential portion of a much larger struggle within the natural world. The primeval creation scene focuses on the coming of order out of nothing and the struggle of order against disorder. The creation of human beings comes later. Indeed, the Mesopotamian myths profess that human beings are created to suffer and die as servants of the gods. The Mesopotamian gods are, for the most part, indifferent to human suffering. When they do intervene in human affairs they do so for their own pleasure.

Certain natural themes are ubiquitous in the Mesopotamian myths. One of the most important of these themes is water. Life is said to have come from water and silt. One can see here an obvious connection with the natural environment of Mesopotamia where flooding and silt deposition were pressing concerns of early agriculturalists. The importance of water recurs in the Gilgamesh epic with the story of the flood as told to Gilgamesh by the immortal one, Utnapishtim. The gods destroyed humanity by way of the flood because the raucous noise made by human beings on Earth was disturbing to their ears. Gilgamesh himself struggles through and across waters to find the immortal one who then directs him to a medicine that can ensure youthful longevity. This medicinal plant is found under water and is later lost by Gilgamesh when a snake comes out of a well and steals it from him. In the Gilgamesh, water is the important element against which human beings must struggle. This struggle does not promise a happy ending, however, as the waters themselves seem to be poised against human success. Human interaction with nature is thus antagonistic.

Egypt

While humans struggled before indifferent gods to subdue nature in the Mesopotamian stories, in Egypt they were seen as allies of the gods in their struggle to maintain order before the forces of chaos. Unlike the precarious and dangerous cosmos of the Mesopotamian stories, the Egyptian cosmogonies seem to hold out the hope for stability and immortality. The Egyptian idea of the primordial nothingness was personified as Nun, waters which are inert and featureless. These waters are not like angry Mesopotamian Tiamat. For the Egyptian, the cycle of time was stable, as represented by the movement of the sun across the sky and the regular cycle of the flooding Nile. There was a promise of stability and permanence, even though there were dangers and monsters to be combated.

The Egyptian creation stories begin when Atum or Re, the first god, comes into existence. His appearance occurs in the same way that a hill might be revealed by the receding floodwaters of the Nile. This naturalistic metaphor has two important aspects for Egyptian mythology. First, Egyptians tried to locate the point of Atum's appearance at some definite geographical high point, which was then sanctified as a center of religious or political power. Indeed, as the Egyptian tradition developed in different cultural centers (Heliopolis, Memphis, or Hermopolis, for example) the geographical location of this holy ground also shifted. Second, it connects the creation myth with the seasonal fluctuation of the Nile and so locates the Egyptian mythology within the natural world. This seasonal ebb and flow, the concealing and revealing of land, may also have been the basis of Egyptian ideas about reincarnation, as seen in the myth of Osiris. In general, the

Egyptian cosmogony appealed to certain basic facts of Egyptian climate and geography.

Other naturalistic elements occur in the Egyptian mythos, including the idea of the generation of the world from a primordial act of divine masturbation or expectoration, as Atum brought the world into existence from out of himself. This idea develops in a more intellectual direction, with connections to the Hebrew creation story, in which the creator god of the Memphis theogony, Ptah, speaks the word into existence. There is also a parallel story featuring the spontaneous generation of frogs and snake from out of the mud left by the receding floodwaters. This naturalistic theme was taken up in earnest by the cosmogony of Hermopolis, which was a city located midway between Thebes and Memphis. In the Hermopolitan cosmogony the cosmic egg either laid by a cackling goose, an ibis, or simply left by the receding waters. Within this egg was the sun-god, Re, who then created the rest of the world. Finally, there were stories about the appearance of the divine flower, the lotus, growing out of the sacred lake at Hermopolis. This flower was again identified with the sun god. Other significant natural themes can be found in the animal imagery of these myths. The god Horus was connected with the falcon, which was connected with the sun, the falcon's eye in the sky. In addition, the sun god was connected with the bull as a symbol of fertility and strength and the cow as a symbol of generation and motherhood.

These naturalistic themes in the Egyptian cosmogony make sense within the geographical context of the Nile system. The cyclical floods of the river, the repetition of cycles and seasons in the natural world showed the Egyptians a concrete example of creation on a yearly basis. Creation occurred in the appearance of land, of the sun, the cycles of the moon, in the genesis of amphibian life, of eggs, and in the birth of the lotus from out of the nothing that was the primordial water of the river and of Nun. The Egyptian concern with immortality and rebirth, its connection with a stable natural world, its worship of the sun-god, and its cult of the pharaoh (who was in some stories the reincarnation of Osiris and thus a descendent of Re) – all of this is connected with the geographical context and its tendency to support these naturalistic explanations for the existence of the world. This natural order was based upon divine order or justice, which was called *ma'at*. This order required human support in the form of rituals and sacrifices because there were threats to order found in the coming of night, the waning of the moon, eclipses, and other natural disturbances to the rule of Re. These disordered elements were personified in Apophis, the evil god who disrupted *ma'at* with its opposite, *isfet* – disorder or injustice. The cosmic struggle between Re and Apophis, between light and dark, seen on a daily basis in the progress of the sun, found its ultimate significance in the cycle of birth and death that permeates the natural

world. Individual humans must support the cosmic order of nature, *ma'at*, so that they will be able to accompany Osiris in pursuit of immortality.

Greece and Rome

In the Greek and Roman myths, as in Egypt and Mesopotamia, we find the creation of order, cosmos, out of chaos. Our sources for Greek cosmogony include Homer, Hesiod, the Greek tragic poets, and later Roman poets such as Ovid (spanning a time frame from the eighth century B.C.E to the first century). In the Greco-Roman mythos, Earth and Heaven, Gaia and Uranos, are born from out of Chaos, the primordial undifferentiated abyss. We also see water as the primordial element, personified as Ocean, who surrounds the cosmos. Like the Mesopotamian myths, the Greek myths told of generations of gods struggling against one another. These generational struggles culminate in the battle of Zeus (the Roman Jupiter) against his father, the Titan Cronus (Saturn). Eventually the Olympian gods became supreme under the leadership of Zeus. Zeus then led the battle against those monstrous offspring of Earth who represented disorder. Once Zeus was triumphant, struggle became understood as a struggle among the Olympian gods. As in other mythic traditions, each Greek god was associated with some natural feature or power. The struggle among these gods was thus used to explain natural phenomena such as earthquakes and storms, the rising and setting of the sun, etc. One of the more important of these stories, which figured in the mysteries of Eleusis, was the story of Demeter and Persephone. Persephone was the daughter of Demeter, the goddess of grain and growing crops. Persephone was seized by Hades and carried to the underworld. In her agony over her lost daughter, Demeter stopped plants from growing until Zeus persuaded Hades to release Persephone. This story, which has obvious connections with the Egyptian stories of death and rebirth, explains the origin of the cycle of the seasons in terms of a struggle among the gods.

The Titan Prometheus created human beings and animals. Prometheus' scatter-brained brother, Epimetheus, who assisted in the creation, botched the job somewhat by giving animals all sorts of physical advantages over humans. Prometheus remedied this by giving human beings the use of fire and other crafts. Another creation story, one taken up by Plato in the *Republic*, finds the gods experimenting with different metals, beginning with gold and ending up with iron. The current race of men is supposed to be descended from the iron race, at the degenerate end of the historical scheme. In these stories we discover the Greek view of the relation between gods and human beings. The gods have no real concern for the human except to the extent that humans maintain rituals for them and make sacrifices to them. Indeed, in one story, similar to the story in Gilgamesh and in the Hebrew bible, Zeus supposedly floods the Earth to kill off the wicked iron

men, leaving, finally, only a degenerate race of men made from stone. These stories of degeneration seem to indicate the Greek awareness of the presence of ancient traditions left over from the Minoan and Cretan civilizations, whose culture was contemporary with that of the ancient Egyptians and Mesopotamians. The point here is that the Greeks possessed a healthy respect for the destructive power of the gods and the destructive potential of their natural powers. Odysseus, for example, was punished by Poseidon for blinding Poseidon's son, the Cyclops. As the god of the sea, Poseidon then buffeted Odysseus with storms and prevented him from returning home. Such stories were important for a people who lived and traded on the shores of the Mediterranean, subject to the whims of weather and sea.

Finally, in the literary development of the Greek and Roman mythos, in the Latin poet Ovid's *Metamorphoses*, we find the creative application of myth as explanation for a variety of natural phenomena. Ovid tells of various ways in which the gods meddle in human affairs for their own pleasure. He also tells us how certain plants and animals became the way they are by way of various metamorphoses of humans and gods. Here we find stories of natural transformations, which have become standard parts of Western culture: the stories of Narcissus and Echo, Io and Europa. In this magical atmosphere, Ovid shows a syncretic tendency, using images and appealing to gods, which were part of foreign traditions, including the gods of Egypt.

The moral of the Greek tradition is thus similar to that of the Mesopotamian and Egyptian traditions. The natural world is created full of spiritual energies and divine beings. Human beings must be careful not to offend these natural deities and disrupt the order of the cosmos. And finally, the features of the natural landscape itself can be explained by way of divine conflict.

Creation Story in the Hebrew Bible

The Hebrew Bible preserves two contrary stories of God's relation to nature and humans' place within it, with little editorial attempt to harmonize the stories.

Genesis' first creation account opens with God wrestling chaotic waters in utter darkness, the stormy conflict seemingly without beginning. God creates by pushing chaotic waters behind the barriers of firmament and Earth (Gen. 1:6, 9). Water is pushed to the periphery of this story, a constant threat to creation if the water ever broke through its limits (Gen. 7:11–12; Ps. 46:1–3). The story's closing mandate exhorts humankind to mimic the divine repression of chaos in order to live within this creation, and life is lived under threat (Gen. 1:28).

Water remains a continual danger to God's chosen people, threatening God's plan for his people's survival at key points. Mass drowning during the flood makes the command to multiply and fill the Earth difficult (Gen. 9:1). Called out of Egypt, Israelites pause before the sea in terror, wishing to return, but God dries up the sea so that they can proceed (Ex. 14:16). God repeats this at the river Jordan so Israelites can cross into the Promised Land on dry ground (Josh. 3:16–17). But God may have driven water too far from the land promised to Abraham, as its frequent famines attest (Gen. 12:10; 26:1; Ruth 1:1).

Water is not the only natural threat to creature and Creator. Israelite religious reformers hack and hew *Asherim* – wooden pillars or trees at sacred sites that represent the goddess Asherah – to purify the cult (Ex. 34:13; Deut. 7:5; 12:3; Jer. 2:26–27). God may consider living trees a personal threat to Israel (Ezek. 20:46–47; Isa. 10:33–34; Jer. 7:20). And wilderness becomes hostile to human existence as well (Gen. 21:15–16; Ex. 23:28–30; Joshua 5:6).

Genesis' second creation story gives a contrary view. The story opens with creation thirsting for water to realize its potential (Gen. 2:4–5). God allies with rain, mixing with soil to make mud, into which he breathes divine breath. From this tripartite mix human farmers are pulled to till the land as well as animals to alleviate human loneliness (Gen. 2:5). God mandates a vegetarian diet that protects this sibling relationship (Gen. 2:16–17, also 1:29–30). When humans transgress divine limits, this harmony turns adversarial and humans, animals, soil and water are estranged (Gen. 3:15–19). The hope of this story cycle is to a future return to this original harmony of God, soil, water and creature.

Water is key to bringing exiled Jews back to a verdant Promised Land. God recasts the hostile desert landscape

recreating it with springs, rivers and trees so that his people can freely eat and quench their thirst on their homeward journey (Is. 41:17–20; Ezek. 34).

Aspects of divinity are present in trees like the Tree of Life and the Temple Tree (Gen. 3:22; Ezek. 31; Isa. 55:12–13). God's essential connection to trees compels Abraham to camp at the groves of sacred trees at Beersheba, Shechem and Hebron so as not to miss divine encounters. Ezekiel envisions God as a sacred tree with water springing from his base (Ezek. 34:25–30; 41:15–26; 47:1–12). Israel also is like a tree according to God (Jer. 11:16, 19; 17:7–8; Hos. 9:10).

God's presence at Mount Sinai is so strong that Moses must bring the people there to meet him (Ex. 19). Moses and Elijah venture into caves in Mount Sinai and experience intense personal encounters with God (Ex. 33:18–33; 1 Kings 19:8–13). Later God's presence is integral to Mount Zion in Jerusalem (Ps. 48:1–2, 12–14; 132:13). Jacob, after visions of divinities shuttling between heaven and Earth, calls the mountain of Bethel a gate of heaven (Gen. 28:17). The wilderness is a place of divine restoration for Moses and Elijah (Ex. 3–4; 1 Kings 19:1–9).

God so pervades the natural world that ancient Israel's legal and wisdom traditions assert that God's will and character are evident in natural phenomena, as well as in animal and human behavior. The law consecrates human and animal life equally before God (Ex. 22:29–30; 23:5). Animals suffer their domesticity, fulfilling their potential far from human habitation (Job 39:5–30).

The history of the covenant, the most legal of the Bible's formal agreements, begins with God making a promise to Noah and every living creature as equals (Gen. 9:9–12). That history ends on the Day of the Lord when God will reestablish a covenant between all life, human and animal (Hos. 2:18–19, Joel 1:14–20). In Hosea's vision God establishes his final covenant by banishing violence to reconcile species (Hos. 2:20–23).

Within this creation story prophets cannot imagine the restoration of the people of God without a concurrent restoration of animals and nature back to their beginnings. In the words of Isaiah, "The Earth lies polluted under its inhabitants; for they have transgressed the laws, violated the statutes, broken the everlasting covenant. Therefore a curse devours the Earth, and its inhabitants suffer for their guilt" (Isa. 24:5–6).

Human vigilance keeping nature's chaotic elements in check is never relaxed in the worldview of the first story. Reestablished harmony between humans, animals and land is the future hope of the second story. Although the two creation stories set out contrary roles for nature, the natural world in both is a medium of divine revelation and instruction – a role as significant as any historical event.

Creationism and Creation Science

Creationism is the belief in the supernatural origins of the universe. Although many different religious believers – with various mixtures of scientific explanation – could agree to such propositions about divine power and involvement in the natural world, the term has come to be associated exclusively with conservative Christian opposition to evolutionary theories of nature, based on the adequacy of the Bible to answer the mystery of creation. Strictly speaking, almost all thought (in the European world) about cosmic origins before the modern era was creationist in character. However, beginning in the seventeenth century, a number of scientifically oriented thinkers in Western Europe began systematic study of the operation of natural laws. These views proposed to reframe divine action in terms of, or even subordinated to, the workings of nature. As science grew in authority, by accumulating worldly reasons for natural facts and explaining previously mysterious phenomena, "creationism" came to refer to the position of resistance to such scientific explanations: creationists retained a caring, Providential picture of the world's operation, including its origins, while "scientific naturalists" posited that natural facts and forces were sufficient to understand nature.

Creation Science has a more specific meaning and a more recent history. By the 1960s, some creationists grew impatient with attempts to defy modern science. Instead of trying to object to science completely, creation scientists

proposed the development of an alternative science, leaving out the naturalistic assumptions and ignoring whole fields of Darwinian research. Creation science attempts to make creationism up to date and scientific through the search for natural facts that support the Providential and biblical picture of God's loving creation of the world.

For both creationism and creation science, the advent of Darwinism was a crucial turning point. Previous views of nature tacitly assumed that God carefully watched over the Earth's creatures with the special creation of individual species, generally in their present location. By contrast, Charles Darwin in *The Origin of Species* (1859) proposed that divergent species develop through wholly natural mechanisms, specifically, by hereditary variation and struggle within their natural environment. While he did not himself openly criticize religious beliefs in the creative action of the divine, his theory of species development through natural selection had no place for such thought. Moreover, as Darwinism and other similarly secular scientific theories in the late nineteenth century rose in public authority and influence, many enthusiasts for science used the new knowledge as a weapon to attack religious belief. In this context, creationism was put on the defensive and grew avowedly anti-scientific and even anti-modernist, as it affiliated with traditionalist social values and conservative politics in the twentieth century.

While the labels "creationists" and "scientific naturalists" defined the polar extremes of this cultural divide, there were also larger numbers of people who occupied positions on the spectrum in between, with various religious Darwinist and progressive evolutionist positions that allowed for divine action in the world expressed through the natural means that science had come to understand. In public debates, however, creationists were eager to identify their position as the only truly religious stance, with any middle ground on the road to secularism and atheism. In the United States, the publication of a series of books called *The Fundamentals* in the 1910s institutionalized this traditionalist religious orientation, with biblical literalism as a theological centerpiece.

Despite the claims to be doctrinally steadfast through the ages, such fundamentalist-inspired creationism has been, ironically, a modernist phenomenon. The focused attention on the biblical creation account in open scorn of modern science has only emerged in the wake of these modern scientific propositions. From the creationist point of view, scientific inquiries are merely elaborate versions of vain human efforts to understand God's cosmic workings; better to keep loyal to a set of truths higher than those of any merely human inquiry. The divinely inspired Word of God enshrined in the Christian Bible provides a lens for viewing the facts of nature in their order, beauty, and blessed indications of divine care for humanity.

While creationists could agree on the truth of the Bible and the arrogant temptations of scientific claims, they disagreed on the ways they read the Word of God. There have been three main versions of creationism: the gap, the day-age, and the young Earth theories. With Genesis as a touchstone for Christian creationist explanations of origins, some have been content to accept large lapses of time in the history depicted within the first few verses of the Bible's opening chapter. "In the beginning, God created the heavens and the Earth," therefore, serves these creationists as an accurate record of origins, with the next verses describing events occurring ages later in time. This gap theory maintains biblical literalism, but leaves room for naturalistic explanations in the gaps of time not explicitly mentioned in the Bible. Other believers in biblical inerrancy strayed a little further from literalism: The day-age theory was the proposition that passages about days in the Bible corresponded to whole long ages of time. For example, the six days of creation therefore would not mean the activities of a literal line on a monthly calendar, but God's actions over eons, explained to humanity in the story form of a creator/father's work week. Both the day-age and the gap versions of creationism offered the potential to accommodate modern professional scientific insights into a biblical understanding of the world. This could not satisfy the most ardent of creationists. The Seventh-Day Adventists, a small American denomination founded in 1863 in the wake of early nineteenth-century millennialist expectations of Jesus' imminent return, championed a more radically literalist, anti-scientific creationism. In the early twentieth century, an Adventist preacher, George McCready Price, made the first modern attempts to systematize the argument for a young Earth. He called evolution absurd for its improbability and inaccessibility to empirical verification, and he proposed an alternative: special creation of unchanging species, and a worldwide flood – namely, the one described in the biblical story of Noah – that can explain the seeming antiquity of rocks and fossils. By the early twentieth century, however, Price represented a minority position, even among creationists. For example, during the Scopes Trial (1925), William Jennings Bryan used day-age ideas to prosecute John Scopes and to defend Tennessee's Butler Act, which prohibited the teaching of evolutionary theories of human origins. Creationists of all varieties remained publicly quiet until the 1960s. During this age of atomic power and ambitions for space travel, when there was unprecedented enthusiasm for progress through science and technology, the young-Earth creationists launched a counterattack.

Creation science, built on the young-Earth version of creationism, began to take shape with the publication of John Witcomb and Henry Morris' *The Genesis Flood* (1961). These ideas for a 6000-year-old Earth took institutional form with the founding of the Creation Research

Society in 1963, and they have been gaining popular support through the democratically compelling argument that creation science does not seek to defy professional science but just to gain equal time alongside it. Ironically this argument has gained unintended support from left-wing theories about the relativity of truth and the social construction of scientific knowledge. In this setting, science is just another ideology and creation science offers an alternative ideology. However, in a precedent-setting legal case about an Arkansas law mandating equal time for creation science with evolution science, the Supreme Court declared that creation science is not a science, but a religious position that has no place in public education. Ironically, some contemporary creationists have turned against creation science because in its eagerness to establish another parallel science, it has taken on too many of the trappings of science; for these creationists, the point is to witness the truth of their religious truths against the godless despair of modernist thinking distorted by the folly of Darwinism. These rumblings from within fundamentalism have not stopped the public progress of creation science.

In its open defiance of mainstream science, creation science has contributed to an inhibition in public education about the basic principles and facts of evolutionary theory in general, and also about the biological functions of ecological systems that support a healthy environment. This has added a religious edge to environmental policy discussions since creationist religious believers have tended to fear environmentally friendly policies because they associate them with paganism. When advocates of the ecological imagination call for biophilia and a humble turn from anthropocentric practices, creationists tend to see non-Christian nature worship and an erosion of moral standards. While most creationists are at least suspicious of environmentalism, there is a recent movement to regard environmental destruction not through scientific ecology, but through a theological argument about defending God's creation. This trend in conservative Christianity connects to its historic distaste for the dissolving forces of cosmopolitan corporate capitalism. Just as mass-culture markets can destroy traditional values, so too they can destroy the beauties of the Earth. Despite these developments, most creationists align politically with anti-environmentalism or with minimal efforts to curb humanity's ecological footprint.

Despite its legal setbacks and its scientific implausibility, creationism in the form of creation science continues to be broadly influential in the United States and in some other parts of the world because it strikes a responsive chord in many people for its ability to portray empirical reasons to believe in the personalized and comforting pictures of the creation that are set out in the Bible and conservative Christian theology. These positions are largely unresponsive to scientific critique, and they fuel

periodic political advances for creationism, most recently in the Kansas school system. In an age when many feel distrust and even fear of the growing power of science, but also enthusiasm for the technological fruits of scientific ways to shape our relation with nature, creationism and especially creation science are ways to keep the traditional faith and still lay claim to a kind of scientific authority.

Creation's Fate in the New Testament

Nature has two dominant fates in New Testament books. It either passes away to be replaced by a new creation, or is transformed anew. In either case tension exists between nature's current state and its future form.

On the future Day of the Lord the heavens and Earth will disappear with a loud snap consumed by fire (2 Pet. 3:10–12). This annihilation of creation prepares the way for new creation to replace the old (Rev. 21:1, 4–5; cp. Isa. 65:17; 66:22). The new creation is to be an entirely spiritual existence (1 Cor. 15:42–50).

This view suggests a disregard for current nature – after all, it is going to be replaced or destroyed anyway. But there is a call for humanity to live transformed lives in the present creation as if it were a new creation (2 Pet. 3:11–14). The dissolution of nature was never intended, and there is a constant hope that the end of the world can be avoided. Nevertheless the dualism behind this view chooses to perfect the human spirit over nature.

The dominant New Testament view of nature's fate is its restoration alongside human restoration. Jesus' miracles

in nature – restoring overtaxed fish populations (Lk. 5:4–10, Jn. 21:1–11), increasing the Earth's fertility through multiplication of fish and bread (Matt. 14:13–21; 15:29–39; Mk. 6:30–44; 8:1–10), enhancing its nourishment by changing water into wine (Jn. 2:1–11), or reestablishing supporting relations between species (fish provide the coin to pay state tax, Matt. 17:24–27) – restore nature's fertility. Those parts of nature resisting Jesus' call of fertility, like the withered fig tree, are removed (Matt. 21:18–22; Mk. 11:12–14, 20–26).

Jesus' miracles in nature reveal nature's divine character previously hidden, thus reestablishing nature's abundant fertility by which it expresses divine creation. The incarnation of God in human form is more than the creator's passion for creation, it argues for God's embeddedness in it. Water is no longer just water and bread is no longer just bread but they are aspects of the divine (Jn. 4:10–14, 6:51).

The agricultural setting of Jesus' parables is more than a reminder of his rural upbringing. The thorns, thistles, frustrated sowing and harvest also recall the cursed farmer and ground of Genesis' Adam and Cain (Gen. 3:17–18; 4:11–12). Jesus' words reinvigorate the farmer and fertilize the land, reversing Adam's curse, if both are receptive to his message (Matt. 13:8, 23, 30 and Mk. 4:8, 26–32). Farmers hesitant to plow – unwilling to trust God's reestablished commitment to man and soil – are not ready for the Kingdom (Lk. 9:62).

Numerous images of husbandry – chasing down lost animals (Matt. 18:12, Lk. 15:4), cultivating (Lk. 13:8), grafting (Rom. 11: 17–19), harvesting (Matt. 9:37; Jn. 4:35), plowing (Lk. 9:62; 1 Cor. 9:10), pruning (Jn. 15:2), reaping (Rom. 1:13; Rev. 14:14–16), sowing seed (Matt. 13:3; Jn. 4:36–37), shepherding (Matt. 25:32; 26:31; Jn. 10:2), threshing (Matt. 3:12) and watering (1 Cor. 3:6–8) – argue for human integration into nature. Human alienation from nature is over.

The fate of nature in Revelation includes its replacement (21:1–5). But there also are stronger images of nature's lengthy transformation process alongside God's purification of humanity. The scroll of history, a literal bridge of material continuity, stretches from the writer's day into the future. Nature is not only increasingly renewed in Revelation but it is also enlisted as Christ's ally in the fight against human evil (Rev. 12:16). Nature is to assist in bringing humanity to repentance (Rev. 16), and to end evil's rule. Birds pick clean the bones of the wicked, the Earth swallows the Devil, and Satan as well as the wicked are locked up and burn forever in terrestrial lakes of fire (Rev. 19:17–21; 20:3; and 21:8).

Restored creation so appeals to God that God descends down to wed creation. God's place is with creation (Rev. 21:3; 22:1–2). The vision of the end times in Revelation returns full circle back to the creation images of Genesis. The Creator, who vivified nature with his water and

breath calling it good, returns in the end to embrace its goodness.

Creatures' Release in Chinese Buddhism

The releasing of captive creatures (*fangsheng* in Chinese; *hōjō-e* in Japanese) destined for slaughter is a popular Buddhist practice in China and the rest of East Asia. It exemplifies an emphasis on cultivation of compassionate and meritorious deeds that is characteristic of Chinese Buddhism; it also resonates with the virtue of nonviolence and the Buddhist sense of concern for the welfare of all creatures. The animals released are usually ones that can survive on their own in their natural habitat, such as birds, wild animals, and fish. Domestic animals are also sometimes donated to monasteries, thereby enabling them to live out their natural lifespans in peaceful environments within consecrated areas.

Traditionally in China many monasteries had pools in which lay devotees could drop fish and turtles they had received from local fishermen, thereby generating good karma for themselves and their families. Like other popular practices, the release of animals was largely motivated by the desire to accrue merit and receive positive karmic recompense. According to Zhuhong (1535–1615), an eminent Ming dynasty cleric and a leading proponent of the practice, the rewards for those who free animals include acquisition of honor and status, extension of one's lifespan, protection from disasters, rebirth in heaven, and enlightenment. Sometimes large ceremonies that feature

release of creatures are also performed for the realization of communal goals, especially protection from natural disasters such as drought.

On occasion Chinese Buddhist associations organize mass releases of creatures, especially during popular Buddhist holidays such as an annual festival dedicated to Guanyin, the bodhisattva of compassion. As part of the ceremonies performed at such occasions, Buddhist monks recite the Three Refuges and Five Precepts on behalf of the released animals in the hope of helping them to accrue good karma and improve their chances for favorable rebirth. For some critics this sort of practice gives rise to ethical concerns. Although the release of creatures basically represents a sympathetic attitude toward animals, in effect it increases the demand for the capture of certain types of animals and fish, thereby merely benefiting local pet shop owners and fisherman but doing little to deal with the basic causes of animal suffering.

Scriptural basis for the practice of releasing of creatures can be traced back to canonical sources such as the *Brahma Net Scripture*, an apocryphal text composed in medieval China. This scripture calls for the liberation of living creatures and their protection from suffering and danger. The practice became popular in China during the medieval period, when it was promoted by pious rulers such as Emperor Wu of the Liang Dynasty (r. 502–549). The emperor adopted a vegetarian diet and enacted laws that restricted the slaughter of animals. Other important factors included the examples set by influential monks such as Zhiyi (538–597), the founder of the Tiantai school. During his tenure as an abbot of monastery at Tiantai mountain, Zhiyi converted the local fisherman to adopt the practice of non-killing and persuaded the imperial government to issue a decree banning fishing along the seacoast close to his monastery.

Rituals for the release of creatures were also transmitted to Japan, where they received support from the medieval Japanese state. Pertinent rites were promoted in concert with a government-issued ban on the killing of animals during specific periods, and eventually they assumed the form of state ritual. Another Japanese innovation was the performance of these rituals at Shinto shrines, especially shrines that served as cultic centers for the deity Hachiman. In the course of time the services came to incorporate and mix elements from both traditions, thereby ceasing to be purely Buddhist rituals.

Crop Circles

Large, complex and intricate patterns have been found swirled into crop fields around the world on a noticeable scale since the early 1980s, though documented reports of related phenomena go back much further. Known generically as “crop circles,” their origin and purpose remains contested or mysterious. Despite many attempts to dismiss them all as the work of human artists, a dedicated coterie of researchers and followers, generically dubbed “cerealogists” (after Ceres, the Roman goddess of vegetation), believe they represent something much more mysterious.

The appearance of crop circles was first reported in 1980 in the Wiltshire area of southern England. Since then, the number, size, and diversity of formations has grown considerably, numbering several thousand in total, found as far apart as Australia and western Canada, though with a disproportionate amount still concentrated in rural England. Formations range in size from about a foot across to several hundred feet in diameter. The earliest reported formations were simple swirled circles and ellipses. By the mid-1980s these were joined by circles with numerous rings and satellites, and by 1990 included elaborate “pictograms.” When the phenomenon first began to attract serious attention in the 1980s, many believed the initially simple circles to be the result of unusual meteorological phenomena. Perhaps the most widely touted scientific hypothesis has been physicist Terence Meaden’s “plasma vortex” theory, which postulates that they are formed by the rapid downward collapse of a standing, electrically charged whirlwind.

But rapidly increasing numbers and evolving designs soon made Meaden’s hypothesis appear untenable. Tantalized by associated reports of glowing lights, strange sounds and other bizarre phenomena, everyone from UFO buffs to eminent scientists became involved in trying to unravel the mystery. The year 1990 saw a substantial leap in the evolution and complexity of the designs and an increase in media attention. For many, the mystery of crop circles was solved in 1991 when two English sexagenarians, Doug Bower and Dave Chorley, announced that they had invented the whole phenomenon as a joke and had themselves created over 250 formations. Despite this and the appearance of other hoax claimants over the years, crop formations of growing sophistication and size

have continued to be discovered, leaving many convinced that there is an unexplained force at work.

Today one can find beautiful interlinked spirals, snowflake and spiderweb-like designs, fractals, and various more free-form shapes, often spectacular and sometimes demonstrating clear symbolism of a scientific or esoteric nature. Any sown crop can host formations, but they are most common in wheat, rye, corn, and barley fields, though they have been found in wild grass and undergrowth. Many cases exhibit great complexity in the swirled lay of the crop, with little apparent stem damage, and scientific tests have reportedly found distinctive biological anomalies within the plants themselves.

Like other mysterious phenomena (see Earth Mysteries), reception of crop circle appearances has tended to be polarized between believers and debunkers. The latter group claims that all crop formations are done by hoaxers, though only a small percentage have been claimed by their erstwhile creators. The former group, meanwhile, resorts to a wide range of arguments to dispute this, including the fact that few, if any, circle-makers have ever been caught in the act, and that some circles are seemingly made in the space of a few minutes, most commonly at night, with the makers leaving no apparent tracks. Cerealogists have proposed several complementary hypotheses to explain the phenomenon. Besides Meaden’s plasma vortex theory, crop formations have been interpreted as caused by lightning-induced electrical pulses; geomagnetic or telluric energies; collective psychokinesis; greetings, warnings, abstract doodles, or other communications from an extraterrestrial source; microwave transient radiation, possibly resulting as a by-product of secret military experiments; or as the trickster-like response of Gaia or of more place-specific Earth spirits to the environmental crisis.

Perhaps of equal interest to the question “what are they?” is the religious dimension of the crop circle phenomenon. The hundreds of individuals who have devoted months or years of their lives to visiting, researching, and pondering these figures constitute a subculture that finds meaning in mysteries, unanswered by the current scientific worldview, which they believe to be associated with the ecological crisis or with an impending transformation in human consciousness. Crop circles thus constitute an enigma that suggests that the Earth itself or some higher power is provoking us to wonder, to “question authority” and to “think outside the box.” At the same time, the individuals who have been responsible for creating at least some of these formations have revived a tradition noticeably absent in the art world since the medieval era – that of the anonymous artist, in this case, a landscape or Earth artist whose work is intended to evoke a sense of mystery, or at least puzzlement, rather than to provide answers or assert one’s individuality. Whatever their origins, crop circles have entered the creative

mythmaking endeavor by which some humans are reconceiving their relationship to the Earth.

Cuero, Delfina (1900–1972)

"My name is Delfina Cuero. I was born in xamaca' (Jamacha) about sixty-five years ago (about 1900)." So begins the classic as-told-to-story in *Delfina Cuero: An Account of Her Last Years and Her Ethnobotanic Contributions*, which offers a window into the Kumeyaay and their relation to the coastal regions of California in the early 1900s. Recorded and edited by anthropologist and ethnobotanist Florence C. Shipek, and originally published by Dawson's Book Shop in 1968, this book provides invaluable information on food collecting, hunting, and fishing along the coastal regions in San Diego County and Baja California. Most important, Delfina Cuero recounts in a precise manner the interdependent relationship between ritual and food resources, a characteristic of California Indians. One can trace the diminution of ritual through their forced displacement in the late 1800s and early 1900s.

"My father and mother left Mission Valley, they told me, when a lot of Chinese and Americans came and told them that they would have to leave. They did not own the land that their ancestors had always lived upon . . ." (Shipek 1991: 23). Delfina Cuero tells how her people survived from hand to mouth, belonging nowhere, owning nothing, exploited as the cheapest form of labor supply. "When the Indians were told to leave a place, they

generally just headed farther into the mountains. Pretty soon they would tell me we had to move again" (in Shipek 1991: 26).

Delfina Cuero describes what plants, such as cactus, acorns, pine nuts, manzanita berries, wild sweet pea with red flowers, pumpkins, mint, sumac, and edible seaweed, had been gathered and where, and how they were prepared for food or medicine. She explains what fish and shellfish, such as starfish, crabs, octopus, abalone scallops, clams, lobster, and shrimp, were collected. She remembers only a few stories and relates them: accounts of the dipper in the sky, lying differently in the summer and winter; coyote and the two beautiful female crows; rabbit's eyes which make one a good hunter; tattooing and nose piercing which helped one travel on a straight road when one dies; and the stinging red ants' "good medicine." She tells of great dreamers, of witches, of medicine people, herb women, "sucking doctors," healing songs and their power.

A good one, after he had dreamed and received his power would go off and fast and dance by himself. Then he would quietly start healing anyone who happened near . . . Anyone who did that, never thought of themselves any more, only of the people who needed help (in Shipek 1991: 51).

What is remembered is an intimate relation with the land, sea and sky. What emerges in this story is not a bitterness, but a sense of tremendous sadness and loss as a people are dislocated from their land, "When I was young, we had to move too much to plant anything. Always being told to leave, it was no use to plant" (Shipek 1991: 32).

There was another loss: ritual. Rituals – menstruation rituals, tattooing practices, the fire dance, the image dance, the death ceremonies – had taught people of life and its transitions. Delfina explains,

In the real old days, grandmothers taught these things about life at the time of a girl's initiation ceremony, when she was about to become a woman. Nobody just talked about these things ever. It was all in the songs and myths that belonged to the ceremony. All that a girl needed to know . . . was learned at the ceremony, at the time when a girl became a woman (in Shipek 1991: 42–4).

But by the time Delfina was a young women, she recounts, "They had already stopped having the ceremonies before I became a woman, so I didn't know these things until later" (Shipek 1991: 43). In a moving narrative, she tells how other young girls had the same trouble she did after she was married. One day she was picking greens, as food was hard to come by, and she says,

No one told me anything. I knew something was wrong with me but I didn't know what . . . I had a

terrible pain . . . I started walking back home but I had to stop and rest when the pain was too much. Then the baby came, I couldn't walk any more, and I didn't know what to do . . . I lost the baby (in Shipek 1991: 43).

Kumeyaay no longer had access to sacred places for ceremonies nor in their search for food could they maintain the ceremonial rhythm as a people. Most young mothers of her generation lost their first-born.

By the early 1960s when this story was told, the Kumeyaay no longer had access to familiar land for food resources, "I went out and hunted for wild greens and honey. Sometimes we found things. Lots of times we did not and we went hungry" (in Shipek 1991: 60). Nor did they have the ritual structure which expressed their interdependent relation of ritual and food resources. Yet we hear the echoes of a transformed continuity, a grateful reciprocity. Delfina Cuero says, "Nobody ever told me anything about God that I can remember. But I thank God all the time, especially for plants" (Shipek 1991: 53).

Cusa, Nicholas of (1401–1464)

The medieval philosopher and theologian, Nicholas of Cusa developed a concept of divine presence in the universe that can be mined for its rich spirituality, which is inclusive, rather than exclusive, of the natural world. Because he saw the world as an outward expression of God's very self, today he is being rediscovered as providing a theological basis for reverence for nature. God enfolds the universe in himself and unfolds himself in the world, Nicholas believed, and thus nature is not a fabricated object apart from God, created for human use, but it is God's self-externalization. Since this doctrine of divine immanence is held in tension with a doctrine of divine transcendence, or extreme otherness, Nicholas avoided both the hierarchy that is the source of much criticism among environmentalists today, as well as pantheism and monism. The variety of nature is a result of divine fecundity, not of the filling in of the slots of a hierarchy reflective of medieval society. Thus, his mystical approach promises a new way of religiously valuing nature.

Nicholas understood the world as fundamentally oriented toward God because of God's intimate presence

there. It originates in divine self-manifestation and is destined for its own unique deification. Although it does not surrender its own independent being, it is nevertheless inextricably linked to God. His concept of divine immanence infuses the world with immeasurable value and gives rise to a Christian spirituality that can address the current ecological crisis.

Since the essence of God is the essence of all things, a characteristic of the natural order is unity. It is because the One reveals itself in multiplicity that the universe is indeed a *uni*-verse. The One God who is absolutely identical to each and every thing appears actually in variety. The divine manifestation of Unity into difference allows for the created order's existence as a united, singular thing. Thus, to divine Unity can be traced the self-identity of the diversity of things and their incorporation into the universe. The unfolding of God in the world and its enfolding in God means that there is an interdependence within the natural order itself. Metaphysically, the whole comes before the part; no aspect could exist without the other.

Nicholas offers a model of the universe that is traditional and yet innovative. God reveals himself to humanity as he reveals the natural order. The link between reverence for the divine and reverence for nature is inescapable. As an expression of the divine, the natural world has its own perfection that commands our respect and care. Hence, "natural" never refers to an order apart from God; nature is never severed from grace. Nicholas of Cusa's model of God offers a promisingly Christian, yet modern, understanding of God that suggests new ways of thinking about nature.

Cyborgism

In *Simians, Cyborgs, and Women: The Reinvention of Nature*, Donna Haraway invokes the ironic image of the cyborg as a tactic to disturb gender essentialism in both mainstream Western culture and feminism. Haraway's embracing of the cyborg figure is born of a concern that certain uses of female imagery associated with nature

tend to essentialize women, and construct “women’s experience” in a unitary fashion. To essentialize is to take a characteristic or part of something as descriptive of the whole phenomenon, as in taking an idea of what a woman is like, perhaps “nurturing” or “closer to nature,” and equating it with what all women are like, ignoring the other characteristics of individual women, such as personality, culture, race, class, sexual orientation, etc. Haraway’s image of the cyborg transgresses such essentialist ideas of what women are like, by disturbing expectations of tidy categories. Cyborgs are transgressive boundary creatures, monsters, ambiguities of organism and machine, neither necessarily one gender nor the other. The image of the cyborg demonstrates and signifies the intertwining of technology and organic bodies in humans, transgressing the categorical boundaries that would name humans as either cultural or natural beings. Using the image of the cyborg communicates the idea that humans are both organic creatures and cultural beings dependent on technology. The cyborg figure undermines belief in the expected explanations provided by biology, evolution, and technology, as it questions the boundaries between living and technological systems. Where do our science and technology end, and our selves begin? The cyborg has the potential to stimulate social change, Haraway argues, as an ironic image that suggests a model of the person as being connected, responsible, and diverse, rather than an independent ego.

Haraway concludes her “Cyborg Manifesto” with the words “I would rather be a cyborg than a goddess” (1991: 181), but this should not be taken to mean that she rejects all feminist spirituality and ecofeminism. On the contrary, she speaks well of ecofeminist and spiritual activities such as the demonstrations against nuclear power in which Starhawk, a prominent American witch, participates. Haraway objects not to ecofeminism or feminist spirituality *per se*, but to any unquestioning identification of women with nature, and use of the image of Mother Nature or Mother Earth in the essentialist forms familiar within mainstream culture. Haraway suggests that women would do better to revision “the world as coding trickster with whom we must learn to converse” (1991: 201), rather than seek a primal mother in nature.

Haraway self-identifies as ecofeminist, yet maintains a critical stance regarding ecofeminism as well as feminist

spirituality. Following the logic of the cyborg, she does not choose to accept or reject these completely, but continues questioning. Her work suggests that the question is wrongly posed to imply that women, to be effective feminists or environmentalists, must choose between science and religion or spirituality. Women should not abandon science, Haraway maintains, because it is too powerful to ignore: it will continue to overwhelm our culture if we do not change it from within. Science is a powerful myth in Western culture, and she suggests challenging it through adopting the ironic political myth of cyborgism. Haraway’s work explains and illustrates a view shared by many ecofeminists, that science and myth, a form popularly thought of as relegated to religion and spirituality, cannot be separated.

Marsha A. Hewitt criticizes Haraway’s cyborgism for offering an escapist abstract vision of emancipation that lacks an awareness of the concrete conditions of women’s oppression, and that is appropriate only to middle-class academic feminists living in late industrial capitalist society. Haraway’s writing may not be accessible to lay audiences, but it has proven influential in feminist and ecofeminist theory, notably in the work of Stacy Alaimo (1994), Catriona Sandilands (1999), and Noël Sturgeon (1997).

D

Dalai Lama (1935–)

The fourteenth Dalai Lama, Tenzin Gyatso, was born in the Amdo region of eastern Tibet in 1935. Recognized at age six as the reincarnation of the thirteenth Dalai Lama, he was brought to central Tibet, where he began his formal education. Dalai Lamas traditionally are invested with full temporal power at age eighteen, but due to the Chinese invasion of Tibet in 1950 the date was moved up by two years.

For the next nine years the Dalai Lama attempted to cooperate with Tibet's new Chinese rulers, but following an abortive popular uprising in March 1959, the Dalai Lama fled to India. Once there, he formed a government-in-exile headquartered in Dharamsala, Himachal Pradesh. Since then, he has become one of the world's most widely recognized religious leaders, and in 1989 he received the Nobel Peace Prize for his work in attempting to promote a peaceful resolution to the crisis in Tibet with the Chinese government. He has authored numerous books on Buddhist philosophy in both Tibetan and English, and also has a keen interest in current social issues, particularly human rights and the environment.

In his writings on the environment, the Dalai Lama stresses the Buddhist notion of interdependence (Sanskrit: *pratitya-samutpada*), according to which all things come into being in dependence upon causes and conditions and change in every moment in dependence upon causes and conditions. The world is conceived as an infinitely complex network of interconnected relations, and there is no clear dividing line between oneself and the environment. This is also linked to the Buddhist doctrine of no-self (*anatman*), which holds that there is no permanent, enduring essence or soul, and that individuals should be viewed as continuums, changing in every moment, continually influenced by and influencing the surrounding environment. In this view, each individual is intimately connected with the dynamic system of the environment, and so one's innate concern for oneself becomes extended to the entire universe.

In light of these ideas, the Dalai Lama contends that a concern for the environment is a natural outgrowth of Buddhist teachings, and he points to the fact that Tibetans have traditionally maintained a sustainable approach to natural resources. That this is due primarily to Buddhist beliefs is open to debate, however, because prior to the Chinese invasion and the subsequent introduction of modern technology, Tibet was a low-technology society

that was sustained mainly by primitive agriculture and animal husbandry.

Moreover, the Dalai Lama's own engagement with environmental themes is not evident prior to the mid-1980s, when his first public remarks on the environment were made in several speeches, which were later published by the government-in-exile. Since this time, however, he has shown an increasing concern with environmental issues, and his plan for a future Tibet envisions it as an environmentally aware country that practices sustainable agriculture, a "zone of peace" in which there would be no armed forces or weapons of mass destruction.

While the Dalai Lama is widely revered among his people, both in exile communities and in Tibet itself, there is little evidence that his pronouncements on the environment have significantly altered Tibetans' attitudes toward the environment or their day-to-day practices. Visitors to Dharamsala frequently remark at the fact that the roadsides are filled with garbage, and there is little visible evidence in other Tibetan refugee communities of widespread concern for environmental issues. Among educated Tibetans, however, there has been a more positive response, and his environmental pronouncements have also struck a responsive chord among his followers overseas. In the past two decades the Dalai Lama has emerged as one of the world's leading Buddhist thinkers in this area.

Daly, Mary (1928–)

Known for her fierce wit and creative wordplay, Daly is widely regarded as one of the most important thinkers of the radical feminist movement. With doctorates in religion, philosophy and theology from Notre Dame and the University of Fribourg, her work is deeply rooted in existentialist and Catholic philosophical traditions, though since 1975 she has publicly disavowed Christianity as irredeemably misogynistic. Daly's impact on feminist thought can be traced to her insistence that radical feminism cannot be content with social, political or psychological change, but requires fundamental shifts at the level of language, spirituality, and ultimately ontology. While she has moved beyond and/or rejected much of the theology of her most influential book, *Beyond God the Father*, its understanding of the sacred as Be-ing, the movement in which women move out of patriarchal constructs into authentic existence, remains a touchstone in her work.

As early as 1978 and increasingly in her later work, Daly identifies "inherent connections between women, especially Wild Women, and all Elemental/Natural Reality" (Daly 1998: 7), and is a prominent voice in discussions of ecofeminist spirituality. She contrasts "biophilia," or love of life in all its elemental forms, with "necrophilia," the death-loving ethos that drives contemporary patriarchal societies worldwide. In *Gyn/Ecology* she catalogs atrocities committed on women's bodies, and in *Quintessence* links these practices with planetary rape and the "necrotechnologies" that pass as creative science. Often charged, especially by postmodern feminists, with essentialist views of gender, Daly insists that the distinction between biophilia and necrophilia is not based on sexual difference. Nonetheless it is the spiritual – indeed metaphysical – journey of *women* toward biophilic Be-ing that remains her unwavering focus and the telos of her radical vision.

Dance

Dancings – the diverse and ever-changing activities of dance, dancing, and dancers – have been associated with religions and "nature" from pre-history to the present day. Paleolithic images of human dancers with animal masks enliven caves in southwestern France and northern Spain. Petroglyphs and pictographs of ritually dancing hunters and planters appear later not only in Europe, but in north and southern Africa, Scandinavia, the Americas, Australia, and the Far East. Pottery, statuary, sarcophagi, weavings, and paintings attest to such dancings worldwide as well.

Much of contemporary secular theatrical and social dancings owe their allegiance to religious "nature" dancings. *Kagura* dancings of Shintoism spawned the court dance *Bugaku*, the classical dance/theatre *Noh*, and the popular theatre of *Kabuki*. Chinese theater developed from Chinese fertility and ancestral rituals practiced by Daoists and Confucianists. Greek dancings and theater are said to have evolved from the rituals of Dionysus, god of wine, fertility, and vegetation. The influence of animal- and plant-inspired dancings from West Africa continues in the dance halls and clubs of the United States, with retentions of particular gestures and movements, and names like "the monkey," the funky "chicken," and "the grapevine step."

In the United States, deeply spiritual, although not necessarily institutionally religious, theatrical dancers in various eras have "gone back to nature" to discover what they have considered to be the essence of dancings. Among these are Isadora Duncan (1877–1927) who scandalized audiences by removing her shoes, her corset, and the clasps from her hair to dance more "naturally" on the concert stage, embodying the movements of waves, weather, and wind. Doris Humphrey (1885–1958) developed an entire movement vocabulary based on the rise and fall of breathing. In the last thirty years, Anna Halprin has made "planetary dances," Simone Forti has embodied animals, and Joanna Haigood has choreographed dancings with live bees or butterflies. Jennifer Monson is following the migration patterns of whales and birds, dancing outdoors in fields, on beaches, and in national parks. Eiko & Koma have blended influences from Shintoism, Buddhism, Marxism, *butoh* and German expressionism to create dancings for stages, caravans, and rivers. In the Sierra Nevada Mountains of California, Project Bandaloup dances outdoor aerial choreography, soaring on ropes from the crest of Yosemite's El Capitán.

Religious "nature" dancings – defined for now as those dancings done in relationship with manifestations of "nature" – have occurred in a variety of ways since ancient times based on where and when the dancers dance, what they wear, and whom or what they invoke, supplicate, propitiate, embody, communicate or join with, defend themselves against, or are entered by. People might dance

in relationship with the deities, spirits, or powers of animals such as deer or whales; plants like corn or manioc; weather, including rain, snow, thunder or lightning; geographical features like mountains or bodies of water; or astronomical entities including the milky way, sun, or moon. Dancers might carry, clothe themselves with, or make musical instruments from “nature:” skins, furs, feathers, flowers, leaves, fronds, bones, horns, claws, shells, and/or masks of “nature” beings. They might dance at “natural” sites considered sacred such as springs or outcroppings of rocks.

People might dance ritually at times that mark the cyclic reappearance of “natural” passages, celestial or biological. Dancings performed at transitions such as seasons, solstices, equinoxes, conception, birth, puberty, or death reinforce for the dancer and the community a visceral understanding of the interrelationship between cosmological, earthly, human, and/or “supernatural” spheres. Through certain dancings, particular peoples might also link the creation and destruction of the universe with the sowing, growing, and harvesting of the Earth’s plants and animals, including or excluding humankind.

Evidence of religious “nature” dancings exists in Hinduism, Buddhism, Shintoism, Daoism, West African Religions, Indigenous Religions, and to a less widely acknowledged extent in Christianity, Islam, and Judaism. Some of these dancings are more obvious in their relationships with “nature.” Others are less visible. For example, the Hindu god Siva Nataraja, Lord of the Dance, is the ultimate dancing eco-cycler. With his matted hair symbolizing the sacred river Ganges, the sun’s flames encircle him as he dances the creation and destruction of the universe. Less frequently pointed out in Hinduism is that the three classic heroes in the epic Ramayana are animal deities. Hanuman, the monkey general, Sugriva, king of the monkeys, and Jambava, king of the bears also represent “nature’s” beneficent powers, and they bring order to the universe while they help Rama to vanquish the demon king.

Disguised under the veneer of Roman Catholic saints are the dancings of the orixas, manifestations of “nature” brought from Africa by the Yoruba people, among others, to the New World. For example, in the Brazilian religion of Candomblé, Yemoja (Yemayá) is both goddess of the sea and associated with the Virgin Mary, sharing, as Robert Farris Thompson writes, “the qualities of sacred love, faith, and purity” (Thompson 1984: 77). Likewise, Xangô (Shàngó), god of thunder, who is associated with the summer solstice, is equated with Saint Barbara, whose murderers God killed with lightning.

Ritual *cham* dancings performed by Buddhist monks include not only the Black Hat Ceremony, but the *Ngonpae Don*, dance of the hunters, a purification rite that appears in nearly every Ladakhi play in northern India; the Snow Lion Dance, performed to secure peace and prosperity; and the *Sha Cham*, dance of the sacred stag. In Daoism and

Confucianism, dancings were an essential practice in the ancestor and nature worship of the Chow (Zhou) Dynasty for nine hundred years. Hexagram XVI in the *I Ching* explains that, “The enthusiasm of the heart expresses itself involuntarily in a burst of song, in dance and rhythmic movement of the body” enabling people to “draw near to God” (*I Ching* 1967: 68). Ritual dancings provided a pathway linking past and present for “The ruler who revered the Divinity in revering his ancestors became thereby the Son of Heaven, in whom the heavenly and the earthly world met in mystical contact” (*I Ching* 1967: 68).

Best known among Shinto dancings is *kagura*, danced to revitalize and prolong human and divine life. *Kagura* was originally performed by Shinto priestesses to honor Ame-no-Uzume, goddess of dancings. For it was through her divine dancing that she lured the sun goddess Amaterasu from her cave, retrieving the world from darkness to light. Less known are other Shinto “nature” dancings including *dengaku*, performed to encourage agricultural fertility, and *furya*, designed to ward off natural disasters and diseases.

Sun-dancing practices of the Lakota Sioux have been widely studied. Less known are those of the cult of the Egyptian pharaoh Akhenaton, or the Inti Raymi, still practiced in Andean Peru. Little known is that Sufi sheikhs also represent the sun, whirling slowly in the center of a Mevlana solar system, surrounded by spinning dervishes orbiting like planets around them. Rarely considered are the Christian medieval dancings of the *pilota*, in which a ball passed among dancers was linked both to the movement of the sun and the resurrection of Christ during Easter celebrations. Rarer still in the context of “nature” dancings is that the French King Louis XIV not only called himself the Sun King, but choreographed himself as the most important celestial being among those lesser, his subjects.

Much has been written about the so-called “rain” dancings of the Hopi and other indigenous peoples. Less has been written about the water-drawing ceremony of Judaism, which was held at harvest time when prayers for rain were offered and performed in the Temple during the seven days of the festival of Tabernacles. Still less has been mentioned of the *orans* (praying) figures of Roman catacomb frescoes that portray what could be called early Christian rain dancings in the biblical story of Daniel 3. As Theodoret wrote in ca. 430, “They [Shadrach, Meshach, and Abednego] summon to the dance both heaven and the waters above the heavens, and the powers that circle round the divine throne” (in Taylor 1976: 80–1) to put out the flames of the fiery furnace that threaten their lives. Likewise, the animal and “spirit” dancings of indigenous peoples have been widely described in the context of “nature” by various scholars, but those of Europeans – for example, the ballet dancings of swans (animals) and sylphs (spirits) – are rarely considered with the same lens.

Religious dancings can serve a variety of functions in

relationship with “nature.” Along with other ritual activities, certain dances can be a conduit for divine energy or power, providing a relational through-way between beings and worlds, between the seen and unseen. Sufi dancers, for example, turn holding their right arms high, palms up to receive power from heaven, which travels through their bodies, and into their left arms held low, palms down, facing the Earth. According to the Indian theory of aesthetics, for Hindus, works of art, including dances, create a bridge from the formless ground of the cosmos, through the many forms of life, to that which is beyond form. Leslie E. Sponsel reports that for indigenous Hawaiians, “A mystical force, *mana*, permeates everyone and everything, including people, plants, animals, fish, stones, landforms, sea, wind, clouds, and rain. Prayers, chants, dances (*hula*), offerings and rituals are among the ways of channeling *mana* and communicating with the spirits” (Sponsel in Grim 2001: 166).

“Nature” dances are often used to convince deities and spirits to act on behalf of the dancer and/or the dancer’s community. Mohan Khokar writes that in India,

In preserved [traditional] societies, dancing is universally recognized as an exercise akin to prayer, in which context it becomes a profound and intense experience. The objective is to communicate with the chosen divinity with a purposefulness that moves the divinity to respond (Khokar 1987: 18).

In a presentation on “Andean Cosmology, Biodiversity, and Regeneration,” Julio Valladolid said of Andean peoples, “We don’t pray; we dance” (Conference on Indigenous Traditions and Ecology, Cambridge, MA, 15 November 1997). In this way, rain dances and those that encourage the fertility of people and fields are vital to invoke the deities to effect transformational and practical change.

Religious “nature” dances are also used to teach the cultural history, traditions, ethics, and values of peoples in relationship with “nature.” They intensify beliefs about and experiences with “nature” psycho-physically. They can strengthen communal bonds among, or hierarchical divisions between, those who are dancing in activities practiced in relationship with “nature.” In many circumstances, they impart a sense of empathic connection with and reciprocal responsibility in the triangular relationship between deities, “nature,” and human beings. As Gregory Cajete writes, for Puebloan peoples, they are essential to “maintain the balance of all essential relationships of the world.” Referring to animal dances in particular he writes, “These symbolic acts of respect and remembrance reinforce communal relationship to animals that gave life for the community’s benefit. It is a way of remembering to remember relationship” (Cajete in Grim 2001: 627).

This “remembering to remember relationship” requires

a responsibility on the part of humans to co-create order, harmony, and balance in the universe. It is a responsibility restricted not only to indigenous religions, but present in “nature” dances of many, perhaps all, religions. In the *Gemma Animae*, the hermit Honorius describes a Christian dancing in the twelfth century that “remembers” cosmological relationships,

They thought of the rotation of the firmament; in the clasping of their hands the union of the elements; in the sounds of song the harmony of the planets; in the gestures of the body, the movements of the celestial bodies; in the clapping of the hands and the stamping of feet the sound of thunder; something which the faithful imitate, converting all to the true service of God (Honorius in Taylor 1976: 90).

There are many questions to investigate in the discussion of “dances,” “religions,” and “nature.” Among them, is there a correlation between those people who still practice religious “nature” dances and good ecological stewardship? What responsibility do people have now to co-create their universe? Is there a correspondence between the rise of scientific inquiry in the West and the divisions of dances into categories of “folk” (rural) and “classical” (urban) genres? Is the presence or absence of “nature” dances a barometer for environmental health of an area? What happens psycho-physically and environmentally when “nature” dances are restricted or removed from a people? What might be regained if they were recovered, reintroduced, or made new?

Daoism

Daoism, or Taoism, is an English word that refers to a wide variety of beliefs and practices that originated in China and are now found, in varying forms, across the world. These various movements have at their heart an understanding of Dao as the deep wellspring of life, and the human condition as inextricably folded into this matrix of cosmic creativity. The staggering diversity and often conflicting values of these movements preclude any attempt at defining a unitary Daoist view of nature. Furthermore, Daoism has taken different cultural forms in China, Indonesia, Korea, Japan, India, Brazil and Canada, to name some countries where Daoist religious groups are currently active. Still further complicating the situation is that Daoism was nearly destroyed in the People's Republic of China in the latter half of the twentieth century, and the scholarly work of understanding Daoism has been undertaken largely in countries that have had a historically colonialist interest in China, such as Japan and France. Despite these problems and with all these caveats in mind, it is possible to make some tentative generalizations about the core motifs and values that have historically influenced Daoist attitudes and behaviors toward the natural environment.

The concept of Dao originated in China during the period of political disunity that saw the gradual dissolution of the Zhou empire (1122–256 B.C.E.) and was accompanied by the flourishing of an intellectual culture whose question was: Where is the Way? This question was answered on a wide variety of levels – ethical relationships, political organization, moral self-cultivation, and ritual order – that were seen as being mutually related. There was, however, one seminal text that penetrated right to the heart of this deeply humane question by stating that the Way is to be sought in the very vitality of nature, in the wholly natural and wholly spontaneous transformation and flourishing of the world. The *Daode jing* (Scripture of Way and Power, fourth century B.C.E.) or the *Laozi* (after its mythical author) is the key text around which the variety of Daoist traditions continue to construct themselves by means of written commentaries, ritual recitation, and meditation. The worldview of this text implies a certain redundancy to the title of this present essay: there can be no “Dao and Nature” as though these were two discrete categories of being (cf. Creator and the created in Christian

thought). Dao is no more – and no less – than the flourishing of nature itself.

This natural spontaneity translates a Chinese term *ziran* (literally, “self-so”) that is the basis of the Modern Standard Chinese term for nature (*ziranjie*). In *Daode jing* 25 we read: “Humans model Earth / Earth models Heaven / Heaven models Dao / Dao models natural spontaneity (*ziran*).” The three basic dimensions of existence (human, earthly, and heavenly) are thus folded into the natural evolution of the Way, which proceeds without reference to any wholly external power or transcendent force.

The earliest Daoists sought a practical experience of nature's creative power, manifested in the spontaneous arising and decaying of things in a ceaseless flow of activity (*yang*) and receptivity (*yin*) within the energetic field (*qi*) that constitutes the material of the universe. And they sought to model their lives after this natural spontaneity, making *ziran*, or naturalness, the core value of their philosophy. In the *Daode jing* this core value entails a strategy of non-(artificial) action (*wuwei*) as a means to achieve the optimal state of harmonic integration between the various dimensions of life.

Many modern environmentalists, who see in this text the principles of conservation, organic harmony and respect for nature that they themselves espouse, have enthusiastically adopted the *Daode jing*, together with selected parts of the tradition. Although it is foolish, not to say blatantly anachronistic, to suggest that early Daoists were environmentalists, nonetheless it is easy to see why the text and its traditions should be so appealing given present environmental concerns.

Indeed, there is much support for the view that early Chinese thought is deeply embedded in the natural world. Sarah Allan persuasively explains how the root metaphors of Chinese culture are derived from images of nature or explained in terms of natural phenomena. The term Dao, for instance, is analogous to the flowing of water. It provides irrigation-life for the ten thousand things (*Daode jing* 62), and like water it is soft, weak, pliable, yielding, and ultimately unstoppable. On the other hand, the attitude that seemingly equates Daoism (or at least the classical, textual Daoism) with an environmentally friendly naturalism, has not been universally shared among modern commentators. Although it is impossible to think Daoism without thinking nature, the Daoist *problematik* calls into question the nature of nature itself and offers many seemingly conflicting and paradoxical answers to the question of the human relationship with, and our being embedded within, the natural world. This is entirely appropriate as the root understanding of *dao* as the spontaneous and creative unfolding of nature is, for Daoists, fundamentally a concept that is also dark, obscure and mysterious.

Table 1: Five Phases

<i>Phase</i>	<i>Direction</i>	<i>Color</i>	<i>Season</i>	<i>Orb</i>	<i>Emotion</i>	<i>Sense</i>	<i>Flavors</i>
Wood	East	Green	Spring	Liver	Anger	Eyes	Sour
Fire	South	Red	Summer	Heart	Joy	Tongue	Bitter
Earth	Center	Yellow	Late summer	Spleen	Worry	Lips	Sweet
Metal	West	White	Fall	Lungs	Sadness	Nose	Pungent
Water	North	Black	Winter	Kidneys	Fear	Ears	Salty

Correlative Thinking

During the Han dynasty (206 B.C.E. to 220) a basic cosmological system was established that remains at the heart of the traditional Chinese worldview. This basic microcosm/macrocosm relationship can be seen in such early Han dynasty cosmological texts as the *Huainanzi* in which the four seasons, five phases, nine directions and 360 days of heaven are correlated with the four limbs, five inner organs, nine orifices, and 360 joints of human beings.

As traditional Chinese medicine developed, a more mature and technical understanding of the relationship between the various cosmic-human dimensions of life emerged. This cosmology is based on the concept of a universe of multiple, interrelated dimensions of *qi*-energy that resonate synchronically with each other and diachronically in a sequence of five phases.

Although there is nothing specifically Daoist about this correlative thinking, it lies at the heart of all traditional Chinese thinking. Moreover, since the body is the pre-eminent field or domain in which Daoist practices take place, it is important to understand how the functioning of the body is located within, and synchronically affected by, the constantly transforming phases of the natural world. In the fully realized or perfected (*zhen*) Daoist, the boundaries between self and world are completely porous; it is as though one is fully transparent to the cosmic location in which one is situated.

This holistic or correlative way of thinking is also emblematic of Daoist texts and practices, in which words and gestures signify and actualize objects of a wholly other dimension. For instance, in Highest Clarity (*Shangqing*) Daoist texts, meditation practices developed that sought to visualize astral deities dressed in certain colored clothes, inhabiting certain organs of the body at certain times of the year. Here the energy cycles of the body are fully aligned with the seasons, the stars, and the colors in an elaborate and highly technical exercise of meditative harmonization. It is important to appreciate how this multi-dimensional all-pervasive way of thinking threads itself throughout the Daoist worldview. In this way, heavens, the Earth, and the body are woven together into the seamless fabric of the spontaneously self-creating *dao*.

Nature in Daoist Community

The most important form of communal Daoism is known as the Way of the Celestial Masters (*Tianshi dao*), a movement that allegedly originated with a series of revelations from the divinized Laozi to a man known as Zhang Ling in 142. We have some insight into how, historically, this communal movement functioned in its earliest days through a text the Celestial Masters adopted and transmitted, known as the *One Hundred and Eighty Precepts* (*Yibaibashi jie*). Some twenty of the precepts are directly relevant to the preservation of the natural environment, including injunctions against chopping down trees without cause, poisoning lakes and rivers, drying marshes, disturbing birds and other animals.

In answer to the question of why the earliest Daoist communities were concerned with the state of the natural environment, Kristofer Schipper has drawn the conclusion that the natural environment functioned as a kind of sanctuary, in the sense of a sacred space, and in the sense of a place of refuge from the human world. Although the *Precepts* have been replaced by other texts as the code for Daoist priests today, their influence is evident in that discussions as to the contemporary Daoist approach to nature are couched in terms of the person-within-the-world, not in terms of “nature” or “environment” as though these terms referred to some external entity or object with which we have to do. In this light the respect for the environment indicated in the *One Hundred and Eighty Precepts* indicates a respect for the life of the communal body and for the life of the individual.

Nature and the Body

From the earliest days of the Daoist tradition, the practice of nourishing the vitality of the body has been a central concern, a concern that was elaborately developed in the Daoist tradition of inner alchemy (*neidan*). The foundations of internal alchemy practices can be found in the cosmogony set forth in chapter 42 of the *Daode jing*: “Dao gives birth to One; One gives birth to Two; Two gives birth to Three; Three gives birth to the ten thousand things.” This cosmogony accounts for the gradual decay and dissipation of energy within the cosmos. The aim of the alchemist is to reverse this dissipation by reverting or countering the cosmogonic process, a process further

elaborated in terms of the cyclical mutation of yin into yang and yang into yin, as symbolized in the 64 hexagrams of the *Yijing*. Briefly, the aim is to arrive, through a series of purifications, at the decoction of undifferentiated yang- and yin-energy (the “Two” of the cosmogonic sequence), and to fuse these two primal energies into the undifferentiated Oneness of the original Dao.

Alchemists such as Ge Hong (283–343) had sought to arrive at this stage through an “external,” operative or laboratory alchemy (*waidan*) based on the use of mercury sulphide or cinnabar (HgS). In one version, cinnabar was heated seven or nine times to produce a pure form of mercury, representing pure yin energy. In a second version, mercury (pure yin) was extracted from cinnabar, and lead (pure yang) from native lead. These two were then fused together, thus reversing the cosmogonic division of One into Two. Many Daoist traditions, however, viewed laboratory alchemy as distinctly inferior to internal forms of alchemy and meditation, reflecting the overall priority of the inner landscape as the field of operations for Daoist practices.

Within the landscape of the body, pure yin (mercury) is imaged as the pure energy of the kidneys (corresponding to water), and pure yang (lead) as the pure energy of the heart (corresponding to fire). The elixir is decocted in the three “cinnabar fields” (*dantian*) of the body. By correctly directing the essence (*jing*) and the *qi* of the body through a series of internal meditations, the adept produces an “immortal embryo,” the pure distillation of the primal energy from which the adept was created. Having been appropriately nurtured and nourished, the embryo is birthed through the head in a complete inversion of the physical birth of the adept.

This alchemical tradition embodies a seemingly contradictory attitude toward nature. On the one hand, life is seen as good and worthy of preservation, but on the other hand, this life is preserved paradoxically by reversing the process that seems to govern it. It must be remembered however, that this reversal is not to be understood as an eradication or as a wholly negative movement. Rather it has the character of a recursion.

Contemporary Daoist Cultivation

China’s rapid industrialization in the late twentieth century has led to widespread environmental degradation throughout the country. The Chinese Daoist Association issued a declaration on global ecology in 1995 that firmly placed the practices of immortality and self-cultivation in the context of the flourishing of nature: one may not cultivate oneself unless one also cultivates one’s environment. This is entirely consistent with the ancient traditions in which Daoist masters retired to the mountains to cultivate their bodies, and in which energy practices and other forms of self-cultivation pay close attention to the rhythms of nature. The recent environmental devastation

has, however, made this “ecological” aspect of Daoist cultivation more urgent than ever. The declaration further proposed using traditional Daoist monasteries and hermitages located in mountain areas as bases where the environment and the body could be properly cultivated. Field research in China indicates that this proposal has met with some success as temples and their environments have been restored since the relative liberalization of religion in 1979, but paradoxically this success has come at the price of increased tourism and development in the mountain areas. The Daoist mountain complex at Mt. Qingcheng, Sichuan Province, now a UNESCO World Heritage Site, is not only full of tourists year round, it is also full of signs warning them to respect the natural environment.

Conclusions

It is not easy to sum up the Daoist view of nature and environment in a few swift sentences, because the tradition is so rich and complex in terms of the appropriation of nature by adepts and the metaphysical imaging of the operation of nature. There are, however, three key principles that tend to distinguish the Daoist view of nature: the surprising recursivity of nature, the practical correlativity of all dimensions of life, and the textuality of the fabric of the Dao.

The recursivity of nature means that nature is evolving in a way that continuously folds back on itself and, as it were, gathers itself up in its hands. Nature is always pregnant with itself in an irrepressible superfluity of vitality and power. This is the theoretical explanation for the fractal-like identity of microcosm and macrocosm in which the overarching patterns of creation, transformation and decay are imaged in both the tiniest and the grandest processes of the cosmos.

The practice of correlativity is thus the way in which the human mind fits together the many different dimensions of life so as accurately to reflect the interlocked and interconnected trajectories of evolution (*dao*) that are woven together into the fabric of time. This fabric, symbolized spatially as a rotating canopy that is suspended from the central ridgepole of the cosmos, contains many different dimensions of being, but they are all made from the same *qi*. This vibrates in particular forms and frequencies to configure the various arrays of matter and energy in the universe, all of which resonate sympathetically with each other.

The Daoist tradition, moreover, holds that the deep mysteries of nature are available to the properly initiated adept in the form of texts and talismans that decode the very nature of the Dao for us. These texts are the symbolic revelation of the root processes of the Dao, processes that are ordinarily veiled from our understanding, and which have the appearance of magic to the uneducated. The whole of nature itself, however, may be understood as an ongoing activity of communication or *dao* – whose

alternate meaning is “to speak.” In this drama whose script – the script of nature – is continuously evolving, we are both privileged actors and mere fragments of self-consciousness. But this is no Hegelian drama that is aiming toward a final purpose of absolute self-communication. It is a drama that is spontaneously rewriting itself in unpredictable, marvelous and deeply mesmerizing ways.

Darré, Walther (1895–1953)

The man most representative of the “green” wing of National Socialism is Walther Darré, who served as Minister of Agriculture for a decade during the Third Reich. Born Richard Walther Oskar Darré on 14 July 1895 to a middle-class German family living in Buenos Aires, Argentina, at the age of 10 he was sent to finish his primary school education in Germany. He later enrolled in the German Colonial School at Witzenhausen and began his formal agricultural studies which he completed after serving in World War I.

In the 1920s Darré became involved with various associations relating to agriculture and husbandry, but generally avoided larger political affiliations. The *Wander-vögel* phenomenon was then still prevalent, with its emphasis on rural values and interaction with the outdoors through climbing and hiking, and Darré was exposed to influences from this as well as input from agricultural collectives and sects such as the Artamanen. In tandem with their attempts to live in greater harmony with nature, many of these *völkisch* groups eschewed Christianity in favor of neo-heathenist ideals. While Darré shared similar anti-Christian and anti-materialist beliefs, he does not seem to have been inclined toward the mysticism or romanticism that were common in such circles. He was a strong proponent of Nordic racialism and maintained contact with groups such as the Nordic Ring that promulgated these ideas. His biological interpretation of Nordicism was not entirely synonymous with more extreme National Socialist beliefs, but instead focused on a preservationist, defensive position. Darré’s racialism was “ecological” in the sense that it was an effort to safeguard precious racial characteristics that he understood as threatened in an increasingly urbanized and unnatural world.

Darré’s two major works were *Das Bauertum als Lebensquell der nordischen Rasse* (*The Peasantry as the Life-Source of the Nordic Race*, 1929) and *Neuadel aus Blut und Boden* (*A New Nobility of Blood and Soil*, 1930). These present the core of his thinking, which remained unchanged over his lifetime. He maintained that the basis of a healthy racial aristocracy depended upon and drew from a thriving peasantry, whose direct link to the Earth was essential. This extended beyond pure biology when Darré extolled the “inner sense” of the Germanic peasant as a gift from the gods which could only properly develop away from the cities. These conceptions were summed up in the evocative phrase “*Blut und Boden*” (Blood and Soil). Despite the fact that it was originally coined by a German Socialist Party member, this slogan would become practically a cliché in the early years of the Third Reich. In Darré’s books he presents a positive vision of this rooted peasantry, and it was only in later commentaries (e.g., the brief forewords to later printings of his books) that he opportunistically added more negative and explicitly anti-Jewish remarks.

Darré began working with the National Socialists at the end of the 1920s, having gained their attention due to his influence among the farmers and the agricultural sector. Following Darré’s crucial success at garnering the peasant vote for the NSDAP, Hitler appointed him the Minister of Agriculture and Peasant Leader in June 1933 after coming to power. It was only at this point that Darré formally joined the party.

Darré quickly set about to improving conditions for farmers in the Reich. Through his efforts the *Erbhofgesetz*

or Hereditary Farm Law was enacted which would protect small and medium-sized farm holdings and ensure they be passed down from generation to generation within families. A *Reichnährstand* or National Food Estate was also formed. This was a corporatist/syndicalist entity that set quality standards for agricultural products, created direct lines of distribution, and ordained equitable prices to the benefit of the farmers. The old town of Goslar in the Harz region was declared a national “peasant capital,” and this became the seat of Darré’s operations. In addition to the large annual rallies held there, a publishing arm called Blut und Boden Verlag was formed which issued books on the importance of peasant history, culture, and racial typology. Darré edited a monthly journal, *Odal* (the title is a reference to the Germanic rune meaning “hereditary property” – this symbol also officially designated the *Erbhöfe*, or hereditary farms), that actively promoted his peasant ideology, and wrote articles during his early years in office on ecological topics as well as on the importance of small-scale farming.

With his vocal opposition toward imperialism and the *Führerprinzip*, Darré was not a typical NSDAP leader. In contrast to the party functionaries, he was a social visionary with a more revolutionary outlook – he leaned toward decentralization and was generally opposed to Germany waging wars of aggression, which he predicted would spell catastrophe for the peasantry. By the latter half of the 1930s increasing conflicts erupted between Darré’s staff and other factions of the government. His last significant achievement was the Entailed Estate Law of 1938. He had also begun initiating measures to promote changeovers to organic farming – a move that was perceived as reckless or unrealistic with the onset of the war. Another key party member who supported environmentally sound and holistic approaches to agriculture was Rudolf Hess, but the latter’s ill-fated solo flight to England in 1941 caused such tendencies to be looked upon with grave suspicion among other party leaders. “Biodynamic” farming methods were seen as inherently connected to Rudolf Steiner, the pedagogical theorist and mystic whose Anthroposophy Society and Waldorf schools had been officially shut down as part of the wider crackdown by the regime upon any non-aligned and potentially subversive groups; as a result, those who campaigned for such methods (including some of Darré’s staff) were persecuted. In an effort to downplay associations to Steiner’s “biodynamic” practices, Darré advocated the use of the term “organic farming,” which has since become commonplace.

Increasingly isolated from the rest of the party leadership, Darré was demoted in 1942 from his position as minister and replaced by a staff member more loyal to Hitler. Although some of his ideas found their way into the doctrines of the SS, Darré never regained his influence on national policies; by this time Germany was in full war-production mode and the proponents of standard

industrialized agriculture and artificial fertilizers had won out.

After the war, Darré underwent two trials and was eventually sentenced to seven years’ imprisonment, primarily for his involvement in the Race and Settlement Office which managed deportations and relocations of non-German farmers in areas of occupied Poland. Given an early release in 1950 on account of failing health, he spent his final years authoring articles on his old themes of the peasantry and the necessity of organic farming. He died on 6 September 1953 and is buried in Goslar.

Notwithstanding his clashes with other government leaders, Darré was generally a popular figure during his years as Minister of Agriculture. His approaches often met with positive interest from abroad, and he has also been cited as an influence on the “Soil Association” organic farming movement that was blossoming in Britain at the time. More recently his legacy has received renewed attention due to the work of ecology historian Anna Bramwell. There are also many sympathizers who see him as a role model for an alternative and pragmatically oriented “Green Nazi,” a racial revolutionary who is opposed to the illness and alienation caused by the excesses of modern capitalism in an industrialized, urbanized, and globalized modern world.

Darwin, Charles (1809–1882)

Charles Darwin, the British naturalist and author of various books and essays on natural history, ranks among the most influential scientists of all time. His theories regarding the evolution and the distribution of species, articulated in *On the Origin of Species* (1859), revolutionized biology during the nineteenth century, and have exerted considerable sway over a wide range of scientific

and other intellectual activities ever since. Arguably, no modern concepts of nature have been as widely influential, or as controversial, as Darwin's.

Darwin's Views of Nature

Although the study of nature made great strides in the century before Darwin, attempts to develop a systematic theory of organic development, such as Jean Baptiste Lamarck's assertion of the inheritance of acquired characteristics, had been poorly received. Therefore, in many ways the natural history Darwin encountered at the start of his career was grounded in theological assumptions. It was widely held that God had directly created a natural realm that was abundant, benevolent, and stable over time. The tasks of natural history were to describe and catalog natural phenomena, and in doing so to glorify nature's Creator by recognizing the marvelous ingenuity that went into its design. Darwin would undo the cozy relationship between science and theology by developing a thoroughly naturalistic explanation of evolutionary development. Such has been the influence and explanatory power of his work that subsequent generations of scientists would speak of their work as being grounded in Darwinian assumptions.

Darwin built his natural philosophy from various sources: his lifelong passion for observing natural phenomena, established scientific traditions (particularly in botany, zoology, and geology), and assorted ideas derived from his reading in philosophy, economics, and literature. Although subsequently referred to as "Darwinism" (i.e., as if a single theory), according to historian Ernst Mayer, Darwin's mature thought accounted for two distinct biological processes, transformation in time and diversification in space, using a "bundle of theories" (Mayer 1991: 35–7). Taken as a whole, Darwin's "bundle" emphasizes dynamism, spontaneity, and novelty alongside the cruelty of natural process wherein the early death of many individuals, and even entire species, was inevitable.

First and foremost, Darwin argued that nature was neither static nor subject to repeating cycles, but in a constant process of change. Drawing upon recent geological theories, he assumed that the Earth was much older than previously thought, perhaps by many orders of magnitude. This allowed nature the time to work through processes of change that were incrementally slow. He next asserted that similar species could be traced to common ancestors, or more generally, that all organisms were descended from a few simple species. This meant that the history of life looked like a branching tree – a process that started with a few forms that subsequently diversified. Darwin felt that variations in organic beings were rather small, but accumulated changes wrought over time could bring about conspicuous change, or transmutation. He also believed that the multiplication of species, and thus the plenitude of nature, was driven by the tendency of all

species to produce more offspring that could be supported by the food supply and space in a given area.

Darwin's most daring, and subsequently controversial concept was natural selection. He argued that because of various competitive pressures there was a constant "struggle for existence" among individuals of a species. Some individuals, because of slight variations that allow them to better compete for resources and mates, are better able to produce healthy offspring and thus are naturally selected to survive. In this, Darwin made an analogy to "artificial selection," or the way that breeders of animals and gardeners in domestic situations culled individuals with undesirable traits and promoted the breeding of individuals with desirable ones. He also recognized the influence of other factors such as "sexual selection," or the way that animals choose their mates.

Although immediately recognized as a set of theories to be reckoned with, Darwinism was not immediately or completely accepted within the scientific community. For example, many who accepted the idea of organic evolution remained skeptical of Darwin's mechanism of natural selection and posed alternatives such as neo-Lamarckianism. Thus it took genetics and population biology in the early twentieth century, the so-called "modern synthesis," to secure Darwin's position as the major theorist of modern biology.

Darwin's Religious Views

Darwin's religious views have been the subject of scholarly and public interest from the time he became famous in the mid-nineteenth century. His voluminous paper trail (including published works, correspondences, notebooks, and other materials) can both assist and vex this line of inquiry in that it offers up evidence that is simultaneously intimate, detailed, and ambiguous. Darwin had free-thinkers and religious dissenters in his family tree, notably his deist-evolutionist grandfather Erasmus, but as a youth he was exposed to, and seems to have accepted, a good deal of prevailing Anglican theology. As a young man, he read the works of natural theologians, and also studied with, and greatly admired, two devout Anglican naturalists, John Henslow and Adam Sedgwick. Darwin even considered a religious career for a while, in part, because it would have afforded him time to study natural history. Writings from his famous trip aboard the H.M.S. Beagle, show the influence of natural theology. For example, while observing the rich variety of life in tropical rain-forests, he described feelings of "wonder, admiration, and devotion which fill and elevate the mind" (Darwin 1958: 91).

After returning to England, Darwin began to rethink some of the reigning assumptions about natural history that dominated his era. In particular, he began to question whether the explanation for the "economy of nature" proffered by natural theology (that God had created

everything in its place) was intellectually satisfying. In searching for an alternative, Darwin was encouraged by Hume, who had challenged the design argument in his famous *Dialogue Concerning Natural Religion*; Comte, who felt that theological thought should be replaced by a “positive” philosophy that emphasized scientific laws; Wordsworth’s poetry and prose, which encouraged intellectuals boldly to rethink the relationship between humanity and nature; and Malthus’s *Essay on the Principle of Population*, which argued that natural populations are irreducibly subject to food shortages that lead directly to struggle and competition. In regards to the last issue, some scholars argue that Darwin, unable to square notions of a good God with the centrality of pain and suffering in the natural process, gave up theism in any meaningful sense during or soon after the development of his theories in the late 1830s.

Others locate his apostasy in later life. James Moore, for example, argues that Darwin only gives up on the basic elements of Christian theology after the death of his daughter in 1851, for reasons related to his bitterness over the doctrine of eternal damnation. And still others find in Darwin’s public and personal writings a lifetime struggle with the concept of God – a theological “muddle,” that wavers between theism, deism, and doubt. Intellectual historians such as Dov Ospovat argue that a type of rational theism underwrote Darwin’s naturalism well into his career. And biographers like Moore note that many members of Darwin’s immediate family and social propriety endorsed religious belief. Clearly, Darwin is ready to call himself an “agnostic” in his *Autobiography* written in the late 1870s. The term, coined by his colleague T.H. Huxley, expresses a formal and perhaps irresolvable feeling of doubt about foundational questions such as the existence of God.

Also noteworthy were Darwin’s later writings that tried to put religious belief in evolutionary perspective. In his main work on human evolution, *The Descent of Man* (1871), he argued that religion (like language and morality) probably first arose as a by-product of the development of the human mind. Building from faculty psychology, Darwin assumes that mental attributes, like limbs or instincts, emerged because they gave adaptive advantage to their hosts. The earliest type of religion, “belief in the unseen or spiritual agencies,” emerged when basic human mental faculties of “imagination, wonder, and curiosity, together with some power of reasoning” had developed enough to speculate crudely about the surrounding world and the nature of existence. Later more elaborate systems of gods and monotheism developed out of these basic attributes. Although Darwin recognizes the complexity of religion and calls belief in an Omnipotent God “ennobling,” he is also quick to point out how religion often got misdirected into superstition and barbaric practices. Cursory as these speculations were, they set the tone

for later thinkers, notably the sociobiologists, who argue that certain ethical ideals, such as altruism, and collective religious activity can be understood in terms of natural selection and adaptive advantage.

General Reactions to Darwinism

As might be anticipated for such a major figure, attempts to situate Darwin’s views of nature into a wider intellectual framework have varied, and these diverse reactions have contributed to Darwin’s decidedly mixed reception in religious quarters. Some interpreters regarded Darwin as the scientist who decisively extended the mechanistic philosophy of the Enlightenment to the biological realm. In doing so, according to scholars such as Michael Ghiselin and Richard Lewontin, he was the key figure in advancing the anti-metaphysical positivism of modern science and the general cause of secular thought. Critics of these tendencies, such as cultural critic Jacques Barzun, accordingly, decry Darwinism as a potent form of reductionism and materialism that contributes to the disenchantment of the natural world.

Historian Daniel Worster regards Darwin’s ideas as a major impetus to modern ecological thinking and thus the reassertion of an essentially organic view of nature. Darwinism has also been celebrated for its ability to unify broad fields of knowledge and inquiry. Philosopher Ernst Cassirer saw in Darwinism a biological version of the idea of universal historical development that elsewhere had more metaphysical (Hegel) and political (Marx) manifestations. Conversely, others find in Darwin’s work a stark recognition of the precariousness of life and the primacy of “chance and necessity” in cosmic history. For some, notably philosopher Jacques Monod, this has been a liberating insight, and an escape from the subjective illusions and teleological views of natural order of previous eras. Many intellectuals, however, have echoed historian Bert Loewenberg’s assessment that Darwinism carries a profoundly unsettling message of randomness and purposelessness, and thus contributes to the modern sense of angst and pessimism.

Political evaluations have found ideological implications in Darwinism; however these have varied considerably. Many on the left saw in the general idea of evolution, particularly when linked to the idea of social progress, a mandate for reform, even revolution. On the other hand, other leftist critics regard Darwinism as a kind “natural” apologetics for Victorian notions of individualism, marketplace competition, and other forms of social coercion and thus highly suspicious. Often these criticisms will echo anarchist Peter Kropotkin in rejecting Darwin’s emphasis on the brutal struggle in favor of a naturalism that emphasizes synergy and cooperative effort. Conservatives have been mixed as well. Many condemned Darwin for undermining traditional social and religious institutions, whereas others, notably American social theorist William

Graham Sumner, used Darwinism to legitimize laissez faire free-market capitalism.

In terms of literary analysis, Stanley Edgar Hyman regards Darwin as the author of a cosmic tragedy wherein all struggles against all, and most of the characters die painfully and young. In contrast, literary critic William Scheik and others recognize traces of a cosmic epic in Darwin's work, a sweeping narrative whose final act emphasizes the emergence of a self-aware humanity that better comprehends its history and controls its own destiny.

Religious Reactions to Darwinism

Darwin's ideas directly challenged one of the bulwarks of theistic theology, the design argument, which held that the intricacies and beautiful structures found in the natural world were evidences of the creative action of an intelligent and omnipotent deity. As opposed to the action of an external power (a supernatural entity that intervened into history and arranged matter directly) Darwinism implied that forces resident within nature, the "laws" of biology, working over a vast time scale, were capable of producing the variety and intricacy of the natural world. Was "God" necessary to this process? Darwin himself was ambiguous on this issue. Although he used language like "Creator" in his works, notably in the first edition of *On the Origin of Species* (1859), many regarded supernaturalism superfluous to his natural philosophy. Darwinism also challenged the centrality of a humanity created in "the image" of God and given dominion over the natural world by arguing that human beings were simply another type of primate with no special claims or status. In ethics as well, Darwin's focus on struggle, fitness, and reproductive success seemed to give sanction to aggressive, even violent, impulses at the expense of classic virtues such as love, benevolence, and selflessness. Finally, Darwinism figured prominently in a larger intellectual revolution that historicized scriptural traditions and, for many, threatened their authority as molders of culture. Thus, since their introduction, Darwin's main ideas have been understood as potent and pointed challenges to religious thought.

The major Western traditions have responded in markedly diverse ways to Darwinism. Some groups have tolerated and assimilated evolutionary views, in part or in total. These include liberal and moderate Protestant denominations, most Jewish groups, and after a long period of suspicion, Roman Catholicism. Also many of the alternative religions of the Western tradition, various esoteric, occult, and New Age groups, have adopted evolutionary thinking. Many of those who accept evolution, however, maintain teleological and theistic beliefs that are arguably extraneous to Darwin's scientific views. Other religious groups have utterly rejected Darwinism as irreligious and immoral. In the United States, anti-evolutionism has been a conspicuous feature of the

conservative wing of Protestantism since the latter half of the nineteenth century. Helped by famed orator and politician, William Jennings Bryan, various fundamentalist groups mounted an aggressive anti-evolution campaign in the wake of World War I that culminated in the Scopes Trial of 1925. Post-Scopes, anti-evolutionists have continued to challenge textbooks that include Darwinism, press for equal time in school curricula for biblically based interpretations of natural history, and disseminate alternatives to Darwinism such as creation science. Popularly, the anti-evolution movement has actually grown in strength over that time, and some current polls indicate that 45 percent of the American population utterly rejects the idea of evolution. In other major world religions, comparable patterns have developed. Thus various attempts to reconcile evolutionary thought with, for example, Islam, Hinduism, and Buddhism, must be measured against anti-modernist, traditionalist, and fundamentalist movements that tend to view Darwinism as a subversive "Western" influence that denies supernaturalism or other traditional beliefs.

Death and Afterlife in Robinson Jeffers and Edward Abbey

The poem "Vulture" by Robinson Jeffers expresses a religious perspective on death and afterlife that is pervasive in contemporary green spirituality. In it, Jeffers reflects on an occasion when, while lying on his back in a desert canyon in the Southwestern United States, he was once mistaken for carrion by a vulture.

Vulture

I had walked since dawn and lay down to rest on a bare hillside
 Above the ocean. I saw through half-shut eyelids a vulture wheeling high up in heaven,
 And presently it passed again, but lower and nearer, its orbit narrowing,
 I understood then
 That I was under inspection. I lay death-still and heard the flight feathers
 Whistle above me and make their circle and come nearer . . .
 . . . how beautiful he looked, gliding down
 On those great sails; how beautiful he looked, veering away in the sea-light
 over the precipice. I tell you solemnly
 That I was sorry to have disappointed him. To be eaten by that beak and
 become part of him, to share those wings and those eyes –
 What a sublime end of one's body, what an enskyment; what a life after death.

Another author with a deep love of the desert was the novelist Edward Abbey. Abbey's reflections on death are reminiscent of Jeffers, whom he admired. For Abbey, an authentic death is unaccompanied by life-prolonging technology. It is when the body is left unpolluted so that it can properly reunite with and nurture the Earth. Reflecting on a tourist who died alone in the desert,

he had good luck – I envy him the manner of his going: to die alone, on a rock under the sun at the brink of the unknown, like a wolf, like a great bird, seems to me very good fortune indeed. To die in the open, under the sky, far from the insolent interference of leech and priest, before this desert vastness opening like a window onto eternity – that surely was an overwhelming stroke of good luck . . . [Today], I think of the dead man under the juniper on the edge of the world, seeing him as the vulture would have seen him, far below and from a great distance. And I see myself through those cruel eyes . . . I feel myself sinking into the landscape, fixed in place like a stone, like a tree, a small motionless shape of vague outline, desert-colored, and with the wings of imagination look down at myself through the eyes of the bird, watching a human figure that becomes smaller, smaller in the receding landscape as the bird rises into the evening (1968: 186, 190).

In their own ways Jeffers and Abbey expressed their sense of belonging to a sacred Earth and a feeling of reverence toward the processes of life and death. In so doing they also rejected the prevalent monotheisms of their day, which obviate the fear of death through belief in supernatural rescue from it.

This kind of attitude, which sacralizes a natural death and views artifice in death as a desecrating act, can be found in a wide variety of contemporary green subcultures. It is expressed in conversation, poetry, art, and song. It has also been implemented through burial practices perceived to be natural. Before his death in 1989, for example, in his last act of desert consecration, Abbey arranged for his body, unpolluted by toxic embalming fluids, to be spirited away and illegally buried in his beloved, sacred desert. In death Abbey would nourish and return to his beloved and sacred desert landscape.

Deep Ecology

Norwegian philosopher Arne Naess (b. 1912) coined the term "Deep Ecology" in 1972 to express the idea that nature has intrinsic value, namely, value apart from its usefulness to human beings, and that all life forms should be allowed to flourish and fulfill their evolutionary destinies. Naess invented the rubric to contrast such views with what he considered to be "shallow" environmentalism, namely, environmental concern rooted only in concern for humans. The term has since come to signify both its advocates' deeply felt spiritual connections to the Earth's living systems and ethical obligations to protect them, as well as the global environmental movement that bears its name. Moreover, some deep ecologists posit close connections between certain streams in world religions and deep ecology.

Naess and most deep ecologists, however, trace their perspective to personal experiences of connection to and wholeness in wild nature, experiences which are the ground of their intuitive, affective perception of the sacredness and interconnection of all life. Those who have experienced such a transformation of consciousness (experiencing what is sometimes called one's "ecological self" in these movements) view the self not as separate from and superior to all else, but rather as a small part of the entire cosmos. From such experience flows the conclusion that all life and even ecosystems themselves have inherent or intrinsic value – that is, value independently of whether they are useful to humans.

Although Naess coined the term, many deep ecologists credit the American ecologist Aldo Leopold with succinctly expressing such a deep ecological worldview in his now famous "Land Ethic" essay, which was published posthumously in *A Sand County Almanac* in 1948. Leopold argued that humans ought to act only in ways designed to protect the long-term flourishing of all ecosystems and each of their constituent parts.

Many deep ecologists call their perspective alternatively "ecocentrism" or "biocentrism" (to convey, respectively, an ecosystem-centered or life-centered value system). As importantly, they believe humans have so degraded the biosphere that its life-sustaining systems are breaking down. They trace this tragic situation to anthro-

pocentrism (human-centeredness), which values nature exclusively in terms of its usefulness to humans. Anthropocentrism, in turn, is viewed as grounded in Western religion and philosophy, which many deep ecologists believe must be rejected (or a deep ecological transformation of consciousness within them must occur) if humans are to learn to live sustainably on the Earth.

Thus, many deep ecologists believe that only by "resacralizing" our perceptions of the natural world can we put ecosystems above narrow human interests and learn to live harmoniously with the natural world, thereby averting ecological catastrophe. It is a common perception within the deep ecology movement that the religions of indigenous cultures, the world's remnant and newly revitalized or invented pagan religions, and religions originating in Asia (especially Daoism, Buddhism, and Hinduism) provide superior grounds for ecological ethics, and greater ecological wisdom, than do Occidental religions. Theologians such as Matthew Fox and Thomas Berry, however, have shown that Western religions such as Christianity may be interpreted in ways largely compatible with the deep ecology movement.

Although Naess coined the umbrella term, which is now a catchphrase for most non-anthropocentric environmental ethics, a number of Americans were also criticizing anthropocentrism and laying the foundation for the movement's ideas at about the same time as Naess was coining the term. One crucial event early in deep ecology's evolution was the 1974 "Rights of Non-Human Nature" conference held at a college in Claremont, California. Inspired by Christopher Stone's influential 1972 law article (and subsequent book) *Should Trees Have Standing? – Toward Legal Rights for Natural Objects*, the conference drew many of those who would become the intellectual architects of deep ecology. These included George Sessions who, like Naess, drew on Spinoza's pantheism, later co-authoring *Deep Ecology* with Bill Devall; Gary Snyder, whose remarkable, Pulitzer prize-winning *Turtle Island* proclaimed the value of place-based spiritualities, indigenous cultures, and animistic perceptions, ideas that would become central within deep ecology subcultures; and the late Paul Shepard (d. 1996), who in *The Tender Carnivore and the Sacred Game*, and subsequent works such as *Nature and Madness* and the posthumously published *Coming Back to the Pleistocene*, argued that foraging societies were ecologically superior to and emotionally healthier than agricultural societies. Shepard and Snyder especially provided a cosmogony that explained humanity's fall from a pristine, natural paradise. Also extremely influential was Edward Abbey's *Desert Solitaire*, which viewed the desert as a sacred place uniquely able to evoke in people a proper, non-anthropocentric understanding of the value of nature. By the early 1970s the above figures put in place the intellectual foundations of deep ecology.

Deep Ecology Platform

Formulated by Arne Naess and George Sessions in April 1984, during a camping trip in Death Valley, California, the Deep Ecology Platform (DEP) seeks to be agreeable to environmentalists from many different persuasions. Individuals may derive the DEP from their own ultimate premises and ecosophies (a term Naess coined for “ecological philosophy”), Buddhism, Christianity, Spinozism, or ecofeminism, or they may arrive at the DEP as a result of deep questioning that moves from particular situations toward more general norms and consequences. The DEP has been criticized, for example, by those who fear that its fourth plank, regarding population reduction, could be used to justify draconian birth-control methods. In general, however, the DEP has won assent from many environmentalists.

The eight-point platform may be summarized in this way:

1. Human and nonhuman life alike have inherent value.
2. Richness and diversity of life contribute to realizing these values, and are themselves valuable.
3. Humans have no right to reduce richness or diversity except to satisfy vital needs.
4. Human life can flourish with a substantial reduction in human population, which is needed for the flourishing of nonhuman life.
5. Present human interference with the nonhuman world is already excessive and is worsening.
6. Economic, technological, and ideological policies must be changed, in a way that leads to states of affairs deeply different from the present.
7. The ideological change must involve appreciating the inherent value of all life, rather than continually increasing the material living standard.
8. Those who subscribe to the foregoing points have an obligation to implement the necessary changes.

Michael E. Zimmerman

A corresponding movement soon followed and grew rapidly, greatly influencing grassroots environmentalism, especially in Europe, North America, and Australia. Shortly after forming in 1980, for example, leaders of the politically radical Earth First! movement (the exclamation point is part of its name) learned about Deep Ecology, and immediately embraced it as their own spiritual philosophy. Meanwhile, the green lifestyle-focused movement known as bioregionalism also began to embody a deep ecology worldview. Given their natural affinities it was not long before bioregionalism became the prevailing social philosophy among deep ecologists.

As a philosophy and as a movement, deep ecology spread in many ways. During the 1980s and early 1990s, for example, Bill Devall and George Sessions published their influential book, *Deep Ecology: Living as if Nature Mattered*; Warwick Fox in *Toward a Transpersonal Ecology* linked deep ecology with transpersonal psychology, thereby furthering the development of what is now called ecopsychology; David Rothenberg translated and edited Arne Naess's important work, *Ecology, Community and Lifestyle*; and Michael E. Zimmerman interpreted Martin Heidegger as a forerunner of deep ecology, thus helping to spark a trend of calling upon contemporary European thinkers for insight into environmental issues. Many deep ecologists have complained, however, that the postmodern thinking imported from Europe has undermined the status of “nature,” defined by deep ecologists as a whole that includes but exists independently of humankind.

Radical environmentalist activists, including the American co-founder of Earth First!, Dave Foreman, and the Australian co-founder of the Rainforest Information Centre, John Seed, beginning in the early 1980s, con-

ducted “road shows” to transform consciousness and promote environmental action. Such events usually involve speeches and music designed to evoke or reinforce peoples’ felt connections to nature, and inspires action. Often, they also include photographic presentations contrasting intact and revered ecosystems with degraded and defiled lands.

Some activists have designed ritual processes to further deepen participants’ spiritual connections to nature and political commitment to defend it. Joanna Macy and a number of others, including John Seed, for example, developed a ritual process known as the Council of All Beings, which endeavors to get activists to see the world from the perspective of nonhuman entities. Since the early 1980s, traveling widely around the world, Seed has labored especially hard spreading deep ecology through this and other newly invented ritual processes. The movement has also been disseminated through the writings of its architects (often reaching college students in environmental studies courses); through journalists reporting on deep ecology-inspired environmental protests and direct action resistance; and through the work of novelists, poets, musicians, and other artists, who promote in their work deep ecological perceptions. Recent expressions in ecotourism can be seen, for example, in the “Deep Ecology Elephant Project,” which includes tours in both Asia and Africa, and suggest that elephants and other wildlife have much to teach their human kin.

Deep Ecology has been criticized by people representing social ecology, socialist ecology, liberal democracy, and ecofeminism. Murray Bookchin, architect of the anarchistic green social philosophy known as Social Ecology, engaged in sometimes vituperative attacks on

deep ecology and its activist vanguard, Earth First!, for being intellectually incoherent, ignorant of socio-economic factors in environmental problems, and given to mysticism and misanthropy. Bookchin harshly criticized Earth First! co-founder Dave Foreman for suggesting that starvation was a solution to human overpopulation and environmental deterioration. Later, however, Bookchin and Foreman engaged in a more constructive dialogue. Meanwhile, socialist ecologists maintain that deep ecology overemphasizes cultural factors (world-views, religion, philosophy) in diagnosing the roots of, and solutions to, environmental problems, thereby minimizing the roles played by the social, political, and economic factors inherent in global capitalism.

Liberal democrats such as the French scholar Luc Ferry (1995) maintain that deep ecology is incapable of providing guidance in moral decision making. Insofar as deep ecology fails adequately to recognize that human life has more value than other life forms, he argues, it promotes "ecofascism," namely the sacrifice of individual humans for the benefit of the ecological whole, what Leopold termed "the land." (Ecofascism in its most extreme form links the racial purity of a people to the well-being of the nation's land; calls for the removal or killing of non-native peoples; and may also justify profound individual and collective sacrifice of its own people for the health of the natural environment.) Many environmental philosophers have defended Leopold's land ethic, and by extension, deep ecology, against such charges, most notably one of the pioneers of contemporary environmental philosophy, J. Baird Callicott.

Although some ecofeminists indicate sympathy with deep ecology's basic goal, namely, protecting natural phenomena from human destruction, others have sharply criticized deep ecology. Male, white, and middle-class deep ecologists, Ariel Salleh maintains, ignore how patriarchal beliefs, attitudes, practices, and institutions help to generate environmental problems. Val Plumwood and Jim Cheney criticize deep ecology's idea of expanding the self so as to include and thus to have a basis for protecting nonhuman phenomena. This "ecological self" allegedly constitutes a totalizing view that obliterates legitimate distinctions between self and other. Moreover, Plumwood argues, deep ecology unwisely follows the rationalist tradition in basing moral decisions on "impartial identification," a practice that does not allow for the highly particular attachments that often motivate environmentalists and indigenous people alike to care for local places.

Warwick Fox has replied that impartial and wider identification does not cancel out particular or personal attachments, but instead, puts them in the context of more encompassing concerns that are otherwise ignored, as when for example concern for one's family blinds one to concerns about concerns of the community. Fox adds that deep ecology criticizes the ideology – anthropocentrism –

that has always been used to by social agents to legitimate oppression of groups regarded as sub- or nonhuman. While modern liberation movements have sought to include more and more people into the class of full humans, such movements have typically not criticized anthropocentrism as such. Even a fully egalitarian society, in other words, could continue to use anthropocentrism to justify exploiting the nonhuman realm.

In response to the claim that deep ecology is, or threatens to be, a totalizing worldview that excludes alternatives and that – ironically – threatens cultural diversity, Arne Naess responds that, to the contrary, deep ecology is constituted by multiple perspectives or "ecosophies" (ecological philosophies) and is compatible with a wide range of religious perspectives and philosophical orientations.

Another critic, best-selling author Ken Wilber, argues that by portraying humankind as merely one strand in the web of life, deep ecology adheres to a one-dimensional, or "flatland" metaphysics (1995). Paradoxically, by asserting that material nature constitutes the whole of which humans are but a part, deep ecologists agree in important respects with modern naturalism, according to which humankind is a clever animal capable of and justified in dominating other life forms in the struggle for survival and power. According to Wilber, a "deeper" ecology would discern that the cosmos is hierarchically ordered in terms of complexity, and that respect and compassion are due all phenomena because they are manifestations of the divine.

In the last analysis, for Naess, it is personal experiences of a profound connection with nature and related perceptions of nature's inherent worth or sacredness, which give rise to deep ecological commitments. Naess believes such commitments may be derived from a wide variety of ultimate premises, religious and philosophical, so as to form a particular ecosophy. Ecosophies that identify themselves as part of the Deep Ecology Movement are consistent with the eight-point, Deep Ecology Platform, which Naess developed with George Sessions in 1984.

Although controversial and contested, both internally and among its proponents and its critics, deep ecology is an increasingly influential green spirituality and ethics that is universally recognized in environmentalist enclaves, and increasingly outside of such subcultures, as a radical movement challenging the conventional, usually anthropocentric ways humans deal with the natural world. Its influence in environmental philosophy has been profound, for even those articulating alternative environmental ethics are compelled to respond to its insistence that nature has intrinsic and even sacred value, and its challenge to anthropocentrism.

Its greatest influence, however, may be through the diverse forms of environmental activism that it inspires, action that increasingly shapes world environmental politics. Not only is deep ecology the prevailing spirituality of bioregionalism and radical environmentalism; it also

undergirds the International Forum on Globalization and the Ruckus Society, two organizations playing key roles in the anti-globalization protests that erupted in 1999. Both of these groups are generously funded by the San Francisco-based Foundation for Deep Ecology, and other foundations, which share deep ecological perceptions.

Such developments reflect a growing impulse toward institutionalization, which is designed to promote deep ecology and intensify environmental action. There are now Institutes for Deep Ecology in London, England and Occidental, California, a Sierra Nevada Deep Ecology Institute in Nevada City, California, and dozens of other organizations in the United States, Oceania, and Europe, which provide ritual-infused experiences in deep ecology and training for environmental activists. It is not, however, the movement's institutions, but instead the participants' love for the living Earth, along with their widespread apocalypticism (their conviction that the world as we know it is imperiled or doomed), that give the movement its urgent passion to promote earthen spirituality, sustainable living, and environmental activism.

Deep Ecology, Institute for

If religion is "that dimension of human experience engaged with sacred norms [and] ultimate concerns, as David Chidester (1987: 4) has argued, then the Institute for Deep Ecology (IDE) can be viewed as a religious movement that reveres the Earth and promotes environmental activism in its defense. The Institute's website states that deep ecology is "a philosophy based on our sacred relationship with Earth and all beings; an international movement for a viable future; a path for self-realization; (and) a compass for daily action." Without specifically defining what is meant by "sacred," the site indicates that it seeks to "honor spirit" by acknowledging that the relationship between humankind and the natural world is a matter of ultimate concern and that to speak of the interdependence of all beings in the natural world is to engage in a description of ultimate reality.

Such understandings undergird the organization's mission to promote "well-being of the whole web of life." In 2002 the Institute's website stated that it does this through

ecological values and actions. At our core is a recognition of and reverence for the interdependence and inherent value of all life. To nourish these values in ourselves and the world, we provide opportunities for inquiry and practice through workshops, publications, and support networks. We seek to encourage and empower people to do good work in their home communities.

These intentions lead to actions, some of which have a marked ritual nature (such as the Council of All Beings), and are designed to foster awareness of the interconnectedness of all things, and to derive promote strategic environmental action.

The institute was initially co-founded in 1992 by Fran and Joanna Macy, in close association with Bill Devall, Stephanie Kaza, Elias Amidon, Elizabeth Roberts and others, and is situated in Boulder, Colorado. A 1993 brochure advertising its first Summer School provided the following description:

The Institute for Deep Ecology Education . . . sponsors regional and national trainings, consults on deep ecology curriculum and programs, and works to build coalitions among educators, activists, and others involved in this work. Its goal is to bring the deep ecology perspective to the environmental debates of our time.

By 1996 the organization had moved to Occidental, California, shortening its name to the Institute for Deep Ecology. In its Spring 1998 newsletter, the Institute's description stated:

The Institute for Deep Ecology (IDE) advances a world view based upon humanity's fundamental interdependence with all life forms – a philosophy commonly known as deep ecology. IDE seeks to heal the contemporary alienation from self, community, and the earth by encouraging a fundamental shift in the way we experience nature and respond to the environmental crisis.

The Institute provides transformative, action-oriented educational resources to a diverse constituency. In particular, IDE hosts trainings that bring community organizers, educators, psychotherapists, clergy, and others together with a large, multi-faceted faculty of prominent environmentalists.

This second description reflects a shift toward experiential work. In addition, certain therapeutic claims are made concerning the work of the Institute ("to heal the contemporary alienation from self, community, and the Earth . . ."). In these shifts, it is possible to detect the influence of ecopsychology, and also, a more explicit articulation of the spirituality common within many deep ecological groups around the world.

For the first several years, the Institute sponsored workshops and trainings in deep ecology. Many of the trainings featured various teachers of deep ecology or environmental activists who ascribed to the principles of deep ecology. In the late 1990s, the Institute went through a self-evaluation process that resulted in a shift from small, workshop-styled trainings to larger conferences

co-sponsored with other progressive groups, such as the Physicians for Social Responsibility, the Cultural Conservancy, Global Exchange, New College of California, Youth for Environmental Sanity, and the Indigenous & Non-Indigenous Youth Alliance. This marked increasing coalition-building around social justice issues. The 2000 Summer Conference held in San Francisco, for example, was entitled "Globalization or Earth Wisdom? Creating Just and Sustainable Communities." Workshops and panel presentations included discussions of the negative impact of globalization on indigenous and poor people, as well as on the Earth's natural variety. With such efforts the Institute has sought to broaden its influence and expand its efforts to include the human community as part of the ecological community by applying deep ecology principles of interconnectedness and interdependence to the political and social spheres. In this way, it has at least implicitly responded to criticisms that deep ecology tends toward indifference toward the plight of human beings.

Deere, Phillip (1926–1985)

The latter part of the twentieth century witnessed a resurgence of Native American traditions, particularly a focused Mother Earth spirituality. One of the most significant leaders in native America who fostered and guided this resurgence was the Muskogee elder Phillip Deere. He was born into poverty, was a carpenter by trade, and became internationally recognized as a spiritual leader, civil and human rights activist, oral historian and storyteller, elder statesman, spellbinding orator and traditional healer. His people, once part of the great Creek Confederacy, had been forced to move in the nineteenth century from the Southeastern U.S. to the "Indian Territory," now the state of Oklahoma, but retained their Earth-related spirituality.

Although he had little formal education, Phillip Deere was literate and of a profound intellect. He had a prodigious memory in which he retained prayers and healing

chants in Old Muskogee, creation stories and the ancient migration legend of his people's history in Muskogee and English, and federal and state governments' treaty provisions in English. He was a Methodist preacher for a time and learned biblical stories and teachings, but returned to traditional Muskogee ways.

Phillip Deere's spiritual calling kept him poor. In the Muskogee tradition, one who is gifted by the Great Mystery (the Creator Spirit) with healing powers is required to care for peoples' needs, no matter the personal cost. The healer had to set aside their usual employment whenever necessary to respond to a request for healing, without any expectation of remuneration and without consideration of the petitioner's ethnic or economic background; post-healing gifts, voluntarily offered, could be accepted from the person cured or their family. Consequently, Deere lived on allotted land in an unfinished home he was gradually building, cooking and heating with a wood stove, using outdoor plumbing. Near his dwelling was the open-walled roundhouse, with its central fire, which he had built for sacred ceremonies. As a traditional healer he learned chants and the names of herbs in Old Muskogee, a language not understood even by the traditional people who spoke Muskogee as their first language. He knew 424 healing chants in Old Muskogee: each chant containing a symptom of illness, the name of the healing herb to treat that symptom, and a prayer to the Great Mystery to make the healing ceremony efficacious. Healers were not allowed to use their powers to help themselves.

Although native to Okemah, Oklahoma, Phillip Deere traveled throughout the world to offer spiritual insights, support for native peoples' treaty rights, and concrete proposals for the promotion of human rights and egalitarian, respectful relationships among all peoples. He was a founder of the Traditional Youths and Elders Circle, and served as the primary spiritual guide for the American Indian Movement (AIM) and the International Indian Treaty Council (IITC), a non-governmental organization (NGO) recognized by the United Nations. In the latter capacity, he traveled in the spring to participate in the annual sessions of the United Nations International Human Rights Commission held in Geneva, Switzerland at the Palace of Nations. He spoke there about care for Mother Earth, and called for redress for injustices suffered by indigenous peoples of the Americas.

In his teachings, Phillip Deere integrated a sense of the sacred with concrete concern for people, all living beings and Mother Earth. He taught that the Great Mystery, when bringing about the creation, instilled certain "natural laws" within it that governed it as a whole and guided each individual creature:

In the beginning when the earth was created,
when everything came about, everything was given

original instructions of life and everything followed those instructions of life. The earth has its duties to perform, the sun, the moon, the stars. Everything was given instructions of life. And the trees have never failed to follow those instructions. They have never made a mistake. The rivers have never made a mistake. Every plant, every animal, every bird, every fish have never made a mistake. They still follow those original instructions of life (Interview by author, 1984).

Phillip Deere taught that people should be aware of and appreciative for what Earth provides, recognizing that although they have a spiritual dimension to their lives, they must also care for the natural home that is their earthly dwelling:

We cannot say that “I am just a pilgrim passing through.” We are the caretakers of this land and we are part of this creation. So we must respect Mother Earth.

We believe in natural laws of love, peace and respect. We learned this thousands of years ago and this was the life of our people. When we destroy anything within the creation, we feel that we destroy ourselves . . . So we must preserve what we have . . . We have felt ourselves to be a part of the creation: not superiors, not the rulers of the creation, but only part of the creation. If we understand those natural ways, natural laws of love, peace and respect, we will be able to get along with everyone. We will learn to love and share with everyone (Interview by author, 1984).

Deere taught that spiritual people must be conscious of their responsibilities to the Creator and grateful that this Great Mystery is solicitous of them as a loving parent, called *Father* in the Christian tradition; and they must be conscious of their responsibilities to, and grateful for the nurturing of, *Mother Earth*:

When we learned about Christianity we heard about the Father. We learned to pray to the Father and in the churches every Sunday we heard about Father. To this day we still hear about Father. But we never hear anything about Mother . . . But every Indian knows what you mean when you say, “Mother Earth.” Traditional people know what you’re talking about . . . We must all learn to say “Mother” as well as we say “our Father.” And in this way of life we will have balance (Interview by author, 1984).

The balance that Phillip Deere called for includes the understanding that spirituality is not something reserved only for a part of one’s week; it must permeate every moment:

Native religion to us is a way of life. That religion is based upon this creation and its sacredness. In this religion every day was a sacred day to us. Religion did not take place just Saturdays or Sundays. Every day of our life was a holy day (Interview by author, 1984).

The Muskogee elder Phillip Deere, who walked gently on the Earth and respected all of her life forms as well as her being, lived a way of life related to all creation, and encountered the Great Mystery along that way. When in his company, people sensed that they were in the presence of a spiritual leader who walked with the Spirit, a holy man who not only taught about spirituality but lived connected to its source and to all creatures. When he died, Phillip Deere was mourned throughout the Americas and Europe by people inspired by his words and made whole from his healing touch.

Deism

Deism is a theological position that upholds a belief in God as a creator of the world, but rejects the concept of divine revelation (including miracles and supernatural events). More broadly, Deism refers to a cluster of philosophical and theological ideas that flourished in Europe and North America during the Enlightenment and led to a thorough critique of Christian orthodoxy. These ideas often found their starting point in natural theology, an ancient theological approach which, in the Enlightenment, became increasingly separate from “revealed” and “supernatural” theology, with which it was once joined in complementary fashion.

Deism began as a response to Christianity from within Christian cultural circles, but often leads to a broader view that extended past Christianity to “religion in general” or “natural religion” (the systemization of knowledge of the divine attained through the use of natural theology). Thus, the thinking of some deists led to the evolution of new

ideas of “religiosity” as being part of human nature. This conclusion led, in turn, to the acceptance of non-Christian religious traditions as being equally valid. While deists varied in their particular convictions, most deists affirmed a view of God that could be arrived at solely through rational reflection (as opposed to revelation) and upheld a perspective that either rejected Christianity, accepted it as a moral guide (but not a personal means of redemption), or embraced certain aspects of the Christian tradition without arguing for its uniqueness when compared to other traditions.

In terms of intellectual history, Deism is associated with such figures as Denis Diderot, Jean Le Rond d’Alembert, Jean-Jacques Rousseau and M. Jean Antione de Condorcet in France; Gotthold Lessing and, to a lesser degree, Immanuel Kant in Germany; Samuel Clark, Matthew Tindal, Anthony Collins, John Toland and Thomas Paine in England, and Ben Franklin and Thomas Jefferson in America. Not surprisingly, the Deists held a range of theological views, including the shifting views of any number of individuals in the course of a lifetime. Less radical thinkers held positions close to those of the English latitudinarians (who maintained a belief in revelation, but put their emphasis on the “reasonableness” and accessibility of Christianity) or stayed in intellectual conversation with the German pietists, while the most radical bordered on agnosticism and atheism. Most were Enlightenment rationalists, though some, like Rousseau and Lessing, produced writing that also would qualify as “Romantic.”

The term “deist” itself was used more often as an insult (to suggest heresy or atheism) by the theological opponents of Enlightenment thinkers. Most deists upheld a belief in God as the creator of the universe and of humanity. Their precise vision of God, however, tended to be abstract rather than personalistic. God was variously termed “the Great Architect” (who designed the world), Providence (who intended good things for the world at the time of creation and gave humanity the capacity to create and sustain such goodness), and the Great Watchmaker (who wound up the “clock” of the world and set it eternally ticking in an orderly fashion). The implication of these various epithets for the divine was that God set the world in motion and gave it all the necessary ingredients to flourish (including humanity), but that God did not intervene in daily life.

Drawing on the methods and conclusions of seventeenth-century ventures in natural theology (such as the writings of John Locke), the deists discounted those aspects of the Bible that were considered to be “superstitious,” supernatural or dubious accretions. Following in the natural theology tradition, they insisted that the character of God could be discerned by studying the “Book of Nature.” By studying nature’s laws and unifying order, deists and other rationalists believed that the character

of God could be determined, and they assumed that God, by definition, would act in a rational, predictable and ultimately beneficent way. Moreover, they believed that God had endowed humanity with special, rational qualities and expected humans to use these faculties. Moving beyond such thinkers as Locke (who still affirmed the existence of truths beyond reason), the deists embraced only a natural theological approach and some – such as the young Voltaire – eventually rejected even a natural theology stance and took up positions of secular humanism, skepticism or atheism.

In America, Deism was attractive to those thinkers who already accepted the thought of John Locke and the implicit rationalism of Scottish Common Sense realism, but who took the Enlightenment emphasis on rationalism much further, to the point of questioning most orthodox Christian opinion. Deism came to America through largely English sources. Deists such as New Hampshire senator William Plummer and Vermont military hero Ethan Allen, took their cues from English authors, while the more prominent Ben Franklin and Thomas Jefferson were influenced by the French intellectual circles in which they were both involved.

In America, particularly, Deism was linked with the importance of paying attention to the natural world. Nature was seen as both a mechanical system of divinely ordained laws (the watch made by the watchmaker) and a Providential gift from the divine Creator, which human reason could “use” for its own progress. As such readings of nature suggest, Deism stood with a variety of other intellectual forces relying on natural theology (Scottish Common Sense, the Enlightenment in general, the rise of Unitarianism) in expressing a confidence that nature’s “secrets” could be discovered by humanity and put to use for humanity’s benefit (with God’s blessing). Not surprisingly, one legacy of such approaches to nature in the seventeenth and eighteenth centuries has been the development of a mechanistic view of nature that has played a role in the anthropogenic impact on the natural world and the destruction and depletion of natural resources. At the same time, however, enlightenment interest in studying the book of nature (while criticizing supernaturalism and the concept of miracles) directly influenced the growth of the sciences, including, ultimately, the development of ecology as a field of study. The deists were among the intellectual ancestors of modern science, and thus leave an ambivalent legacy of emphasizing the importance of nature, the value of progress and the promise of human intellectual capacity. At the same time, the enlightenment “disenchantment” of the natural world has led some environmentalists to search for ways in which nature might be reconceptualized as a site of mystery or of divine action and grace, in contrast to a deistic concept of nature as machine or system of laws. In addition, some aspects of eco-criticism explicitly blame

Enlightenment thinking and writing for developing concepts of nature that have led to its exploitation.

While Deism is generally understood to be a historical movement, some Westerners today refer to themselves as deists. Moreover, while Deism, by definition, resists “organization,” many individuals without claiming the term, hold essentially deist views, upholding a belief in God, while denying revelation and miracles. Some organized forms of Deism do persist. The World Union of Deists, for instance, promotes Deism as a rational religion that is appropriate to the contemporary period. They also emphasize Deism as a “religion of nature.” This current emphasis counteracts earlier critiques of the Enlightenment legacy and, to a certain extent, rehabilitates older deist concepts of nature which, while scientific, were not wholly disenchanting.

Deloria, Vine, Jr. (1933–)

The 1960s civil rights movement had an enormous impact on American Indian communities, not least in sparking the career of Vine Deloria, generally considered the leading intellectual figure among twentieth-century American Indians. Deloria has been a prolific author and – for over twenty years – professor at two public universities, making an important impact on scholarly and broader public understandings of native interests and perspectives in fields such as law, political science, religion, and anthropology. In addition to advocating a strong defense of tribal sovereignty and native rights over against mainstream American culture, he has consistently argued that native outlooks on the environment constitute an important critique of American values, and that tribal land-use practices demonstrate an important alternative to American practices toward the natural world.

A member of the Standing Rock Lakota (Sioux) tribe, in

South Dakota, Deloria inherited a long family tradition of “being involved in the affairs of the Sioux tribe” (Deloria 1969: 263), including a father (Vine, Sr.) and grandfather (Philip) who were both important native leaders in the Episcopal church, a great grandfather (Saswe) who practiced as a medicine man within the Yankton Dakota tribe, and an aunt (Ella) who, as an author trained in ethnography and linguistics, wrote a number of important volumes on Lakota/Dakota culture. Although Deloria, Jr. studied theology at Augustana Lutheran Seminary, he eventually did his graduate work in law – at the University of Colorado – after serving as executive director of the National Congress of American Indians from 1964 to 1967.

As a student of both law and theology, Deloria’s early work appeared in the years marked by a resurgence of militancy within native communities, such as the occupations of Alcatraz Island (1969) and Wounded Knee (1973), and the “Trail of Broken Treaties” (1972) – which resulted in the occupation of the federal Bureau of Indian Affairs office in Washington, D.C. With publication of *Custer Died for Your Sins: An Indian Manifesto* (1969), Deloria issued a series of biting polemics against official American Indian policy and underlying public attitudes and prejudices.

In *God Is Red: A Native View of Religion* (1973), Deloria developed a sustained critique of the weaknesses of Christianity in contrast with American Indian tribal religions. Key to this critique is the claim, reminiscent of the perspective of historian of religion Mircea Eliade, that Western religious traditions have developed their understandings of human life based more on temporal as opposed to spatial orientation. Native American religions, by contrast, are place-specific, concerned more with maintaining communal and individual well-being within a particular piece of land than in providing salvation at the end of history. Christian religion, for Deloria, thus proved an exercise in alienation when Europeans brought it to the Americas, in effect removing it from its original environment.

Christianity shattered on the shores of this continent, producing hundreds of sects in the same manner that the tribes continually subdivided in an effort to relate to the rhythms of the land. It is probably in the nature of this continent that divisiveness is one of its greatest characteristics, a virtually uncontrollable freedom of the spirit (Deloria: 1992 [1973]: 145–6).

In subsequent work, such as *The Nations Within: The Past and Future of American Indian Sovereignty* (1984) and *Tribes, Treaties and Constitutional Tribulations* (1999) Deloria addressed the continued dilemmas tribes faced in dealing with the legal system, the web of racial stereotypes, and the forms of official knowledge through which Americans have insured the continuing subordination

of Indians, and accomplished the expropriation of their lands. For Deloria, the legal/scientific/political administration of Indians and tribal land reflects the same differences in worldview that he first sketched out in *God Is Red*.

In arguing that the tribes, many of whom have retained important though strained cultural links to their lands in spite of colonizing pressures, could “speak meaningfully to the modern world,” Deloria has provided younger Indians with a role model of a publicly engaged intellectual with a relentless critique of American society. The heart of that criticism, though darkened over time, is that tribal values and practices offer much-needed correctives to the fundamental ideas animating industrial society. In questioning the marginalizing design he finds shaping mainstream anthropological practice regarding Indians, he asks, for instance, whether

the festivals by which people reestablished relationships with the natural world [could] provide us with a vehicle for making our concern about the environment an actual change of behavior instead of a vague sense of warm sentiment about chipmunks? (in Biolsi and Zimmerman 1997: 220)

However, in functioning as critic, his role differs from that of his forebears, who sought to soften the impact of American society land-use aims on those turn-of-the-century Lakotas first confined to reservations. Deloria’s task has been not to soften, but to challenge those aims through creation of an alternative consensus about treaty law, about conceptions of the sacred, and about the future place of Indians in American society. His expertise in both law and religion has enabled him to play a crucial role in a variety of land-claim and land-use cases brought into the courts during the last decades of the twentieth century, and in the process to amend the American Indian Religious Freedom Act of 1978, which the high courts unanimously found insufficient to provide tribes with protection of traditional sacred sites. While serving as a critic of American legal culture, he has also consistently advocated the alliance of Indian and non-Indian in efforts to protect the environment. For Deloria, all Americans have an interest in the land claims which tribes have brought to the bar. “No real progress can be made in environmental law unless some of the insights into the sacredness of land derived from traditional tribal religions become basic attitudes of the larger society” (Deloria 1999: 213).

Although much of Deloria’s career has been taken up with addressing the practical and political dilemmas facing Indian tribes, he has consistently sought to analyze the conflict of worldviews underlying the contests between tribes and Western institutions. In such works as *The Metaphysics of Modern Existence* (1979), and more recently in *Red Earth/White Lies: Native Americans and the Myth of Scientific Fact* (1995), Deloria has challenged

the deepest assumptions about nature, God and truth animating modern Western culture. In these works, the knowledge claims of Western science, and the taken-for-granted-superiority of Western technology, take a thrashing for their reduction of nature to the malleable and controllable, a thrashing grounded as much in the metaphysics of Alfred North Whitehead and methodological suspicion of Berkeley’s anarchistic philosopher of science Paul Feyerabend, as in the reconstituted tribal traditions that Deloria hopes to preserve. Scientific theory, Deloria has argued, has yielded not so much the authoritative account of nature, but rather “the folklore of materialistic industrialism” with “no basis in fact” (Deloria 1999: 275). His willingness to attack scientific consensus as well as Western religion has earned him many opponents, some of them other American Indian writers. Deloria has consistently played the heretic, however, not simply out of a polemicist’s desire to disturb the orthodox. Instead, he has held to a rather traditional Lakota conviction that though nature remains an intractable mystery, any possible progress in meeting human needs requires epistemological humility, and in the case of modern society, a good deal more humility than religion or science have been able to retain.

Delphic Oracle

The Delphic Oracle, the most important religious center in the ancient Greek world, owed its existence to a unique natural setting. The Greeks themselves believed that the oracle derived its power from a number of geological features: a cleft in the rock; a spring; and a gaseous exhalation. A nearby cave and a second spring were also linked to the prophetic tradition at Delphi.

Nature visibly dominates Delphi. The temple of Apollo

and the sacred precinct lie cupped in a spectacular semi-circle of precipitous limestone cliffs, giving the effect of an open-air theatre. Below the sanctuary the ground plunges down to the gorge of the Pleistos River. The southern exposure fills Delphi with sunlight all day: "To argue about a shadow in Delphi" was a proverbial phrase for arguing about nothing. The surrounding cliffs, known as the Phaedriades or "Shining Ones," lie on the southern slope of the massif of Parnassus, one of the holy mountains of Greece. The waters of the Corinthian Gulf are visible in the distance to the southwest, so Delphi seems to hang suspended between mountain and sea. The special geographical position of the site was shown by the omphalos or "navel-stone" inside the temple, marking Delphi as the center of the known world.

According to Greek tradition, the Delphic Oracle was founded by Ge or Earth herself, the mother of all things. Ge was followed first by her daughter Themis or Justice, and then by a succession of nymphs – female water deities. The site is indeed famous for its springs: Cassotis (the modern Kerna spring) inside the sanctuary and Castalia in a rocky cleft to the east.

The oracle played an important role in some of the most ancient myths. According to the Greek version of the Flood story, the two survivors Deucalion and Pyrrha took refuge on the summit of Mount Parnassus, and then asked the Delphic Oracle how they could repopulate the Earth. They were told to walk away from the oracle, throwing the bones of their "mother" behind them as they went. After some perplexity, they realized that Earth was their mother and rocks were her bones. From the stones that they cast over their shoulders, a new race of humans came into existence.

The Delphic Oracle was also believed to have given advice to such mythical heroes as Aegeus, father of Theseus, and Agamemnon, leader of the Greek expedition against Troy. In the *Odyssey*, Homer tells how Agamemnon received a riddling message at Delphi that indicated that his victory over the Trojans would come only after dissension and fighting among his own captains. The Delphic Oracle was famous for cryptic responses. Most famous of the legendary prophecies was that given to young Oedipus: "You will kill your father and marry your mother." The oracle neglected to explain that he did not know the identity of his real parents.

Most modern scholars doubt that the oracle was in existence before the eighth century B.C.E. The ancient Greek tradition has however received some support from archeological discoveries showing that a small town existed at Delphi as early as the Middle Bronze Age, roughly 1600 B.C.E. The importance of religious cults in this first settlement is shown by finds of terracotta figurines of female deities or priestesses (some seated on three-legged chairs or thrones), and a fine ceremonial rhyton in the form of a lioness' head.

An even older link between religious ritual and this region of Mount Parnassus was discovered in the Corycian Cave, a few kilometers north of Delphi. During classical times, pilgrims who came to consult the oracle at Delphi often hiked up to the Corycian Cave as well. Here the deities were not Ge or Apollo but Pan and the nymphs. But thousands of years earlier, in the Neolithic age, early farmers and herders were visiting the Corycian Cave for ceremonies of divination. Archeologists discovered thousands of "knucklebones" in the cave – the astragalus bones from the hooves of sheep and goats – which have been traditionally used in Greece and elsewhere in drawing lots or obtaining "Yes/No" answers to questions.

In essence, the formal oracle of Apollo continued this tradition of providing guidance in making difficult choices. During the heyday of the oracle from the eighth through fourth centuries B.C.E., thousands of pilgrims made their way by ship or overland to Delphi. There they received divine guidance on decisions ranging from founding a colony or launching a war to choosing a spouse or investing in a cargo. On days when the god did not speak, one could still receive a "Yes/No" answer to a question through the drawing of colored beans that served as lots.

But the major feature of Delphi was undoubtedly the performance of the Pythia, the woman who spoke for the god Apollo on the seventh day after each new moon in the spring, summer, and fall. The Pythia derived her title from the ancient name of the site, "Pytho," as did the legendary serpent or dragoness "Python" that the young Apollo had killed there with his bow and arrow. The Python had guarded a crevice on the mountainside from which Ge pronounced her oracles to humans. By killing the beast, Apollo was able to claim the oracle as his own, though he continued the tradition of speaking through the mouths of women. During classical times, the Pythia served as a medium for the god's voice, passing into a trance while seated on a tripod in the subterranean crypt or "adyton" of the temple. In no other spot could the woman be filled with the spirit of prophecy.

The service of the Pythia was exhausting and debilitating. During the glorious era when Delphi was consulted by Greek city-states and foreign monarchs alike, the Pythia who began the morning's session might later be replaced by a second woman, with a third held in reserve for days when the line of questioners was exceptionally long. Every Pythia was a woman of Delphi, but the office was not monopolized by any one family, as was the norm for Greek religious positions. The Pythia could be young or old, rich or poor, well educated or illiterate. The sisterhood of the oracle seems to have chosen the Pythias based on their aptitude for spiritual experience, specifically for experiencing a mediumistic trance. In this state, the Pythia would reply to questions either by chanting in poetical verse, or by responding in simple prose. In the latter case,

male temple attendants might compose a poetical version of the Pythia's response in return for a gratuity from the questioner. There is no ancient evidence for the popular modern claims that the Pythia spoke gibberish, and that the oracular responses were really composed by the male priests.

The most remarkable element of the prophetic ritual was the part played by an exhalation of natural gas or vapor within the temple. The Greek term was *pneuma*, which also meant "breath." According to a number of ancient Greek and Roman writers, the Pythia mounted a tripod that straddled a cleft or fissure in the rocky floor of the adyton. She would then breathe in the *pneuma* rising from the cleft, and then be empowered to speak in the words of the god Apollo. The *pneuma* normally triggered a benign trance, in which the Pythia could sit upright (though relaxed), see and hear the questioners, and give audible responses. On occasion, however, the Pythia was seized by a violent delirium, and would rave and thrash wildly. After one such frenzy, it was recorded that a Pythia in the time of the Roman Empire actually died a few days after the oracular session.

The source of this information is Plutarch, priest of Apollo at Delphi for many years and therefore an eyewitness to the workings of the oracle. In his three essays or dialogues dealing with Delphi ("On the E at Delphi," "Why the Oracles Are No Longer Given in Verse," and "On the Obsolescence of the Oracles"), Plutarch made it clear that even the priests were not let into all the secrets of the women who served as Pythia. However, he did provide many insights into the relationship between religion and nature at Delphi, particularly in the third dialogue.

Plutarch cast "On the Obsolescence of the Oracles" as a debate between conservative religious belief in the limitless power and eternal existence of the gods versus rationalizing natural philosophy. Pious visitors disapproved of the idea that Apollo or any other divine being should need to use a transitory, fluctuating natural phenomenon such as the Delphic *pneuma* to work his will. Skeptical philosophers on the other hand attributed the behavior of the Pythia merely to the physical effects of the gaseous emission, or dismissed the oracles as mere guesswork. At the end, Plutarch attempted to reconcile Science and Religion by stating that the gods were indeed divine and eternal, but were compelled to use the corrupt substances of this earthly world in order to communicate with mortals.

In the course of this fascinating discussion, Plutarch provided considerable information about the *pneuma*. It had a sweet smell; it was detectable to the priests and questioners outside the adyton, although faint and unpredictable; it could reach the surface either as a free gas or through water; and its flow had diminished through time. The weakening of the *pneuma* was identified by Plutarch as the cause of the oracle's decline. He advanced three possibilities to account for the change, all of them physical

or geological. First, the vital essence in the rock that produces the effect on the Pythia may have simply worn out over time. Second, heavy rains may have washed the vapor away. And third, it may be that the great earthquake of 372 B.C.E. not only destroyed the old temple of Apollo but also blocked up the vents that allowed the *pneuma* to reach the surface. The first observation is an early recognition that natural resources are not inexhaustible, and the third a reminder that Poseidon the Earthshaker was also worshipped in the temple at Delphi.

From the Renaissance to the end of the nineteenth century, modern scholars took these reports of geological activity at face value. But when French archeologists failed to find a large chasm in the rock under the central part of the temple, skepticism set in. In the first half of the twentieth century, a number of articles and books were published which purported to debunk the ancient tradition. Adolph Paul Oppe published the seminal article "The chasm at Delphi" in 1904, and Pierre Amandry summed up the evidence against the ancient tradition in his book on the oracular procedure at Delphi in *La Mantique Apollinienne à Delphes* (1950). The latter work included the claim that it was geologically impossible for an intoxicating gas to have been emitted at Delphi, since such exhalations can be found only in areas of volcanic activity. The new skepticism was embraced by historians and archeologists throughout Europe and the Americas, and established itself as the dominant opinion concerning the oracle.

Starting in 1996 an interdisciplinary team from the United States carried out geological and archeological field surveys at the oracle site, followed up by laboratory analysis of rock and water samples. The team included geologist Jelle de Boer of Wesleyan University, archeologist John Hale of the University of Louisville, chemist Jeff Chanton of Florida State University, and toxicologist Henry Spiller of the Kentucky Regional Poison Center. The team's fieldwork showed that the temple of Apollo had been built at the intersection of two geological faults, dubbed the Delphi and Kerna faults, at least one of which was still active. One of the springs rising along the Kerna fault emerged in the interior of the temple. The architecture of the temple had been adapted to the geological setting, with a sunken interior so that the natural surface of the mountainside could be reached by Pythia and pilgrims. The builders also constructed an off-center niche for the adyton at the spot where the spring reached the surface.

The underlying bedrock proved to be bituminous limestone, with a petrochemical content of up to 20 percent. Geologist de Boer theorized that friction due to movement along the fault would heat the rock to a temperature at which the petrochemicals vaporized. The resulting gases would rise to the surface along the fault, along with ground water. During laboratory analysis, traces of intoxicating

light hydrocarbon gases, including methane and ethane, were found in the travertine rock that had been laid down by the spring in antiquity. And sweet-smelling ethylene, also an intoxicant, was detected in the modern Kerna spring directly up the slope from the temple.

When seated in the enclosed, poorly ventilated adyton inside the temple, the Pythia would thus have been exposed to a mixture of gases that could trigger a trance state. Of particular interest was ethylene, which is known to produce both mild out-of-body experiences and (on rare occasions) violent delirium. The results of the interdisciplinary project confirmed the validity of the ancient literary sources, and suggest that the scientific observations of Greek natural philosophers should be carefully considered.

The existence of gaseous emissions and springs under the foundations of Apolline temples elsewhere in Greece and in Turkey make it clear that Delphi is not an isolated instance, but rather the center of a widespread religious tradition – a tradition that linked the worship of Apollo and the presence of oracular power to geological features in the landscape. The temples of Apollo at Ptoon in Greece and at Claros, Didyma, and Hierapolis in Turkey were all built on such sites.

In about the year 362, the Pythia at Delphi received a visit from envoys sent by Julian the Apostate, the last pagan ruler of the Roman Empire. Julian was attempting to combat the tidal wave of Christianity that was sweeping away the old pagan cults, and he asked the Pythia to prophecy once more in order to show the continuing power of the old gods. The woman replied, “Tell the king the fair-built hall has fallen. Apollo no longer has a shrine here, nor a prophetic laurel tree, nor a talking spring. The water of speech is silent.” Even in these last verses from the last of the long line of Pythias, the natural features of Delphi dominate the scene.

Demons

The demon is a traditional designation for a hostile and/or evil spirit entity. As a concept, it becomes part of Western culture through the influence of Zoroastrian thought that polarizes the world between good and negative forces. The dualistic framework has become part of gnosticism, hermeticism, kabbalist doctrine and the Abrahamic religions of Judaism, Christianity and Islam. However, the term “demon” derives from the Greek *δαίμων*, Latin *daemōn* the “divider” – the one who apportions the resources of the natural world among recipients. The daemon was originally a part-human and part-divine spiritual entity that was amoral rather than immoral. The transition of this superhuman power into a devilish being reflects the loss of an earlier understanding based on the sanctity of nature’s plenitude and its subsequent institutionalized transformation into dualistic theologies that posit the natural as something inferior and impeding to transcendental evolution. As a result, the demonic has become synonymous with impurity, sensuousness and harm. The ambiguity of the threshold zones associated with the Greek daimon as demi-god has been likewise translated into a long-standing vernacular fear of liminality. Passages, entryways, bridges and the like become regarded as unsafe and unclean. As Mary Douglas contends, this antipathy toward the liminal extends to the human body and its openings considered as dangerous places. By positing a framework that holds purity and impurity to be good-and-evil opposites, such natural negatives as miasma, illness and misfortune become ethical issues. The historic trajectory of the demon is, therefore, a narrative that describes the superimposition of a hermeneutics of ethics onto natural conditions. It is the story and legacy of Western civilization’s distortion of the organic and holistic into an artificial world that is divided and opposed to itself.

With the advent of Christianity, the nature spirit, the genius as intermediary between the human and the divine, and the power of the pagan gods were turned “by an easy, traditional shift of opinion . . . into malevolent ‘demons,’ the troupe of Satan” (Fox 1987: 137). While the classical

deity transcended ethnocentric ethics and the daemon could be either benevolent or malevolent, the nascent Church came to classify all demons as evil in contrast to God, Christ and the angels of heaven. Christian demonology divided the spirit world in conformity to the four elements of fire, air, Earth and water – respectively, the salamander, sylph, gnome and undine. By the Middle Ages, drawing on the account of Lucifer's rebellion and defeat by the archangel Michael, the demonic legions assumed a complexity of order that mirrored the angelic hierarchies consisting of seraphim, cherubim, thrones, dominions, virtues, powers, principalities, archangels and angels. In the magical arts of conjuration, a rich iconography developed through which the evoked devil could be identified by rank, form and shape. The corollary of conjured demonic apparition is the Christian pursuit of exorcism. Adjuration of the demonic is not, however, a Christian innovation. Ambiguous *daimones* might once have been eliminated, for example, through recitation of particular Homeric verse. But whereas the pagan tended to understand disease as an imbalance of nature, for the Christian it was a result of demonic invasion of the body. Remedial effort invariably centered on expulsion of the unclean spirit, and this attitude has carried through into the dominant ethos behind contemporary secularized allopathic medicine as well. Western curing does not predominantly countenance regaining health through restoring a natural balance of the whole organism but rather by simply suppressing and/or getting rid of an invading entity.

This metamorphosis of the Greek *daimon* into the Christian demon rests on the development of a dualistic worldview. Prior to this, the demon at worst simply represented the difficult and dangerous aspects of the natural cycle (night, winter, tempest, death, etc.) With the emergence of dualistic theology, both demons and God are removed from the natural cycle – God as transcendent; the demon as intrinsically evil. The result for the human being is alienation from nature. Moreover, if there is only good and evil – and particularly evil that is intrinsic – the danger that arises with such an understanding is that every dissenting opinion is categorically condemned. This situation ultimately leaves no room for dialogue and the possibility of reaching any democratic compromise between different positions. However, the very foundation of democracy is predicated on the fundamental equality of each individual's worth. Without this assumption, democracy itself becomes an impossibility. If, on the other hand, one assumes that those who appear to thwart his or her own way or those who would appear to be motivated solely by self-interest are fallen angels or demons masquerading as humans, the voice of the other is simply condemned and not heard.

P Depth Ecology

Deep Ecology, as a movement and a way of thinking, has generally been contrasted to conventional environmentalism, and especially to approaches that focus only on alleviating the most obvious symptoms of ecological disarray without reflecting upon, and seeking to transform, the more deep-seated cultural assumptions and practices that have given rise to those problems. Rather than applying various “band-aid” solutions to environmental problems, adherents of deep ecology ostensibly ask “deeper” questions, and aim at deeper, more long-range solutions. Yet some stalwart environmental activists have taken offense at the implication that their own strenuous efforts merely amount to a kind of “shallow” ecology. In fact, the implicit contrast between “deep” and “shallow” approaches to ecological problems has led various folks to suspect a kind of arrogance in the very idea of “deep ecology”; and such suspicions have weakened the deep ecology movement.

Yet the tremendous potential of the deep ecology movement, and the real eloquence of “deep ecology” as a powerful, if largely inchoate, set of intuitions, never really had anything to do, I believe, with the contrast between “deep” and “shallow” approaches. Worthy and visionary activists from many different fields – scientists and farmers, professors and poets, artists and anarchists, all with a intense love for wild nature and a sense of outrage at the ugly insults that civilization was inflicting on the animate Earth – were drawn to deep ecology because they could sense a new kind of heartfelt humility in this movement, a gathering of brilliant spirits who were not afraid to acknowledge their own existence as earthly animals. All were happy to affirm that the human was but one of the Earth's many creatures – a remarkable creature, to be sure, but ultimately no more astonishing than the grizzly bears, or the cormorants, or the spiders riding the grasses as they bend in the wind. Far from being arrogant, deep ecology

was marked by a new kind of humility – a new assumption that we two-leggeds were entirely a part of the intricate web of life – and by a new wish to reflect and to act without violating our responsibility as plain citizens of the biotic community. The other side of this humility was a steady wonder in the face of a world that exceeds all our designs, the delicious and sometimes terrifying awareness of being human in a much more-than-human world.

The name “deep ecology” resonated well with this new impulse, mostly because of the richness of meaning in this curious word “deep.” It is a meaning that very few of us recognized consciously, yet I suspect that our animal bodies sensed it right from the start. For the adjective “deep” speaks of a particular dimension of the experienced world: often termed the third dimension, it is that which photographers refer to when they speak of “depth of field.” It is that dimension that stretches from the *near* to the *far*, from the place where we stand all the way to the horizon, and beyond. The curious nature of this dimension is such that, unlike “height” and “width,” which seem entirely objective aspects of the perceived world, the dimension of depth is wholly dependent upon the position of the viewer *within* that world! The height of a boulder, for instance, seems to stay constant as I move around that rock. Yet the *depth* of the rock, the relation between the near and the far aspects of the boulder, steadily changes as I move around it. Unlike the height of a mountain range, and the width or span of a valley, the *depth* of a landscape depends entirely on where we are standing within that landscape. And as we move, bodily, within that landscape, the depth of the landscape shifts around us.

In truth, a space has depth only if one is situated somewhere within that space. A cluster of boulders, or a grove of trees, may be said to have a particular depth only if you are situated, bodily, in the same world as those rocks or those trees.

If, for example, I am watching some nature program on the television, observing a female lion, perhaps, as she lolls with her cubs under the shade of a leafy tree, and I happen to stand and walk across the room, my movement does not alter anything on the screen. The depth of the room will shift around me as I move – the bookcase looms up in front of me and then recedes as I move past it, the music stand comes between me and the television screen for a moment as I walk by – yet the spatial positions of those cubs do not shift in relation to one another or in relation to the tree behind them. For the lions and I do not inhabit the same space. There is no depth between us, for I look at their world from a position entirely outside of that world, an utterly detached spectator looking at a flat spectacle. My real, bodily encounter is not at all with those lions, but with the flat screen of the television.

Modern, conventional science has long presumed to observe the natural world from a detached position utterly outside that world. And the science of “ecology” inherited

this presumption from the older sciences that preceded it – the assumption that we could objectively analyze the interactions of various organisms and their earthly environment as though we ourselves were not participants in that same environment, as though our rational minds could somehow spring themselves free from our coevolved, carnal embedment in the thick of this ecology in order to observe it from a wholly detached and impartial perspective. In high school biology class, we gazed at a complex diagram of the local ecosystem drawn on the flat blackboard, but of course we did not include our own gaze within the system. Later, some of us learned to model particular ecosystems on the flat screens of our computers. Although I learned a fair amount from such exercises, the primary lesson I learned was that earthly nature is an objective, determinate phenomenon that can best be studied from outside, not an enveloping mystery in which I am wholly participant.

Such is the view of nature that we perpetuate when we neglect, or overlook, the depth dimension of the world – the fact that, in truth, we only ever experience the *actual* world from our embodied, two-legged perspective down here in the thick of things. Since we are entirely *in* and *of* this earthly world, nature can disclose certain aspects of itself to us only by concealing other aspects; we never perceive the whole of any earthly phenomenon all at once. Because we are animals immersed in the world, each thing we directly encounter meets us with its own depth, its visible facets and its invisible facets, its closer aspects open to our gaze and its more distant aspects hidden from view. The belief in a purely objective comprehension of nature, in a clear and complete understanding of how the world works, is the belief in an entirely *flat* world seen from above, *a world without depth*, a nature that we are not a part of but that we look at from outside – like a God, or like a person staring at a computer screen.

Deep ecology calls this presumption into question; it suggests that such cool, disembodied detachment is itself an illusion, and a primary cause of our destructive relation to the land. It insists on the primacy of our bodily embedment in the encompassing ecology, on our thorough entanglement within the earthly web of life. It suggests that we are utterly immersed in, and dependent upon, the world that we mistakenly try to study, manipulate, and manage from outside.

Thus, the most relevant contrast provoked by the notion of *deep ecology* is not a facile contrast between “shallow” and “deep” approaches, but rather the contrast between the *flat* and the *deep* – between *flat ecology* and *deep ecology* – between a detached way of seeing that looks *at* nature from outside, and an embedded way of seeing (and feeling) that gazes into the depths of a nature that encompasses and permeates us. *Deep ecology*, in other words, implies that we are situated *in the depths* of the earthly ecology.

It is this tacit implication of our thorough inherence in the biosphere, this intuition of depth, that unites all of us who were drawn, from various directions, to the phrase “deep ecology.” We all sensed the need for a way of speaking, and thinking that did not tear us out of our felt immersion in, and consanguinity with, the animate Earth. By acknowledging that we are a part of something so much vaster and more inscrutable than ourselves – by affirming that our own life is entirely continuous with the life of the rivers and the forests, that our intelligence is entangled with the wild intelligence of wolves and of wetlands, that our breathing bodies are simply our part of the exuberant flesh of the Earth – deep ecology opens a new (and perhaps also very old) sense of the sacred. It brings the sacred down to Earth, exposing the clearcuts and the dams and the spreading extinctions as a horrific sacrilege, making us pause in the face of biotechnology and other intensely manipulative initiatives that stem from a flat view of the world. Deep ecology – or *depth ecology* – opens a profoundly immanent experience of the holy precisely as the many-voiced land that carnally enfolds us – a mystery at once palpable, sensuous, and greatly in need of our attentive participation.

Descartes, René (1596–1650) and the Problem of Cartesian Dualism

If historical figures can be understood best by examining the contradictions that condition their lives, then it is worth noting that René Descartes, the wellspring of enlightenment rationalism, found the direction of his career in a series of traumatic dreams he took to be a divine communication. And despite his rational commitment to the view that animals are soulless automata – becoming, thereby, the philosopher most often blamed for reducing laboratory animals to mere mechanisms available for guilt-free vivisection – he owned a dog named Monsieur Grat. Anthony Grafton summed this up succinctly when he noted

Paradoxically, Descartes, the pre-eminent modern rationalist, took dreams as the basis for his con-

fidence in his new philosophy – a philosophy that supposedly did more than any other to deanimize the world, to convince intellectuals that they lived in a world uninhabited by occult forces, among animals and plants unequipped with souls, where the only ground of certainty lay in the thinking self (Grafton 1996: 36).

The following pedestrian details provide the outer shell of his life: Descartes was born in La Haye on 31 March 1596, was sent off at age 10 to the Jesuit college of La Fleche, and attended the University of Poitiers in 1615 where he graduated in canon and civil law. In 1618 he enlisted in the army of Prince Maurice of Nassau and was startled into philosophic action by dreams in 1619. He afterwards lived in Amsterdam, Deventer, and Leiden where, in 1637, he published *Discourse on Method*. *Discourse on Method* contains a more concise version of the arguments he expounded in his later and better-known *Meditations* – like the famous proof of his own thinking existence (*cogito ergo sum*), and the argument that animals do not have souls. He began work on *Meditations*, his most famous and lasting contribution to Western philosophy, in 1639 and published it a year later. In 1643 he relocated to Egmond du Hoef and began a correspondence with Princess Elizabeth of Bohemia. In 1644 he published *Principles of Philosophy* and dedicated it to her. In 1646 he began to correspond with Queen Christina of Sweden. This remarkable sovereign persuaded him to move to Stockholm to become her tutor in philosophy in 1649. Unprepared for either the climate of Stockholm or the extraordinary constitution of the Queen – who scheduled their meetings well before Descartes’ normal waking hours – he died halfway through his first Scandinavian winter, on 11 February 1650.

The importance of the Cartesian dichotomy – Descartes’ division of the universe into two distinct substances, spiritual and physical – can hardly be understated. Using the language of philosophy and early science, his arguments articulated and sanctioned the long-held view that human beings are incorporeal souls inhabiting corporeal bodies. Set into the bedrock of Western culture, these underlying tectonics continue to condition the overlying topography of discourse that divides soul from body, spirit from matter, God from nature, and religion from science. These divisions continue to affect even the most mundane aspects of daily life. Even today, humans remain strangers in a strange land and nature remains a waiting room, a temptation, or a gauntlet to be endured on our trek into paradise or hell or the Great Nothing.

In his *Meditations* II and VI and, more accessibly, in Part IV of his *Discourse on Method*, Descartes argued that mind and body are composed of two distinct substances. This distinction follows, Descartes asserted, clearly and distinctly from an irrevocable certainty: that because he

thinks, he can know with certainty that he exists. *Cogito ergo sum* – I think therefore I [know] I am. From here he argued that it is possible to doubt the existence of the physical body – since anything known through the senses can always be deceived – but that it is not possible to doubt the existence of the mind – since to do so simply verifies that the doubting mind must exist. Because it is possible to doubt what we know about physical reality (since it is known through the senses) but impossible to doubt the existence of our minds, Descartes concludes that minds and bodies must be composed of distinct substances. He wrapped up by noting that physical substance is extended in space while mental substance is not. Physical objects take up space. Objects composed of mental, spiritual, substance do not.

His argument reinforces worldviews that define human beings as incorporeal souls trapped in corporeal, spatially extended, bodies.

This was the traditional and well-accepted point of view, but there are stunning contradictions buried like fault lines in his argument. Most simply: Descartes defined mental and physical substances in a way that makes their interaction impossible. If bodies take up space and souls do not, then they can not interact. He attempted to save his argument in Part V of *Discourse on Method* – just prior to his argument that animals are not sentient – with the ad hoc hypothesis that the mind/body connection is maintained by “animal spirits,” neurological angels composed of both substances. Unfortunately, once we ask how the corporeal and incorporeal parts of the animal spirits themselves are able to communicate with each other (even tinier animal spirits), this patchwork dissolves into an infinite regression.

What we have here, apparently, is a philosophical dead end.

Given these obvious contradictions one might well ask why Descartes could have had such a great effect on the history of Western thought. His distinction between minds and bodies is deeply flawed; his contemporaries aggressively critiqued it; the consequences have been sore and even dire; and yet it continues to affect the trajectory of thought at the level of an entire culture. So why would anyone have accepted it? The answer is simple. His argument was appealing not for its logical consistency, but because it: 1) asserted something his readers already believed (the paradigmatic assumption that humans are incorporeal souls inhabiting physical bodies) and, more relevant to his era, 2) temporarily soothed the mounting tensions between science and Christianity. His division of the world into mental or physical substances brilliantly resolved some dangerous and uncomfortable predicaments facing scientist and theologian alike – at first.

Descartes opened a door both to the budding scientific enterprise, fearful of religious Inquisitions and conducting

its investigations in the shadows of darkened surgical theaters, and to theologians who were beginning to feel the hammer of science chipping away at the decaying fortress walls of dogma. His distinction between spiritual and physical realms negotiated a buffer zone between religion and science and set this distinction, as if in concrete, into the psyche of Western culture. By setting aside a specific subject-matter for religion (mental or spiritual substance) and a specific subject-matter for science (physical substance), Cartesian dualism 1) made a safe haven for scientific explanation and 2) allowed the religious community to avoid increasingly embarrassing questions such as “Where is heaven if not among the stars?” and “Where is the Garden of Eden if not on Earth?” – and later, “What are human origins if not those suggested by the fossil record?” Physical substance remains the subject matter of science; mental or spiritual substance, the arena of theology. This clear and distinct separation of subject matters seemed to alleviate the increasing tension between sacred and secular. Scientists and theologians alike could, at their leisure, pursue their respective lines of inquiry without interference from one another.

This boundary agreement secured a few centuries of détente between science and religion, time that would allow the logical contradictions in Western culture to work themselves to the surface – like splinters of glass in your thumb. It was a useful solution that left Western culture with some unhappy consequences. Scientists who wished to comment on religious questions and theologians who wished to say something meaningful about the physical universe found themselves hobbled by the shackles of their assigned subject-matters. The distinction that set them free became a quarantine. Science, exiled to the “merely” physical world, became a discipline without spiritual or ethical consequences. Theology, confined to mental substance, was cloaked in a spiritual insulation that kept it from being relevant to the world of time and space. The human soul was unable to interact with the body it inhabits and, analogously, the Western world’s God was left equally unable to interact with the physical universe. If God is locked out of the physical universe then Nietzsche’s sentiment is correct: the physical universe, the place in which humans live and try to find meaning, is nothing but an empty tomb. Existentialism, anomie, and postmodern desiderata all find their first toehold here.

Human values continue to divide along this fault line. Here is a simple example: Descartes’ philosophical method allowed him to contemplate an applied philosophy by which,

Knowing the nature and behavior of fire, water, air, stars, the heavens and all the other bodies which surround us, as well as we now understand the different skills of our workers, *we can employ these*

entities for all the purposes for which they are suited and so make ourselves masters and possessors of nature (Descartes 1956: 40, author's italics.)

The way in which our relationship to nature has been conditioned by the Western cultural paradigm was explored, most notably, by Lynn White. Human dominion over nature was a logical consequence of defining human beings as spiritual "entities" rather than as earthly "creatures." Incorporeality set human souls safely outside the Heraclitean flux of cause and effect. Human, spiritual, "being" was paradigmatically defined as "above" nature. In this, Descartes simply propagated an old and accepted worldview – but its inherent contradictions are easier to see in his dry philosophical prose than in the sweep and tumult of Old Testament saga or Francis Bacon's hopes for the recovery of Eden through the implementation of a divinely implanted rationality. Descartes' commitment to being clear and distinct makes it possible to pry out these submerged influences and take their effect on contemporary culture into account.

The clear contradictions within Descartes' dichotomy forced science and theology to reconsider how "human" and "nature" have been defined. Contemporary environmental ethics provides a good example of how these unexamined assumptions, and the paradigm underlying them, have been scrutinized during the last few decades.

The challenge of environmental ethics is, simply put, to produce ethical theories that can extend what Kenneth Goodpaster called "moral considerability" to the rest of nature. Unfortunately, any ethical consideration that proceeds from Descartes' definitions will fail because it begins by assuming an axiom that makes it impossible to apply an incorporeal-soul-based, human-centered, ethics to the realm of corporeal nature. If you begin from the position that the gap between humans (as spiritual entities) and nature (as fallen corporeality) is unbridgeable, then any ethical theory that attempts to extend anthropocentric ethics to nature – or supplant it by merely denying any such distinction (without addressing the assumptions that frame this distinction in the first place) – will also, and necessarily, fail.

What makes radical environmental ethics "radical," for example, is that it begins not by arguing about what actions or objects are good or right, but by challenging the underlying conceptual framework that conditions what "good" or "right" must be. Arne Naess began the project of deep ecology by taking aim at the underlying assumption that human beings are independent from the world they inhabit, by calling into question the human-self-as-independent-from-nature. Redefining humans as *part* of nature shatters the grounding assumption that ensouled humans stand outside the material world – and so too it topples the ethical corollaries that depend upon this definition.

Ecofeminism takes a similar approach through the problematization of assumptions about gender and applies this method to our assumptions about the boundary between humans and nature. Descartes and Francis Bacon, the primary modern proponents of rationality as humanity's privileged mode of understanding and manipulating nature – a mode of understanding and a manipulation, many ecofeminists claim, that has caused and justified the domination of both nature and women – stand out as primary targets for the critique of ecofeminist authors. The solution is to overcome not only the culturally institutionalized subjugation of women and nature, but the very cognitive processes that perpetuate and legitimate such oppression. Carolyn Merchant analyzed what she concluded is the common ground of this oppression and argued "we must reexamine the formation of a worldview and a science that, by reconceptualizing reality as a machine rather than a living organism, sanctioned the domination of both nature and women" (Merchant 1980: xvii). Karen Warren aimed her critique at "oppressive conceptual frameworks" that she believes underlie and condition any possible ethical system in a way that "an oppressive *patriarchal* conceptual framework sanctions and justifies the domination of women . . ." (Warren 1999: 155). This "logic of domination," a term borrowed from Marcuse, such ecofeminists claim follows axiomatically from the embedded dichotomy that defines humans as ensouled beings and nature as a realm of mechanical "creatures."

Social ecology argues that the same fault lines underlying the paradigmatic division of nature from the human self, and female from male, are also at work in the division between the natural world and human society. In this context society can be understood to be the product and embodiment of human rationality ("spirituality" encoded by Cartesian algorithms) while nature (as the material Other) is mere matter. Just as Marx claimed that political issues are economic, social ecologist Murray Bookchin has suggested that social and political issues are environmental ones and that environmental problems are just as much social and political in nature. Bookchin notes that, "This social system is especially rapacious. It has projected the domination of human by human into an ideology that 'man' is destined to dominate 'Nature' " (Bookchin 1991: xiv). The conceptual gulf between society and nature, Bookchin thus argues, allows political and economic institutions to ignore their effects on the environment. This conceptual gulf follows the same fault lines outlined and reinforced by the Cartesian dichotomy.

All such "radical" theories are radical simply because they address the real problem. The real problem was, as always, that we have attempted to answer questions without examining what they meant in the first place and the degree to which we may be paradigmatically conditioned to answer them.

The reader is encouraged to explore this event horizon by carefully analyzing, and then attempting to answer, the following, simple question: "Are humans natural?"

For Descartes, and the Western cultural paradigm, the answer is no.

Desert Writers (Western United States)

A spirit of place, in the most literal sense, has long been central to southwestern storytellers whether they work in

an oral or written tradition. Stories have been grounded in sand, stone, and soil since the early creation myths of the region's native inhabitants. For tribes like the Hopi, whose crops depend on the life-giving gift of the annual rains, interactions with the desert have always been an inseparable blend of the spiritual and practical. Religious beliefs are embedded through ritual and story in the land: the basis of daily experience and the ultimate source of sustenance.

The westward migration of whites brought different values into the American desert, some of which still influence contemporary attitudes toward it. This can be traced to another set of stories, which stem from experiences in the dry lands of another continent. It is difficult to understand the American colonial past without mentioning Jewish and Christian desert imagery. The Puritans, for instance, employed desert references from the Old Testament to underline the moral imperative of what Perry Miller called their errand into the wilderness. Viewing the new continent as a test of their faith, settlers drew on biblical descriptions of making a recalcitrant desert bloom. Like the ancient Hebrews, they hoped that their devotion would be rewarded by the transformation of barren wasteland into a promised land of milk and honey.

Such a narrative of reclamation, which saw the desert as an enemy to be conquered rather than a place with which to make peace, influenced everyone from Mark Twain (who endlessly gripes about the landscape's worthlessness in *Roughing It*, his account of a journey to the gold fields of Nevada) to the Mormons. The latter brought this displaced imagery into an actual desert region near Utah's Great Salt Lake, where they settled down to turn the land into Zion. The desert appeared a forbidding purgatory, but it could be redeemed and was thus a good place to make saints, according to Brigham Young. Labor on the land was a means of achieving salvation for the soul.

But as that land was subdued and settled, different feelings emerged. Many Americans began to flee the growing stresses and excesses of urban, industrial civilization for wide open spaces like the desert, which in its relatively undisturbed state became a sort of refuge. In leaving behind the garden, Americans created "out of a desert continent," spurning its values as destructive of our relationship with nature; the dissenters were resurrecting another Judeo-Christian narrative: that of the desert fathers, who shunned the sinfulness of human cities for the austere and revelatory purity of the wilderness.

Increasingly, it was the desert that came to seem holy, not the task of eradicating it. Edward Abbey's 1968 book *Desert Solitaire* encapsulated this countercultural shift in attitudes. An agnostic of sorts, Abbey was less interested in finding God in the desert than in stripping the otherworldly away from religion, focusing on what is at hand. "I dream of a hard mysticism," he wrote, "in which the naked self merges with a non-human world and yet

somehow survives still intact, individual, separate" (1968: 7). Abbey's sojourn in the desert was fueled by a personal quest to behold the immediate divinity of what is before us rather than beyond us.

Relocating spirituality in the land, Abbey foreshadowed an ecospiritual approach shared by other contemporary desert writers. Various influenced by modern environmentalism, feminism, and New Age imagery, they find holiness in the desert and have joined the struggle to protect it. So the desert is transvalued: from a fallen wilderness condemned to worthlessness by secular society, it returns to a state of grace. With its seasonal beauties, suggestive silences, and flashes of insight, it becomes a shrine for modern-day pilgrims who see the natural world increasingly threatened by a rapacious society.

In Terry Tempest Williams' book *Refuge*, the marshes and deserts surrounding the Great Salt Lake become a psychological sanctuary from the anguish of losing her mother to cancer. A Mormon, Williams grew up in an area wrested into productivity through hard work and spiritual resolve. But the changes she experienced in the desert were entirely internal; the land's quiet role in healing is contrasted with the violent physical transformation of desert into something other than desert. Williams discovered an innate capacity for personal strength and affirmation of the universe in accepting, not rejecting, these arid places: "If the desert is holy, it is because it is a forgotten place that allows us to remember the sacred. Perhaps that is why every pilgrimage to the desert is a pilgrimage to the self. There is no place to hide, and so we are found . . ." (1991: 148).

The desert has a rich history as such a testing-ground: a powerful, even dangerous space of personal purification, or of confrontation with the demons inside one's head. Transplanted to southern California in the 1930s, the British writer Aldous Huxley fell in love with the crystalline landscapes that stretched east from Los Angeles. As befitting someone interested in the mystical dimensions of experience, Huxley found there a place in which to slough off the spiritual decay of a dystopian modernity. For him, the desert's space, silence, and emptiness formed a holy trinity of perceptual insight. Here, one confronted both self and not-self: the manifold possibilities of being and the inevitable imminence of nonexistence. The latter was symbolized for Huxley by the atomic bomb tests then being conducted in Nevada.

Today, proposals to bury radioactive waste in that same state underline the continuing split between Americans who view the desert as blank – devoid of history and suitable only as a dumping-ground – and those whose personal connections to these places, when communicated to others in words, redeem them from generalization and devaluation. The resurgence of Native American story, for instance, has meant a renewed interest in the links between language and landscape.

Leslie Marmon Silko's novel *Ceremony* depicts a struggle in contemporary Indian culture between preserving old ways that viewed the land as sacred, essential to the spiritual health of its inhabitants, and adopting white American values and lifestyles. Tayo, her protagonist, returns to the Laguna Pueblo reservation in New Mexico bearing the scars of war and despair. His eventual renewal comes about as a result of traditional rituals tied to the deserts and mountains in which he grew up. The novel is itself a ceremony, enacting the power of story to heal and make whole; and the tales, like the people telling them, are grounded in the places they call home. Silko explicitly juxtaposes Tayo's healing with the return of rain to the drought-plagued region. With the completion of the ceremony, "the land was green again," rich and complete in itself, defying another character's spiteful reference to "this goddamn dried-up country around here" (1977: 234, 55).

Though they may reach certain limits in attempting to express the innermost mysteries of existence, words are a powerful force in bringing people together to defend what they love. As Silko writes, "You don't have anything if you don't have the stories" (1977: 2). In the face of ongoing threats to America's fragile deserts, writers of all backgrounds are continuing to forge spiritual connections to these beautiful and visionary places.

Devi, Savitri (1905–1982)

Savitri Devi, whose birth name was Maximiani Portas, was one of the most compelling figures to emerge from the wreckage of post-war National Socialism. More than any single figure, it was Devi who would carry the torch of

occult National Socialism through the grim period following World War II. Through her writings and her personal example, she would inspire a new generation of National Socialists to explore the occult byways of racial mysticism that were once blazed by such nineteenth-century German figures as Guido von List and such Third Reich figures as Heinrich Himmler.

Originally a French citizen, Devi was born on 30 September 1905 of Greek and British parents. Educated in France and in Greece, Devi earned masters'-level degrees in philosophy and science in France in the 1920s, and received a Ph.D. in chemistry in 1931. Mathematics and science however, held less allure to Devi than did contemporary politics, religious speculation, and, of greatest import, the Aryan philosophical and religious traditions of ancient India, which would be her home for much of her life.

Before embarking on her spiritual quest, however, Devi took an active interest in politics. Even as a young girl, she was much attracted to Germany and to the German philosophical and intellectual traditions. Appalled by the betrayal of Germany at Versailles following the First World War, as well of the treatment of Greek refugees in the same period, Devi determined to learn more of what she instinctively felt were the deeper realities which determined the seemingly chaotic course of world events. It was during this youthful quest for hidden and suppressed knowledge that Devi acquired her lifelong aversion to Judaism.

In the 1930s, Devi moved to India and undertook what would prove to be a lifelong study of the classic Indian texts – the Vedas and the Upanishads. From these sources, and from their contemporary manifestations in the caste system, Devi felt that she had found the true sources of the once and future greatness of the Aryan race.

In 1940, Devi married a pro-Nazi Indian nationalist named A.K. Mukherji. This gave her a British passport and the possibility of deepening her work for the Third Reich. In Calcutta, the Mukherji home became something of a salon for Allied diplomats and military officers, and whatever intelligence that could be gathered quickly found its way to the German consulate. Devi felt her greatest service to the cause, however, would be in her ongoing research and the book which she was writing which would set out a blueprint for the new Aryan religion of nature which she believed would be instituted in Germany after the inevitable Nazi victory.

In the event, of course, Germany was defeated. Devi's dream of a global Aryan racial paradise would now never be realized, but through considerable adversity, she held fast to her ideals until her death in 1982. She returned to Europe in 1945, settling in England where her book on the religious heritage of Ancient Egypt, *A Son of God*, was published and well received in British intellectual and occult circles.

It was the work that followed however, the *Impeachment of Man*, which was finished in London and published in 1946, that stands as a classic in the current world of National Socialism. A radical approach to environmentalism, amounting indeed to a religion of nature that has striking affinities with the nature-revering spiritualities of radical environmentalism, has always been strong in National Socialist thought, and with the wartime defeat, has become as much a trademark of the movement as anti-Semitism and racialist thought. The *Impeachment of Man* remains the strongest statement of the National Socialist nature religion that may be found today. Opening with epigraphs from Alfred Rosenberg ("Thou shalt love God in all things, animals and plants") and Josef Goebbels, who in a diary entry quotes the Führer's resolve to create a post-war society that would eschew the eating of meat, the book is a passionate treatise on the rights of animals and of plants, as contrasted with humans' egocentric consumption and destruction of the natural world. The argument is couched in religious terms and the proof texts are drawn from the Aryan Golden Age. The book, long out of print, underwent a revival with a new Noontide Press edition, which appeared in 1991.

In 1946, Devi moved from England to Iceland. There, the ancient Norse pantheon joined the ancient Indian heritage as a source for Aryan religiosity. Here too Devi anticipated by decades Odinism's popularization of the Norse/Germanic pantheon as a fitting Aryan racial religion in the post-war movement.

Two years later, Devi undertook a more open pro-Nazi course of activism, traveling to occupied Germany and distributing propaganda leaflets. This resulted in her incarceration in 1949. While in jail, Devi expanded one of her leaflets into the book that she considered her magnum opus, "Gold in the Furnace", which is at once an autobiography and a dreamy meditation on what could have been. In it, she states explicitly that until 1948 she had never dared to publicly utter:

. . . I love this land, Germany, as the hallowed cradle of National Socialism; the country that staked its all so that the whole of the Aryan race might stand together in its regained ancestral pride; Hitler's country . . . Because for the last twenty years I have loved and admired Hitler and the German people . . . I was happy – oh so happy! – thus to express my faith in the superman whom the world has misunderstood and hated and rejected. I was not sorry to lose my freedom for the pleasure of bearing witness to his glory, now, in 1948 (page number unavailable).

Devi was released from prison after six months, and then entered her most productive literary period. The autobiographical "Defiance" appeared in 1950. Devi's

example served as an inspiration to a new generation of National Socialists when a portion of the book was published in the Winter 1968 edition of William Pierce's American Nazi Party intellectual journal *National Socialist World*. "Gold in the Furnace" came out in 1952, followed by *Pilgrimage*, another memoir, in 1958 (although some sources place the publication date as early as 1953).

Her most important work, "The Lightning and the Sun", appeared in 1956 and a condensed version was published in the premier edition (Spring 1966) *National Socialist World*. "The Lightning and the Sun" is a remarkable exposition on occult National Socialism's nature mysticism, which explicitly defies Hitler as the savior of the Aryan people. The first words read: "To the godlike individual of our times; the *Man against time*; the greatest European of all times; both Sun and Lightning: ADOLF HITLER" (Devi 1966).

"The Lightning and the Sun" ranges through the ages, suggesting a religious and political history in which the Third Reich is the apex and the natural culmination of Aryan development. The book ends with at once a cry of despair and an affirmation of hope:

Kalki [Kali] will lead them through the flames of the great end, and into the sunshine of the new Golden Age . . . We like to hope that the memory of the one-before-the-last and most heroic of all our men *against time* – Adolf Hitler – will survive at least in songs and symbols. We like to hope that the lords of the age, men of his own blood and faith, will render him divine honors, through rites full of meaning and full of potency, in the cool shade of the endless regrown forests, on the beaches, or upon inviolate mountain peaks, facing the rising sun (page number unavailable).

Devi's last years were bleak. Much of this time was spent back in mother India with her husband, writing and corresponding with National Socialists throughout the world. She was an early convert to the field of holocaust denial, and it was under her influence that such well-known holocaust revisionists of the present day such as Ernst Zundel were introduced to the field. Her personal circumstances did not fare so well, however, and at her death in 1982 she was reportedly penniless.

In the course of her life, Devi's achievements, if measured on the scale of her dream of the re-creation of a National Socialist revival, were meager. At her death, the world of explicit National Socialism was, if anything, more fragmented and powerless than ever before. But her writings, and the powerful dream of a religio-mystical Aryan Golden Age which they so eloquently convey, are having a powerful impact on the radical right.

Devils Tower, *Mato Tipi*, or Bear's Lodge (Wyoming)

At the turn of the twentieth century, as Americans grappled with the anxieties and opportunities inherent in their tumultuous shift from rural to urban life, the United States Congress granted the president authority to preserve from development "objects of historic or scientific interest" found on public land. Accordingly, on 24 September 1906, President Theodore Roosevelt proclaimed that Wyoming's Devils Tower was "such an extraordinary example of the effect of erosion in the higher mountains as to be a natural wonder and an object of historic and great scientific interest." In declaring Devils Tower the first national monument under the Antiquities Act, Roosevelt equated scenic beauty, scientific import and a significantly storied past as harmonious rationales for its preservation. In subsequent decades these rationales have also given rise to conflicting cultural, religious, and legal efforts to mark both the monument's meaning and the kinds of human practice appropriate there.

Devils Tower, a phonolite porphyry monolith rising 1267 feet above the Belle Fourche River, is the westernmost outcrop of the igneous rock that thrust up beneath the ancient seabed to form the Black Hills some sixty million years ago. Erosion of the surrounding sandstone deposits by the Belle Fourche gradually exposed the outcrop to weathering, resulting in the vertical scars that mark the length of its surface today.

Many Plains tribes have a long, continuing history at Devils Tower, their members regarding it as a place manifesting sacred power. The malevolent sound of its name in English is due to Col. Richard Dodge, commander of the

1875 United States Geological Survey's military escort. In most native languages, however, the name itself is more typically some variety of *Mato Tipi* or "Bears Lodge" – which hints at the presence there of powers upon which human beings are dependent. An oft-told story of the butte's formation, with Lakota and Kiowa variants, tells of a group of sisters chased by bears. The girls jumped onto a rock and prayed "Rock take pity on us." The rock grew rapidly as the bears tried to scale it and left their claw marks behind as they slid back down its side. The rock pushed the girls so far from danger that they became the Pleiades, visible in the winter night sky above the mountain.

Lakotas historically found on its sheltering side a good winter camp, and through a variety of ritual means turned to the butte to provide or restore individual and community well-being. Naming ceremonies, vision quests, healing rites, funerals and notably a summer solstice Sun Dance have all been performed at the Bear's Lodge. Cheyennes regard the lodge as the resting place of Sweet Medicine, the heroic figure whose contact with superhuman beings there founded the Cheyenne way of life. The Bear's Lodge is thus seen as a place where wisdom dwells, and might be obtained by human beings. Lakota and Cheyenne traditions speak of receiving important objects from the sacred beings at the Bears Lodge, such as the Lakota Pipe and the Cheyenne Four Sacred Arrows, which established their people's religious and ethical identities. Other tribes with significant attachments to the mountain include the Crow, the Arapaho, and the Wind River Shoshone. All of the ritual activities associated with the Bear's Lodge became harder to sustain in the years after the northern plains wars, as tribes were confined to reservations on marginal land, individual travel was policed, and federal law restricted the performance of the Sun Dance and other ceremonies.

White residents of the newly formed neighboring ranching communities were gathering at Devils Tower for recreation by the close of the nineteenth century. Summer camping, festivals and Fourth of July celebrations were all popular, some bringing people in from one hundred miles away – a long journey on buckboard. The 1893 Independence Day celebration featured the first formal climb of Devils Tower, by local rancher William Rogers, who scaled a 350-foot ladder and planted an American flag at the top. Not until 1937 was a technical ascent accomplished, by a team of New York mountaineers. Given its remoteness and the absence of paved roads in the area, interest in the monument remained primarily local until after World War II, by which time it was being incorporated into the vacation routes of the middle class, and was being recognized as a notable destination for rock climbers.

Another interest in Devils Tower was marked by film director Steven Spielberg, whose 1977 *Close Encounters of the Third Kind* climaxed with the descent of an enormous

alien spaceship onto the mountaintop. Spielberg's film connected the benevolence of alien beings with the mountain's mysterious appearance and storied past. Conspiratorial federal agencies seek to deprive the public of what amounts to an experience of supernatural wonder and interstellar travel at the mountain – in effect a modern gloss on the native story of the mountain's mediating link with the stars. Although the New Age themes have certainly played an important role in shaping American expectations of this and other native sacred places, what the film expresses even more is the perceived role of the federal government in denying to Americans their public lands birthright.

In the years following *Close Encounters* annual visitation rose drastically, reaching half a million by the mid-1990s. At the same time, Congress had mandated in the American Indian Religious Freedom Act (AIRFA) of 1978 that federal agencies accommodate traditional religious practices as far as practically possible. Encouraged by this legislation, in 1984 some Lakotas resumed the June Sun-Dance tradition at the monument, and the park service began receiving complaints of visitors disturbing ritualists. Most troublesome to those natives who continued to engage in ritual activities at the monument was the increasing number of ascents, which grew in the twenty years after 1973 from three hundred to some six thousand. Not only the noise from climbers, but also the increased scarring of the rock surface from pitons and bolts up the two hundred climbing routes, registered as profaning the Bear's Lodge's sacred role in native history.

In 1995, as a result of challenges to administrative procedures made possible under AIRFA, representatives of several tribal and intertribal groups were able to influence the National Park Service to accommodate native religious practitioners at the monument. The NPS established an interpretive exhibit on native cultural history that included information on religious use of the mountain, and a series of trail signs asking visitors to remain on trails and not disturb native ritualists. In addition, the NPS implemented a voluntary climbing ban, effective during the month of June. The number of June climbs dropped dramatically – from twelve hundred to less than two hundred in each of the following years, but several individuals and one area outfitter saw the climbing ban as a significant restriction on their personal freedom. As a result, the Denver-based Mountain States Legal Foundation (MSLF) – an active defender of the private use of public lands – and the local Bear Lodge Multiple Use Association, brought suit against the Department of the Interior in 1996 in *Bear Lodge Multiple Use Association vs. Babbitt et al.*

The MSLF claimed that the climbing ban violated the establishment clause of the First Amendment, which enjoins the government from privileging one religion over another. In support of the suit, some climbers argued that since they saw climbing as a form of spiritual practice, the

climbing ban was an infringement on their religious freedom. In addition, the MSLF argued that a new interpretive exhibit focused on the mountain's cultural history, and a series of signs asking visitors to remain on trails, coerced visitors into supporting native religions. For the MSLF the park service's efforts to accommodate native religions reflected what William Perry Pendley – its president, and former assistant to Reagan-era Secretary of the Interior James Watt – has written of as acts of “war on the West,” conducted by “an increasingly tyrannical government that abuses federal laws” (Pendley 1995). The Wyoming federal district court was not swayed by the MSLF argument, however, concluding that it did not show legal standing in regards to the coercive impact of the park service's accommodation to native religion, and that the voluntary ban passed the relevant tests conducted by the courts to ascertain whether government actions violate the establishment clause. On 27 March 2000 the U.S. Supreme Court also refused to hear the case, concurring unanimously with the lower court's ruling that the monument's Climbing Management Plan was not unconstitutional. The higher courts' uniform defense of native religious practice at the monument is especially significant given their more typical stance, as maintained in *Lyng vs. Northwest Indian Cemetery Protective Association* (1991), that accommodation of native land-based religion is not a constitutional necessity on the public lands.

SP Dharma – Hindu

Frequently translated as “duty” or “righteousness,” the word dharma has been used by Hindus since the nineteenth century to refer to religion in general and to their religion in particular. The term *sanatana dharma* (the eternal or perennial dharma), specifically, is used to designate the Hindu tradition. Buddhists, Jains, and Hindus use the term “dharma” to indicate a fairly wide variety of concepts and issues, and the word has some recognition in the Western world. In Hinduism, dharma has been used in many contexts including (1) a force, power, or value that sustains the cosmos; (2) one's duty as incumbent on one's caste/class of society and stage of life (*varnasrama dharma*); (3) as a code of conduct which includes and is not limited to regulations involving marriages, food, and religious observances; (4) virtues such as gratitude, non-violence, and compassion which are thought of as common aspirations of all human beings; (5) a word for “religion”; and (6) as a path to liberation from the cycle of life and death (*moksha*). Although this may sometimes fit into some of the earlier categories, it is also possible to distinguish it as a separate one. The texts on dharma also form the basis for formulating the administration of Hindu family law in India. Highlighting dharmic virtues such as compassion and nonviolence, retrieving and giving prominence to textual passages and local practices which promote ecological welfare, as well as the relative latitude in the Hindu tradition in the interpretation of dharma to be relevant to changing worldviews are conceptual tools which can help us understand its significance for nature.

The meanings of dharma frequently depend on the context and some emphases have changed over the centuries. The Monier-Williams Sanskrit-English dictionary gives about seventeen meanings: dharma means religion, the customary observances of a caste, sect, law usage, practice, religious or moral merit, virtue, righteousness, duty, justice, piety, morality, sacrifice, and so on.

This preliminary set of meanings gives us only the parameters of the concept and practice. Sanskrit and vernacular texts as well as oral traditions affirm the importance of dharma. The Tamil work *Tirukkural* (ca. 3rd–4th centuries) celebrates the importance of *aram* (dharma) thus:

What greater wealth is there than dharma? It gives heavenly joy and earthly happiness.
 There is no greater wealth than dharma. There is no greater loss than to forget it.
 Try to perform dharma in every way.
 Don't wait another day to perform dharma; it will remain with you on the day you die
 (*Tirukkural* 4:1–3, 6).

The many treatises on the nature of righteousness, moral duty, and law composed around the first few centuries C.E. were called the dharma sastras (texts on dharma). The most famous of these is the Manava Dharmasastra, or the Laws of Manu. These were probably codified around the first century and reflect the social norms of the time. The Laws of Manu (2.6), along with some other texts, list four sources as the foundations for our understanding of dharma: the Vedas (sruti); the epics, texts of lore called the *Puranas*; the behavior and practices of the good people (*sadacara*); and finally, the promptings of one's mind or conscience.

In the early Vedic texts, “dharma” means “religious ordinances and rites” and in others, it refers to “fixed principles or rules of conduct.” In conjunction with other words, “dharma” also means “merit acquired by the performance of religious rites” and “the whole body of religious duties” (Kane 1968: 1–2). Eventually, the prominent meaning of dharma came to mean a human being's privileges, duties and obligations to the community as a member of one of the castes and as relevant to a particular stage of life (Kane 1968: 3). Texts on dharma both described and prescribed these duties and responsibilities and divided up the subject-matter into various categories.

The earliest texts on dharma are the *Dharma Sutras*. These are part of the *Kalpa Sutras*, which is considered to be an ancillary to the Vedas. Thus, the earliest and pre-eminent source for dharma, at least in theory if not in practice, is considered to be the Vedic corpus. In addition to these texts, the more famous works on dharma is the corpus of *dharma shastra* texts, of which those written by Manu and Yajnavalkya are well known. The text of Yajnavalkya was commented upon by Mitakshara in the twelfth century. This text has, for the last few centuries, formed one of the bases in formulating Hindu family law in India and is seminal in understanding the legal structure in India.

The lofty ideals of the texts of dharma are made accessible in the stories of the epics, the *Ramayana* and *Mahabharata*, and texts known as puranas. The main *Puranas*, texts of myth and lore, composed approximately between the fifth and tenth century, have wonderful resources on trees. Hindus in India and the diaspora know the epics and puranas better than the dharma shastra texts. They understand stories from these texts as exemplifying values of

dharma and situations of dharmic dilemmas. Some of these texts have encouraged the planting of trees, condemned the destruction of plants and forests, and said that trees are like children. For example, the *Matsya Purana* says that the goddess Parvati planted a sapling of the Asoka tree and took good care of it. She watered it and took care of it and it grew well. The divine beings and sages came and told her:

O [Goddess] . . . almost everyone wants children. When people see their children and grandchildren, they feel they have been successful. What do you achieve by creating and rearing trees like sons . . . ?” Parvati replied: “One who digs a well where there is little water lives in heaven for as many years as there are drops of water in it. One large reservoir of water is worth ten wells. One son is like ten reservoirs and *one tree is equal to ten sons (dasa putra samo druma)*. This is my standard and I will protect the universe to safeguard it . . . (*Matsya Puranam* chapter 154: 506–12).

Parvati's words about a tree being equal to ten sons has been lifted from the text and put on billboards by at least one major Hindu temple in Tirupati, Andhra Pradesh. Those sentences are seen to be particularly significant for the Indian context where more trees and a lower population are considered to be ideal. Having many children, particularly sons, is a traditional Hindu dharmic goal, and selectively valorizing statements which highlight the importance of trees rather than sons is significant in modern interpretations of dharma.

The *Varaha Purana* says that one who plants five mango trees does not go to hell, and the *Vishnu Dharmotara* (3.297.13) claims that one who plants a tree will never fall into hell (in Kane 1958: 415–16). The *Puranas* differ in the number and description of hells in the universe, and one may perhaps take the liberty of interpreting “hell” as symbolic of various levels of suffering, including a steamy planet where human beings make holes in the ozone layer. The *Matsya Purana* also describes a celebration for planting trees and calls it the “Festival of Trees.”

Virtues that are said to be common or obligatory to all human beings are called *sadharana dharma* (common dharma), *sanatana dharma* (eternal dharma), and *samanya dharma* (general or ordinary dharma). These include virtues such as gratitude nonviolence, compassion, generosity. Emphasis on and cultivation of these virtues would be particularly significant in the protection of nature and prevention of further harm to the environment around us. The term “sanatana” or eternal dharma has been used in the epics and Puranas to refer to these virtues, but since the nineteenth century it has been used to refer to the Hindu tradition which is perceived as continuous and eternal.

Dharma is also seen as one of the four aspirations or goals of human beings. The epics and classical texts of the period just before the beginning of the Common Era also recognized that there were certain aims for which human beings strive. The four “goals of man” (*purusha artha/purusartha*) are said to be dharma, the discharging of one’s duties and responsibilities, *artha* (wealth, polity, power in many forms), *kama* (sensual pleasure in a narrow sense but referring to aesthetic experience as well) and *moksha* (liberation from the cycle of life and death). The goals of *kama* and *artha* are not good or bad in themselves, but the intensity with which one is preoccupied with them as well as the stage of life when one pursues them make them appropriate or a-dharma, that is, immoral. Thus, the gluttony for more wealth and power can be seen as the root cause of environmental degradation in all its manifestations.

Moksha was sometimes seen as being on a different plane and as having goals distinct from dharma, but several theologians have interpreted the Bhagavadgita and other texts as saying that dharma and liberation are contiguous and not contradictory. Devotion to the deity is sometimes seen as the highest dharma.

Dharma and Moksha

However, while dharma, in many contexts, focuses on order in this world, *moksha* leads one away from existence in this world. Dharma frequently refers to actions that promote righteousness, order, and well-being in this world; the realms of monetary success and power encompassed by the term *artha* as well as the sensual love denoted by *kama* are all also of this world. *Moksha*, on the other hand, generally refers to liberation from the cycle of life and death and is other-worldly in character. Is there a continuum between dharma and *moksha*, or are they fundamentally opposed to each other, pointing in different directions and having different aims? Books on dharma say that one is to be married at a certain age, beget children (especially sons), do acts of righteousness, ritual actions and so on. Many texts which show the path to *moksha* speak of renunciation and abandonment of attachments. Seen from this perspective, the path to *moksha* may imply a denial of ultimate value to the world and nature around us.

Modern reconstructions of the term dharma in environmental contexts can be perceived in many parts of India. The cleaning up of rivers, opposition to the building of large dams, and planting of trees are all proclaimed to be part of one’s dharma. Here the reference is both to the generic duty and the action incumbent on human beings to the specific situation. Institutions such as the Tirumala Tirupati Devasthanam, which controls the wealthy and powerful temple in Tirupati, Andhra Pradesh, post signs all over the local town saying “Trees, when protected, protect us.” This is a deliberate reformulating of the traditional

saying in the dharma texts: “Dharma, when protected, protects us.” From the Hindu perspective, appeals to dharma seems to be one of the most promising ways to relate to issues of environmental protection.

Diana

One of the animal deities that appear in religious culture of many societies, Diana is recognizable to Western culture as the Roman goddess of the hunt. She is one of several goddesses and gods in European mythologies associated with the full moon, the forest, and sexuality, fertility, and marriage (despite being male deities, Odin, Herne, Wodden, and the followers of the Wild Ride of the dead, all embody similar characteristics). As Diana, the goddess represents a host of archetypal associations: virginity, midwifery, fertility, domestic and wild animals, and the moon. She appears in myth under the Greek names Artemis and Cynthia, the latter deriving from Mount Cynthos, the agreed birthplace of Diana. Artemis was one of the three Greek goddesses of the moon that indicated the cyclical pattern of life, time, and fertility. Artemis represented Virginity, while Selene was the Mother of the

moon, and Hecate, the Crone, embodied the waning and dark moon. Furthermore, the moon is the governing symbol of the female menstrual cycle, whose regular waxing and waning is said to be caused by the orbit of the moon. Despite her variable name and her plural associations, it is clear that Diana appears as a constant in history as a goddess embodying the concerns of women.

In pre-Christian Rome, Diana was the figurehead of a cult and was associated with ceremonies in the grove of Aricia near Lake Niemi (which is also known as Diana's Mirror). Here, the goddess was celebrated in a women's festival of lights on 13 August each year. The goddess Diana was "explicitly connected with the lower classes, plebeians and slaves," writes the post-colonial critic Homi Bhabha in his elegy for the more recent Diana, the Princess of Wales (1998: 107). As the figure of myth, her name and image worked their way into literature and art across the ensuing centuries. For example, the Temple of Diana at Ephesus, one of the Seven Wonders of the World, was celebrated in Shakespeare's early seventeenth-century play, *Pericles*, and the goddess watches over the virginal daughter of the protagonist through childbirth, shipwreck, and peril. The actual statue at Ephesus is recorded to depict Diana as a many-breasted pagan deity, thus emphasizing her ability to conceive and to nurture.

Diggers and Levellers

During the English Civil War (1642–1649), between Charles I and Parliament, the Levellers emerged as the left wing of the Parliamentary forces. They advocated the levelling of society to create a classless democracy. The Diggers, in turn, called themselves the "true levellers" and voiced yet more radical demands. They were best known for putting their philosophy into action by establishing a series of short-lived communities across Britain where they occupied and farmed land. The most important of these was at St. George's Hill, Surrey in 1649. As many as ten other Digger communities were established in southern England but all were broken up by the authorities.

Their best-known spokesman, Gerrard Winstanley, wrote numerous tracts outlining the movement's religious

and political beliefs. He advocated a pantheist philosophy, arguing that spirit dwelled in both humanity and the rest of nature. Such pantheism was shared to a greater or lesser extent with a range of seventeenth-century religious/political movements in Britain such as the Ranters but remained undeveloped and unemphasized by Winstanley. His overriding concern was with property, which he identified as evil. He argued that the real Fall occurred not when Adam and Eve were expelled from Eden but when Cain and Abel fought over property. Despite the Diggers' belief that God resided in nature, they stressed the communal productive use of land through human stewardship, rather than any philosophical or practical commitment to the sanctity of the natural world itself.

The Marxist historian Christopher Hill suggests that Winstanley was concerned with political priorities and clothed his philosophy with religious metaphors. In contrast others have suggested he was essentially a religious millenarian awaiting a New Jerusalem who had little interest in worldly matters. In turn, the British historian E.P. Thompson argued that a long tradition that articulated theology and revolutionary thought can be traced from the Diggers to William Blake and beyond.

The Diggers' communism, pantheism and direct action orientation made them a potent symbolic resource for later radicals, including ecological ones; many socialists, anarchists and greens trace their roots back to the Diggers. Typically, the British Labour MP Tony Benn, writing in 1980, noted:

The modern movements towards a more responsible attitude towards the environment, together with a commitment to the common ownership of the land, to be held in trust for future generations, can all be traced back to the influence of the Diggers (in Brockway 1980: xi).

In the 1960s a Diggers' movement was established in California, which carried out acts of street theatre and gave away free food. In 1974 a Digger Party contested the Cambridge parliamentary constituency in the British General Election. The Diggers have been important to the direct action environmental movement in Britain, especially the land-reform campaign "This Land is Ours," which reoccupied St. George's Hill in 1999 on the 350th anniversary of Winstanley's action. The Diggers' Song based on Winstanley's lyrics is often sung at environmental protest camps in Britain and the United States (lyrics in Taylor 2002: 51–2).

Thus, while Winstanley did not develop a detailed green theology, his campaign of direct action and his writings have acted as potent resources for later green movements.

Derek Wall

The Diggers' Song

Commonly known in radical environmental subcultures in the United Kingdom and America as "The Diggers' Song," a song written by Leon Rosselson that is actually entitled "World Turned Upside Down," has been recorded by a number of artists. Probably the best-known version was recorded by Dick Gaughan on *Handful of Earth* (Green Linnet, 1993; full lyrics in Taylor 2002: 51–2). The song, inspired by the Diggers and influenced by Gerrard Winstanley's writings, expresses a radical critique of religious power and the way it sanctions private property and poverty, while offering an alternative vision where the land is shared equitably by all. Excerpts provide a sense of the song:

In 1649, To St. George's Hill

A ragged band they called the Diggers
Came to show the people's will
They defied the landlords
They defied the laws
They were the dispossessed
Reclaiming what was theirs

"We come in peace" they said
"To dig and sow
We come to work the land in common
And to make the waste land grow
This earth divided
We will make whole
So it can be a common treasury for all
"The sin of property, we do disdain
No one has any right to buy and sell
The earth for private gain

By theft and murder
They took the land
Now everywhere the walls
Rise up at their command

"They make the laws
To chain us well
The clergy dazzle us with heaven
Or they damn us into hell
We will not worship
The God they serve
The God of greed who feeds the rich
While poor men starve . . .

"You poor take courage
You rich take care
The earth was made a common treasury
For everyone to share
All things in common
All people one
We come in peace" –
The order came to cut them down

Dillard, Annie (1945–)

Annie Dillard is known for her attentiveness to the dramatic details of the natural world and for linking those minute details to divine mystery. She made a double impact with her 1974 Pulitzer-Prize winner, *Pilgrim at Tinker Creek*, which has influenced contemporary musing on both nature and the sacred. In that first book she says, "Our life is a faint tracing on the surface of mystery, like the idle, curved tunnels of leaf miners on the face of a leaf" (1974: 16).

A quarter of a century later, in *For the Time Being*, she still looks unflinchingly at cruel minutiae, weaving natural horror along with delight on finely spun prose, perusing a manual of children's birth defects. She muses on the flaw of all human life, "Ours is a planet sown in beings. Our generations overlap like shingles. We don't fall in rows like hay, but we fall" (1999: 202).

In addition to her contemplative and introspective non-fiction (*Teaching a Stone to Talk*), she is a novelist (*The Living: A Novel*), poet (*Mornings Like This: Found Poems*), a self-reflective writer (*The Writing Life*), and memoirist (*An American Childhood*). Dillard has rejuvenated the old idea of nature as revelation or sacred book, has revived Emersonian nature mysticism, has quickened the sense of beauty at the heart of mortal experience. She is an exuberant witness of beauty in the minuscule and the macabre.

At Hollins College she wrote her master's thesis on Thoreau and many readers and critics have been quick to compare her to him; Tinker Creek is a short literary distance from Walden Pond in terms of pensive nature writing. Dillard inherits from and replenishes that strand of the American tradition claiming nature as divine revelation and key to the awakening individual.

A distinguished name in American letters, she is often classified as a mystic or an environmentalist. Yet, one might be cautious about calling the work of this inquiring convert to Catholicism a pantheist or mystic. She has called herself a "Hasidic Christian" and casts her inquiry through ethical terrain to confront the role of a theologically Christian God: "Do we need blind men stumbling about, and little flamefaced children, to remind us what God can – and will – do?" (1977: 61). The burned child she names "Julie Norwich," for Julian of Norwich, the fourteenth-century Christian mystic who experienced the passion of Christ. Dillard also makes lyrical statements detached from theism or its ethical dilemmas, more in line with the description of the mystical according to William James's "ineffable" or Rudolf Otto's *mysterium tremendum*:

It has always been a happy thought to me that the creek runs on all night, new every minute, whether I wish it or know it or care, as a closed book on a shelf continues to whisper to itself its own inexhaustible tale. So many things have been shown me on these banks, so much light has illuminated me by reflection here where the water comes down, that I can hardly believe that this grace never flags (1974: 68).

She seems to express a pantheism struggling with the theological problems of monotheism; she seems to express an immanent God in contradiction with a transcendent reality. Her writing is studded with paradox, but theologically she entertains multiple and contradictory perspectives.

One might be cautious, too, in classifying Dillard as an environmentalist. Her work is not a call to action, even though she has inspired environmentalists of her generation. Yet she has said,

There is no one but us . . . a generation comforting ourselves with the notion that we have come at an

awkward time, that our innocent fathers are all dead – as if innocence had ever been . . . But there is no one but us. There never has been (1977: 56).

She celebrates relentless nature,

A golden female moth, a biggish one with a two-inch wingspan, flapped into the fire, dropped her abdomen into the wet wax, stuck, flamed, frazzled and fried in a second. Her moving wings ignited like tissue paper, enlarging the circle of light in the clearing . . . (1977: 15).

But her interest in nature finally focuses inward, on the human observer. She makes parables of those details of weasels and eagles, and draws correspondences between human experience and the natural world, and between nature and an elusive, mysterious, divine. She had years ago opened her specimen box and saw that a carrion beetle had been for days "swimming on its pin" and Dillard transformed into incandescent prose the puzzle of suffering.

Finally her beautifully constructed language silences conclusions: "But the air hardens your skin; you stand; you leave the lighted shore to explore some dim headland, and soon you're lost in the leafy interior, intent, remembering nothing" (1974: 2).

Diola (West Africa)

The Diola of Senegal, Gambia, and Guinea-Bissau number about 500,000 people and include the largest number of adherents to an African traditional religion in the Senegambia region. Living in well-watered coastal areas, the Diola inhabit the northern limits of the Guinean forest. This area has a dry season stretching from late October until late May and a shorter rainy season during the remainder of the year. Annual rainfall averages between

2000 mm in the southwest to about 1100 mm in the northeast, though droughts are frequent. The Diola are generally considered to be the best wet-rice farmers in West Africa. Before the colonial conquests of the nineteenth century, most of these communities governed themselves through councils of shrine elders and village assemblies and were considered to be stateless societies.

Diola religious traditions focus on a supreme being known as Emitai, who created the Earth and all living things. The name Emitai, or Ata-Emit, means “of the sky” and is closely associated with rain (*Emitai ehlahl*) and the calendar year (*emit*), which begins with the onset of the rains. Emitai may withhold precipitation when the community fails to live up to its ritual obligations or when witchcraft becomes pervasive. Reflecting a sense that the supreme being is primarily concerned with issues of broad significance, most Diola regard the supreme being as the creator of a variety of lesser spirits who serve as intermediaries with humans in regard to specific types of problems. Thus, there are spirit shrines (*ukine*) associated with the procurement of rain; the fertility of women, livestock, and the land; economic activities ranging from fishing to hunting; the ritual transformation of young people into adults; healing; and community governance.

Central to Diola religious traditions is a dichotomy between the settled community (*hukin*) and the bush (*boudiale*). The former is an area that is relatively harmonious and predictable; the latter is chaotic and amoral. Benevolent ancestors (*kahoeka*) live within the community, but are invisible to all but those with a special power of the eyes to see into the realm of the spirit. Phantoms, the unrighteous dead (*kahoelra*), reside in the bush, often revealing themselves to solitary travelers at dusk. Violations of rules established by Emitai and lesser spirits can transform otherwise fertile land, where an offense took place, into barren land, symbolized by the hard red laterite soil that lies exposed in many locations.

Because of the frequency of drought, the procurement of rain is a central concern of Diola religion. Some of the oldest shrines are primarily concerned with rainfall and fertility and are invoked at the time of the harvest festival and at the beginning of the rainy season. Diola historians trace the origins of these shrines back to a group of men who established the earliest settlements in the region, initially inhabited by Bainouk people who were conquered by and incorporated in invasive Diola communities. These men, often said to have originated with Emitai rather than with earthly parents, created spirit shrines for the procurement of rain, and then returned to Emitai. The most famous of these early “prophets,” Atta-Essou, fashioned wings out of fan palm leaves and flew up into the heavens (*emit*) to Emitai.

In the twentieth century a new type of prophet became central to Diola religion. These people, mostly women, are described in Diola traditions by the epithet, “whom

God has sent” (*Emitai dabognol*). Beginning in the first decade of the twentieth century, three women, Weyah of Nyambalang, Djitabeh of Karouinate, and Ayimpene of Siganar claimed that Emitai commanded them to create new spirit shrines, also known as Emitai, to be used for prayers to the supreme being for the procurement of rain and the healing of illness.

During the Second World War, a young woman named Alinesitoué Diatta believed that she was called by Emitai to introduce a new ritual for the procurement of rain, along with a series of teachings that rejected French colonial agricultural schemes. In the midst of a severe drought, Alinesitoué began work as a maid in the capital of French West Africa, Dakar. While running an errand in the Sandaga market, she felt the presence of Emitai who commanded her to go down to the sea and dig in the sand. As the hole she had dug filled with water, she realized that Emitai had wanted her to end the drought and renew the Diola religious tradition. In 1941, she summoned the elders of her township and told them about a new ritual called *Kasila*, which required community participation in the sacrifice of a black bull. She also taught that the Diola had to renew their observance of a Diola day of rest, (*Huyaye*) every sixth day. It was a day of rest for the rice paddies, not for people; so work outside of rice cultivation could be performed. Furthermore, she instructed her followers that they must continue to plant the varieties of rice that had been given to them by Emitai, expressly to be planted in their lands. These West African varieties (*oryza glaberrima*), she argued, were spiritually related to the land and to Emitai. While she allowed her followers to continue planting what they regarded as European rice (actually Asian, *oryza sativa*) she insisted that only African varieties could be used in ritual. She also prohibited the cultivation of peanuts, the major Senegalese cash crop, which the French were promoting throughout the Diola territories. Peanuts grew on the low plateau areas that normally sustained mixed forest and grasslands, which were sources of palm oil and palm wine, thatch, and herbal medicines, while providing vital habitat for game animals. Furthermore, men planted peanuts and, at least among the Muslim northern Diola, they abandoned most of the labor-intensive rice cultivation to women. This dramatically increased women’s labor, as men focused on cash crops, while undermining rice production.

Alinesitoué taught that the droughts were caused by Diola neglect of their religious traditions and conversions to Islam or Christianity; by their reliance on foreign rice; by their embracing of peanut cultivation and the resultant cutting down of upland forests. These changes undermined their duties as caretakers of a land given to them by Emitai. Unfortunately, the Vichy French administration decided, in 1943, that Alinesitoué constituted a threat to their authority. They arrested her and exiled her to Timbuctoo, where she died of starvation in 1944.

Other men and women claimed to be prophets in the tradition of Alinesitoué. Most shared her emphasis on the community sacrifice known as *Kasila* and her rejection of foreign crops. One of the more influential, Todjai Diatta of Djivent, expanded her teachings to demand the renewed cultivation of a wide variety of crops that Diola had once planted but were still only farmed in the most remote areas. Diola prophets have not only revitalized a Diola religious tradition in the face of the sustained challenges of the colonial and post-colonial eras. They have also provided a critique of agricultural development schemes, of a “Green Revolution,” based on divine revelation.

SP Dirt

In both its literal and metaphorical associations, dirt is a central theme in religious discourse. Its primary dictionary meaning is something that contaminates or befouls. The label dirty marks something as bad or taboo. Yet dirt also signifies the Earth or soil, the very ground of human being. Any consideration of the symbolic meaning of dirt must take into account all of these associations.

In many religions, “the mere existence of the soil was seen as significant”; the Earth is understood “as a religious form . . . repository of a wealth of sacred forces” (Eliade 1958: 242). The beloved dirt, soil or Earth, sometimes eaten as an act of identification, has been understood as the very flesh of Goddess, the cosmic womb that begets us and to which we ultimately return. Conversely, in less Earth-respecting traditions, dirt becomes the core metaphor for sexual thoughts, words, and deeds, for demeaning labor, and for fraudulent practices.

In *Purity and Danger* Mary Douglas asserts, “There is no such thing as absolute dirt.” Rather, dirt, that which is perceived to be disorderly, contaminating or polluting, is “in the eye of the beholder” (1966: 2). Moreover, dirt is not always seen as profane, as it is in the now dominant

moral system. Rather, worldviews that recognize suffering, disease, and death as ontological necessities frequently understand the dirt as sacred.

Arguably, the degradation of dirt and its ensuing association with impurity and obscenity is linked to the negation of the feminine that underlies many patriarchal religions, philosophies and civilizations. In some belief systems associated with Abrahamic religions, it is Eve’s original transgression that is believed to be “responsible for bringing bodily ‘dirtiness’ (defecation, sweating, menstruation, etc.) into existence” (Delaney 1988: 79). In such beliefs, a conceptual dualism separates the masculine from the feminine, culture from nature, spirit from matter. The identification of nature with the feminine serves not as a source of respect, but as a legitimation for the subordination of nature. The moral imperative is to transcend and/or control the “lower realms,” and to attain distance from nature in order to achieve spirituality, rationality, and control. Thus everyone and everything associated with the “lower” realms (of the body and the world) – including the land, the sexual flesh, animals, women, and ethnic “others” – are stigmatized and deemed dirty. Disgust, the emotion occasioned by contact with the dirt, functions as a touchstone for degrees of civilization.

Feminist ecological thinkers urge a reconciliation with matter, a rethinking of socially constructed disgust. Alienation from the dirt/land/nature enables gynocide, genocide, misogyny, body hatred, fear of diversity, negativity toward sex, and an inability to come to terms with disease and death. These factors underlie and interrelate sexism, racism, heterosexism, and environmental depredations.

Despised groups are stigmatized as “closer to nature” and inherently dirty. Alice Walker synthesizes this perspective:

Some of us have become used to thinking that woman is the nigger of the world, that a person of color is the nigger of the world, that a poor person is the nigger of the world. But, in truth, Earth itself has become the nigger of the world . . . While it is “treated like dirt,” so are we (1988: 147).

The English word “dirt” is derived from a word meaning excrement. Excrement, what Goethe referred to as our “remnant of Earth,” though obviously dangerous if it comes in contact with food and water, is intrinsic to the cycling and regeneration of nature. For just as the Earth bears, nourishes, and sustains us, humans are obligated to return gifts and energy to the Earth. We do this through prayer and ritual but also through our bodily functions, including respiration, sexual exuberance, defecation and urination, and ultimately death when our bodies return to the elements. These cyclic processes are represented by such divinities as the Aztec Tlaelcuani, the “Filth Eater,” so

named because she is able to absorb the sins, ego, corruption, disease and waste of human beings. Tlaelcuani takes filth (pollutions of all types, psychical as well as material) back into herself and cosmically recycles it, transforming and energizing the cosmos, and rebirthing matter.

The word human derives from the Latin humus, Earth or dirt, signifying the basic equality of all humans, and the core connection of our flesh to the matter of Earth. Humus also is the root of humility, a virtue that is based in respect for the ways of the flesh and recognition and acceptance of human dependence on the Earth. Linda Hogan recognizes the madness of a worldview in which “the clay of creation has ceased to be the rich element from which life grows.” Dirt-denying cultures promote “lives that are lived outside of life, without a love or respect for the land and other lives” (1995: 132). A healthy dose of respect for the land/dirt as well as for the permeable, sensual, fragrant, fluid, intelligent, excreting and finally mortal body is undoubtedly helpful to our survival (as is our humor around the subject). Yet, civilization has opted for a dissociating disgust and a suicidal pursuit of a monotonous purity, which is, of course, sterility, rather than revering the muck, diversity, darkness, and riot of fertility, which is invariably and exuberantly dirty.

In 1970, Lewis Mumford lamented that an egomaniacal technological culture, marked by a reigning “myth of the machine,” has idealized a “transcendent world of light and space, disinfected of the human presence” and “fit only for machines” (33). War against the dirt is ultimately warfare against ourselves. The desire to “disinfect,” to separate totally from the dirt/flesh motivates a panoply of related cultural practices and beliefs (e.g., violence engendering obsessions with sexual and racial purity; embalming; controlling wayward flesh with “botox” injections; silicone implants, and plastic surgeries; the proliferation of antibiotic soaps and lotions in everyday use; the promotion of virtual realities and/or a heavenly afterlife as superior to material existence). It is easy to empathize with the human desire to avoid suffering, diminishment of powers through aging, and death. Yet, the dirt-phobic and death-denying culture ultimately is a self-defeating one.

Earth cannot be cheated. The quest for transcendence, control of the wild, and purity produces not only temporary conveniences and comforts, but also long-term desensitization and loss of purpose as well as chronic and sometimes terminal diseases (from allergies through cancer). And while humans will not become immortal, our technologically engineered wastes (from plastics through nuclear droppings) will continue in perpetuity.

Louke van Wensveen identifies virtues associated with environmentalism, including humility, compassion toward animals, hope and frugality – ones that she personally thinks of as “dirty virtues” because they express “a preoccupation with the Earth” and also because, as she says, this juxtaposition points out that many of these

virtues would be considered “vicious,” bad or taboo during most of Western history (van Wensveen 2000). Of course, the phrase “dirty virtues” also reclaims dirt as a metaphor for the good. Environmentally minded folks might seek actively to name and celebrate dirty virtues, as well as dirty thoughts, words, and deeds.

Disney

Like McDonald’s and Coca-Cola, the Disney brand name is now synonymous with American culture. The symbols and meanings of the corporation’s seemingly ubiquitous products maintain a strong presence in our minds and households. In 1994, Disney had the number one record, movie, video, and television show in the United States. The History Channel, ABC, ESPN, A&E, E!, Lifetime, SOAPnet, Miramax, Hyperion Books, Hollywood Records, Touchstone Television and Anaheim’s professional sports teams are all owned by Disney. More than a half a billion people have been to a Disney theme park. Walt Disney World is the most popular tourist destination on Earth, with approximately 20 million visitors per year. The company’s websites attract 28 million unique visitors monthly and rank in the top ten of all Internet properties, according

to Media Metrix and Disney's 2002 annual report. The company owns 10 local television stations and 62 radio stations across the country. Disney has infiltrated Broadway, Times Square, and even, in 2002, the World Series, with a victory by its Anaheim Angels.

The Walt Disney Company's pervasiveness puts it in a powerful position to perpetuate and shape beliefs and practices related to gender, race, ethnicity, class, international relations, and in many and important ways, with regard to the environment. From its early days in 1923 as an animation studio, the Disney Company's creations have always been loaded with images and messages of nature and animals that were often not natural: Mickey Mouse and his barnyard pals, Jiminy Cricket's *I'm No Fool* short films, *Old Yeller*, Davy Crockett's exploration, and the synthetic hillsides and humanmade lakes that hide the engineered infrastructure of Walt Disney World.

Critics have dismissed Disney's presentations of nature, especially the tendency to anthropomorphize, to gloss over environmental degradation, and exploit the natural world for financial gain. Such criticisms, while insightful, can obfuscate other important activities, narratives and interpretations. Increasingly, researchers have questioned audiences' reactions to and interactions with Disney's portrayals of nature. Walt Disney, the person and creator of an entertainment empire, explicitly outlined and embodied what sociologists in the 1960s dubbed "Civil Religion" (Bellah 1968). Disney's weekly television show, frequent movie releases, and theme parks provided opportunities for ritualized behavior, social cohesion, and emotional expression. These behaviors were linked to a thoroughly modern manifest destiny – a belief in social progress fueled by science and technology, the nuclear family and domesticity, wealth and leisure through national supremacy, and corporate influence in all facets of public and private life. For example, Disney's 1957 animated television broadcast, *Our Friend the Atom*, was a redemptive tale encouraging the baby-boom children of the Cold War 1950s – the same children who were taught to crouch under their desks during air raid sirens at school – not to fear the atom, but to take the optimistic view that it could be applied to solve the world's problems. The message is that natural processes can and should be harnessed for human use and progress.

Another important Disney/religion/nature nexus has been the presentation of nature as a source of deep meanings and symbols *sui generis* – for its own sake. This can be seen as a modernizing of the Walt Disney Company's presentation of nature and religion, and is most prominent in the Company's more recent films and attendant theme park attractions. Disney's version of nature as a source of deep meanings and symbols has developed over many years, emerging alongside of and at times overlapping with the civil religion and frontier narratives. For instance,

between 1948 and 1960, Walt Disney studios produced a series of live-action nature films called "True Life Adventures," beginning with *Seal Island*. With titles like *The Living Desert* (1953), *The Vanishing Prairie* (1954), and *White Wilderness* (1958), many of these films won Academy Awards in the "Best Documentary Feature" category. These stories, often in contradictory ways, reflected both civil religion and frontier myths: the primacy of the resourceful individual, but the sanctity of the family, and the success of cooperation; the inevitability of death, yet the possibilities of birth and renewal. What has made this developing narrative of nature celebration distinct, however, was the change from an attitude where Frontierland was a wilderness to be conquered to a view of wilderness as a place for inspiration and wisdom. Today Jiminy Cricket touts "Environmentality" in Disney hotel bathrooms and on brochures, while in the Land pavilion in EPCOT, *Lion King* characters Timon and Pumba decry the evils of development in Nestle's *The Circle of Life*.

The question arising from this discussion is how people use Disney's nature narratives to give their own lives meaning, order and ritual. We can only be sure that, like Disney's treatments of nature, what people draw from them is filled with contradiction, irony, and inconsistency. At Disney the natural world and wilderness are simultaneously presented as dark and dangerous places, to be feared and controlled, but at the same time peaceful, beautiful, light, airy places, imbued with sacred meanings to be protected and enjoyed.

SP Disney Worlds at War

Walt Disney's theme parks, television productions, and motion pictures evoke strong feelings among those who attend and avoid them. These feelings are an indication that the narrative experiences conveyed in them are plural and contested. These reactions represent a canvas ripe for scholarly analysis – one that reveals not only a battle among devotees and critics of Disney, but also internal ambiguities and contradictions over what is a contested ideological and spiritual terrain. Put simply, there is a war over Disney Worlds, and Disney Worlds are at war. And as is usually the case when humans go to war, religion has a lot to do with it.

Disneyland (California)

Growing up in southern California, in the late 1960s I regularly visited the original “Disneyland” (which opened in 1955), taking advantage of a paperboy's perk. I learned the place with an intimacy made possible by regular access and the energy of youth. Now, several decades later, perhaps I can be an un-Disney-like tour guide.

Upon entering Disneyland, one's first encounter is with “Main Street USA,” and the initial glimpses it offers the park visitor is something I now consider (with my retro-active religious studies lenses) to be a model of utopian sacred space. Here one finds symbolized what Martin Luther King, Jr. hoped for, “the beloved community”; in other words, a utopian and sacred space reinforcing what Robert Bellah dubbed Civil Religion, and what others have labeled more negatively as “religious nationalism.” (American civil religion conceives of the United States as representative of sacred ideals and includes a divine mandate to protect – if not extend globally – such ideals, including religious liberty and democracy.) An Opera House where visitors learn about Saint (Walt) Disney and from his childhood hero, President Abraham Lincoln, is featured prominently at the Mainstreet USA locale. (At Florida's Disney World, Lincoln was moved to the Hall of the Presidents at Liberty Square, but his message remained the same.)

Lincoln is perhaps the central idol of American Civil Religion. He features prominently in Bellah's *The Broken Covenant*, for his speeches express a conviction in the divine calling of the nation, as well as God's displeasure and judgment when it does not live up to its ideals. The Lincoln Memorial in Washington, D.C. provides a classic example of such civil religion adorned with key quotations

from Lincoln's speeches, it provides visitors with an opportunity to sense the weight of Lincoln's vision of the nation. Similarly, visitors at Disneyland attend “Great moments with Mr. Lincoln,” a presentation adapted from the 1964–1965 New York World's Fair exhibit, where a robotic Lincoln extols upon the ideals of the Republic and the sacred trust of liberty, and recapitulates for thousands daily a key script from the nation's sacred narratives. The message coheres well with early Puritan understandings in which the Atlantic Ocean was understood to be the Red Sea-like challenge to be crossed on the way to the promised land, a land whose sacredness depends not only on divine creative fiat, but on human labor establishing religious liberty and social justice. Lincoln acknowledged American imperfections (such as slavery), but his central message was that America had a God-given duty to build, from nature, a utopian sacred space. Of course, this space was to be carved out from that which was considered a “wilderness,” a notion increasingly contested, in part, because the continent was already well populated by indigenous peoples.

These peoples provide part of the backdrop at Disneyland's Frontierland, where the American continent is presented as an exciting and dangerous place, full of Indians as well as pirates and other bandits, all of whom must give way to the advancing, implicitly Christian, Euro-American civilization.

My suggestion that this narrative has to do with the advance of an implicitly Christian civilization could be challenged. But Walt Disney himself, who died in 1966, implied that Christianity contributed to his vision for the Park. He insisted on strict moral codes for employees and even visitors, for years banning same-sex dancing while opening the park after normal hours for Christian special events. Moreover, he attributed his success in part to his “Congregational upbringing and lifelong habit of prayer,” according to “Crosswalk,” a website hosted by conservative Christians dismayed at what they considered to be the moral decline of the Disney Worlds after Walt Disney's death. Indeed, an internet search with key words like “Walt Disney” and “Christianity” reveals that many Christians now believe Disney World propagates anti-Christian beliefs and practices, including sorcery, witchcraft, paganism and homosexuality; concerns that played a role in a 1997 Southern Baptist boycott of everything Disney. A smaller number of fundamentalist Christians believe Walt Disney himself promoted occult religion, in a secret conspiracy with Freemasons, Jews, Catholics, the Illuminati, and Satan himself, seeking to create a repressive One World Order.

Despite such perceptions, Disney's mainstreams more clearly promote Christian religious nationalism than a nefarious world system. But the Christian ethos is partially obscured by Disney's presentation of a “melting pot” theory of America. This pot coheres, of course, with the

assimilationist agenda of the predominantly Christian, Euro-American society, manifesting its “destiny” to control the land and its original human inhabitants. Many Disney Television shows and feature films, notably the Davy Crockett television shows of 1954 and 1955 (the first one was subtitled “Indian Fighter” and, combined with later shows, was released as a retitled feature film) reinforced this “progressive” narrative. At Disneyland, visitors could symbolically participate in the story by paddling “Davy Crockett’s Explorer Canoes,” shooting imagined Indians in the river below the frontier fort’s parapets, and by purchasing period guns and coonskin caps.

While Davy Crockett justified European-American domination of the American land it is worth underscoring that patriotism involves both “we feeling” and affection, if not reverence, for land. This can be seen, for example, in national hymns such as “America the Beautiful,” in the long history of American art, such as that of the Hudson School and in the photography of Ansel Adams, which finds the sublime in the continent’s outstanding landscape features. Such patriotism is also found in the nineteenth-century emergence and subsequent evolution of tourism, especially to National Parks and historic landscapes, which John Sears and Edward Linenthal have shown powerfully (and often in ironic if not contradictory ways) fuse religion and nationalism as they invest the certain places on the American landscape with sacredness.

The Crockett stories reflected a kind of patriotic nature spirituality that has erupted in America. They conveyed the idea that a strong connection to wild American land is the ground of good moral character and political legitimacy. Davy Crockett, after all, “Goes to Congress” (episode #2), ironically perhaps, in part to help ensure peace with and the just treatment of the Indians he earlier went to fight. And later he would die heroically “At the Alamo” (episode #3), defending an outpost at the southern border of the expanding Euro-American empire. (Crockett was not the only American whose charismatic authority was grounded literally in wild land; with more time we could run a similar analysis on Abraham Lincoln and others.)

Historians would label these Crockett narratives fanciful, but at Disneyland Frontierland is no fantasy. Neither is Fantasyland, which is an adjacent realm, placed at the very center of the park. This placing is unlikely to be accidental. Sleeping Beauty’s castle is there, modeled after Neuschwanstein Castle, which was built in the late nineteenth century by Bavaria’s King Ludwig, who was himself called “mad” by some in his day for creating a castle impractical for defense and fanciful of design. It was an excellent design to borrow for Fantasyland, however, which is populated by people and creatures drawn largely from European folk stories and Disney inventions drawing on such stories. Fantasyland is presented as both a fun and (playfully) dangerous place. There, European culture, and

even European land, is symbolically central: Switzerland’s Matterhorn Mountain is Fantasyland’s sacred mountain, rising majestically above the entire park. If Disneyland is exemplar of the nation’s civil religion, then here at its center is Europe, appearing as the new Fatherland’s mother. Perhaps it is not fanciful to suggest that, at Disneyland, Europe is the implied ground from which European civilization could strong-arm its way to power in Frontierland, mustering its troops to secure the American future.

That future, labeled Tomorrowland, appeared opposite Frontierland and adjacent Fantasyland. With exhibits like the “Carousel of Progress,” it painted an unambiguously positive picture of modern, industrial civilization. Its major venues were sponsored unself-consciously by multinational corporations, including those of the extractive, chemical, oil, and telecommunication industries.

The chemical corporation Monsanto, for example, took visitors on a journey inside of the atom, celebrating the science that was unlocking nature’s secrets. This and kindred venues promised “better living through chemistry” and the peaceful if not utopian benefits of nuclear power. The oil giant Chevron presented “Autopia,” giving youngsters a chance to drive pint-sized cars. This fusion of utopia with the automobile was more than linguistic innovation. For millions of children it was a performative rite of passage into car culture. Many of them went on to view America itself as an Autopia, finding great if not ultimate meaning in everything automotive.

Cumulatively, Tomorrowland expressed unbridled, utopian optimism in technology and America’s leading role as its developer. And the American mission was otherworldly as well, with venues expressing awe at rocketry, Apollo moon explorations, and an envisioned “Mission to Mars.” Placed adjacent to Main Street USA, Tomorrowland has provided ever since the 1950s a physical connection between American sacred space and outer space, grounding civil religion and the future of religion both in the here and now in America, and above and beyond this world.

Disney World (Florida)

But the narrative could not end there, though it did require additional habitat. Disney had run out of room in Orange County, California. So, Disney World was created in Orlando, Florida, where Walt Disney secretly purchased seventy square miles of biologically diverse, wild land to secure control of the developments to come. Denounced as a desecration by radical environmentalists who positioned themselves in opposition to the Disney myth, Disney World repeated and elaborated the plot begun in California. But as this new Disney World was built, the story line became even more expansive, complicated, ironic, and contested. The “religion and nature” dimensions of this appear most clearly at two new developments there: Epcot Center and Disney’s Animal Kingdom.

Epcot globalizes the mythic vision of a technological utopia presented more provincially at Disneyland. Its “world showcase” celebrates the cultures of eleven nations on Earth, which stand in for the world’s cultural diversity. Meanwhile, “Future World” continues Tomorrowland’s utopian technological optimism. There, a “Geosphere” labeled “Spaceship Earth” is Epcot’s axis mundi, towering 165 feet over visitors ever since the park opened in 1982. Located within the dome itself is “Spaceship Earth,” a ride that tells a story reminiscent of the Epic of Evolution; it is a newly invented narrative, inspiring diverse forms of nature-oriented ritualizing that consecrates cosmological and evolutionary narratives. Sponsored by American Telephone and Telegraph, the ride focuses on 60,000 years of human communicative evolution and signals wondrous new ways humans will communicate in the near future.

Keeping the original Disneyland’s fusion of corporate America and technical utopianism, the “Universe of Energy” venue was sponsored by ExxonMobil. “Mission Space” (which opened in 2002) superseded Disneyland’s “Mission to Mars” with a grander cosmovision. Other venues celebrated agricultural innovations, such as hydroponic plant cultivation – touted as a way beyond pesticides – and bioengineering, promising freedom from hunger. Meanwhile, “Living Seas” programs provided an opportunity to commune with sea life, including what many in the New Age movement today consider morally if not spiritually superior beings, the dolphins. These last two examples show that competing if not warring world-views are emerging, even at Epcot itself. The possibility of a pesticide-free agriculture implicitly acknowledged a shadow side to chemical-intensive agriculture, and the living seas programs reflected a growing concern for and valuing of the oceans and sea creatures, something not strongly represented in earlier Disney World incarnations.

This subtle counternarrative, present even at Epcot, broke out in a more full-scale counterrevolution at the nearby Animal Kingdom, which opened in 1998. Here a strong message in favor of environmental conservation was expressed, often wrapped in and reflecting a kind of nature-as-sacred religion that seemingly contradicted civil religion-baptized narratives of progress and beneficent territorial expansion.

At the “Kilimanjaro Safari,” where visitors ride a simulated Land Rover to view authentic African plant and animal life, poachers are identified as the villains responsible for endangering species. This is, of course, a simplistic explanation for the near-extinction of much African fauna; one chosen, little doubt, for its snug fit into Disney melodrama. But elsewhere in the park, admittedly in more museum-like exhibit panels that engage fewer visitors than the adventure rides, visitors can view social-scientifically credible exhibits on the diverse interplay of social and ecological factors precipitating Africa’s biodiversity crisis. When I first viewed these areas the month

the park was opened, I found myself wondering if there was any place in America where greater numbers of ordinary people could be exposed to such an analysis of the challenges facing African conservation. It was a presentation standing in direct opposition to the corporation-friendly optimism that reigns almost everywhere else in Disney’s Worlds.

The first business of the Animal Kingdom, of course, was not environmental education. Disney Chief Michael Eisner, who took a tour of the “Kilimanjaro Safari” before the park opened, decided unilaterally that the lions could not be allowed to feed in front of the visitors, as the park’s planners had planned. This decision was to the annoyance of the Kingdom ecologist who told me that people should not be shielded from the predatory nature of the Animal Kingdom. On the other hand, another venue, the “Affection Section,” provides a place where children can, presumably, emotionally connect to (non-predatory) animals.

These exhibits and this experience, perhaps especially when compared to Disneyland and Epcot Center, suggest there are fault lines in Disney’s Worlds: they are not an entirely monolithic, hegemonic, and unchanging enterprise.

Disney Movies in the Animal Kingdom

Recent Disney movies, for example, have been adopted by the Animal Kingdom where they are given even more pointed conservation messages. This adoption further illustrates that some of the architects laboring under the Disney umbrella resonate with, and promote, a nature-as-sacred spirituality. Or at least, they have affinity with what I have elsewhere called “spiritualities of connection” to the Earth’s creatures and living systems.

Of course, even Disney’s classic animated film *Bambi* (1942) may be read as an early environmental film, one that expressed a kind of animistic nature spirituality that emotionally connected the viewer to the film’s non-human forest inhabitants. Few who saw it were unmoved by Bambi’s wrenching loss at the hands of a hunter, or could easily forget the fear of the forest creatures facing the anthropogenic forest fire. In this picture, nature untrammelled by humans is depicted as miraculous and sublime, but it is also revered as the very life cycle itself that envelopes all creatures. In this way, all creatures are kin and have reciprocal obligations.

Much of this formula was repeated in the *Lion King* (1994), where nature was again portrayed as sublime but threatened. The “Circle of Life” theme song celebrated a natural metaphysics of interrelatedness, and the moral of the fable was the need for the reharmonization of life on Earth by fitting into one’s proper niche in the natural order. At the Animal Kingdom’s “Festival of the Lion King,” these themes are re-presented daily before huge crowds of spectators.

The film *Pocahontas* (1995) is even more obviously an expression of contemporary nature spirituality if not eco-religion. Its transformation from the inherited story of the American Indian Princess who saved a European explorer and later died in Europe – which critics like Christian Feest argue provided a symbolic justification for European invasion – is remarkable indeed. In Disney's version, the princess and her people hear nature's spirits. At their receptive best, they learn from them (especially, in this movie, through Grandmother Willow), particularly of their sacred interconnections within the web of life. Meanwhile, though Europeans are largely portrayed as agents of desecration, the good-hearted among them learn to respect the indigenous peoples and their land. Like the best-known versions of the inherited story, Disney's *Pocahontas* saves a European explorer. But in Disney's version she does not die alienated from her sacred place in a foreign land. She stays with her people to help them to protect nature and learn to coexist peacefully with the newcomers.

According to many scholars and at least one band of contemporary Powhatan Indians "The film distorts history beyond recognition" (Powhatan Renape Nation, from their website, accessed June 2003). But it pleased many Native Americans, who found the portrayal of the Powhatan people respectful and authentic. Some of them were, apparently, consulted about the film, as was the (non-Powhatan) American Indian Movement activist Russell Means, who provided the voice for the animated Chief Powhatan character in the movie. He said afterward,

I find it astounding that Americans and the Disney Studios are willing to tell the truth. It's never been done before . . . and I love it. The cooperation I got with every suggestion I made, even the smallest little things about our culture, have been incorporated into the script (Anonymous, movie review at .movieweb.com/movie/pocahontas/pocprod1.txt, May 2003).

Not only were the film's directors and Native American participants moved by the film's depiction of Native American nature spirituality. So was Stephen Schwartz, the lyricist for the film's signature song, "Colors of the Wind," which challenged Euro-American understandings of land ownership, countering these with the claim that one ought not to "own" the creatures and spirit-filled entities that make up animate nature. In words sung by the *Pocahontas* character:

You think you own whatever land you land on
The earth is just a dead thing you can claim
But I know ev'ry rock and tree and creature
Has a life, has a spirit, has a name . . .

The rainstorm and the river are my brothers
The heron and the otter are my friends
In a circle, in a hoop that never ends

Toward the end, to the question, "How high does the sycamore grow?" the song answers, "If you cut it down, then you'll never know." Here the environmental message is inescapable. Commenting about the process of writing these lyrics, Stephen Schwartz would later comment,

It was just one of those magical things . . . We knew what we wanted to say and we knew who the person was. We were able to find the parts of ourselves that beat in synchronicity with *Pocahontas* on those particular thoughts. The image of a sycamore echoes Chief Seattle's speech to Congress, in which he says, "No one can own the sky" and "What will you do when the rivers are gone?" (Quoted from the previously cited movie review).

It is certainly ironic that these words served as inspiration for the movie's Indian nature spirituality, since the words attributed by Schwartz to Chief Seattle (more accurately Chief Sealth) are now suspected of being history-inspired fiction. Nevertheless, many would consider this speech, and these lyrics, to have captured well the nature spirituality of many Native Americans. Whether accurate or not, the speech and its resonance certainly reflect a nature-as-sacred spirituality that is increasingly common among a diverse spectrum of the American public. And lest anyone think I am reading too much into all this, it was not only the lyricist Schwartz who resonated with what he took to be the nature spirituality of *Pocahontas* and her people. The film's directors Mike Gabriel and Eric Goldberg reported that in the film they also "tried to tap into her spirituality and the spirituality of the Native Americans, especially in the way they relate to nature" (Quoted from the same anonymous movie review).

The animistic nature spirituality and environmental kinship ethic of the recast story is not only clear in the movie, it is also clearly reiterated at an Animal Kingdom's show entitled "Pocahontas and Her Forest Friends," which reiterates the Disney version of the story, thus the moral quest for kinship among all creatures. The literature promoting the performance ends with the question, "Will you be a protector of the forest?"

Indeed, if we look at Animal Kingdom overall, commerce and conservation intertwine in complicated and contradictory ways. Certainly there are profound ethical questions surrounding the borrowing (some would say stealing) of stories and spirituality from Native Americans or other indigenous people for commercial purposes, even if there is also a motive to promote reconciliation between

different groups of people and between these groups and their wider relations. Such questions are properly debated in a wide variety of contexts. To acknowledge this part of the controversial nature of Disney's nature spirituality should not distract us, however, from recognizing that in this part of the Disney orbit, the conservation theme seems in some sense at war with its commercial logic. It also stands in direct opposition to the techno-utopian civil religion that is its dominant narrative, for in the Animal Kingdom, the sacred center is not a European point of divine origin, nor a technological utopia, but the Earth and her denizens interconnected in the circle of life.

Indeed, at the center of Animal Kingdom is a giant Tree of Life, standing nearly 150 feet tall, containing the sculpted images of more than 300 animals. In this sculpture the animals flow one into another, hybridized, in a way reminiscent of art sometimes created by indigenous peoples with shamanic traditions. The message could not be clearer: life is an interconnected web, worthy of reverence, and we must all eventually recognize that it is within this circle that we belong.

Disney Wars

Disney Worlds provide an excellent contemporary case study of how the salutary and shadow in contemporary nature religion become engaged and change over time. As Joseph Champ and Rebecca Self Hill suggest in their overview entry on *THEME PARKS* in this encyclopedia, further study is needed into the experiences people have in such places. What do they bring to and take from such experiences in the area of religion, nature, and ethics? To my knowledge, there has been no in-depth scholarly study of the way Disney Worlds influence the millions exposed to them.

One thing is certain. Disney's Worlds are at war. Or at least, they are hotly contested. And these battles have much to do with religion and nature.

This, of course, is a complex claim that depends on which enclaves within and beyond the Disney Universe we are focusing upon. While the dominant narratives place a sacred canopy of legitimation over a globalizing empire and a techno-utopian Tomorrowland, they are not immune from incursions. Some Disney World partisans subvert the dominant plot lines offering a nature-oriented spirituality that may provide a significant counterweight. These guerillas are themselves under attack, charged with eroding the moral fiber of the nation, which depends, according to the worldviews of the attackers, on the nation's putatively Christian underpinnings. In short, Disney Worlds and the vehement nature of the reaction to them, provide one significant example that, in American culture and our globalizing world, religion and nature are contested, in play, and very much up for grabs.

Divine Waters of the Oru-Igbo (Southeastern Nigeria)

The Oru-Igbo of Southeastern Nigeria perceive their waters animated by water deities – the goddess of Oguta Lake, Ogbuide also known as Uhammiri, and her divine husband, the river god, Urashi, among others. The corresponding worldview among the Oru-Igbo is thus diametrically opposed to the Western notion of water as a mere natural element, resource, or commodity.

The Oru-Igbo are a sub-division of the Igbo people, one of Nigeria's major ethnic groups numbering 20–40 million people whose language, Igbo, is heterogeneous with many dialects. Also known as Riverine Igbo, the Oru live in and around Oguta and distinguish themselves from other Igbos on account of their institution of sacred kingship and their physical and spiritual affinity to major bodies of water (e.g., Oguta Lake) and rivers including the River Niger.

Igbo-land is among the most densely populated areas of Africa, with intense agricultural productivity and several large urban centers. Yet, despite their success in drawing on their natural resources to support a large population for centuries, pre-Christian Igbo religion regards the major forces of nature as divine and the environment as sacred. Moreover, the need for balance emerges as a major cultural value contributing to an ecologically responsible worldview whereby humans are accountable for their actions to their gods and goddesses, must constantly strive for equilibrium in their social and natural environments, and groom and re-conciliate various forces to maintain and perpetuate human existence spiritually and physically. The resulting goals of balanced gender relations, and a fruitful and respectful correlation of humans and nature manifest in Oru-Igbo religion, is expressed in everyday life and culture, economically, socially, politically, emotionally, spiritually, and in art and ritual.

The prime deity underpinning Igbo custom is the Earth goddess, Ani/Ala, as reflected in the Igbo word for custom, *omen-ala* / *omen-ani*, or laws of the land. Colonial administrators interested in territorial claims recognized the importance of the Earth goddess. But in addition, there are several other equally significant nature deities whose prominence varies from place to place in correspondence to the natural environment. One major divinity besides the Earth goddess is the mother water goddess generalized as *nne mmiri* and locally known by different names (e.g., Ogbuide / Uhammiri in Oguta). A brief outline of Igbo cosmology illuminates this deity and spiritual significance ascribed to the natural element, water.

The Mother Water Goddess in Igbo Cosmology

The Igbo supreme god is Chi-Ukwu / Chukwu, the great spirit of creation and destiny, an unlimited entity, beyond shape, age, or gender, neither male nor female, too vast

to be contained in manmade images or temples, and traditionally addressed through the arishi, or messenger deities, an entire pantheon of nature deities, spirits, and ancestors below the supreme god.

Among the lesser deities, the supreme Earth goddess, Ani/Ala, the supreme water goddess, *nne mmiri*, and in some areas the god of thunder, Amadi Oha, take the lead. Antagonisms and tensions exist between more static forces on the one hand, and creative ones challenging tradition, on the other. This binary opposition has been equated to the antagonism of “water spirits” and “land spirits” and is a major theme in the religious beliefs of the Igbo, Kalabari and Ijaw people of the Niger Delta. The various manifestations of the divine forces of nature (Earth and water) and human achievement (ancestors) may either confront or support human beings, are at times antagonistic to human life, yet may also support life, and are potentially either beneficial or harmful. People must constantly balance these challenges in order to survive.

The Earth goddess, Ani/Ala, harbors the preservation of custom, but she is complex, manifesting herself in multiple antagonistic ways: firstly, Ani is the supreme Earth goddess of the town; secondly, the Earth goddess of the wild bush, Onabuluwa, represents the opposite of Ani; third, there are the many individual Earth goddesses of different compounds and farmlands, each commanding her own calendar of days of worship, or refraining from farming.

The water goddess, *nne mmiri*, is complementary to the Earth goddess. With her own set of rules she may either affirm custom, or challenge, renew and modify tradition. A fertility goddess, she may give life. Yet, a volatile force, she may also destroy and take life. Moreover, she challenges, and may even alter human destiny.

In the Igbo worldview each human being has his/her own *chi*, an individual force derived from and endowed by Chi-Ukwu. The individual *chi* leaves the human body at death, reunites with *Chi-Ukwu*, and may be reborn through reincarnation, albeit in another body, at a later stage of the eternal life cycle.

Before entering and exiting this world, the human being must cross a river. Because the concept of time is circular, the individual must cross a river twice, and forever – not only once, as in ancient Greek mythology. Each time a person is crossing the river to enter life on Earth he/she is challenged either by the water goddess, *nne mmiri*, or by the Earth goddess of the wild bush, Onabuluwa. At this point, the individual's destiny, *akarakara*, and sacred pact with the supreme god are at stake. The person may either defend his/her destiny, or change its course by forming a pact with the mother water goddess. This pact not only alters one's life and destiny, but also dedicates the person to the goddess as her devotee. If the individual later tries to evade both his/her original destiny and the water deity's claim by refusing to fulfill her requirements

resulting from the pact to change one's destiny, then, it is believed, this may cause illness, particularly mental derangement and even death.

Water Priesthood

Oguta's mother water goddess is Uhammiri, also known as Ogbuide, or Mammy Water in pidgin English, a name that has caused much controversy. The Oru-Igbo ascribe vital importance to this volatile deity who may either grant or destroy life. Her beauty, power and threatening qualities are expressed in one of her names, *Ogbuide*, "She/ beauty that kills with excess."

The worship of this awesome deity and her husband, the river god Urashi, is imbued with existential responsibility for the town's well-being, and vested in several different types of priesthood and services. There are hereditary male priests for each water deity whose shrine is reserved to the oldest man of a designated clan. In addition, both male and female priesthood titles may be attained through possession, or water spirit calling. These priests/priestesses are often widely known as diviners, or mediators between humans and the spirit world who interpret the complex Igbo universe and its requirements to individual clients. Moreover, some of these priests/priestesses and diviners are renowned herbalists, many of whom have once suffered from either physical or emotional illness, were healed by a local herbalist and priest, and have attained their own special status through a complex personal history of disease, healing, initiation, training, and title-taking.

Everyone may seek a water deity's assistance in times of need, or to pray for children, or wealth. Some individuals permanently dedicate themselves to a water deity as a priest/priestess, or as members of a congregation of followers, worshipping the water deity every four or eight days. The Igbo market week has four days and weeks are grouped in sets of two. The Earth goddess is worshipped on Eke, while Orié and Afor days are dedicated to the lake goddess, Ogbuide, and Nkwo to her husband, Urashi. In addition, the Owu priest, Omodi, and the town's oldest woman, the Eze Nwanyi, address and invoke the water deities during the Oru towns' major festivals, *Agugu*, New Year, and *Omerife*, New Yam festival, once every year.

Owu, Agugu and Omerife, the Art and Ritual of Balancing People and Nature

Oru-Igbo villagers describe the *Agugu* festival as "doing, acting out, or celebrating our custom" – a body of beliefs and activities representing, defining and reaffirming their culture and collective identity. In the absence of brute force, and different from our rules of law, the order of custom is a rather subtle agent compelling people to live up to society's norms, keeping society together, and its culture and values alive. Oru custom is based on a body of sanctions and religious beliefs encoded in myths and

celebrated in the annual *Agugu* festival. Individual practices may change, but the complete erosion of custom threatens the very integrity of a people's culture, identity, and social cohesion, together with their emotional and economic well-being and environment.

The *Agugu* festival is a multi-layered, complex event: a ritual, it addresses the religious beliefs in the divine forces of nature and teaches respect rather than mere exploitation of the environment; an event of economic importance, it signals the beginning of the planting season, and an occasion and venue for the accumulation and subsequent distribution of surplus staples; a major educational and social event, it initiates boys into the ranks of men, whereby the initiates are taught esoteric knowledge and also the most essential existential skills necessary to live and flourish in their social and geographic environment; an occasion for festivities, recreation and play, *Agugu* entertains, educates, and unites the townspeople with their fellow humans, custom and identity, their beliefs in the gods and goddesses of their land and water, local knowledge and survival skills, the necessity of balancing power and complementary gender, and the distinction between the wilderness of nature and civilization created by humans.

Only if the *Agugu* festival is properly performed and the order of custom maintained, can a good harvest follow with *Omerife*, the New Yam festival in due course. For, only if people observe nature properly – in this case, the flooding and recessing of the water levels of rivers and lakes – and plant accordingly, can they enjoy a rich harvest. Based on this belief and wisdom, *Agugu* promotes an environmental strategy of respect, observing nature and acting accordingly, rather than interfering and attempting to dominate.

Agugu reenacts sacred myths and celebrates the indebtedness of successfully farming and procreating to the forces of nature and to the mysterious force of *Owu*, "something mysterious from the water, good, and life giving." The *Owu* myth celebrated during the festival encodes custom (e.g., paternal rights) and is reenacted in a masquerade, initiation ceremonies and other rituals performed at that time. All of these events illustrate how religious beliefs, the local environment, knowledge, practical skills, and the economy are closely interrelated.

The Oru farmer knows very well that an accurate observation and analysis of the water levels of the lake, rivers, and local creeks are basic to his success. He also knows that male and female must complement each other step by step, just as "you cannot walk on one leg alone." During the festival, young men are initiated into adulthood. They become men who may soon plant their seeds to grow and yield fruit, yam and children. Men must eat to survive, but without women, there are no children, and there is no cooked food. Moreover, it is nearly impossible to eat without one's hands, or handiwork.

These are some of the practical lessons taught to the initiates during initiation, in the informal “university of the village,” rather than in formal education. All of *Agugu*'s lessons are highly relevant to the local life and environment. Preparing the graduates of initiation to confront and master life at home, they learn to respect while making use of the gifts of nature/water. This education is for living locally, rather than feeding into or stemming from a body of Eurocentric or merely utilitarian knowledge whose benefit to society and the natural environment is highly questionable in Africa as elsewhere.

Contrary to Western models, but equally striving for maximum emotional and existential benefit, *Agugu* promotes an environmental strategy of observing and respecting, rather than merely exploiting or dominating nature. The religious beliefs underpinning Oru-Igbo custom provide additional safeguards toward protecting the environment.

Sacred Groves

Uhammiri/Ogbuide and Urashi, and other water deities, are worshipped in multiple locations. Priests, priestesses and their followers privately maintain shrines for these deities in their homes, some built on demand, and specific clans own other shrines in or near the town. In addition, major communal shrines to the water deities are located far from town, hidden in the wild thicket near the shores of rivers and lakes. These sacred groves can only be reached by canoe. In these semi-secret, special places nature must not be disturbed and not one branch cut, according to the water deity's rules. The requirement to respect nature's sacred integrity is strictly observed, for the python, sacred avenger of divine anger, is believed to keep watch and punish transgressors. From an ecological point of view, sacred groves sustain the natural environment as sanctuaries for diverse species of plants and animals threatened by cultivation and destruction of their natural habitat (*Nyamweru*).

Totem Animals and Other Creatures

Because of their association with the water deities, certain animals are sacred to the Oru-Igbo, including the python, crocodile, tortoise, and Iguana who must not be killed under any circumstances. If accidentally trapped and killed, a python is buried like a human being. Additional creatures are taboo to part of the population, for whenever a human is born in town, an animal is believed to be born in the bush, considered a totem animal of the clan in question, who must not harm but instead protect this creature under any and all circumstances. The killing of another animal, “beautiful *Asa*,” the “fatty fish without eyes,” is taboo to worshippers of Ogbuide. If accidentally caught, the fisherman must report this to his elder and share his spoil with his entire clan. These and other religious rules protect the natural environment and its

flora and fauna, partially threatened with extinction due to the dismantling of indigenous religious beliefs and the resulting erosion of African culture.

Behavioral Codes

A host of behavioral codes indebted to Oru-Igbo custom and religion, particularly the belief in divine water and the sacredness of nature in general, regulates how much and when people may take from their environment (e.g., fishing near the lake shores where the young ones hatch is permitted only at certain times of the year, allowing for the fish population to restore itself). Moreover, custom requires reciprocity, a balance of give and take not only between people, but also between man and nature (e.g., manifest in the notion of water deities and the need to sacrifice to them in return for divine gifts): offering an animal's life may be necessary to show gratitude for receiving the gift of life (e.g., the birth or survival of a child).

Pre-Christian Igbo religion and cosmology acknowledge human indebtedness to nature and the need to maintain equilibrium with her divine forces (e.g., Earth, water and thunder). All life, human and animal alike, is sacred, and traditionally domestic animals were slaughtered only in ritual, not for profane greed. Even the seemingly unimportant lizard's life must be respected, as Obiadinbugha, the hereditary priest of the lake goddess Uhammiri, said in his prayer, “He who kills the lizard for nothing, let the war of lizards encircle him.”

Dogs in the Abrahamic Traditions

The widespread practice of pet-keeping in modern society is in line with ancient traditions that elevated dogs to the epicenter of the harmonious relationship between animals and humankind. Greek and Roman literature offer ample evidence of dog-keeping, with all its emotional weight. Faithfulness, memory, intelligence, love – all the rich spectrum of human virtues – were attributed to dogs, which in many cases were said to excel the average human being in these qualities. This highly positive approach, however, stands in complete discordance with the tenets of all monotheistic religions, which at best developed ambivalence toward dogs, and, at worst placed a strong emphasis on their negative nature. This religious antagonism, though, lacks clear dogmatic validation, similar to that found in Genesis against the snake, for example, and raises questions that are still open to further research.

The Bible mentions dogs 32 times, mostly in a deprecatory form. When God adopted the Children of Israel to become his chosen people and, as such, regulated their diet, he commanded, “And ye shall be holy men unto me: neither shall ye eat any flesh that is torn of beasts in the field; ye shall cast it to the dogs” (Ex. 22:31). During the week of Passover, as well, Jews were allowed to throw forbidden leavened food to their dogs (*Babylonian Talmud, Pesahim* 32a). Medieval homilies explain this command as a kind of reward for the good behavior of canines during the Exodus when they supposedly refrained from barking, thus facilitating the flight of the Hebrews from Egypt to the land of Canaan (Ex. 11:7). Still, their connection with carrion and carcasses turned canines into despised animals, and the Bible records many instances of dogs lapping human blood (1 Kgs. 14:11; 16:4; 21:19, 23–24; 2 Kgs. 9:10, 36; Ps. 68:23). To their essential impurity – which, according to Jeremiah, will burden dogs with carrying the dead on Doomsday (Jer. 15:3) – the Book of Proverbs adds their stupidity: “As a dog returneth to his vomit, so a fool returneth to his folly” (Prov. 26:11; cf. 2 Peter 2:21–22). The Bible also uses dogs as a common metaphor to hint at the unfortunate status of men (2 Kgs 8:13; Job 30:1) or at the negative elements of society, whether the enemy (Ps. 22:16, 20), renegades in general (Ps. 59:6, 14), or false prophets (Isa. 56:10–11). The apocryphal Book of Enoch, as well, utilizes canine symbolism to describe the Philistines, Ammonites, and Edomites – all of whom posed a danger to the Chosen people. No wonder, therefore, that Deuteronomy proscribes the admittance of

dogs along with whores into the House of the Lord: “Thou shalt not bring the hire of a whore, or the price of a dog, into the house of the Lord thy God for any vow; for even both these are abomination unto the Lord thy God” (23:18).

Rabbinical literature effectively provides the long-range development of biblical tenets and some explanation of their enigmatic nature. Although the rabbis differentiated between “evil” and “good” dogs, they advised taking a cautious attitude toward “good dogs,” as well. These dogs had to be securely chained during the day and could be freed only at night, when decent people remained in their houses. The ownership of an “evil” dog – that is, one that bites and barks – was completely forbidden, since it could cause its owner to violate a biblical prohibition: “Do not place blood in your home” (Deut. 22:8). The equation gradually became clear: a good Jew had to avoid the presence of dogs in his home, since a pet could turn into a public danger. Among the three “objects” that a wise Jew was to evade, dogs stood alongside women and snakes, all three being suspected of sorcery and malevolence (*Babylonian Talmud, Pesahim* 111a).

On the other hand, rabbinical literature also acknowledges canine loyalty and courage, which justified a charitable attitude to pets. Following Deuteronomy 11:15, the Talmud states that Jews may not eat before feeding them (*Babylonian Talmud, Berachot* 40a, *Gittin* 62a); it also acknowledges the meritorious behavior of canines in defense of their owners, thus earning them recognition for life. Stories of this kind were used to emphasize God’s omnipotence, which in times of danger may turn the “natural enemies of men” (i.e., dogs) into their allies. Thus, after exiling Cain from paradise, God furnished the first criminal in the history of humankind with a dog, to defend him from the attack of savage animals (*Babylonian Talmud, Bereshit Rabbah*, 22, 12). The apocryphal Book of Tobit, as well, refers to Tobit’s dog, which faithfully accompanied its owner on his journey to Media (5:16, 10:14). One rabbi further commented that “there are three distinguished in strength: Israel among the nations, the dog among the animals, [and] the cock among the birds” (*Babylonian Talmud, Beitza* 25b).

Biblical and rabbinical tenets heavily influenced the prevailing attitude toward dogs in the New Testament and early Christian theology. In his eschatological vision, St. John perpetuated the biblical connection of dogs to whores: “For without are dogs, and sorcerers, and whoremongers, and murderers, and idolaters, and whosoever loveth and maketh a lie” (Rev. 22:15). Together with the most despicable strata of human society, and as the only representative of the animal kingdom, dogs were therefore excluded from heavenly Jerusalem. Jesus, as well, corroborated their dishonorable status when he decreed: “Give not that which is holy unto the dogs, neither cast ye your pearls before swine, lest they trample them under

their feet, and turn again and rend you" (Matt. 7:6). Both Matthew (15:26) and Mark (7:27) testified that Jesus had requested of the Greek woman: "Let the children first be filled: for it is not meet to take the children's bread, and to cast it unto the dogs." No wonder, therefore, that Paul advised the Philippians: "Beware of dogs, beware of evil workers, beware of the concision" (Phil. 3:2).

Receptive as it was of the Classical heritage, Christendom was not immune to the worthy aspects of dogs, which left their mark on patristic literature. Commenting upon the parable of Dives and Lazarus (Luke 16:19–25), Ambrose of Milan, one of the four recognized Doctors of the Latin Church in the fourth century, blessed dogs "that represent those who guard the flock and protect it against the wolves . . . keep guard for their masters' safety . . . and display noteworthy smelling skills" (Ambrose in Springer 1931: 29–32). He also reported in detail the genealogies of several dogs – carefully established in patterns similar to those that served the aristocracy – and described birthday parties celebrated in their honor.

The ambivalent attitudes toward dogs found in Christian and Jewish traditions, further strengthened by ecological challenges, found a fruitful arena in the emerging Islam. Faced with a plague of stray dogs, Muhammad at first made a categorical decision to exterminate all dogs. He moderated his decree afterwards, reasoning that God had created the canine genus and that people needed certain species of dogs. The Prophet thus decided to exterminate only black-coated strays, particularly those with light patches, the indisputable mark of the devil. Muhammad further established that a woman, a donkey and a black dog interrupt the prayer. The widespread belief that dogs, especially black dogs, were in fact a demonic emanation of evil spirits created the ground for a biased approach toward dogs in Islam. According to Moslem exegetes, any place where the eye of a black dog is buried will fall into ruins. Everything a dog touched or licked was rendered impure, and the place where it had lain had to be purified with water, following the practice of the Prophet on one occasion. A dog prowling close to a believer in prayer invalidates his prayer, and its presence prevents angels from visiting a house. Ultimately, any believer who keeps a useless and vicious dog lessens his final reward, a categorical conclusion very similar to that reached in the Babylonian Talmud. No wonder, therefore, that the Arabic word for dog, *kalb*, became a biting insult and appears pejoratively in numerous proverbial sayings.

All useful dogs that obey their master are freed of divine condemnation, however. This category includes trained hunting dogs and watchdogs, which guarded houses, alleys, flocks, crops, or vineyards; their killing was punished with heavy fines, which varied according to the species and the functions that the dogs fulfilled. Though useful dogs were socially tolerated, they remained unclean with respect to religious practice. On the other hand, there

was a widespread belief in the therapeutic value of dogs, as scape-animals against intestinal and stomach disorders, the disease being transmitted to them through physical contact. There are also some indications of attachment to dogs, even from the Prophet himself. It was said that Muhammad had promised a divine reward to an old woman for her act of charity to a thirsty dog. Moreover, a dog by the name of Kitmir will be allowed to enter paradise (Qur'an C?XVIII:17), because of its praiseworthy behavior toward some youngsters whose lives were in danger.

In sum, all three monotheistic religions seem to promote an ambivalent attitude toward dogs, one that embraces different emotions: love and hate, power and submission, depravity and honesty. All kind of polarized attitudes were projected on dogs, thus turning "man's best friend" into a faithful reflection of the history of humankind itself.

Dogs in the Islamic Tradition

Islamic discourses on the nature and function of dogs are representative of a range of tensions regarding the roles of history, mythology, rationality, and modernity in Islam. In fact, the debates surrounding the avowed impurity of dogs, and the lawfulness of possessing or living with these animals, was one of the main issues symbolizing the challenging dynamic between the revealed religious law, and the state of creation or nature. In addition, certain

aspects of these debates pertained to the power dynamics of patriarchy, and more generally, the construction of social attitudes toward marginal elements in society.

In a fashion similar to European medieval folklore, black dogs, in particular, were viewed ominously in the Islamic tradition. According to one tradition attributed to Muhammad, the Prophet of Islam, black dogs are evil, or even devils, in animal form. Although this report did reflect a part of pre-Islamic Arab mythology, it had a limited impact upon Islamic law. The vast majority of Muslim jurists considered this particular tradition to be falsely attributed to the Prophet, and therefore, apocryphal. Nevertheless, much of the Islamic discourse focused on a Prophetic report instructing that if a dog, regardless of the color, licks a container, the container must be washed seven times, with the sprinkling of dust in one of the washings. Different versions of the same report specify that the container be washed once, three, or five times, or omit the reference to the sprinkling of dust. The essential point conveyed in these reports is that dogs are impure animals, or, at least, that their saliva is a contaminant that voids a Muslim's ritual purity. Hostility to dogs, not just as a source of physical but moral impurity, is further expressed in Prophetic reports claiming that angels, as God's agents of mercy and absolution, will not enter a home that has a dog, or that the company of dogs voids a portion of a Muslim's good deeds. Cultural biases against dogs as a source of moral danger reach an extreme point in reports that claim that Prophet commanded Muslims not to trade or deal in dogs, and even to slaughter all dogs, except for those used in herding, farming, or hunting.

These various anti-dogs reports expressed culturally ingrained social anxieties about aspects of nature that were seen as threatening or unpredictable. In addition, discourses on dogs played a symbolic role in the attempts of pre-modern societies to explore the boundaries that differentiated human beings from animals. In that sense, the debates about dogs acted as a forum for negotiating not just the nature of dogs but also the nature of human beings. This is most apparent in traditions that create a symbolic nexus between marginalized elements in society, such as non-Muslims or women, and dogs. In some such traditions, it is claimed that the Prophet said that dogs, donkeys, women, and in some versions non-Muslims, if they pass in front of men in prayer, will void or nullify that prayer. Interestingly, early Muslim authorities, such as the Prophet's wife Aisha, strongly protested this symbolic association between dogs and women because of its demeaning implications for women. As a result, most Muslim jurists ruled that this tradition is not authentic, and that the crossing of women in front of men does not negate their prayers.

Despite the attribution to the Prophet of a large number of traditions hostile to dogs, for a variety of reasons, many pre-modern Muslim scholars challenged this orientation.

The Qur'an, the divine book of Islam, does not condemn dogs as impure or evil. In addition, a large number of early reports, probably reflecting historical practice, contradicted the dog-hostile traditions. For instance, several reports indicated that the Prophet's young cousins, and some of their companions, owned puppies. Other reports indicated that the Prophet prayed while a dog played in the vicinity. In addition, there is considerable historical evidence that dogs roamed freely in Medina and even entered the Prophet's mosque. A particularly interesting tradition attributed to the Prophet asserted that a prostitute, and in some versions, a sinning man, secured their places in Heaven by saving the life of a dog dying of thirst in the desert.

Most jurists rejected the traditions mandating the killing of dogs as fabrications because, they reasoned, such behavior would be wasteful of life. These jurists argued that there is a presumption prohibiting the destruction of nature, and mandating the honoring of all creation. Any part of creation or nature cannot be needlessly destroyed, and no life can be taken without compelling cause. For the vast majority of jurists, since the consumption of dogs was strictly prohibited in Islam, there was no reason to slaughter dogs. Aside from the issue of killing dogs, Muslim jurists disagreed on the permissibility of owning dogs. A large number of jurists allowed the ownership of dogs for the purpose of serving human needs, such as herding, farming, hunting, or protection. They also prohibited the ownership of dogs for frivolous reasons, such as enjoying their appearance or out of a desire to show off. Some scholars rationalized this determination by arguing that dogs endanger the safety of neighbors and travelers. For the majority of jurists, however, the pertinent issue was not whether it was lawful to own dogs, but the avowed impurity of dogs. The majority contended that the pivotal issue is whether the bodies and saliva of dogs are pure or not. If dogs are in fact impure then they cannot be owned unless there is a serious need for doing so.

As to the issue of purity, the main point of contention concerned whether there is a rational basis for the command to wash a container if touched or licked by a dog. The majority of jurists held that there is no rational basis for this command, and that dogs, like pigs, must be considered impure simply as a matter of deference to the religious text. A sizeable number of jurists, however, disagreed with this position. Jurists, particularly from the Maliki school of thought, argued that everything found in nature is presumed to be pure unless proven otherwise, either through experience or text. Ruling that the traditions mentioned above are not of sufficient reliability or authenticity so as to overcome the presumption of purity, they argued that dogs are pure animals. Accordingly, they maintained that dogs do not void a Muslim's prayer or ritual purity. Other jurists argued that the command mandating that a vessel be washed a number of times was

intended as a precautionary health measure. These jurists argued that the Prophet's tradition on this issue was intended to apply only to dogs at risk of being infected by the rabies virus. Hence, if a dog is not a possible carrier of rabies, it is presumed to be pure. A small number of jurists carried this logic further in arguing that rural dogs are pure, while urban dogs are impure because urban dogs often consume human garbage. Another group of jurists argued that the purity of dogs turns on their domesticity – domestic dogs are considered pure because human beings feed and clean them, while dogs that live in the wild or on the streets of a city could be carriers of disease, and therefore, they are considered impure. It is clear from the evolution of these discourses that as nature became more susceptible to rational understanding, complex and potentially dangerous creatures, such as dogs, became less threatening for Muslim jurists.

Aside from the legal discourses, dogs occupied an elusive position in Muslim culture. On the one hand, in Arabic literature dogs were often portrayed as a symbol of highly esteemed virtues such as self-sacrifice and loyalty. For example, Ibn Al-Marzuban wrote a fascinating treatise titled *The Book of the Superiority of Dogs over Many of Those Who Wear Clothes*, which contrasts the loyalty and faithfulness of dogs to the treachery and fickleness of human beings. Dogs were also widely used for protection, sheep herding, and hunting. On the other hand, dogs were often portrayed as an oppressive instrument in the hands of despotic and unjust rulers. Similar to the medieval European practice, in the pre-modern Middle East region, as an expression of contempt or deprecation, at times dogs were hung or buried with the corpses of dissidents or rebels. Furthermore, in popular culture, unlike cats, dogs were considered filthy or impure animals that ought not share the living space of the pious or religiously observant. This cultural anti-dog prejudice survived into modern times, and as a result, the ownership of dogs continues to be socially frowned upon. In the contemporary Muslim world, dog ownership is common only among Bedouins, law enforcement, and the Westernized higher classes. As a matter of fact, it is rather striking that, to a very large extent, modern Muslims are unaware of the pre-modern juristic determinations that vindicated the purity of dogs. Nevertheless, this in itself is a measure of the ambiguous fortunes of the dynamics between Islamic law and nature in modernity. In the pre-modern age, Islamic law evolved in near proportion to the advances achieved in the human knowledge of nature. But as the institutions of Islamic law were deconstructed by European Colonialism, and with the rise of puritanical movements in contemporary Islam, Islamic jurisprudence has ceased to be a forum for creative thinking or dynamic interactions with the vastness of nature.

Dolphins and New Age Religion

Dolphins have become an important icon in the New Age movement, and a large number of publications and websites testify to this. Book titles like *Dolphins into the Future*, *Journey into the Dolphin Dreamtime* and *Dolphins, ETs & Angels* are typical of the genre, as are websites like The Divine Dolphin, Dolphin Connection and DolphinHeart.

At least two lines of thought are brought together to form this icon. One is inspired by pre-modern myths and legends about dolphin-human relations. The other is inspired by high tech, modern science and space travels. Common to both is a notion of a highly intelligent and social animal.

Dolphins have fascinated people in many societies throughout the world. In Australia, for example, a tribe calls itself the "Dolphin People" and believes their shamans to be reincarnated dolphins, whereas on the Butaritari atoll in Kiribati, people believe that spirits living beneath the ocean shed their human form to become dolphins and other small whales when invited to village feasts by hereditary "callers." Upon arriving at the beach, they are slaughtered and eaten. Dolphins have both in Australian and in Northwest Coast Indian cultures been regarded as totem animals, which imposes prohibitions against hunting and consumption of dolphins by the groups having these animals as their totem. (Totemism is a taxonomic system by which animals, plants, and other natural phenomena are used to divide people into groups [e.g. clans], and where the group members have a ritual relationship to their natural phenomenon/totem.) And in the Brazilian Amazon numerous tales are told about dolphins transforming themselves into human beings to take part in village festivals. But it is to the ancient Greeks that modern dolphin enthusiasts most often turn in their quest for inspiration. Dolphins had a semi-divine status in Greek cosmology and they figure prominently in many of the ancient myths. Moreover, a number of legends tell about friendly dolphins capable of assisting people in a number of ways and even saving their lives.

Since the 1960s new elements have been added to these myths and legends. The friendship between people and dolphins of antiquity has become a symbol of an idyllic, primordial relationship between human beings and nature, a relationship allegedly destroyed by modernity. The dolphin stands for nature as a whole, and being good to dolphins has become a yardstick of human evolution. In much New Age literature dolphins are given important

roles to play in our struggle to reunite with nature as well as with our fellow human beings. In this cultural critique, which blames development of modern technologies and the market economy for both our environmental and social problems, dolphins appear as a noble teacher able to guide humans back to sustainable living in harmony with nature. Such views may even be found within more mainstream environmental organizations. A former leader of Greenpeace in Denmark, Michael Gylling Nielsen, for example, asserted that because they are without hands, dolphins are not distracted by mechanical objects and can concentrate on their social skills, emotional self-control and humor, and even develop their intelligence in a spiritual direction. Many writers on dolphins see this pre-tech dolphin as a champion of values and knowledge that people have lost along the road to modernity, such as playfulness, kindness, and caring.

Interspecies communication is a strong element in the dolphin cult. Dr. John Lilly, a psychiatrist, inaugurated research on dolphin language to learn from dolphins their ethics, laws and knowledge that have allowed them to live sustainably for millions of years. Others think that it is possible to communicate telepathically with dolphins. It is claimed that it is particularly beneficial to infants to be born among dolphins, as it is believed that similar brain waves facilitate transmission of dolphin wisdom to the infants through telepathy. A dolphinarium in Eilat, Israel, is among those that have been sought by pregnant women who wanted to deliver their babies among dolphins.

The discovery that dolphins – like bats – navigate and locate their prey by the aid of echolocation or sonar has helped to create an image of a sophisticated, high-tech animal. Dolphins are believed to be able to scan each other in order to diagnose ailments in their comrades and even to cure tumors and cancer (both ideas are taken from the use of ultrasound in modern medicine). From here it is only a short step to the notion of the dolphin as a healer, and a number of swim-with-dolphins programs now offer dolphin therapy. For those unable to meet dolphins in the water, Horace Dobbs – a British psychiatrist and founder of International Dolphin Watch – has for years distributed what he calls “audio pills” consisting of an audio-tape with music combining Westernized versions of Aborigine didgeridoo music and dolphin sounds. According to Dobbs, people with a variety of ailments have been cured by listening to this vibrant *Dolphin Dreamtime* tape. Echolocation is also seen as a means of communication in a three-dimensional mode by which ultrasonic pictograms build up holographic images. The difference between this way of communication and human languages is like the difference between 3D TV broadcasts (not yet invented) and radio broadcasts.

The image of a pre-tech dolphin of a nostalgic past has in the dolphin cult merged with an image of a high-tech dolphin that may even have contacts with galactic forces.

In this cosmology, the dolphin takes on the character of messiah and serves as an instrument or a medium for a divine or cosmic mind. The dolphins have been sent on a mission to save the Earth. The science fiction writer Douglas Adams has in his *The Hitch Hikers' Guide to the Galaxy* popularized this belief. In his novel, the dolphins return to space after giving up their attempt to alert human beings to the impending ecological destruction of the Earth. New Age writers have developed this idea, such as Joan Ocean, who via the internet and in a series of seminars invites people to swim with dolphins and meet “our Extraterrestrial, galactic neighbors” and share their latest messages. Opinions are divided whether the messages are rooted in profound dolphin wisdom or in a cosmic or divine mind outside both dolphins and human beings. Their messages can be received in different ways, not least through “dreamtime,” a concept inspired by literature on the Australian Aborigines. Others may feel a resonance between dolphin crystalline energy fields and cosmic vibrations, bringing them to a higher level of awareness and thereby making contacts with the divine possible.

Despite their engagements with dolphins, organizations promoting mainly a spiritual connection with these animals have played only minor roles in the campaigns against dolphinariums, dolphin hunting and dolphin by-catches in fisheries, campaigns that are led by environmental or animal rights activists. Activists seldom contest views expressed in the dolphin cult, however, and many may in fact be influenced by spiritualism themselves. Indirectly, such spirituality may therefore have considerable impact.

Domanski, Don (1950–)

The titles of Don Domanski's seven poetry books – such as *Heaven* (1978), *Wolf-Ladder* (1991), and *Parish of the Physic Moon* (1998) – indicate the roots of his poetry in both nature and spirituality. For over three decades, his poetry has tried to balance the belief (once quoted from Novalis by Domanski) that “All that is visible clings to the invisible” (Domanski 1986: 7) with the feeling expressed in one of his poems that “the human heart is still / three ribbons tied to a belief / in flesh and form” (from an unpublished poem).

Born in Cape Breton, Nova Scotia, in 1950, Domanski has lived most of the past thirty years in Halifax. His poetry is richly original, with influences ranging from Baudelaire and twentieth-century Surrealists to Wallace Stevens, from ancient Chinese poetry to Rilke, from Buddhist scriptures and Sufi teachers to Hindu, Christian, and Jewish mystics. During an interview conducted in 2002, Domanski humourously called himself “a spiritual free-range chicken, pecking here and there, finding what suits the hunger of a moment” (Domanski 2002: 247). He has also read extensively in the sciences, and collected fossils for many years. He sums up one of his core beliefs in the interview just cited: “The wonder is that anything at all exists” (Domanski 2002: 246). His poetry is also permeated by his sense of the interconnectedness of all things.

Domanski's poetry is less likely to record stages in human history than to hint at the vastnesses of biological, geological time; less likely to describe natural phenomena in their full idiosyncratic detail than to present them as seen by a transforming eye energized by both reason and intuition. Domanski's experience of nature is one of restless, unusually fertile metaphor-making. The shortcomings of language fully to express both the immediate and the ineffable are reflected in his metaphors, his constant renaming and redescribing. Though his poetry includes images of wolves, bears, and whales, it has been especially drawn to small creatures such as ants, moths, snails, mice, and bats. A spider “prays that its buckle / of flesh will last out this night” (Domanski 1978: 34). A finch is “surely not Lucifer / yet in the quick climb / a true competitor for Man” (Domanski 1975: 23).

For all the sustenance his poetry finds in myth and dream, even when Domanski uses words like “heaven,” “angels,” and “gods” he does so with a startling physicality. His “heaven” is not conventionally palatial and golden, but something that “sprawls its unearthly hulk / an inch above the pond / to finger its brainwork of flies” (Domanski 1978: 60). Elsewhere, heaven is “miserable,” “lonely / for wooing / for the dolphin's / sensual flesh” (Domanski 1978: 25). This is poetry in which a god of creation “put on a wool sweater / and felt the tugging of sheep / down the back of it” (Domanski 1986: 67), and in which angels have “pen-names / like Michael and Israfil /

but know themselves as larvae / twirling in a man's ear” (Domanski 1975: 54). It is a poetry that delves deeply into the borderland between the visible and the invisible.

Domestication

Among the seminal processes that characterized the evolution of human culture, one of the earliest was human-kind's developing awareness of the surrounding physical world. This led, inevitably, to attempts to explain this world and the human relationship to it, attempts which found expression in the emergence of philosophical and religious belief systems. All such systems, whether relatively simple and localized in character or the subsequent complex, institutionalized structures of the world's great religions, contain elements that focus on these concerns. Among tribal peoples, for example, “nature” (in its broadest sense) provides sustenance, and is inextricably linked with fertility and fecundity, and the mysteries of birth, life, and death; the elements of nature that direct these forces have to be dealt with – controlled, where possible, or propitiated or appeased through ritual and sacrifice. Among more advanced philosophical and religious traditions, however, humanity's place in the world is formalized in doctrine and dogma. In religions originating in South Asia, for instance, humans are a part of nature and subject to the same guiding principles. This is quite different from Western views of the world, which place humans apart from nature and in dominion over it.

One aspect of this “dominion” over nature is seen in the domestication of plants and animals. Precise definitions of what “domestication” actually involves is a matter of considerable scholarly debate, but the concept invariably encompasses human control of the reproduction of plant and animal species, usually for utilitarian purposes and commonly to provide sustenance – a process that

invariably results in genetic differentiation between wild and domesticated forms of the species involved. Domestication has occurred in many locales and with many different species and at many times in the past, but the domestication of cereals and of herd animals that occurred in the ancient Middle East around 8000 B.C.E. is widely seen as the *sine qua non* of the beginnings of agriculture, the rise of the earliest urban civilizations, and associated emergence of complex social structures and formal religious systems.

The origins of agriculture, along with the motivations for, and the processes of, domestication represent important themes in Western thought. Numerous theories have been put forward to explain these origins, from the cyclical Golden Age theory of classical times to the “Three Stages of Man” theory of the nineteenth century, to various hypotheses of the modern era. The latter include the evolutionary thinking of Robert Braidwood and David Rindos (domestication is the result of natural evolutionary processes involving contact between humans, plants and animals), environmental challenges (e.g., the climatic change proposed by V. Gordon Childe and Charles Reed), economic factors (e.g., the population-pressure theory of Mark Cohen), social mechanisms (Barbara Bender and Brian Hayden) and the ecological model of Kent Flannery.

A common thread underlying many of these theories of agricultural origins is that domestication was undertaken for the purpose of developing food supplies. Such interpretations, however, have been challenged by scholars who argue for non-utilitarian motives for domestication. In the late nineteenth century, the German geographer, Eduard Hahn (1896) proposed a religious motivation for the domestication of herd animals, especially cattle. He noted that the usefulness of wild cattle for labor or milk could not have been foreseen until after they had been domesticated, and that initial interest in them was as sacrificial animals. Hahn specifically proposed that common cattle were the first herd animals to be domesticated; and that they were domesticated in Mesopotamia to provide animals for sacrifice in fertility rites dedicated to the lunar mother-goddess.

Hahn’s ideas were taken up and elaborated by the influential cultural geographer Carl Sauer and others during the middle and later decades of the twentieth century. Animals were often domesticated, Sauer argued, less as a food source than for ceremonial or ritual purposes (1952). Erich Isaac restated Hahn’s view that the motive for domestication of cattle in western Asia was religious rather than economic (1962). In their study of the *mithan*, a free-ranging, domesticated bovine of the northeastern hills bordering the Indian subcontinent, Frederick and Elizabeth Simoons, concluded that the animal was probably domesticated for sacrificial purposes. The Simoons suggest similar processes at work in the domestication of common cattle in the ancient Near East, though there –

unlike in South Asia – economic functions subsequently came to dominate the initial ritual role of cattle.

Religious motivations for the domestication of cattle in the Ancient Near East have come to be challenged in the light of the archeological record. However, some scholars see religion playing a significant role in the process by which stable, sedentary agricultural societies (i.e., societies whose economies were based on domesticated plants and animals) emerged in Southwest Asia. Jacques Cauvin (2000), for example, notes the explosion of religious symbolism associated with the Neolithic in this region and argues that a religious revolution preceded the shift from hunting and gathering to farming. Çatal Hüyük, an important archeological site near Konya on the Anatolian plateau of Turkey, shows remarkable evidence of thriving fertility cults dating to as early as 6500 B.C.E. embracing a mother-goddess, a bull-god, and cattle. The site also shows the presence of both wild and domesticated forms of cattle at approximately the same time. Such evidence has led Ian Hodder (1990) to speculate that agriculture, surrounded by ritual, was adopted not for the purpose of ensuring food supplies, but as a metaphor for human domination over nature.

Whatever the validity of arguments for religious motivations for the domestication of cattle in the Ancient Near East, there are other instances where religious or ritual motivations for the domestication of specific plants and animals have been proposed. Some scholars have suggested that cereals were domesticated to produce beer for ritual purposes prior to their use as food. Turmeric and other dye plants may have been domesticated for religious reasons. Isaac (1970) has argued that the citron was domesticated for ritual purposes, and that its spread through the Mediterranean region was tied to the Diaspora and the citron’s role in Jewish ritual. He also cites the domestication of the cat in ancient Egypt as being the clearest case of religious motivation in the domestication of an animal (the cat was the epiphany of the Egyptian goddess Bast). Sauer proposes that the chicken was originally domesticated in Southeast Asia for cock-fighting purposes, representing, perhaps, a ritual reenactment of some mythological divine combat. Certainly, the association of the cock-crow with sunrise and the identification of the poultry egg with death, rebirth and fertility (e.g., the “Easter egg”) are ancient ideas held in widespread areas of the Old World. Similarly, the pigeon played a significant role in the religious conception of early farming communities in the ancient Near East, becoming a symbol of the mother-goddess. This symbolism appears to have been adopted in Christianity, and even today the dove continues to be a universal sign of peace.

Examples of domesticates from the New World, with its different fauna and flora and history of human settlement are more limited, though they do occur. Raúl Azúa has suggested, for example, that in MesoAmerica, macaws,

some parrots and several songbird species were domesticated for religious purposes, while howler monkeys, hares, quail, and woodpeckers were maintained in captivity for ritual purposes.

Domestication is a process by which humans have extended their control over nature, bringing certain plant and animal species under their direct control. The first domestication of cereals and herd animals in the Ancient Near East nearly 10,000 years ago led to a significant change in the nature of humans' relationship with their environment, one that had remained relatively unchanged since the species *Homo sapiens* first appeared on Earth. The more assured food supply permitted the emergence of permanent settlements, population growth, the rise of cities, social stratification, religious systems, technological advances – indeed, all the features commonly identified with “civilization.” Traditional views propose that domestication was undertaken for utilitarian reasons, but these views have been challenged by those who argue that a religious revolution preceded the emergence of agriculture and that religious belief and practices may have played a critical role in this process. Whatever the validity of this view, numerous examples exist where religion and ritual may have been involved in the emergence of specific domesticates. Religion has, in a sense, acted as an arbiter between humans and nature. It has allowed humans to explain their place in the natural world, but has also allowed them to dramatically change the character of this very same world. The domestication of plants and animals has been one means by which the latter has been accomplished.

Donga Tribe

The “Donga Tribe,” as they came to be called, were a group of 15–20 young people who lived for most of 1992 directly on Twyford Down in an effort to stop the land from being destroyed for the M3 (Southampton–London) motorway. Twyford Down was apparently “the most protected site in Britain,” its chalk downland the habitat for a number of rare species, ensuring that several areas were designated Sites of Special Scientific Interest. Twyford Down had long been an area of human habitation; a barrow containing excavated skeletons was just one of several Scheduled Ancient Monuments. The whole Down was an Area of Outstanding Natural Beauty.

Another Scheduled Ancient Monument on part of the Down was the iron-age trackways where the Dongas had their camp. These trackways were first called “Dongas” nearly a century ago by the two ex-Winchester private schoolboys who left Twyford Down in the protection of Winchester College in their wills. Dongas is the Matabele word for the same type of humanmade gullies and remained the local word for the trackways. The group of

people who came together to protect and live on the land “acquired” the name the Donga Tribe, and this self-identification with the land itself quickly became explicitly tied to their political and spiritual beliefs.

The Dongas, Earth First!ers, and other activists (needless to say, these identities blurred) who, over the course of the protest, delayed the motorway construction through their direct actions, were the catalyst that sparked a decade of roads’ protest and related direct action in the nineties, and up to the present day. The Dongas were, to borrow Sidney Tarrow’s term, “early risers” in this protest cycle, and thus their actions and worldviews had a significant influence on the wave of activists who followed. In turn, many of these ideas had diffused down from Greenham Common women – whose long-lived anti-nuclear protests became a model for the Dongas activists to emulate.

In the first stages of the protest (autumn 1992), the primary action strategy was to defend the land from “attacks” by the contractors and their machinery; a regular occurrence was the arrival of bulldozers on the Donga end of the Down, activists lying down in front of the machinery, and the retreat of the bulldozers. This changed on “Yellow Wednesday” (9 December 1992 and, ominously for the Dongas, the date of a full moon lunar eclipse) when for the first time security guards were hired to forcibly remove the Dongas and other activists from the site. The three-day eviction sparked accusations of security and police violence, national media coverage, and a resurgence of protest at Twyford in 1993. “Site invasions” – charging onto the increasingly vast (40 meters deep, 250 meters wide, a mile long) scar through the Down and stopping the machines working – became a regular occurrence, sometimes attracting hundreds of people.

Underpinning the political direct actions of the Dongas was an ethical framework, an explicit spirituality – or to be precise, a political paganism. The Dongas explicitly articulated a sense of connection to nature; nature was seen as sacred. Crucially, the Dongas saw themselves and all life as part of this web: nature was not some “other.” These concepts (most people were familiar with Lovelock’s “Gaia” theories) were linked to ideas about significant landscapes and Earth energies. The Down, and the nearby hillfort St. Catherines’ Hill, were “powerpoints,” markers for currents of Earth energy or ley lines. The Dongas were not alone on this; the founder of Winchester College, also a Mason, was also a keen sacred geometer, and to this day, Winchester College schoolboys hold a service on the Hill on summer solstice morning.

The Dongas felt that these beliefs would have been shared by the Bronze and Iron Age people who had lived on the Down. Identifying with sacred landscape thus meant identifying with these earlier “tribes.” They felt such a connection to the place and its history that they produced stories, poems, songs and myths about wheels come full circle, new tribes, old ways. Conscious parallels

were also made with the beliefs and political land-rights struggles of indigenous tribes worldwide.

Magic reality, myth-weaving and sympathetic magic melded into direct action. Believing themselves protected by the land that they physically defended with their bodies, they symbolized this protection and called it into being with the use of significant images and objects. Music, especially drumming, and invoking protection through chants and songs, often preceded action, and went on during it. The Dongas would stop work for the day by running onto a worksite at the other end of the Down, dressed in a wicker and cloth dragon and sitting on the machines. They would meet the advancing bulldozers with (for example) goddess chants, faces smeared with chalk from the Down, sage sticks – the purifying herb used in ritual by the North American Indians – and hazel pentacles (the pentacle symbolised protection and the five elements – Earth, air, fire, water and spirit). Their camp was protected by a ditch that they dug in the shape of a dragon (the dragon symbolized Earth energy), runes, and a hawthorn hedge. Women on the camp would go out on moonlit nights and make very personal magic, planting (for example) garlic bulbs (as a purifying herb, garlic symbolized protection) and other objects of personal importance on the boundaries of the land. They would sing, invoke (most often) the moon, and ask for the land to be protected.

Simply on the level of group psychology, this meld of ritual and direct action worked well, uniting and empowering the group and making the digger drivers (and later the security guards) very wary. In the early days, it was significant how the bulldozers always stopped at the dragon ditch boundary at the edge of the camp. On the first night of “Yellow Wednesday,” when the lunar eclipse started and the (outnumbered) Dongas broke back onto the land now defended by security guards, the guards huddled around their fires as the Dongas danced. Dozens quit their jobs the following day.

Donga paganism was of a very earthy, “hedge-witch” nature (i.e., closer to country herbalism than anything else). Thus plant identification, noticing what was in season and making herbal remedies with the results such as comfrey root ointment for bruises and rosehip syrup for colds was a mainstay of Donga paganism. Everyday nature, the facts of life, growth and change, were at the heart of what was seen as magical. Similarly, the Dongas observed and celebrated natural cycles such as full moon and winter solstice with fire, music, drumming, circle-dancing and often the ingesting of “magic mushrooms,” an indigenous hallucinogenic mushroom which, whilst “recreational,” also enabled shamanic connection to the Earth/universe, increasing the sense of sacredness. On such nights (and on many others), protection “spells” for the Down were made up on the spot during drumming and chanting sessions like performance poems, very

differently from formalized ritual. “Male” and “female” energies present in living things were celebrated, articulated in archetypal ways – the Green Man, the Triple Goddess (maid/mother/crone; also linked to the moon, new/full/waning). One such “spell” sung straight out went: “green man of sap springing / moon lady water flowing / both bound together / protect the land around us.”

It should be emphasized that the Dongas did not claim to see these essences actually manifesting (unless they had eaten many magic mushrooms). Rather, they were symbolic ways of reestablishing connections to nature, and, as importantly, to history.

Such everyday “cookbook” eco-magic was tied into ideas about living lightly on the Earth through living communally and sustainably. The Dongas lived in benders (like rounded tepees) made from saplings and tarpaulins, ate communal simple meals, buried their feces, etc. Such alternative lifestyles were seen as providing at least partial solutions to overconsumption and an anthropocentric alienation from nature, viewed as the modern (Western) condition. Critiques of Christianity’s role in creating cultures/structures of patriarchal anthropocentrism and dislocation from nature were a common thread, concentrating on such manifestations as the power implications of burning village midwives and herbalists as witches, the loss of animism, and the like. Such discourses, and the political paganism, link Donga spirituality to eco-feminist, deep ecology, and social ecology perspectives, as such distinctions often blur among and within individuals.

P Dragon Environmental Network (United Kingdom)

Dragon was founded in London in 1990 to link environmental action with a magical practice called “eco-magic.” Founding members sought a practical expression of the pagan belief that “the Earth is sacred.”

Dragon’s practical work began with woodland conservation, but within months we became involved in the campaign to save Oxleas Wood. Dragon worked closely with other campaign groups providing practical as well as eco-magical support. We initiated a postcard campaign and petition, published a school information pack on the Wood and helped organize fundraising events.

Dragon initially kept our magical work secret, but allowed it to become public knowledge once our practical work was proved. Oxleas Wood became a major campaign success when the road project was shelved in July 1993. As Dragon became more widely known, the need arose to establish basic principles that allowed flexibility but clearly established our identity.

We agreed that:

1. Dragon believes that the Earth is sacred.
2. Dragon is a decentralized network – a web of people working together on local, national and international issues.
3. Dragon combines practical environmental work with eco-magic. Each is as important as the other and it is through this synergy that we focus our vision for change.
4. Dragon is committed to nonviolent direct action.
5. Anyone who shares our principles and aims is welcome to join, regardless of their religion or spiritual path.

Our aims were defined as to:

1. Increase general awareness of the sacredness of the Earth.
2. Encourage Pagans to become involved in conservation work.
3. Encourage Pagans to become involved in environmental campaigns.
4. Develop the principles and practice of magical and Spiritual action for the environment (which we call “eco-magic”).

With Oxleas Wood safe, Dragon became more involved with the M11 road protests in East London and the Twyford Down campaign. The Dongas Tribe, who were encamped on the Down, were natural allies, although Dragon remained an essential urban pagan group.

Dragon grew throughout the early 1990s reaching a membership of over 300 in 13 local groups. The organiza-

tion was particularly active in road protests and nature conservation, and published a regular newsletter discussing environmental issues and eco-magic.

The mid-1990s marked a peak of activity. Dragon became involved with many campaigns including protests against the Criminal Justice Act, road building at Solsbury Hill and Newbury, and the Manchester airport campaign. Conservation work continued, and the Essex Dragon group started to manage woodland for the regional Wildlife Trust. Positive media coverage of Dragon improved public perception of Pagans, while environmental concerns proved to be fertile ground for interfaith work. But despite, or perhaps because of, this success, Dragon needed to change.

The influence of eco-paganism meant that by the mid-1990s eco-magic had become common at campaign sites in Britain. Some Dragon members felt that eco-magic had become a movement that was beyond any one organization, so Dragon increasingly adopted a networking role.

Meanwhile, internal concerns that Dragon had become a campaigning rather than a magical organization led to an increasing focus on eco-magic. Dragon now encourages the development of eco-magic through conferences and a journal. The Dragon website has a selection of eco-magic workings and a links to an email discussion list.

Dragon has become part of a global movement and, instead of membership, holds a register of eco-magic practitioners. Joining the Network is free and open to all. Although Dragon welcomes people from all magical traditions, we have evolved an eco-magic that is strongly influenced by Starhawk. Dragon rituals, which typically include drumming, dancing, chanting and simple ritual, blur the distinction between ceremony, performance and political action. Dragon has organized open ceremonies at protest sites, during the illegal "Reclaim the Streets" street parties, and at nightclubs.

The Dragon World Tree Rune, a central symbol for the Network, is a sigil combining several runes. The Dragon Rune has been drawn onto machinery, buildings and trees, used in ritual and meditations and worn as a talisman.

Mainstream campaigners typically show a skeptical tolerance of eco-magic, while grassroots protestors often invite it. Dragon works mainly with grassroots groups, although there has been constructive cooperation with Friends of the Earth, Surfers Against Sewage, the Wildlife Trust and local councils.

Several campaigns illustrate Dragon's commitment to social protest as well as narrowly defined environmental campaigning. The M11 campaign, for example, was as much about the destruction of an urban community as the environmental impact of a road.

The Dragon Network resists a final definition. Although the Network has specific principles, it encourages constant

reinterpretation and ultimately belongs to whoever practices eco-magic.

Druids and Druidry

Contemporary Druidry, notionally derived from the ancient religion and philosophical system of the Celts as described by classical authors and later Christian commentators, is a highly eclectic phenomenon. There is considerable variety within Druidry (Pagan Druids, Christian Druids, New Age Druids, CyberDruids, syncretistic Zen Druids and Hassidic Druids) and differing levels of commitment, formality and seriousness among Druids.

The earliest references to Druids come from classical authors, who remark upon their level of learning (acquired over many years of study), and their ritual use of mistletoe, oak trees and groves. The social and religious position of the Druid described in classical literature is often equated with that of the Brahman in Hinduism, a tradition with which Druidry is frequently compared. Bards (concerned with poetry, genealogy and music) and Ovates (specializing in healing) were also part of this system. Classical accounts of human sacrifice are rejected by some modern Druids as a slur by hostile outsiders, while others explain that for a willing victim acting for the good of the community it would have been a great honor.

Although for centuries Druids were depicted as the pagan enemies of Christianity, their image underwent considerable rehabilitation in the eighteenth century. Antiquarian and Anglican cleric William Stukeley characterized Druids as proto-Christians who had come to Britain "during the life of Abraham, or very soon after," with a religion "so extremely like Christianity that in effect it differ'd from it only in this; they believed in a Messiah who was to come, as we believe in him that is come" (in Piggott 1989: 145). Welsh patriot, freemason and Unitarian Edward Williams – better known as Iolo Morganwg – presented and promoted what he claimed was an authentic, ancient Druidic tradition of the British Isles which had survived in Wales through the bardic system, a distinctive Welsh language poetic tradition. He held his first Welsh Gorsedd (assembly of bards or poets) in 1791 on Primrose Hill in London. In 1819, Morganwg's Gorsedd became affiliated to the Welsh Eisteddfod (itself an eighteenth-century revival of a medieval literary and

musical competition), which promotes Welsh language and culture, and is still held annually in Wales. Morganwg claimed that ceremonies were to be held outside, within a circle of stones (at Primrose Hill he carried stones in his pocket for the purpose) and “in the eye of the sun”; they were to start by honoring the four directions. He also taught the Gorsedd Prayer, which he attributed to an ancient bard:

Grant, O God! thy refuge,
And in refuge, strength,
And in strength, understanding,
In understanding, knowledge,
In knowledge, knowledge of right,
In knowledge of right, to love it,
In loving it, the love of all essences,
In love of all essences, love of God,
God and all Goodness

(in Morgan 1975: 51)

Morganwg’s claims and writings were accepted as genuine at the time, and it was not until the late nineteenth century that they were denounced as imaginative elaborations or forgeries.

Many modern groups trace their roots to the eighteenth-century Druidic “revival,” particularly the Ancient Order of Druids which in the nineteenth century spread widely in America, Canada, Australia and Europe. A number of those involved with the late nineteenth/early twentieth-century Celtic revival (such as W.B. Yeats) were involved in Theosophy, which in turn had an impact on how Druidry was envisaged. Broadly speaking, three main strands of Druidry emerged in the nineteenth century: cultural Bardism on the Welsh model, with its linguistic, literary and cultural focus; “mutualistic” Druidry, primarily concerned with its members’ welfare; and esoteric or religious Druidry. This third strand developed and flourished in the twentieth century, with a great proliferation of new Druidic groups in Britain, Ireland, Europe, America, Australia and New Zealand, in parallel with the growth of paganism, alternative spirituality and Celtic religiosity.

Modern Druids generally observe the Celtic or eightfold calendar, although nowadays some ceremonies (particularly relating to Imbolc, Beltane, Lughnasagh/Lammas and Samhain) may be held on the nearest weekend to allow more people to attend. Rituals are held “in the eye of the sun” (i.e., usually in the middle of the day), the spirits of the four directions are honored, and Morganwg’s prayer is said (sometimes adapted to include God *and* Goddess, gods, or whatever is appropriate to the group). Ceremonies tend to reflect on the time of year, the passing of the seasons, and connectedness with both the land and the ancestors. Some groups are keen on what are regarded as “traditional” long white robes, while others innovate or

leave dress style to individual taste. Becoming a Druid in some groups involves instruction, initiation and a cumulative three-stage process, from Bard through Ovate to Druid; other groups regard these three as distinct and complementary roles, and are less formal or completely informal about membership criteria.

The connection between Druidry and Stonehenge, popularized by Stukeley in the eighteenth century, continues to be articulated and acted upon by Druids in England, for whom the issue of access to the site for ritual purposes has become a matter of religious and civil liberty. While some Druids believe that Stonehenge and similar monuments were built by or for Druids, others argue that although their building may predate the arrival of “historical” Druids, they are of such obvious sacredness and significance that Druids would have used them as ritual sites. The “archeoastronomy” of writers such as Thom (1967), Hawkins (1965) and Hoyle (1972) has reinforced views of the importance of the solstices and the advanced scientific knowledge of the ancients. Numerous new stone circles have been and continue to be built for ritual purposes by Druid groups in the British Isles, Europe, America and the Antipodes. While many prefer to perform ritual at ancient sites such as Stonehenge and Avebury where possible, some Druids argue that rather than traveling to distant sites, people should be honoring and sacralizing their local landscape.

As some regard Druidism as the original native spirituality of the British Isles, the incorporation of elements from “other” indigenous traditions seems logical; thus didgeridoos and drumming are commonplace at Druid rituals, there are Druidic sweatlodges, and Druidry is commonly equated with shamanism. Some Druids resident in countries such as North America and Australia use Druidry as a means of expressing their Celtic heritage and practicing what they consider their ancestral religion; others strive to make creative links between Druidry and the land, spirits, people and religious practices of the places where they now reside.

The close connection between Druidry and the land is frequently articulated. One of the aims of the Order of Bards, Ovates and Druids (OBOD) founded in 1964, is “to work with the natural world, to cherish and protect it, and to co-operate with it in every way – both esoterically and exoterically.” The Charnwood Grove of Druids in England declare,

We believe that people working together are capable of raising power which can balance and heal the Earth. We focus our energy at local sacred sites and we honour the Celtic god and goddess forms as personifications of the land and the seasons (1997: 33).

Many Druids are committed to schemes for planting woodland, and some have been involved in protest action

against the destruction of ancient sites, landscapes or forest. The various courses that orders and individuals now run on Druidry tend to include instruction on sacred trees, animals and plants, and herbal lore. "Awen," traditionally understood as the poetic or creative inspiration particularly associated with Bards, is more broadly interpreted by the British Druid Order as "the divine inspiration that flows, spirit to spirit, between the people, the land and the ancestors."

Just as Stukeley considered Druids proto-Christians, there are Christian Druids who see Druidry as both precursor of and complementary to Celtic Christianity. Indeed, many feel that Celtic Christianity became the repository of Druidic wisdom, accounting for what are seen as its distinctive features, such as awareness of nature and holism.

Modern Druidry is symptomatic of the flexibility and creativity of contemporary spirituality generally, and the ways in which people look to the past to create something meaningful for the present. While aspiring to continuity in relation to ideas and practices from earlier periods, Druidry becomes ever more diverse and globalized in its beliefs and praxis.

Drums and Drumming

Rhythm is a repeating pattern of beats marking the passage of time. It is embodied in the cycles of nature: of life and death, evaporation and rain, the sequencing of ocean waves and tides, the inhalation and exhalation of animal breath, the donning and shedding of leaves. Earth is a planet heavily influenced by the recurrent phases of an orbiting moon, dependent upon and defined by its steady pace around the sun. The consistent heartbeat of the mother is the first sound a fetus hears afloat in the womb, and a child is born into a rhythmic world. In a sense, the health of an individual or ecosystem is the result not only of its diversity, but also of the polyrhythmic interaction of its constituent parts. Taking this metaphor a step further, it is as though in its practiced separateness civilized humanity has gotten "off beat," out of synch with the overall composition of greater creation.

Rhythm can be an aid to reconnection, and the drum is an instrument of rhythm. Drumming has the potential to lead both the player and the engaged audience into deep sensory and emotional contact with their natural selves, each other, and the natural world of which they are an integral part. Played rhythms can reflect and at times entrain with the rhythms of the body, suspending normal cognition and intellection and leading to an expansive feeling of connection or oneness. The result may not only be musical but religious.

Ethnomusicologist Fredric Lieberman and Grateful Dead percussionist Mickey Hart have written in their book *Planet Drum*,

Our word religion comes from the Latin and means "to bind together." A successful religion is one that binds together all the fundamental rhythms that each of us experiences: the personal rhythm of the human body, the larger social rhythm of the family, tribe, or nation, and the enveloping cosmic rhythms of the planet and universe. If a religion "works," its followers are rewarded with a new dimension of rhythm and time – the sacred (1991: 17).

For "primitive" indigenous peoples the meaning and success of human affairs is often held to be determined by nature spirits or forces. The drum is a vehicle for the shaman to access the realms of these spirits, in order to bring back to the people the wisdom and songs found there. The medicine elders of many tribes and traditions – such as the Inuit of Canada, the Huaorani of Ecuador and the Siberian Buriat employ distinct mesmerizing rhythms for the purpose of encouraging an altered state that can lead to sacred visions, heroic spiritual assignments or miraculous cures.

Drums produce the low-frequency "steep fronted" sonic impulses that most strongly affect the auditory cortex.

Commercially available biofeedback machines indicate that the psychically aroused “alpha/theta border” occurs when the electric brain waves are pulsing at a rate of six to eight cycles per second – the predominant tempo of Haitian Voudo music and African trance dancing. The theta state occurs after sex and right before sleep, the twilight phase when linear thought succumbs to free-form images, and awareness of the narrowly defined self is supplanted by identification with the shifting fields of an organic whole.

Drumming and ecstatic dance are common elements not only of primitive land-based tribes, but also of many contemporary gatherings featuring a synthesis of spirituality and nature including Eugene, Oregon’s Environmental Law Conference, the annual Earth First! Rendezvous, the Rainbow “tribal gatherings” in the U.S. and Europe, and pagan festivals such as Starwood in Ohio or the solstice and equinox events at Stonehenge, Great Britain.

The drum’s purported ability to provoke personal religious experience was understandably threatening to various state churches and their far-flung missionaries, as was its tendency to excite behavior that the Christianized Roman Empire ruled “licentious” and “mischievous.” Portuguese colonizers in Brazil in the sixteenth and seventeenth centuries enforced laws against the percussive music of their African slaves. The sound of Native American drums was sometimes enough to trigger a violent response from the U.S. Cavalry during the messianic religious revival of the late 1870s known to historians as the Ghost Dance. Since the 1960s drums have been a regular feature of environmental protests throughout the world, from efforts to save the Daintree Forest in New South Wales, Australia, to “drum-ins” at the Nevada nuclear test site. Ecoactivist drummers include Starhawk, an acclaimed author and Wiccan priestess known for her community organizing and environmental stance.

The styles of drums range from tiny Asian finger drums to the giant hanging barrel drums found in various Buddhist temples in Japan. Some have one head, others are covered at both ends. Hand-held open-frame styles were popular with Siberian shamans as well as the Druidic priests of ancient Great Britain. The most popular hand-made drums in America today are designs that originated in Africa: the narrow-bottomed ashiko, and the hourglass-shaped djembe. Until the introduction of the first plastic heads in the 1950s, drums were built entirely of natural materials. Their womb-like shells were usually constructed of wood or clay, with animal-skin heads stretched tight with the help of iron bolts and rings, or with cord laced at the sides.

The carvers of ceremonial drums take into account the religious symbolism of the materials they are made with. The bodies of the instruments may be sculpted into the shapes of animal spirits, dyed with sacred minerals or shed

blood, or hung with fur and feather. In Cuba as late as the 1860s priests of the Abakua brotherhood are said to have used drums made out of human skulls during their funeral rites, alongside symbols of resurrection. In ritual terms, the impermanence of life is made more bearable through the apparent impermanence of death.

Other traditional percussion instruments employed for ceremonial and spiritual purposes include rattles, shakers, gongs, bells, claves (wood blocks), the African m’bira (thumb piano), and the Brazilian berimbau – a wire affixed to a wooden bow, struck with a painted stick, and with a coin eased against the wire to affect a haunting vibrato. In the creation of rhythms the player becomes a part of a process that goes back to the very beginnings of time.

“A sound precipitates air, then fire, then water and Earth,” Joseph Campbell wrote, “and that’s how the world becomes. The whole universe is included in this first sound, this vibration . . .” (in Hart and Lieberman 1991: 11).

Dualism

Dualism refers to a view of reality as divided into two incompatible parts. Early forms of dualism focused on the division of good and evil, embodied in two divinities. The religion of Zarathushtra for instance, emerging approximately 600 B.C.E. and located in the area of what is today eastern Iran, identified a good and an evil spirit who are locked in battle. Since no middle ground exists between good and evil, humanity needs to decide on which side to stand. This divine dualism, however, does not imply a dualism between spiritual and material reality or between religion and nature. The good spirit is seen as the creator of the material world, and even though the evil spirit has

SP Dualism – A Perspective

Religious reflection instigates resistance to the exploitation and devaluation of nature in its critique of dualism as separation of spirit and matter, and where it locates God not only in relation to humanity but also in relation to nature. This position finds support not only in the religious traditions of Judaism, Christianity, and Islam, but also to a certain degree even in Zarathustra's ancient religion which promoted its own kind of dualism. The difference between Zarathustra's dualism of good and evil and the dualism of spirit and matter promoted by the Gnostics shows that dualism as such is not in itself a problem for the relation of religion and nature. A clear distinction of good and evil that does not shy away from naming destructive forces and dares to call for open resistance may well help in resisting the exploitation of nature. An insistence of God's otherness not in terms of the tension between spirit and matter (or transcendence and immanence) but in terms of the tension between liberation and oppression/exploitation may indeed strengthen the relation of religion and nature. Not dualism in general but the dualism of spirit and matter and the related dualism of humanity and nature are, therefore, at the root of the problem. These latter dualisms endorse a devaluation of matter and nature and are thus unable to resist the increasing exploitation

of nature and the material world which has acquired a whole new dimension with modernity and the industrial revolution.

At the dawn of the new millennium, one more step in the metamorphoses of dualism needs to be mentioned. In the world of the postmodern global market there is a new shade of dualism that takes on quasi-religious legitimacy due to the fact that it is considered as rooted in ultimate reality. This dualism poses new challenges. Here the increasing pace of commodification – of turning more and more of reality into commodities whose value is determined by the market – extends ever further beyond nature and the material world to human beings and even to what might be considered the “spiritual world.” In this situation, the dualism between humanity and nature (anthropocentrism) is no longer the primary issue. A new form of dualism, between a world of pure economic value (venture capital, stocks and bonds, the fiscal “bottom line”) and a world in which most of humanity and nature are lumped together as subservient to the economy (defined by economic value for instance as raw material, as producers of commodities, as commodities, or as without value due to lack of employment or use for the economy) poses new challenges to religious reflection and invites new forms of resistance.

Joerg Rieger

also had a hand in the creation of things like demons and “noxious creatures,” the material world is not bad in itself or inferior as such.

The later religious systems of the Manicheans (a group that also originated in Iran) and of the Gnostics in the early centuries of the common era expanded their divine dualisms to include a dualism between spiritual and material reality. Here the material world is no longer the creation of the good spirit; rather, the material world is the work of an inferior spirit, often called the “Demiurge” in Gnostic systems. The material world, including nature and the human body, is thus less than perfect. Perfection can only be found in the spiritual world. In the Manichean and Gnostic dualisms, salvation no longer aims at living a harmonious life in the material world and in nature in accordance with the will of the good spirit (Zarathushtra's religion, by contrast, even included reflections on the divine quality of the sowing of grain). Salvation now aims at finding ways to sever one's ties with the imperfect material world and to find refuge in the perfect spiritual world. Dualism now includes the incompatibility of the material and the spiritual, a position that has wide-ranging implications for the relation of religion and nature.

In the modern study of religion and nature, this latter dualism between the material and the spiritual seems to

be invoked in the argument of medieval historian Lynn White and others after him that Christianity, particularly in its Western form and in contrast to ancient paganism and Asia's religions, established a dualism of nature and humanity that made it “the most anthropocentric religion the world has seen.” This dualism has been used to endorse the mastery of humanity over nature. In light of this often repeated critique, however, it is well to recall that such a strong dualism does not seem to be warranted by Jewish and Christian beliefs that Godself is the sole creator of the world and that this creation is good in God's eyes (Gen 1:31). In Islam, too, Allah is seen as the creator of the world, a conviction that does not allow for a strict dualism of matter and spirit and implies a positive view of the world and the imperative to preserve it.

Nevertheless, it is true that followers of Judaism, Christianity, and Islam have not always managed to resist dualistic images. Christianity, in particular, has often harbored a residual dualism between humanity and nature that is paralleled by other dichotomies between spiritual and worldly things and between mind and body (frequently based not only on Gnostic influences but also on internal developments, such as misreadings of the Pauline dichotomy between “flesh” and “spirit” – a dichotomy that does not necessarily refer to a dualism of matter and spirit but to two different ways of living in the world [Gal.

5:19–22]). With the Enlightenment and the industrialization of the West, these dualisms have been further extended to dualisms of producer and product, of culture and nature, and of subject and object, all of which have had detrimental effects on the relation of humanity and nature.

In recent history there has been increasing awareness of the connection between dualisms that have led to the exploitation of nature and other exploitative relationships. Feminists and feminist theologians have exposed links between the dualism of matter and spirit and the dualistic images of maleness and femaleness. Ecofeminists have taken this critique further and located dualism in three phenomena, including (1) classical thought and certain aspects of the Jewish and Christian traditions, (2) the Enlightenment emphasis on human autonomy, objective knowledge, and mechanistic thought, and (3) the dichotomy of Earth and a transcendent God. Similar arguments are now also made from a Latin American point of view, where Brazilian liberation theologian Leonardo Boff identifies the core problem of religion and nature as the dualistic separation of people and nature.

Dualism, it has been argued, has contributed to the economic exploitation of nature, justified the depletion of natural resources, and led to the destruction of nature. The main problem with the dualisms in question is not merely that they divide reality, but that this division leads to subordination and to a structure of service according to which one part of reality must serve the other: nature must serve humanity, women must serve men, and the body must serve the mind. Dualism, therefore, results in a form of anthropocentrism where everything is subordinated to the concerns of humanity, which is seen as a manifestation of the spirit, and – as feminists would add – in androcentrism (male-centeredness) where everything is subordinated to the desires of men.

If dualism is thus identified as the problem, the remedy is often seen in establishing unifying relationships. Notions like “organism,” “community,” “wholeness,” “interdependence,” “connectedness,” and “mutuality” are considered to provide antidotes to dualism and separation. Process theology has promoted a natural theology on the basis of the philosophy of Alfred North Whitehead, which relates nature, humanity, and the divine without giving up the distinctions between them. In this way, process thinking counters the often overly mechanistic worldview of modern science (mirrored in industrial and other economic developments), which relegates nature and the world to a lower level of existence and shows little concern about its well-being. New Age spiritualities, incorporating insights from multiple religions, have rediscovered mystical and cosmological traditions in order to heal the gaps (see, for instance, the work of Matthew Fox and Western efforts to incorporate Eastern spirituality). Others, like the Brazilian theologian Ivone Gebara have

talked about relatedness as “primary reality.” The North American theologian Sallie McFague praises ecological thought because it transforms the division of subject and object in modernity into relationships between subjects and proposes to rethink the world as nothing less than the “body of God.” Ecofeminism adds an understanding that relationship is not uniform but permits diversity and a complex web that respects differences of race, class, and national boundaries.

Dualist Heresies

Dualist heresies, beginning with Gnosticism, basically held that there was a fundamental antagonism between the world of matter and the world of spirit. Good was posited in the spiritual sphere and Evil in the natural. Some systems held that the evil, created world came into being because of a revolt against a primordial spiritual god. Others believed that there were two coeternal and equal gods and that the material world was a product of the evil supernatural being. These views came into sharp conflict with an orthodox Christianity that saw the natural world as the creation of a good God and a place where salvation could be realized. Ironically, the dualist emphasis on personal knowledge, pacifism, the equality of women and simplicity – over against institutional religion, power, conformity and doctrine – set the stage for later perspectives on the environment as sacred.

In the second century, Gnosticism presented a considerable challenge to orthodox Christianity. The Gnostics said that Christ had a body only in appearance and that his death on the cross was a show. At this time, a new type of Christian theologian arose to address the challenge. Called apologists, they were frequently converts well versed in the philosophies of the times. Irenaeus of Lyons (d. 202) set the stage for the orthodox refutation of Gnosticism and subsequent dualistic heresies. His basic position was simply that Gnosticism contradicted the experience and teachings of the Apostles who knew and wrote about the historic Jesus and the events surrounding the Resurrection. Christian orthodoxy consists of this traditional teaching of the Church handed down in large part by bishops. The orthodox position stood in sharp contrast to the direct and personal experience of the Gnostics and their view that the resurrection of the body was symbolic.

Gnosticism existed before Christianity and functioned independently of it. Manicheism began in the fourth century as a distinct religion that incorporated elements of Christianity. Mani, the founder, saw three stages in the world's development. In the First Time, Light and Darkness comprised two kingdoms. In the Second Time, the two kingdoms clashed and produced a mingling of the two substances. Adam and Eve begin the Second Time. The end of the world will inaugurate the Third Time. The great ambassadors of revelation were Buddha, Zoroaster, and Jesus. The definitive revelation comes to Mani.

Mani's purpose was to recover the light imprisoned in the world. Knowledge and understanding are the first conditions of salvation. Light resides in knowledge, revelation, spirit, soul, heaven, the heights, repose and endurance. Darkness is found in ignorance, matter, body, depth and unrest. Light will be free and pure after the final destruction of the cosmos by eschatological fire. Each person is a microcosm of the struggle. Therefore, one should withdraw from the darkness of meat, wine, sex and property and eat luminous foods such as melons and fruit.

The Manicheans had two types of members; the Elect and the Auditors. The Auditors brought food to the Elect. With the Auditors, marriage was tolerated, concubinage was permitted, but procreation should be avoided. They believed in a transmigration wherein the soul could move down to become an animal and, beyond that, move to hell. The Emperor Justinian (r. 527–565) joined with the Christians and drove Manicheism east. It was virtually gone by the end of the ninth century.

The Cathars

After the Manicheans, the Paulicians, a dualist group, emerged in Armenia in the sixth century. Bogomilism, another dualism, started in the Balkans in the tenth century. The Bogomils believed that God the Father had two sons, Jesus and Satan. This heresy influenced the Cathars.

The Cathars arose in the Middle Ages as the strongest dualistic heresy since the Manicheans. Its principle hubs were in Northern Italy, Southern France and Bosnia. The most dramatic conflicts occurred in Southern France during the early years of the thirteenth century.

Languedoc is the area of present-day France that stretches from Avignon west to Aquitaine and south to the Mediterranean Sea and the Spanish border. It was a prosperous land, rich in troubadour poetry with a reputation for tolerance and a significant number of Jews. The Jewish Cabbalist writings from this area and period show dualistic influences.

The Great Cathar Council met at St-Félix-de-Caraman sometime between 1166 and 1176 to establish the tenants and design the infrastructure for the new movement. The Cathars began with a doctrine of an absolute dualism that posed the inexorable opposition between two co-eternal and coequal powers; a good god and a bad one. They believed that matter was evil and that one should live an ascetic life without sex. The community was divided into The Perfect and the Believers. Ideally, the Believers would go through the rite of *Consolamentum* before they died. This rite was administered by the Perfect and it alone assured salvation. The Cathars had no use for the Christian sacraments or a belief in the resurrection of the body. The soul was imprisoned in the body and the object of redemption was simply to release it. The Cathars found dualistic meanings in the Bible and in nature. One Cathar theologian said that morning dew and honey were the fluids that flowed from the coitus of the sun and moon. Therefore, humans should not eat honey.

The Perfect were black-robed monks-in-the-world. They lived lives of great simplicity, abstinence and serenity that were in marked contrast to the opulence of the Catholic clergy around them. Unlike the Manicheans, women could be Perfects. There was real gender equality here. The approximate number of the Cathar Perfect at the beginning of the thirteenth century has been estimated at between 1000 and 1500.

Strong opposition to the Cathars began when Innocent II became pope in 1198. He called for a crusade against the kingdoms of Languedoc. Called the Albigensian Crusade after the town of Albi, the movement quickly became very violent. The crusaders used the occasion for plunder and personal gain. The word "Albigensian" was originally used to denote the Cathars of Southern France. It later became loosely synonymous with all Cathars.

The procedure for dealing with the Cathars was to put them on trial and, if convicted, burn them. Deceased Cathars were exhumed and their bodies burnt. The Albigensian Crusade and its aftermath gave rise to the notion of a permanent papal heresy tribunal as opposed to a local episcopal one. In 1231, Pope Gregory IX established the Inquisition, which continued to search out and try

suspected Cathars. The newly founded Dominicans had little success preaching in Languedoc before the Albigensian crusades. Afterwards, they and the Franciscans were involved with the Inquisition. The Inquisition quickly went from being an undertaking of a fanatical few to a proficient bureaucracy employing hundreds and interrogating thousands. Their process included a pervasive system of informants. On the other hand, the Cathars lived simple and frugal lives. They abhorred violence, and were fine doctors and herbalists.

The Inquisition slowly eliminated the Albigensian threat. Some pockets survived for a while in the Pyrenees and Alpine mountains, Verona, Sicily and Bosnia. By the beginning of the fourteenth century, only a heroic few dared to say aloud that the world was evil. By the middle of the century, the Inquisition had virtually eliminated any residual traces of the Albigensian heresy from the landscape.

But today, the Cathars are still remembered. Driving south into Languedoc, there are signs that read, "Entering Cathar Country." In the 1930s, Simone Weil looked to medieval Languedoc as a moral utopia. French Protestants have recalled the Cathars with sympathy, as have advocates for a more decentralized France. Romantic tales were written linking the Cathars with the Holy Grail. A Nazi-Vichy spin on these stories prefigured "Raiders of the Lost Ark." After the Second World War, a Ku Klux Klansman in Michigan named Robert Miles, influenced by the Cathars, called for a new religion named dualism as a way of attracting white racist followers.

Later Developments of Dualism

The Protestant Reformation showed some dualistic elements. Roman Catholics referred to the Protestants as "heretics" and the reformers had the same opinion of the Catholics. Martin Luther (1483–1546) emphasized the sinfulness of human nature and claimed that it was only the sheer grace of God that could save humanity. John Calvin (1509–1564) added the notion of predestination, which held that before someone was born, they were predetermined to be saved or damned. No human effort

could alter the consequences. In this arrangement, God's complete power was manifest.

Jansenius (1510–1576) gave Calvinism a Catholic twist. According to Jansenism, the supernatural and preternatural gifts (i.e., immunity from death and sickness) were natural to Adam and Eve. These gifts were "lost" in the Fall and consequently everything purely natural is evil. Humanity is powerless. If God gives grace, sin can be avoided. Further, God gives the grace only to a few. Jansenius saw himself as a man raised by Providence to save the Church from the Jesuits. The Jesuits preached prayer and the sacraments as ways humans could cooperate with grace and avoid sin.

Quietism was later developed by Michael de Molinos (1628–1696), a Spanish priest who worked primarily in Italy. Quietism advocated a passive rather than an active approach to the spiritual life. An individual's will should be lost in God. If one committed sin, they would then do so without offense. One should annihilate all his or her powers. The desire to be active in one's spiritual life is offensive to God. Temptation should be ignored because resistance involves activity.

E

SP Earth Bible

The Earth Bible is an international project, initiated in Adelaide, Australia, which attempts to read texts and traditions from the perspective of Earth, by employing a set of eco-justice principles. This five-volume series was published in England by Sheffield Academic Press and in the United States by Pilgrim Press. The central aims of the Earth Bible are to:

1. Develop ecojustice principles appropriate for an eco-justice hermeneutics (modes for interpretation) for

understanding the Bible and for promoting justice and healing for Earth.

2. Publish these interpretations as contributions to current debates on ecology, eco-ethics and ecotheology.
3. Provide a responsible forum within which the suppressed voice of Earth and the Earth community can be heard.

Following the hermeneutics of the project, interpreters read the biblical text with the suspicion that it is probably anthropocentric rather than Earth-friendly, but they also allow the possibility of retrieving traditions in the text

SP Eco-justice Hermeneutics

This approach assumes that the posture of the reader influences what is found in the interpretation process. In an eco-justice hermeneutic, the reader acknowledges that he/she is part of Earth and seeks to read from the perspective of Earth. This hermeneutics is the approach employed in the Earth Bible project (see under Earth Bible). As a guide to this reading process, a set of eco-justice principles have been developed in dialogue with ecologists. These principles are not overtly religious and do not refer to God explicitly, but provide a basis for dialogue with a range of disciplines and religions on the way humanity has interpreted Earth.

These principles are:

The principle of intrinsic worth: The universe, Earth and all its components have intrinsic worth/value.

The principle of interconnectedness: Earth is a community of interconnected living things that are mutually dependent on each other for life and survival.

The principle of voice: Earth is a subject capable of raising its voice in celebration and against injustice.

The principle of purpose: The universe, Earth and all its components are part of a dynamic cosmic design within which each piece has a place in the overall goal of that design.

The principle of mutual custodianship: Earth is a balanced and diverse domain where responsible custodians can function as partners with, rather than rulers over, Earth to sustain its balance and a diverse Earth community.

The principle of resistance: Earth and its components not only suffer from human injustices but also actively resist them in the struggle for justice.

When reading the text, the interpreter asks critical questions rising from these principles to ascertain whether there is justice for Earth in the orientation, ideology or focus of the text. Typical questions are: Is Earth viewed merely as a human resource or as a subject with intrinsic worth? Is Earth treated as a subject with a "voice" or as an object to be exploited?

Some of the biblical psalms, for example, acknowledge the voices of Earth and call on Earth and its creatures to celebrate (e.g., Ps. 148). Other Psalms (e.g., Ps. 8) reflect a hierarchical view of the cosmos in which humans are on a level close to God and "all things" are located "under their feet." Employing a hermeneutics of suspicion and retrieval, the reader may assume that both the text and the interpreting traditions are likely to be anthropocentric, giving priority of voice and value to humans. In such contexts, Earth is at the mercy of human exploitation both by the original writers and modern interpreters.

Another feature of eco-justice hermeneutics is a consciousness that in the Western tradition patterns of dualistic thought have tended to devalue much of the natural world. Within dualistic oppositions between heaven and Earth, humanity and nature, spirit and matter, the material and natural world has been considered inferior. The task in this approach is to ascertain whether this dualism is maintained in the text and expose how the tradition has assumed this dualism to devalue Earth and the Earth community. Ultimately, the goal of this approach is to retrieve the voice and value of Earth in the context of the environmental crisis at the beginning of the twenty-first century.

Norman Habel

See also: Eco-justice in Theology and Ethics.

SP Heavenism

Heavenism is a form of spirituality that tends to value all things associated with heaven to the detriment of Earth. This spiritual orientation is reflected in hymns such as *Guide me, O Thou great Jehovah, pilgrim through this barren land*. Compared with heaven, Earth is viewed as a vale of tears, a barren land, a place of exile, a domain ruled by the forces of darkness. Heaven is the abode of God, a place of purity, happiness and spiritual joy. Those who espouse this spiritual view of reality tend to be more concerned about getting to heaven than caring for Earth. Heaven is eternal and sacred; Earth is disposable and mere matter. It is not really important what happens to Earth because it is only a temporary abode for humans; heaven is home. Christian texts like Hebrews 11, which speak of a heavenly country (11:16), are used to interpret the rest of the scriptures and render care for a polluted Earth a waste of time. The Earth Bible project (see under Earth Bible) exposes the anthropocentric and anti-Earth orientation of such texts. The project also identifies alternative traditions that highlight the sacredness and intrinsic value of Earth. A clear example is Isaiah 6:3 where the heavenly host declare, “the whole Earth is full of God’s glory.” Here God’s glory – firecloud of God’s presence – not only fills the temple but the whole planet. Heavenism is reflected in slogans such as “Forget the planet, save yourself,” and sees the environmental movement as a negative force that directs the believer away from his/her true goal: getting to heaven.

Norman Habel

which affirm the intrinsic worth of Earth or reflect the voice of the Earth community.

The studies in the project demonstrate that many parts of the Bible devalue Earth and the Earth community. When God sends punishment on a particular people, whether Israel, Egypt or another nation, the land, nature and living creatures often suffer unfairly. In Ezekiel, for example, the land is made desolate to somehow vindicate the name of God (Ezek. 6:14; 12:20 *passim*), not because the land has done anything to deserve such a fate. In Jeremiah, however, there are indications that the prophet hears the land mourning under the weight of these judgments (e.g., Jer. 12:4, 11).

Especially significant is the “mandate to dominate” found in Genesis 1:26–28, where humans are given the command to “rule over all living things” and “to subdue Earth.” In the Earth Bible, the verbs “rule” and “subdue” (Gen. 1:28) are not softened but allowed to have their full weight. To “subdue” (*likh’bosh*) refers to forceful subjugation (as in Jer. 34:11; 2 Sam. 8:11; Josh. 18:1). To “rule”

(*lir’dot*) refers to forceful control and conquest (as in Ps. 72:8–11). Because passages like this mandate have played a role in the conquest of nature in some countries, the Earth Bible project seeks to highlight the negative force of such texts in the current ecological crisis and balance them with alternative traditions such as Genesis 2:15. In this text, the first human is placed in the garden to “till/serve” (*la’avod*) and to “keep” (*lish’mor*) it, not to “rule” and “subdue” it.

Between the years 2000 and 2002, five volumes of the Earth Bible were published. The five volumes are 1. *Readings from the Perspective of Earth*, 2. *The Earth Story in Genesis*, 3. *The Earth Story in Wisdom Traditions*, 4. *The Earth Story in the Psalms and the Prophets*, 5. *The Earth Story in the New Testament*. Norman Habel of Adelaide, Australia, is the chief editor of the Earth Bible, who is also preparing popular works based on these academic volumes. One of these is a volume of Earth liturgies entitled *Seven Songs of Creation*, also published by Pilgrim Press.

Earth Charter

The Earth Charter is a declaration of fundamental principles for building a just, sustainable, and peaceful world. It endeavors to identify the critical challenges and choices facing humanity and to provide a moral framework for the development of the emerging global civilization. It is designed to inspire in all peoples a new sense of global interdependence and shared responsibility for the well-being of the human family, the greater community of life, and future generations. It is at once an urgent call for major social and economic change and an expression of hope. The principles in the Earth Charter were developed in and through a decade-long, worldwide, cross-cultural, interfaith dialogue on common goals and shared values.

First proposed in *Our Common Future* (1987), the report of the United Nations World Commission on Environment and Development, the drafting of the Earth Charter was part of the unfinished business of the 1992 UN Rio Earth Summit. In 1994 Maurice Strong, the secretary general of the Earth Summit and chairman of the Earth Council, and Mikhail Gorbachev, the president of Green Cross International, launched a new Earth Charter initiative with

support from the Dutch government. An Earth Charter Secretariat was established at the Earth Council in Costa Rica, and in 1997 an Earth Charter Commission of eminent persons with representation from all regions of the world was formed to oversee the project.

The Commission proceeded to draft the Earth Charter as a people's treaty, because there was little interest among governments in negotiating new and stronger commitments regarding the environment and sustainable development. Thousands of individuals and hundreds of organizations from Africa, the Americas, Asia and the Pacific, Europe, and the Middle East participated in creating the Earth Charter. Forty-five Earth Charter national committees were formed. Earth Charter dialogues were held in all regions of the world and on the internet. The project involved the most open and participatory consultation process ever conducted in connection with the drafting of an international document.

The ideas and values in the Earth Charter reflect the influence of a rich diversity of intellectual sources and social movements. These include over fifty international law declarations and treaties, the new scientific worldview being shaped by discoveries in physics, cosmology, and ecology, the wisdom of the world's religions and philosophical traditions, and over 200 non-governmental declarations and people's treaties. The document reflects the concerns and aspirations expressed at the seven UN summit conferences held during the 1990s on human rights, population, children, women, social development, and the city as well as the environment. It also recognizes the importance of the spread of democracy for human development and environmental protection.

The Earth Charter is an especially significant product of the global ethics movement, which gained wide support in the 1990s. In an increasingly interdependent world, cooperative problem solving is a necessity, and effective collaboration among diverse cultures and peoples requires shared values. It has been the objective of the Earth Charter initiative not to impose the values of one group, culture, or tradition on all others, but rather to seek common ground while respecting and supporting cultural diversity. This meant, for example, that the Earth Charter could not employ theological language or the concept of animal rights, but the document does acknowledge the important role of religion in achieving sustainability and affirms that animals warrant moral consideration. The Earth Charter principles reflect a consensus on basic values that is taking form in the rapidly developing global civil society.

The vision of widely shared values in the Earth Charter does focus special attention on the environment. However, the document contains an inclusive and integrated ethical vision reflecting the realization that humanity's environmental, economic, political, social, cultural, and spiritual challenges are interrelated. It recognizes, for example, the

interconnections between the protection of ecosystems, the eradication of poverty, human rights, gender equality, economic justice, democracy, and a culture of peace. The result is a new holistic understanding of what constitutes a sustainable way of living and sustainable development.

At the heart of the Earth Charter is an ethic of respect and care for all life forms and the greater community of life, of which humanity is a part. The Earth Charter founds the principle of respect for all life on the recognition that all beings are interdependent and all life forms have value regardless of their worth to people. The sense of ethical responsibility begins with an attitude of respect for others and finds expression in active caring, which involves the prevention of harm and the promotion of well-being. A fundamental purpose of the Earth Charter is to encourage all peoples to identify with the whole Earth community as well as their local communities and to expand their moral concern and caring to include the present and future well-being of the entire human family and the larger living world.

The ethics of the Earth Charter are grounded in a vision of widely shared spiritual values. For example, the document affirms, "when basic needs have been met, human development is primarily about being more, not having more." It asserts, "the spirit of human solidarity and kinship with all life is strengthened when we live with reverence for the mystery of being, gratitude for the gift of life, and humility regarding the human place in nature." The Earth Charter culminates with a vision of peace and the joyful celebration of life.

A final version of the Earth Charter was approved by the Earth Charter Commission in March 2000. A new phase in the Earth Charter initiative began with the official launching of the Earth Charter at the Peace Palace in The Hague the following June. Efforts are now underway to disseminate the Charter around the world, to promote its educational use in schools, universities, and faith communities, and to encourage its endorsement and implementation by civil society, business, government, and the United Nations General Assembly. Thousands of local, national, and international organizations, including hundreds of local governments, have endorsed the document and are using it as an educational tool and guide to a sustainable way of living.

Earth First! and the Earth Liberation Front

Radical Environmentalism comprises a cluster of environmental movements and ideologies that share an overall worldview that includes a perception of the sacredness of nature. The religious and ideological beliefs of these movements, and the criticisms to which they are typically subjected, are described in detail in *RADICAL ENVIRONMENTALISM*. Their basic orientation can be, however, briefly characterized: Radical environmental movements trace environmental degradation to anthropocentric and hierarchical Western philosophies and religions. They prescribe in response lifestyle simplification, political resistance to the destructive forces, and a spiritual "reconnection" with nature. These responses, they believe, depend on a "resacralization" of human attitudes and perceptions of the natural world.

By the early twenty-first century Earth First! and the Earth Liberation Front (ELF) had become the best known of the radical environmental groups in the United States, Australia, and the United Kingdom, and they had established beachheads in scores of countries on every continent but Antarctica.

Earth First!

Earth First!, with its slogan "no compromise in defense of mother Earth," was founded in 1980. It rapidly became known for its dramatic civil disobedience campaigns and the occasional use of sabotage in its efforts to thwart commercial incursions into biologically sensitive lands. In its first two decades it focused especially upon North America's remaining old-growth forests, evocatively labeled "ancient" or "cathedral" forests to reinforce their special importance.

Dave Foreman, who left the *WILDERNESS SOCIETY* after he became disenchanted with the efforts of such mainstream environmental groups to arrest environmental decline, was the most charismatic leader among Earth First!'s co-founders (variously numbered at 4 or 5, depending on differing movement origin myths). His strategic purpose in

founding the group was, firstly, to introduce and promote sabotage as well as civil disobedience as a means of environmental struggle, whenever possible increasing the costs and removing the profit from environmentally destructive practices – in other words, waging economic warfare against those destroying nature; secondly, to shame mainstream environmentalists into taking stronger stands by harshly criticizing them and exposing their compromising positions; thirdly, and ironically given the second tactic, he expected that by taking on the mantle of "environmental extremism," a label often applied to mainstream groups by their adversaries, mainstream groups might appear more reasonable by comparison, thereby increasing their influence and effectiveness.

As importantly, Foreman wanted to attack anthropocentric attitudes, for he viewed the root of the problem as religious in essence. Drawing on historians such as Lynn White, Perry Miller and Roderick Nash, Foreman argued,

Our problem is a spiritual crisis. The Puritans brought with them a theology that saw the wilderness of North America as a haunt of Satan, with savages as his disciples and wild animals as his demons – all of which had to be cleared, defeated, tamed, or killed (Harpers Forum 1990: 44).

So like most radical greens, Foreman blamed the advent of agriculture (following Paul Shepard and Jim Mason), and Christianity as well, for environmental decline. During Earth First!'s early years it was not difficult to find evidence of an anti-Christianity view, particularly since James Watt was the Secretary of the Interior. In 1976, before his appointment by President Ronald Reagan, Watt had founded the Mountain States Legal Foundation, which bills itself as a defender of individual liberty, property rights, and free enterprise. It is regarded by environmentalists as an anti-environmental group, one of the first and most important members of the so-called *WISE USE MOVEMENT*. Watt was also an evangelical Christian who minimized environmental problems and was widely if inaccurately perceived (largely due to selectively quoted congressional testimony) to believe the imminent second coming of Christ obviated the need for environmental concern. Reagan, who had appointed him, told confidants that he also expected the imminent return of Christ.

Like most radical greens, Foreman saw promise in pagan religions for a biocentric ethics. Indeed, the most common perception animating the movement can be labeled "pagan," if this is defined as spirituality involving one or more of two perceptions: (1) the Earth itself is alive and sacred, a perception that for many could properly be labeled pantheism (a word derived by conflating the Greek word *pan* meaning "all" and *theos* meaning "god," signifying that "all is god"); and (2) that the world is filled with nonhuman intelligences – often thought to be capable of

communicating and communing with humans – who are worthy of reverence. Such perceptions, sometimes labeled “ANIMISM” (from the Latin for “soul”), involve a belief that various entities in nature have souls or spirits.

Early in the publication of the *Earth First!* journal, Foreman signaled his spiritual inclinations by publishing according to what has become known in contemporary Paganism as the PAGAN CALENDAR. He was significantly influenced by PAUL SHEPARD, GARY SNYDER, and STARHAWK, each of whom promoted earthen spiritualities. Even more influential upon Foreman was the subtle nature spirituality of the ecologist ALDO LEOPOLD and the novelist EDWARD ABBEY. After learning about ARNE NAESS and DEEP ECOLOGY shortly after founding Earth First!, Foreman and his comrades also immediately seized on and adopted deep ecology as Earth First!’s natural philosophy.

But it was Abbey’s *Desert Solitaire* (1968) that captured especially well the deep affective connections that Foreman had for nature, as it had for many other desert dwellers. In this book Abbey described mystical experiences in the desert that taught him humility and a proper spiritual perception, which for him meant biocentrism and a reverence for the land. Abbey’s novel *The Monkeywrench Gang* (1975) portrayed ecological saboteurs fighting back against an industrial civilization portrayed as totalitarian and relentlessly destructive. The book was not entirely fiction, because it was based on an ecological resistance movement that had begun in the 1950s and had been hinted at in *Desert Solitaire*. Indeed, Abbey’s friend Jack Loeffler would later indicate that Abbey and many of his friends had been experimenting with *The Anarchist Cookbook* during the campaign to save BLACK MESA from Peabody Coal, and that some of these experiences, and related fantasies, were incorporated into the novel (author’s interview, July 1997). Moreover, through its characters, *The Monkeywrench Gang* effectively captured the various types of nature religion that animated those early green rebels, such as Doc Sarvis’s enthusiastic hope that “Pan shall rise again!” (1975: 44), and George Washington Hayduke’s occasional pondering of “the oceanic unity of things” and his rationale for desert monkeywrenching as a perception that the desert was “holy country” (1975: 227, 128).

Like Abbey and most of his rebel characters, and critics including Louis Mumford and Gary Snyder, Foreman’s social philosophy was anarchistic, although his was a kind of libertarian individualism common in the western United States, not the kind that envisioned the overthrow of the United States government. Yet the early *Earth First!* journal included language in its masthead about not accepting the authority of the state. Its pages expressed enthusiasm for anarchism, on the one hand, and paganism, indigenous religions, and sometimes religions originating in Asia, especially Daoism and Buddhism, on the other. These expressed affinities contributed to the

kind of subcultures that were drawn to the movement, which included communitarian anarchists and anarcho-primitivists, who really *did* wish to overthrow the state, as well as Pagans and some Wiccans, many from California and the Pacific Northwest, who brought a more overt and ritualized form of nature religion to the movement.

In general, the newcomers were more avowedly anti-capitalist and likely to completely reject the legitimacy of nation-states than were Foreman and some of the environmentalists who had helped form Earth First!. In short, they did not believe the capitalistic world system could be reformed. Meanwhile pacifists, anti-war and anti-nuclear weapons activists, many who had been inspired by the religious ethics of Mahatma Gandhi and Martin Luther King, were also drawn to the movement because of its willingness to engage in civil disobedience in defense of life.

The diverse streams that flowed into the movement quickly led to tensions. A few activists including Howie Wolke, an Earth First! co-founder and one of Foreman’s closest friends, argued strongly but unsuccessfully that the pagan tone of the journal was counterproductive and should be halted. In 1982 an Earth First! editor objected to publishing articles describing tactics such as tree and road spiking (using metal or other sharp spikes in an effort to prevent tree felling by making it unprofitable, or to damage the tires of adversaries, sometimes in order to avert apprehension and incarceration). Despite his cogent argument that such tactics could lead to injuries, he was forced out by Foreman and his supporters, who considered the environmental crisis to be so grave that such risks were acceptable and necessary. Indeed, Foreman and many of his supporters, who sometimes musingly called themselves “rednecks for wilderness,” asserted that if attacked during campaigns, they would not hesitate to use violence in self-defense, even lethal violence if necessary. Foreman wrote that while he admired the nonviolent approaches “advocated by Gandhi and Martin Luther King” he could not go along with them because, “unfortunately, I am still an animal . . . I cannot turn the other cheek” (1982: 4).

Two prominent Buddhists, Robert Aitken and Gary Snyder, criticized the martial and violent-sounding rhetoric of those initial years, but Foreman responded strongly in a way that many other Earth First!ers would later parrot:

Any creature, no matter how seemingly meek, will fight back when threatened . . . Eastern [religious] ideas of stepping out of the violent cycle are presumptuous and anthropocentric (by setting human beings apart from the semi-violent natural world) . . . I am entirely pragmatic about violence/non-violence. We should use whichever we feel comfortable with and whichever is most appropriate to a particular situation . . . There are many paths one

can take to defend our Earth Mother. Including that of the warrior (Foreman 1982: 2).

By 1983 a “Cathedral Forest Action Group” had formed to defend Oregon’s forests and distance themselves from such martial tones, a group that generally thought that the revolution of consciousness that was needed would have to come from a loving rather than an angry and violent disposition. But another response was emerging at the same time, that of impatient Earth First!ers who thought that the time had come to escalate tactics. Some began to advocate arson, and such incidents began in the 1980s.

Others sought to develop a revolutionary strategy to overturn the nation-state, or at least, to be ready to take advantage of the inevitable devolution of industrial civilization, which they considered to be unsustainable. In 1988, for example, an anarchist faction began publishing *Live Wild or Die* to promote what they considered to be an even more radical approach. During the same period of the mid- to late 1980s, a former labor organizer turned environmentalist, Judi Bari, rose to some prominence, advocating “revolutionary ecology” in an effort to blend biocentrism and socialism in a pro-worker green ideology.

Bari became famous when a bomb exploded in her automobile in May 1990, permanently disabling her and causing lesser injuries to fellow Earth First! campaigner Darryl Cherney. Both were soon arrested, charged with knowingly possessing the bomb and labeled “eco-terrorists” by law-enforcement authorities. They were soon released for lack of evidence in a case that was never solved.

Both Bari and Cherney had been campaigning to protect California’s redwood forests and had strong, pagan spiritual sensibilities; Cherney even had become involved with the innovative, pagan CHURCH OF ALL WORLDS, itself inspired by Robert Heinlein’s science fiction novel, *Stranger in a Strange Land* (1961). Bari and Cherney sued the Federal Bureau of Investigation (FBI) and the Police Department in Oakland, where the bombing occurred, asserting these authorities had violated their rights when they publicly accused them of knowingly transporting the bomb and of planning to use it in an act of eco-terrorism. Bari and Cherney won their lawsuit in 2002 and were awarded 4.4 million dollars in damages, five years after Bari’s death from cancer in 1997. She specified that her obituaries list her occupation as a “revolutionary” and urged her friends to remember what Wobbly martyr Joe Hill said just before he was executed in 1915: “Don’t mourn. Organize!”

A year before the bombing, in 1989, Foreman and four others were arrested and charged with a number of sabotage incidents after a multi-million dollar FBI operation. The attention of the authorities had been drawn to Earth First! as a result of their rhetoric and a growing amount of “ecotage” (a term meaning sabotage in defense of the

environment), occurring in the Western United States. FBI agents infiltrated Earth First!, identified an active group of saboteurs, and encouraged it to use explosives, which its members refused to do. The cell decided to use torches to topple power-line towers carrying electricity from a nuclear power plant. The plan was hatched as a protest against nuclear power, which radical environmentalists oppose for the radioactive pollutants it produces, as well as for its role in nuclear weapons production and as an example of an irresponsible human appetite for energy. Authorities successfully portrayed the action as nuclear terrorism, even though stopping electricity transmission from a power plant poses no danger to its stability or safety.

After the arrests, of course, Foreman and his supporters were feeling especially vulnerable. The west coast leftists (including Judi Bari) and anarchists of Earth First! continued to press for a more radical movement. Between 1989 and 1990, a schism occurred, with Foreman and many of the earliest Earth First!ers disassociating themselves from the movement that they had launched.

One of the many reasons for the schism was that many Earth First!ers, including at least two who had been arrested and charged with Foreman, felt that he had disassociated himself from the movement for selfish motives, as part of a strategy to prevent a long prison sentence. Foreman, in an unusual plea agreement, pled guilty to a felony conspiracy charge in the power line incident, and the charge was reduced to a misdemeanor after a period of good behavior was certified by the court. He thus escaped serving time in prison. Two other activists with relatively minor roles received little jail time, but Peg Millett and Mark Davis, who had been directly involved in trying to topple the power line towers, served several years each in federal prison.

Both Millett and Davis were motivated by a deep earthen spirituality. Millett often sang songs expressing reverence for the Earth at Earth First! gatherings, and did so also during her sentencing hearing, to convey why she had taken such an action. Davis explained his vandalism of ski lifts in Arizona as an effort to thwart the expansion of a ski resort in Arizona’s San Francisco Mountains, because he agreed with the Hopi and Navajo tribes who believe “those mountains are sacred.” He concluded with regret that “what has occurred there, despite our feeble efforts, is a terrible spiritual mistake” (Letter to the author, summer 1992).

After the disposition of the case and writing from prison to the *Earth First!* journal, Davis asserted that his own, more honorable silence, had enabled Foreman and his attorneys to craft his creative plea agreement. Davis claimed that Foreman had knowingly given him \$480 for the anti-nuclear action and that he “was fully aware of the anti-nuke plans. I know this because I told him myself . . . I could easily have cut a deal to [put him in prison] and save myself” (Davis 1993: 14).

The arrests, bombing, and the aftermath of both, intensified the tensions inherent in the diverse streams of American radicalism that had been drawn to Earth First!. By the late 1990s the contradictions that produced the schism that had begun the decade had led to the departure of the majority of Earth First!ers who did not consider themselves anarchists (or considered themselves more libertarian than communitarian/socialistic), along with some of the anarchists who considered their primary passion and moral commitment to be the protection of wilderness and biodiversity. Such activists did not leave environmental work, but created or joined other groups to continue it. Dave Foreman, for example, founded the Wildlands Project in 1992 and started a new magazine, *Wild Earth*. Both endeavors reflected a more mainstream political strategy and drew on CONSERVATION BIOLOGY, as Foreman continued his association with many of the leading figures in this field. The strategy was to draw together scientists, grassroots biodiversity activists, private landholders, and environmental groups such as the Nature Conservancy to secure critical habitat while simultaneously lobbying North American governments to support research and policies congruent with managing ecosystems for long-term biodiversity preservation.

Another outcome from all the discord was that beginning in the late 1980s and through the mid-1990s, many of the movement's most talented musicians and ritual innovators drifted away, including Dana Lyons, whose songs, including TREE MUSIC (which has also been turned into a children's book), would later find an audience within the wider environmental movement. With such figures went much of the wilderness ritualizing that had evolved within the movement, especially from the early 1980s to the middle of the 1990s. This ritualizing had included song and poetry fests, Wicca-influenced dances, and other processes designed to deepen connections with nonhuman nature, such as the Council of All Beings. At the annual "Round River Rendezvous" (named after a story by Aldo Leopold), sometimes elaborate pageants had been performed that expressed the typical radical environmental cosmogony of a fall from a foraging paradise, a sense of an apocalyptic present, and the hope for a world with all life forms that would again live in a sacred balance.

Most long-term participants recognized that the Earth First! of the 1980s and first half of the 1990s, which had involved a great deal of religious innovation, had been replaced by the end of the century with a much more urban and anarchistic ethos. The movement was increasingly fueled by disaffected youth from large cities more than by career environmental activists whose primary passion was the wilderness. Many long-term activists came to consider moribund the movement they had known earlier. Many of these felt nostalgic for what had been and regretted their own uncharitable behavior that

led to its devolution. The upshot of this history is that by the early twenty-first century, it seemed less likely than it did a decade earlier that Earth First! would establish itself as a nature religion with its own evolving ritual life that would continue to inspire environmental action.

This does not mean that radical environmental activism had disappeared or lost social power. Its worldview continued to spread, and in the early 1990s, a new faction emerged, interjecting new energy, if not into the movement's religious dimensions, into its strategic arsenal. This came with the invention of the Earth Liberation Front.

The Earth Liberation Front

Earth First! was established in the United Kingdom after a 1990 "roadshow" tour by activists from the United States. It grew and flourished there in the 1990s in the midst of sometimes furious direct action resistance to road-building projects, many of which enjoyed significant public support. Much of this campaign was conducted under the Earth First! umbrella, which had a number of creative expressions, including overtly pagan groups such as the DONGA TRIBE and DRAGON ENVIRONMENTAL NETWORK.

In a way reminiscent of the factionalizing of the Earth First! movement in the United States, however, individuals who considered themselves to be the most radical if not revolutionary of these activists, felt that more aggressive tactics than nonviolent civil disobedience were necessary. According to an account published in the *Earth First!* journal in the United States, activists frustrated with resistance within Earth First! to more aggressive tactics, formed the "Earth Liberation Front" in 1992 (ELF 1993). A communiqué from "Tara the Sea Elf" (ELF members refer to themselves as "elves") claimed that by 1993 the elves had created twenty clandestine cells in England, and had used arson and other means to attack corporations in Europe and North America, including a number engaged in producing genetically modified organisms.

In the United States, many of the most radical of Earth First! and green anarchists quickly adopted the ELF acronym, seemingly emboldened by it. The name caught on rapidly, in part because it provided a rubric for the most radical of actions that was good public relations: elves are viewed positively in Western literature as playfully mischievous, not malicious. The moniker caught on also, in part, because the idea of elves in the woods cohered with the pagan spiritualities commonly found in radical environmental movements and among some of these activists.

Given the covert nature of the ELF, which makes interviewing such activists nearly impossible, care must be taken when discussing the religious motivations of its participants. Interviewing spokespersons is problematic, for it is unclear how close they and their views are to the Elves themselves. Two anarchists, Craig Rosebraugh and Leslie James Pickering, who said they had received anonymous

communiqués from ELF activists and were anointed (by themselves and the media) as official ELF spokespeople, claimed not to know any of the Elves personally. Moreover, they did not dwell on spiritual motivations in defending ELF actions. Instead, they seemed primarily interested in promoting their anarchist cause, connecting it closely with an understanding of ELF as an anti-capitalist movement. They “resigned” from their spokesperson’s roles in 2003, they averred, because they did not believe the ELF had a revolutionary strategy, nor did they believe that arson and other sabotage tactics should preclude harming human beings. For these reasons, they said, they were resigning in order to form a truly revolutionary organization. The desire to avoid further unwanted attention by law-enforcement authorities may have provided a more concrete rationale for the resignations.

Despite the difficulties involved in learning directly from ELF cell members, it is possible to surmise, given the ELF’s birth from the Earth First! movement which is often overtly pagan in its spirituality, that at least some of its activists would be similarly motivated. Tara the Sea Elf provides concrete reason to suspect a similar spirituality animating both Earth First! and the ELF. She asserted that the ELF

... perpetuates the legends of the “Little People,” which in most European countries have a history of causing trouble, being mischievously always heard, but never seen. These “mythical creatures” lived close to the earth in most legends (1996: 18).

Here elves function as fairies have for other radical environmental activists – they are appropriated as symbolic Earth warriors – conjuring images that resonate with the pagan spirituality of many such activists. One Earth First!er, for example, writing under the pseudonym “Buck Young,” argued that modern people cannot experience the world as enchanted because they have paved over and thus muted the Earth’s sacred voices. He wrote an innovative account of the emergence of radical environmental activism that hints at why “elves” proved to be an attractive trope:

Gnomes and elves, fauns and faeries, goblins and ogres, trolls and bogies . . . [must infiltrate our world to] effect change from the inside . . . [These nature-spirits are] running around in human bodies . . . working in co-ops . . . talking to themselves in the streets . . . spiking trees and blowing up tractors . . . starting revolutions . . . [and] making up religions (Young 1991: 8–9).

This statement reveals not only a pagan spirituality but also awareness that he and his compatriots are inventing religion. In an interview during an Earth First! Rendezvous

(Vermont, August 1991) he explained, for example, that J.R.R. Tolkien’s fantasy novels, *The Lord of the Rings*, were important to his nature spirituality. In this he is not alone, for these novels were inspirational to a number of radical greens. He is also not alone in recognizing that he and others are making up a new green religion, crafting it in innovative ways from historical sources, existing religions, and new sources wherever found, whenever useful.

Tara the Sea Elf would have no objection to spiritualities that help people to perceive the Earth’s sacred voices. She concluded her own primer on the ELF by asserting that radical environmental and indigenous groups like the militant American Indian Movement “reflect the philosophy of many First Nations [indigenous peoples] across the world, that you have to show your enemy how serious you are in defending what you regard as sacred” (1996: 18). Yet she insisted that Elves and their sympathizers emphasize nonviolence, with the proviso that it is improper to consider property damage violent: “As always, ELF calls for no injury to life, only to profit and property” (1996: 18).

By 2004, a little more than a decade after it was founded, the Elves had proven fertile and innovative, growing in number and expanding their targets to include luxury homes and apartments being built in areas considered ecologically sensitive, ski resorts expanding into habitats considered critical to endangered species, and sport utility vehicles, considered the most egregious examples of unbridled materialism and pollution-causing consumption. In the United States alone, damages had grown to well over 100 million dollars, and the Federal Bureau of Investigation had labeled the ELF its number-one domestic terrorism group. Yet neither Earth First! nor the ELF had caused serious injuries or deaths of their adversaries or bystanders, although their many critics understandably asserted that it was only a matter of time before they would do so, even if unintentionally. Meanwhile, other critics claimed it was only a matter of time before some of their members broke off into another faction that would intend, and succeed, in doing so.

Conclusions

Care must be taken not to overemphasize the influence of religion when analyzing social movements, for religion is a variable that combines with other factors in complicated ways, and its relative importance is often obscure. Nevertheless, Earth-centered religious perceptions and motivations do appear to be decisive for many if not most in radical environmentalism and Earth First!, and probably in the shadowy realm of the movement’s elvish underground.

If there is a radical environmental milieu in which these subcultures freely trade in religious and political ideologies that are at variance with the mainstreams of the cultures in which they are situated, it would make

sense to assume that this process of exchange and cross-fertilization will continue. There does seem to be such a milieu, so this process is likely to continue, as will the debates and contested nature over what different people consider authentic expressions of radical environmental sensibility. Only time will tell the future evolution of radical environmentalism in general, and the Earth First! and ELF movements, but in the short term, it looks like the twenty-first century will see more of such earthen spirituality-inspired activism.

Despite the commitment not to cause injuries to adversaries or innocents that is professed by most of the activists who engage in sabotage or arson, they clearly risk causing harm. Some of the most radical among them, at least rhetorically, seem ready to abandon such scruples. Presumably they would if the revolutionary moment appeared to be nigh. This may be the most common criticism, and fear, of Earth First! and the ELF. There are other criticisms of the radical environmental worldview and ideology that are discussed in RADICAL ENVIRONMENTALISM, as well as typical rejoinders, which need not be repeated here.

What ought not to be lost in the social scientific analysis of these movements is the moral challenge posed by them. Whether one ends up agreeing with or condemning them, or doing a little of both, carefully considering the claims these activists make can spur reasoned moral debate. With their illegal, outrageous, and sometimes dangerous tactics, they urge us to evaluate whether our behaviors are threatening the fecundity and diversity of life on Earth. They demand that we consider whether our putatively democratic political systems provide what they claim to, namely a reasonable chance to promote and protect the values that we as citizens consider inviolable. And they pose the morally and spiritually radical question, whether nature is sacred in some way, and if so, what moral duties to the wider community of life inhere to such a perception, to such a faith.

Earth Ministry

Earth Ministry, located in Seattle, Washington is one of the more successful Christian eco-groups to emerge in the 1990s in the United States. Not only does it have several thousand subscribers to its newsletter, *Earth Letter*, but it has also built a successful outreach program in the Seattle area that has involved over a hundred congregations. The organization describes itself as a Christian, ecumenical, eco-justice organization whose work "engages individuals and congregations in knowing God more fully through deepening relationships with all of God's creation" (Barnett, 2002: Appendices 61).

Founded in 1992 by James and Ruth Mulligan and Reverend Carla Berkadal, Earth Ministry grew out of a successful ecology and spirituality group at the St. Mark's Episcopal Cathedral in Seattle, where Reverend Berkadal was minister. They felt called to start a larger ecological ministry that went beyond the Cathedral (partly as a result of their shifting energies, and Reverend Berkadal leaving, the eco-group within the Cathedral dissipated and was revived by Ruth Mulligan ten years later). Its first years were devoted to convincing Christians that there was a deep ecological tradition within Christianity and that Christians were called to "earth ministry."

Jim Mulligan, and eventually a staff of five, continued

to lead EM until his retirement in 2003. Several key staff have published relevant books: Michael Schut, edited *Food and Faith* (2002) and *Simpler Living, Compassionate Life* (2001), Tanya Marcovna Becker Barnett was editor and contributor to Earth Ministry's *Greening Congregations Handbook* (2002) and Nancy Wright (who left the organization in late 2002), co-authored *Ecological Healing* (1993). These publications, as well as their website, extended their outreach beyond the Seattle area. In addition, the staff travel widely as speakers, and consult with those hoping to start an ecological ministry in their own church or in other venues (including prisons).

Two reasons for the organization's successes have been its extensive guide to congregational organizing and the related Congregational Colleagues programs. The *Greening Congregations Handbook* provides relevant biblical texts, a wide range of excerpts from key authors, an extensive appendix listing resources by denomination, and detailed suggestions on how to get something started that emphasize examining the organizer's community, faith tradition and bioregion for already-available resources. It then encourages congregational organizers to start small, focus on specific activities, balance action with reflection, and be strategic. This section is followed by an explanation of the various dimensions of congregations that can be "greened," from the liturgy and worship, to mission and educational aspects, to transportation, landscaping, food, energy, water, consumption, recycling, composting and green building design. "Helping a congregation cultivate a creation-honoring vision," as the *Handbook* puts it, is the central goal of the Congregational Colleague program.

The congregation of one of Earth Ministry's most successful participants, Leroy Hedman, pastor of an independent Pentecostal congregation in a poor, racially and ethnically diverse urban neighborhood ringed by industry and hazardous waste sites, won the first Environmental Protection Agency Energy Star congregation award in 1999. The efforts of Pastor Hedman at the Georgetown Gospel Church demonstrate the multiple aspects of congregational life that can be transformed, even when the theological outlook of the congregation is not particularly ecological, for few would describe his parishioners as "tree-huggers." The award recognized the comprehensive use of compact fluorescent bulbs and other energy-saving devices by the congregation. Additionally, every ounce of ground in the small, paved lot surrounding the church is planted with flowers, fruits, vegetables and herbs available to all. Hedman, energy miser and master gardener and composter, teaches his congregation and community how to save money as well as grow a source of healthy food.

Another successful congregational group, set in the middle-class outskirts of Seattle, goes on frequent hikes, rides bikes to church, educates parishioners about endangered species and environmental issues, and con-

verted the congregation to serving fair-trade, shade-grown coffee, which expresses its concern for the people and bird-life of the areas where coffee is produced.

Beyond Earth Ministry's intensive grassroots and outreach efforts, the organization brings in speakers, organizes conferences and local events such as outings to help local groups to successfully restore salmon habitat, and enlists churches to support local immigrant community farmers through Community Supported Agriculture cooperatives.

Earth Mysteries

Unusual geophysical and environmental phenomena exercise a persistent fascination on the human imagination. Since its coinage in the early 1970s, the term *earth mysteries* has become an umbrella designation covering a variety of speculative studies and theories regarding the alleged powers of the Earth; mysterious energies that are thought to be found at particular sites on the Earth's surface (especially recognized sacred sites); and the construction, positioning, and uses of ancient monuments and prehistoric landscapes. For the "alternative archeologists" and others who study Earth mysteries, the field constitutes a multidisciplinary and holistic endeavor to understand the past and the human relationship to the Earth, an endeavor that encompasses such wide-ranging pursuits as archeology, archaeoastronomy, the study of folklore and mythology, geophysics, consciousness studies, geomancy, dowsing and other divinatory and clairvoyant techniques, sacred geometry and "gematria," epigraphy, crystallography, pyramidology, speculation about lost continents, and the study of scientifically anomalous phenomena such as UFOs, crop circles, and so-called Earth lights. From the outside, the field often appears a hodgepodge, and most of the scientific establishment of archeologists and prehistorians characteristically dismisses it as empirically flawed and theoretically incoherent, pseudoscientific, atavistic, and irrational.

Nevertheless, “alternative archeology” and the study of Earth mysteries has helped to fuel a popular interest in the distant past and in preserving natural and cultural landscapes, and, in some measure, has helped to correct earlier views of prehistory, which had characterized the ancient world as a time of toil, superstition, and ignorance. In the view promoted by writers on Earth mysteries, the ancients were more attuned to the Earth than we are now, and the time has come to learn what we can from the evidence of the past.

Though research on the geophysical qualities and alignments of prehistoric sites had been undertaken sporadically since the mid-nineteenth century, the inaugural moment of the contemporary Earth mysteries movement, at least in its Anglo-American formulation, is often taken to be the summer day in 1921 when the English businessman Alfred Watkins (1855–1935) stood on a hilltop in Herefordshire and suddenly saw the English landscape spread out before him as if laid out in a network of invisible lines. In his 1925 book *The Old Straight Track*, Watkins presented the case for a network of completely straight roads used by traders in prehistoric England and marked by a variety of Neolithic, Bronze and Iron Age, Roman, and medieval monuments, including standing stones and megalithic structures, barrow mounds, holy wells, old churches, castles, hilltop beacons, crosses and old crossroads, and significant place-names. To pursue his “linear vision,” Watkins founded the Old Straight Track Club, a group of ley aficionados, which flourished between the wars and inspired countless other “ley hunting” enthusiasts.

Also in the early decades of the twentieth century, German landscape researchers Wilhelm Teudt and Josef Heinsch popularized the notion that ancient Teutonic peoples possessed a centralized, protoscientific solar cult which built an extensive network of astronomical lines, so-called “Holy lines” (*Heilige linien*), the existence of which could still be found in the geographical layout of ancient sites. Supported by Heinrich Himmler, Teudt became the head of an association dedicated to promoting Germany’s ancestral heritage (*Deutsche Ahnenerbe*), and the search for “holy lines” and astrological orientations was encouraged as a pro-party act by the Nazis before and during World War II. For Teudt and his associates, the Teutoburger Wald district in Lower Saxony – with astronomical lines linking sacred places, all centered around the dramatic rock formation called *Die Externsteine* – was the sacred heartland of Germany.

After the war, German geomancy suffered from its connections with Nazism, but by the 1960s, similar ideas resurfaced in other parts of Europe and North America, as part of the general resurgence of interest in ancient civilizations and mysterious phenomena. The 1965 publication of Boston University astronomer Gerald Hawkins’s *Stonehenge Decoded* injected a modicum of scientific

respectability to the burgeoning field. Equipped with the latest Harvard-Smithsonian IBM digital computer, Hawkins claimed to discover close correlations between the placement of the main stones at Stonehenge and the positions of the rising and setting midsummer and mid-winter sun, the moon, and other celestial bodies, and concluded that Stonehenge was an ancient astronomical observatory and “prehistoric computer.” Hawkins’ ideas gave rise to the new field of *archeoastronomy* (or astro-archeology) and spurred on other scientists and amateurs to seek similar correlations elsewhere. Among others, mechanical engineer Alexander Thom carried out extensive surveys of British stone circles and hypothesized the existence of a “megalithic science,” complete with a precise measuring unit called the “megalithic yard.” Though many of Hawkins’ and Thom’s findings have since been rejected by most scholars, there is a consensus today that some sorts of alignments with celestial events were important in the design and uses of many stone circles in certain parts of the world, even if these alignments were on the whole imprecise, non-systematic, and most likely secondary to ritual, political, and other concerns; and archeoastronomers have continued to research astronomical correlations at European stone circles, as well as Mayan temples, networks of straight lines at Nazca and Cuzco in the Bolivian Andes, and sites of the pre-Columbian Anasazi culture of the U.S. Southwest.

Buoyed by the growing popular interest in unexplained phenomena, however, ley hunting has undergone a dramatic revival in countercultural and New Age circles in recent decades. In 1965, a group of ley aficionados founded *The Ley Hunter*, a magazine that was to become the longest running publication (it is still publishing) devoted to Earth mysteries, the term that the magazine’s editors coined in the early 1970s. The journal attracted the rising stars of the British Earth mysteries community, including John Michell, Paul Devereux, Anthony Roberts, and Nigel Pennick. Michell’s 1969 book *The View Over Atlantis* helped to crystallize the movement, synthesizing an eclectic array of previously disparate fields into an alluring narrative of a glorious past in which a caste of astronomer-priests built and manipulated a “great scientific instrument” of stone construction that lay sprawled over the surface of the planet. With other proponents of “sacred geometry,” Michell proposed that there are correspondences between geometrical shapes, mathematical principles, natural energies and other geophysical properties, and cosmic harmonies; and that these principles were utilized in the design and construction of sacred monuments including the stone circles of the British Isles, the pyramids of Egypt, Greek and Hindu temples, medieval and Renaissance cathedrals and churches and, it seems, almost anywhere else he looked. By associating leys with Chinese “dragon-paths” or *lung mei*, Michell also made “geomancy” a central notion of the Earth mysteries

movement. Responding to the apparent contradiction that Chinese dragon lines are thought to flow through the land in undulating curves, while Britain's ley lines are, by definition, perfectly straight, Michell suggested the straight leys were a human construction intended to channel natural energy flow into direct pathways, and went on to produce a detailed local case study of megalithic sites at West Penwith in Cornwall which is still considered by ley aficionados as convincing proof of the ley hypothesis.

By the mid-1970s, Watkins' notion of a network of trade routes had been largely supplanted by the idea of ley lines as invisible but perceptible energy pathways pulsing and circulating through the landscape – “etheric” or “subtle” energies which meet at nodes or concentrated “power points,” and which can be directed and manipulated for good or ill like the *chi* or *prana* of Eastern medicine. One of the ways in which these energies can be perceived, according to believers, is through dowsing, that is, divining with metal rods, twigs or other aids. Dowsers have, over the years, enthusiastically mapped out not only the underground water sources for which they are better known, but also countless other purported energies in the vicinity of ancient sites. Much recent Earth mysteries writing portrays the Earth itself as alive and sentient, but under threat by industrial civilization, with the appropriate response to that threat being magic, eco-ritual, and so-called “Earth acupuncture,” as in Tom Graves' 1986 book *Needles of Stone Revisited*. At the “power points” where energy leys supposedly converge, everyday reality is said to interpenetrate with non-ordinary, parapsychical realities, facilitating transpersonal experiences and communication with spiritual or non-physical beings. Mixed in with much of this literature on Earth energy is frequent reference to Earth lights, UFO sightings, mysterious crop formations, psychic phenomena, and other curiosities.

Sensing a need to establish scientific credibility for Earth mysteries research, *Ley Hunter* editor Paul Devereux in 1977 launched the Dragon Project, an interdisciplinary research effort to document and measure unusual energy phenomena, such as magnetic or radiation anomalies, ultrasonic emissions, and light phenomena, at stone circles in Britain. A shoestring-budget operation, the project lumbered along for several years in fits and starts, but by 1989, Devereux had admitted that its psychic archaeological work (using dowsers and psychics for archaeological purposes) had produced unclear results, and that energy dowsing had “not yet developed much beyond belief-system status.” The project had, however, produced suggestive, if inconclusive, evidence of magnetic, ultrasound, and radiation oddities, giving rise to speculation that unusual phenomena reported at megalithic sites may be related to the natural radiation of the stone itself, usually granite. This hypothesis seemed to parallel the claims of a handful of North American neurophysiologists

who have found correlations between geophysical features, such as underground uranium deposits (e.g., in the U.S. Southwest), seismic phenomena, or tectonic stress zones, and increased reporting of UFOs and other unusual psychological experiences. Neurophysiologist Michael Persinger hypothesizes that piezoelectric effects and other electromagnetic discharges associated with tectonic plate movements, specifically at geological fault zones, stimulate specific areas of the human neocortex, producing hallucinatory images which the brain interprets as encounters with UFOs, poltergeists, or even near-death experiences. Certain regions of the world, including the famed Bermuda Triangle, the so-called Wessex Triangle in Britain, the Sedona area in Arizona, and the island of Maui, have seemed to specialize in generating such phenomena, or at least in attracting people who specialize in perceiving them.

In line with this more pragmatic and scientific approach, Devereux decisively rejected the “energetic” school of ley line theorizing and proposed a third hypothesis to account for the leys. In this new view, straight-line tracks and landscape alignments, such as the extensive landscape lines found in the South American Andes, are collective mental constructs or “shamanic spirit paths,” representations of the trance-state travels of shamans, and as such represent the ability of the human mind to roam across space in altered and religious states of consciousness. Alongside a wealth of other data from around the world, Devereux supported his case citing the use of straight tracks as actual funerary roads for the carriage of the dead in some cultures; and despite its overgeneralized nature, the spirit path hypothesis has been taken up enthusiastically by other ley researchers.

Though Britain has been a hothouse of recent Earth mysteries theorizing, other parts of the world have produced their own variants. North American Earth mysteries research has been especially infused with cultural diffusionist speculation, including far-flung theories of ancient transatlantic migrations by Celts, Vikings, Phoenicians, and other seafarers. The doyen of these pursuits has been Harvard marine biologist Barry Fell, whose theories about Pre-Columbian voyagers were outlined in a series of popular books in the 1970s and early 1980s. Though dismissed by the scientific community, Fell's books drew attention to various sites, such as Mystery Hill in New Hampshire (also known as the American Stonehenge) and other stone structures, whose suggestive features and apparent inscriptions have continued to exercise a fascination on the curious. Another subcategory of Earth mysteries researchers have sought to confirm is archeologist Marija Gimbutas's hypothesis of an ancient goddess civilization, discovering imagery associated with “the Goddess” in landscape formations and folklore as far and wide as England (notably Silbury Hill) and Ireland, islands in the Mediterranean, and North and South America.

Yet another line of Earth mysteries research has been the hypothesis of a global energy grid. In the 1970s, Cambridge mathematician Michael Behrend began detecting alignments of ancient sites in geometric shapes (such as hexagons and decagons) spread on a vast scale across Britain. Other researchers have since projected such geometrical patterns over the entire Earth, portraying the planet as a crystalline structure made up of regular geometrical patterns based on Platonic solids, or as composed of vast circles, so-called Rings of Gaia, whose intersections mark energy points or “planetary chakras.” Some theorists have attempted to classify the different “power points” or “energy vortexes” into types. One common scheme, proffered by psychic Page Bryant, distinguishes between *electrical* vortexes, which include areas of high elevation and sacred mountains (such as mounts Shasta, Kilauea, or Denali/McKinley) and are said to be physically charging and stimulating; *magnetic* vortexes, which are lower lying and include wells and springs, lakes, and caves, and are said to be conducive to meditation, healing, past-life recall, and intuitive guidance; and *electromagnetic* vortexes or larger *electromagnetic grids*, which combine the two types of features over larger areas (e.g., Niagara Falls, Maui and Kauai in Hawai’i, the Rocky Mountains). The volcanic Ring of Fire that stretches across the Pacific is, for Bryant, the axis for the Earth’s “kundalini” energy. (In Hindu and Buddhist spiritual and physico-medical traditions, the *chakras* are thought to be energy centers that run along the body’s central axis, and along which flows the spiritual or “life energy” known as *kundalini*.)

Like other researchers of the paranormal, Earth mysteries researchers have not fared well against the scrutiny of scientists and skeptics. Though most archeologists know little of the world of “alternative archeology,” the few instances of scholarly scrutiny of Earth mysteries research have proved humbling to the field’s credibility. Ley hunters have been critiqued for their “telescoped” view of prehistory, which sees all prehistoric earthworks and all grass-covered mounds as roughly contemporaneous, and for flawed methodology, selective and inappropriate use of statistical evidence, dubious use of folklore and place-names, and the sheer incoherence of their various notions of Earth or telluric “energies.” Their site-evolution or site-continuity argument – according to which different cultural groups, separated from each other by many centuries, are said to have recognized the sanctity of a place, erecting a variety of structures, from stone circles to tumuli to churches, to mark it out – is rejected by most archeologists, as is the common claim that the British ley network was established back in the Neolithic, since, in fact, most purported ley lines require the use of later sites as well as ill-defined mark points (including moats, ponds, lanes, and even trees) to “confirm” their veracity as leys. More generally, Earth mysteries research is faulted for

over reliance on outdated ideas about prehistory, and for injudicious appropriation of scholarly theories – such as Gimbutas’s hypothesis of an ancient goddess civilization, James Lovelock’s Gaia hypothesis, or the wild variety of “new physics” ideas about holographic universes and multidimensional realities – to prop up their own ideas, without recognizing the limitations of those theories or their tendentious status within their respective source disciplines. As archeological knowledge has accumulated, especially since the dawn of radiocarbon dating, the picture of the European Neolithic, for instance, has become altogether much more complex, characterized by a recognition of intense local regionalism and conflict, extensive environmental disruption, profound changes in cultural tradition over time, with different structures being built for different purposes at different periods of time – but also with a proliferation of ritual monuments, which served less as astronomical observatories than as large-scale visual and territorial markers. Analogous situations apply in other parts of the world. Earth mysteries researchers, in contrast, have tended to ignore archeologists’ growing knowledge of the cultural, functional, and chronological contexts of ancient sites, while doggedly pursuing their overarching hypothesis of a lost Golden Age.

Nevertheless, dialogue between fringe and orthodox (i.e., amateur and professional) prehistorians has taken place sporadically, at conferences and in occasional articles in popular archeological journals and alternative venues. Some of the ideas of earlier Earth mysteries research have, in fact, turned out to be more accurate than the science of the time had supposed: for instance, the idea, shared by Watkins and others, that the Neolithic landscape of Europe and the British Isles was widely cleared and settled, or the view that “continuity of development” was a keynote to European history (this contrasts to early archeologists’ emphasis on invasions and migrations). Recent developments in symbolic, cognitive, interpretive, phenomenological, and post-processualist archeology, however, have pursued with great vigor the sorts of questions that should interest Earth mysteries aficionados. If the “Earth mysteries” field is to have a future other than mere wishful thinking, skillful collaboration between scholarly prehistorians and amateur enthusiasts – and, more practically, with environmental activists – would seem to be a prerequisite.

EarthSpirit Community

EarthSpirit is a national organization of neo-pagans located in western Massachusetts. The organization, which was founded in 1980 in the Boston area by its current directors, Andras Corban Arthen and Deirdre Pulgram Arthen, organizes festivals and open rituals, offers classes on neo-pagan topics, maintains a website, and publishes a newsletter for its members. The organization has a performance group, Mothertongue, which has produced several recordings of stories and songs with neo-pagan and nature themes. From 1988 to 1993 EarthSpirit published a popular glossy magazine, *FireHeart*, which included interviews with well-known neo-pagans and articles about magical practices, rituals, and topical issues within the neo-pagan community. Although most of the articles were written by EarthSpirit members, neo-pagans, who were not active members in ESC and environmental activist groups, such as Earth First!, were also invited to write articles for this journal, helping to make it an important source for information and debate within the neo-pagan community.

EarthSpirit is best known for its festival, Rites of Spring, which takes place yearly around Memorial Day weekend in western Massachusetts. The festival began in 1979 as a two-day gathering of neo-pagans in the Boston area, grew to an event that occurred over a long weekend, and ultimately to a week-long gathering that has drawn up to 700 people. The theme of the gathering changes each year but always focuses on the spiritual connection between participants and the Earth. EarthSpirit also organizes three smaller gatherings – Twilight Covening in

the fall, Suntime in midsummer, and the Festival of Lights in mid-winter – as well as workshops throughout the year to train neo-pagans in aspects of magical or ritual practice or to facilitate discussions of topics such as the spiritual connection between people and the Earth as reflected in the folklore and practices of indigenous peoples. Public seasonal rituals held by EarthSpirit in both the Boston area and western Massachusetts often serve as a bridge for interested individuals to become neo-pagans. These rituals also provide an arena for local neo-pagans to meet one another and to make and renew friendships, magical partnerships, and sometimes form into working spiritual groups.

EarthSpirit's large rituals are dramatic, involving the use of music, masks, props, and dance to enact some aspect of change that is occurring in nature and its meaning for participants. For instance, at Samhain rituals, which occur around October 31st, death and rebirth in nature is celebrated. Participants are encouraged to remember deceased friends and family members and to think about their own bad habits or relationships that they want to "die" to be replaced with healthier ones. EarthSpirit is gifted at using dance, chants, songs, and mazes to involve large groups of people in open rituals. For example, at one Rites of Spring a maze was created through which approximately 600 individuals walked at the conclusion of a ritual, transfiguring the amebic circles of participants into a butterfly, which reflected that year's theme of transformation in nature and in individuals' lives.

The organization is run by a dedicated group of individuals, many of whom, like Andras and Deirdre, have taken the last name Arthen, share a homestead in western Massachusetts, and are members of the Glainn Sidhr (Glenshire) Order of Witches. The organization and its leaders often serve as public spokespersons for neo-paganism and Earth-based spirituality. EarthSpirit was one of the three neo-pagan groups to represent their religion at the World Parliament of Religions in Chicago in 1993 and in South Africa in 1999. The organization boasts over 4000 members, most of whom live in the New England area, although others reside throughout the United States and abroad. Membership within the organization requires individuals to pay a small fee in return for which they receive newsletters, mailings about upcoming events, and discounts at those events. Members vary in their commitment to the organization; some donate time to help organize its rituals and festivals, and to maintain the organization, while others attend only some events. All of EarthSpirit's events are open to members and non-members alike.

Although those in the inner circle are members of the same spiritual and magical tradition, EarthSpirit aims to be a service organization for the larger neo-pagan community. At both the festivals and open circles organized

by EarthSpirit the focus is on what they believe all neopagans share – a magical worldview and reverence for the Earth. Animals, streams, trees, the wind, and stones are all venerated as part of the sacred web of creation. Woven into the fabric of the rituals is a theme that humanity, which is viewed as part of the sacred web, needs to honor and protect nature. The group encourages its members to be environmentally responsible. Some outdoor rituals include the planting of trees or the removal of trash from public lands as a symbol of the participants' respect and care for Mother Earth.

Eco-Church

The Eco-Church Movement was initially developed by the North American Coalition for Christianity and Ecology (NACCE), a Minnesota-based organization founded in 1986 to foster greater ecological responsibility and care of creation among Christians. Since then, the concept of eco-church has extended beyond the context of the NACCE to non-affiliated grassroots groups that define themselves as eco-churches but not necessarily under the guidelines advanced by the NACCE. As conceived by the NACCE, eco-churches (the NACCE now calls them “Earthkeeping Circles”) were to be small groups of people who meet weekly to discuss relevant biblical passages and to study issues related to Christianity and ecology. Eco-churches would have freedom to experiment and tailor their own gatherings to the interests of the local group but would largely remain biblically based. Eco-churches could create their own rituals for celebrating Christian holy days, the natural seasons, or even Earth Day. NACCE’s guidelines for eco-churches identify body prayer, song and music, study and action, exploring the bioregion, cultivating Earth literacy, and observing holy days as suggested group activities. Although there were very few eco-churches actually affiliated with the NACCE as of 2003, the eco-church concept and name had been picked and interpreted

in different ways by various independent lay-led groups. Catholic lay groups in particular, which have come to the eco-church idea through the writings of Father Albert Fritsch (and not necessarily through the NACCE) have given the eco-church concept their own interpretation and added a special emphasis on eco-justice concerns.

Although the NACCE advises groups to hold gatherings outdoors as much as possible, at other times eco-church groups meet in members’ homes instead of within institutional walls. Like the “House Church Movement” of the 1970s and the Liberation Theology Movement with its small Christian Based Communities (CBCs) in Central and Latin America, eco-churches are committed not just to study and worship but also to social and environmental action. Much as the House Church Movement did, the Eco-Church Movement today draws support and precedent from key passages in the New Testament (Acts 2:46, 12:12; Rom. 16:5; 1 Cor. 16:19; Col. 4:15) to authenticate the new growth of more egalitarian and experimental home-based liturgical groups. Much of the literature on eco-churches has a “Liberation Theology” feel to it and emphasizes the powerful potential of local grassroots action. For example, the March/April 2000 written message from NACCE President Rev. Finley Schaeff said,

Why should we want to create house churches, or “Eco-church circles,” or “earthkeeping circles,” or cells? The answer is quite simple: the existing local churches, in my humble estimation, will never make the radical changes we envision. Local churches, if they can get beyond the mission of sociability and charity, do try to address individual salvation, but that’s the limit (Schaeff 2000).

Eco-church proponents also argue that smaller, home-based groups are by nature more ecologically sustainable since they do not require the resources to build, maintain, and power large institutional buildings. Creating simpler, more flexible churches that model sustainability and commitment to creation is thus one of the movement’s goals. For traditional congregations that wish to become more eco-friendly, the NACCE provides eco-Church ministry teams a variety of resources and directs them to Father Albert Fritsch’s book *Eco-Church: An Action Manual* (1992), which offers step-by-step instructions on how congregations can conduct their own environmental resource audit. Rev. Schaeff has welcomed and praised such institutional “greening” but with the caveat that “established churches need to do much more than tack on ecological issues to their existing agenda” (Schaeff 2000). The development of eco-churches then, which has extended even to a study group inside a New York penitentiary, was ideally conceived of as a way to build a more immediate grassroots movement of ecologically sensitive Christians from the bottom up without waiting for slower-moving

church bureaucracies to implement changes. Much like House Churches, these “cell groups” are by nature decentralized and not necessarily affiliated with any environmental organization or congregation, making the scope of the movement more challenging to judge.

Ecofascism

Fascism is a totalitarian form of government that requires individuals to sacrifice their interests and even their lives to the well-being and glory of the state. Acquiring mystical qualities usually reserved for divinities, the state and its leaders become the heroic manifestations of the people’s sacred blood. A new social hierarchy is required to overcome the debilitating, blood-destroying effects of mass civilization. Militarism, expansionist nationalism, and racism usually follow from fascism’s social Darwinism, according to which dynamic societies can and must win the inevitable struggle for survival against weaker states.

Following this definition, we may define “ecofascism” as a totalitarian government that requires individuals to sacrifice their interests to the well-being and glory of the “land,” understood as the splendid web of life, or the organic whole of nature, including peoples and their states. The land acquires mystical properties as the sacred source and absolute measure for all things. Polluting the land, either by toxins or by admitting the wrong kind of immigrants, not only threatens the state’s stability and security, but also affronts the sacred natural order itself. Even though the web of life supposedly admits of no hierarchies, ecofascism requires leaders who enforce “natural” principles against selfish (hence, unnatural) individuals and peoples. Militarism, expansionism, and

possibly racism are required to defend the land – Fatherland, Mother Earth, Gaia – from those who disrespect the land, including both industrialized countries and overpopulated “developing” nations. Consistent with Darwinist principles, the ecofascist state will succeed in the struggle for survival, because such a state is more adaptive to (respectful of) the environment, now glorified as the sacred web of life.

No ecofascism government has yet existed, but important aspects of it can be discerned in German National Socialism, one of whose central slogans was *Blut und Boden*, “[pure] blood and [pure] land.” Some portray Nazism as a political religion, according to which the state must protect the racially pure blood that manifests and sustains the creative power of nature. Many Nazis believed that blood purity was crucial for Germany’s sacred mission of saving noble northern European races from degenerate ones, such as the Jews. The Nazis explicitly contrasted their “religion of nature” with the otherworldliness of Christianity, itself a product of the “unnatural” Jews. Since races were closely tied to the land in which they arose, German land had to be protected both from industrial pollution and from the injurious presence of half-breeds. Only pure blood Germans could draw creative energy from the land that originally gave rise to the *Volk*. Divinity was purely immanent within nature, respect for which was possible only for people with the blood of northern Europeans. Capitalism and communism, which not only reduced peoples to undifferentiated masses, but also destroyed the land with their industrial practices, were supposedly ideological offspring of the nature-despising, blood-polluting, semi-human Jews. These attitudes were not erased from Nazism, despite its post-1936 commitment to the total industrial mobilization required for acquiring *Lebensraum* to the East and for “liberating” northern European countries from the institutions imposed by modernity, such as democracy, socialism, and capitalism.

Nazism’s perverted neo-paganism must be sharply contrasted with contemporary neo-paganism, which typically affirms the achievements of modernity, while disagreeing with its total desacralization of nature. Nevertheless, the ecofascist aspect of National Socialism must be kept in mind by those environmentalists who call for worshipping nature and who also engage in a totalizing critique of modernity. In the future, the possibility of some kind of ecofascism could grow if environmental problems lead to international tensions (e.g., disputes over water rights or immigration) that national leaders use as an excuse to whip up nationalist and/or ethnic passions, build up military forces, suppress internal opposition, and enforce draconian laws compelling people to behave in ways consistent with the well-being and purity of “nature.”

Ecofeminism and Biblical Interpretation

For some time now ecofeminists have interpreted the Bible both critically and hopefully. Alert to the ways biblical religion has been implicated in the oppression of women and the domination of nature, ecofeminist theologians such as Rosemary Radford Ruether, Judith Plaskow and Ivone Gebara have used ecofeminist ethics as a basis for critical and selective reinterpretations of biblical material. For example, in *Gaia and God* (1992) Ruether reinterprets the biblical motif of "covenant" to encompass "the covenant of creation" in which "we are to be in right relation to our fellow beings" (1992: 228). Plaskow refers to biblical prophecy in the context of a Jewish ecofeminist vision of repair of the world (in Adams 1993). In *Longing for Running Water* (1999), Gebara describes an orientation toward life within the parables of Jesus. Through these new interpretations, the Bible becomes a source for developing an ecofeminist response to environmental devastation and to the interrelated oppressions of women, indigenous peoples and other subordinated groups.

Of particular interest to ecofeminists have been the biblical motifs of genesis and apocalypse. In a reversal of the Christian canon, Anne Primavesi's *From Apocalypse to Genesis* (1991) moves from contemporary judgments on human actions destructive of nature to the possibility of an ecological re-reading of the creation stories of Genesis 1 to 3. Critical of the role of Christianity and Western society in the subordination of women and the domination of nature, Primavesi interprets the Spirit of God in creation as an image of the regenerative power of trees, oceans and human bodies. In "Nuclear Power and the Sacred," Jane Caputi (Adams 1993), following the work of film critic Michael Wood, links the gendering of the atomic bomb as

female with the biblically based myth of Adam and Eve. She traces a pattern in which nuclear weapons are given women's names and associated with the sexual power of women. This pattern, portraying woman as seductive and destructive, emerges from a tradition that represents Eve as culpable for human evil. In Ruether's "Women Healing Earth" (1996), Sun-Ai Lee-Park focuses on "the forbidden tree" of Genesis 2 and 3. There God offers the first humans all the bounty of the forest garden, except for the fruit of the tree of knowledge of good and evil. When Lee-Park witnesses the logging of ancient rainforests in Sarawak, she recalls this divine prohibition. The Genesis story for her parallels the way in which ignoring environmental limits leads to destruction and loss.

Themes of genesis and apocalypse come together in Carolyn Merchant's *Earthcare* (1995) and Catherine Keller's *Apocalypse Now and Then* (1996). Both writers describe ways in which the myth of a lost Eden and the vision of a New World coalesce in the colonization of the Americas. Keller argues that an apocalyptic framework, rejected by Western modernity, continues to influence Western imagination and practice through what she calls a "cryptoapocalypse." By offering an extended, ecological, feminist engagement with a single biblical book, namely the Book of Revelation, Keller's *Apocalypse* represents a shift for ecofeminist biblical interpretation.

Within biblical studies, ecofeminist frameworks of interpretation are continuing to be developed. As Gebara indicates, in several Latin American countries women are re-reading biblical scriptures from the joint perspective of "the integrity of creation" and "respect for women." In the first volume of the *Earth Bible*, Australian biblical scholar Elaine Wainwright has extended a feminist hermeneutic to develop an ecofeminist reading of the Gospel of Matthew. Focusing in particular on Matthew 11, which deals with the question of who Jesus is, Wainwright suggests that the deeds of Jesus reveal the presence of divine wisdom and the possibility of right relationship not only between humans but within the entire Earth community.

In the same volume Heather Eaton draws on feminist biblical criticism to suggest directions for an ecofeminist approach to biblical interpretation. Questioning conventional notions of the text as sacred and authoritative, Eaton writes: "From an ecofeminist perspective, the Bible can be accepted only as contingent and provisional" (in Habel 2000: 59). This implies an acceptance of the material reality of the Bible. Words on a scroll, page or screen are not possible without the plants from which paper or papyrus and ink are produced or the fossils and rocks from which the plastics of a CD-ROM and the parts of a computer are formed. Writers and readers of the text are also dependent on the Earth community for their sustenance. A recognition of the interdependence of readers and text within an Earth community is particularly pertinent for ecofeminist biblical interpretation.

Related ecofeminist concerns with embodiment surface in the *Earth Bible's* volume on biblical wisdom literature (Habel and Wurst 2001). Shirley Wurst's focus on eco-kinship develops aspects of interconnectedness and Earth kinship evident in the biblical personification of divine wisdom as a woman. Drawing on the practice of biblical scholar Claudia Camp, Wurst names this figure of kinship Woman Wisdom. For Laura Hobgood-Oster, Woman Wisdom offers a vision of the divine which contrasts with other less Earth-friendly images: "The divine being frolicking in creation suggests a very different image than a king sitting on a throne with Earth as 'his' footstool" (in Habel and Wurst 2001: 40). Woman Wisdom inhabits the realm of Earth; she invites humans to open themselves to a passionate knowing of Earth. In the same volume, Carole Fontaine focuses on the celebration of sexual desire in the Song of Songs. The lovers' desire to connect is reflected in the wider interconnectedness of the Earth community. Not only does the natural world provide space for the lovers' meeting and material for their metaphors, but also it itself is both lover and beloved.

As Eaton indicates, ecofeminist interpretations must be ethically responsible. The patriarchal and androcentric character of much biblical material remains a key concern. So, too, does the problem of the anthropocentrism of the text and its readers, which tends to make ecological concerns marginal to the work of biblical interpretation. Further, as post-colonial insights are integrated with ecofeminist ones, there is a critical focus on the ways in which the Bible has been used in the Eurowestern project of colonization. At the same time, eco-sensitive readings are emerging in the interplay between ecofeminist reader and biblical text. Considering the problematic aspects of the text, Hobgood-Oster writes: "Earth recontextualizes and subverts" (in Habel and Wurst 2001: 46). The challenge to ecofeminist interpreters of the Bible is to allow Earth to recontextualize and subvert our readings of the text.

Ecofeminism – Historic and International Evolution

Ecofeminism emerged in the 1970s and 1980s as myriad forms of feminist and environmental theories and activism intersected. The term was introduced by Françoise d'Eaubonne in her book *Le Feminisme ou la Mort* (Feminism or Death) published in 1974. Some theorists, such as Ynestra King, name it as a third wave of feminism, while others place it in the general category of deep ecology. Ecofeminism acts in both and neither of these broad movements, simultaneously serving as an environmental critique of feminism and a feminist critique of environmentalism. Ecofeminist trajectories are varied; there is no one accepted or orthodox "ecofeminism." Rosemary Radford Ruether, Ivone Gebara, Vandana Shiva, Susan Griffin, Alice Walker, Starhawk, Sallie McFague, Luisah Teish, Sun Ai Lee-Park, Paula Gunn Allen, Monica Sjöö, Greta Gaard, Karen Warren and Andy Smith are among the voices speaking from ecofeminist positions.

Ecofeminism asserts that all forms of oppression are connected and that structures of oppression must be addressed in their totality. Oppression of the natural world and of women by patriarchal power structures must be examined together or neither can be confronted fully. These socially constructed oppressions formed out of the power dynamics of patriarchal systems. In one of the first ecofeminist books, *New Woman/New Earth*, Ruether, states:

Women must see that there can be no liberation for them and no solution to the ecological crisis within a society whose fundamental model of relationships continues to be one of domination. They must unite the demands of the women's movement with those of the ecological movement to envision a radical reshaping of the basic socioeconomic relations and the underlying values of this [modern industrial] society (1975: 204).

Ruether makes clear a central tenet of ecofeminism: Earth and the other-than-human experience the tyranny of patriarchy along with women. Classism, racism, sexism,

heterosexism, naturism (a term coined by Warren) and speciesism are all intertwined.

Ecofeminism is multi-faceted and multi-located, challenging structures rather than individuals. By confronting systems of patriarchy, ecofeminism broadens the scope of the cultural critique and incorporates seemingly disparate but, according to ecofeminism, radically connected elements. Combining feminist and deep ecological perspectives – in and of themselves extremely varied ways of thinking about reality – is a complex, transgressive process that is often in flux. Ecofeminist positions reflect varied political stances that may be, and usually are, transformed through time and place. In other words, the political activism and alliances stemming from ecofeminism modify in relationship to the perceived justice issues being confronted in differing cultural and historical settings. Because of this constant morphing, ecofeminism simultaneously challenges patriarchies from different angles. This is one of the myriad strengths of the fluid and radically diverse positions assumed by ecofeminism.

Ecofeminism claims that patriarchal structures justify their dominance through categorical or dualistic hierarchies: heaven/Earth, mind/body, male/female, human/animal, spirit/matter, culture/nature, white/non-white. Established oppressive systems continue to manifest their abusive powers by reinforcing assumptions of these binaries, even making them sacred through religious and scientific constructs. Ecofeminism posits that as long as any of the dualisms exist as an integral component of societal structuring and justification, they will all continue to serve as starting points to justify patriarchy. Therefore all dualisms and binary oppositional forms must be dismantled otherwise humanity remains “divided against” itself, a phrase that Griffin uses to describe the ideological impact of dualism.

As a justice advocate for the entire web of life, ecofeminism resists dividing culture into these imbedded separate or dualistic arenas. In her introduction to *Ecofeminism: Women, Culture, Nature*, editor Warren asserts: “What makes ecofeminism distinct is its insistence that nonhuman nature and naturism (i.e., the unjustified domination of nature) are feminist issues. Ecofeminist philosophy extends familiar feminist critiques of socialisms of domination to nature” (1997: 4).

Ecofeminism’s constructive worldview replaces hierarchical dualisms with radical diversity and relationship, modeled on both biodiversity and the feminist emphasis on the strength of difference.

Throughout the 1970s, few ecofeminists in academic settings designated themselves as such, though several engaged in similar theoretical endeavors linking feminist and environmental ideas. Early publications that analyze the woman/nature connection in light of the environmental crisis include Ruether’s *New Woman/New Earth* (1975), Mary Daly’s *Gyn/Ecology* (1978), Griffin’s *Woman*

and Nature (1978) and Carolyn Merchant’s *The Death of Nature* (1980).

Some of the earliest articulations of ecofeminism analyzed the patriarchal underpinnings in religious and philosophical systems of the European and Mediterranean world. These cultural and geographical foci surfaced from the primarily European and Euro-American voices that constituted the initial ecofeminist conversations. Such scholars as Anne Primavesi, Carol Christ, Merchant, Daly, and Charlene Spretnak examined cultural and religious systems from such areas as ancient Mesopotamia and Greece, as well as religious systems such as Judaism and Christianity. They proposed that patriarchal cultural structures revolved around layers of symbol systems that justified domination. For example, they interpret the creation stories in the book of Genesis, foundational for Judaism, Christianity and Islam, as demonizing both woman (Eve) and animal (the snake).

These and other early ecofeminists analyzed pre-patriarchal cultures in the Mediterranean and old European worlds as well. Feminist historian Gerda Lerner and archeomythologist Marija Gimbutas provided some of the groundwork for this analysis. Gimbutas’ theories of Old Europe are based in her complex and widely critiqued archeomythological reconstructions. Her theories suggest that life-valuing, sometimes matriarchal and rarely militaristic societies existed before Indo-Aryan invaders slowly destroyed these cultures. Lerner’s historical reconstructions focus on the shift from small Neolithic villages to city-based states with the accompanying rise of patriarchal cultural systems. Both theorists posit pre-patriarchal Mediterranean world religious cultures in which fertility goddesses and other nature symbolism figured prominently.

Gradually, patriarchal, militaristic sky gods replaced Earth goddesses and gods. Most of the ancient symbols of power were subverted and remythologized as evil or chaotic. The mother goddess, whose body often birthed or constituted the Earth, became the target of the powerful sky gods, as evidenced by such creation stories as the Babylonian *Enuma Elish*. The pattern of male deities killing female or animal deities in an effort to establish a patriarchal order and to control forces assumed to be chaotic repeats itself consistently. The snake, once a symbol of life, was trampled under the foot of the male deity and connected to evil. Hell was in the Earth, and Heaven was removed to the sky. Paradise lost its materiality and became a masculine, hierarchical projection.

Such theories raise many questions for scholars interested in the reconstruction of early human civilizations. For example, few archeologists accept Gimbutas’ theories and suggest that they are projections of matriarchal and goddess myths. Still, some ecofeminists reference these historical reconstructions as alternatives to the commonly accepted patriarchal constructions that project historical

progress. In other words, the idea of civilizations advancing from pre-agricultural to agricultural to industrial to post-industrial/technological might also be construed as a mythological projection. Applying feminist historical methodology, some academic ecofeminists reevaluate the patriarchal myth of progress, particularly its detrimental effects on the human–nature relationship. Carolyn Merchant articulates a version of this critique in *The Death of Nature*.

From the work of Griffin, Daly, Ruether, Merchant and others in the 1970s, grew a dramatic expansion of ecofeminism in academic circles during the 1980s and 1990s. Activist movements, sometimes connected with but generally outside of the academy, also increased in the 1980s. Several conferences focusing on ecofeminism were organized: “Women and Life on Earth: Eco-feminism in the Eighties” (1980), “Ecofeminist Perspectives: Culture, Nature, Theory” (1987), and a group at the National Women’s Studies Association (1989). These efforts, along with other attempts to create sustainable organizations such as the Feminist Peace Institute and WomanEarth, led to the publication of several foundational anthologies. *Reclaim the Earth: Women Speak Out for Life on Earth*, edited by Stephanie Leland and Leonie Caldecott (1983); *Healing the Wounds: The Promise of Ecofeminism*, edited by Judith Plant (1989); and *Reweaving the World: The Emergence of Ecofeminism*, edited by Irene Diamond and Gloria Orenstein (1990). All three volumes were edited by Euro-American ecofeminists but the editors included authors from various cultures. Petra Kelly, in her foreword to *Healing the Wounds*, proclaims a “global ecological sisterhood” and calls on the women of the Chipko Movement (India), the Greenham Common (England), the Krim Region (former Soviet Union) and the Western Shoshone Indian Nation to “link arms” as global sisters (1989: ix). The practice of publishing anthologies with diverse voices rather than books representing just one voice exhibits the overall tendency among ecofeminists to value inclusivity and difference. Still these anthologies, while influential, were criticized for essentializing the woman/nature connection and for over-romanticizing or over-simplifying women in non-Western cultures.

Vandana Shiva, a physicist and environmental researcher/activist in India, published *Staying Alive: Women, Ecology and Survival in India* (1988), which reflects the increasingly global nature of ecofeminism during the 1980s. Shiva connects the “death of the feminine principle” with “maldevelopment,” a term she uses to describe the introduction of Western, intensive agriculture to the “Third World.” In her essay “Development, Ecology and Women” Shiva articulates the relationship clearly:

Maldevelopment militates against this equality in diversity, and superimposes the ideologically constructed category of western technological man as a

uniform measure of the worth of classes, cultures, and genders . . . Diversity, and unity and harmony in diversity, become epistemologically unattainable in the context of maldevelopment, which then becomes synonymous with women’s underdevelopment (increasing sexist domination), and nature’s depletion (deepening ecological crises) (Shiva in Plant 1989: 83).

Shiva also published, with Maria Mies, a German, Marxist sociologist, *Ecofeminism: Reconnecting a Divided World* (1993). In this book the authors connect the capitalist-patriarchal economic system with the oppression of women in both the northern and southern hemispheres. However Shiva, not unlike some other ecofeminists, has been criticized for essentializing women and nature in her work.

Another area of focus concerned the relationship of scientific worldviews to religion and culture. Ecofeminism suggests that the antagonism sometimes existing between religious and scientific worldviews has been detrimental, used by both approaches to advance their own hierarchical structures. The reductionist models of both Western theologies and many Western scientific ideologies project a material world that is not sacred, but mechanistic. This apparent disconnect between the material and the sacred, alleged by ecofeminists to be fostered by both religion and science, has been particularly detrimental when acted upon by European-American dominant cultures. The Christian ecofeminist theologian Sallie McFague, in her book *The Body of God: An Ecological Theology* (1993), summarizes the situation:

Moreover, and most significant for an ecological theology, this picture projected disembodiment: disembodied knowing (the Cartesian mind/body dualism) and disembodied doing (internal human peace or forgiveness of sins became the principal action between God and the world) (1993: 29).

In *The Death of Nature*, Merchant links this hierarchical, mechanistic approach to nature to the oppression of women. She argues that, whereas organic thinking and interdependence shaped European life through the Middle Ages, the “fathers” of the scientific revolution determined to dominate nature. Merchant quotes Francis Bacon extensively. He proposes to “hound nature in her wanderings” in order to “drive her afterward to the same place again.” To disclose the “secrets of nature” Bacon suggests that “entering and penetrating into these holes and corners” of nature will lead to the uncovering of truth (in Merchant 1980: 168). During the same general time period, numerous European women (and men, though significantly fewer) were accused of witchcraft. The *Malleus Maleficarum* or *Hammer of Witches* (1486), a manual on

identifying and interrogating witches, instructed inquisitors to “penetrate” and torture witches in order to discover their secrets. Merchant argues that the feminine language used for “nature” and the parallel violent approaches of control assigned against unruly nature and unruly women are obvious.

Both Merchant and McFague emphasize the new (and also old), organic model of the cosmos developing in some areas of science and religion. The “common creation story” and the growing field of ecology, as well as some new cosmologies emerging from physics, provide fertile ground for ecofeminist entry into dialogue with the natural sciences.

The first volume of essays to focus on the topic of ecofeminism and spirituality was *Ecofeminism and the Sacred*, edited by Carol Adams. Voices from various religious and ethnic perspectives were included; for example: Hindu (Lina Gupta), Jewish (Judith Plaskow), Buddhist (Stephanie Kaza), Native American (Andy Smith), Womanist (Delores Williams), Christian (McFague). The volume combined voices from activist positions as well as from academic ones, with many contributors speaking from both simultaneously. Byllye Avery of the National Black Women’s Health Project and Zoe Weil of ANIMAL-EARN, a division of the American Anti-vivisection Society, are two such contributors.

During the same three decades (1970–2000), ecofeminist activists engaged in myriad protests, boycotts and campaigns to bring attention to the interconnection of justice issues related to women and the environment as a whole. Feminism is politically activist at its core and feminist methodologies applied to scholarly work make political engagement requisite. Various scholars entered the activist arena via their intellectual contributions and various activists entered the academic arena via their commitment to justice-oriented endeavors. Many first generation ecofeminists encountered each other through antimilitarist and anti-nuclear protests during the height of the Cold War. In 1980 *A Handbook for Women on the Nuclear Mentality*, written by Susan Koen and Nina Swaim, used the word ecofeminism as a foundational concept for action. The Women’s Pentagon Actions (1980–1981) and the Greenham Women’s Peace Camp (established in 1981) are two examples of ecofeminist, antimilitarization and anti-nuclear organizations.

The influence of the United Nations Decade for Women (1975–1985), with its many gatherings and coalition-building opportunities, on the development of ecofeminism has not been adequately researched. Various international political conferences sponsored by the U.N. and international NGOs did impact ecofeminist activists. For example, the U.N. Conference on Women in Nairobi in 1985 brought together ecofeminist leaders and provided them with further opportunities to connect with inter-

national colleagues. Other major international conferences that linked environmentalism and women’s issues were the “U.N.’s Environmental Programme’s (UNEP) Global Assembly on Women and the Environment” and the “World Women’s Congress for a Healthy Planet,” both held in Miami in 1991. While these international ecofeminist (though not named explicitly as such) gatherings connected academic voices with activist voices, there are some ecofeminists whose focus has been activist and justice-oriented who deliberately separate themselves from the academic arena in general, and in particular from the Euro-American academy.

The issue of racism within ecofeminist, and feminist, dialogues has also been prominent. Though paying significant attention to diversity, white ecofeminists have often essentialized racial difference. For example, in the academic anthologies listed above, Shiva’s voice figures prominently and seems to stand for all women who are not European or Euro-American. Few women of color have been able to remain in positions of leadership in activist or academic organizations for long periods of time. The political power of white women in these organizations undermines, often unintentionally, that of women of color. Even though such organizations as WomanEarth attempted to make racism an integral part of the ecofeminist conversation, racial tensions contributed to the eventual disbanding of numerous ecofeminist dialogue groups. Even the designations “white” and “of color” seem to maintain a binary within ecofeminism as it tries to subvert all such labels.

Another outcome of issues connected to racism is the critique of the label “ecofeminist” by various activists from indigenous peoples. For example, Winona LaDuke (Anishinaabeg), director of the Honor the Earth Fund and the White Earth Land Recovery Project, identifies herself as an activist for indigenous people rather than an ecofeminist activist. In an interview with Judith Plant (published in *Healing the Wounds*) Marie Wilson, member of the Gitksan-Wet’suwet’en Tribal Council (British Columbia) explains her perspective on this issue:

At the risk of sounding scornful or derogatory I have to say that the Indian attitude toward the natural world is different from the environmentalists. I have had the awful feeling that when we are finished dealing with the courts and our land claims, we will then have to battle the environmentalists and they will not understand why (Wilson in Plant 1989: 217).

Some of this tension grows from the appropriation of indigenous religious rituals by white people, including some ecofeminists. Andy Smith harshly criticizes such borrowing in her essay “For All Those Who Were Indian in a Former Life” (*Ecofeminism and the Sacred*).

Ecowomanists and African-American ecofeminists, express related concerns. They identify with racism as the first and most dominant oppression in their experience, while sexism is secondary. As Shamara Shantu Riley points out in *Ecofeminism and the Sacred*:

There are several differences between ecofeminism and Afrocentric ecowomanism. While Afrocentric ecowomanism also articulates the links between male supremacy and environmental degradation, it lays far more stress on other distinctive features, such as race and class, that leave an impression markedly different from ecofeminists' theories (Riley in Adams 1993: 197).

With the growing recognition of the extensive environmental racism in the United States and on a global scale, ecowomanists and others determine that their political alliances need to shift from a feminist agenda to one more directly engaging issues of race and class. This complexifying of interconnected oppressions, a central tenet of ecofeminism, continues to arise within the varieties of ecofeminism itself.

Globalization of all aspects of environmentalism has begun to shift the momentum in ecofeminism as well. *Women Healing Earth: Third World Women on Ecology, Feminism, and Religion* (Ruether, ed. 1996) provides insight into Latin American, Asian and African ecofeminism. In the introduction Ruether notes that while ecofeminism is not a "movement" in these large geographical areas, the global dialogue inspired by connections between the oppression of women and nature needs to be recognized. The contributors are all local/global activists and their work speaks to the globalization of ecofeminisms. The Con-Spirando Collective in Chile collaborated with Ruether in developing the volume. Con-spirando, translated as "breathing with" or "spiritual conspiracy," tries to "weave a network of women throughout Latin America who are interested in feminist theology, spirituality and ecofeminism" while also holding women's rituals (1996: 51). This collective publishes a magazine by the same name and operates a women's center in Santiago in addition to focusing specifically on ecofeminist activism and analyses. Victoria Tauli-Corpuz, from the tribal community of the Igorots in the Philippines, reflects on the spiritual links between women and nature in Igorot culture. But the "introduction of high-yielding varieties of rice seeds (HYV)" has disrupted women's spiritual leadership roles (in Ruether 1996: 105). Finally, Sarah Mvududu, with the Women and Law in Southern Africa Research Project in Zimbabwe, claims "gender is also fundamental in understanding human interaction with the environment and with respect to natural resources" (in Ruether 1996: 144). She explains this by analyzing Shona beliefs and woodland management. Spirit mediums, often women, are

deeply involved with sustainable woodland development in Zimbabwe and their connection to sacred places where trees are protected is requisite for reforestation.

Ecofeminism has not been without critics, from ecofeminists themselves as well as from others. Some of the most ardent critics question the woman/nature link that is sometimes placed at the core of ecofeminism, as evidenced in the title of such essays as Sherry Ortner's "Is Female to Male as Nature is to Culture?" (1974). Because of the strong woman-nature connection assumed and developed in some ecofeminist positions, various feminists distance themselves from ecofeminism and suggest that it is essentialist in nature. Essentialism claims that cross-culturally and cross-historically those of a particular race, gender or other category share the same traits. Many expressions of feminism and ecofeminism argue against all such essentialist constructions, while others expressions seem to maintain essentialism. Kate Nash, in her 1994 essay "The Feminist Production of Knowledge: Is Deconstruction a Practice for Women?" published in *Feminist Review*, clarifies the "tension" between the "deconstructive politics of feminism and the assertions, or constructions of unified identity that feminists are frequently called on to make on behalf of the category 'women' which gives the project its political specificity" (Nash 1994: 75-6).

Various attempts at typologizing feminisms and ecofeminisms have been made and are helpful for clarifying the diverse perspectives, though it should be noted that even these designations are understood differently by different ecofeminists. Cultural and radical forms tend to idealize the feminine (therefore being labeled as essentialist more often) whereas activist (and theoretical) ecofeminists usually see their position as an analysis of a particular historical and cultural phenomenon. Some activist ecofeminists do engage in shifting political alliances that employ essentialist arguments functionally, but disengage from these alliances and reform others as requisite for effectively subverting patriarchal structures. One of the most helpful treatments of this continuing, sometimes heated, interaction among diverse manifestations of ecofeminism is Noel Sturgeon's work *Ecofeminist Natures: Race, Gender, Feminist Theory and Political Action* (1997). In addition to these groupings within ecofeminism are ecowomanism, mentioned above, with a focus on race as the primary lens through which to view oppressions, and animal rights-oriented ecofeminism. There are also those who consider themselves spiritual ecofeminists, such as Starhawk, embracing the religious, Earth-goddess-based components of the position.

Deep ecology and ecofeminism also engage in ideological debates. Many ecofeminists count themselves as deep ecologists and many deep ecologists count themselves as ecofeminists, while others might designate themselves as one but not the other. The background to the

differences between some deep ecologists and some ecofeminists grew from the feminist critique of the androcentric (male-centered) tendency of deep ecology in its earliest, and often militaristic or violent expressions, such as those expounded upon in Edward Abbey's *The Monkey Wrench Gang*. This approach has been dubbed eco-macho. Specific philosophical discussions took place under the auspices of the journal *Environmental Ethics*. Karen Warren and Michael Zimmerman published essays in this journal in 1987, both of which made explicit connections between feminism and deep ecology. In 1989, Warwick Fox's essay "The Deep Ecology–Ecofeminism Debate and Its Parallels" was published in the journal and followed by a response by Deborah Slicer in 1995 entitled "Is there an ecofeminism–deep ecology 'debate'?" Though the intricacies of the discussion cannot be expanded here, recognition of this ongoing tension (i.e., whether or not male–female dualism is the primary lens through which to analyze and critique destructive power relations) is requisite. One interpretation of ecofeminism that shifts this analysis is Val Plumwood's *Feminism and the Mastery of Nature*. Plumwood's central relational model for abusive Western power structures is master–slave rather than male–female.

Another area of ecofeminism that needs to be addressed is the connection with animal rights activism, as noted previously. Adams has made explicit links between androcentric, patriarchal treatment of other-than-human animals, particularly focusing on the meat-producing industries of the United States, and the exploitation of women. Her study, *The Sexual Politics of Meat*, provides the foundation for this field of inquiry. Greta Gaard's anthology *Ecofeminism: Women, Animals, Nature* includes several essays that analyze the mutual oppressions of women and nonhuman animals in patriarchal societies. A prominent activist presence in this field is the organization Feminists for Animal Rights, whose co-founder, Marti Kheel, is also recognized as a leading ecofeminist voice. However, these perspectives are countered by another prominent author, Mary Stange. She has referred to herself as an ecofeminist, though one who is critical of much that is usually assumed as central to ecofeminism. Her books, *Woman the Hunter* and *Gun Women*, posit that women are natural hunters, therefore in a predatory relationship with animals. Stange suggests that the linkages between woman and other animals sometimes made by ecofeminists could justify continued essentialism and, therefore, continued domination of both women and other animals. Thus she claims that the woman–animal connection should be reevaluated.

As ecofeminism continues to shift and grow, different positions will surely form and surface, while other positions and alliances will fade away or be replaced by more urgent connections. Diverse understandings regarding the nature of the web of relationships between various

spiritual/religious traditions and ecofeminism could persist. Ecofeminism and deep ecology may continue wrangling. Issues of racism, population growth and the valuing of some humans over others, or of all humans over other-than-human animals, will stir the thoughts and actions of ecofeminists on a global scale. Charlene Spretnak provides one perspective that summarizes ecofeminist ideological positions effectively: "An ontology based on dynamic and admittedly partial knowledge as well as awe toward the complexity of embodied and embedded existence would contribute substantially to the profound social transformation that is needed" (in Warren 1997: 435).

And Wangari Maathai, while speaking at the World Women's Congress for a Healthy Planet in 1991, succinctly stated the activist positions of ecofeminism: "Things will not just happen. Women must do something" (in Gaard 1993: 3).

SP Eco-justice in Theology and Ethics

As planet Earth becomes hotter, stormier, less biologically diverse, more crowded, unequal and violent, a growing number of scholars in theology and ethics as well as discerning leaders and members of churches on six continents are joining the eco-justice movement. It involves environmentally responsive Christians (along with adherents of other world religions) who seek the well-being of Earth and people through practices and policies that serve ecological wholeness and social justice together (ecology + justice).

Stepping into an Ecumenical Stream

When cultural historians look back at the last third of the twentieth century with renewed appreciation for religion's ambiguous power, they may see that religious leaders, scholars, and organizations had to relearn from the ecologists that, in addition to the human species and culture, nature in all its biodiversity is real and valuable. But historians should also see that twentieth-century environmentalism often lacked passion for, or adequate principles of, social justice. So, it was left to working groups of ecumenical theologians and socially engaged laity – informed by the insights of environmental activists and social ecologists, as well as by the Hebrew Bible's Sabbath sensibility and Covenant ethics – to emphasize that there will be little environmental health without social justice, and vice versa. Once the ecumenical movement came to this realization, its gatherings and leaders began to express an inclusive vision of eco-justice that seeks what is ecologically fitting and socially fair through democratic decision making for the common good.

The global ecumenical movement and its member churches began to address the environmental challenge in

the mid-1970s, following the U.N. Stockholm Conference on Environment and Development (1972). In response, the Nairobi Assembly of the World Council of Churches (1975) emphasized the need to establish a “just, sustainable, and participatory society” (JPSS). In his address to that Assembly, Australian biologist Charles Birch explained:

A prior requirement of any global society is that it be so organized that human life and other living creatures on which human life depends can be sustained indefinitely within the limits of the earth. A second requirement is that it be sustained at a quality that makes possible fulfillment of human life for all people. A society so organized to achieve both these ends we can call a sustainable global society in contrast to the present unsustainable global society. If the life of the world is to be sustained and renewed . . . it will have to be with a new sort of science and technology governed by a new sort of economics and politics.

After Nairobi, there was significant responsive activity in ecumenical circles. A 1979 WCC-sponsored Conference at MIT on “Faith, Science and the Future” pursued the subject in more detail, and the next WCC Assembly (Vancouver, 1983) focused on the theme: Justice, Peace, and Integrity of Creation. Even with these prominent initiatives, it took at least another decade to gain wide ecumenical acceptance of a fulsome eco-justice ethic that features basic moral norms of: solidarity with other people and creatures; ecological sustainability in development, technology and production; sufficiency as a standard of organized sharing that requires floors and ceilings for equitable consumption; and socially just participation in decisions about how to obtain sustenance and to manage community life for the good of all.

Coordinated Environmental Engagement by U.S. Churches

In the United States the ecumenical environmental response has involved five emphases:

Cultivating quality Eco-theology and Ethics

It started with essays by forerunner Lutheran theologian Joseph Sittler, and developed through the National Council of Churches Work Group on “Faith-Man-Nature” formed in 1963–64 by biologist Philip Joranson. Prominent theologians such as Daniel Day Williams, H. Paul Santmire, John B. Cobb, and Rosemary Radford Ruether soon added contributions. Roderick Nash tracked this early period in *The Rights of Nature*. But Nash did not discern the beginnings of a theological bent toward eco-justice ethics and action (exemplified by a popular 1971 Friendship Press anthology entitled, *A New Ethic for a New Earth*). He also overlooked what the ecumenical denominations actually said and did in proximity to the

first Earth Day, and was unaware of extensive church engagement with hunger and energy policies from the mid-1970s forward.

Eco-theology and ethics languished in the 1980s, and then developed with vigor again in the 1990s. Now diverse voices representing both genders and a rainbow of people across the Christian spectrum are contributing, and thinking about well-rounded praxis, as can be seen in the growing body of writing on eco-theology and ethics. Yet, few theological schools give prominence to this important advance in theology and ethics; most seminary and religious studies programs only offer electives on this subject, with very few fieldwork opportunities. To refocus higher education in general and religious studies in particular to teach for the environment and to educate for sustainability is an unfinished, daunting agenda.

Fostering sustainable food systems and lifestyles

During the 1970s, progressive churches were prominently involved in struggles to protect the rights of farm workers. National boycotts of grapes and lettuce, spearheaded by the United Church of Christ, lent strong support to the United Farm Workers. Boycotts (selective buying) of other commodity producers because they violate labor rights have also occurred with less fanfare in recent years.

Meanwhile, the churches working together in the National Council of Churches became quite knowledgeable about U.S. government food and farm programs, as well as problems of international aid and trade, and the churches invested considerable energy in leadership development for hunger education/action through new denominational initiatives and the ecumenical effort named WHEAT – World Hunger Education/Action Together – (which I chaired). The hunger programs institutionalized by the churches in the late 1970s gave some attention and project funding to the environmental dimensions of sustainable food systems (e.g., how to decrease monoculture, pesticide use, export cropping, and grain-fed meat consumption, while using appropriate technology for food production in poor countries). Today we face deepening problems of inappropriate technology in export crops, controlled by corporations that patent and produce genetically modified organisms (GMOs) such as pesticide-resistant plants or “killer” seeds. So far, ecumenical critique of these ominous developments seems muted. The churches need to take seriously the assertion by Lester Brown (Founder of the World Watch Institute), “We need an environmental revolution of an order of magnitude that matches the agricultural and industrial revolutions, and at the same time transforms them.”

As the crisis of family farmers deepened in the 1980s and 1990s, church groups, influenced by Wendell Berry, Wes Jackson, and Dean Freudenberger, began to focus on the need for sustainable agriculture, church- and community-based agriculture, and local food security. In the

U.S., much of the solid analysis, education and advocacy has been led by creative clergy – often Lutherans – working with centers for land stewardship and rural life, especially in the upper Plains states. Roman Catholics have approached these concerns in a different style featuring regional pastoral letters (drafted in both of the following cases by John Hart of Carroll College, Montana). In 1984, Catholic bishops of 12 Midwestern states issued *Strangers and Guests: Toward Community in the Heartland*. In February 2001, 12 Northwestern Catholic bishops issued a pastoral letter on the *Columbia River Watershed: Caring for Creation and the Common Good*. That international watershed is threatened not only by inappropriate dams and logging, but by water diversion for irrigated agriculture, and a regional population explosion of high consumers.

Speaking of consumption, the pioneering work of campus minister William E. Gibson and the Eco-Justice Project at Cornell University fostered quality education for lifestyle change as an emphasis of the church’s hunger programs. It focused on reduced consumption, voluntary conservation, appropriate diet and recreation, plus public engagement. In the 1990s, education for lifestyle integrity returned to prominence, thanks to the initiative of another regional ecumenical project called Earth Ministry, based in Seattle.

Advocating responsible energy and climate change policies

Before the first oil shock from OPEC, U.S. churches were not involved in energy policy debates, viewing them as too technical or merely political. But in 1974, the Division of Church and Society of the NCC formed a committee of inquiry, chaired by Margaret Mead and Rene Dubos, on the use of plutonium as a commercial nuclear fuel. When, in October 1975, the committee proposed a policy statement condemning such use of plutonium, the nuclear industry and utility executives attacked the NCC for being irresponsible. A resolution calling for a moratorium was substituted for the policy statement, and in the same action, the Council mandated a broad study on The Ethical Implications of Responsible Energy Production and Use. The study was directed by the late Chris Cowap, NCC Director of Economic Justice, who wrote her own concise, instructive overview of that highly conflicted study to conclude a book I edited on *Energy Ethics*. Her description of the emphases and outcome of the three-year study involving a panel of 120 knowledgeable persons indicates how intellectually demanding and politically sophisticated was this timely ecumenical endeavor.

The energy study impelled the ecumenical church to be powerfully present among competing interests with contradictory answers to the environmental challenge. The NCC energy policy study coincided with the grassroots movement to delegitimize nuclear power and to take a “soft energy path” (as promoted by Amory Lovins and his

Rocky Mountain Institute). It was followed by inter-church programs to foster local energy responsibility, by substantive denominational energy policy statements, and by interfaith efforts to demand corporate accountability to communities on the part of utilities with CO₂-emitting or nuclear power plants.

Local congregations, however, tended to limit their participation to lowering the thermostats on their heating systems, and a few to retrofitting their buildings for energy-efficiency. At the turn of the century, thanks to a creative project called Episcopal Power and Light, and federal government funding for an “energy star” program, more congregations began to take energy conservation seriously.

Now, three decades later, the U.S. has come back full circle to many of the same aspects of energy policy that the 1970s NCC study explored: fossil fuel dependence, reliance on dangerous nuclear and CO₂-emitting coal-fired generators, lack of public accountability by power companies, and lethargic federal support for renewable energy technologies, conservation incentives, mass transit or carbon taxes to reduce consumption.

Moreover, the world now faces an urgent need to halt global warming, regarding which the U.S. – with 4 percent of the world’s population, but responsible for 25 percent of the world’s heat-trapping gasses – is dragging its feet. Ecumenical work on climate change – the world’s most urgent moral issue – emerged through workshops in different parts of the world organized by Canadian churchman David Hallman as a way to focus on the links between economic injustice and environmental destruction. WCC workshops and its 1988 study paper on “Climate Change and the Quest for Sustainable Societies,” plus reinforcing reports and statements by member communions, presented scientific facts about climate change and theological-ethical reflections on socio-ecological justice. This was followed by a worldwide petition campaign involving the churches and other faith communities, which got the attention of government officials. It positioned an ecumenical team of church representatives to become active advocates at climate-change negotiations from Kyoto forward.

Ecumenical advocacy on this issue emphasizes the disproportionate impact of climate change on the poor and the responsibility of the most industrialized countries to demonstrate global responsibility and fairness to developing countries by making real cuts in greenhouse gas emissions, rather than just relying on “trading” emission credits. Toward this end, churches in the industrialized countries are engaged in advocacy work with public officials. Currently in the U.S., this is done through Interfaith Climate Change Campaigns – that have emerged in about half of the fifty states – coordinated by the National Council of Churches Eco-Justice Working Group working with state councils of churches.

Community organizing for environmental justice

The U.S. churches’ most distinctive involvement with the environmental movement has been to demand environmental justice. The UCC Commission on Racial Justice first prepared, published and circulated documentation about severe racial and class inequity in locating toxic dumps and incinerators. The churches also took the initiative to contact community organizations fighting toxic facilities, to bring some of their leaders together, and to find funding that enabled community organizations to challenge unjust waste management. Though the Citizens’ Clearing House on Hazardous Wastes (now the Center for Health, Environment and Justice) deserves more credit for starting this kind of organizing, the ecumenical churches helped to make environmental justice more possible for communities of color, rural areas, and Indian nations.

By late 1987, these initiatives were being coordinated through the NCC Eco-Justice Working Group (EJWG) formed the year before, with Chris Cowap as staff director, and myself as founding co-chair. Support of community organizing for environmental justice led the EJWG to subsidize participation by leaders of community groups in the National People of Color Environmental Leadership Summit (Washington, D.C., 1991), where they pushed the leaders of established environmental organizations to support basic principles of environmental justice, and to help “build a movement of all peoples of color to fight the destruction and taking of our lands and communities. . . and to secure our political, economic, and cultural liberation.” Lutheran layman Jim Schwab pointed out in *Deeper Shades of Green* that this unique summit “drew more than 600 activists, combining the colors of the rainbow in one giant sharing and strategizing meeting that has literally and permanently changed the complexion of the U.S. environmental movement.” The environmental justice emphasis also strengthened collaboration between para-church groups and non-governmental organizations (NGOs) at United Nations forums such as the Rio Earth Summit (1992), the Cairo Conference on Population and Development (1993) and the Beijing Conference on Women (1995).

The environmental justice focus carried over into the work of the National Religious Partnership for the Environment (involving Christians and Jews), which provided funding for the NCC to hold special meetings with leaders of the Black Churches and the Orthodox communions. But preoccupation with community organizing to combat toxics tended for a time to preempt other styles of engagement and to narrow eco-justice work to become a mere subset of economic justice advocacy.

Developing leadership for earth community ministry

At this point, the churches remembered that it is not enough to support grassroots groups of activists siding

with the powerless in ecologically degraded urban and rural communities. A mature agenda of environmental responsibility is also concerned with preserving bio-diversity and protecting special places. To grapple with this broad agenda the churches must continuously develop leaders and nurture members, gain a voice in the media as well as the attention of public officials, and challenge indifferent or hostile institutions to care about the web of creation and human relations with otherkind. In other words, for there to be significant movement toward eco-justice that responds to the oppressed, there must be more pedagogy of the privileged and careful structuring of well-rounded environmental ministry.

Beginning in the mid-1990s, the NCC Eco-Justice Working Group and the U.S. Catholic Conference, utilizing foundation funding obtained by the National Religious Partnership for the Environment, published educational resources and invested in leadership development to integrate creation-care into parish life – always with a strong social justice component. The NCC group has continued to gather its grassroots network annually to share the latest educational resources, strengthen community engagement and focus public policy advocacy efforts. Aware congregations and ecumenical groups can move most effectively in a similar direction, not by starting from scratch, but by utilizing the ecumenical movement's resources for faith communities and building on its pioneering eco-justice initiatives.

Despite the emergence of ecumenical leadership for eco-justice, few Christian communions have actually institutionalized a ministry of care for creation. Many congregations and their leaders remain unaware of or indifferent to the eco-justice ethic. Church bodies and congregations still tend to affirm and practice social "stewardship" apart from ecological responsibility. Only a scattering of congregations care for the place where they are as much as they are for the people in their pews. They have yet to grasp the depth of the eco-justice crisis, or to see mission in terms of communing and suffering with creation while building just and sustainable community. Except for some recycling and modest retrofitting of church buildings to conserve energy, congregations typically continue to conduct religious business as usual with little time for the most basic human vocation of earthkeeping (see Gen. 2:15).

Concluding Observations

The preceding story of ecumenical eco-justice journeying shows that leaders of the religious and environmental communities can positively influence each other in a reciprocal relation that needs to continue. *On the one hand*, environmentalists have pushed the ecumenical churches to rethink theology, ethics, and mission in light of the ideal of a sustainable society, to which the churches came slowly. While the ecumenical movement affirmed

its social calling, in light of Jesus' public ministry, to care for and seek distributive justice to other humans, the environmental movement was focusing world attention on the plight and rights of the rest of nature, challenging the narrowly human-centered preoccupations of modern culture. Environmentalists, in addition to clarifying global ecological problems, contributed important concepts such as carrying capacity and interconnectedness. They defined the norm of sustainability in terms of ecological integrity, which forbids human activities that diminish Earth's bio-diversity or life-carrying capacity. The environmental movement also asserted that humans are called to feel respect and show care for all forms of life, not just other humans – an emphasis that broadens the meaning of "solidarity."

Instructed by these ecological insights, as well as critical social analysis, ecumenical ethicists came to a holistic understanding of what eco-justice requires to meet the world's dual crisis: degradation of the natural environment and oppression of poor people. So, on the other hand, ecumenical eco-justice sensibility about human-Earth relations has positively influenced the environmental movement. It has pushed environmental organizations to explore beliefs about what is sacred, and (moving beyond the insights of environmental philosophy and ecological science) to broaden their thinking about ecological sustainability to encompass principles of social and economic justice. That advance was demonstrated vividly in two events that bookended the 1990s: the October 1991 People of Color Environmental Leadership Summit (discussed above), and the Earth Council's completion and release in March 2000 of a peoples' Earth Charter, a global ethics document that, without using the term "eco-justice", states ethical principles expressive of solidarity, sustainability, sufficiency, and participation – in that order.

In retrospect, a posture that first emerged after the first Earth Day to mediate hostile competition between social justice and environmental action groups turns out to offer much more than "tradeoffs." Eco-justice is a dynamic framework for theological study, ethical reflection, and practical action. The eco-justice movement, knowing that justice and sustainability increase together or not at all, melds concerns for the natural world and for human life in ways that foster both environmental wholeness and economic justice. Eco-justice vision and values reshape the way we approach ecology, justice and faith – stimulating broader expressions of environmentalism, challenging social activists to build sustainable community, and recycling religious doctrine, liturgy and social teachings to focus on the well-being of Earth community.

Eco-Kabbalah

This term refers to a school of thought within Judaism first articulated near the turn of the twenty-first century that turns to the Jewish mystical tradition (Kabbalah) as a source of inspiration for a contemporary religiosity emphasizing the holiness of the natural world. It may be seen as a Jewish parallel to the "Creation Spirituality" (not to be confused with Creationism) tendency found in certain contemporary Christian thinkers.

The growing awareness of ecological crisis in these decades led to a reconsideration of the central role of faith in creation in pre-modern Jewish theologies. Most modern (nineteenth/twentieth-century) versions of Judaism downplayed the theme of creation, "conceding" speculation on the world's origins as an area better pursued by scientists than by theologians. Outside of rather narrow ultra-Orthodox circles, few Jews cared to defend the biblical account of creation, even if extended to refer to seven "eras" rather than the literal "days." This stood in sharp contrast to the classical theologies of the Middle Ages, both the philosophical thought of Moses Maimonides (1135–1204) and the mysticism of the Zohar

(ca. 1290), in which faith in creation stood at the very heart of Judaism's self-understanding. Nevertheless, the Genesis creation narrative retains a prominent place in the religious life of contemporary Jews as the source of the weekly Sabbath celebration, the defining ritual act of traditional Jewish piety. Celebration of the Sabbath is portrayed as an act of human participation in the divine rest that constitutes the fulfillment of creation. There thus remains a sense, mostly undefined, that faith in God as Creator is an essential part of Judaism, despite Jews' willingness to accept the legitimacy of scientific cosmology and cosmogony.

Kabbalah, an esoteric Judaism dating at least to the twelfth century, offers an alternative version of creation, one that has been more attractive to some contemporary seekers. Some have even claimed parallels between Kabbalistic speculations and the language of contemporary science. The Kabbalists see creation as emerging out of God, an energy-flow that both embodies and hides the elusive divine presence within the ever-changing physical forms that constitute our world. God is the underlying source of all reality, the "deep well" or "quarry" out of which being is drawn, the "Ground of Being" (to readapt a phrase from Christian theologian Paul Tillich, itself echoing Jewish mystical usages) rather than a supreme Creator who stands outside the universe as created. The divine flow of energy constantly proceeds from *Eyn Sof*, the infinite and completely mysterious entity that contains all of being, transcending any distinction between past, present, and future. The creative energy of the cosmos, often depicted as a divine desire for self-expression, first emerges in a realm described as "Nothing" or perhaps "non-being." From there it emerges into a primal point of reality, continuing to expand and grow through various stages (named *sefirot* or primal numbers, and constituting the essential subject of most Kabbalistic speculation) until it is manifest as *Shekhinah*, or the "indwelling" divine presence (often depicted in feminine terms) immanent throughout the universe. God is thus seen as the mysterious core of being, the natural world serving as a "garb" within which the divine is hidden. God and world are primarily related as deep structure and surface manifestation, rather than the conventionally understood Creator and creation. (This is not to say that theistic formulations of God as Creator are entirely absent from Kabbalistic sources. The mystical tradition is imperfectly grafted onto a much older and highly developed tradition of personalist theism, which it seeks to absorb and transform, but never to deny.)

Such a theology implies that reverence for God and respect for nature are inseparable from one another. God is present throughout the natural world; indeed it is primarily through nature that God is experienced and comes to be known. It offers a version of Judaism that appreciates the work of botanist, zoologist, chemist, and physicist

as each uncovering some part of the single truth that constitutes *raza dim'hem'nuta*, the mystery of faith. Rather than feeling threatened by scientific understanding, as so much of religion has in recent history, this renewed Kabbalah positions itself as a poetic meta-science that both transcends and encompasses scientific achievement, much as *Eyn Sof* both transcends and embraces the universe that is the object of scientific observation.

This theology of creation is complemented by a revelation theology (always essential in Judaism) that understands God's self-revelation as a constant process, symbolically encapsulated in Moses' and Israel's experience at Mount Sinai. The content of revelation is essentially nothing "new," but a making manifest of that which has been true since creation: the realization that God underlies all of being and is thus to be discovered and encountered in every time and place. This revelation, however, serves as well to make a demand upon the faithful that they act and indeed shape the lives of both individual and community according to norms that reflect and respond to this great truth. In traditional language this shift is indicated by the move from God's ten utterances of creation ("Let there be" in Genesis 1) to the ten commandments of Sinai, restating the original utterances in the imperative mode.

This theoretical framework is articulated in various ways in the writings of Zalman Schachter-Shalomi, Daniel Matt, Arthur Green, and others. Its historical roots can be seen in several of the great mystical theologies of Judaism in prior ages. Philo of Alexandria (ca. 20 B.C.E.–50 C.E.), the Zohar, Rabbi Israel Ba'al Shem Tov (ca. 1700–1760), and Rabbi Abraham Isaac Kook (1865–1935) have all had a role in shaping this contemporary understanding. Eco-Kabbalah also contains a series of implied attitudes and norms of behavior (here the writings of Arthur Waskow especially come to mind). It is an activist strain within the Jewish community as well as an intellectual/religious tendency in Jewish thought. The reappropriation of Kabbalistic language by postmodern Jewish seekers takes place in an age when vast numbers of Westerners are turning to the neglected wisdom traditions of humanity (Asian, Native American, etc.) in hope of guidance to transform behaviors that threaten the very existence of humanity and the planet we inhabit. The Eco-Kabbalist believes that such wisdom is to be found within mystical Judaism, needing only to be liberated from the anti-materialist bias that is so pervasive in the medieval Western tradition. Such classical biblical and Jewish forms as the sabbatical year (requiring that farmland be left fallow for one in every seven years), the Sukkot festival with its supplications for the rainy season, and the annual celebration of a New Year of Trees all invite adaptation to the needs of our time. The last of these, the Tu biSh'vat festival (occurring in January or February), has taken hold in large parts of the Jewish community as an occasion for

ecological awareness. The formerly obscure Kabbalistic custom of a *seder* or symbolic banquet for that day has been adapted by several modern Jewish movements, each of which has published its own text for a celebration that highlights environmental education. These and other rituals throughout the year are reinterpreted as reminders of ecological awareness and opportunities for heightened sensitivity to environmental issues in the Jewish context.

Ecological Anthropology

What is the place of humans in nature? What should it be? The first question is pivotal for ecological anthropology, the second for environmental philosophy and ethics, and also for a more recent field, spiritual ecology. Probably both are very ancient and elemental questions of most thoughtful humans, the former since humans evolved into self-aware and rational beings, the latter since they became spiritual beings. Viable answers to such questions are indispensable for any ecologically sustainable green society. In most cultures, religion is usually decisive in answering such questions. Nevertheless, with a few notable exceptions, ecological anthropology has usually ignored the relationships between religion and nature.

It was not until the pioneering field research of anthropologist Julian Steward (1902–1972) in the Great Basin and Plateau region of the United States, especially among the Shoshone, that the place of humans in nature was addressed through ecological observations on cultural behavior. The result was his 1938 *Basin-Plateau Aboriginal Socio-political Groups*, wherein lie the roots of cultural ecology. Steward's theory and method of cultural

ecology was elaborated in his 1955 *Theory of Culture Change: The Methodology of Multilinear Evolution*. He rejected the dominant theoretical position in American anthropology during the formative phase of his career – that usually cultural factors alone are sufficient to explain culture. Steward was not an environmental determinist, but sought to identify the aspects of a particular culture that are most influenced by its environment through field research focused on the natural resources on which the society is dependent for survival along with the technology used to extract and process them; the ways the society organizes work in order to accomplish this; and the ways these two factors delimit the culture core, those aspects of culture most closely related to ecology. Yet Steward did not address the relationship between religion and nature, either in theory or fieldwork.

Roy Rappaport (1926–1997) was the first ecological anthropologist to encompass religion in his theory and fieldwork. Rappaport and others transformed cultural ecology into ecological anthropology during the second half of the twentieth century. They biologized cultural ecology by applying concepts from biological ecology: population as the unit of study, the environment as ecosystem, and the ecological processes of energy flow, nutrient cycling, and adaptation. All of these were in turn related to carrying capacity and limiting factors; that is, the level at which a given population can be sustained in a particular habitat without irreversible natural resource depletion and environmental degradation; and the factors which regulate the population below that threshold. Rappaport applied these principles in a detailed case study of the Tsembaga Maring in his 1964 *Pigs for the Ancestors: Ritual in the Ecology of a New Guinea*.

Yet another innovation in ecological anthropology developed by Rappaport was his argument that ritual functions as a mechanism regulating the Tsembaga population below the carrying capacity of their habitat. Accordingly, in Rappaport's empirical and theoretical work, the questions of what is and should be the place of humans in nature began to be addressed in more systematic and sophisticated ways than ever before. Rappaport worked through these and other ideas on the role of religion in human evolution and ecology in his subsequent more theoretical books, *Ecology, Meaning and Ritual* in 1979, and *Ritual and Religion in the Making of Humanity* in 1999.

A third major contributor to the advancement of ecological anthropology was Marvin Harris (1929–2001) through his development of cultural materialism as a research strategy. He laid the groundwork for cultural materialism in his monumental inventory, *The Rise of Anthropological Theory* in 1968. In 1979 Harris elaborated on this research strategy and refuted competing approaches in his *Cultural Materialism: The Struggle for a Science of Culture*. Harris divided up the cultural system

into three components. Infrastructure is the product of the interactions of the environment, population and technology. Structure refers to the local domestic economy and the wider political economy. Superstructure encompasses the ideational realm of the cultural system including religion, myth, and the arts.

Harris asserted that infrastructure was most basic and influential because it functioned as the ultimate adaptive mechanism for the very survival and maintenance of individuals and society. Therefore, he considered infrastructure to be the primary cause of most of the rest of the cultural system including religion. Accordingly, Harris assigned research priority to infrastructure instead of superstructure.

Harris demonstrated the power of cultural materialism with ingenious explanatory analyses of many cultural puzzles: among them, religious phenomena such as Aztec ritual human sacrifice as a source of sorely needed quality protein; the sacred cow of India as far more useful alive for farm-field plowing, fertilizer, and milk; and the Islamic and Jewish prohibitions on eating pork as the most effective way to cope with a problematic animal in their desert environments. Pigs are not well adapted to such an environment and they can transmit diseases and compete with humans for the same foods. His analyses appeared in a series of articles in the magazine *Natural History* as well as in his numerous books and other publications.

A fourth major figure is Eugene N. Anderson, especially his 1996 *Ecologies of the Heart: Emotion, Belief, and the Environment*. His basic argument is that the sustainable use and management of resources depends not only on economic cost-benefit calculations, but also on beliefs, emotions, rituals, and symbols. Traditional indigenous societies that invest heart and soul as well as body and mind in caring for their environment usually do so successfully. Resource strategies linked with religion that may appear superficially to be irrational to an ignorant outsider might actually be ecologically sound, grounded in intimate daily observations of nature over many years or generations. In contrast, so-called modern scientific, technocratic, and bureaucratic resource and environmental policies of centralized governments have failed more often than not. They usually lack not only meaningful experience on the ground locally, but appropriate religious motivations, guidelines, rituals, and the like. Anderson demonstrates these principles with data and insights from his fieldwork on forest management by Mayan farmers in southern Mexico as well as fisheries and other resource management by communities in the Pacific and Asia. In the process Anderson counters the simplistic reductionism of extremists from cultural materialism, evolutionary ecology, and postmodernism. Instead, he prescribes an intermediate path that combines reliable information, rational decision making, and positive emotion focused on reverential respect and care for nature,

rather than simply the obsessive pursuit of resources as commodities for merely material ends.

A fifth and final individual to single out here as an outstanding pioneer in the development of ecological anthropology is John Bennett in his 1976 *The Ecological Transition: Cultural Anthropology and Human Adaptation* and other publications. Bennett characterizes the ecological transition as the global movement from societies in relative and dynamic ecological equilibrium to an accelerating number in disequilibrium. Equilibrium societies are small, sustainable, and green cultures focused on subsistence, food sharing, and kinship. In general, most traditional indigenes lived in some degree of balance with their environment. However, other than discussing Rappaport's work, Bennett did not address the possible relationships between religion and nature, even though he conducted fieldwork in the religious communes of Hutterites in Saskatchewan, Canada.

In contrast, disequilibrium societies are large-scale urban and industrial cultures. Their population as well as needs and desires have exceeded the carrying capacity of their habitats, and consequently they must import vast quantities of resources extracted worldwide from distant environments through extensive trade networks. Disequilibrium societies have an extraordinarily high impact on the natural environment from local to global levels as agents of ecocide, ethnocide, and genocide. Examples of disequilibrium societies are the nation-states of the European colonial systems during the last five centuries. In recent decades many disequilibrium societies have become increasingly obsessed with materialism, consumerism, and capitalism like a fanatical religion of greed.

The nearly 7000 distinct cultures existing in the world today fall along a continuum from equilibrium to disequilibrium, with the net trend shifting toward greater disequilibrium, and this spiraling beyond control. The logical conclusion of Bennett's concept of the ecological transition is that global environmental catastrophe is imminent. Bennett's basic idea has been independently envisioned and variously labeled and described by deep thinkers from a wide diversity of backgrounds and professions, an example of the convergence in environmental thought during recent decades. Some of these deep thinkers, although not ecological anthropologists, have been pioneers in spiritual ecology.

Of course, many others have contributed to ecological anthropology, but here it must suffice to summarize their work as three trends: a proliferation of exploratory approaches; a very substantial expansion in the spatial and temporal scale of the phenomena researched; and far greater concern for practical environmental problems and issues.

Several new approaches emerged mainly in the 1990s. Behavioral or evolutionary ecology, inspired mostly by neo-Darwinian, microeconomic, and game theories, con-

centrates on the costs and benefits of exploiting different resources. Historical ecology emphasizes how human societies change their natural environment and this in turn changes them. Political ecology focuses on power differentials regarding resource use and environmental problems like pollution in relation to colonialism, poverty, racism, and injustice. Postmodern environmental anthropology analyzes and challenges basic ideas as relativistic constructions, such as nature, wilderness, environment, ecosystem, environmentalism, conservation, sustainability, and development. Postmodern and other revisionists have also challenged dualistic thinking such as the dichotomies of culture/nature and natural/supernatural. In addition, during recent years more attention has been afforded to specific events, individual actors, and decision making in the processes of adapting at the behavioral level to environmental constraints, hazards, stresses, and perturbations as well as opportunities. Among all the approaches previously mentioned, only spiritual ecology directly explores the relationships between religion and nature.

A second recent and related development has been to consider local communities as linked to an ascending hierarchy of more inclusive systems – regional, national, international, and global. Thus, the spatial, geographic, and cultural scales have expanded, as has the temporal one, the latter with historical ecology. Furthermore, the spatial dimension is increasingly viewed from the perspective of political economy combined with social and economic justice, the pivotal concerns of political ecology. Of course, historically the geographic and political expansion of the so-called world religions like Buddhism, Christianity, and Islam impacted in varied ways and degrees on local cultures, religions, and environments, but this topic has yet to be pursued by ecological anthropologists.

The third major recent trend in ecological anthropology is now called environmental anthropology. It is more applied, largely stimulated by the growing gravity and urgency of ecological crises from the local to the global levels. Furthermore, beyond an activist concern with practical environmental problems and issues, environmental anthropology takes advantage of the latest technologies such as satellite images of land cover or vegetation changes to document and assess human environmental impacts from the regional to the global levels. However, it has largely ignored religion.

This trend toward the greater application of ecological anthropology to practical environmental matters is also stimulated by growing concern over the tragedy of tropical deforestation. That and related issues nourished a new frontier in science largely precipitated by biologist Edward O. Wilson in the 1990s, biodiversity studies and conservation. (The usual measure of biodiversity is the number of species in an area.) An increasing number of anthropologists and linguists have recognized what the

present author calls the diversity principle – the geographical coincidence of high biological diversity with high cultural and linguistic diversity (Posey 1999). Thus, whenever biological diversity is threatened and eroded, so is cultural and linguistic diversity, and vice versa. This applies as well to religion as an integral component of most cultural systems. A correlate of the diversity principle is that the loss of cultural, religious, and linguistic diversity also involves a loss of local ecological knowledge, understanding, and wisdom. In recent years there has been growing appreciation of traditional environmental knowledge – that indigenous and folk societies who interact in an intimate way on a daily basis with their habitat for subsistence have an enormous wealth of reliable empirical information about local soils, plants, animals, and their web of interrelationships in ecosystems. This knowledge has become a Western research focus, especially in ethnoecology, but only recently has it begun to be linked with spiritual ecology (Posey 1999).

Thanks to the contributions of Steward, Rappaport, Harris, Anderson, and Bennett, among others, ecological anthropology provides numerous heuristic models of sustainable green societies and also of maladaptive ones through its accumulating repertoire of case studies. Simultaneously, it provides a defense of indigenous and other societies while critiquing the external forces imposing change on them, such as colonialism and secular models of development from so-called Western civilization.

Today ecological anthropology is mature and thriving, as evidenced by the publication of a special journal called *Human Ecology* since 1972; the establishment of the Anthropology and Environment Section as a unit within the American Anthropological Association in 1996; its internet forum called Eanth-1 hosted by the Department of Anthropology at the University of Georgia; a second generation of textbooks; and special training and research programs and/or concentrations of ecological and/or environmental anthropologists at several universities including Arizona, California (Davis and Santa Barbara), Georgia, Hawai'i, Indiana, Maryland, Massachusetts (Amherst), Michigan, New Mexico, North Carolina (Chapel Hill), Rutgers, and Washington (Seattle). This regional diversification of academic interest contrasts sharply with the prior heavy concentration of ecological studies in anthropology at Columbia University during the 1950s–1970s. However, as yet little attention is afforded to spiritual ecology.

The greatest achievement of ecological anthropology may yet be the demonstration that many societies have created a benign place in nature or a viable niche, and thereby flourished for centuries or even millennia. An extremely important correlate is that the human species is not necessarily inherently anti-nature, environmentally destructive, maladaptive, or ecocidal. Indeed, historical ecology reveals that the more serious environ-

mental problems are remarkably recent, largely a result of colonialism, industrialization, and “modernization.” For five centuries, and increasingly so in the last five decades, there has been an alarming and accelerating synergy of ecocide, ethnocide, and genocide throughout planet Earth. From the perspective of ecological anthropology, nevertheless, it is quite possible for humans to harmoniously coexist within the biosphere far into the future, if, among other things, they can learn and follow the knowledge and wisdom of many past generations that have achieved this so successfully. Religion must be an integral part of such adaptations though instilling viable environmental values, reverence for nature, and other means. The most formidable barrier to this is that, like a cancer, a most powerful expansionist, predatory, maladaptive, global, and secular political economy is gradually degrading and even destroying previously adaptive local cultural and environmental systems.

Humans interact with their natural environment in emotional and spiritual as well as intellectual ways (Anderson 1996). A growing number of deep thinkers are pointing to religion as the single most important consideration in dealing with and alleviating ecological crises, because, in general, religion is usually the primary source for the particular worldview, attitudes, and values determining how most people interact with their habitat. Undoubtedly, some very fundamental changes in the way humans relate to nature need to be made, if humanity and the biosphere are to survive and flourish. In this connection, a systematic in-depth assessment of the relationships between religions and environments as pioneered by Rappaport and others is of increasing practical importance. In the face of this global holocaust, spiritual ecology, which emerged largely in the 1990s, has a very special strategic role to play in promoting a healthy coevolution of humanity and the biosphere in the future.

Ecology and Religion

An ecological approach to religion requires taking into account the environmental constraints within which organisms seek to survive, as well as the fact that being an organism entails being subject to internal constraints, constraints which are themselves the result of adaptive evolutionary strategies. In this regard, a properly understood ecological approach, instead of contradicting, encompasses the methods employed by biologists, ethologists and cognitive scientists. From this unified perspective, religions can be understood as the attempts to come to terms with constraints of all kinds, a task that is accomplished by exploring through speculation and ritual the range of options open to the kind of organisms that humans happen to be. But because of the peculiar human capacity to use complex tools and symbols – including tools to make tools and symbols to refer to symbols – a peculiarity that necessarily entails establishing distance between oneself and the rest of reality, religions must also be understood as attempts to escape limitations of all kinds, an undertaking that involves the postulation of mystical or utopian realms. In either case, just as it happens with other natural processes, the symbolic systems, ritual practices or mystical speculations generated by human beings can metastasize, taking forms that instead of furthering survival go against it. In order to approach religion from an ecological angle, therefore, one needs to consider instances of adaptation as well as of maladaptation; indeed, given that adaptation is a process rather than a state, one must pay attention to the precariousness inherent in all social and ideological formations. At the same time, just as the reference to a precariousness that is "inherent" in social formations points in the direction of certain epistemological assumptions, we must assume that during certain long evolutionary segments – which for us human beings constitute reality *tout court* – certain

constraints, which are also enablers, will be at work, underlying the "social constructions" that seem to have become the primary concern of social scientists.

In order to do justice to the role played by the ecosystem in the development of a religious system we must place societies along a continuum according to their size and complexity. At one end we find small-scale societies, whose symbolic-ritual systems seem to have emerged in order to insure the maintenance of an equilibrium between a human population and its ecosystem, while at the other we encounter vast social systems whose religions seem to play no ecological role whatsoever. As we shall see, however, even in small-scale societies it is difficult to discern the role played by religion in ensuring adaptation to an ecosystem, that difficulty being multiplied when one deals with large-scale, especially industrial, societies. The classical example of an ecological approach to the ritual system of a small-scale society is found in Roy Rappaport's *Pigs for the Ancestors*, a study of the ritual system of the Tsembaga of New Guinea. In this book, Rappaport postulates that the Tsembaga ritual slaughter and consumption of pigs – the *kaiko* – functions as a regulatory mechanism that keeps within acceptable parameters the size of the herd of pigs, the intake of animal protein, and the amount of female labor needed to take care of them as well as of the gardens. The picture presented by Rappaport is one in which all the components of Tsembaga reality – ecological, nutritional, social, military, ideological – constitute a coherent totality. But Rappaport's reconstruction has not gone unchallenged; for example, Lees has called attention to a passage of *Pigs for the Ancestors* in which Rappaport mentions how "men with few or no pigs responded to the talk of an approaching *kaiko* by attempting to acquire animals," thus questioning the regulatory function of the slaughter of pigs (Rappaport 1984: 159; see Lees 2001). Similarly, Gillison has pointed out the contradiction between Rappaport's report that "the Tsembaga have difficulty in *increasing* their herds" and his "assertion that Tsembaga herds spontaneously grow to unmanageable proportions" (Gillison 2001: 293). Whatever the results of the debates among New Guinea specialists, it can be said that *Pigs for the Ancestors* together with Rappaport's related studies provide a model for understanding the role of ritual in the creation and maintenance not just of social solidarity, à la Durkheim, but in the maintenance of the conditions within which human organisms can survive. It must be added that, despite its flaws, Rappaport's model has been used by a classical historian, Michael Jameson, to show the correlation between the Greek sacrificial calendar and the consumption of animal protein; Jameson having also shown the continuity of that correlation in Greece in recent times. The persistence of this connection shows that even in a modern society such as Greece one can still see the ritual calendar being involved, however minimally, in the regulation of meat

consumption – a significant fact, given that virtually all the meat consumed in the ancient Greek world came from animals that had been ritually slaughtered.

Besides studying the Tsembaga and making important contributions to the theory of ritual and sacredness, Rappaport proposed a distinction that is useful for an ecological approach to all symbolic systems. He distinguished between “cognized” and “operational models,” the former referring to the systems of meaning created by human actors, whereas the latter refers to the organization of nature. Rappaport’s thesis is that there is a correlation between the level of discrepancy between the cognized and the operational models and the degree of endangerment of the individuals who generate the cognized models. An example of a situation in which there seems to be a consonance between cognized and operational models, that is, of the way in which a symbolic system is used to regulate the relation between a human population and its ecosystem, is provided by the Tukano of the Colombian northwest Amazon, studied by Reichel-Dolmatoff. The Tukano understand the cosmos as having been designed by Sun-Father, an anthropomorphic divinity who created only a limited number of animals and plants, which he placed in a restricted space. These limitations have led the Tukano to understand the world in a manner that resembles modern systems analysis – that is, as a system in which the balance between them and their ecosystem is kept in place through the regulation of the input and output of finite energy. This circulation of energy is represented in sexual terms, in such a way that repressed sexual energy is believed not to have been wasted but to have gone into the ecosystem. In practical terms, this results in periods of sexual continence which, in combination with herbal oral contraceptives, keep the population size under control. Dietary restrictions, continence, and taboos involving menstruation are enforced during periods of hunting, thus reinforcing the regulatory function of sexual abstinence. The role of the supernatural realm in the regulation of hunting is shown by the role of the “master of animals,” who jealously guards his flock, as well as by the shaman, who controls all the activities through which the population interacts with their ecosystem – hunting, fishing, gathering and harvesting.

Bali provides an example of a larger, more complex society, but one in which it is still possible to discern the interaction between religious practices and the maintenance of equilibrium between a population and its ecosystem. The ecological characteristics of the island require the construction and maintenance of a vast network of irrigation canals as well as a system to regulate the supply of water to the rice fields. Construction, maintenance and distribution of water to the rice fields are regulated by the “religion of water” (*tirtha agama*), a system constituted by a ritual calendar and by a number of hierarchically arranged water temples and shrines built at various points

between the Crater lake and the places where the irrigation water enters the fields. It must be pointed out that unlike the cases studied before, in which the entire population lived in a homogeneous territory, one finds in Bali an ecologically determined distinction between forms of social organization: egalitarian forms are found in the highlands where wet-rice cultivation is not possible, and where, therefore, there is not much of a surplus to be extracted by the lowland nobility; in the southern plains villages, on the other hand, one finds a hierarchical organization that approximates to the Indian system. This distinction, and the fact that force or the threat of force were used to extract surplus from the peasantry, refutes the irresponsible claims advanced by C. Geertz, for whom Bali was a “theater state,” where pomp validated power rather than the other way around.

Having found in Bali a ritual system which besides being intimately connected with the management of agriculture is also hierarchically arranged – both in terms of the hierarchy of water temples and of social hierarchy – we must now pay attention to the effects of stratification on the management of the ecosystem, a connection that is relevant insofar as both the management of the ecosystem and the division of society have generally required validation through non-falsifiables, that is, religious, means. Nowhere is the concern with hierarchy more visible than in India; and it is in India that a hierarchical system built ostensibly around the poles of ritual purity and impurity affects society and its ecosystem in a number of sometimes contradictory ways. In effect, the obsessive concern with the purity of one’s body and of one’s dwelling, but not of one’s surroundings, contributes to the degradation of the environment. To complicate the situation, the fear of ritual pollution confers a degraded status on garbage collectors, making it difficult to institute recycling practices. A concrete example of the connection between mythology and health risks is provided by the belief in the purifying nature of the Ganges, a belief that leads worshippers to disregard the effects of human waste on the river, as well as the contaminating effects of the water on themselves. Being interested above all in maintaining their livelihood, the *pandās*, the Banaras pilgrim priests, contribute to the problem by resisting efforts to reform the traditional cremation practices. No less important in terms of its ecological impact is the role played by religiously validated views of gender. In furthering the desire for male offspring, these views contribute both to the subordinate position of women and to population growth, growth which in turns exacerbates ecological problems. It is instructive to contrast this reality with the claims made by Western enthusiasts and by purveyors of Oriental wisdom concerning the holistic view of reality supposedly prevalent in Asian societies. In reality, neither in the canonical texts nor in those that belong to the Tantric or Shakta forms of South Asian religion does one find evidence

of attempts to preserve nature. Similarly, contemporary everyday practices do not lead one to assume that modern Asian societies are better equipped than Western ones to achieve ecological balance.

The interaction of ecological and ideological constraints can be seen at work in the practice of intensive irrigation agriculture in the polities that emerged in Southeast Asia partly under the influence of Indian symbolic systems. For our purposes it will be sufficient to mention the case of the hydraulic Khmer cities, whose collapse appears to have been caused by the negative ecological consequences of the building frenzy ordered by the Angkor rulers, between the ninth and the eleventh century. According to Groslier, the sedimentation in the artificial lakes built between the ninth and the eleventh century impacted negatively the soil, leading eventually to the destruction of what had been the flourishing agriculture of these hydraulic states. The Cambodian situation demonstrates the consequences of the discrepancy between the operational models, constituted by the ecological conditions of the Khmer territories, and the cognized models, constituted by the Angkor rulers' need to legitimize themselves through the use of pan-Southeast Asian symbolic systems involving vast temple complexes. In the end, the ideologically motivated need to create ever larger reservoirs eventually outstripped what the land was able to sustain, leading to the decay of the kingdom. Ultimately, the Khmer situation seems to constitute the ecological amplification of the economic consequences of temple building encapsulated in the Burmese saying, "the pagoda is finished and the country is ruined."

Examples of this maladaptiveness can be found in many places. Indeed, in his critique of ecological approaches to religion, Walter Burkert has pointed out as a counterexample the ecological collapse of Stone-Age Malta about 2500 B.C.E., a collapse that may be linked to the proliferation of large temples during the Tarxien period – that is, to the fact that instead of using their resources in a productive way, Stone-Age Maltese diverted their energies into wasteful construction projects. Burkert is right in referring to the Maltese case; nevertheless, there is no necessary contradiction between ethological approaches such as the one he proposes and ecological ones, for one can still hold to an ecological/evolutionary perspective, as long as one is aware that, as pointed out at the beginning of this essay, adaptiveness is not a once-and-for-all affair. One must recognize, rather, that in order to be effective the practices through which a community seeks to maintain an ecological equilibrium need to be fine tuned; for if such practices become ends in themselves, they will eventually lead to situations which imperil the survival of the community in question. It is above all changes in the size of the human population or in the ecosystem that require changes in the mechanisms of adaptation: in either case, the disappearance of the situ-

ation that gave rise to a given symbolic universe and to their concomitant ritual practices renders such symbolic-ritual clusters ineffective or, worse, counterproductive. Often, the very success of religiously legitimized adaptive strategies may lead to population increase, which in turn leads to ecological degradation.

Related to population expansion and to the resulting increase in social complexity is the coming into being of a priesthood. The role of a self-perpetuating body of religious specialists is generally negative in terms of the maintenance of ecological equilibrium, as the members of the priesthood tend to be concerned above all with their self-perpetuation, whether this takes place as the result of sexual reproduction or of recruitment. Being above all ritual specialists, priests seek to protect the means that validate their existence. In the case of Buddhism, for example, the concept of merit (*punya*) led to the direct economic support of the monks, understood as "merit fields," and to the construction of temples, an activity that in some cases – Burma, for example – has been economically wasteful, while in others – China, Cambodia – has had negative ecological consequences. In this regard, insofar as the process can be reconstructed, the Maltese case constitutes but an extreme example of what happens when the means become the ends, or when "a people focus too much energy on worshiping life rather than sustaining it" (Malone et al.: 1993: 110) – to use the words of a team of archeologists engaged in studying prehistoric Malta.

We can also see the ecological dangers inherent in the concern with priestly self-perpetuation in the case of the Roman Church, an organization whose ritual specialists are concerned with defending at all costs their status as the necessary link between ordinary Christians and the supernatural realm. Torn between an understanding of reality as a god's creation and a deep unease toward anything that comes between the believers and their god, the Roman Church is condemned to claim the right to manage sexual reproduction and physicality in general, while at the same time having to reject those aspects of sexuality that come between human beings and their god. These contradictory demands force high-ranking celibate ritual specialists – popes, cardinals, and such – to stress the link between sexuality and reproduction, while being adamantly against sexual activities that are not aimed at reproduction, as well as, *a fortiori*, against homosexual behavior (this last aspect more in theory than in practice, as clerical recruitment may suffer now that the population pressures that led men and women to enter religious orders have disappeared in Europe).

The Roman Church's concern with the regulation of life can be seen in the speech the pope delivered to the Italian parliament in November 2002, a speech in which, among other things, Woytila spoke about a "birth crisis, demographic decline and ageing of the population"; he also referred to the human, social and economic problems that

this crisis will cause in Italy in the next decades. Given the fact of Italy's low birth rate, one can say that the operational model involving the relationship between the future retirees and the as yet unborn workers whose contributions will keep those retirees alive, coincides with the cognized model proposed by Woytila, a cognized model constituted by the Roman Church's understanding of sexuality and reproduction. Insofar as the sermon to the Italian people contained within the speech to the Italian parliament constitutes a non-calendrical ritual attempt to regulate human fertility, we can see Roman Catholicism still seeking to function in a way that is not substantially different from the manner in which religions have functioned in the pre-industrial world – that is, as a ritual/ideological mechanism that regulates the relations between a population and its ecosystem. In this regard, therefore, one can say that some manifestations of contemporary religion can still be understood in evolutionary terms as having been generated in order to regulate birth, copulation and death. We must recognize, however, that even though this particular call to increase fertility seems to be reasonable, such reasonableness is the exception rather than the rule, as the reproductive policies – that is, the cognized models – that constitute the Roman Church are counterproductive outside Europe.

What is significant about this obsession regarding sexual activities and gender roles is its archaic character, which in certain ways resembles that of the Tukano. In effect, this sacramental conception of reality presupposes the existence of certain natural constants, the most important of which is the distinction between maleness and femaleness and, in more general terms, the distinction between male and female realms, the latter having been charged with the preservation, and indeed multiplication of life regardless of the costs. Despite the reasonableness of assuming the existence of natural constants, one must recognize that symbolic systems that keep small-scale societies viable are unlikely to serve the needs of large-scale societies; therefore, the deleterious effects of this sacramental conception of reality in terms of population increase, transmission of diseases and ultimately of ecological disaster cannot be overstated.

While bodies of clerical ritual specialists try to regulate, generally without success, the sexual behavior of the citizens of modern societies, those same citizens are still subject to a successful ritual calendar that contributes to the mobilization of the process of demand, production and work. In contemporary Western societies the process is set in motion by the Christmas season, a period which, clerical protestations notwithstanding, is built around giving and receiving rather than around the human birth of a god. It is true that given the complexity of the social system as well as the size of the economic sphere, the regulatory function of the Christmas rituals of giving is not as evident as that played by analogous practices in small-scale societies

such as the Tsembaga or the Tukano. This is especially clear when one compares the frequency of meat consumption in tribal New Guinea or ancient Greece with that of modern Western societies. Whereas, as noted above, meat consumption among the former was regulated ritually, increased meat consumption during Christmas and Easter (and Thanksgiving in the United States and Canada) has a negligible effect in terms of the total intake of animal protein among the inhabitants of industrial societies. Nevertheless, it would be a mistake not to pay attention to the long-term environmental effects of ritually regulated social practices in large-scale industrial societies.

Besides considering the characteristics of a given territory, an ecological approach to religion must pay attention to weather patterns, especially to the effects of abrupt changes on people's religious attitudes. With this in mind, we can consider from an ecological angle developments as distant from each other as a drought that affected Greece in the eighth century B.C.E. and the witch-craze of the sixteenth and seventeenth centuries. Regarding the first, we can follow Camp's reasoning and recognize that the drought, famine, and epidemics that affected Athens in the late eighth century B.C.E. led to a renaissance in religious activity, prompted by the fears of inhabitants of the affected areas. (It must also be mentioned that an ecological explanation of Greek pederasty and of its surrounding mythology has been offered: according to Percy, Greek pederasty emerged in the seventh century as an attempt to control the population.)

Moving ahead more than two millennia, we can turn to the witch-craze, the madness that unfolded at the threshold of European modernity, pitting neighbor against neighbor. That religious and political elites were involved in fanning the fires is beyond doubt; that the anxieties produced by the Reformation and the Counter Reformation played a role seems beyond doubt as well; nevertheless, the evidence indicates that the accusations appear to have grown mainly from below, in many cases having been resisted by the ecclesiastical and civil authorities. Why the fear and the accusations then? The reasons for them are multiple, but there is one to which not enough attention has been paid, namely, that the accusations of witchcraft took place during the "little ice age," that is, at a time when crops, always at the mercy of the weather, were especially vulnerable. The mix of scarcity and fear resulted in neighbors being accused of stealing or damaging crops through magical arts. Rather, then, than the generalized fear chronicled by historians such as Jean Delumeau, what we encounter in late medieval and early modern Europe seems to be a situation in which the uncertainty that characterizes pre-industrial societies – the image of the limited good – was exacerbated by a world that, as Lehmann and Behringer have shown, in climatic terms had been turned upside down.

Far more radical than changes in weather patterns are those brought about by sudden natural disasters such as earthquakes and volcanic eruptions. The effects on the European intelligentsia of the destruction of Lisbon in 1755 by an earthquake are well known, but despite the contribution of that catastrophe to the process of secularization one may be hesitant to consider this episode as having much to do with an ecological approach to religion. On the other hand, the effects of the explosion that destroyed the island of Krakatoa in 1883 must be mentioned, for it seems to be the case that as the result of believing the disaster had been caused by their gods, the inhabitants of Java converted to Islam, making Indonesia the largest Muslim country in the world – this development being parallel, albeit extreme, to the surge in devotional activity in late eighth-century B.C.E. Greece.

The role of labor, cognition and ideology in the adaptive process must be mentioned to conclude this survey. Labor functions as the mediator between groups and their ecosystems, for it is through labor that human beings confront their milieu, in a process that involves accommodation as well as transformation. As we have seen, in small-scale societies both the accommodation and the transformation involve, besides physical exertion, the generation of etiological myths, symbolic systems, and ritual practices through which the interaction between humans and the rest of nature are made intelligible. Lest one be tempted to romanticize the pre-industrial world, or to reduce it to the realm of pure meaning, it must be stressed that in hierarchical societies the myths, symbols and rituals represent attempts to validate social stratification, attempts that are always backed by the threat of force. In the stratified societies that emerged in the Fertile Crescent, for example, the rise of organized labor gave rise to a mythology involving a stratification of the pantheon. Whether subaltern groups, generally condemned to acknowledge the reality of brute force, submit also to the ideological constructs that seek to transfigure that brute force is open to question; it can be said in fact that the symbolic systems constitute arenas within which various groups advance their interests.

If we turn to the cognitive capacities through which human organisms engage in the process of accommodation and transformation to which we have referred, we see that these cognitive capacities emerge, just as labor does, in order to allow the organism to satisfy needs. But it must not be forgotten that our cognitive proclivities are such that through the religions they make possible, these cognitive propensities serve also as the scaffolding for symbolic/ideological constructions. Among the former we find the tendency toward the personalization and indeed the anthropomorphization of natural processes; these include the personifications of staples, such as the “goddess of rice” in Southeast Asia, or the dema divinities,

sources of tubers and grains, studied by Jensen. We find also the tendency to imagine mythical beings, such as the master of animals, who serve as the mediators between humans and their prey; the human counterpart of the master of animals is the shaman, a ritual specialist who has been postulated at the origin of kingship, thus establishing one of the connections between religious and political symbolism.

In the context of a discussion of the relationship among conceptions of supernatural beings, political organization, forms of production and ecological constraints, we can refer to a controversy among Swanson, Underhill and Simpson, in which Swanson maintained that monotheism tends to appear in societies which having developed settled agriculture, depend on grain as their most stable sources of food. He also claimed that there is a correlation between monotheism and political complexity, defined by the presence of a hierarchy of sovereign groups in a society. Underhill, on the other hand, emphasized the correlation between economic complexity and monotheism and claimed that although economic and political complexity have effects on monotheism, economic complexity has the stronger independent effect. Approaching the problem from an ecological angle, Simpson focused on the activeness or inertness of the subsistence raw materials on which small-scale societies depend, claiming that the degree of activeness or inertness can serve as predictors of the presence or absence of a high god. He observed that “active raw materials may provide contingencies that are best dealt with by the skilled and, sometimes, necessarily swift action of individuals and/or the concerted action of highly motivated individuals . . . active raw materials support and encourage pragmatic and autonomous role definition” (Simpson 1979: 306). This led him to conclude that a high god “can be viewed not only as the symbolic arbiter and judge of the world’s events but also as the symbolic representation of the efficacious, pragmatic worker” (Simpson 1979: 307). He also approached the activeness/inertness continuum by focusing on the type of animal kept and the type of fauna hunted in a given society, concluding that there is a correlation between large and powerful animals and the belief in high gods. For our purposes it is not necessary to try to determine which of these positions is the correct one; it is sufficient to point out that by emphasizing the correlation between purposeful action and the belief in high gods, Underhill and Simpson, and to a lesser extent Swanson, explore the connections among ecology, work and conceptions of god.

As we can see from this controversy, the work required to survive within a set of ecological constraints gives rise to conceptions of agency and of rulership, human and divine; but as we also saw at the beginning of this essay, human peculiarities also give rise to the opposite: to the desire to give up one’s agency, to flee the power of

the ruler, to erase the distinction between oneself and the world.

Eco-magic

Eco-magic is the use of magical and spiritual techniques for the benefit or protection of the environment. Because practitioners believe that magic backed by practical action is more effective, eco-magic often supports conventional campaigning or is integrated with direct action.

Eco-magic is an evolving practice that blurs into a whole ideology of change. Starhawk, a witch and political activist, "offers the principles of magic not as a belief system . . . but as an alternative descriptive system that can help develop a psychology of liberation" (1987: 20).

Because eco-magic is a strategy that a conventional opponent will find hard to counter, it has been perceived as a tool of the oppressed.

Any magical tradition or technique can be adapted to eco-magic and practitioners work with a wide variety of

deities. Rituals can be public or private and involve groups or single individuals.

Western eco-magic does exhibit certain distinctive qualities, notably the use of elements of performance, especially drumming, dance and chanting.

Certain symbols and mythic elements recur. The goddess Gaia and the Green Man appear frequently, as does the Dragon, symbol of Earth energy. Spirals and runic talismans (e.g., the Dragon Tree Rune) are common.

Eco-magic often involves working with the "Genius Loci" of the place, the Devas or Faery Folk, who are understood as teachers and allies in the campaign.

Since the early 1980s, a more theorized eco-magic practice has emerged from Western Paganism. Starhawk, Reclaiming and the Dragon Environmental Network have been influential in defining this practice, which I call "Dragon/Reclaiming eco-magic" (DREM).

Although generally eco-magic may include cursing or similar "aggressive" magic, DREM is nonviolent, non-hierarchical, and strives toward holistic solutions. It is a magic that works toward building reciprocal relationships between the natural world and humanity. DREM excludes Western magical traditions that use nature spirits instrumentally. Practitioners allege that such traditions emerge from a cerebral "dominator" ideology of control that is incompatible with an eco-magic that works in tune with nature.

Mainstream environmentalists are generally dismissive of spiritual perspectives while many spiritual people consider political issues to be irrelevant. Eco-magic, like liberation theology, explicitly connects the political and the spiritual: "the personal is political is spiritual" (Harvey 1997).

Eco-magic blurs the distinction between political action and magical ritual: "When political action moves into the realm of symbols it becomes magical" (Starhawk 1982: 169).

The Three Mile Island Memorial Parade (1980) combined a march with a large-scale public ritual. By integrating elements of a conventional political demonstration with ritual and aspects of theatre, magic and politics can merge seamlessly.

Although magical practice is normally secret, eco-magic rituals are often public. This serves a psychological purpose, boosting the morale of campaigners and unnerving the opposition. Public ritual is unusual in Western magic but is common in the tribal cultures that influence many eco-activists.

Economics

While research into economic relationships is a fairly recent development in the study of religion and nature, the fast-moving pace of global capitalism constantly poses new challenges and demands fresh reflection.

The pioneer of the relation of economics, religion, and nature has been E.F. Schumacher, an economist writing from a Buddhist perspective. One of the fundamental problems of modern economics, according to Schumacher, is that dominant economics leads to "economism," a state where human values, work, and even the environment are all subordinated to the pursuit of material ends. As a result, certain dimensions of spiritual reality are neglected. Schumacher follows Mohandas K. Gandhi's sense that only the realization of the permanent nature of the soul, apart from the body, will give us peace. At the same time, Schumacher believes, modern economics has itself assumed the metaphysical status of a religion and its main values of money and entrepreneurial profit have brushed aside other values, including respect for the natural environment. As a result, Buddhist economics (or economics inspired by any of the other great Eastern or Western traditions, including Christianity, Islam, and Judaism) is seen to have the potential to reverse this trend. Valuing people as more important than goods and profits, espousing principles of simplicity (how to attain given ends with the minimum means) and nonviolence rather than a "bigger is better" lifestyle built on aggression toward nature and resulting in political aggression, provides the necessary antidotes to an economic system and its religion that will destroy both the Earth and humanity, according to Schumacher.

Bringing together insights from fields as different as economics, biology, history, philosophy, physics, and theology, self-described Christian theists Herman Daly (economist) and John Cobb (theologian) develop an alternative vision that seeks to go beyond standard models of capitalism and socialism. Their project is based on the vision of a community in which all aspects of reality are related in an emerging "biospheric consciousness." The main problem with dominant economic paradigms, they

argue, is a myopia that leads to the destruction of communities and the separation of humans and the natural world. The theoretical lack of values that promote community and nature has led to the practical destruction of community and nature. Anthropological dualism, the belief that humans occupy a higher stage than the rest of nature, and philosophical idealism, the assumption that ideas are more important than matter, are among the main culprits in this state of affairs. Once this myopia is cleared up and a biospheric consciousness is adopted, Cobb and Daly argue, the principles of the free market can be put to more constructive use. In this approach, the religious component plays a role in how the biospheric vision is conceived. Faith in God – a theocentric perspective – liberates us from the misdirected anthropocentrism of Western culture and economics. Faith in God also helps to interrelate concern for the value of individual beings and for the holistic interrelation of all beings since both exist only in relation to God.

Christian ethicist Larry Rasmussen has raised concerns about a mismatch between the globalizing human economy and the economy of nature. The challenge, he asserts, is to realize that any human economy is always part of the larger economy of nature since everything depends on the regenerative powers of nature. Rasmussen assumes that there is a certain "carrying capacity of nature" and that economic systems which disregard it end up destroying the Earth not because they are too materialistic but because they are too "docetic," namely, not materialistic enough. There are parallels to a colonial logic where the true costs to the colonized are kept off the books. As a result, those who profit from such colonial relations broadly conceived remain unaware of the real cost of their lifestyles and may end up destroying their own basis of survival as well. One way to address this situation is to engage in a "reenchantment of the world" and to develop religious symbols that promote new values. According to Rasmussen, religious symbols can lead to a new appreciation for nature and the integrity of God's creation of which human beings are a part.

Christian theologian Sallie McFague has also begun to extend her work in religion and ecology to include economic concerns. Her argument begins with the observation that first-world Christians are destroying nature not because they lack love for nature – an earlier theme of her work – but because of their consumerist lifestyles. The greatest ecological dangers have to do with the consumerist desires of the middle class, which are seen as necessary for sustained economic growth. This sort of consumerism can only be resisted through a new ecological-economic lens that sees the whole of reality as interrelated. McFague develops the theme of interrelation through a notion of God not as distant and related externally to the world, but as embodied in it and as its source and fulfillment.

In sum, one of the fundamental problems to be addressed in the study of religion and nature is what Schumacher and later Cobb have called “economism,” a system in which economic concerns have absolute priority over concerns for nature and – to a certain degree – over concerns for human beings as well. Under the conditions of globalizing capitalism, however, this insight needs to be taken to the next step. Anthropocentrism may no longer be the greatest challenge to nature, and even the more and more common critique of consumerism needs to be reevaluated at this point. Arguably, the economy has become hegemonic to such an extent that the majority of humanity matters less and less and consumerism has become a mode of existence that can no longer be contained by the individual will of the consumer. In this context we need to rethink what it means to propose religion as an antidote – as the place from where resistance can be formed and alternative lifestyles can be developed. Can religion itself be considered to be free from the pull of the global market economy?

Today, progress in reconfiguring the interrelations of economics, religion, and nature depends on a return to places similar to those where the initial insights of the pioneers of this question were forged: situations of great pressure. In this context the contribution of theological and religious reflection to the further development of economics and ecology is not primarily that of providing another set of ideas or a new state of mind but of finding glimpses into the reality of God where the pressures of the economic and ecological status quo become unbearable and are thus being questioned. Here, the different religions will be able to offer alternatives not primarily where they represent symbols of regulated religiosity (easily commodified by the commercial spin doctors’ efforts at reenchantment) but where they draw on the irrepressible energies emerging out of the undercurrent of their own traditions and strengths as they have developed and continue to take shape in the midst of the pressures of life as a whole.

Eco-paganism

In an attempt to curb Britain’s worsening traffic congestion problems, the Conservative government of the 1990s commenced a massive program of road-building. In the process they unwittingly instigated a protest movement vehemently opposed to road and other construction schemes (such as the expansion of open-cast quarrying, and the building of new airport runways), and which centralized the use of nonviolent direct action to achieve its environmental and political aims. While protests against new roads had occurred since the 1970s, those at Twyford Down in Hampshire (1992) are regarded as igniting the direct action movement in Britain.

Protests followed across the country, culminating in the Newbury Bypass campaign (which, with many hundreds of protesters, achieved considerable media coverage) and the A30 campaign at Fairmile in Devon (where Daniel “Swampy” Hooper achieved notoriety by spending seven days locked underground in a tunnel). Protesters combined “the protest camp” from the British anti-nuclear protests of the 1980s, with the direct action tactics of American Earth First!, to barricade themselves in camps along the proposed route, using treehouses, tunnels and other locking-on points, or to disrupt construction by “digger diving” and occasionally by eco-sabotage. As camps had to be evicted before construction could continue, protesters hoped, if not to halt construction completely, then to render future projects economically unviable.

While by no means all protesters had pagan or other religious sympathies, eco-paganism is used as a loose term for spiritualities within the British protest movement; it includes two broad groups. Firstly it refers to the practices of initiated members of existing pagan faiths who involve themselves in direct action. Perhaps the best example is the Dragon Environmental Network (Dragon). Dragon was established by progressive Wiccans who, motivated by the belief that “all the Earth is sacred,” sought to combine ritual/magical practice with direct action in what they termed “eco-magic.” Borrowing ideas of “Earth,” or “dragon,” energies from *Earth mysteries*, they used ritual to “raise the dragon” so as to protect and empower both a piece of threatened land, and those attempting to defend it. Thus during a mass trespass on the newly constructed M3 at Twyford Down, Dragon members used frenetic drumming to raise this dragon energy. In a similar fashion they created a sigil or “bindrune,” the “Dragon Tree Rune,”

which they “charged” using drumming at public rituals (often held in rave clubs); the rune was worn by protesters for protection, and daubed upon trees and construction machinery to intimidate workers. Practitioners attribute the saving of Oxleas Wood in London to the efficacy of eco-magic. There is some evidence of similar, but locally nuanced, practices occurring in Europe. Lindquist (1997) describes how heathen neo-shamans invoked “ice giants” from Norse mythology using *seidr* trance, so as to prevent residential construction outside Stockholm. Whatever its cause, the resulting freeze prevented work just long enough for the local government to be persuaded to abandon its plans.

Eco-paganism secondly refers to the “detraditionalized,” elective and affectual spiritualities of protesters living more permanently at protest camps. Loose and resisting tight categorization, these syncretic spiritualities incorporate belief and practice from Buddhism, Shamanism, the New Age, Theosophy, 60s psychedelia, the Rainbow movement, and British folklore, while retaining a core pagan doxa. Thus the standard eight pagan festivals are marked (in addition to full moons and other celestial phenomena), and many practitioners honor a god (“the Horned God,” or “the Green Man”) and a goddess (usually “Gaia” the Earth Mother). However ritual structures, if they occur at all, are rudimentary, and the emphasis is very much upon celebration. Such occasions are often marked by entheogenic consumption, especially of cannabis and indigenous British Psilocybin mushrooms. Such celebrations are a product of the movement’s origins in (free) festival, and so-called “new-age traveler” culture. Traveling, the romanticized gypsy life, and a new tribalism are important aspects of this eco-pagan identity. Protesters at Twyford Down named themselves “the Donga tribe,” and set off on the “freedom trail.” Traveling on foot or by bicycle (later with horse and cart, goats and chickens) between prehistoric sites, they regarded themselves not only as spiritual and ecological exemplars, but as the indigenous pagan nomads of Britain.

Eco-pagans of both groups stress the importance of a bodily engagement with environmental problems, and with the natural world more generally. Adrian Harris (1996) argues for a “somatic ecology,” a move away from intellectual to bodily “knowing,” while others stress the need to build a relationship with the spirit(s) of a place, the *genius loci*, by spending time outdoors. Camp dwelling eco-pagans often feel intense emotional bonds with the tree in which they live, or the land they are defending, and often regard their lifestyle as exemplary when compared to that of urban society, pagan or otherwise.

Eco-paganism exhibits a fascination with fairies and the mythology of the otherworld, an aspect that takes two forms. Firstly, identification with fairies can be purely symbolic. The reiterated belief that practitioners are the downtrodden “little people,” helps them to make sense of

the inevitability of eviction, and hence defeat. Further, by identifying with fairies, practitioners are allying themselves with “nature,” and with nature’s “higher” morality, a move that helps justify the legal infractions of protesting. Thus the damaging of machinery is called “pixieing,” a move that downplays the implications of what is effectively sabotage. Secondly, though, some practitioners maintain a literal belief in fairies as spirits of, or spirits dwelling within, a pristine nature untrammelled by human agency. Occasional phenomenological encounters with fairies, entheogenically inspired or otherwise, fuel the belief that “nature” supports protesters’ actions. Eco-pagans believe that encounters with fairies are a reward for their ecological self-sacrifice and that they are being granted privileged access to nature’s hidden realms.

The road protests galvanized eco-paganism, allowing it to become embedded through the establishment of camps; the construction of new roads ironically provided spaces in which eco-paganism could flourish. Having effectively succeeded in its aims the movement removed its *raison d’être*, and has remained in a dormant phase. However a new wave of protests has begun, focusing on issues of climate change and globalization, and so eco-paganism can be expected to emerge as a significant religious movement once again.

Ecopsychology

Ecopsychology is a diverse field committed to placing human psychology into an ecological context. Perhaps

the main idea behind ecopsychology is that the human mind does not stand wholly apart from the natural world but is deeply rooted in and tangled up with it; the human psyche is a phenomenon of nature, an aspect of the larger psyche of nature. By ignoring the natural world, modern psychology both misconceives the human mind and helps to maintain the Western/industrial world's destructive state of estrangement from its Earth home. Ecopsychology seeks to reverse this situation. By expanding the focus of psychology to include the relationship between humans and nature, it aims to develop a truer picture of human psychology and to draw attention to the psychological dimension of the ecological crisis.

One of the strong claims made by ecopsychology is that psychological well-being ultimately involves establishing mature, reciprocal relationships with the natural world, seeing it not as a mere resource pool for human use but as the larger community of life of which humans are mere members. As a general failure to develop such relationships, the ecological crisis can be viewed as a psychological and spiritual crisis. Many ecopsychologists trace the degradation of the planet to the consumeristic, ego-driven, Earth-alienated mode of consciousness that governs modern society's exploitative interactions with the natural environment. Ecopsychology thus maintains that the pursuit of human sanity and spiritual fulfillment, on the one hand, and environmental recovery, on the other, are closely related tasks.

Ecopsychology is usually described as an "emerging" field, having only recently been named as such. This does not mean that the subject matter of ecopsychology is entirely new. Numerous references to the human-nature relationship have been made in a wide variety of sources since at least the time of Jean-Jacques Rousseau. Moreover, the lifeways of indigenous peoples are generally viewed by ecopsychologists as already being "ecopsychological." However, if ecopsychology is regarded as an ecological revisioning of modern psychology and as a response to a particularly modern state of disconnection from nature, then it is indeed a historically unique undertaking. The first major work to criticize modern psychology for its anthropocentrism, and to propose a psychology that specifically focuses on the natural world, did not appear until 1960. In his book *The Nonhuman Environment: In Normal Development and in Schizophrenia*, psychoanalyst Harold F. Searles observed that the psychological theorists of his day regarded the nonhuman environment as irrelevant to human personality development, as if humans existed completely alone in the universe. He posited instead that a sense of relatedness to nonhuman reality, even if largely unconscious, is one of the most significant facts of human life, which humans ignore at their peril. Searles' work came and went with little comment from his professional peers. The years that followed did, however, witness a number of developments

that can be seen as evidence of an evolving ecopsychological sensibility.

In 1963 Robert Greenway introduced the term *psychoecology*, using it to describe his search for a language capable of conceptually merging mind and nature, as well as to describe his subsequent work on the psychology of wilderness experience. In the 1960s and 1970s Gregory Bateson carried out his cybernetic studies into the "ecology of mind," locating the human mind within a greater ecosystemic mind or Mind. In the late 1960s Paul Shepard suggested that the central problem of human ecology is the relationship between mind and nature. Shepard's anthropologically informed work culminated in his 1982 book *Nature and Madness*, in which he argued that normal psychological development requires that children be thoroughly bonded to the natural world and that adolescents be initiated into the sacredness, mysteriousness, and poetry of earthly life. According to Shepard, Western society's irrational destruction of the Earth can be directly linked to an increasing disruption of this normal process of psychogenesis. By the mid-1980s, the deep ecology movement had gained a significant following. This movement advocates deepening one's sense of connection to the Earth, in the process of which one becomes "ecologically conscious" or "ecologically mature," or realizes an "ecological self." The psychospiritual quality of much deep ecology discourse and practice makes it an obvious precursor to ecopsychology, and some regard the two movements as essentially the same. The 1980s also saw the introduction by Joanna Macy and others of "despair and empowerment" work. One of the main principles of this work is that personal distress over the state of the planet is not just a symptom of individual neurosis but is better understood as a healthy expression of "pain for the world," the pain one feels as a result of being connected to the ecological whole. By consciously experiencing this pain one is led to a kind of spiritual awakening in which one realizes one's interdependence with all life. Macy was also involved, along with John Seed, in developing the "Council of All Beings" ritual, a deep ecology practice in which participants shed their human boundaries to identify with and experience the suffering of other life forms. Another noteworthy development was that of transpersonal psychology, the psychological study of spiritual experience or nondual states of consciousness. Transpersonal psychology forms a basis for ecopsychology because one of the goals of ecopsychology is to overcome the dualistic mode of thought and experience that supports the illusion of separation between the human ego and the natural world. Indeed, much ecopsychological and deep ecological activity focuses on those ego-dissolving, free-flowing, or mystical experiences in the natural world that defy easy conceptualization. Hence Warwick Fox's 1990 proposal that the name deep ecology be replaced with *transpersonal ecology*, the latter term indicating a

marriage between transpersonal psychology and the eco-centric ecology movement. These and many other developments – including the appearance of environmental psychology, environmental education, and ecofeminism – prepared the way for an explicit ecopsychology movement to finally surface in the early 1990s.

The first major work directly to explore the idea of ecopsychology was cultural historian Theodore Roszak's 1993 book *The Voice of the Earth*. At the center of Roszak's "exploration of ecopsychology" was an attempt to revise an animistic worldview by drawing on the latest ideas in scientific cosmology. Around the time this book was published, the term ecopsychology entered into relatively wide (if not trendy) usage. A number of ecopsychology workshops were held, and in 1995 an anthology of ecopsychology writings was published. Ecopsychology was also finding its way into a handful of college and university departments, primarily in the United States, though also in Canada, Britain, Europe, and Australia. A small ecopsychology literature now exists, including a 1996 college text by Deborah Du Nann Winter, *Ecological Psychology: Healing the Split Between Planet and Self*. To date, however, the stress in ecopsychology has arguably been less on its theory and more on its practice.

The practice of ecopsychology currently includes or extends into – though is not limited to – the following areas: ecologically oriented psychotherapy (especially within Gestalt, body-centered, Jungian, and transpersonal frameworks); psychospiritual work in support of eco-activism; wilderness rituals/eco-therapy, including vision quests and deep ecological councils; numerous forms of contemplative practice; neo-paganism; large-scale Earth rituals; shamanic counseling; Earth poetics and story telling; experiential programs for reconnecting with nature; perceptual ecology/sensory awakening practices; gardening; environmental education; bioregionalism; building sustainable communities; ecological design; ecological restoration; organic farming; and environmental and social justice (including community land rights) activism.

As a still-emerging field, ecopsychology faces a number of challenges and criticisms. These can perhaps be grouped into two areas. The first general challenge is to build a comprehensive and intellectually coherent body of ecopsychological thought. Critics such as Joseph Reser charge that ecopsychology is not really a psychology because it has produced little in the way of recognizably academic research findings; it is more of a popular movement than a disciplined profession. Others say that as a synthesis of psychology and ecology, ecopsychology opens up a subject matter that is so all-encompassing as to defy workable definition. Part of the difficulty for ecopsychology is that modern academic psychology assumes a divide between inner/human reality and outer/natural reality, and uses objectivistic methods that deny nature its

own voice. Many ecopsychologists are accordingly leery of turning their field into a conventional psychological discipline, believing that this would betray their very subject matter. Ecopsychology is often distinguished from the more mainstream field of environmental psychology for just this reason. It nonetheless remains for ecopsychology to clarify in what sense it may be thought of as a psychology and to build its own distinct body of well-defined theory.

The second general criticism of ecopsychology is that it is politically weak. Ecopsychology has been faulted (as summarized in Andy Fisher's *Radical Ecopsychology*) for having a Eurocentric bias, for neglecting the significance of social and economic forces, and for being too narrowly therapeutic in practice. These criticisms have not gone entirely unmet, as there are efforts within ecopsychology to develop a multicultural approach, to consider how the corporate sphere distorts consciousness toward consumptive behavior, and actively to engage in social change work. The challenge, however, is to create an ecopsychology that when considered as a whole has sufficient political weight to be included among the important social and ecological movements of these times.

For all that ecopsychology may be theoretically and politically underdeveloped, the very idea of it has great intuitive appeal for many people. It speaks to their experience of earthly dislocation and their yearning for a greater sense of communion or kinship with the natural world. If it can adequately address the challenges facing it, ecopsychology may therefore play an important role in bringing about an urgently needed reconciliation between modern humanity and the rest of the natural world.

SP Ecosophy T

The term “Ecosophy T” is the name of a total view, or better, general view from part of which I *derive* (in the sense being of derived from a set of premises) what I call the eight points of deep ecology. This is only a small part of Ecosophy T which has not been and probably will not be adequately described or articulated by me. As a philosopher, I have of course not been outstandingly original, but have accepted and partly modified philosophical theories on a vast variety of subjects. What I am trying to do is to articulate fairly adequately a representative part of the views I entertain.

During many years as a student and a professor I specialized in the theory of knowledge. Within a great variety of clusters of problems, I developed a view which may loosely be characterized as skepticism. My book with the title *Scepticism* has been characterized as an endeavor to make the term a plus-term, a term for a kind of view many people would accept. Since the book was published I have slightly modified the relevant view covered by the term “skepticism.” Ecosophy T may better be characterized as (radical) “pluralism.” But Ecosophy T may be said to contain the fairly radical view expressible by the short sentence: “Humans are fallible whatever they assert.”

How is deep ecology with its eight points *derived* from Ecosophy T? Cosmology has an important place in Ecosophy T. The answer to “Where am I, what am I, what do I want?” starts with cosmology – the insight that I am in a largely meaningless, largely lifeless, ghastly, utterly immense world. Any island of any kind of life breaks the uniformity in a touching, heart-rending way. Through hundreds of millions of years of development, living beings have broken the uniformity of death and unconsciousness. How could we but embrace life with enthusiasm? How far away are our potential friends and neighbors from our planet? What do we do to protect life in this strange, marvelous place where we live? Have we been mature protectors of the biological diversity and the teeming of life? How does it come about that we now try to stop the extinction of species and behave in a way that is good for the teeming of life? What senselessness has made us capable of radically diminishing this teeming of

animals which are not a danger to us? Especially not when we limit our interference with the ecosystems and stop extending the areas of the planet which are clearly dominated by human activities?

In short, the derivation of a deep ecology outlook from Ecosophy T is not complicated. But it should be stressed that a total view like Ecosophy T is vastly broader in outlook than the teachings of deep ecology.

An important part of Ecosophy T is my semantics, also called my “empirical semantics.” Whether in daily life or in professional verbal communication, a sentence may be interpreted differently. Let T0 be a sentence that presumably is intended to express an assertion. It may be interpreted in at least two ways – one makes it synonymous with a sentence T1, the other with T2, these being considered to mean something different (at least) in the communication C. A primitive example: Mr P and Mr Q agreed to meet at 9 o’clock.

P: I meant (of course) 9 in the evening.

Q: I meant (of course) 9 in the morning.

There is an ambiguity. The more precise sentences, “We meet at 9 in the morning” and “We meet at 9 in the evening,” I call “precizations” of the two more ambiguous sentences.

Let “Humans are fallible whatever they assert” be considered a T0 uttered by a (second) person P, a point of departure formulation. We may immediately ask P whether T0 is to be considered a human assertion, and if so, whether what is said is meant to be interpreted as a human assertion and therefore as fallible. It is likely that P will answer that he is not fallible when uttering T0. Compare the sentence sometimes said to have been uttered by Socrates that he knows nothing. In general, I use the signs “T1” and “T2” for two conflicting interpretations of T0. But the sentences T1 and T2 may be considered open to two interpretations. We then have 4 precizations which I express by T11, T12, T21 and T22.

The empirical semantics I make use of in Ecosophy T I apply to my own sentences in Ecosophy T. That is, conceive it as likely that the sentences of Ecosophy T are open to various interpretations. Some differences in interpretation may be uninteresting and negligible; others ought to be “clarified,” that is, explicitly formulated. I may then tell which precization furnishes a more precise expression of what it is intended to assert.

Ecological views may be part of a “total view,” a general philosophy of life and the world (universe). The latter I call an “ecosophy.” By a “philosophy,” here I don’t mean a professional philosophy; I include personal comprehensive general views of non-philosophers, of people who tend to reflect a lot and who do form, however amateurishly, a total view including priorities of value in life.

My own total view I call “Ecosophy T.” The letter “T” is an arbitrary letter which suggests that there may be other ecosophies, A, B, C, . . . I just wish to indicate an openness

toward ecosophies that I personally find are not in harmony with my own opinions.

One of the central points of Ecosophy T may be formulated as follows: Humans are in many ways wonderful creatures living on the surface of a wonderful planet and have required hundreds of millions of years to form. The brain, which ordinarily is thought of as an organ of intelligence, is an organ capable of surveying and assessing immense varieties of relations, an organ that eventually will make humans not a destructive, but a constructive factor on the planet. The change may occur relatively soon, perhaps within, say, a few hundred years. Wars will not only seem ethically objectionable, but somehow childish. It might of course be asked how I can be sure about this.

A more moderate number of humans on this planet will eventually make it possible for people to continue to live where they would like to live. This would make it possible to live in acknowledged “wonderful” places where you today need to have a lot of money in order to buy a tiny plot of land. Mentioning population reduction, people naturally ask “how?”, suspecting coercion. I admit that my belief in a reduction is of a rather abstract kind. I do not see an easy way of how it could happen. It has to be an ethically perfectly satisfactory way. For instance, a way that encourages couples to produce only two children on average. Of the various social changes I envision, I shall here mention only one: there will be customs making it easier for people to have closer relations to the children of friends. From time to time we might house or be host to children other than our own, reducing the difference between “having” and “not having” children in the ordinary sense.

The two-children average is a system that rapidly reduces population, especially if the number of teenagers having babies is reduced, or if the general average of the age of mothers increases.

Reduced population is of course an important factor in decreasing the ecological crisis. This applies especially when there is a reduction in the materially richest countries. An ordinary family in such a country may cause more ecological damage than ten families in countries with a lower material standard of living.

Some might say that if people lived in accordance with the motto “rich life, simple means” then we need no reduction of the population. But Ecosophy T does not assume such a revolutionary change of lifestyle. Furthermore, it seems that in countries with economic poverty and less ecological damage, the aspiration is generally to live in an ecological way not very dissimilar to the way to live today in the rich countries. In short, Ecosophy T envisages considerable reduction of population, but does not predict how long a time it will take, how many centuries.

If I have to characterize Ecosophy T with one word, I will choose “this-worldly-ness,” *Diessetigkeit* in German,

something similar to what Plato rejects with his world of ideas. There is an emphasis on realism – in a wide sense. It implies (for me) the admittance that we live in a universe (described by modern cosmology) which seems to be devoid of every sort of meaning, any sort of purposefulness. And it should be added that what we get to know of it – and to know a lot – is an endless sequence of explosions. Through our great telescopes we actually see such explosions. The explosions provide light rays traveling at the speed of light for millions of *years* and which hit the lens of the telescope. Humans today can *see*, realistically see, happenings which occurred millions of years ago. The gigantic character of the explosion is grasped if we make note that a colleague of an astronomer looking through a telescope near the neighborhood where the first astronomer is looking sees another fraction of the explosion. This means that every single locality in gigantic space is filled with effects of the catastrophic explosion. Enough about the main ingredient in cosmos: electromagnetic waves of great energy.

But there are infinitely small areas of the kind we inhabit: planets with life, some of them possibly with life forms with human or even transhuman capacities. We have potential friends out there, but at distances so great that you would be “lucky” if you got an answer to a letter sent at the speed of light one hundred thousand years after your death.

In short, Ecosophy T contains a short description of modern cosmology and some rather confusing or disconcerting conclusions about *where we are* when we take this question in its cosmological sense. Is Ecosophy T in this sense taken seriously? Because of the important conclusions of modern science that the basic chemistry of the universe seems to be the same everywhere – with carbon and its potential for various complex combinations with other elements – this is a strong reason why Ecosophy T is highly optimistic about potential friends “out there.” We should not feel alone; we may feel that we are parts of a kind of living world and universe. Since I was a small child, very big numbers and distances have fascinated me, and it is only natural that contemplation of cosmological questions is important to me. We are genuine parts of something immense, and strange parts because we talk and think about it.

After so much about so distant concerns, I shall diminish my horizons and talk about humans, my “fellow humans.” Whatever the differences between us, I have a strong feeling that in all essentials we are similar.

It was in Vienna in 1934–1935 when I was in my early twenties that I sensed that I had left behind me the characterization of being “stupid.” Being critical of others, I seemed to have more complex criteria than most people. But even being in some cases very critical, I got a firm feeling that I could understand others as fellow human beings. A climber friend of mine was a Hitler fan, but I

joined him on a climb. When I started eating some pieces of bread, I offered him some, saying "Would you have some of this? But it was prepared by a Jewish girl I know." He hesitated, but took some of the bread. I do not think he hesitated for ideological reasons. Gentle, young Nazis did not react against individual Jews. They were seemingly capable of seeing individuals as fellow humans. But certainly I was somewhat extreme in my fellow human ideology. And this radicalness was part of my personal philosophy. Among the consequences was the view that the death penalty was unwarranted.

"Socialism" today in the West is a positive word among extremely few people, and the idea of radical change in general appeals to few. But in the very long run there will be, I firmly believe, radical change in radically different ways from what is now expected, if at all.

Socialism had profound consequences in 1945, when the German occupation of Norway ended. A great percentage of Norwegians considered communism to be a greater and deeper danger for Norway than the National Socialism of Hitler and neofascism. Several thousand Norwegians believed that it was their duty to join the Germans fighting the Soviets on the Eastern Front in Russia. To the Norwegian Government, however, the Soviets were allies in the fight against Hitler, and Norwegians fighting against the Soviet Union were, according to the established terminology, committing high treason.

All this is important if we are to understand the situation when the "Eastern Front Fighters," that is, those who survived, came home to Norway. They were put in prison as traitors. This was ethically absurd in my opinion, and because I had fought in the resistance movement, I could talk and act without danger in favor of the so-called traitors. I saw them as fellow humans and worked to get them out of prison. It was amusing and very important for me to call up the director of a prison to say that I needed a couple of prisoners in my seminar on "moral indignation during and after wars." The resistance movement fighters who survived the war and who were members of the seminar were flabbergasted when I entered the auditorium with well-known "traitors," people on the very wrong side of the war. But already in the next session (the following week), tempers were neutral and this was a victory for an important conception of being fellow humans. Members were interested in two basic questions: "How did *you* develop into a fighter on the front x?", where x could mean the highly prestigious front and/or the highly detested front. The seminar was important and strengthened the feeling that we were all fellow humans, all having too much in common to make certain, very common value judgments.

This leads to the consideration of causal chains. Freedom of will and freedom of decision in a sense imply strict causality. One of the most frightful and devastating experiences we *can* have is to do something seemingly

"uncaused," "unexplainable," not merely impulsive. We cannot but wish to be links in causal chains as long as we, ourselves, are part of the chains. We wish that our "will is free" in the sense of making our own decisions freely, not by being forced or pushed.

In recent years I have introduced a verb "to emerge." When certain things, maybe tiny things, *happen*, they occur *because* of something. There *must* absolutely be something, some constellation of factors, just making those things happen at the moment. Today I think that, sometimes, something *just emerges*. I believe in "emergings" in such a sense. Of course I'm not thinking of major, complex events, but of tiny details. "But they must come from something!" Why must they? Because even tiny details *may* have great importance. Answer: such details, perhaps, may never emerge.

Acceptance of emergence is one thing, but to give a convincing example is very difficult. Even conceiving how one could pick out and describe the emerging "thing" is difficult to establish. But does it justify the gigantic generalization about tiny happenings: "Absolutely nothing comes from nothing"?

The complex debate on the relation between testability and meaning of hypotheses is relevant here. Is the hypothesis of an emergence testable? Scarcely or surely not testable. But for those who do not subscribe to a completely general requirement of such a kind, the assertion "emergence *may* happen" may still have cognitive meaning. After all, it is a gigantic, and in a way, fantastic assertion that emergence never happens and never will happen. Fantastic only in the sense of its scope.

Enough about events that may absolutely never have occurred.

Concluding, I would simply maintain that Ecosophy T contains a thesis that there *may* occur emergences. Even within your own thinking, for instance, within your thinking about emergences.

How does this feel? Momentary, like some slight forms of liberation. Nothing much to write about? I am not certain about that.

The last but not the least important aspect of Ecosophy T is the attitude and practice of education. It is more or less generally accepted that four-year-old boys and girls who did not have siblings enjoy enormous self-respect, a feeling that they are something important, and require an acknowledged status as such. What I find especially remarkable is their spontaneous "deep" questions. What is the world? How great is it? Has the world ever been like it is? You say that grandmother is dead. What does that mean? Simply being away? Are we all going to disappear? Or nothing?

Whether four-year-olds vary in different cultures I do not know. But I suspect that their precocious questions may be similar. The question I would like to get answered may be thus formulated: Why do their lively interests in

the above-mentioned questions seem to be reduced rather than stimulated in ensuing years, especially in the first school years, when adults, in principle, should furnish excellent conditions for a deepening and an articulation of those questions; even conditions for learning about tentative answers to them?

If we say that God created nature, what we usually mean by the word “nature” is an extremely small part of what the contemporary science of cosmology teaches us. When a young religious group half a century ago asserted, “We have sinned against God’s creation” they referred to a sin against an extremely small part of cosmos – the tiny Earth. Today, there are frightful questions we must answer. Are we able to see God’s hand in the hundred-thousand million galaxies, each with, on average, a hundred-thousand million stars? Yes, we may say, why not? Eco-sophy T does not exclude mentioning the constant gigantic explosions going on, perhaps killing living beings on a vaster scale than our imagination can fathom.

The enormity and seemingly brutal and meaningless character of the cosmos as described by science makes it important to ask whether we might limit God’s direct creation to what is suggested in the Bible, and in many other basic religious documents. Nothing was known about the cosmos at the time these old texts were written. It must be religiously acceptable to ignore cosmology and thereby acknowledge that creation concerns the world inside a gigantic cosmos that was already there.

An ecosophy is a “general view” which should not keep silent about the above questions.

ECotherapy (by Hans Andeweg & Rijk Bols)

Hans Andeweg, M.Sc. is a Dutch biologist who has worked as a researcher in the field of bioorganic agriculture, gardening and forestry, and as a teacher and international organizational consultant. With his wife Rijk Bols, in 2001 he founded the Center for ECotherapy in Waltrip, Germany, to teach a way of healing the spiritual energies of natural systems in which the healer, the system and the caretaker/manager are equally involved. Based on the viewpoint that nature has a soul and that we can communicate with it, ECotherapy helps to restore and maintain a harmonious balance of vital energies underlying health and vitality. Andeweg and Bols believe ECotherapy can be effectively applied anywhere where the balance between living organisms and their environment has been disturbed.

Andeweg and Bols draw on their long experience at the Institute of Resonance Therapy (IRT) in Germany where they worked with remote healing of pollution-stricken forests in Central and Eastern Europe. However, whereas the IRT relies more on the effects of radionic equipment, Andeweg and Bols maintain that the conscious involvement of the caretakers, their inner intuitive development in working with nature, and their connection with the higher spiritual world is essential for the ecosystem’s long-term vitality. This links ECotherapy with the ideas of Pogačnik and other present-day, spiritual-ecological movements.

In his book *In Resonance with Nature* (1999) Andeweg explains his worldview, which underlies the practice of ECotherapy. He combines a wide range of phenomena such as life-force energy (*ch’i*), form resonance (based on Rupert Sheldrake’s morphogenetic fields), and orgon (from Wilhelm Reich), with the biometry of André Bovis, the work of Rudolf Steiner, blending these and the worldviews of Hawaiian, Dutch and other spiritual thinkers into a unified, holistic model. The model is applicable to anything that fits the description of an organism, organization, or system, be they animals, people, plants, gardens, houses, businesses, farms or landscapes. It includes measurable parameters by which a diagnosis can be made and replicated, and progress can be monitored over time.

On the basis of this model he builds the principles and practices of ECotherapy. A typical ECotherapeutic project lasts several months at least and consists of a diagnostic component and a “treatment” component. In the former, the healer intuitively diagnoses the energetic values of the system – Earth radiation, Bovis values, (Reichian) “orgon” etc. – with the aid of a pendulum or dowsing rod; this is done before treatment and repeated at regular intervals during the second phase. The resulting qualitative and quantitative observations reveal the energetic “state” of the system concerned, including spots where energies are disbalanced. The “treatment” itself is aimed at restoring

the balance and is therefore called a “balancing.” It involves the application of various well-known remedies for human healing (Reiki, homeopathy, music, etc.) adapted to the system’s specific needs. The “balancing” can be performed not only on the spot but also – and more efficiently so – at a distance (“remote balancing”). Instead of having to go around large areas (e.g., forest), the treatment is applied on a map, photograph or other representative item of that forest which resonates with the physical system through its morphogenetic field. In this way the healer can repeat the “balancing” protocol more frequently, work over larger areas and more projects simultaneously, and reduce costs. When the “balancing” is applied correctly, disruptive vibrations are relieved and terrestrial and cosmic energy flows are renewed. Application to organizations may generate new solutions to old problems.

ECotherapy can be learnt by anyone willing to make the effort. Andeweg’s Center offers short courses and workshops, as well as a four-year certificate training course in ECotherapy.

Ecotopia

Ecotopia, a novel written by Ernest Callenbach in 1975, is a fictional depiction of the ideas espoused in E.F. Schumacher’s *Small is Beautiful, The Whole Earth Catalog*, and Callenbach’s nonfiction. It presents a vision of an alternative, future society, located in the North-western United States, which is based on a sustainable economy, de-urbanization, political decentralization, alternative energy sources, feminism and a nature-oriented spirituality: “a seamless, stable-state web of living organisms” (47).

Subtitled *The Notebooks and Reports of William Weston*, it describes a skeptical reporter’s descriptions of, and eventual conversion to Ecotopian values and practices, during the early twenty-first century, twenty years after independence. Weston is an advocate of “ever-continuing progress . . . a rising Gross National Product” and materialistic lifestyles (4). He is disturbed by what he considers a primitive society “led by those damn women” (2).

In *Ecotopia* sexism has been outlawed, white-collar crime is vigorously prosecuted, workers are owners, and cities have been reduced to self-sustaining communities of no more than 50,000 people, with no suburbs. Automobiles have been replaced by electric buses, taxis, and magnetically propelled high-speed trains, and chemical

fertilizers with processed sewage and compost. Television is interactive, and videoconferencing reduces travel. Houses are integrated systems with passive solar power and heat pumps. The extended family has replaced the nuclear family, and sexuality is freer and more playful.

Religion and spirituality are not institutionalized in *Ecotopia*, but a nature-centered *Weltanschauung* permeates every aspect of everyday life. People have “a secure sense of themselves as animals,” domestic animals are raised semi-wild, and wild game is valued for its physical and spiritual properties (32). The Protestant work ethic has been abandoned because,

humans were meant to take their modest place in a seamless, stable-state web of living organisms, disturbing that web as little as possible. This would mean sacrifice of present consumption, but it would ensure future survival – which *became almost a religious objective, perhaps akin to earlier doctrines of “salvation.”* People were happy not to the extent that they dominated their fellow creatures on earth, but to the extent that they lived in balance with them (47–8, emphasis mine).

Like the New Age movement that emerged in the 1970s, Ecotopian spirituality promises a New World, a new way of life, and is also highly syncretic, implying aspects of Buddhism and Taoism, while explicitly blending pagan and Native American philosophies. Weston is surprised to hear a young man hail “Brother Tree!” (63). His first Ecotopian sexual encounter takes place in the forest “in some kind of shrine . . . this incredible woman is a goddamn druid or something – a tree worshipper!” (58). As Weston is slowly converted he notes, “Their little shrines are not merely pious nature-appreciation,” but are part of a more complex unity (90).

The strongest influence, though, is from *Ecotopia*’s earlier inhabitants.

Some Ecotopian articles . . . are directly Indian in inspiration. But what matters most is to live in balance with the nature, “walk lightly on the land,” treat the Earth as a mother . . . Who would use an Earth-mover on his own mother? (32)

Consequently,

the Ecotopians do not feel “separate” from their technology. They evidently feel a little as the Indians must have felt: that the horse and the teepee and the bow and arrow all sprang, like the human being, from the womb of nature, organically (51).

Ecotopians also take a tribal approach to the arts, in which “there is almost no distinction between amateurs and professionals” (145).

There are also elements of Christianity, primarily in the ritual warfare that has replaced competitive sports and actual warfare. When a participant is seriously injured, the combat ends and he is placed on a "stretcher made of red cloth with a white cross on it. His body was arranged in a startlingly crucifix-like way, with straps on wrists and ankles" (79). When Weston inquires about the cross he is told,

Ecotopia came into existence with a Judeo-Christian heritage . . . We make the best of it. You will find many expressions of it in our culture still . . . There's also a little ceremony for when a wounded man comes back from the hospital. You might guess what it's called: the raising. He stands up and walks (81-2).

Christlike, the combatant has made a sacrifice, but one consistent with the Ecotopian ethos. He has arisen not for the sake of heavenly salvation, but for that of humanity's continuing survival in the natural world.

As the novel approaches its conclusion, Weston still has his doubts about Ecotopia and is preparing to return to the United States with his reports. He is abducted to a hot spring for several days, and after initial resistance he experiences ego loss and psychic transformation.

I lost all sense of horizon, of place – all sense of anything except the steady gurgling of the water coming to me from deep inside the warm earth. I have no idea how long I remained in that state, but suddenly I heard my own voice saying "I am going to stay in Ecotopia!" (179)

Ironically, he has been "saved" and he tells his editor that his assignment in Ecotopia "led me home" (181).

Callenbach later penned *Ecotopia Emerging* (1981) to describe how the new society was created. In it, the Survivalist Party, dedicated to the biological welfare of all species, slowly gains power in local and state legislatures on the West Coast while infiltrating the National Guard and intelligence agencies. The unpopular reopening of a dangerous nuclear plant near Eureka, a nuclear disaster near Seattle, and the involvement of the governor of California in a massive water scandal precipitate an Ecotopian uprising. Paralyzed by covert wars in Brazil and Saudi Arabia, facing revolt in other areas of the country, and fearing that stolen weapons-grade uranium had been used by Ecotopians to mine New York and Washington D.C., the United States government can do little to prevent secession.

The Survivalist agenda is encapsulated in a Ten Commandments-like "No More!" list:

No extinction of other species.
No nuclear weapons or nuclear plants.

No manufacturing of carcinogenic or mutagenic substances.

No adulterants in food.

No discrimination by reason of sex, race, age, religion, or ethnic origin.

No private cars.

No advertiser-controlled or broadcast television.

No limited-liability corporations.

No absentee ownership or control – one employee, one vote.

No growth in population (35-6).

(It should be noted that while the original Ten Commandments focus on individual behavior, the Ecotopian version applies to corporations and society as a whole. In 1990 Callenbach promulgated a more individually oriented "Earth's Ten Commandments.")

The Ecotopian blend of Native American and pagan cosmology inspires people to consider themselves intrinsic parts of nature and act accordingly. "If you have holy traditions, you will not have to fight over everything every day; people will know what needs to be done" (74). Appropriate behavior is also a catalyst for personal transformation: "She didn't exactly worship trees . . . But she felt, more and more, that trees partook of some mysterious Earth spirit in which she too shared . . . others would notice a quiet radiance from her. 'Here comes the tree witch!' " (117)

Christianity is also part of the emerging Ecotopian ethos. "There were even Survivalists who spoke with the fervor of evangelists. Their meetings even acquired a name: Vision Bringing, from the ancient idea that where there is no vision, the people perish" (128). Their deep ecology version of Original Sin is the introduction of agriculture, with crop plants as the Tree of Knowledge. Eventually, "they turned the Garden into a Factory" (129). Although the Survivalists do not believe a return to The Garden is possible, they preach conservation and restoration as part of a conscious human participation in a "circle of being" (130). The Garden remains, in the words of President Vera Allwen, "a standard, a measure of our actions now, a holy ground on which to stand. Amen" (131).

The biblical parable of the rich man and the poor man is similarly transformed.

Now the moral of this story is that the rich man, even though he was trying to be good to the Earth, actually did a great deal of damage to it. The poor man, who was too busy trying to survive to pay much attention to ecology, caused far less damage . . . Blessed especially are the thrifty and resourceful . . . Blessed are the producers of their own necessities . . . And I say unto you, verily it is easier for a camel to pass through the eye of a needle than

for a rich man to enter into a world of ecological sanity (147–8).

Simple living and self-sufficiency are considered not only ecologically and economically necessary to survive, but sacred. The Ecotopians use Christian rhetoric in a wry manner when they spray pesticide on the Raussen Chemical Company's lawn party " '2,4,5-T is perfectly safe.' – Raussen. 'Ye shall reap as ye sow.' – God" (213).

Utopian and evangelical modes are synthesized in the end: "We speak for life, not death. We speak for joy, not anxiety. We speak for voluntarily joining together to create a new one, not for military tyranny to preserve an old one" (319). The Ecotopians consider their vision to be a beacon to enlighten others and guide their way.

Future Primitive: The New Ecotopias (1994) is a fascinating collection of science fiction and fantasy stories inspired by *Ecotopia*. Contributors include Kim Stanley Robinson, Ursula Le Guin, Robert Silverberg, and Pat Murphy. Callenbach's story, "Chocco," might be subtitled "Ecotopia Prevails." A group of Ecotopians had migrated to an ancient Indian pueblo shortly before the Earth's human population was nearly exterminated by global warming, drought, disease, and radiation. Nearly a thousand years in the future they live a simple but culturally and spiritually rich lifestyle, using only environmentally benign technologies. Two young men vie for the position of Memory Keeper by recounting the collapse of the short-lived "machine people" civilization and the lessons learned from it. This seems to be a worst-case scenario wherein even though most of humanity continued down the path of extinction, a small group managed to adapt and survive.

Originally published in English, *Ecotopia* has been translated into ten other languages and has sold nearly a million copies. It has been criticized for romanticizing Indians, and more recently for sexual profligacy, which seems anachronistic in the age of AIDS. The overall reaction, however, has been positive. Many of the environmental and technological processes such as mass recycling, organic gardening, solar power, electronic publishing, and teleconferencing have become part of everyday life. It has inspired many individuals to simplify their lifestyles and become environmental activists, eco-feminists, and/or deep ecologists. Some of the principles and tactics used by radical environmental organizations such as "EarthFirst!" and animal rights groups are based upon those depicted in *Ecotopia* and another visionary novel published the same year, Edward Abbey's *The Monkey Wrench Gang*. The platform of the Survivalist Party is reflected in those of the American and German Green parties. *Ecotopia* continues to offer both an inspiring vision and some practical ideas about how to create a sustainable, positive future.

P Ecotopian Reflections

From an Ecotopian perspective, the Moloch of our age is industrial consumerist capitalism. To it are being sacrificed the energies and joys of billion-strong generations of people – human cash cows – not to mention uncountable trillions of other living beings. What Marx called the "cash nexus" and moderns call "the market" is everywhere triumphant – a corrosive force so powerful that it dissolves social bonds and subjects all natural phenomena to economic "rationality." Everything and everybody has a price. The emotional valences that have held together communities, companies, governments, churches, even families, attenuate.

The market's priestly class, economists, endlessly glorify the dominance of the market over all other considerations. In truly religious terms they may be heretics, but their doctrines are supported by all corporate media, by the leashed-dog representatives in our money-humbled legislatures, and of course by our oil-industry-bred leaders and their corporate cronies. It is an era blatantly corrupt.

These are, as Buddhists would say, evil times – a new Dark Age. We stumble headlong toward unimaginable ecological catastrophes: probably not sudden ones (although to genetically nimble microbes, six billion human bodies constitute a tempting new nutrient pool) but a long dimming down of the beautiful productivity of the planet's living systems – with especially painful consequences for the majority of the human species, who depend on them directly. Citizens of the “Northern” advanced countries currently enjoy a hectic prosperity. Our better-off classes are submerged in a consumer glut fueled by ruthless exploitation of the Earth's resources and a massive transfer of wealth from the “South” – exacerbated by globalization and its one-sided “free trade.”

But our long-term fate, like that of the Earth's billions of poor, is to live through mostly irreversible ecological decline: desertification and impoverishment of soils, extinction of species, shortages of fresh water, atmospheric and ocean warming with its biological disruptions and spread of diseases, atomization of human societies, desperate migration fluxes, wars.

In such a dismal situation, can we find consolation and guidance in a new kind of faith? The puzzle and the challenge of our era lie in this: can relentlessly anthropocentric institutions like religion and capitalism be transformed into sustainability-enhancing new forms, so that some kind of stable civilization can be preserved? The answer is almost certainly No. Yet it is worth trying to envision positive alternatives – some kind of ideological/theological jujitsu. Can our tendency to imagine we are the center of the universe, which condemns us to disaster, be converted to an ecocentric regard for all our fellow travelers on Spaceship Earth which is at the same time self-serving and ecology-preserving?

Ecotopians like myself like to think it is possible. We know that most religions are resourcefully syncretic: they draw not only from earlier religions but from new ideas of their time. Several growing nodes in contemporary religious thought and practice seem promising.

One is the old Christian idea of stewardship. “Dominion” ought not to mean unlimited exploitation, in the full-bore capitalist mode that Lynn White thought Christianity authorized, relentlessly externalizing ecological and social costs from humans and our corporations outward, but responsible administration. To modify Stewart Brand's famous declaration in *Co-Evolution Quarterly* that “We are as gods, and might as well get good at it,” we should come to believe that “We are sensible managers, with an eye toward long-term survival of all Earth's creatures,” (no reference available) and had better get good at *that*. We have tried enough of it to know that it is not easy. We think we are planning “smart growth” and still sprawl our suburbs over precious wild or agricultural lands.

Sometimes our devoted marsh or prairie restoration efforts go awry. We are unable or unwilling to forgo war,

now unimaginably destructive to the environment as well as human beings. Sometimes we inadvertently introduce fatal diseases into precious ecosystems. We fail to notice the long-term effects of our massive (and highly subsidized) global transportation system. We know that the sheer burden of human numbers is one of the major pressures toward environmental destruction, yet we are unable to stem the tides of reproduction and migration. Nonetheless, “stewardship” remains a useful ideal. Most people, when they are goaded to think about it – and this should be an overriding goal of a worthwhile modern religion – agree that God or Allah or the Great Spirit did not create the world so that our species could despoil it. We are not here merely to work, buy, and die.

Second, religions make it possible to codify righteousness. Sometimes they pervert it – into religious wars, for example. Sometimes they commercialize it – with high-living hierarchies or TV preachers, indulgences, unaccounted-for “contributions.” But we all need help to achieve some coherence in making choices about what is right. There is, of course, a wide range in how different faiths manage this, as well as in theological doctrines. The “sky god” religions of the West traditionally vest righteousness somewhere up above, in a super-patriarch who wreaks vengeance on lawless or defiant people, authorizes the oppression of women, and lays down the rules – obviously not a model with enormously productive implications for an ecological sensitive and responsible, not to mention democratic, civilization.

Eastern (or ancient Greek) religions are more polymorphous, with many gods and goddesses, including some up to no good and dubious as models.

The primordial goddess religions focused on productivity (human, agricultural, and animal), sometimes sought to amplify it through sacrifice, and did not support warlike or hierarchical leaders; we do not really know what their rules were. The only successful “modern” religion, Mormonism, combines a theology as bizarre as Catholicism's with rules that enforce socially supportive practices almost equivalent to a welfare state's. Modern Westerners (suspicious of other peoples' mysticism and unaware of their own) tend to think of Buddhism, Daoism, and Confucianism as little more than glorified and codified common sense, but in these religions' sense of humanity as an integral part of a universal order we find much that is not only amenable to ecological wisdom but eerily parallel to ecological science, and practices of meditation, austerity, and right livelihood that are ecologically beneficial.

Thus it seems to me not inconceivable that as we continue on our trail of ecological tears during the twenty-first century we will build a new kind of religious synthesis out of the “good parts” of all these religious traditions. It will be a formidable task, because it goes up against the dynamic of global capitalism, with its endless

resources for propaganda endeavoring to convince us that all is well, or even if it isn't well, that there is no alternative. I do not myself possess faith in any ordinary religious sense, but I do have faith that in the long run – fifty years, a hundred years – people will see through the propaganda, pay attention to the real emotional and social needs that no consumerist balm can salve, and develop beliefs appropriate to our actual ecological station. What theological shape this evolution will take, I cannot really guess.

“Pagan”-Christian-Islamic-Buddhist? It is easier to imagine, as I tried to do in *Ecotopia* and *Ecotopia Emerging*, some of the practices that might be involved. It is worth remembering that, on the level of everyday life, the elaborate Talmudic laws were a response not only to theological notions but to the concrete living conditions of a desert people. The laws dealt with hygiene and thoughtful ritualized relations with animals, as well as a proper posture toward God. It is surely possible that we can develop a modern, ecologically sophisticated set of equally specific rules for sustainable living in a global, industrialized society. For instance, Rabbi Arthur Waskow, author of *Down-to-Earth Judaism*, is a leading thinker in the “ecokosher” movement. At his website Waskow asks, “Is it ecokosher to destroy great forests, to ignore insulating our houses, synagogues and nursing homes, to become addicted to automobiles?” As Waskow has emphasized in many writings, these are moral and religious questions, inseparable from ecological ones.

In the perspective of endless-choice consumerism, attempts at codification may tend to seem silly, just as the ancient injunctions not to eat pork or shellfish may once have sounded. “Eat lower on the food chain” is not going to win prizes for memorable commercials – but it happens to be excellent counsel ecologically and nutritionally, and my prediction is that by the end of the century it will be considered old-hat and unexceptionable advice. Two decades ago, after all, anybody who urged neighbors to recycle was considered a crank. Now almost everybody feels it is a civic duty, and does it. In the long run, doing things right pays off, people notice, and their ideas change. Only two decades ago, any American business or social gathering was smoke-filled; now smokers huddle furtively outside offices – and lung cancer rates are dropping. Sky-god religions do not pay enough attention to such mundane things, but our future depends on them.

Third, a new religion will restore heart to our emotional lives. I do not mean merely that getting the cash nexus off our backs (like the pods in *Invasion of the Body Snatchers*) will feel good. Acknowledging and celebrating our actual place in the universe can be inspiring and humbling and comforting. It has always puzzled me that some people who conclude that God is Dead say it makes them feel lonely. Here they are, in the midst of a stupifying wealth of miraculously interdependent living beings – so various,

lovely, mysterious, and often friendly. They partake in their cells of an ancient heritage of other living beings, going back billions of years. They are gifted with the capacity for glorious joys and pleasures. They have minds capable of incredible feats of thinking, feeling, understanding. They have the emotional potential to form deep and lasting bonds with friends, lovers, spouses, pets, favorite plants, and far beyond. As members of a particularly resourceful species, they have the opportunity to play a key role in the healthy unfolding of the universe. Our new religion must help us to grasp and value this astonishing and very unlonely status. It needs to incorporate the mysterious and wonderful findings of ecological science.

It needs to relate them to a righteous way of living. And if it does these things, since there is probably an ecology of religions too, it should prove adaptive and survive.

Ernest Callenbach

See *also*: Callenbach, Ernest; *Ecotopia*; *Ecotopia – The European Experience*.

P Ecotopia – The European Experience

Ecotopia is an annual, two-week-long event in Europe that began in 1988 and is held in various European venues. Organized annually by European Youth For(est) Action, based in the Netherlands, Ecotopia seeks to create an active environmentally friendly community. Its purpose is to teach people how to live a sustainable, eco-friendly and low-energy lifestyle by demonstrating how to do so. There is a strong disillusionment with the current material and selfish world, with its reliance on technology and science to solve problems. At Ecotopia, people are given space and encouraged to explore other solutions through political, environmental, and spiritual knowledge and methods.

In 2001, Ecotopia was held in Bulgaria and the year before in Finland. In August 2002, Ecotopia was held in County Clare in Ireland. This was the first time Ecotopia had come to Ireland and it was hosted by *Gluaiseacht*, an all-Ireland environmental and social justice activist movement with which I participate. The site chosen was Bealkelly Wood, a native woodland forest, on the shores of Lough Derg, in Co. Clare.

All Ecotopias strive to create an environmentally sustainable and participatory community. In preparing our site we tried to create a gathering place that would use renewable energy sources and leave little impact on the local environment. We built temporary structures such as tepees and geodesic domes to house our kitchen and meeting areas. Water was provided to the kitchen and toilet areas from a natural spring on site. We built compost

toilets, which are dry, use no chemicals, and convert all waste into usable compost.

We also established a vegan kitchen. Cooking was done on wood-fired braziers, where the wood was collected from the forest using sustainable woodland management methods taught to participants by the site owner, and three meals were provided each day. An organic vegetable garden provided many of the vegetable needs for the community.

Ecotopians gather in Morning Circle after breakfast to plan the activities of the day ahead, to volunteer for chores that are necessary for the community, and to discuss any difficulties that people are having. Decisions are made by consensus. Morning Circle begins with a short game to awake and energize people, followed by an introductory round where everyone states their name and their country of origin. The list of workshops is announced and facilitators make short descriptions. Then discussion follows, centering on issues arising from the previous day or any difficulties people are experiencing. This inclusive atmosphere created a sense of ownership and involvement in Ecotopia, giving all participants the experience of living in a community with attendant rights and responsibilities, contrary to the greed and individualism of modern Western society.

The days at Ecotopia are filled with activities including many workshops on topics ranging from environmental awareness and alternative medicines, to making your own compost and ecological building. Workshops ranged over a broad spectrum of political, environmental and religious or spiritual issues. Political issues included: cultural diversity, peace activism, conflict resolution, the feminist critique of industrialism, UN peace-keeping activities, the World Summit on Sustainable Development. Environmental topics included seed saving, climate change, ecovillages and green burials. Religious topics explored Celtic spirituality, the Falon Gong movement, the Holy Wells project, and Tibetan religious rites. There were also practical workshops on alternative healing, making tinctures, reflexology, and daily Qi Gong and yoga sessions.

One of my favorites was a smudging ceremony. This American Indian cleansing ritual was taught to an Irish woman when she lived in Canada, protecting their tribal lands from deforestation by logging companies. It was a very special ceremony, where we cleansed ourselves using sage and reciting poetry.

Workshops were held on Ireland's unique legal history, Brehon law, where the history of Brehon law and its principles were explained. Ireland, known as the Land of Saints and Scholars, has a strong history of scholarship in the many monasteries established here. These scholars had access to large libraries of Latin texts and Bibles. From these sources, they fused their teachings into Ireland's unique law, known as the Brehon Laws. For example, in relation to theft, they modified Exodus 22:1-4 to include

economically important animals such as horses and pigs (O'Corráin 1989: 13).

Everyone who attends Ecotopia is asked to travel there by sustainable energy-saving ways. To facilitate this, a bike tour is organized annually. Participants spend four weeks traveling cross-country to arrive at the Ecotopia site. This year's tour began in Dover in the South of England, traveled across Wales and the Irish Sea, and on to Ecotopia. Along the way, the tour group participated in Critical Mass actions, where cyclists block city streets to slow down traffic and highlight the need for sustainable transport methods.

As Ecotopians we hope that by practicing inclusive politics, by learning more about spirituality and our connectedness with the Earth, and by learning how to reduce the impact our lifestyles have on the planet, we will demonstrate a path toward an environmentally sustainable and socially just world.

Eden and other Gardens

Gardens of "Eden" (Hebrew, "delight") have represented the womb of human creation and culture, the expectation of happiness and desire for endless joy on Earth, and nostalgia for a safe harbor, a place of protection against humankind's fear of nature. Across time, earthly gardens of milk and honey have been re-visioned and imagined by prophets, saints, mystics and philosophers, and by painters, from Islamic miniaturists to Europeans like Hieronymous Bosch, Albrecht Durer or Jan Breugel the Elder. Peaceable kingdoms, where all sentient beings lie down together have been repeatedly depicted by artists such as Henri Rousseau or Edward Hicks.

Poets from Hesiod to Edmund Spenser and John Milton have written with yearning of a golden age when the Earth itself was paradise. Explorers, cartographers and conquerors have sought the original biblical garden in the Middle East, as well as utopias and paradises relocated on Pacific isles or in the Americas. Kings, landscapers and dreamers have replicated them in parks and elaborate gardens.

Many ancient cultures placed the first humans in a primordial paradise. After a long epic struggle during

which the roiling cosmos divides and separates to shape Earth, the Sumerian myth of Enkidu (ca. 2000 B.C.E.) rewards its hero with a peaceable kingdom, free of disease and distress. But until Enkidu can obtain water, life in the garden cannot advance. When he finally secures fresh water from the sun god Utu, civilization is allowed to develop. Civilization itself has been considered a paradise, its cities victories over of the anarchic forces of nature.

The Tower of Babylon reached from Earth toward the cosmos to touch the gods. The great Chaladean king Nebuchadnezzar II (ca. 605–562 B.C.E.) built this tall tribute to the divine, based on an earlier ziggurat form, in colorfully glazed brick terraces that coiled toward the heavens. The terraces were fed by the Euphrates and planted with trees and every flower and herb then known to gardeners. Like the spires of a cathedral, the Hanging Gardens resembled an upside-down root, piercing the firmament, or a lightning rod, a medium pulling the divine earthward. At the top stood the shrine of the fertility god in the midst of a cedar grove, personifying all-important vegetal forces.

In 1976, artist Alan Saret created *Ghosthouse*, a ziggurat in Artpark in Lewiston, New York. Like the ancient tower, *Ghosthouse* “was intended,” art critic Lucy Lippard writes in *Overlay: Contemporary Art and the Art of Pre-history* (1983: 205), “as an ethereal emblem of a life ‘where,’ [Saret says] ‘technology bows to the spirit of the natural world from which it derives its materials and inspiration.’ ”

The poet Hesiod (eighth century B.C.E.) and the philosopher Plato (ca. 428–347 B.C.E.), among other ancient Greeks – including Homer (eighth century B.C.E.) and Pindar (518–438 B.C.E.) – envisioned lands where nature’s generosity was unbounded, overflowing with sweet waters and glorious fragrances, where suffering was absent and humankind lived in harmony with other animals. In his didactic poem, *Works and Days*, Hesiod imagines a golden age of “merry feasting beyond the reach of evils.” Human beings “dwelt in ease and peace” on lands rich with flocks “and loved by the blessed gods” (vv. 111–21).

Nevertheless, on Hesiod’s island “untouched by sorrow,” humans are not immortal (vv. 170–5). There is death, but it is soft and soporific, free of pain, merely as if one were overcome by soothing sleep.

Plato, in *The Statesman*, recalls “fruits in plenty from trees and other plants, furnished by the Earth without help from agriculture” (272A). The Roman poet Ovid (ca. 43 B.C.E.–17 C.E.), in *Metamorphoses*, also pictures a primordial history in which “the Earth herself without compulsion, untouched by hoe or plowshare, gave all things needful.” Humans were “content with food that came without seeking” (1.90–112).

Archaic Greeks did not build pleasure gardens as such. They set their temples and theatres in natural landscape,

amid fantastic vistas, surrounded by myrtle, lilies, honeysuckle and ivy. This was Arcadia, the wild playground of gods, where they acted out their dramas with each other and with mortals. Elysium, the Land of the Dead, was situated below the Earth, where shades dwelled in absolute contentment amid luxuriant vegetation.

The unity between humankind and nature in these Elysian Fields, Happy Isles, and diverse golden ages comes of nature controlled, manageable on a human scale. In *Earthly Paradise and the Renaissance Epic*, A.B. Giamatti notes three sorts of earthly paradises: gardens (more or less governable manifestations of nature), pastoral settings (which nourish romantic love), and “wilderness” that fully accommodates human well-being, created for and about humans (1966: 34–48). Regardless of the theme, each vision of paradise offers freedom, bliss, and effortless, constant communication with the divine. Its beauty dominates the rest of the world; there are no storms, and despite a constant flow of water, no rain. Winter is nonexistent, as is overbearing heat in summer, and even the roses have no thorns.

For pre-Christian Celts, “civilized” pleasure gardens belonged to the *sidhe*, or faerie clans, whose homes were elaborate, luxurious affairs complete with jeweled orchards: Tir na n’Og, the lands of Eternal Youth or Ever-Summer; the Fortunate Isles; and later, in Christian Arthurian legend, Avalon and the Blessed Isles. These might be entered by various means, including magical music or the seduction of a mortal by a faerie. They could be encountered by stumbling on a stone or into a cave, bush or well, or they might be reached after death. Ancient Celts embraced both agricultural and nomadic existences, both offering in poetry and song high praise to wild lands. They enthusiastically embraced their animal natures, not necessarily amicably with other creatures rendered toothless and trustworthy, but able themselves to transform into ferocious, untamed beasts.

The 1953 Revised Standard Version of the Bible (Gen. 2:8–15) describes a garden filled with bounty and replete with “every tree that is pleasant to the sight and good for food,” as well as a tree of life and another of knowledge of good and evil. Human dominion over nature is immediately stated (Gen. 1:26), then reiterated when the first man, Adam (Hebrew, “Earth”), is given the task of naming each and every beast and plant (Gen. 2:19, 20). In Eden, there are no “brute beasts.” Elsewhere, in origin myths worldwide, animals are responsible for spiritual awakening and frequently for our creation. They are often siblings to humans. A mark of holiness from ancient Greece to St. Francis of Assisi was the ability to charm the animals. Here again we find the relentless human longing to civilize the wild, a romanticized relationship with animals, whereby they are reduced to pets. However, some theologians consider this charming of beasts a metaphor for taming our own undomesticated natures and feral behavior.

Ironically, it was that injurious behavior toward nature which exacerbated our craving for an earthly paradise.

The biblical Garden of Eden is a place of extreme fertility and perpetual springtime. Four rivers border the garden, for water is the key element to all earthly paradise, as indeed it is to all life. In desert lands, water is a precious commodity and thus the ultimate source of exhilaration. That Adam is placed in the garden “to till it and keep it” (Gen. 2:15) indicates humankind’s obligation to stewardship – a point made by some environmentalists, although others dismiss the notion as patronizing – and also makes agriculture, the cultivation of plants, implicit. Having observed the territorialism and destruction inherent in human survival, not to speak of agriculture, the fifth-century Gaulish poet Claudius Marius Victor posited in *Alethia* that Adam and Eve simply had no need for food, but lived “like angels” on air and ripe fruits that dropped from the trees.

(Others, of course, have looked at Eden as a foraging paradise, and the Fall as the historic point where agriculture begins.)

In Eden, too, there is gold, bdellium and onyx (Gen. 1:12), the first traces that this place of relentless goodness, isolated from the rest of God’s violent creation, carries within it resources precious to human trade and material wealth. Thus, inevitable corruption – with dissension and war – is built into the scene, notwithstanding temptation at the tree of knowledge of good and evil and the Fall.

In a Ngombe origin myth of Africa, human beings are also first situated in a garden, which they must till, having been ejected from the idle realm of the gods for complaining and talking too much. The mortals’ very appearance on Earth introduces or motivates ambivalence and other qualities that come of being human. Unlike the Judeo-Christian Fall, wherein the Earth and human life upon it, having come to know evil, are punished with hardship, toil and toxicity of every kind, the Ngombe tale accepts from the beginning that malevolence in the scramble to survive is simply part of our legacy. The Earth is nevertheless beautiful and fecund, and wild nature innocent of malice.

Eden reappears throughout the Old Testament. In Isaiah (51:3), God will turn Zion’s desert into a garden like that of Eden. Ezekiel’s prophecy recollects the garden, but adds “carnelian, chrysolite, and moonstone, beryl, onyx, and jasper, sapphire, turquoise, and emerald . . .” (Ezek. 28:12–14). The image conjures a stage-setting, glittering gems whose shadow is acquisitiveness, for rocks are attractive and useful to humans only when polished – “civilized” – from their rough state. Here, in Ezekiel’s Eden, revisited with its lawns of jewels, is garden design, whose architectural features are further explored in the New Testament, in a new, cordoned, messianic Jerusalem, a city resembling a garden, shining “like jasper, clear as crystal,” its walls adorned with emeralds, topazes and myriad other precious stones (Rev. 21:11–22).

In nearly every major religious drama, gardens appear to describe abundance, fertility, renewal and rebirth: “Now in the place where he was crucified, there was a garden” (Jn. 19:41).

Although we use the word to illustrate a place of limitless perfection, whether here or in the Otherworld, “paradise” comes from the Persian, *pairidaeza*, meaning simply “park” or an orchard surrounded by a wall. Paradise is the *hortus conclusus*, the enclosed or cloister garden. In Islam’s holy book, the Qur’an, the Fall in the earthly Garden of Eden is covered quickly in a few brief verses (Surahs I, VII, XX); both humans are equally culpable and at each reference they are readily forgiven so long as they follow God’s guidance and do “not go astray/neither shall they be unprosperous” (Surah XX).

The Qur’an makes nine additional mentions of the Garden of Eden (Surahs IX, XIII, XVIII, XIX, XX, XXXV, XXXVIII, LXI, XCVIII), all describing it as the garden in *jannah*, heaven, the reward for a life spent in righteousness, where rivers flow and water is abundant. Pools in ancient Persia and Egypt were oases, earthly equivalents to paradise, and so became the garden’s focal point. Egyptian garden ponds were channels used for irrigation as well as pleasure and refreshment. Rather than house-with-garden, wealthy Egyptians had gardens with houses in them. Kiosks or pavilions were built around the pool, the central feature of Persian gardens, where indoor and outdoor spaces were so artfully merged, that the division between them was nearly invisible. The pool is always the heart of the so-called “Islamic” garden.

In the Qur’an and various *Hadith* traditions (sayings of the Prophet Muhammad), Muslims are enjoined to appreciate without exception all God’s creation and to grow gardens on Earth.

The paradisaical garden is outside time and space. Medieval European monastic gardens were dedicated frequently to the Virgin Mary, planted as her paradise on Earth. Their intention was to direct the soul to God. Renaissance attempts to restore or replicate Eden were meant on the other hand to exalt their owners. These artificial paradises, spanning hundreds of acres, were triumphs of technology over nature, built with grottoes, labyrinths and mazes, filled with statuary and carefully planted “forests.” Some even featured animals, the dangerous ones “peaceably” displayed in cages, while the less threatening, like deer, were free to wander, and be hunted.

In 1533, the first botanical garden was established at Venice, followed throughout the sixteenth century by gardens in Padua, Pisa, Paris and Leipzig, in the hope of recovering or at least mimicking the lost paradise. These places – with artfully placed fountains – became repositories for collections of the rarest plants found in all the “lands of discovery,” imagined to have been in Eden itself. As we have destroyed species, botanic gardens – and

zoos – while no longer serving as manifestations of our melancholy for the garden of delight, have become useful in some kinds of preservation of plants and animals that we have rendered extinct or nearly so.

Around the world there are fabulous “gardens of revelation,” as John Beardsley calls them in his book, *Gardens of Revelation: Environments by Visionary Artists*. From Simon Rodia’s famous Watts Tower in Los Angeles to “Carhenge” in Nebraska to Nek Chand Saini’s rock garden of carved and mosaic Buddhas and Boddhisattvas in Chandigarh, India, to Reverend Howard Finster’s “Paradise Garden” and his “Plant Farm Museum” in Alabama and Georgia to “La Freneuse” created by Robert Tatin in France to extensive “Grottoes of the Holy Book” built by Roman Catholic priest Paul Mathias Dobberstein in Iowa and lay brother Joel Zoetl in Alabama, and many more, these folk-art landscapes are personal investigations of Edenic gardens, devotional and nostalgic acts of art making and construction in tribute to creation, in search of the divine (by the very act of making them).

Numerous contemporary artists, beginning in the 1970s, have created art on and sensitive to a site in nature, which, Lippard writes,

seems to have been a reaction against disengaged art objects that can be moved from place to place, but rarely “belong” to any place . . . much “ecological art” reflects a . . . need to “return.” At the same time, our social restlessness demands a sense of movement. This gives rise to impermanence as a sculptural strategy well-suited to natural environments, allowing many different objects to enjoy a brief but relatively unobtrusive public existence (1983: 197).

“Belonging” seems to be a key to the wistful yearning for earthly paradise. The garden is a sanctuary of nature against nature’s terrifying power. Yet for eons, prophets have withdrawn “to the voice that cries in the wilderness,” as in Isaiah. Among the many wild men, saints, and hermits of Ireland, the twelfth-century recluse Suibne recited, “. . . Though you think sweet / your students’ gentle talk in yonder church / sweeter, I think, the splendid talking of the wolves in Glenn mBolcáin” (in Jackson 1951: 74).

Revelation and revolution begin in the true wilderness: countless heroes of mythology, numberless ascetics wandering homeless, Jesus in the desert, Muhammad in a cave on Mount Hira. The rebel flees into wilderness – into the divine, to god beyond the gods – and returns to civilization to claim righteousness and justice.

SP Eden's Ecology

Images of paradise reveal our muddled feelings about our place in nature: our guilty pride, our snug discomfort. By imagining a time or place of perfect harmony between humans and nature, they indict the discord we feel here and now.

The nineteenth-century American farming village, the medieval city, the desert pueblo, the allegedly woman-centered culture of Neolithic Europe, the hunter-gatherer band, the free-love revels of pygmy chimps – each of these has been seized upon as a lost paradise, as the point after which our lineage took a wrong turn.

Is it possible to get beyond this parlor game of “Pick Your Eden” – to make sense both of the near-universality of the paradise myth and of its maddening tendency to recede into an ever-mistier past? Let us begin by setting the myth of an earthly paradise against the broadest possible backdrop: not just humankind’s history, but that of life on Earth.

We humans tend to think of ourselves, pridefully or guiltily, as unique in our remaking of the globe. But we have not remade it single-handedly: we have had the help

of annual grasses, quadrupeds, perennial grasses (notably grains), and a host of other organisms. What is more, our various alliances are merely the latest of many examples, over the course of Earth's history, of conglomerates of species that conquered the Earth – from the various bacteria that united to form the eukaryotic cell to the axis of fur, feathers, flowers, and probosces that created the Cenozoic. Seen from this point of view, our own victories seem a shade less grand and a few degrees less shameful.

That is not to say they are harmless. For instance, by allying ourselves with annual grasses – which thrive in disturbed soil, and put their energy into seeds rather than roots – we have thrown into reverse a process of soil formation that had been going on, in fits and starts, for nearly half a billion years.

As the edge of a new wave of human-led change moves across the Earth, it first “improves” and then ruins each place it passes through. To make sense of these changes, we make up stories and assign names: Eden, Arcadia, the Golden Age. Though we may not use these names every day, the stories are always buzzing in the idle corners of our minds.

As our subject here is Eden, we must now move from Earth history to a narrower focus: the myths and ecologies of the Ancient Near East. In that time and place, two ways of looking at the world arose that are with us yet. For one, the heart of the world is wilderness. For the other, the world revolves around the city, the work of human hands.

The two great worldviews I am speaking of belonged to two kinds of civilization: those of the hilly uplands and those of the great river valleys. The first kind is best represented by the Canaanites, the second by the Mesopotamians.

The peoples of the hills, narrow valleys, and narrow coastal plains made their living from small-scale mixed husbandry. This was a refined descendent of the earliest farming known, which had developed in those same hills. The peoples of the great river valleys were more ambitious. They practiced large-scale, irrigated agriculture that was not so different, in essence, from what large corporations do throughout the world today.

Tied to these different ways of living on the land were different economies, different social structures, different political forms – and different world-poles.

The world-pole is the axis on which the world turns. It is the heart of the world, the source of all life. Nearly every people has a world-pole, but they do not all agree on its shape. For the Canaanites, the world-pole was the Mountain: the wild place sacred to the gods, the font of life-giving water. For the Mesopotamians, it was the Tower: the ziggurat that rose in the midst of the city.

Both sides were right, of course. Both wilderness and civilization are sources of life, of wealth, of weal. The question is whether one looks to the proximate source or

the ultimate source. Looking to the proximate source is useful in many ways, but in the long run it is dangerous. Convinced that our well-being springs from our own cleverness in reshaping the world around us, we are tempted to reshape more and more of it, extending the reach of the Tower into every corner of the world. And that is biting off more than we can chew. An apposite instance is the irrigation that both nourished successive Mesopotamian civilizations and, through salinization of the soil, contributed to their downfall; but history is studded with hundreds of others.

For the myth of the Mountain is rooted in ecological fact. Manmade landscapes survive only at the sufferance of the wildness around them, or the wildness that remains in them. The flow of energy, water, nutrients, and genetic information; the maintenance of temperature and the mix of atmospheric gases within narrow limits; the fertility of the soil: all these are achieved by wild nature in ways we do not fully understand. As we do not know how the job is done, we cannot do it ourselves. Even if we could, we would end up spending most of our waking hours working for something that we used to get for free.

In other words, humans and their allies are able to conquer the world, but they are not able to run it all by themselves. If the waves of human advance go too far, or too fast, or run too deep, they may finally bring about their own undoing.

Where does the story of Eden fit in this framework?

The more we know about the Israelites, the clearer it is that they were Canaanite hill farmers who practiced a sophisticated and fairly sustainable mixed husbandry of grains, vines, livestock, and trees yielding fruit, nuts, and oil. They were neither desert nomads mistrustful of nature, nor proud hydraulic despots lording it over nature. They were good farmers living frugally on the margins and using the best stewardship they knew. They were not so different, perhaps, from other peasants of the Mediterranean basin, past and present.

Being Canaanites, the children of Israel might be expected to have some notion of a World Mountain. So they did. It took several forms, but foremost among them was Eden.

Although the Bible never specifies Eden's elevation, it does make it the source of four great rivers that flow to the ends of the Earth. Armed with the knowledge that water does not flow uphill, scholars from Philo's time to the present have placed Eden in the mountains of Armenia, or other mountains vaguely north of Mesopotamia.

As the source of water, and therefore life, for the known world, Eden is a classic world-pole. Classically, too, it crowns its Mountain with a Tree of Life – a tree which, according to the Midrash, “spread over all living things. . . . All the primeval waters branched out in streams under it” (*B'reishit Rabbah* 15.6). To walk around its trunk would take a man five hundred years.

Eden is the source of life in another sense: it is the navel of the world, the first home of humans and, arguably, of other creatures as well. It is even a home of sorts for God, who walks in the garden in the cool of the day. But while God and plants and animals get to stay in Eden, humans are ejected.

Modern scholars tend to picture Eden as a formal, irrigated garden in the Mesopotamian style. But while some of the sources of the Eden story may have had that shape, others were a good deal wilder and woollier. In the Mountain of God, we have a vision of paradise as a forested peak – the summa and last resort of wildness in a region chock-a-block with cities, fields, canals, herds, and armies. While the Hebrew word *gan* usually means an enclosed vegetable garden or fruit orchard, the phrase *gan Elohim*, “garden of God,” seems to be meant as a kind of analogy: just as we might call the prairie “God’s lawn.”

In passages from Ezekiel (28:12–16; 31:1–18) and Isaiah (14:9–15) – in some of which Eden is explicitly called “the mountain of God” – scholars have glimpsed the glittering shreds of a lost Hebrew epic of Eden, having to do with an angel or god who rebelled against YHWH and was cast down to Earth or into the pit. If even gods and angels were cast out of Eden, what chance did humans have of lasting out their term?

Such wild places were not paradises for humans, but for gods. They were not meant for humans at all.

The cosmic center is not always thought of as a nice place for humans to live in or even to visit. Yet it is the source of life. “All the world is watered with the dregs of Eden,” the Talmud says (*Ta’anit* 10a); and the dregs are as much as it can take. We cannot see God’s face and live.

As soon as we become fully human, we begin to “fill the Earth and subdue it.” We begin to destroy Eden, and thereby expel ourselves. Only by keeping our distance from some of the wilderness that remains can we keep from fouling the wellspring of our own life. The fiery sword (whatever it is: our awe of wilderness, our fear of its dangers, our dismay in the face of its grueling beauty) is the best friend we have.

The myth of the Fall, like that of the World Mountain, is based on ecological fact. We began to change our surroundings in a drastic way as soon as we mastered fire, but it was the second wave – the alliance with annual grasses – that sealed our self-expulsion. We stripped forests, troubled the soil, uprooted whole ecosystems. “Cursed is the ground for thy sake . . . In the sweat of thy brow shalt thou eat bread . . .” (Gen. 3:17–19). Indeed, the culture of barley and wheat – first for beer and toasted seedheads, then for bread – did apparently begin in the uplands of the Near East, some ten thousand years ago.

What was the forbidden fruit? In the Midrash (*Beresheet Rabbah* 15:7), a rabbi of the second century gives a remarkable answer: “Rabbi Meir said: It was wheat, for

when a person lacks knowledge people say, ‘That man has never eaten bread of wheat.’”

The Hebrew phrase usually translated, “Cursed is the ground for thy sake” can, with a bit of license, be read to mean, “Cursed is the ground by thy passing over.” As the waves of human expansion move across the Earth, Eden is trampled underfoot.

Adam was put in the garden “to work it and protect it” (Gen. 2:15). The two jobs are complementary, but they are also contradictory. From what are we to protect Eden, if not from our own work? The more we work the Earth – by which I mean not only tilling but the whole spectrum of human meddling, from setting grass fires to splitting the atom – the more we are obliged to protect it. If we fail to do either, we fail to be fully human.

What light might such an understanding of Eden shed on the present environmental debate?

Two schools of thought dominate now that debate: I call them the Planet Fetishers and the Planet Managers. The Fetishers (including many deep ecologists and other radicals, as well as some old-fashioned romantics) dream of returning to Eden, restoring a state of harmony in which wilderness reclaims the planet and man is lost in the foliage, a smart but self-effacing ape. The Managers dream of a manmade paradise, an Earth managed by wise humans in its own best interest and, by happy chance, humankind’s as well. The Fetishers want to get past the fiery sword that guards Eden by crawling humbly under; the Managers, by vaulting over. Neither has learned the lesson of the Mountain.

At present, wilderness is so worn down and battered that there is no escaping the need to manage it. The best we can do is to follow this rule: so manage nature as to minimize the need to manage nature. To begin with, that means stepping back and giving wilderness a chance to breathe, to dust itself off, to get back on its feet.

If the first lesson of Genesis is that we cannot live in Eden, there may be some comfort in the second lesson: we can yet enjoy Eden’s blessings, if only we let them flow. That is a big if, however. The four rivers of Eden are symbols of the flow of wildness. Dam that flow, and the man-made world must dry up and blow away; and so, at last, must wilderness itself. Even the biggest wilderness preserves are not big enough if migration, gene flow, and the circulation of energy and nutrients are blocked beyond their borders by highways, dams, development, ranchers’ fences, the dredging of wetlands, and the poisoning of waterways. (I do not mean to ignore the problem of biological invasion. At present we are blocking flow locally and encouraging it globally, which is exactly wrong.) Wilderness is the heart of the world, but a heart is not much good without arteries and capillaries that touch every cell of civilization with wildness.

This touching is more than mere contiguity. It involves learning from Eden – an activity that goes by such non-

mythic names as agroecology, biomimesis, and industrial ecology.

Thus the dream of Eden remains alive, and instructive. The dream of living “in harmony” with nature, as animals do, is dangerous only if we forget that it is a dream. It is dangerous if we pretend that we are just animals; or that animals live in anything that one can seriously call harmony with other animals, or with plants, fungi, or microbes. But if we strive to decipher what this thing we want to call harmony really is, we can try to reproduce it – as far as humanly possible – in the humanized landscape.

Egypt – Ancient

The civilization of ancient Egypt provides a salient example of the ways in which attitudes to nature became embodied in religion, and of the effects of religion on treatment of the natural environment. Egypt’s environment is dominated by the Sahara and the grand Nile River more than by the Mediterranean Sea that abuts its northern coast. The fertility of the land and the growth of crops depended on the Nile’s annual flood, since rain was rare. The gods and goddesses of Egypt in large measure represented this overriding environmental concern. With unclouded sky as the rule, the orderly movements of the heavens were evident. Re, the Sun God, ascended each morning and sailed across the sky to his western harbor, the movement of his path to north and south showing the year’s passage. Stars marked hours and seasons; when Sothis (Venus), star of the goddess Isis, rose just before the sun, it announced that flood time was at hand. The sky goddess Nut arched her body above her fertile consort, the male Earth god Geb, in perfect balance. When the stars, the children of Nut, showed the proper season, then Geb’s children, the plants, bore fruit. This is a reversal of the identifications common in other societies, where Earth is feminine and Sky masculine. But the principle in Egyptian myth was a balance of sexual roles, not the dominance of either. Deities often occurred as pairs of male and female, like Geb and Nut. Sometimes pairs showed contrasting sides of the feminine, such as kind Hathor (nurturing warmth) and angry Sekhmet (withering heat), or aspects of the masculine, as, for example, Horus, hero-god of the black crop land, and his counterpart, the red desert-god Set, enemies whose battles ended, giving way to peaceful co-rule.

The land and its aspects were sacred, and therefore gods. Osiris, a preeminent god, embodied among other things vegetation and agriculture. Every stage of the agricultural year repeated an event in the life of Osiris, whose birth, growth, death, dismemberment, burial, and resurrection became planting, harvest, fallow, and new

growth. Hapi was the god of the life-giving Nile. Though male, he was portrayed with breasts to show his power to nurture. He was called “father of the gods” because they depended on the Nile for offerings from humans, or for their very existence. He suckled Osiris and helped to resurrect him, a myth representing the reliance of vegetation on the Nile flood. When the flood came at an appropriate level, people rejoiced at the advent of Hapi.

The round of the agricultural year was marked by festivals honoring the recurrence of natural events. Originated by villagers in Neolithic times, these celebrations were formalized in the historical period. Farmers cared for the Earth and carried on a long-established tradition. At the harvest festival of Min-Amun in Thebes, Pharaoh cut the first sheaf of wheat and a bull was led in procession. So the actions of the Egyptians in agricultural ritual reflected their sacred vision of the Earth.

Many aspects of the landscape, along with the river, were considered sacred. People planted trees around or adjacent to a pool, making sacred groves that were early places of worship. Even small villages possessed such locales where they observed religious occasions. Priests and their servants planted trees such as *ished* and palm in temple gardens beside sacred lakes. Ramses III (ca. 1184–1153 B.C.E.) gave 514 gardens to various temples, which would have been considered incomplete without them. Trees were worshipped, and deities were shown in tree form. Isis, for example, was symbolized by a tree with breasts from which Pharaoh received milk. Mortuary paintings depicted the tree of life, with the deceased bowing low before it or drinking from a spring of water at its base. Planting a tree was considered to be a good work, aiding the soul on its progress toward life in the next world. Care was taken to plant and water trees near tombs and mortuary temples like the terraced monument of Hatshepsut at Deir el-Bahri.

Many animals were sacred to the Egyptians. Certain species were regarded as visible manifestations of deity: the jackal of Anubis, the ibis or baboon of Thoth, the hawk of Horus, the lioness of Sekhmet, the crocodile of Sobek, and others too numerous to mention. Groups of animals were often kept in temple precincts, and when they died were mummified and accorded an honorable burial. Tens of thousands of these mummies containing Horus hawks, Thoth ibises, and Bastet cats have been found in underground vaults. Worship accorded to animals did not, however, prevent wild animals from being hunted. Amenhotep III boasted that he had killed more than a hundred lions with his own hands, and still less did it save them from the effects of habitat destruction.

The numbers of birds, particularly waterfowl, were astonishing in Egypt, but as centuries passed their abundance was reduced. Nobles enjoyed bird hunting in marshes, but there were fewer marshes as drainage proceeded. Canals were dredged to draw off water and open

land to cultivation, leaving fewer wetlands that birds could use for nesting and feeding. Ramses III gave 426,395 waterfowl to temples, including a bequest of 9350 per year to the Temple of Amun at Thebes. Some of these became part of temple flocks, while others were prepared as offerings. Thus bird life was diminished by the Egyptians. A similar fate afflicted the fish of the river, although some were protected; even Pharaoh was forbidden to fish in sacred temple lakes.

The sciences of sacred geometry, sacred astronomy, and sacred records (hieroglyphics) were marshaled to assure the dependability of relationship to the environment. Geometry, which was necessary to reestablish inviolable boundaries between fields when markers had been swept away in the flood, was not a mundane skill developed through trial and error, but a hallowed occupation that descended from gods such as Thoth and was entrusted to trained scribes. Although all Earth was holy, certain places had a more sacred character, and they and their produce were often holdings of temples, which were located according to geomancy and oriented to important points in the revolutions of the sun and stars.

Irrigation was a form of sacred technology shown by art to be an activity of the Pharaoh and the gods themselves. Indeed, canal building was believed to be a major occupation of those in the blessed world beyond death. Laborers dredged channels, built earthen dams, constructed dikes and basins, and used buckets to raise water. These activities were considered to be parts of a holy occupation.

As centuries passed, technological inventions were made and incorporated into the sacred system of environmental regulation. Nilometers (instruments used to measure the height of the Nile river) inscribed with religious symbols and attended by special priest-scribes were installed near the First Cataract and elsewhere to help predict the extent of the annual flood.

The Egyptians’ joy in their environment can be sensed in pictures of human activities such as plowing, hunting, and building. Active as these portrayals are, they show little realization that nature was being altered in the process. Egyptian art has little feeling of human progress or decay, nor of the conquest or destruction of nature. For them, the Earth was unchanging. Time ran in cycles, not along an inexorable straight line. But changes, some of them destructive, were nonetheless occurring. Dangers to sustainability included practices that produced salinization, deforestation, overdevelopment, and habitat destruction.

Environmentally, Egypt at the end of the ancient period was much changed, but still productive and full of life. The Nile still brought its annual floods, with sufficient water and sediment in most years to guarantee good crops. Grain, other foodstuffs, and crops such as flax for linen and papyrus for paper, were abundant enough to meet

Egypt's needs and to be exported as well. This is at least in part due to the attitude of reverence for the land and its denizens that was part of the Egyptian religious view. The principles of sacred space guided the division of land and the regulation of irrigation. Egypt was not lacking in environmental problems such as gradual loss of natural vegetation and wildlife, but in every case where the influence of the realization of the sacredness of the Earth and living creatures was felt, that influence helped to mitigate damage and to preserve life and the natural environment itself.

Egypt was in most respects self-sufficient, so that the Egyptians were content with their land. Some modern writers have interpreted this contentment as an attitude that was limited and complacent. That this was not the case is clear from the vigorous way in which Egyptians pursued the timber trade abroad in order to obtain a necessary resource in which they were not well supplied at home. Cedar wood from Mount Lebanon was called "a wood which [the God] (Amun-Re) loves" (Wilson 1956: 183), so that journeys undertaken to secure it were believed to please the god. At home as well, they understood their relationships to the land to be governed by the gods and sacred principles that were derived from them and from Ma'at, the universal order that controlled the Pharaoh and the gods themselves.

Egypt – Pre-Islamic

There is a clear correlation between landscape, nature and religion in pre-Islamic Egypt. Natural landmarks (hills, lakes, marshes, the Nile itself) could become objects of veneration, and such idealized but recognizable landscapes were portrayed as elements of the afterlife. Throughout the pharaonic phase of society in the Nile Valley (3000–330 B.C.E., excluding the Hellenistic and Roman periods), there was a clear and close association between the natural environment and the Egyptians' response to it. In its iconography, language, and use of social space, ancient Egyptian society acknowledged and venerated its landscape and even its towns as divine or semi-divine beings. Religious buildings were not only prominent architectural features in their own right, but were purposely situated across the landscape in such a way as to manage and exploit intervisibilities and to present themselves as closed or open (the most conspicuous example being the pyramids, not only as solar embodiments but also as man-made mountains, located within sight of Heliopolis, the centre of the sun cult). Similarly, the vegetal and animal worlds were evidently observed and explained in religious terms, though why certain regions emerged as being particularly associated with certain totemic objects and animalistic icons remains unclear.

Overfamiliarity with the map of Egypt has perhaps dulled our perception of just how strange a social context it provides: by 3000 B.C.E., when Egypt had developed politically into the world's first territorial state, it was essentially a hyper-arid desert with a river flowing through it, and the Nile Valley allowed only a ribbon-like pattern of settlement in a floodplain that is rarely more than 25 km across. Significantly, the Nile Delta, which differed from the Valley in several important respects, with its fan of distributary branches spreading to a breadth of 200 km along the Mediterranean, its relatively high coastal rainfall, and its land routes to North Africa and the Levant, was probably always a more ethnically mixed region; however, the relative lack of archeological investigation in the Delta, combined with the normative effects of a powerful state religious apparatus, combine to give the general impression that inhabitants of the Delta shared a single belief system.

The personification and deification of the elements and of the climate itself reflects some of the oddness of the Egyptian situation: while there were certainly sun, storm and wind deities, in contrast to the usual belief pattern around the eastern Mediterranean rim, the sky (Nut) is female and the Earth (Geb) male. Their relationship is conventionally shown as a post-coital separation in which Geb collapses exhausted beneath Nut, who arches over him with arms and legs outstretched, representing the four supports of heaven. There is thus a strongly architectural quality to this formal conception of the structure of the

universe: it has a roof, supports, and floor, and is “filled” by air (Shu). Celestial bodies (sun, moon, stars and constellations) were also personalized and incorporated in the regional cosmogonies.

The most important climatic event of the agricultural year in this overwhelmingly agricultural society – the annual flood, fed during late summer by monsoonal rains over the Ethiopian highlands and the swelling of the Blue Nile – was deified as Hapi, in distinction from the “normal” river (iteru). Within the state ideological system, the country’s economic vulnerability is reflected by the fact that an ideal flood event and a successful harvest were notionally the responsibility of the king, although many major and minor deities (Osiris; Ernutet the snake goddess; a cohort of androgynous “fecundity figures”) were also associated with the harvest at the state and household levels. Several major towns along the banks of the Nile competed or cooperated as theoretical “sources” of the river: Aswan, as the first (i.e., most southerly) town of Egypt proper; Memphis, as the notional source of the delta; and, oddly, Thebes, where the claim seems to rest on the town’s importance as the dynastic center in the New Kingdom. It is inescapable that the environmental conditions of the Nile inundation also directly fed the development of a creation mythology in which order and society in the form of dry land emerges from the waters of chaos, with a complex set of cultic references that dictated the architectural schemes of Egyptian temples throughout the pharaonic and even into the Ptolemaic and Roman periods, with the main ecological zones of the Nile floodplain being represented by the pylons, courtyards and columned halls, and even the white enclosure walls as simulacra of the desert cliffs defining the valley itself.

The sharp and constant division between the cultivated/populated/valley and the barren/depouled/desert zones was recognized in ancient Egyptian terminology: “Black land” (Kemet) and “Red land” (Desheret) respectively, each of which was accorded its own assemblage of cult figures and its own exclusive topography, flora and fauna. Interestingly, the conservative nature of Egyptian iconography meant that images of landscapes were probably still being produced long after the environmental conditions for them had disappeared. The black topsoil of the Nile Valley was not surprisingly associated with fertility, birth and regeneration (and later on with magical, spontaneous generation): “Osiris beds” were mummiform miniature fields or gardens in which “crops” were planted in soil; “birth bricks” of Nile clay were a common adjunct to childbirth rituals, and it has been suggested that mud-brick remained a preferred building material for tombs, long after the introduction of stone, for this reason as well. By contrast the vast expanse of the Sahara desert on both sides of the river valley (except for the Red Sea coast and occasional pockets of settlement in the western Oases) was

shunned and feared as a hostile acultural environment, into which the Egyptians only ventured at need and even then delegated the organization of travel to nomadic-pastoralist groups with local knowledge. Significantly, the cult of Amun, the dominant state cult during the New Kingdom, became established almost by default in some of the outposts of Egyptian political control such as Nubia and the eastern and western deserts.

The geography of the Nile Valley dictates however that south of Cairo the desert escarpments are always visible (or were, before modern high-rise vegetation and building and air pollution). Within this essentially linear framework, desert-edge features as viewed from the valley floor assumed a particular importance, and it is clear that at intervals certain conspicuous localities became singularities associated with particular cults. A striking example of this is the Theban mountain – an impressive sheer cliff facing the main east-bank town – which had its own deity, the “Mistress of the Mountain” and was deliberately selected, perhaps because of the resemblance to an animal of the natural rock form, as the backdrop for some of the elite and royal mortuary temples of the eleventh and eighteenth dynasties; the nearby Qurn (peak) with its distinctive pyramidal shape formed a similarly evocative reference for others. Local prominent landscapes could often transcend the conventional need for cemeteries to be on the west side of the valley, as at the sites of Amarna, Bersha and Beni Hassan, where the imposing escarpments containing most of the elite burials are on the east. At Memphis, too, the most numerous (though not necessarily the most prestigious) burials are on the east bank until the Third Dynasty, with its establishment and promotion of the solar religion and the building of the first pyramids.

Other sites, notably Amarna, Abydos, and Memphis, show that equal attention was paid to local natural horizons. At Amarna, the only example available of a major archeologically recovered Egyptian town, the street plan and the distribution of social and sacred space have two main determinants: the river and the bankside road running parallel to it, and the eastern horizon containing the elite and royal tombs. In this instance the horizontal view is especially important because of the association of the king’s burial, located beneath the sunrise, with the new, royally sponsored solar religion of the Aten. At the pre- and proto-dynastic royal cemetery of Abydos, the arrangement of elite and royal tombs and funerary enclosures, and even the internal provisions of the tombs themselves, depend on the processional routes taken and the lines of visibility between the valley and the major wadi (desert valley) system behind the necropolis. At Memphis the western horizon was characterized as *tehen* (the peak) and was particularly associated with the city’s mortuary cults. The Memphite region is also singled out by the pyramid fields of the Old and Middle Kingdoms in

which the western horizon, noticeably lower in elevation than the eastern, is redeemed by the construction of these artificial mountains (although the high-quality facing stone for them still came from the eastern hills).

At the other end of the country, the towns of Aswan at the first cataract and Semna at the second not only had distinctive landscapes but at different times were regarded as national frontiers. Local manifestations of deities might also be marked out by the produce or natural resources for which the region was known, as for example Hathor “Lady of Turquoise” in the Sinai Peninsula. Animal cults were often geographically specific: crocodiles for example, identified with the deity Sobk, held an almost canonical significance for the Fayyum region (hydrologically an overflow basin with its own residual lake, to the west of the Nile Valley just above Memphis-Cairo) from at least the third millennium B.C.E. to Roman times. Like the crocodile, some other animals became unique identifiers for the nomes or political units, such as the mormyrus fish at Oxyrhynchus in the nineteenth Upper Egyptian nome or the oryx of the sixteenth. On the national scale, the falcon, originally an emblem of the predynastic power centre of Hierakonpolis in southern Egypt, and the vulture, which symbolized the town of Buto in the western Delta, became icons of unitary rule over the two regions during the dynastic period, and an essential item in the royal regalia and official titulary.

Other animal deities became universal through their protective function in critically dangerous and potentially fatal stages in the life cycle. Apotropaic wands or clappers, probably used in childbirth, are engraved with a selection of hostile creatures and confabulations which were ritually destroyed by breaking the objects. One of those deities closely associated with birthing rites and appearing regularly on these wands was the figure of Taweret, combining features of both crocodile and hippopotamus, and typically shown standing, with distended abdomen and a fixed facial grimace, its weight carried by downstretched arms and hands gripping the protective *sa* (knot) talisman. In terms of regeneration on a national scale, the falcon god Horus and the desert deity Sutekh (Seth) in the form of a composite animal fight for the body parts of Osiris to ensure that natural order is restored and the harvest is successful.

Mortuary landscapes, or the natural scenery favored in the repertory of tomb scenes and models and in the Books of the Dead (magical funerary inscriptions on papyrus) from the Old Kingdom onwards, show a particular range of environments from the “tame” such as the Fields of Yaru and of Hetep – essentially a vista of agricultural activity amid horticultural land plots and canals – to the “wild” such as desert-edge hunting, trapping and fishing activities. An interesting example of different types of natural phenomena shown in juxtaposition is the tomb of Khnumhotep at Beni Hassan in Middle Egypt, in which

upper registers of desert scenery and fauna contrast with scenes of farm produce being brought by the tomb-owner’s retinue of estate workers. In the middle, occupying a liminal position between the wild and the domesticated, is shown a group of humans, though in this case not indigenous but foreign interlopers (immigrants?) from western Asia, who carry their equipment and means of subsistence with them in nomadic style. On the one hand they are led in and presented by Egyptians as an exotic entity, but on the other, they themselves also lead in and present as their own contribution two gazelles, perhaps caught by and advertising their own specialist group skills as trappers. A common element in the repertoire of elite tomb scenes from the Old Kingdom (third millennium B.C.E.) onwards is the range of hunting, trapping and fishing scenes, emphasizing the vigor, ability and active life of the deceased; these take place in the extensive marshes that were a regular feature of the valley margins at that time.

Plants as well as the animal kingdom played a key role in the religious vocabulary of Egyptian society. Some were associated with particular forms of deities such as Hathor “Lady of the Sycomore”; and there is the curious image of the tree suckling the dead king in funerary contexts. Like the falcon and vulture, emblematic plants and animals also stand for Upper Egypt (the Valley) and Lower Egypt (the Delta) in the royal titulary. Monumental architecture in stone was undoubtedly derived from vegetal forms, and two plants in particular, the lotus and the papyrus, feature as the prototypes for engaged and freestanding columns in temple and tomb construction. The lotus in particular held a special place in religious iconography, being routinely carried by officiants in tomb scenes and shown supporting the god Horus in his form as the infant Harpocrates.

Ehrenfeld, David (1938–)

David Ehrenfeld is a biologist and philosopher of science best known for his critique of hubris in *The Arrogance of Humanism*. Humanism, Ehrenfeld has argued, has rationalized enormous destructiveness because it rejects all external limitations on human behavior. No God, gods, or nature can lay claim to human fealty – humanity is its own measure. It is freedom without responsibility to or for the world. Humanism, in Ehrenfeld's assessment, places humanity – though in practice only some of us – at the pinnacle of the universe. It holds that we are the only beings with intrinsic value and all else is reduced to the utilitarian, existing for our purposes. As such, all else may be used, altered, even destroyed, to suit our designs.

Humanism's sway, Ehrenfeld believes, is not just a coincidence of belief and interest, though, is a rationale for human hegemony. For Ehrenfeld, Humanism is more than ideology – it is *like* a religion and has the same power to shape and constrain vision and behavior. It is not a religion, he says, in the sense of belief in the divine or supernatural. But it is like a religion in that its major tenets are taken on faith, not questioned or critically reflected upon, and seen as timeless (i.e., sacred).

The religious attributes of Humanism, Ehrenfeld believes, are partly a result of its continuity with Christianity's similar faith in progress and the centrality of humans in the universe. All one need do, he notes, is substitute "reason" for "soul" to see these striking similarities: humans are special because we have reason; we are different from all other species because we have reason; we *are* our reason; "I think, therefore I am"; those without similar capabilities are without intrinsic value. This continuity is masked by the modern tension between Christianity and Humanism, but originally there was little or no tension between Christianity and those in the forefront of the drive to control nature.

For Ehrenfeld, faith in reason is Humanism's holy of holies. Such reductionistic faith is dangerous because it denies all that binds us to ourselves and to the natural world that sustains all life. Our emotions, not reason, Ehrenfeld argues, has been tested by millions of years of selection, teaching us right and wrong, good and bad. He says that to deny our experience apart from reason is to deny our bodies and the bulk of our lives. Humanism ends up, he believes, denying not only nature out there, but our own nature, our humanity.

Faith in reason gives rise to the illusion that through reason humans can understand and control nature. In *The*

Arrogance of Humanism Ehrenfeld examined a constellation of beliefs resulting from this faith in Man, the eternal conqueror: we can always solve the problems that confront us; we can usually do so with technology; sometimes we need to alter our social organization to overcome problems; we can rearrange the Earth to suit ourselves without consequences that are beyond our ability to address; material growth and progress are endless – we will never run out of resources or the ability to fashion substitutes; and when push comes to shove, we will hunker down and do what needs to be done to ensure civilization survives.

In Humanism's Enlightenment infancy these beliefs were not testable, but now nature is unmistakably talking, though the faithful do not hear. What nature is "saying" Ehrenfeld argues, is that every solution creates more problems, and these problems are more complicated and difficult to solve. The Earth is finite and material growth has limits. When we seek to rearrange the Earth to maximize what we value most, the consequences usually cannot be managed. Nature invariably is degraded and civilizations do collapse.

Ehrenfeld's critics have attacked particulars. Left Humanists, like Murray Bookchin (1988), took exception to Ehrenfeld's notions that humans are just another species, and that if a species exists it has value. The Humanist Steven D. Schafersman and ethicist Peter Singer (1979) argued that the problem is anthropocentrism not Humanism and reason. Some who share Ehrenfeld's views about the pitfalls of excessive abstraction and reductionism rejoined, pointing to positive changes in science and the creation of new disciplines like conservation biology, which Ehrenfeld himself helped to found.

The critics Ehrenfeld has responded to are those who say he offers little guidance on the way out of the current predicament. In *Beginning Again*, Ehrenfeld stated that a positive change in societal "heading" would recognize that rights always entail obligations; we would choose carefully where we place our loyalty; those with expert knowledge would step down from their pedestals, admit the limits of their knowledge, and engage the larger society over values and purpose. Feeding billions will continue to require agriculture, but it must be an agriculture that imitates nature and abandons the industrial model. Society itself must change – and drastically, he argued. In our daily lives we must seek to "creatively imitate" nature, abandoning fantasies of control and limitless wealth for values of resilience, beauty, right scale, honesty. These were Ehrenfeld's prescriptions, not his predictions; he remained skeptical of human's ability to learn short of catastrophe.

Ehrenfeld has contributed much to the development of the discipline of conservation biology by his many years as the first editor of the influential journal by that name,

through a major text, *Orion* columns and a series of edited volumes. But it is his *The Arrogance of Humanism* that has earned him a much broader reputation and major influence. Along with Paul Shepard, Ehrenfeld's critique of hubris has been cited by many conservationists as a major influence on their thinking.

Ehrlich, Gretel (1946–)

Gretel Ehrlich is a contemporary U.S. writer whose life and work were shaped by the California landscape of her childhood, as well as by the stories and Buddhist religion of the Japanese Americans who were part of the human landscape. References to her later studies of Zen Buddhism and her Tibetan practice, as well as to indigenous religious traditions, appear throughout her works. Ehrlich is best known for her prose reflections on her experiences within the natural world, especially *The Solace of Open Spaces*, which is set in the Wyoming landscape, where her writing first flourished. She has also written poetry and short stories that use Wyoming as indispensable context, as well as a novel, *Heart Mountain*, which brings together her childhood acquaintance with a Japanese community in California with a World War II internment camp in Wyoming. More recent work has grown from her travels in the Arctic, Asia, and Greenland, as well as returning to her native California. In all her work landscape is central and this is particularly true of her nonfiction works, which center on her spiritual journey in nature.

Unlike some nature writers who use nature as a catalyst to move to transcendent concerns, the natural world is never left behind in Ehrlich. It is the source of understanding the human and spiritual – which are fully embodied. Her art, too, is not apart from nature. "The truest art I would strive for . . . would be to give the page the same qualities as Earth: weather would land on it harshly; light would elucidate the most difficult truths;

wind would sweep away obtuse padding" (1985: x). This is not an idealized Earth – suffering and death are very much a part of her landscape. She sees in nature the randomness of things, which threatens human meaning; the painfulness of life, which includes death. She knows the devastation of drought to the land and loneliness to the human heart. She has lost her partner to cancer and almost dies herself when she is struck by lightning – and has to live the anguished life of a survivor.

Yet her healing also comes from the natural world when she is able to give herself to the place, and to find her connectedness to a web of people, animals, and elements through the daily rituals of life – feeding animals, irrigating fields, working with neighbors. "Ritual," she says, "goes in the direction of life" (1985: 103) and the sacred is found in the ordinary. As human ritual joins with the rituals of nature, she feels the assurance that all things are joined at their roots and this brings solace. But the healing is never complete. Even the phoenix after rising, she muses in *A Match to the Heart* two years after being struck by lightning when chest pains continue to recur, no doubt had to face new trials (1994: 197). But she is able to say, in spite of the darkness, "Yet in all this indeterminacy, life keeps opting for life . . . How fragile death is, how easily it opens back into life" (1991: 82, 85). And in *Solace*, "The lessons of impermanence taught me this: loss constitutes an odd kind of fullness; despair empties out into an unquenchable appetite for life" (1985: x).

Ehrlich's work affirms a sacramental landscape that interweaves Buddhist notions of impermanence and change, the giving over of herself to place (renunciation), and the nondualistic connectedness of all things with indigenous awareness of the embeddedness of human life – including ordinary work and mystical visions – in the natural world.

Einstein, Albert (1879–1955)

Albert Einstein is the pioneer of twentieth-century physics. In 1905 he published his Special Theory of Relativity, which was followed by the General Theory of Relativity in 1916. In short, this theory states that time, mass and length all change according to velocity. Space and time are a unified continuum, which curves in the presence of mass. Einstein also was involved in the elaboration of quantum mechanics and had lively discussions with his colleagues, Heisenberg, Bohr, and Pauli, regarding its implications. Contrasting Niels Bohr and (even more) Wolfgang Pauli, Einstein insisted on what he once called “the grandeur of reason incarnate” (i.e., his conviction that there is no room for chance or irrational elements in the universe). Whereas this is exactly what quantum mechanics seems to imply, Einstein held that “God does not play dice.” Instead of accepting non-determinacy and a-causal relations in physics, he was sure that at one time there will be found a comprehensive and unified theory that will reveal the seemingly irrational to be part of a higher order.

Despite his attachment to rationalism it is important to note that throughout his life Einstein regarded himself as a “religious” scientist. While he rejected the idea of a personal god who might interfere with human affairs or with nature – this would have been a severe inconsistency with the notion of causality and lack of freedom – he definitely had a kind of pantheistic religious attitude. In a telegram of 1929, he expressed belief in “Spinoza’s God who reveals himself in the orderly harmony of what exists” (Einstein in Jastrow 1978: 28). And in his confessional *The World As I See It* (1934), Einstein dwelled on the idea of pantheism, talking about the mystery of the eternity of life, the inkling of the marvelous structure of reality, and his endeavor “to comprehend a portion, be it ever so tiny, of the reason that manifests itself in nature” (Einstein 1999: 5). In an almost mystical fashion he described his belief in a superior intelligence or transcendent spirit that reveals itself to every scientist who experiences a “rapturous amazement” at the harmony of natural law.

The “mystical” dimensions of physics and its pantheistic connotations have been an issue that Einstein discussed with major proponents of quantum mechanics. With regard to the more esoteric or “New Age” discourse, it is worth mentioning that Einstein debated the topic with David Bohm in the early 1950s. Later, Ken Wilber drew on his theories and pointed out that most of the quantum physicists came to embrace mysticism although simultaneously they rejected any parallelism between physics and mysticism. This is true for Einstein in particular, who remained a classical realist, finding something religious not in nature itself but in the *laws* of nature.

Eiseley, Loren (1907–1977)

Loren Corey Eiseley was born in Anoka, Nebraska, on 3 September 1907, the son of Clyde and Daisy Corey Eiseley. In his early years he sought refuge from the loneliness of a turbulent home life by living among the books of the Lincoln City Library and observing the wonders of his native landscape. At the age of 14 he wrote an essay entitled “Nature Writing” in which he made the rather remarkable assertion that “Killing for the excitement of killing is murder.” He became interested in geology and paleontology, and was drawn by imagination and personality into creative writing. However, because of the poverty of his childhood he understood the need for practical employment and decided to become a scientist. He graduated from the University of Nebraska in 1933 with a major in anthropology.

After a period of drifting, Loren went east for graduate studies at the University of Pennsylvania, finishing his doctorate in 1937. In 1944 he became Professor of Anthropology and head of the Department of Sociology and Anthropology at Oberlin College, having served his scholarly apprenticeship at the University of Kansas. He spent three years at Oberlin before returning to Philadelphia to become chair of the department from which he had received his doctorate. Eiseley died on 9 July 1977 of pancreatic cancer.

For Loren Eiseley “nature” was not some exosomatic machine that awaited the tactical dexterity of the trained technician. The person who intends to learn what the surrounding world has to teach her must adopt the contemplative comportment of the poets, those “word-flight specialists” who are wary of self-evidence in thought and activity. “They probe into life as far as, if not farther than, the molecular biologist does, because they touch life itself and not its particulate structure” (Eiseley 1970: 125). The poets think across the ages, backward and forward, even sideways, according to Eiseley. They perceive more than the bumps of a recent scientific discovery – “this

venerable, word-loving trait . . . is what enables [us] to transmit [our] eternal hunger – [our] yearning for the country of the unchanging autumn light” (Eiseley 1970: 125).

Eiseley’s thought is unique, but very difficult to accompany in “an age which advances progressively backwards” (Eliot 1952: 108), its eyes fixed upon the endless cycle of invention. Eiseley’s is no “nature religion,” if by that we mean the self-sufficient marvel at beautiful sunsets, awesome canyons, or the fascination with our latest attempt to escape what Eiseley calls “the cosmic prison.” The only escape is by the poet’s perception, which is somehow an awareness that what we perceive, what we know, is more than our perception, our knowledge. It is here that Eiseley’s thought gives way to revelation. “The fate of man,” he writes,

is to be the ever recurrent, reproachful Eye floating upon night and solitude. The world cannot be said to exist save by the interposition of that inward eye – *an eye various and not under the restraints to be apprehended from what is vulgarly called the natural* (Eiseley 1969: 88 [italics mine]).

Eiseley’s is a “nature religiousness” that makes every measurement and calculation of the surrounding world a transparent observation – perhaps akin to Eastern Orthodox use of the icon.

With Thoreau, Eiseley “dwelt along the edge of that visible nature of which Darwin assumed the practical mastery. Like the owls Thoreau described in *Walden*, he himself represented the stark twilight of a nature ‘behind the ordinary,’ which has passed unrecognized” (Eiseley 1969: 122). Loren Eiseley does not propose or espouse a religion in the sense of adherence to a carefully articulated, defined, and preserved tradition. That is what he meant when he stated in his autobiography *All the Strange Hours*: “Ironically, I who profess no religion find the whole of my life a religious pilgrimage” (Eiseley 1975: 141). His was a religious pilgrimage, first, because he stood with one foot firmly placed in the discipline of the scientific enterprise, while his other foot probed the spinning dust cloud – Job’s whirlwind.

It is not sufficient any longer to listen at the end of a wire to the rustling of galaxies; it is not enough even to examine the great coil of DNA in which is coded the very alphabet of life. These are our extended perceptions. But beyond lies the great darkness of the ultimate Dreamer, who dreamed the light and the galaxies. Before act was, or substance existed, imagination grew in the dark (Eiseley 1978: 120).

Eiseley’s thought is religious in both style and content. In his prose, his historical studies of Darwin and Francis

Bacon, and in his poetry, words are the essential human domain. They are transcendental – they create, evoke, and test. They partake of meaning, examining the ideas engaged in inventing our “machines.” Words are host to “the unexpected universe” and must be felt and heard as well as measured and nurtured. Style is fundamental to the imaginative power to be comprehensive as well as pragmatic.

In their content, words provide life orientation; they express ultimate order and meaning. We are liberated from bondage to the belief that the achievements of our disciplines somehow represent certitude on a cosmic scale. That is why Loren Eiseley was as interested in language as in bone hunting – his way of referring to his archeological responsibilities. It is why his reflections are mediated by consultation with theologians, philosophers, the works of Homer, Dante, Donne, Shakespeare, and Dostoevsky – and, of course, Emerson and Thoreau. It is why he was often forced to use the word God, or fashion substitutes like “the Player,” “the Synthesizer,” “the ultimate Dreamer.” Whether or not we like the terms “religion” or “religious,” Loren Eiseley insists that we become cultural heretics who move beyond certitude to a sense of the holy.

The term “nature” represents the paradox of the human mind. It is creative ambivalence, a heuristic necessity. We must have the biology and geology upon which the mind feeds. But, in feeding we recognize that nature is a fabrication; in reality there is no such “thing.” The truly responsible mind, aware of the oppositional pull – the impulse to reach out, receive, and change – will never assume the absolute claims of its observations. If there are rigidities in Darwin’s “take” on the evolutionary process, it is because he and the Darwinists were unable to observe their observations or to extend themselves into and beyond those observations. Eiseley quotes Pascal: “There is nothing which we cannot make natural; there is nothing natural which we do not destroy” (1978: 159).

According to Eiseley, there is more to the human mind than the pragmatic urge to take things apart or to be *homo faber*. Failure to nurture this sensibility leaves us in a physiological trap, faced with the difficulty of escaping our own ingenious devotion to making everything natural. Loren Eiseley revised his *Francis Bacon and the Modern Dilemma* and retitled it *The Man Who Saw Through Time* because Bacon has been misused by those who took him to be the advocate of making everything natural. “The world is not to be narrowed,” wrote Bacon in *The Parasceve*, “till it will go into the understanding . . . but the understanding is to be expanded and opened till it can take in the image of the world” (Bacon in Eiseley 1973: quoted on facing page to table of contents).

Loren Eiseley was a prolific author of scientific papers, poetry, and personal essays. He was a recipient of the Athenaeum of Philadelphia Award, the Phi Beta Kappa Award in Science, and was a member of the

National Institute of Arts and Letters. His many published works are host to the intellectual struggle to celebrate the ambivalence of “nature” and to expand the understanding, opening it to the image of the world.

Eisler, Riane (1931–)

North American cultural historian Riane Eisler analyzes the connection between contemporary ecological issues and the global suppression of women, which she thinks are both caused by the dominator model of social structures. The model is developed around *androcracy* – which she defines as the view that men and “masculinity” are superior to women, “femininity” and nature. Since ancient times the dominator model was symbolized by the power of the blade. An alternative suggested by Eisler is the partnership model, developed around *gylany*, a term she uses to describe a societal structure in which women and men are equally valued. Traditional “feminine” values, such

as caring and nonviolence, are, however, given priority in Eisler's partnership model and are taught to both biological sexes.

Instead of a domination hierarchy, the partnership model counts on actualization hierarchies wherein ecological and social systems are constructed out of a hierarchy of complex entities, from the most basic functions to the actualization of the highest potential of these systems. Eisler believes that the partnership model flourished in Neolithic goddess-centered cultures of southeastern Europe and Asia minor. She draws upon the archeologist Marija Gimbutas' findings of Neolithic female figurines and symbols of female reproductive organs, which, according to Gimbutas, symbolize the life-giving power of the divine. The chalice is a symbol of these powers. Partnership spirituality is centered on life-giving, nourishing and empathy; mutual love and sexuality are ultimate expressions of life. Eisler also suggests that the partnership model is reflected in the community around Jesus and in Gnostic Christianity.

Elephants

Cave and rock pictographs and petroglyphs of mammoths and elephants dated to 30,000–10,000 years ago show these large animals have long been of interest to humans. Paleontological analysis of cut marks on bones indicates proboscideans have been a source of sustenance for far longer, perhaps going back to *Homo erectus*. The debate over whether Paleolithic representations of animals were made for religious, utilitarian, or aesthetic reasons remains unsettled. Information linking gender and elephants is evident. Some early depictions show men hunting proboscideans. Connections of elephants with masculinity and economic/power themes continued in the following millennia. Elephants were used as living battle tanks by state societies in the Middle East, Europe, Asia, and Africa. Islam dates the birth of the Prophet Muhammad to the “Year of the Elephant,” so marked in the Qur'an because Ethiopian military mounted on elephants invaded Mecca, his birthplace, in 570. Judaism also links elephants to men and military might. 1 Maccabees recounts a 163 B.C.E. Syrian-led invasion, when war elephants turned violent with the “blood of grapes and mulberries,” against Jews. Going under it to strike “the belly of the beast,” Eleazar

was crushed to death by the largest elephant, which he had thought carried the Syrian king, seeing it was adorned with a great tower and gold. The elephant became a symbol of freedom fighters resisting military might in Judaism. The Jewish holiday of Hanukkah, which commemorates the Maccabeans, sermonizes about and places the elephant on dreidels, menorah, and other Judaica. Contemporary Judaism, however, puts blame on the Syrian leadership, not their war elephants. One prayer recited when lighting the Hanukkah menorah goes as follows:

For the sake of the weak who are trampled underfoot by elephantine power, for the many forms of life that vanish every week from off our planet, I pledge to join with Noah and Naamah to affirm God's covenant with all that lives and breathes – to save each species from extinction by making all of Earth an Ark of comfort (www.shamash.org).

1 Maccabees became part of the deuterocanonical books of the Old Testament for Catholics from the fourth century. Luther later placed it into the appendix of his German translation of the Bible. Scenes of "Eleazar under the Elephant" became a theme for Christian sacred art, taken up by Gustave Doré and others. The elephant came to symbolize "noble deaths" and male heroism for Christians as well as Jews.

Building upon actions modifying the environment, which elephants do on their own, men have also made elephants serve them as living tractors in the clearing of land, construction of roads, and getting of tree products. *The Book of Mormon* (Ether 9) contains a charter myth which makes Indians of the Americas of Semitic stock. It claims North America was virgin territory until 2247 B.C.E., when immigrants from the land of the Tower of Babel built a "high civilization" using the labor of domesticated animals, "more especially the elephants." Elephants have served state societies as mobile canvases in parades of civil religion, displaying wealth on their bodies and those of their mostly male riders, both adorned with ivory, gold, jewels, and fine cloth. Elephant masks and other regalia have been prominent in African "cults of masculinity" and chiefly/royal status. During the age of imperium over the non-Western world, Western males cultivated the mythos of the "great white hunter" able to bring down the elephant with their guns.

Cave and rock paintings, such as those of San of southern Africa, dated between 18,000 and 27,500 years ago, present female elephants protecting their young from predators. These images point to another strand of symbolism surrounding elephants: maternity and its powers. While the majority of contemporary archeologists exhibit wariness about "myths of matriarchy" which some feminists read into early human social organization and

spirituality, matriarchy is readily associated with elephants. Female elephants do live in closely related groups of sisters, daughters, and their young. They are led by one or more experienced older females. Elephant "matriarchs" are said to be repositories of "local traditions" who guide kin through their "wisdom."

African savannah elephants (*Loxodonta africana*) are the largest of living terrestrial animals. Adult males weigh up to 15,500 lbs. and are about 10–13 feet tall. Adult females weigh up to 7700 pounds and are 8–10 feet tall. The African forest elephant (*Loxodonta cyclotis*) and Asian elephants (*Elephas maximus*) are smaller with similar dimorphism. After they are about eight years old, "bull elephants" live largely outside "bond groups" in "bachelor herds" which have weak social bonds, or as solitary individuals. Females seem to develop larger "vocabularies" from their greater sociality. Males will reenter female-dominated groups when additional protection provided by their greater bulk is needed, or for sex. Despite greater size and strength, "big bulls" are not essential to bond groups on a daily basis. Female elephants remain inaccessible to males during their 18–22-month pregnancies, the maximum number of which seems to be a dozen, and while lactating. Since breast milk is the exclusive food of elephant young for six months and part of their diet until they are two or older, lactation and pregnancy put females out of reach of males for extended periods.

Elephants appear to show concern for wounded, handicapped, elderly, and "grieving" group members. Elephants have been seen burying their dead under branches, standing around corpses, and examining, caressing, and carrying group members' bones. One interpretation of their smashing tusks and bones of their dead is that elephants want to release "spirits" indwelling in the bones and tusks. Another is that they are concerned to prevent the removal of the bones and tusks from their "home territory" by poachers and others. Elephants have been seen covering the corpses of other animals and humans. Some observers have "racialized" African and Asian elephants, claiming, for example, to see the map of Africa in the ears of the "proud" and "truculent" African elephants, and the map of India in "Asians," whom they deem more "manageable" and "calmer." Others researchers, however, point out that Asian and African elephants demonstrate "altruism," giving aid to and forming attachments with each other. In 1607, Edward Topsell, an English cleric-naturalist, proposed that "a kind of Religion" existed among elephants. While such views have been called "anthropomorphic fallacies," beliefs that religion is not confined to humans persist into the present. The counter-defense calls for avoidance of "anthropocentrism" in the study of religion and ethics.

Elephant symbolism figures in a number of religions. Mother-son symbolism is evident in beliefs surrounding

Ganesh, Hinduism's god of art, wisdom, and well-being. One account states that the first son of Shiva and Parvati gained his elephant head after losing his human one while protecting his mother from Shiva's unwelcome sexual advances. Parvati showed such "maternal rage" at what had happened to her son that Shiva sent emissaries to find a replacement. Parvati is a symbol of the Earth. Sharing in this symbolism, elephant-headed Ganesh has become a patron for Hindus concerned with the environment. Scholars feel that belief in Ganesh helped preserve elephant numbers in India and Sri Lanka, and link the rise of large-scale killing to the period of British colonial rule.

Elephantine maternal strength is also represented in Hindu beliefs about female elephant caryatids supporting the Earth on their backs. The elephants rest upon a giant turtle, which stands in a pool of milk encircled by a giant snake, a further female symbol. Shri-Gaja, also called Megha (Cloud), is the Divine Elephant associated with rain, fertility, and Lakshmi, Hinduism's Lotus Goddess. Lakshmi is herself associated with moistness, good harvests, and the fertilizing dung of cows, in which she dwells while retaining her purity. It is women especially who show devotion to Lakshmi in the form of dung. In Hindu history, the breasts and gait of female elephants have been beauty ideals for women to emulate. Mithila house art of Hindu India and Nepal, which is produced in private rituals by women, gives elephants prominence on walls, floors, and household goods. Ayurvedic medicine has made use of elephant urine and dung. As with many other religions, there is more to elephants in Hinduism than male war, work, hunting, civil religion, and political pageantry.

Mother-son symbolism linked to elephants is found in Buddhist beliefs that the Buddha was an elephant in one of his incarnations. His mother is said to have conceived Buddha after dreaming an albino elephant came from heaven and touched her with a white lotus blossom that he held in his trunk. Mahavira, the twenty-fourth and final "ford-maker," or great teacher, in the Jain religion, who was a contemporary of Buddha, also has a biography with an elephant motif. Jains believe Mahavira was born to Queen Trishala after she had a series of fourteen dreams. The first involved an "auspicious" albino elephant. The Tantric religion of Nepal reveres Ganipatihardaya, who is elephant-headed like Ganesh, and a manifestation of Shakti, the female creative cosmic force.

Judaism and Christianity both place elephants in the Garden of Eden and on Noah's Ark. One "old Jewish legend" recounts that dung from the elephants shifted in the Ark, which led rats and mice to run out of the dung and start to eat the Ark's wood walls, whereupon Noah beseeched God for help. He was instructed to strike a lion on the nose, who sneezed out cats, which kept the rodent population in balance. Christianity shows greater use of elephant symbolism than Judaism. Male elephants' testes are internal, their penises normally withdrawn. Female

elephants' relatively long clitorises can be stiffened like penises, but this too is evident only in amorous moments. Female elephants put plant materials into their vaginas during their "monthly cycle." This has been seen as their observing a "menstrual taboo." Some Christian writers have made elephants symbols of "chasteness." The *Physiologus*, compiled between the second and fifth centuries, depicted the female elephant "cajoling" the male with whom she wished to mate to eat of a male mandrake root, while she ate a female root. Biblical references record uses of mandrake (*Atropa mandragora*) to promote fertility and as an aphrodisiac (Genesis 30; Song of Songs 7). Maintaining elephants only became amorous after ingesting mandrake, the *Physiologus* described elephant mating as "free from wicked desire." It presented female elephants giving birth in water and providing offspring with "something like baptism." The twelfth-century *Workshop Priory Bestiary* described elephant conception taking place without intercourse – standing beside mandrake sufficed.

Elephant caryatids and other elephant statuary gained placement on church fountains, bishop's chairs, choir misericordes, buttresses, in nativity crib scenes, and other locations. Elephant ivory, a rare material that reinforced notions of purity and durability, was used for statues of Christ and Mary; receptacles for the host, missal covers, crucifixes, and other sacred objects. In the late 1400s, the Portuguese started commissioning artists in Sierra Leone to create "hybrid art" in the form of salt-cellars, horns (oliphants), and other items, often dictating the designs. The ivory decorations incorporated animals, including Asian elephants, men and women caryatids, human mother-child scenes, and male hunters. Ivory crucifixes and vessels were also produced. The Portuguese bestowed these "exotic" ivories upon important personages. Seeking papal favor for his colonial agenda in 1514, the King of Portugal sent Pope Leo X Hanno, a living, young, rare, Asian, albino elephant. The elephant participated in church processions and stayed in one of the Vatican gardens until its death on 8 June 1516. Pope Leo had Raphael, renowned for his Madonna and Child paintings, make a memorial fresco for Hanno, and himself composed the elephant's obituary. In 1667, Bernini, recognized for his sculptures of Mary, designed an elephant caryatid for Pope Alexander VII. The Egyptian obelisk placed on the elephant's back had once stood by Rome's "Temple of Isis." The work was placed in front of Rome's Saint Mary over Minerva church, where elephant-loving Pope Leo was buried. Elephants, both real and transformed by artistic imaginations, have a long hybrid history connecting them to Christianity. While Martin Luther censured Pope Leo and Hanno as symbols of excess in *Against the Papacy of Rome* (1545), this did not stop Protestants in later times from succumbing to "tusk lust" and acquiring ivory.

Almost five centuries after Hanno's burial in Vatican

gardens, Anglo-Nigerian and Roman Catholic artist Chris Ofili's revisited the complex symbolic mix surrounding elephants in his painting, "The Holy Virgin Mary." His "hybrid" work became the subject of global debate extending to Europe, Turkey, India, Nepal, and other places, after it was shown at the "Sensation" exhibition in Brooklyn, New York in 1999. Ofili affixed elephant dung to Mary's right breast. He used white-headed map pins to fashion concentric circles on the dung ball on her breast. Her face is African visaged, more masklike than representational, and said by Ofili to be based on a rapper he saw having "tons of power." The large 8 × 6 foot painting is supported on two feet, also made of elephant dung. White map pins spell out the word Virgin on the left support, Mary on the right. Some critics called the work "The Elephant Dung Madonna." Some Western detractors declared elephant dung did not belong in the art of "civilized" societies, and labeled Ofili's use desecration. Some African critics charged Ofili with reinforcing the stereotype "Africa is indeed the jungle." The London Zoo was the source for the dung, which came from an African elephant with an Igbo name, and an Asian elephant with a Chinese name. The dung was treated to prevent decomposition. Since elephants are herbivores, their dung has far less odor than that of humans whose appetites are omnivorous. Westerners who claimed to "smell the scent of Africa" in Ofili's painting were relying on their imaginations and not the dung's origins and actualities.

For many Africans, animal dung does not have negative connotations. Elephants have been called "gardeners of the tropics." One aspect of this role is their sowing while defecating. Elephants produce 300–400 pounds of dung daily. They engage in synchronous defecation "greeting rituals." Their dung contains plant seeds. It serves as a matrix for insects and beetles useful to humans and their ecosystems. For elephants, coprophagy is ingestion of a "health food" that adds essential bacteria and nutrients to their diets. In Africa, animal dung has been used as a plaster in building, basketry, and flooring. Mixed with mud and clay, plant-fiber-rich dung is a material providing stability and waterproofing. Dung and clay, in contrast to ivory, are "soft substances." In Africa, working with soft substances is associated with women, and women are especially associated with dung-based sculptures. Dung fuel has been utilized to fire clayware and for other purposes. Dung also has served as a poultice, an ingredient in indigenous medicines, and as a cleansing substance when turned into ash. The elephant dung on the breast of Ofili's Mary can be seen as a multivocalic compliment, rather than a sacrilege.

The Luo of Kenya, for example, used to use elephant dung as a fertilizer and put it into "strong medicines." Elephant dung was part of medicines Luo used for the protection of crops, the treatment of eye ailments, and for other purposes. Luo women would eat a bit of elephant

uterus cooked in soup to treat placental retention following childbirth. Luo believe female elephants utilize the bark of *Albizia coriaria* and *Kigelia africana* to stop their flow of menstrual blood. These plants have also been used by Luo women to treat menorrhagia and other reproductive problems. Luo appreciation for the parallelism between elephant zoopharmacognosy and human ethnobotanical knowledge is shared by other ethnic groups in Africa.

When elephant had been available for the Luo to eat, there had been proscriptions against eating breast meat. The reason given was the resemblance between female elephants' breasts, which hang between their front legs, and women's breasts. Luo say that elephants form groups that can be called by the same term they use for lineages. This terminology cannot be applied to cattle because cattle "are controlled by men." Elephants have been seen as capable of organizing themselves into matrifocal groups, of living contiguous to but apart from humans, while contributing to the ecosystem and humans with their dung and in other ways. Several Luo narratives feature old women found living among elephants, or deciding to go among them. These old women possessed spiritual powers enabling communication with elephants with whom the women shared commonalities.

Some African groups proscribe all elephant meat out of respect for the "grey matriarchs." Samburu of Kenya present an explanation like those who prohibit only breast meat: the correspondence between the bodies of women and elephants. Members of the Orkor clan of Gabbra in Kenya explain that Gabbra build their houses to look like an elephant's body because in the past a new mother, displeased with her marital family, left the community with her house on her back and turned into an elephant. In Sierra Leone, Liberia, Senegal, and the Gambia, women's secret societies identify with elephants and use elephant masks as symbols of female strength, maternity, and wisdom. In Onitsha, Nigeria, it is praise to call an old woman an elephant, and proper for her to dance in rituals with the ponderous steps of a pachyderm.

The near "genocide" of elephants has reduced the frequency of human encounters with elephants. For many Africans, wild elephants are but a memory. However, even now some Africans have fields trampled or devoured by nature's "ultimate harvester." Family compounds and school grounds are "invaded." People lose their lives in clashes with elephants. Killing "rogue elephants" and "culling" elephants to prevent problems have the approval of some Africans, who see some conservation efforts as "eco-colonialism." Yet elephants who keep their distance from human settlements remain highly regarded by many Africans.

In the last few decades, elephants have become creators and not just subjects of art, largely at the prompting of people who have raised funds from the sale of their

paintings and music to help pay for their upkeep. The colors in the paintings elephants make may match those of things in their environment but are otherwise abstract, at least so they appear to human sensibilities. Most of the elephant artists are female, as are most of the elephants in zoos, circuses, and elephant sanctuaries. Females are held to be easier to keep in captivity. Some female elephants have turned away from “bad girl behavior” linked to their captivity, including masturbation and amorous encounters with large trucks, when given art as an outlet. In 1607, Topsell said of elephants, “They have a wonderful love to their owne Countrey . . . in memory thereof they send forth teares” (Topsell in Sillar and Meyler 1968: 70). With the distance from their homelands and bond groups so great that their complex infrasound communications and other social signals cannot reach far enough to re-create all they have lost, elephants seem to find that art helps them deal with the boredom and stress of being away from their own creative social worlds.

Eleventh Commandment Fellowship

The Eleventh Commandment Fellowship (1980–1988) played an early but significant role in the creation of a viable national movement of environmental activists working from within the mainstream American Christian churches during the late twentieth century. The fellowship was also successful in fostering awareness and implementation of an ethic of ecology that was firmly rooted in traditional Christian teachings and doctrine.

The group derives its name from a 1979 article by Vincent Rossi, “The Eleventh Commandment: Toward an Ethic of Ecology.” Rossi was the director general of the Holy Order of MANS, an independent Christian service and teaching order that had been founded in 1968 in San Francisco. The order practiced a Theosophical and Rosicrucian-based system of initiatory spirituality and proclaimed the dawning of an age of spiritual enlightenment. Group members took traditional monastic vows, observed daily periods of meditation and prayer, celebrated cyclical festivals such as winter solstice and the full moons, and lived in common in over 46 centers throughout the United States and Europe. In the wake of the Jonestown mass suicides, the group moved away from its esoteric and Theosophical origins toward a more mainstream Christian identity. Rossi’s article in the order’s new journal, *Epiphany*, was an attempt to communicate the group’s vision of a spiritually informed ecological lifestyle to a mainstream Christian audience.

The article indicted American materialism and consumerism for the wholesale desecration of the Earth. Rossi declared that the dire condition of the Earth’s biosystem called for a profound alteration of human values and goals, a revolution of consciousness that would reawaken humanity to the presence of the divine throughout the natural world. Toward this end, he proclaimed an eleventh commandment: “The earth is the Lord’s and the fullness thereof: Thou shall not despoil the earth, nor destroy the life thereon.” In grafting a new commandment on to the Ten Commandments, Rossi was following in a tradition that began with Walter Lowdermilk’s famous 1939 address on Jerusalem Radio, which outlined an eleventh commandment of eco-justice.

Rossi also issued a call for environmental action that included education concerning the ecological crisis, the use of appropriate technologies, the elimination of personal actions harmful to the environment, and the formation of environmental action groups. In 1980, The Eleventh Commandment Fellowship was organized to carry out this action plan. Between 1980 and 1984, the fellowship promoted a broad, ecumenical approach to educating Christians about the ecological crisis. It organized local chapters in major cities throughout the country, set up food cooperatives, planted community organic gardens, and convened public educational

meetings. The fellowship's national office published a newsletter, sponsored annual Earth Stewardship symposia in the San Francisco Bay Area, and organized environmental conferences in retreat facilities nationwide. The fellowship's symposia and conferences were open to the general public and attracted members of diverse environmental groups and churches.

The most significant of the fellowship's initiatives was its central role in organizing the North American Conference on Christianity and Ecology (NACCE). This large-scale ecumenical conference of environmental activists included, among others, the Au Sable Institute, the National Catholic Rural Life Conference, the Eco-Justice Working Group of the National Council of Churches, and the Threshold Foundation. Despite major disagreements during planning meetings in 1986 over the meaning of Christianity and the Church's relationship to the broader environmental movement – in particular Wiccans and secular ecologists – enough agreement was reached to schedule a major conference.

In August 1987, over five hundred people representing nearly every major Christian denomination in North America attended the North American Conference on Christianity and Ecology in North Webster, Indiana. The stated purpose of the conference was to stimulate a Christian response to the global ecological crisis. The conference's 63 sponsoring organizations represented a broad cross-section of secular and religious organizations. Its working document stated the conferees' belief that God was calling humanity to: 1) preserve the Earth's diverse life forms; 2) create an ecologically sustainable economy; 3) overcome the despoliation of nature wherever it was occurring.

Deep divisions between moderate and conservative Christian groups in the NACCE that were simmering during the Indiana conference led to the formation in 1989 of the North American Conference on Religion and Ecology (NACRE). NACRE founder Don Conroy hoped to foster an ecospirituality that was open to interfaith cooperation on ecological issues. The North American Conference on Christianity and Ecology (NACCE) – strongly influenced by the Eleventh Commandment Fellowship's Fred Krueger, who, like the Holy Order of MANS' successor organization, Christ the Savior Brotherhood, had embraced a traditional Eastern Orthodox worldview – rejected this splinter group and argued that NACRE's creation-centered spirituality substituted evolution for repentance and was anti-Christian in nature and intent. By 1991, the Eleventh Commandment Fellowship's influence on NACCE was waning. Krueger, who had edited NACCE's publication, *Firmament*, left the conference after funding for the magazine dried up. Christ the Savior Brotherhood and the Eleventh Commandment Fellowship continued to organize local and regional conferences on Christian ecology during the early 1990s, but these con-

ferences had a more exclusivist and anti-modern Eastern Orthodox tone. The Eleventh Commandment Fellowship's brand of hard-edged, apocalyptic Eastern Orthodoxy isolated it from both NACRE's and NACCE's more ecumenical and interfaith approach.

During its early years, the Eleventh Commandment Fellowship's writings, workshops, and conferences helped a diverse array of regional and local religious/ecological groups organize themselves into what became, by the mid-1990s, a national and international movement. It also helped mainstream Christians to formulate a response to Lynn White's charge in a 1966 address to the American Academy of Arts and Sciences that "Christianity bears a huge burden of guilt" for the ecological crisis.

Eliade, Mircea (1907–1986)

Mircea Eliade was a dominant figure in twentieth-century history of religion studies. Born in Romania, he graduated from the University of Bucharest in 1928. He then studied yoga and Vedanta in India until 1931. Throughout the 1930s, the young scholar was a much-discussed Romanian writer, professor, and newspaper commentator. In the latter part of this period he had a controversial relation to the fascist Iron Guard. During the Second World War, Eliade served as cultural attaché to the Romanian legations in London and Lisbon. In 1945, no longer welcome in his now-communist homeland, the historian of religion became a professor at the Sorbonne in Paris, and in 1957 joined the faculty of the University of Chicago.

Eliade was a prolific writer whose works include fiction, memoirs, and treatises on the history of religion. Among

his most important publications in the last category (with date of major English edition) are *Cosmos and History: The Myth of the Eternal Return* (1954), *Patterns in Comparative Religion* (1958), *Yoga: Immortality and Freedom* (1958), *The Sacred and the Profane* (1959), *Myth and Reality* (1963), and *Shamanism: Archaic Techniques of Ecstasy* (1964).

Fundamentally, Eliade as historian of religion was concerned to recover the mind of *homo religiosus*, the ideal type of traditional, pre-modern persons acting and thinking religiously. Basic to this perspective was the experience of the world as “non-homogeneous,” contoured by the “dialectic” between the sacred and the profane. Certain times and places, such as those of festivals and temples, were experienced by traditional humanity as “sacred,” of a different character from the ordinary “profane” world. Above all, the sacred revealed itself in the sites, often situated amidst nature, of “hierophanies” or spontaneous/mythical manifestations of divine power. The sacred, according to Eliade, was seen as participating in some way in the energy of *illud tempus*, the “strong” time recorded in creation myths, the time of the beginning when God or the gods made the world. Especially important were sacred sites that could also be identified as an *axis mundi*, a “center of the world” that was also a way of access to heaven. These sacred axes could be an actual or mythical sacred tree or mountain, the sanctuary of a temple, or even a holy city like Jerusalem or Mecca.

Such dimensions of the sacred were especially prominent in their nature-oriented form in what Eliade called “cosmic religion,” the form of religion which obtained prior to the emergence of religions like Judaism, Buddhism, Christianity, or Islam that are centered on historical event. Cosmic religion was focused instead on hierophanies [manifestations of the sacred in nature, in such phenomena as the turn of the seasons, or holy mountains, trees, rocks, and waterfalls. To cosmic *homo religiosus*, the gods might dwell atop a mountain like Olympus, the New Year’s festival may be the principal temporal “opening” to the divine as in Shinto or ancient Babylon, and the land of the immortals an island just visible on the horizon.

In Eliade’s view of the history of religion, nature appears as powerful but ambivalent. In cosmic religion, nature and natural sites exuding power are likely locales for hierophany. Yet nature was also the realm of chaos and danger, the abode of demons and the terrain into which apprentice shamans or those on a vision quest would venture to engage in spiritual warfare and gain the favor of a divine patron. At the same time, in the camp, later the town and finally the city, with their symbols of demarcation between the human and natural worlds, and their *orientation* toward controlled sacred space and time, the natural as well as the supernatural could be “tamed” and integrated into the rhythms of human life.

Later, as the great historical religions perceived the most important hierophanies to be events in human history rather than in nature – the Exodus, Bethlehem, the Bodhi Tree, the Hegira – nature and the attributes of cosmic religion were still more marginalized and regarded with suspicion, although Eliade was aware that the Enlightenment and Romanticism had set in motion a recent reversal of that tendency. Deeply sensitive to humanity’s lingering “nostalgia for the sacred” and aware of the distortions of human life attributable to its modern “eclipse,” he believed that study of the history of religion could lead to a recovery of human fullness.

Ellul, Jacques (1912–1994)

Jacques Ellul, social historian and biblical theologian, author of some fifty books, influenced many resisting the assault on the natural environment, including many neo-pagans, primarily because of his radical critique of technocracy.

Born in Bordeaux, France, on Epiphany, 6 January 1912, to parents of eclectic European ancestry, Ellul was pushed by his father into the study of law and excelled. As a youth he became a Marxist (though not an uncritical one) and went through an obscurely mystical conversion to Christianity, two commitments which he could neither reconcile nor entirely abandon. After being removed as a professor of law by the Vichy government in 1940, he spent World War II in the French Resistance, peasant farming and spiriting Jews to safety across the border. His post-war assessment was that Hitler won the war. The Nazi spirit had triumphed. The atom bomb was emblematic of the necessary “fact,” the apotheosis of “technique” – of means overwhelming and supplanting ends.

In this terrible dance of means which have been unleashed, no one knows where we are going, the end has been left behind. Humanity has set out at tremendous speed – to go *nowhere* . . . Everything

that “succeeds,” everything that is effective, everything in itself “efficient,” is justified (Ellul 1967: 69).

Ellul elaborated this prescient theological reflection with a lifetime of sociological examination. These remarks presaged a major critical project of his life: analyzing the emergent technocratic system. *The Technological Society* (1954 French; 1964 English), was the first book of a trilogy which examined the mechanisms by which technology takes on a life of its own. He identified the “automatism” of technical choice. Efficiency in and of itself, rationally calculated, in effect preempts human choice, and by this process the technical movement becomes self-directing, and self-augmenting. Things occur as if the system were growing by an intrinsic, internal power, without decisive human intervention. It seems to operate by a self-generating logic of necessity. Techniques and technologies recombine in incessant new innovations which preclude any external value, ethic, or judgment apart from efficiency itself. Supplanting the natural environment, they act as if exempt from it.

Ellul was often criticized for making this technological pessimism an article of faith, a nearly dogmatic presumption. There was some basis for the argument. However, he tended to publish simultaneously on parallel tracks: a sociological work would be matched with a separate biblical study. This reflected a rigorous methodology partially rooted in his early tension between Marx and the gospel, but there was more. Ellul desired the scathing sociological works (including others about political power, propaganda, or ideology) to stand on their own as analyses, but he also wanted Christian readers to live with the dialectical tension of the two tracks. Eco-pagan anarchists to whom his analysis of the technological juggernaut has strong appeal, are often oblivious to if not dumbfounded to discover his biblical theology.

By way of example, *The Meaning of the City* (1960 French; 1970 English), a topical survey of the scriptures, radically pessimistic about human works and radically hopeful about God’s grace in history, was the theological counterpoint to the first technological study. It mines the etymological roots of the Genesis pre-history to find the city, especially the imperial city, an act of rebellion against God, a rejection of the creation in favor of a self-constructed world of security. In the alienation seeded by the violence of Cain, who was the first city-builder, the city takes on a life of its own. It becomes in effect a power on the spiritual plane. (Critics would add that the totally consistent theology of the city which Ellul manages to unearth in scripture, comports entirely too well with the totalizing view of technological culture that he proclaims.)

Marva Dawn has shown convincingly that the biblical concept of “the principalities and powers” indeed figured programatically in Ellul’s overall work, and that he contributed to the recovery of “the powers” in social ethics. He

was among the first to apply the notion to structures other than the state, such as money, law, technology, or, as here, the city. Biblically, he understood the principalities to have active agency in dominating and possessing human beings, precisely at the moment human beings imagine they control and possess the powers. Moreover, it can be demonstrated that this comprehension of the principalities is precisely the bridge between Ellul’s twin tracks of social criticism and theology. For example, the dominating “logic of necessity” in his sociological stream of thought, parallels and verifies the bondage of fallenness in the theological stream.

The powers are a concern of environmental theology. They are proving useful in analyzing the structures of globalization, both the technology which has so compressed time and space, and the new structures of political economy such as the global corporation and the overarching institutions of world trade. Where ecological theology has stressed awareness of relationship and has rejected an overemphasis on fall and redemption often at the expense of naming the aggressive ascendancy of these structures, Ellul’s theology of the powers can identify their contemptuous assault on human community and the planetary environment.

Jacques Ellul thought and wrote globally, but he lived and acted locally. Despite incessant invitations he never traveled to the United States. He lived almost his entire life in and around Bordeaux, the place of his birth. As part of the environmental movement he engaged a long-standing and largely losing struggle to defend the Aquitaine coastline against overdevelopment. He was indeed an anarchist, generally of the Anabaptist variety, formed in French Personalism. This he defended and explained biblically. It seemed no contradiction to a French Calvinist who was, paradoxically, also a universalist. He advocated a social ethic of radical freedom. And in that freedom he died and lived.

Elves and Land Spirits in Pagan Norse Religion

The best-known deities of the pre-Christian, pagan religion of the Norse peoples of old Scandinavia are Odin, god of wisdom, war and poetry, and Thor, god of thunder, strength and protection, of the Aesir family of gods, and the brother-sister pair of fertility deities, Freyr and Freyja, of the Vanir group. There are however many other types and classes of deities and supernatural beings known from Old Norse texts and folklore. These include the fate-ruling Norns, the protective *Disir*, the metalworking Dwarves, and the generally malevolent Frost-Giants. Two further categories, the *Álfar* (Elves) and *Landvaettir* (Land Spirits) are of special interest as divine beings closely related with the natural landscape. It is notable that while the worship of the major gods and goddesses of past times was suppressed by Christianization, belief in the Elves and Landspirits has remained popular in the religious imagination of Icelanders to the present time, at the level of folk religion and oral tradition.

The nature of the Elves and Land Spirits is not straightforward. They cannot be precisely defined nor sharply distinguished from one another, from the gods, or from the spirits of dead. It is advisable to conceptualize the Norse pantheon of divine and semi-divine beings as a continuum; a spectrum of divine powers and presences some of which are close at hand, others more remote.

The Poetic and Prose Edda collections, the primary Icelandic literary documents for Old Norse mythology, contain quite a few references to the Elves. These are generally not sustained discussions and descriptions, but brief formulaic phrases whose matter-of-fact repetition establishes their grounding in long-held beliefs and tradition. In a number of different texts, the Elves are listed alongside the Aesir in phrases in which the two classes of gods represent the entirety of Norse divinity, in the manner of a synecdoche (a figure of speech in which the word for part of something is used to mean the whole). For example, the Seeress, describing the fate of the gods and of the cosmos in *Völuspá* 48, poses the question, “What of the Aesir? What of the Elves?” to introduce her account of the final collapse of the gods and their world. In *Hávamál* 159, Odin illustrates his broad range of knowledge with the boast, “Aesir and Elves, I know the difference between them; few who are not wise know that.”

The description of the Elves as the primary category of divine beings other than the Aesir places them into the position in Norse cosmology that is normally assigned to the Vanir, the class of gods that includes the fertility deities Njorðr, Freyr and Freya. There are certain indica-

tions that Elves and Vanir may be synonymous. *Grimnismál* names “Álfheim” as Freyr’s home (*Grimnismál* 5), and the humorous poem *Lokasenna* includes Loki’s taunt to Freyja, “Of the Aesir and Elves that are in here, each one has been your lover” (*Lokasenna* 30). As the deities gathered in the hall are otherwise described as the Aesir and the Vanir, the “Elves” to which Loki refers to can only be the Vanir. However, the Eddic poem *Fafnismál* clearly distinguishes the Aesir, Elves and Vanir as three separate categories of beings (*Fafnismál* 13), for which reason a straightforward identification of the Elves with the Vanir is not tenable.

Nonetheless, there would seem to be considerable overlap between the Elves and the Vanir, particularly in regard to the fertility function explicitly identified with the Vanir but also shared by the Elves. The sun, the mightiest power in all nature, is a feminine being called *Álfrodull* (Elf-disc). Fated to be devoured by the monstrous wolf Fenris in the cataclysm of Ragnarok, Elf-disc will first give birth to a new sun who will shine on the new world that will rise from the ashes of the old (*Vafþrúðnismál* 47).

A complex of beliefs centered on fertility links together the Elves, the dead, the god Freyr and deceased kings. According to *Ynglingasaga* (chapter 10), the god Freyr provided the blessings of fair weather and rich harvests during his life, and was after his death worshipped in his grave-mound in the hope of continuing the benefits of his past reign. Similarly, *Flateyrbók* reports that when the Norwegian king Olaf of Geirstad died, his subjects worshipped him as the “Elf of Geirstad” for the same reasons as with the legendary worship of Freyr. In *Gíslis Saga* (chapter 18), Thorgrim, a pious worshipper of Freyr, is buried in a grave-mound, which remains free of snow and ice in the worst of weather, as a kindness of the god toward his fallen devotee. In each case, worship is offered to the dead for the sake of fertility and related benefits, with reference to both Elves and Vanir in different cases. Of the three major seasonal *Blóts* (literally “blood-sacrifices,” but actually meaning solemn community feasts in honor of the gods) described in the *Ynglingasaga* and believed to have been practiced across Scandinavia, one was the *Álfablót*, dedicated to the Elves. Jormundur Ingi Hansen, *Allsherjargödi* (High Priest) of the Icelandic Neopagan association *Ásatrú* from 1994 to 2002, says he once knew old women who would put out offerings of food to the Elves, hoping to thereby secure future prosperity.

The association of benevolent supernatural powers, whether of the dead, of Freyr or Elves, with grave-mounds is highly significant and suggests linkages with other religious traditions of Europe and beyond. In Celtic Irish myth, there is a similar belief in sacred hills, which are often grave-mounds, called *Síd*, which are gateways to the Other World. On the night of *Sámhain*, the *Síd* were believed to open wide, enabling the living, the dead and

the gods to cross into one another's domains. In ancient Russia, persons of high status were buried in immense grave-mounds called *Kurgans*. The late archeologist Marija Gimbutas theorized that such burials were a distinctive trait of Indo-European culture, spreading from the Russian steppe region toward Europe through a series of migrations or invasions over thousands of years, possibly as early as the fifth millennium B.C.E. *Eyrbyggja Saga* tells of *Helgafell* (Holy Mountain, a rocky hill with an impressive view, located in the Snaefellsness peninsula) opening to welcome the newly deceased into the community of ancestors (chapter 11). The saga literature also describes other cases of the dead buried in sacred hills. It is tempting to see such tales as a far-flung extension of the Indo-European Kurgan idea; even if they are not, the commonalities remain of interest.

Turning to Land Spirits, these beings are mentioned less often in the Edda collections than the Elves and are more in evidence in the Sagas and other later Norse texts. An oft-cited passage which very well illustrates the importance of the Land Spirits in the early history of Iceland is an injunction against ships with dragon-head ornaments on their prows coming into port, for fear that the dragon-heads might upset the native Land Spirits of Iceland (*Landnámabók*, *Hauksbók* version, chapter 268). This and other passages express the belief that it is vitally important to maintain the goodwill of the Land Spirits, the native powers of any given region, as their enmity can spell disaster. In *Egils Saga* (chapter 58), Egil Skallagrímsson attempts to purposely rouse such supernatural ill-will by composing a poem in which he calls on the Land Spirits to curse the Norwegian king Eirik Bloodaxe and his wife Gunnhildr.

The same belief is still influential in modern-day Iceland, where a special division of the government highway commission is entrusted with the task of determining whether Elves, Land Spirits, or other such invisible beings inhabit particular hills, boulders or other natural formations. If such a place is believed to be the dwelling-place of a Land Spirit or other divine being, then that area is held off-limits to road construction. Folk belief holds that whoever disturbs the dwellings of the Land Spirits will suffer illness or other calamities, possibly including death. The location of the Land Spirits in large stones and hills is again reminiscent of the Celtic *Sídh* and the Russian Kurgan.

An important common feature of the Elves and Land Spirits is their lack of individual identity. They are generally referred to not as named individuals but as anonymous, divine collectives, in contrast to such distinctive individual personalities as, for example, Odin, Thor, Freyja and Loki. The lack of distinctive identity of the Elves and Land Spirits may be among the factors that enabled belief in such beings to survive suppression by Christian authorities over the centuries.

Modern Icelanders are of two minds about displaying their belief in Elves and Land Spirits. Most are quite guarded about openly admitting to such beliefs, for fear of seeming foolish or superstitious, and it is more common to hear statements that other Icelanders believe in such things than to meet with a direct confirmation of these beliefs.

On the other side of the spectrum, there are certain entrepreneurial Icelanders who have come to see local customs concerning Land Spirits and Elves as a business opportunity, and have taken it upon themselves to market maps, books and tours to foreign visitors.

The Elves and Land Spirits are linked both with the power of nature and with the world of the dead. This is most clearly borne out in the association of the Elves and Land Spirits with hills and mountains, which resemble and are in some cases identical with grave-mounds where ancestors are believed to continue their existence. This linkage echoes very early levels of Indo-European religion, with reference to the Kurgan grave-mounds of southern Russia. The myths, beliefs and folklore concerning Elves and Land-Spirits suggest an enduring connection between fertility and death and between gods and ancestors in the Nordic religious imagination, which survived the official suppression of Old Norse Paganism and continues to the present day.

Emerson, Ralph Waldo (1803–1882)

Ralph Waldo Emerson can rightly be called the first American "man of letters." By the end of his life, Emerson had published nine books of essays, had served as the editor of the Transcendentalist journal *The Dial*, had traveled and lectured in Europe on three occasions and had regularly delivered a series of lectures on the Lyceum circuit almost every year between the mid-1830s to the late 1860s.

The son of a Boston Unitarian minister and heir to a long ancestral line of Protestant leaders, Emerson trained for the same career in his early youth. Nevertheless, significant personal losses (the early death of his father and of his first wife Ellen Tucker) helped to shape his increasing theological doubt, which included a growing disbelief in the idea of immortality, in the "miracles" of Christ's ministry and in the efficaciousness of such rituals as the Lord's Supper (Communion, the Eucharist). Emerson's intellectual development also turned him away from his early fascination with Scottish "Common Sense" theologians and philosophers and toward the writings of Plato, Swedenborg, Kant and the European Romantics. These personal, theological and intellectual transformations all mutually reinforced Emerson's growing sense that he must re-create his life according to his own sense of intellectual and spiritual truth.

Emerson was perhaps the single person most responsible for what has come to be called "The American Renaissance," a flowering of literary and artistic production of the mid-nineteenth century which consciously strove to establish a unique "American voice," distinct from the constraints and conventions of European culture. His two most famous lectures, both delivered at Harvard,

established his particular contribution to this Renaissance. In "The American Scholar" (1837), Emerson voiced the call for American intellectual independence from Europe, urging on his audience the importance of individual self-expression, though importantly, a kind of self-expression that is contained and tempered by the disciplined pursuit of self-culture (a theme he later elaborated in his essay, "The Poet"). His 1838 Divinity School Address was much more controversial, challenging not only the theological orthodoxy of the time, but even its most liberal expressions in the form of New England Unitarianism. Calling the Unitarianism of his day "corpse-cold," Emerson literally faced-down his ancestors and teachers, arguing for the spiritual authority of individuals in communion with their own consciences and deemphasizing the role of Jesus as a source of authority. He emphasized the importance of discerning spiritual truth from everyday life, a wide range of reading and ongoing experience in nature.

Emerson's first published work, the extended essay *Nature* (1836), is particularly important for our understanding of Emerson's contribution to the many and varied "spiritualized" visions of nature in American culture. While one of Emerson's first career ideas (after rejecting the ministry) was to become a naturalist, it is clear that his understanding of nature is weighted more toward nature's symbolic, rather than scientific importance. Throughout his life, however, Emerson continued to weave together a complex reading of nature that was informed by both his own amateur experiments as a botanist and his more sophisticated intellectual meditations on the meaning of nature as a source for human, spiritual growth.

Written as he was setting into a second marriage, a new home in Concord, Massachusetts and a newly launched career as a writer and lecturer, *Nature* can be seen as Emerson's personal manifesto, a claim to his self-fashioned spiritual and intellectual vocation. While entitled "Nature," the essay is much more than a study of the natural world (though it includes moments of precise, naturalist observation); rather, it is a broad-ranging inquiry into language, art, beauty and spiritual experience as these are informed and illuminated by what we commonly think of as "nature" (landscape, mountains, rivers and so on).

While physical nature is the touchstone throughout the essay, Emerson's text ultimately concerns itself with the figure of the ideal Poet (whom Emerson both creates and embodies) whose task it is directly to experience the spiritual lessons inherent in nature and then to transform the language of the natural world into the written word for a wider audience. The Poet, in Emerson's view, replaces the minister as the modern version of the ancient biblical prophets, open to direct, spiritual experience and called to share that experience with others.

While drawing on the Christian concept of the “Book of Nature,” Emerson disavows Christian traditionalism and argues that the human mind (consciousness) and the natural world are the only necessary foundations for genuine, spiritual experience and the cultivation of the self. Nature is portrayed by Emerson as a democratic medium, available to all, for a broad range of uses. The common use of nature is that of “commodity,” nature as a resource for shelter, food, tools and other human creations. But nature’s more important and authentic uses, Emerson argues, is as a medium for immediate, spiritual revelation that provides each individual with a vision of truth, beauty and goodness. Like other Romantic and Transcendentalist thinkers, Emerson includes in his definition of nature almost anything that can be defined as the “not me.” Not surprisingly, then, his essay is as much about the effects of the “not me” on the development of self as it is about bio-physical nature as such.

The vision of “The Poet” (and his or her proper relationship to the natural world) that Emerson first outlined in *Nature*, would become a centering point in his life and his writing throughout his career. At the same time, while *Nature* can be said to be more “about” the self than about the natural world as such, it played a significant role in a growing shift in American culture toward attentiveness to nature, rather than seeing the physical world as primarily a stage in the human–Divine drama, or as a resource for human use.

Emerson’s writings set the intellectual foundation for Henry David Thoreau’s, John Burroughs’ and John Muir’s own arguments on behalf of nature as a beneficent force which must be respected, studied and protected. While it would be a mistake to see Thoreau’s *Walden* (1854), Burroughs’ *Locusts and Wild Honey* (1879), or Muir’s *My First Summer in the Sierras* (1911) as merely “Emerson put into practice,” all are “conversion narratives” that testify to finding a new spiritual life “close to nature” which depend heavily on Emerson’s earlier insights. In this sense, the ripple effects of Emersonian thinking about nature extended far beyond the reach of his immediate contemporaries to include early conservationists such as George Perkins Marsh, as well as environmentalists Aldo Leopold and Rachel Carson in the twentieth century. While Emerson is remembered most broadly as a literary figure who set the terms of a new flowering of American writing in the nineteenth century, his influence on liberal religious life and his unintentional contribution to American environmentalism continue to this day.

Emissaries of Divine Light

In the 1930s, Lloyd Meeker, also known by the spiritual name Uranda, gained a following as a lecturer on human potential. In 1939, he met Martin Cecil, a hereditary British Lord, and together the two visionaries began to develop a network of intentional communities. The first was opened in 1945 at Sunrise Ranch, near Loveland, Colorado. By 1948, a second community, known as 100 Mile House, had opened in the remote interior of British Columbia. By the 1980s, the movement had about a dozen intentional communities worldwide and well over 100 other organized centers, although later some of the communities and centers closed. A distinctive type of New Age spiritual outlook that embraces both body and soul characterizes the Emissary movement, which sees its central task as the spiritual regeneration of humankind and attempts to embody its spiritual values in all parts of daily life.

A strong connection to the natural world has always been central to the Emissary outlook. Individual members seek to attune themselves with the divine force that is held to permeate everything. The communities have worked toward self-sufficiency, with extensive organic gardening and farming operations, including hydroponic installations. Through a strong outreach program of publications, seminars, and retreats they have spread their spiritual message to the general public.

Entheogens

The history of religion is intertwined with the use of drugs believed to facilitate the religious experience. Such substances are best referred to as "entheogens," a term coined in 1979 by a group of scholars including R. Gordon Wasson, Carl A.P. Ruck, and Jonathan Ott to denote "drugs which provoke ecstasy and have traditionally been used as shamanic or religious inebriants, as well as their active principles and artificial congeners" (Ott 1996: 15). The term's Greek roots translate as "god generated within," which better describes the drugs' religious use than do such words as "intoxicant" (literally, poisonous), "hallucinogenic" (causing hallucinations), "psychotimetic" (mimicking psychosis), "narcotic" (sleep-producing) or "psychedelic" (soul-showing).

In both traditional and contemporary societies, entheogen users believe that they experience a more primal and unmediated spirituality than those persons not using them. Their human spirituality is connected to and mediated by the plant world, rather than transcending it. Yet at the same time, many entheogen-based religions speak of another world that is more real and true than our three-dimensional world.

Nor is the entheogenic experience essentially different from other religious experience, argues historian of religion Huston Smith in *Cleansing the Doors of Perception* (2000: 37), any more than a religious experience introduced by physical danger or illness. However, Smith suggests that, lacking a supportive spiritual community, entheogenic ecstasy could be less likely to effect permanent life changes.

Modern study of the relationship between entheogens and religion began in the 1890s, when the American psychologist William James wrote about changes in consciousness produced by inhaling nitrous oxide. His English contemporary, Havelock Ellis, experimented with peyote (from which mescaline was chemically extracted in 1919), as did a variety of other Americans and Europeans, mostly physicians and psychologists. The British writer Aldous Huxley experimented with mescaline in the early 1950s and described his reactions in an influential short book with a title taken from the mystical eighteenth-century poet William Blake, *The Doors of Perception*. LSD was first synthesized in 1938 but not extensively investigated until the 1950s, first by psychiatrists who thought its

use replicated schizophrenia and then by scholars of religion who investigated parallels between entheogenic experience and other reports of mystical experience.

A famous experiment took place on Good Friday, 1962, at a Christian religious service in the Boston University chapel. Walter Pahnke, M.D., who was completing a Ph.D. in religion at Harvard University, conducted a double-blind study of psilocybin (found in the psilocybian mushrooms) by giving it to half of a group of twenty theology professors and students before the service, while the other half received a placebo, nicotinic acid. Participants recorded their experiences in writing the following day, and the reports were scored for mystical traits by independent raters on a scale of zero to three. Almost all of those receiving psilocybin reported significantly higher scores for mysticism, based on a list of seven traits (Smith 2000: 100–6).

Researchers began to consider the influence of entheogens on ancient religions, particularly Hinduism during the Vedic period and the Eleusinian Mysteries of Classical Greece. In addition, Renaissance and Early Modern accounts of possible entheogen use by European witches were reexamined to see if such substances played a part in the witches' poorly understood activities.

Richard Schultes (1915–2001), a botany professor at Harvard University, had learned in the 1930s that the use of entheogenic psilocybin mushrooms survived in remote southern Mexican villages, despite four centuries of effort by the Roman Catholic Church to eradicate their use. The British writer Robert Graves (whose book *The White Goddess* played a significant role in the contemporary Pagan revival) put mushroom researcher R. Gordon Wasson in touch with Schultes. Wasson and his associates visited Mazatec Indian healers who used psilocybin mushrooms and other entheogens in their ceremonies. From Schultes' and Wasson's research flowed a stream of publications describing an unbroken tradition of shamanic use of entheogens in Mexico.

In the 1960s, Wasson asserted that *soma*, a miraculous substance celebrated in the Vedas (holy texts dating from the second millennium B.C.E. and fundamental to the Hindu religion) was actually the mushroom *Amanita muscaria*. The Brahmans, priests of the Aryan tribes who moved into northwestern India in this period, composed numerous hymns mentioning *soma*, a substance that was pressed, mixed sometimes with milk, and then drunk by the Brahmans, but which was not alcohol. Hymns describe the war god Indra, in particular, delighting to consume vast quantities of *soma* before battling demonic opponents. One Vedic hymn (RV 8.48) proclaims, "We have drunk soma . . . we have become immortal; arrived at light. We have found the Gods."

Examining the textual evidence, including such hints that *soma* was associated with mountains and that its active principle remained in the drinker's urine, and

comparing that evidence with ethnographic descriptions of modern *Amanita muscaria* use by Siberian shamans, Wasson and his associate, the Indologist Wendy Doniger, argued that the Aryan tribes had used the mushroom in the homeland. After they expanded into India, however, they were only able to acquire it through trade, since it did not grow in India, and eventually soma's actual nature was forgotten.

Subsequently Wasson, together with research chemist Albert Hofmann (discoverer of LSD) and Classics professor Carl A.P. Ruck, advanced a theory that the Greek mystery religion of Eleusis, practiced from about 1500 B.C.E. until 395, had at its climax a ritual ingestion of a water solution of ergot, *Claviceps purpurea*, a psychoactive fungus that grows on wheat and barley, from which LSD was chemically derived.

Entheogens provide evidence for the persistence of an "Old Religion," some form of pagan religion persisting in Europe until relatively modern times. Roughly 40,000–60,000 accused witches were executed between the fourteenth and eighteenth centuries, and almost all were at least nominal Christians. Nevertheless, some accused witches were found to use ointments containing such psychoactive plants as *Atropa belladonna* (deadly nightshade) and *Hyoscyamus niger* (henbane), plants, which can be deadly if misused. These findings suggest the presence of an underground tradition of their ritual use.

The chief North American religious tradition employing entheogens is the Native American Church, whose rituals include consumption of its sacrament, the peyote cactus. Used for millennia in Mexico, peyote's use spread into the United States in the 1890s as Plains tribes were fractured and relocated onto reservations. In its teachings, the church combines Plains tribal religious ideas with Christianity, thus competing with the Christian missionaries who flocked to the new reservations to make converts. As one church member said, "Our favorite term for Peyote is Medicine. To us it is a portion of the body of Christ, even as the communion bread is believed to be a portion of Christ's body for Christians" (Smith 2000: 117).

An ancient South American entheogen, *ayahuasca* or *yagé*, has also spawned formalized international religious organizations. *Ayahuasca* ("vine of the souls" in the Quechua language of the Peruvian Amazon) is the vine *Banisteriopsis caapi*, containing the alkaloid harmine, frequently mixed with other psychoactive plants to increase its potency. (Harmine is also present in a Eurasian plant, Syrian rue, *Peganum harmala*, which has also been put forth as the source of *soma*.) Its use continues unabated today.

Two Brazilian churches employing *ayahuasca* sacramentally were founded in the twentieth century. The *Santo Daime* church originated about 1930 and the *União do Vegetal* was founded in 1961. Like members of the Native American Church in North America, followers of

the *Santo Daime* religion speak of their sacramental entheogen in Christian terms: the *Daime*, the sacred drink, is described as giving them a form of Christ-consciousness. Yet its followers also say that their religion incorporated the spiritual force of the indigenous Amazonian peoples. *Santo Daime* reaches out as well to the Spiritist and Afro-Brazilian religions and urges activism on behalf of the rain-forest. *Daimistas*, like many other entheogen users, see their sacrament as "both a shortcut and a medicine" that helps them to discover their spiritual identity (Polari de Alverga 1999: 131). "There are no human intermediaries in the *Daime*" (Polari de Alverga 1999: xxiii).

In Peru and Brazil, since the 1970s in particular, *Ayahuasca* has also become a component of ecotourism, as outsiders visit Amazonia to study with local shamans and partake of their sacrament. *Santo Daime* in particular has spread to other South American countries outside the traditional *ayahuasca*-using region and also to the United States and Western Europe, where Dutch members won in court after being arrested as "narcotics users."

Environmental Ethics

Environmental ethics can be defined, in very general terms, as efforts to articulate, systematize, and defend systems of value guiding human treatment of and behavior in the natural world. Philosophical and religious

reflection on human obligations toward nature or “other-kind” has a long pedigree in human cultures, whether occidental, Asian, or indigenous. Environmental ethics as a distinctive subfield within Western philosophical and religious ethics, however, did not emerge until the last three decades of the twentieth century.

The roots of modern environmental philosophy predate the emergence of “environmental ethics” as an academic field. In North America, for example, there are critically important antecedents that can be traced to the second half of the nineteenth and early twentieth century, perhaps especially in the writings of American naturalists HENRY DAVID THOREAU and JOHN MUIR;. Both Thoreau and Muir influentially promoted environmental preservation and the setting aside of forest reserves. This encyclopedia is replete with additional examples of the many, global tributaries to contemporary environmental ethics.

From Leopold to Earth Day

But among environmental ethicists in the West, at least, there is widespread agreement that the forester and ecologist ALDO LEOPOLD provided a benchmark against which subsequent environmental ethics can be measured. His short essay “The Land Ethic” in *A Sand County Almanac* (1949) provided an evocative and profound effort to articulate ethical guidelines for human interactions with nature. In it Leopold defined ethics as guidelines for social or ecological situations, based on individual membership in “a community of interdependent parts.” Applying this definition to the environment, a “land ethic,” he claimed, “simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land” (239). This enlargement of humans’ moral community transformed their place in relation to the natural environment, “from conqueror of the land-community to plain member and citizen of it” (240).

Leopold’s land ethic provided a model of and foundation for a type of environmental ethics now known as “ecocentrism” (ecosystem-centered ethics), or alternatively, “biocentrism” (life-centered ethics). Such ethics assert that the well-being of entire ecological communities, not just individual species (like *Homo sapiens*) or individual organisms, should be the axial moral concern. Ecocentrism therefore challenges most Western philosophical ethics, which tend to be “anthropocentric,” namely, focused on human welfare. For such ethics, non-human life is valuable at most indirectly, to the extent it satisfies some human need or preference. For ecocentric ethics, human interests do not trump that of all other life forms and the well-being of the biosphere as a whole. An ecosystem, rather than its constitutive parts, is the axial point of moral concern.

The ecocentric approach presented by Leopold and his progeny, challenges environmental ethics to specify which individuals and groups should be given moral con-

sideration, that is, have their interests considered or protected in some way. It also implicitly demands justification for claims limiting moral consideration to individuals or groups that are less than wholes. Indeed, much environmental ethics is engaged in the effort to determine the extent and nature of the moral community and to develop principles for deciding hard cases, such as when the interests of morally considerable organisms conflict.

It would be difficult to overestimate the importance and influence of Leopold’s land ethic, although this influence took some time to germinate and grow. To understand its influence, however, the affective, aesthetic, and even religious underpinnings of his writing need to be fully recognized. But the religious dimensions of Leopold’s writings are often overlooked in the environmental ethics literature, making it difficult for some fully to apprehend the evocative resonance Leopold has had with readers. Curt Meine’s biography of Leopold revealed what can be discerned by the perceptive reader throughout his work: Leopold had a deep spiritual connection to the Earth’s living systems and a profound sense of their sacrality, this being the foundation of his land ethic (Meine 1988: 506–7, and in his biographical entry in this volume).

Following Leopold’s untimely death in 1949, the next intellectual landmark in the development of environmental ethics was the work of ecologist RACHEL CARSON. In the late 1950s Carson began publishing magazine articles exposing the dangers of radioactive materials, pesticides and herbicides, the creation and use of which had boomed in America after World War II. In her now-famous *Silent Spring* (1962), Carson argued that industrial society was decimating avian populations and threatening the health of many other organisms, including humans.

Less well known are two of Carson’s books on oceans, published in 1951 and 1955, in which her own nature spirituality is more obvious than in her exposés of chemical culture. These books illustrate the most powerful themes in Carson’s work: a religious reverence for the sea, which she considered the womb of life, and a belief in the connectedness of all living things. The sea, she believed, was the generator and the grave for all: the alpha and omega of the planet. The life of the sea controls the life of the land and thus human life, an axiom that Carson believed should humble human beings (McKay, this volume).

This humility coheres with Leopold’s sentiment that humans should act as plain members of the land community, and it subtly conveys her own ecocentric spirituality. It also reflects how important such humility has been in much of the subsequent evolution of environmental philosophy, religious or otherwise. Carson not only helped set the stage for explicitly ecocentric environmental ethics, she also criticized the reductive and instrumental methodology that characterized (male-dominated) Western science since Francis Bacon (1561–1626), thus tilling the

soil for ecofeminism, which would emerge as a particularly vital form of environmental ethics a decade or so later.

While many events and thinkers contributed to the ferment shaping the field of environmental ethics, several additional critically important figures who published in the second half of the 1960s deserve to be singled out for playing a decisive role. Two articles in particular had an immediate impact because they were published in the widely read journal *Science*.

Lynn White's 1967 argument blamed much of the environmental crisis on ideas that he believed had incubated for centuries within Christianity. White was hardly the first to suggest such a connection, of course. The historians Perry Miller in *Errand into the Wilderness* (1956) and Roderick Nash in *Wilderness and the American Mind* (1967) had argued that Christianity fostered anti-environmental attitudes and behaviors. And in *The Rights of Nature* (1989) Nash showed that a number of Christians, including Walter Lowdermilk, Joseph Sittler, and Richard Baer, had earlier criticized their tradition's complicity in environmental decline before White had.

A year later the biologist Garrett Hardin argued in *Science* that there is a "tragedy of the commons" wherein, given an ecosystem open to all, individuals pursuing their own interests degrade that ecosystem's resources and their own life-prospects if there are no mutually agreed-upon constraints to limit self-interested behavior and prevent overexploitation. Combined with apocalyptic environmental predictions such as in the ecologist Paul Ehrlich's *The Population Bomb* (1968), Hardin's much debated 1974 article "Living in a Lifeboat" – which infamously argued that aiding the poor intensifies population growth, environmental degradation, and human suffering – generated additional controversy. It forced many to consider, for the first time, the environmental dimensions of public policies and ethical decision making.

Two other works published in the 1960s, one by ERNEST FRIEDRICH SCHUMACHER, the other by Gary Snyder, merit special attention when considering the antecedents to the discipline of environmental ethics and its religious dimensions. In 1966, first as an article in a book, then republished two years later in the first volume of *Resurgence*, which would become a leading venue for the discussion of religion, mysticism and nature, Schumacher published "Buddhist Economics." In it he argued that "The teaching of the Buddha . . . enjoins a reverent and non-violent attitude not only to all sentient beings but also, with great emphasis, to trees" (1966: 699). Such reverence, he asserted, offers a Buddhist approach to economics that rejects economic growth and material acquisition and strives instead for "highly self-sufficient local communities [which] are less likely to get involved in large-scale violence than people whose existence depends on world-wide systems of trade" (1966: 698). Reflecting and

promoting a decentralist ideology that would become common among environmentalists, Schumacher's essay was republished widely and included in the economist Herman Daly's influential, edited works promoting a "steady state economy" (1973: 231–9; 1980: 138–45). Such economies, wrote Daly, Schumacher, and the other contributors to these volumes (discussed below) are more ethical and fitting for a world of limited resources. Schumacher's influence increased dramatically after the publication of *Small is Beautiful* (1973), which is now considered a classic environmentalist text, and includes his essay on Buddhist economics.

Meanwhile, the poet GARY SNYDER began his influential publishing career in his own way by promoting decentralized bioregional economies, and what in America were alternative spiritualities, as a pathway toward sustainability. Snyder considers himself a "Buddhist-Animist" (Taylor 1995: 114) and his remarkable book, *Turtle Island* (1969), focused on the ecological spirituality and wisdom of North America's indigenous cultures, becoming the first of many writings in which he offered a religious green alternative to occidental religions. His influence grew rapidly after he was awarded the Pulitzer Prize for this work in 1975.

While much of the religion-and-nature-related intellectual work during the 1960s was critical of occidental religions and/or proffered supposedly greener alternative spiritualities, an important dissent was published by the geographer Yi Fu Tuan in "Discrepancies Between Environmental Attitude and Behaviour: Examples From Europe and China" (1968). Tuan rejected as facile the assumption of a close connection between nature-related beliefs and ideals and actual practices. Specifically, he rejected the claim that occidental cultures before Christianity were relatively benign by pointing to the environmental devastation caused by the Greeks and Romans, and he argued that the Chinese devastated their environment long before Western civilization could have exercised any influence in this regard.

A significant portion of the subsequent debate over religion, ethics, and nature engaged the arguments advanced by all of the above figures. The ferment they created contributed to the social forces that precipitated the world's first "Earth Day" in 1970, which further focused attention on environmental values. Soon the term environmental ethics would come into common usage and the related scholarly field would develop rapidly.

Environmental Ethics beyond the First Earth Day (1970)

Ecocentrism and Deep Ecology become focal points of debate
In 1971 philosopher J. BAIRD CALLICOTT placed environmental ethics as a discipline on the academic landscape, teaching what may have been the world's first course with this title at the University of Wisconsin, Stevens

Point, where he then taught. In the following decades Callicott became the world's leading interpreter and promoter of Leopold's land ethics. A central part of his constructive efforts was engaging the LYNN WHITE THESIS. In his many articles, eventually collected in books, Callicott argued that generally speaking, Asian and indigenous religions provide more fertile ground than occidental religions for generating an environmental ethics compatible with Leopold's land ethics. In this way, he supported the outlines of White's thesis and implicitly contradicted part of Hardin's argument, at least insofar as he was convinced that indigenous societies, which traditionally held land in a commons, generally develop environmentally sustainable lifeways and religious mores (now often called "TRADITIONAL ECOLOGICAL KNOWLEDGE") that help to protect their habitats – a point that the naturalist Gary Paul Nabhan and many anthropologists also argued.

The next watershed in environmental ethics occurred in 1972 when the Norwegian philosopher ARNE NAESS coined and explained the term "DEEP ECOLOGY" at a conference in Bucharest, publishing his thoughts in *Inquiry* the following year. He contrasted "deep ecology" with anthropocentric, "shallow ecology" (which he later more diplomatically called "reform ecology"), by which he meant environmentalism concerned only for human well-being and unwilling to radically reconfigure society toward sustainable lifeways. Naess called his own approach and pathway toward deep ecology "ECOSOPHY T" – "ecosophy" was another Naess neologism meaning "ecological philosophy." In his discussion of "Ecosophy T" one can see the religious dimensions to his belief that nature has "intrinsic" or "inherent" value. (Environmental philosophers variously define and debate the terms "intrinsic" and "inherent" value; specific reasoning about such terms involves "meta-ethics," a task beyond the present purpose. Here these terms are used simply as synonyms for the idea that nature has in some way value in and of itself, independent of human need.)

"Deep Ecology" rapidly became a catchphrase for most environmental ethics claiming nature had intrinsic value. The wider extension of the term and its growing popularity obscured some of deep ecology's distinctiveness, which was frustrating to Naess and some of his collaborators. But in its generic, easy-to-understand version (Naess's own writing, by his own admission, is difficult reading), in which deep ecology is equated simply with a belief in the intrinsic value of nature, the trope found a widespread resonance among environmental activists, scientists, and scholars. "Intrinsic value theory" thus became an important element in the growing environmental ethics debate. Indeed, Naess himself was influential upon scientists developing CONSERVATION BIOLOGY, a field which, like environmental ethics, had important antecedents (in this case in earlier conservation science) but

which emerged with a catchy name and thus a stronger identity in the 1970s.

The next watershed in the evolution of environmental ethics in general, and of non-anthropocentric environmental ethics in particular, was the "Rights of Non-Human Nature" conference held in California in 1974. The conference was convened by John Rodman, a political theorist at California's Claremont Graduate School, who would later declare himself a "radical environmentalist" and articulate his own theory of intrinsic value (Rodman 1983). But the conference was at the time inspired by a 1972 law review article entitled "Should Trees Have Standing?," written by University of Southern California law professor Christopher Stone. Stone argued in this article and a subsequent book that natural objects, including trees, have interests and should have standing in the courts, represented by sympathetic humans. Although the claim that nonhuman nature has rights had been made before Stone's better-known argument, the conference nevertheless was a landmark because it drew together for the first time many of those who were or soon would shape the emerging environmental ethics field.

Indeed, speakers at this conference included several whose publications in the 1960s have already been noted, for example, Gary Snyder, Garrett Hardin, and Roderick Nash. Others included professor of human ecology PAUL SHEPARD, who in 1973 published *The Tender Carnivore and the Sacred Game*, the first in a series of books arguing that the spiritualities and lifeways of the world's foraging cultures are superior to the world's agricultural societies and the religions that accompany them. Shepard's contributions to deep ecology and radical environmentalism can hardly be overestimated. Dave Foreman, the most charismatic of Earth First!'s co-founders, for example, considers Paul Shepard to be "the most brilliant and provocative intellect of our time" (promotional blurb inside Shepard 1998). Native American scholar VINE DELORIA added his complementary argument, first published in *God is Red* in 1972, accusing Christianity of waging a genocidal war against Indians and nature and arguing that only indigenous wisdom could save the planet. George Sessions and Bill Devall were also present; they became influential deep ecology proponents upon their publication of *Deep Ecology* in 1985.

Sessions, a philosophy professor at a small college in the foothills of California's Sierra Nevada Mountains, during this conference and in subsequent publications, joined the bandwagon, blaming anthropocentrism and its most forceful bearer, Christianity, for repressing the ecologically sustainable lifeways and spiritualities of the world's indigenous, foraging peoples. He suggested that Western humans could work their way back to a proper understanding of the "God/Nature/Man relationship" via the pantheism of the seventeenth-century philosopher BARUCH SPINOZA. Sessions also likened the presumed

nature-beneficent spirituality of indigenous peoples to what ALDOUS HUXLEY (following Leibnitz and others) called THE PERENNIAL PHILOSOPHY (1945), the nature-mysticism and feeling of oneness with the universe that some believe is a widespread, crosscultural human experience. Sessions credited not only Huxley but also the anthropologist LOREN EISLEY (1970) for recognizing the ecological sensitivity of “primitive man” (Sessions 1977: 481–2), and lauded the poet ROBINSON JEFFERS as “Spinoza’s twentieth-century evangelist” (Sessions 1977: 509). Arne Naess had also been influenced by Spinoza, and this provided one of the affinities with Sessions that led to their collaboration on a “deep ecology platform” (Naess 1989: 29), which shaped the identity of this branch of environmental ethics.

While many of the voices at this conference had affinities with what would soon afterward be understood as deep ecology (Snyder, Shepard, Sessions, Devall, and in some ways Deloria), there were other perspectives as well. Another Claremont professor, process philosopher and theologian JOHN COBB also presented, providing an environmentally sophisticated version of Christianity. His presentations suggested that the prevalent critiques of Christianity might well be overbroad. In his conference presentation he drew on *Is It Too Late? A Theology of Ecology* (1972) the first of his many publications exploring Christian environmental responsibility. Also presenting was Roderick Nash whose work reinforced White’s thesis about the ecological calamities brought on by Christianity (1973). Observing the greening of Western philosophy and religion in the 1970s and 1980s, however, Nash eventually argued differently in *The Rights of Nature*, asserting that environmental ethics can be well built on occidental cultural roots.

Not long after this conference, in 1976, George Sessions began publishing the first of six issues (the last in January 1983) of *Ecophilosophy* (a term borrowed from Naess for “ecological philosophy), an irregular newsletter distributed to about 150 scholars around the world. Many of these scholars consider this to have been an important incubator for the emerging field. But by 1979, another philosopher, Eugene Hargrove, with the support of the John Muir Institute for Environmental Studies (illustrating the field’s continuity with early conservationism), began publishing *Environmental Ethics*, which would become the discipline’s flagship journal, and facilitate the rapid development of the field. The journal regularly engaged religion, and Hargrove facilitated such discussion not only in its pages, but also in *Religion and Environmental Crisis* (1986), which examined a number of religious traditions. On the tenth Earth Day in 1980, a colloquium on environmental ethics held at the University of Denver was organized by Donald Hughes, who had himself joined the fray as early as 1975, analyzing occidental culture’s contributions to world environmental degradation. (See

EGYPT, GREECE, and the ROMAN EMPIRE for his current perspectives on these cultures.)

Animal Welfare Ethics add to the ferment

Not all environmental ethics, of course, express ecocentric or deep ecological values, as did so many of those drawn to the 1974 conference. The mid-1970s were also a time of creative approaches that focused on the welfare of individual animals or certain kinds of animal species. In 1976, for example, philosophers Tom Regan and Peter Singer co-edited *Animal Rights and Human Obligations*, introducing to a wide audience both animal rights and animal liberation. Regan’s “animal rights” theory endeavored to convince others to extend individual rights to those other beings who were “subject of a life,” that is, basically conscious of their own good. Singer, an Australian philosopher, borrowed from the English utilitarian Jeremy Bentham for his secular theory of animal liberation. Singer argued that the pleasure and pain of all sentient organisms deserves moral consideration and that actions are right that, on average, increase the former and decrease the latter. He used the argument to defend both illegal and extra-legal campaigns to reduce animal suffering. His later hiring at Princeton University into a prestigious academic position drew strong protests from those who rejected his view that humans deserve no more moral consideration than other sentient creatures.

Others followed with theories of their own focusing on the rights or interests of animals. Paul Taylor, for example, drawing on the early twentieth-century work of physician ALBERT SCHWEITZER, argued that moral agents owe respect to all organisms, as individual “teleological centers of life,” which properly pursue their own ends and should be allowed to do so.

The role of primatologists (first and especially JANE GOODALL) and other ethologists (scientists who study animal behavior), contributed decisively to theories of animal welfare. They did so by overturning a wide variety of common assumptions regarding human uniqueness (such as that only *Homo sapiens* use and fashion tools, or have emotional lives and suffer), and the notion that animals are mere moving machines, “automata,” as French philosopher Rene Descartes famously put it in *Discourse on Method* (1637).

Although animal rights ethics have usually been articulated in non-religious terms (arguing essentially that there are no morally relevant differences between humans and sentient animals), it is common to find in publications or interviews that those advancing such ethics have had profound experiences of connection with the animal subjects they seek to protect. Such experiences can often be understood in religious terms, and sometimes are expressed in them. Tom Regan, for example, thinks that while most drawn to animal rights activism slowly grow into the needed awareness, others are “like Franciscans

who just seem to be able to enter into an “I–thou” relationship intuitively,” while others have a “road to Damascus” experience and are suddenly “infused with animal consciousness.” Not a few animal activists recall that their beliefs really began suddenly, or intensified greatly, upon the occasion of eye-to-eye contact with an animal, where its full personhood seemed immediately obvious. Examples can be multiplied, including many in this encyclopedia, such as the biographies of CAPTAIN PAUL WATSON or JANE GOODALL, or in Goodall’s own reflections upon PRIMATE SPIRITUALITY.

Regan’s own presentations can involve a kind of ritualizing. He often urges his audiences to choose a “totem animal,” and make a commitment to its well-being. He thinks this is one way to facilitate an emotional reconnection to our earthly animal companions and to ensure long-term participation in the animal rights movement (Regan’s views are from a 14 February 2003 interview with the author).

Such examples suggest that more research into dimensions of environmental ethics that are not at first glance religious might well prove fruitful. Clearly, environmental ethics that may not be *necessarily* religious often make sense to people either *because* of religious experiences or as the result of religious cultural influences they have had. The forester GIFFORD PINCHOT, for example, who articulated an anthropocentric and utilitarian rationale for forest protection, was significantly influenced by America’s politically progressive social gospel movement. Nevertheless, few recognize the religion-related roots of his environmental ethics.

Environmental Ethics Debates from Earth Day 1980 and Beyond

The discussion thus far has identified antecedents to the decade in which environmental ethics became established as an important field for exploring moral and religious aspects of nature–human relations. It spotlighted some of the diverse influences that pushed these developments forward, including certain ecological sciences (especially population dynamics and ethnology), anthropology, and environmental economics (and below we will add environmental history). The analysis suggests that environmental ethics is necessarily interdisciplinary.

“Environmental ethics” emerged during a time of cultural upheaval affecting people with a wide variety of religious perceptions and backgrounds. Many religionists and scholars of traditions not singled out for special blame nevertheless began their own reappraisals during this period. These developments, which intersect with the present analysis, are described in RELIGIOUS STUDIES AND ENVIRONMENTAL CONCERN and are discussed in detail in the many tradition-focused entries analyzing contemporary developments.

This discussion concludes by summarizing important

religion-related issues that emerged in the environmental ethics field since *Environmental Ethics* began publishing in 1979. The major issues are related to (1) ecofeminism, (2) social philosophy, (3) the idea of wilderness and the social construction of nature, (4) the relationship between science and religious ethics and, (5) the relationship between environmental values and practices.

1) Ecofeminism

Two arguments made by some ecofeminists are particularly relevant to *religious* environmental ethics. One is the assertion that the oppression of women and nature are closely connected and that establishing proper human relationships among humans and other creatures requires an overturning of patriarchal civilization and the corresponding breach between men and women. The other is the claim that women *are* essentially closer to nature, more naturally able to appreciate its sacredness, and that this ability needs to be recognized and nurtured as an important resource in the struggle to reharmonize life on Earth. The latter claim is controversial among ecofeminists (some of whom reject any assertions that women are “essentially” one way or another) and those unsympathetic to such a perspective. The vitality and diversity of these approaches are discussed in ECOFEMINISM and related entries.

2) Social philosophy

So much environmental ethics has been invested in debates regarding moral considerability (anthropocentrism vs. ecocentrism vs. animal rights), and over the relative merits of Western vs. Eastern philosophies and religions, that relatively less attention has been devoted to social philosophy. Indeed, many environmental ethicists seem unaware of a rich literature in political science that has struggled over the relative merits of different political arrangements. Environmental ethics, however, needs a strategy, and since the environmental diagnosis generally involves a claim that there is something wrong with society, the prescription must also be political. There is no avoiding social philosophy, therefore, which seeks to analyze, discover and defend the social arrangements and political systems that best cohere with morality. *Green* social philosophy adds environmental sustainability as an essential litmus test for any social philosophy; the effort to discern what sorts of social arrangements are most likely to ensure the flourishing of all species and ecosystem types is crucial to this investigation.

This is not to say social philosophy has not been discussed or debated. Two contributors to Herman Daly’s steady-state economy books, Garrett Hardin and the political scientist William Ophuls, did so explicitly. Ophuls surmised that a benevolent green dictatorship was needed to arrest environmental degradation and ameliorate social conflicts exacerbated by environmental scarcity. In a

more democratic vein, Hardin urged mutually agreed-upon coercion. These kinds of perspectives have made many nervous, even leading to charges that environmentalism can promote FASCISM or ECOFASCISM.

Vermont-based communitarian anarchist Murray Bookchin pioneered one school of thought focusing on social philosophy. Known as "Social Ecology," this approach could be described briefly as communitarian anarchism. Social ecology resists hierarchy in general and capitalist market societies with special intensity. It offers as an alternative decentralized community self-rule, and voluntary federations of these participatory bodies, as the path to social justice and environmental sustainability.

Bookchin has been sharply critical of the nature mysticism he accurately perceived as animating much contemporary environmentalism, including that of radical environmentalists. But Bookchin's antipathy to such spirituality does not mean anarchism and social ecology cannot provide fertile ground for religious environmental ethics. As the work of the anarchist scholar John Clark has shown (in his books and in ANARCHISM and SOCIAL ECOLOGY in this encyclopedia), and certain direct action environmental groups such as the DONGA TRIBE, many anarchistic environmental ethics are sympathetic to if not grounded in nature spirituality. These forms of environmentalism generally view the animistic, pantheistic, and/or panentheistic spiritualities of indigenous peoples, or certain religions originating in Asia, as offering positive environmental values superior to those found in large-scale, centralized, monotheistic societies. Indeed, especially in the mid-1980s in the United States and Europe, "green anarchism" has become one of the most rapidly growing popular fronts within RADICAL ENVIRONMENTALISM.

On the one hand, this is unsurprising, for to be "radical" an ethics must purport to get to the root of the problem and offer a solution that does more than address symptoms, but eradicates causes. This is unsurprising as well because much environmental ethics has criticized large-scale industrial civilization, especially in the Occident, and because many of the earliest proponents of such critiques, such as GARY SNYDER and BIOREGIONALISM, a movement he helped inspire, trace their roots to anarchistic thinkers and movements and see affinities between such movements and indigenous cultures. On the other hand, this is ironic, for deep ecology, a form of radical environmentalism in many minds, has been criticized for refusing to be specific about which political systems are warranted, while other forms, such as EARTH FIRST! AND THE EARTH LIBERATION FRONT, are often viewed as one or more of the following – anti-democratic, violent, terrorist, Malthusian/anti-poor, racist, sexist, or in general fascistic – for putting concern for the whole biosphere and ecosystems over the well-being of particular groups or individuals.

Many environmental ethicists and activists, of course, simply take for granted the existing political systems and

institutions, viewing these as the structures within and through which they must work toward environmentally sustainable lifeways. With such a presupposition, there is little impetus to focus on social philosophy. Most of those in Western democratic countries, for example, who focus on ENVIRONMENTAL JUSTICE AND ENVIRONMENTAL RACISM, do not seek to overturn existing political institutions, but rather, to hold them accountable to their own, stated ideals.

Since societal majorities do not think revolution desirable or feasible, this may help to explain why social philosophy, despite pressure from more radical groups, has not received more attention than it has. It may be, however, that if political scientists such as Thomas Homer-Dixon are correct in their projections of intensifying environmental deterioration, scarcity and concomitant social conflict, that increasing attention to social philosophy in environmental ethics will follow. This would seem to be a likely response as frustration intensifies regarding the inability or unwillingness of existing political institutions to respond to environmental crises. One possible piece of evidence in this regard is the draw that green anarchism seems to hold for many frustrated radical environmentalists. Another example of this kind of dynamic might emerge based on the assertions of those Muslim intellectuals who have begun to argue that ISLAMIC LAW provides the best ground upon which to establish environmental and human well-being.

There are many other possible futures, of course, including the repressive green government that in the 1960s Ophuls and others asserted would become necessary. This much is reasonably clear: to the extent that liberal democracies are viewed as tethered to anti-nature religions, religious environmental movements will offer competing social philosophies; moreover, as people struggle for power and over social arrangements in order to arrest ecological catastrophe, religion and politics will be intertwined.

3) *The social construction of nature*

In 1992 Neil Evernden published *The Social Creation of Nature* and with it debates about the social construction of reality spread rapidly into environmental disputes. In a nutshell, the resulting battle has been over whether, given the widespread impact of human activities, any "non-human" nature remains available to function as a base-line reference point for environmental conservation or restoration, and even whether there was ever any legitimacy to such endeavor.

The controversy intensified when the environmental historian William Cronon published "The Trouble with Wilderness; Or, Getting Back to the Wrong Nature" in 1995, including an abridged version in the *New York Times Sunday Magazine*. Cronon argued that the idea of a wilderness (defined as a place "untrammelled" by humans in America's 1964 Wilderness Act) where humans have no

impact is wrong and ethically problematic. It is wrong because there is no such place, and it is ethically problematic because it distracts people from caring for the environment every place else, which on Cronon's reading, is actually everywhere. The sometimes vitriolic debate that followed was well captured in the first volume and issue of *Environmental History* (1996), which reprinted Cronon's article alongside critiques of it by conservation historians Samuel P. Hays and Michael P. Cohen. Soon after that, even broader discussions occurred in the *The Social Siege of Nature* (Soulé and Lease 1995) and *The Great New Wilderness Debate* (Callicott and Nelson 1998), as well as in a variety of environmental journals.

Cronon, assailed if not shunned by some in the environmental community whom he considered his allies and friends, offered both an unusual apology and a religious confession in his response to the uproar his article had precipitated:

One problem with "The Trouble with Wilderness," then, is that in reminding those who worship at the altar of wilderness that their God (like all deities) has a complicated and problematic past, I have perhaps not been as respectful of this religious tradition as I ought to have been. I mean this quite genuinely: to the extent that I have given offense by treading too carelessly on hallowed ground, I sincerely apologize. Had I been writing about Judaism or Christianity or Islam or Buddhism, or about the spiritual universes of native peoples in North America and elsewhere, I certainly would have been more careful to show my respect before entering the temple to investigate and comment on its architecture and origins. The reason I did not do so in this case is that the religion I was critiquing is my own, and I presumed a familiarity which readers who do not know me can be forgiven for doubting.

... I criticize wilderness because I recognize in this, my own religion, contradictions that threaten to undermine and defeat some of its own most cherished truths and moral imperatives. I have *not* argued that we should abandon the wild as a way of naming the sacred in nature; I have merely argued that we should not celebrate wilderness in such a way that we prevent ourselves from recognizing and taking responsibility for the sacred in our everyday lives and landscapes (Cronon 1996: 56, 57).

Cronon's pledge of his allegiance to the wilderness church in America was revealing in a number of respects. First, he recognized that only a member of this church could effectively speak to it. Second, wilderness religionists, like their counterparts in institutional religions, are capable of sanctioning their own and forcing recantation. Third, scholars play important roles in nature-related

religious production and ethical reflection, even those who rarely if ever write in a religious genre. And fourth, the perception that nature is sacred, especially the Earth's remaining wildlands, is resilient, even against constructive attack that would relativize such claims. Further discussion of the implications for both religions and secular environmental ethics regarding such issues is found in the entries on WILDERNESS RELIGION and THE SOCIAL CONSTRUCTION OF NATURE.

4) *Science and religious environmental ethics*

Conflicts between religious and scientific claims are as old as Galileo and science itself. The cosmogonies of scientists (perhaps especially evolutionary biologists) are always difficult to reconcile with those cosmogonies in which a divine being or beings are responsible for how the world came to be the way it is. Moreover, new scientific theories and understandings often create new cosmogonic conflicts, and this has been occurring in environmental ethics. While many encyclopedia entries explore religion, science and environmental ethics, in this overview it may be helpful to mention several religion-and-science-related issues that promise to preoccupy environmental ethics for a long time to come.

J. Baird Callicott, already discussed as an environmental ethics pioneer who found greater environmental potential in indigenous and Asian religions than occidental ones, went on to publish *Earth's Insights: A Multicultural Survey of Ecological Survey from the Mediterranean Basin to the Australian Outback* (1994). In the main, he repeated his earlier perception, but in this case, he also described themes within Judaism and Christianity that could undergird positive ethical approaches to nonhuman nature. More importantly with regard to the present conundrum, however, was Callicott's proposed method to resolve conflicts between religion and science. When religious and scientific understandings conflict, he asserted, scientific beliefs should trump religious ones.

This is certainly one way to deal with the problem, privileging science over religion, but Callicott's claim proved controversial. In *Worldviews: Environment, Nature, Culture* (vol. 1, no. 2, 1997), a special issue devoted to Callicott's book, he was criticized along two major lines. First, he was faulted by some who argued that science is not sacred, but rather, it is an ideologically shaped cultural construction that often serves anti-human and anti-nature interests and should therefore not be privileged. A related critique was that Callicott was offering a hegemonic narrative that could not fully respect religious or cultural diversity. Secondly, he was faulted for failing to ground his ethics in a religious perception of the sacredness of life. Purely scientific narratives cannot provide an independent ground for ethics in general, let alone environmental ethics, according to this line of criticism (Taylor 1997b). The proper balance between scientific and religious under-

standings, of course, remains contested, and promises to provide indefinitely a lively debate.

Other scientific theories offered different challenges for religious environmental ethics. Ecologists and evolutionary biologists advanced theories that explained human moral sentiments, including ones establishing a basis for environmental concern, without reference to an explicit need for religion. For example, EDWARD O. WILSON (later with Stephen Kellert) propounded a theory he called BIOPHILIA, as well as another called sociobiology, that viewed our affective and moral connections to nature as adaptive behaviors explainable as evolutionary outcomes. David Sloan Wilson in *Darwin's Cathedral: Evolution, Religion, and the Nature of Society* (and in *EVOLUTIONARY BIOLOGY, RELIGION, AND THE STEWARDSHIP OF NATURE*), as well as anthropologists (see especially *ECOLOGY AND RELIGION* and *ECOLOGICAL ANTHROPOLOGY* and the cross-references provided in them) argued similarly that religion at its best is a mode through which human organisms successfully adapt to their environments.

These theorists are generally either agnostic or do not believe that the associated metaphysical beliefs of religions are true, even the ecologically adaptive ones. Such perspectives do not seem, therefore, to provide for anything other than a short-term rationale for religion, for it is valuable only to the extent that it promotes environmental sustainability. A question naturally follows, then: If there are compelling non-religious grounds for environmental ethics, then is religion really needed? And if religious metaphysical beliefs are incredible anyway, then does not intellectual integrity and a concern for veracity require that they be jettisoned, even if they might serve other interests?

Of course, such perspectives and reasoning would be troubling, to say the least, to religionists, and would make them suspicious of scientific perspectives they might otherwise embrace, as Anna Peterson points out in, *Being Human: Ethics, Environment, and Our Place in the World* (2001), a book-length study by a religious ethicist and feminist that wrestled seriously with these kind of evolutionary perspectives without dismissing them out of hand. That this was an exceptional effort underscores that a fully interdisciplinary discussion of such issues had barely begun by the early twenty-first century.

5) *The relationship between environmental values and practices*

Already mentioned was Yi-Fu Tuan's assertion of a bifurcation between environmental values and practices. To the extent that this is true much of, if not all of the ferment over "environmental ethics" will be largely or entirely a waste of time. For whatever else it is, environmental ethics is not only about understanding environmental values; it is also about promoting these in such a way that behaviors follow. What if achieving the former does not accomplish

the latter? This is one of the least explored areas of inquiry in environmental ethics, perhaps in part because philosophers and religious ethicists are usually not very well equipped to ask such questions.

J. Baird Callicott and Roger Ames did respond to Tuan's argument, asserting that "there is less evidence for Tuan's skepticism than for White's optimism about whether environmental ideas and values can exert a significant influence on environmental behavior" (1989: 287). Little empirical data was assembled in the rebuttal, however, and the studies that have been done on the relationships between environmental attitudes and behaviors do not suggest a close correlation. Glenda Wall, for example, found that environmental action is unlikely "regardless of [levels of environmental] concern, unless an environmental issue is linked to immediate personal concerns, or societal arrangements exist that help to reduce the costs of compliance and facilitate cooperative action" (Wall 1995: 465). She also summarized the growing literature on environmental attitudes and concluded as a result that the correlation between attitudes and behaviors, when present, is low. Similarly, in a broad study of the American Public published in *Environmental Values in American Culture* (1995) Willett Kempton and his team of researchers found a significant disconnection between environmental values and changes toward environmentally sustainable lifestyles or environmental protection actions. As the geographers James Proctor and Evan Barry show in *SOCIAL SCIENCE ON RELIGION AND NATURE*, "empirical work in environment as religion is relatively scarce" and "Social science has done a tremendous service to the study of religion and environmental concern, but it has failed to deliver the conclusive chapter to the story." They are among those working on getting more definitive answers. Certainly what social science discovers about the various conditions under which environmental ethics, including religious ones, produce concrete environmental action should be and presumably will be important in the evolution of environmental ethics. Equally important, however, are qualitative and historical studies which are better at explaining why small groups and movements break out from the normal patterns and engage in dramatic environmental action, sometimes if not usually motivated by religious perceptions and ideals, as was seen, for example, in the numerous case studies scrutinized in *Ecological Resistance Movements: The Global Emergence of Radical and Popular Environmentalism* (Taylor 1995), which was itself informed by what has become known as "social movements theory."

Rather than assuming a close connection between religion, environmental values, and environmental behavior, any practical environmental ethics will have to go further than has been the case to this point to understand the connections between values and actions. Why are these connections apparently weak usually and in

general, but in some cases apparently strong and directly motivating?

Conclusion

The preceding introduction to environmental ethics, although far from comprehensive, does provide a sense of the religious dimensions, tributaries, evolution, vitality, fecundity, and conundrums surrounding it. It also illustrates that the lines between non-religious and religious environmental ethics often blur as they play off of and influence one another. Cross-disciplinary and cross-cultural ethical and religious influence has become an important characteristic of the evolving field of environmental ethics.

Environmental History – See Environmental Ethics.

Environmental Justice and Environmental Racism

Environmental justice refers to a broad range of issues that combine values of social justice with environmental values and practices. Environmental justice pertains when the cause of social injustices are mediated by environmental conditions, or the environmental burdens that threaten human health are bound by social injustices of marginalization, exploitation, discrimination, racism, sexism, and various forms of imperialism. Examples of environmental burdens include exposure to hazardous materials and toxic wastes, pollution, health hazards, workplace hazards, as well as the exploitation and loss of traditional environmental practices and depletion of local natural resources. Environmental benefits include a safe workplace, clean water and air, easy access to natural surroundings or parks, fair compensation for environmental burdens, and the preservation of traditional environmental practices connected to local natural resources. Concern for environmental justice grew as a grassroots movement of people of color and poor communities. Various populations including African-Americans, Hispanic Americans, Native Americans, and Americans of Asian and Pacific Island descent, as well as the urban, rural, and industrial poor populations – who make up their own local cultures – actively defended against the inequitable distribution of environmental burdens and the lack of participation in environmental decision making. The religious and spiritual importance can be addressed in four general arenas of environmental justice: distributing environmental burdens according to religious affiliation; organizing grassroots reactions to environmental threats from the religious community base; struggling to protect sacred spaces and places; and comprehending spirituality through values of environmental justice.

The first arena of religious environmental injustices pertains to the direct targeting of religious affiliation as a criterion for the location of environmental burdens. One of the most dramatic instances of religious targeting for environmental discrimination exists in the report authored by the Cerrell Associates, a public relations firm for the State of California. The now-infamous 1984 *Cerrell Report* argued that a community with reduced capacity for resistance, rather than geological and other scientific characteristics, would best determine the location of environmental burdens. In the report, characteristics such as high unemployment, high school or less education, and Catholic congregations would prove to be likely sites of least resistance. Identifying the faith of a community exposed a sanctioned religious discrimination in the distribution of environmental burdens.

The second arena of religious and spiritual significance for the environmental justice movement pertains to grassroots organizing around a religious community base. Communities in environmental justice cases often rely upon the moral center and congregational core of their religious organizations. A critical example is also one of the focal points in the movement's origins in the community of Afton in Warren County, North Carolina, where in 1981 it was chosen as the site for a toxic landfill. At the time, Afton had an 84 percent African-American population; Warren County had the highest percentage African-American population in North Carolina. In 1982, Dr. Charles E. Cobb, Director of the United Church of Christ's Commission for Racial Justice (UCC-CRJ), spoke out against this landfill, arguing it demonstrated how African-Americans and the poor are forced to assume heavier environmental burdens than white communities. Other important national organizations, such as the Southern Christian Leadership Conference and the Congressional Black Caucus also protested. This support inspired a campaign of nonviolent civil disobedience culminating in protest of activists and residents bodily blocking the trucks hauling toxin-laced soil, which led to over 500 arrests and drew national media attention. The Warren County protest represented one of the first public mobilizations against environmental racism. Although the protest was unsuccessful in stopping the toxic landfill site, the incident sparked the environmental justice movement, and two decades later the state closed the landfill and attempted to compensate the community for the long period of environmental injustices.

As its legacy, the Warren County incident introduced a new set of environmental obligations in the United States: the first of which was to decipher the extent of the disparate distribution of environmental burdens on communities of color and poor communities. For instance, the 1983 General Accounting Office study, *Siting of*

Hazardous Waste Landfills and Their Correlation with Racial and Economic Status Surrounding Communities, focused on the Southern states that make up Region IV of the United States Environmental Protection Agency (US-EPA). This study noted a strong correlation between the location of poor and African-American communities and hazardous waste sites. The study still left many questions about the extent of the problem beyond this region, which prompted the United Church of Christ's own nationwide study, *Toxic Wastes and Race in the United States*. It confirmed the disparate distribution of hazardous waste facilities suffered by minorities and lower socio-economic groups, concluding "Race proved to be the most significant among variables tested in association with the location of commercial hazardous waste facilities" (UCC-CRJ 1987: xiii). Upon the 1987 presentation of this study to the National Press Club, in Washington, D.C., Reverend Ben Chavis, Director of the UCC-CRJ coined the first official definition of *environmental racism*:

racial discrimination in environmental policy making, and the unequal enforcement of environmental laws and regulations . . . the deliberate targeting of people of color communities for toxic waste facilities . . . the official sanctioning of the life-threatening presence of poisons and pollutants in people-of-color communities for toxic waste facilities . . . the history of excluding people of color from the leadership of the environmental movement (*Hearings Before the Subcommittee* 1993: 4).

At the same time that studies were confirming the extent of the problem, religious organizations created their own networks as an obligation to protect these communities. The National Council of Churches created the Eco-Justice Working Group in 1983 and later The Environmental Justice Covenant Congregation Program, as way to promote environmental justice. The Black Church Environmental Justice Program established community support among seven historically black denominations. Spiritual and religious support in environmental justice struggles also occurred in many diverse, localized forms, including expressions of cultural heritage. An example of the former is the Mothers of East Los Angeles (MELA), which began as a group of Latina grandmothers who, with their local priest, organized a neighborhood watch group. During one of their meetings, they organized MELA to block the building of a prison in their neighborhood. MELA continued in strength, by blocking an oil pipeline planned to traverse a local schoolyard, successfully derailing plans for a hazardous waste incinerator, and building a women's grassroots organization capable of leading voting drives for representatives and introducing community improvements on multiple environmental justice fronts. Another front of religious

community support in cultural heritage can be found in the struggles against pesticides and labor injustices fought by César Chávez and the United Farm Workers. These struggles were often based on principles found in Catholic papal encyclicals, the Mexicano religious heritage of suffering and penance, and an iconic following of the Virgin of Guadalupe.

The environmental justice frame expands into territories beyond the waste and pollution issues; since, vital cultural, spiritual, and natural resources concern social justice and ecological sustainability around values of place. The third arena of environmental justice, therefore, pertains to the protection of sacred spaces and places of ritual. Many examples of indigenous land struggles occur at the intersection of place and spiritual values. Such struggles often are articulated around issues of resource use. In the United States, indigenous peoples struggle for water use that connects them to their spiritual heritage. Acoma poet Simon Ortiz, for example, reflects,

water defines our culture, water from the skies, and groundwaters, which are really part of each other. In terms of religion, the gods and the kachinas bring the water, of course they bring it in terms of the weather forces, the climatic conditions that provide that water (Adamson, Stein, and Evans 2002: 21).

In the same conversation, Chicano anthropologist Devon Peña has observed, "for the Pueblo Indian and the Hispano Mexicano alike, water was not a commodity. It was not the exchange value that was important, it was the communal and spiritual value that was important" (Adamson, Stein, and Evans 2002: 22). The overall struggle is spiritual: for sacred values, practices, and resources are unfairly distributed to large population centers.

Other kinds of examples include the preponderance of high-level nuclear waste facilities slated and proposed for Indian lands. Sites typically offer attractive economic compensation; however, debates about land rights and respect for sacred lands still ensue. The Shoshone Indians have long debated the Yucca Mountain nuclear waste facility and the extent to which it impacts sacred land. The appeal to ritual spaces and sacred land is a vital sticking point in environmental justice cases for indigenous peoples. Given such values cost-benefit analysis cannot easily be used for such decision making, for resource economics and the values of sacred spaces are construed very differently. Hence, Rep. Lindsey Graham (R-SC) commented to the Shoshone: "God made Yucca Mountain for the express purpose of storing high level nuclear waste. There's nothing within a 100 miles of the place" (LaDuke 2002: 26).

A fourth example of a religious arena in the environmental justice movement pertains to the emergence and expression of spirituality through values of the movement

itself. In 1991, the First National People of Color Environmental Leadership Summit convened in Washington, D.C., and adopted *The Principles of Environmental Justice*, heralded as the truest example of the movement's self recognition. Within it are multiple references to spirituality emerging from the movement. For instance the Preamble stated,

We, the people of color, gathered together at this multinational People of Color Environmental Leadership Summit, to begin to build a national and international movement of all peoples of color to fight the destruction and taking of our lands and communities, do hereby re-establish our spiritual interdependence to the sacredness of our Mother Earth (Hofrichter 1993: 237).

Additional examples of spirituality growing from concerns of environmental justice are identifiable in many works of ecological theologians, which span a number of themes. Among some examples of this scholarship, we can include Rosemary Radford Ruether's observation of the interrelation between the dominance of human activity upon the Earth with the social dominance around gender, racial, and economic inequities. She has called for a language of eco-justice that spiritually connects and addresses these forms of domination. Sallie McFague has measured the religious concept of the "good life" in contrast to the damaging effects of distributive inequities of environmental burdens and the Western over-consumption of resources that have causal status to these inequities. One of the critical features of the environmental justice movement is that 70–80 percent of the grassroots leadership has come from women who are mostly blue-collar women and predominantly women of color. Karen and Garth Baker-Fletcher expand upon this backdrop and utilize environmental justice concepts in their interpretation of Black womanist theology:

The entire cosmos, then, is engaged in God's activity of providing resources for survival and wholeness. Not only do we see Jesus in the faces of Black women; we see Jesus in the face of the earth, in the face of the waters, in the faces of wind and sun and moon. One of the forms of captivity that keeps human beings enslaved, womanists must add, is environmental racism and the global problem of environmental justice (Baker-Fletcher and Baker-Fletcher 1997: 84).

The history and scope of the environmental justice movement is often mistaken as a recent, merely anthropocentric cause. However, the purpose for conceptualizing environmental problems in terms of environmental justice

is fundamentally to resist the separation of environmental degradation from social justice. The environmental justice movement, now recognized by its veteran voices as the largest and fastest growing social movement in the world, refuses the final distinction of anthropocentric and non-anthropocentric concerns. Many global environmental crises, such as global warming, ozone depletion, climate impacts, acid rain, desertification, and downstream pollution are transnational problems that leave the poorest peoples, often previous colonies and indigenous peoples of the world, as the sufferers of environmental burdens produced by the wealthiest, previous colonial powers, of the world. For many communities and peoples worldwide, environmental justice is a matter of protecting ways of living that view religious, environmental, economic, and social values as inseparable. Thus, in Chiapas, Mexico, indigenous struggles are about land rights, sustainable agriculture, cultural self-determination, and spiritual heritage. In India, sacred groves must be protected against new land-use pressures from industry and growing populations. And, in San Jose, Phillipines, farmers struggle against invasive chemical farming and genetically modified seeds from American biotechnology corporations, in order to sustain their heritage of organic land management. Such diversity in global environmental justice movements involves comparably broad connections between religion, ecology, and social justice.

Environmental Sabbath

The Environmental Sabbath grew from two seemingly unrelated events: the Assisi Declarations on religion and nature, written by representatives of five major world religions at a 1986 meeting in Italy, and a declaration by the United Nations that 1987 would be the Year for the Homeless.

To the UN Environment Programme, these events were connected. The religious leaders at Assisi wanted to awaken followers around the world to the spiritual dimension of the environmental crisis by declaring how each faith reflects on and celebrates the natural world as a manifestation of the sacred. Similarly, UNEP reasoned that since Earth is our only home, we must preserve it, not destroy it, or we all could become homeless.

In the autumn of 1986, soon after Assisi, John J. Kirk, Director and Professor of Environmental Studies at the New Jersey School of Conservation of Montclair State University, met with Noel J. Brown, Director of UNEP's Regional Office for North America. Dr. Kirk asked if a dialogue with representatives of some religions might help UNEP in its efforts to protect the planet. Spiritual and ethical values were essential for equitable environmental policy making, they agreed, since science and technology could not provide all the answers. They decided to invite the leaders of several faith communities to the United Nations to initiate a project that would inform North American congregations about the serious environmental problems facing life on Earth.

The planning group of fifteen had just seven months before the first Environmental Sabbath in 1987. Their goal was to create a sabbatical for the planet – an Earth Rest Day to be celebrated annually by faith communities at any time, but especially on the weekend nearest World

Environment Day, June 5th, to commemorate the first major UN conference on the environment which took place in 1972. In the spring of 1987, the group sent kits to 1500 religious leaders in the U.S. and Canada, with ecological information and liturgical suggestions from several faiths, inviting them to use the material in special Environmental Sabbath services.

Letters lauding the initiative came in, not only from those on the mailing list, but also from others who wanted to know more: grassroots groups, garden clubs, colleges, the Scouts and other youth groups.

Following this encouraging reaction, the planning group was enlarged to become the Environmental Sabbath Steering Committee with a wider religious scope and greater access to grassroots organizations. In 1988, a more substantial package containing fact sheets on the state of the environment and liturgical suggestions was sent to 3500 faith and grassroots communities.

Although the event had been promoted only in North America, the response was surprisingly international with letters coming in from as far away as the Philippines, India and Australia. By 1989, the number of participating groups had nearly tripled with 10,000 requests for the Environmental Sabbath kit, and the number kept growing. By 1990 the mailing list again had more than doubled to 25,000. The Sabbath network grew so fast that a newsletter began publication in 1989 as a conduit for ongoing action and interaction, and, over the next few years, the simple kit became an annual magazine – an Earth Care Day guide for the faithful, teachers and students alike, in all settings.

As a result of this success, representatives of other faiths expressed interest in participating. A great deal of consideration was given to changing the name from Environmental Sabbath to something more suitable for faiths that do not celebrate a sabbath. During this time – the mid-1990s – both the newsletter and annual Earth Care Day guides were discontinued and there was no UN outreach, although people continued working independently within their faith communities.

In 1999, the new director of UNEP's New York Office, Adnan Amin, began working with the recently expanded and renamed group, the Interfaith Partnership on the Environment, to develop a new series of initiatives. The following year *Earth and Faith: A Book of Reflection for Action* was published; within a year, nearly 40,000 copies were in use in religious institutions, schools, community groups and people's homes worldwide.

What began as an Environmental Sabbath evolved into much more than an annual observance. For many it has become a way of life that has melded scientific knowledge and spiritual values in a new covenant with the Earth.

Epic of Evolution

The Epic of Evolution, like its synonymous terms, "cosmic evolution" and "the universe story," encompasses what Eric Chaisson has labeled "the broadest view of the biggest picture." This epic tells the sprawling story of the evolution of the cosmos, from the first moment of creation to the present state of the universe. It is the attempt to construct a unified and comprehensive narrative of systematic development throughout the history of the universe, including the origins and the diverse organization of matter, life and consciousness. The Epic of Evolution is premised on the insight that the universe as a whole is best

understood as a single unfolding event, beginning with the big bang, about 14 billion years ago, and continuing through the emergence of macroscopic structures (e.g., galaxies, stars, solar systems), and microscopic structures (e.g., atoms, molecules, cells).

The Epic of Evolution has been inspired by the remarkable theoretical unification of scientific disciplines taking place during the course of the twentieth century. The most exciting theoretical advances in science in recent decades are those enabling an integration of the sciences of the large with the sciences of the small. In physics, astronomy has been theoretically coupled with particle physics to produce quantum cosmology. In biology, evolutionary theory has been coupled with molecular biology to produce a grand synthesis. Theoretical breakthroughs have continued into the social sciences, where behavioral genetics and neurobiology are being integrated with cognitive, developmental and social psychology. These advances have gradually revealed what Edward O. Wilson has called "consilience," that is, a fundamental continuity and theoretical coherence among the physical sciences, the life sciences and the behavioral sciences. Consilience among scientific disciplines now makes it possible to construct a coherent narrative of the emergent properties of matter, life and consciousness. Implicit in contemporary science is an Epic of Evolution.

The task of making the Epic of Evolution explicit is not

P Epic Ritual

The "Epic of Evolution" is the 14-billion-year narrative of cosmic, planetary, life, and cultural evolution – told in sacred ways. Not only does it bridge mainstream science and a diversity of religious traditions, if skillfully told, it makes the science story memorable and meaningful, while enriching one's religious faith or secular outlook.

In the early through mid-twentieth century, the Jesuit paleontologist Pierre Teilhard de Chardin promulgated a Christian version of the story, while Julian Huxley (biologist), Aldo Leopold (ecologist), and Loren Eiseley (anthropologist) wrote eloquent tomes from what could be called a "religious naturalist" perspective. But it was not until the 1970s and 1980s that the intellectual and literary expressions of the Epic of Evolution began to be celebrated in ceremony and ritual.

The first ritual expressions were associated with the deep ecology work practiced and promoted by Joanna Macy (California) and John Seed (Australia). Although "The Council of All Beings" is the most familiar of their productions, Macy and Seed (as well as Jean Houston in New York) created solemn processes and guided meditations that helped participants connect with their primate, reptilian, and fish heritage.

In the early 1980s, Sister Miriam Terese MacGillis of New Jersey, a student of Thomas Berry who founded Genesis Farm, created "the cosmic walk," which has become perhaps the most common way in which the Epic of Evolution is celebrated in ritual format. A rope or pathway is laid out in a spiral on the ground, with stations representing major evolutionary events, scaled (arithmetically or geometrically) to the actual time of their occurrence. Thus 14 billion years of evolution is represented along the length of the spiral. Those who take the walk begin their journey at the center of the spiral, at the birth of the known universe, and then advance toward the present as they walk the spiral outward. Scientists refer to this beginning as the Big Bang, but Epic practitioners prefer more sacred terms, such as "Great Radiance" (a term from Philemon Sturges) or "Primordial Flaring Forth" (drawing from Brian Swimme and Thomas Berry). Variations of MacGillis' initial walk are still in use, as well as completely new texts, though still using the spiral format. Many examples of such ritualizing are available on the internet, which is a good place to track the evolution of such spirituality and ritual processes. Catholic retreat centers are increasingly building permanent outdoor cosmic walks on their grounds.

Continued next page

In his book, *Hidden Heart of the Cosmos*, cosmologist Brian Swimme selects several components of the Epic of Evolution and offers practices for bodily awareness of several of them, including: 1) how to experience the Earth turning rather than the sun “setting”; 2) how to experience the center of the Milky Way Galaxy. To experience Earth turning, Swimme suggests going out at sunset and envisioning oneself “standing on the back of something like a cosmic whale, one that is slowly rotating its great bulk on the surface of an unseen ocean” (1996: 27). To experience the center of our galaxy, Swimme invites us to lie on our backs under the night sky, to gaze at the constellation Sagittarius (which aligns with the center of the galaxy), and then to imagine the stars not as “up” but “down.” Earth’s gravity is the only thing that holds the viewer from falling “down” into the gravitational attraction at the center of the Milky Way. “You hover in space, gazing down into the vault of the stars, suspended there in your bond with Earth” (1996: 52).

Around the turn of the millennium, several people in the United States independently originated a way to experience the Epic of Evolution in a new and very personal way: through the stringing of “Great Story Beads,” “Universe Story beads,” or a “Cosmic Rosary.” Beads are purchased (or made from clay) and strung in a loop to signify major moments of transformation (“grace moments”) in the long journey of evolution. Unlike the public “Cosmic Walk” these loops or necklaces of beads enable individuals to personalize the story: choosing which events are most meaningful to them, including significant events in their own life story as beads in the loop. Instructions for creating Great Story Beads, including a suggested timeline, are available online to facilitate this process.

Seasonal celebrations are yet to develop for the Epic of Evolution. The creation of the chemical elements (carbon, oxygen, iron, gold, and so on) inside of stars that lived and died before our sun swirled into existence is beginning to be celebrated at the winter solstice. But it is such an alluring aspect of the epic that it is celebrated also throughout the year. In a sort of “Cosmic Communion” (which has been performed at Sunday services of Unitarian Universalist churches), participants are anointed with “stardust” (glitter) to signify, as Carl Sagan pointed out in the 1980s, that we are quite literally “made of stardust.”

Connie Barlow and Michael Dowd (whose “The Great Story” website details the stardust ritual) have brought the Cosmic Communion into Unitarian churches and spiritual retreat centers, along with an experiential process to “celebrate your cosmic age.” Barlow also emphasizes how one can see the constellation Orion in a

new way: the Red Giant star Betelgeuse, in Orion’s right arm, is fusing helium into carbon, oxygen, and nitrogen right now (all are elements that we breathe in and out). The blue-white star Rigel (in Orion’s left leg) is fusing carbon and helium into silicon, calcium, potassium, and will one day forge silver and gold when it expires in a brilliant supernova explosion.

Other forms of Epic Ritual, still evolving, are designed to keep the memory alive, and thus honor, extinct organisms – from dinosaurs to passenger pigeons. One example is the “Coming Home to North America” ritual, designed by Connie Barlow which leads participants through a playful and reverential reenactment of the comings and goings of plants and animals in North America for the last 65 million years, since the extinction of the dinosaurs. In it, participants learn that camels and horses originated in North America fifty million years ago, were isolated on this continent until spreading into Asia and Africa just three to five million years ago, and then became extinct in their land of origin just 13,000 years ago.

In 2001, Epic enthusiasts began writing “evolutionary parables” for teaching values congruent with ecological/evolutionary awareness. In these, a major moment of transformation (such as vertebrates venturing onto land) is rendered into an engaging story and scripts for acting out. Although ancestral creatures may be depicted in dialogue, and thus anthropomorphized, the science underlying the narratives is accurate and up-to-date. Because the Epic of Evolution is “the story of the changing story,” as new advances occur in the sciences, these parables, rituals, and other experiential forms will necessarily evolve.

itself a part of science, although it is directly informed by scientific disciplines. It may rather be said that the Epic of Evolution is a product of imaginative mythmaking under the critical and watchful eye of contemporary science. As such, we must allow for a relatively wide range of variation on the central theme of cosmic evolution. Here follows an attempt to summarize the broadest view of the biggest picture.

In the beginning was singularity. Everything that would eventually become the universe was contained in an unimaginably small and dense region. About 14 billion years ago the singularity was released in an expanding burst of pure radiant energy, out of which particles of matter distilled into copious amounts of hydrogen and helium atoms. For about a billion years the universe billowed forth in an expanding cloud of cooling gas. Under the influence of gravity, irregularities in the expanding cloud fragmented into billions of galaxies, and within galaxies matter was condensed into stars. At this point in our cosmic history, physics was the only science that would have made any sense. Many stars eventually exploded in supernova events, synthesizing the nuclei of diverse atomic elements in the process. As exploding stars emptied their contents into space, chemistry would begin to make sense. Atoms of many types commenced to form molecules in interstellar space. Second- and third-generation stars were condensed out of interstellar matter, and around some of these new stars there swirled disks of particulate matter, gradually accumulating into orbiting planets. Our own solar system was formed in this process about 4.6 billion years ago. The young Earth was a semi-fluid cauldron of physical and chemical activity, allowing heavier elements to gravitate toward the center and lighter elements to be pushed toward the surface. By 3.8 billion years ago the Earth had sufficiently cooled and settled so that distinct regions of Earth (lithosphere), water (hydrosphere), and air (atmosphere) were formed. Chemical interactions at the interfaces of these regions eventually produced the biosphere, the region of the Earth's surface where living systems emerged from the prebiotic soup. The prebiotic soup was a chemical quagmire of molecular evolution, wherein molecules competed for the attention of unbound atoms. The big winners in this chemical free-for-all were large molecules having special properties, such as those for catalyzing chemical reactions (metabolism), making copies of themselves (replication), or both. Once the functions of metabolism and heredity were coordinated within the membranes of primitive cells, biology would begin to make sense. Living systems diversified aggressively. The earliest prokaryotic cells specialized in pioneering diverse metabolic pathways. Drawing on these biochemical breakthroughs, eukaryotic cells introduced a stunning diversity of shapes, sizes and movements – all variables that prepared organisms to adapt to new environmental niches. The next frontier for

bioexperimentation was to diversify behavior. This eventually led to multicellularity and sexual reproduction. The evolution of behavior took a dramatic leap forward when some organisms developed cell lines (nerve cells) specialized for processing information. Increasingly complex neural systems enabled the capacity for learned behavior and conscious experience. Psychology would now begin to make sense. About a million years ago our human ancestors acquired the rudiments of language, thus introducing potentials for organizing consciousness in diverse ways. Social systems, technologies and ideologies would now develop and diverge rapidly as cultures responded to environmental challenges.

The Epic of Evolution is inherently controversial because it has astringent implications for traditional religious worldviews. Every cultural tradition is nourished by a distinctive myth, a metanarrative providing individuals with a shared orientation in nature and history. Myths engender a collective identity by informing us about our ultimate origins, our common human nature and our shared destiny. The meanings embedded in our cultural stories give us the essential resources for thinking and acting with a unity of purpose. Epic of Evolution enthusiasts have found many of the elements of a religious-cultural myth implicit in the story of cosmic evolution. Any story telling us that we are star-born, Earth-formed creatures, who are absolutely dependent on the integrity of the Earth's (now threatened) natural systems, cannot fail to arouse religious and moral sensibilities. Moreover, the Epic of Evolution engages the imagination in a way that relativizes prescientific mythic traditions. The Epic of Evolution is religiously controversial because it affronts the intellectual plausibility and the moral relevance of traditional religious worldviews.

The many ancient religious traditions of the world originated in historic circumstances very much like our own, that is, moments of deepening crisis when nothing short of a transformation in human consciousness would save the day. Human beings are presently faced with an emergency of global proportions. Every natural life-support system on the planet (air, water, soil, climate, ozone, biodiversity) is in a state of serious and rapid decline, creating a suicidal trajectory accelerated by the very social institutions we have invented to safeguard the future. Human beings presently lack the intellectual and moral resources required to achieve solidarity and cooperation on a scale commensurate with the problems we collectively face. We find ourselves spiritually maladapted to our environmental circumstances.

When faced with comparably dire prospects our ancestors did the reasonable thing: they turned to new sources of wisdom and fashioned new myths of enduring promise. It is in this spirit that Epic of Evolution enthusiasts have turned to the scientifically informed narrative of cosmic evolution as a point of departure for proselytizing a new

religious orientation that sanctifies the natural order. What they hope for is the emergence of Religious Naturalism; that is, new forms of ritual and practice that celebrate and serve the sacredness of the Earth. It remains to be seen whether religious naturalism might eventually replace traditional religious orientations, merely stimulate their radical self-transformation, or prove to be of little influence on religion and environmental practice.

Esalen Institute

Michael Murphy and Richard Price founded the Esalen Institute in 1962 and it quickly became a Mecca for the human potential movement. The institute itself sits on 163 acres of California's Big Sur coast, located in central California, 38 miles south of Carmel. The property, noted for its natural hot springs, belonged to the Murphy family and had been a sacred place for the Esselen, one of many California tribes driven to extinction by waves of European immigrants.

Murphy had studied philosophy at Stanford University and he later spent a year at the Sri Aurobindo ashram in Pondicherry, India. Aurobindo saw the evolving universe as a manifestation of the divine. In humanity, nature becomes conscious of itself and this consciousness is the key to further evolution. Aurobindo called for a yoga practice combining Western scientific method and a personal discipline that seeks illumination from within. We are called, he said, to a greater consciousness that participates in its own transformation and the world's advancement. Aurobindo's thought, through Murphy, shapes Esalen philosophy.

Dick Price, also a Stanford graduate, met Michael Murphy at an ashram in San Francisco. Price had spent a year and a half in a mental hospital and reacted to what he felt was dehumanizing treatment. Price worked with Fritz Pearls, the founder of Gestalt therapy and a resident at Esalen. Gestalt uses imagination, dialogue and movement to more fully enter one's present emotional state. The process is an effort to break through psychological blocks and allow for natural healing and growth. Together, Price and Pearls made Gestalt an Esalen staple. In 1964, the workshops at Esalen shifted from a verbal format to become more participatory. The emphasis was on Gestalt therapy and bodywork (massage and movement exercises).

During the 1960s, the celebrities who came through Esalen represented the driving forces of the human potential movement and included Aldous Huxley, Gerald Heard, Arnold Toynbee, Linus Pauling, Gregory Bateson, Joseph Campbell, Bishop James Pike, Ansel Adams, Norman O. Brown, Virginia Satir, Rollo May, Carl Rogers, Carlos Castaneda, Michael Harner, Ashley Montagu and Paul Tillich. Abraham Maslow, the father of humanistic psychology, stumbled on Esalen by accident during its first year and gave several workshops there, and it remained a guiding force throughout his life.

As a place, Esalen holds a strong attraction. Thickets of redwood trees rise sharply on the Santa Lucia Mountains behind the institute's facilities. A rocky coastline lies at its base while fog and sunlight interact with land and sea throughout the day. Selig Morgenrath was the gardener during Esalen's early days and he brought a special touch to his work. Today, some six acres at Esalen are devoted to an organic farm that produces a considerable variety and quantity of food for the kitchen.

The El Nino storms of 1998 created landslides that destroyed the baths, damaged buildings and closed the access road for three months. The crisis became a turning point in Esalen's development. In rebuilding, the organization shifted its focus to include, not only work on individual human potential, but also efforts to become a model community in harmony with its environment. Plans are underway to conserve energy and preserve the land. The aim is eventually to give back to nature more than we take. The hot springs will be used to provide geothermal heat. Members of the institute are installing solar panels and placing buildings in better positions to utilize the sun. Wastewater treatment will use organisms rather than chemicals and recycle the water to gardens and lawns. Footpaths are replacing paved areas and native grasses are being planted.

Andy Nusbaum, Esalen's executive director, says that they want, "to utilize nature's teaching, to mimic life's underlying proportions in shaping our environment." He cites discoveries that have uncovered and copied natural structures: fuel cells that imitate plant cells, fibers as hard

as abalone shells, and computers that work like the human brain. Michael Murphy calls for a sustainable society that balances inner and outer resources. Personal and social developments are inextricably linked.

Today, Esalen has two major components. There are the public programs, some 450 seminars and workshops that draw 10,000 people a year. There are also research projects sponsored by the institute's Center for Theory and Research (CTR).

Since 1967, Esalen's CTR has sponsored conferences dealing with experience-based techniques in education, Russian-American relations, the place of the body in spirituality, and government systems that would allow for greater equity among people and better stewardship of the environment. The institute has also undertaken a long-term exploration of evolutionary theory. Here, they bring together physicists, cosmologists, biologists, sociologists, psychologists, historians, contemplatives and philosophers to study the evolutionary processes in the physical, biological, and human worlds. Since 1998, Esalen's CTR has also explored the empirical evidence for post-mortem survival.

Esalen today can be viewed against the backdrop of the philosophies of David Thoreau and John Muir. But whereas "nature" with Thoreau and Muir could be experienced at Walden Pond and in the Sierras, "nature" with Esalen is the whole cosmos, which has a history and a future. "Nature" also includes human consciousness and its efforts to understand itself as part of that evolutionary process.

Estés, Clarissa Pinkola (1945–)

Clarissa Pinkola Estés, a Jungian psychoanalyst, storyteller and poet, is the author of numerous books and articles, including *Women Who Run with Wolves: Myths and Stories of the Wild Woman Archetype* (which remained on the *New York Times* best-seller list for three years and has been published in thirty languages). In this book, Estés, a cantadora or keeper of the old stories (Latina

tradition), presents intercultural stories and myths, along with Jungian interpretations of these tales. She based the book on a study of wolves and begins by stating that "Wildlife and the Wild Woman are both endangered species," thus linking the "instinctive nature" of woman with the wilderness. Estés' roots in Mexican culture and Hungarian culture, specifically in women folklorists and storytellers in these two cultures, lead her to engage story as "medicine." She understands storytelling as a form of activism, with healing powers and possibilities. Estés' other published works include *The Faithful Gardener: A Wise Tale About That Which Can Never Die* and *The Gift of Story: A Wise Tale About What is Enough*.

Another genre in which she works is the spoken-word performance. In this area, she has produced a series of audio works, among them the twelve-part live performance *Theatre of the Imagination*, and performed *woman-life.song* with Maya Angelou and Toni Morrison.

In addition to practicing Jungian psychoanalysis and engaging in various modes of storytelling (both oral and written), Estés founded and directs La Sociedad de Guadalupe, a human rights organization.

Estés holds a doctorate in clinical psychology and intercultural studies from The Union Institute. She served as director of the C.G. Jung Center for Education and Research and has received numerous awards including the Las Primeras Award from MANA (The National Latina Foundation), the Joseph Campbell "Keeper of the Lore" Award (she was the first recipient), the Spirit of Women Award (National Consortium of Health and Hospitals) and the President's Medal for Social Justice (Union Institute).

Ethics and Sustainability Dialogue Group

The Ethics and Sustainability Dialogue Group (ESDG) is an ongoing series of exchanges in the United States between a contingent of environmental and social ethicists and representatives of the Chlorine Chemistry Council and its member companies. The purpose of the dialogue is to

explore the ethical issues associated with the processes, products, and by-products of the chlorine chemistry industry. The partners and their purpose make this dialogue an unusual model of moral engagement.

The ESDG has had religious connections from its inception. The catalyst for the dialogue was a U.S. church's resolution in favor of "sunsetting" most chlorine chemistry products. Four persons with ties to this denomination – a social and ecological ethicist, an industry executive, and two chief officers in a business consulting firm – designed the dialogue to focus on the ethical issues in this controversy. Moreover, industry representatives in the ESDG have generally been participants in Christian churches. Similarly, all the ethicists have been students of Christian social and ecological ethics, and most have been associated with Christian churches – of diverse denominations. Specifically Christian values and norms, however, have rarely, if ever, been invoked in the dialogues. Nonetheless, given the Christian connections of the participants, this moral tradition, in all its diversity, has undoubtedly shaped the character of the conversations.

The ESDG has met twice per year, for a day and a half each time, since November 1998. Some dialogues have included panels of scientists, discussing the state of scientific knowledge on designated problems. Several have used case studies to enhance understanding of the moral dilemmas in decision making.

The agendas have covered a variety of issues, including pesticides, water disinfection, dioxins and other persistent organic pollutants (POPs), endocrine disruption, and national security concerns about the industry. The "precautionary principle" has been a major topic in a couple of sessions. Yet, the central concern, permeating all the others, has been the moral meaning of sustainability for this industry and the global community. The dialogue has begun to outline some of the social and ecological indicators of sustainability.

The Secretariat for the dialogue is Millian Byers Associates, a business consulting firm in Washington.

To encourage candor, participants agree not to quote or otherwise attribute statements to any other participants outside of the dialogue without their expressed consent. No formal records of the conversations are kept by the ESDG – though for reasons of practicality, not principle. Moreover, the partners understand that participation in the ESDG does not preclude public advocacy on the divisive issues under discussion.

The ESDG has had no preconceived "products." These depend on decisions emerging out of the process of dialogue itself. Otherwise, the ESDG has viewed the dialogical process itself as a "product" – a way to discover and deal with differences effectively while enhancing human connections.

For the ESDG, dialogue is not negotiations to reach agreements. Nor is it a consultant–client relationship.

Instead, the ESDG understands dialogue as a process of communication between equal partners with strong commitments and often divergent perspectives for the sake of mutual growth. Such dialogue is a demanding discipline – requiring, for instance, respect for both the rules of rationality and the rules of fairness, as well as a mutual openness to the partners' perspectives on the truth.

The effects of this dialogue on the participants and their institutional behavior are impossible to measure. Some, however, have testified to changes they see in themselves and others – not as transformations in worldviews or even as resolutions of some major differences, but rather as growth in understanding moral problems and responsibilities.

The ESDG offers industry representatives a fuller understanding of the moral dilemmas and responsibilities they face, prompted by the challenges and counsel of the ethicists. Equally, the ESDG offers the ethicists a fuller understanding of the moral dilemmas and responsibilities associated with chlorine chemistry, enabled by the challenges and counsel of the industry representatives. The main value of the dialogue depends on the partners being, and perceiving themselves as being, both givers and receivers in a dynamic that finally contributes to social justice and ecological integrity. Indeed, the bottom line for evaluating the ESDG will be its broader social and ecological benefits.

Ethnobotany

Ethnobotany is the study of plants and people in their historical and geographic totality. Ethnobotany traditionally has been restricted either to economic botany on the one hand or to cognitive and linguistic anthropology on the other. Economic botany focuses on the utility of economic plants (such as food, fiber, and medicinal crop plants) in specific cultural contexts and often on the systematic biology of these economic plants, namely, the place of these plants in nature. Cognitive and linguistic anthropology have tended to focus historically on how people in diverse cultural milieus name, classify, and in some cases manage and manipulate plants according to coded and usually orally transmitted folk knowledge. Combining the efforts of both botanists and anthropologists, it can readily be seen that plants constitute an irreducible realm of human experience.

Even though plants pertain to a kingdom of the natural world, plants – at least some plants – have been affected in

their distribution, reproduction, and morphology by the ways people have utilized and managed them over time. As such, many plant resources represent cultural as well as biological artifacts that highlight the intimate connection between people and their local environments over time. Likewise, human cultures have been conditioned by the plants occurring in their environments. The motivation for human use and management of plants is diverse, and essentially represents basic material needs for food, medicine, fiber, fuel, and construction materials. Yet plants not only provide a wealth of material resources for subsistence and economic use (the more traditional focus of ethnobotanical research), they also function as important objects of thought, in the same sense that animals are also “good to think,” as Claude Lévi-Strauss said in *A Savage Mind*. Being important objects in the immediate environment, plants are “named, classified, studied, interpreted, and responded to” (Alcorn 1995: 26). Salient plant forms and botanical processes provide important material for symbols, metaphors, mythologies, and legends. Culturally important plants may even exert important influences on religious beliefs and practices. Entire landscapes, such as sacred groves or forests, likewise play an important role in the cosmologies of different peoples.

Certain plants and vegetative associations have been reified in various cultures, such that they are perceived to harbor and radiate supernatural powers, independent of biological needs. To the individual carriers of ethnobotanical knowledge within any human community, plants are experienced as a constellation of different biophysical, economic, social, and mythical connotations from a particular social vantage point within a given cultural setting. Although constituting an understudied aspect of ethnobotany, religious understanding and use of plant resources is therefore embedded within these overlapping spheres of plant use and knowledge. In a sense, religion is the premier locus of human experience, in which plants and people not only interact as mutually important actors in the puzzle of existence, but in which their identities are transmuted. Plants from nature are incorporated into the cultural world, and humans bearing culture are turned into plants. Plants in countless cultures have been perceived and used as fundamental markers of mythology, divinity, and ritual.

The very life cycle of plants provides a rich metaphorical counterpoint to human existence. Whereas human death results in a return of the body to the soil, plants emerge from the Earth and represent the eternal cycle of life springing forth from death. Trees, shrubs, herbs, flowers, fruits, grains and other plant products often appear in mythologies and legends as general symbols of rebirth, decay, and immortality. The ancient Mesopotamian legend of Gilgamesh and his search for the herb of immortality provides an example of the way in which plants symbolize life and the nourishing power of nature.

Certain plants have acquired more specific associations in religious folklore. The mistletoe, familiar to Euro-American culture as both a parasitic epiphyte and as a plant that when properly hung at Christmas time can catalyze romance, was historically associated with mystical qualities. For the ancient Norsemen the mistletoe represented the Golden Bough, a protector-spirit against sorcery and the reincarnation (in plant form) of a priest – the King of the Wood – who was believed to have been slain during a specific ritual of rebirth and renewal.

The origin myths and creation stories of many societies likewise invoke the mystical properties of plants. Frequently egalitarian peoples believe themselves derived from particular plants. In the Brazilian Amazon, the Ka’apor culture hero Mair made the original Ka’apor ancestors from logs of *Tabebuia impetiginosa*, a hardwood tree used in making bows, along with other hardwoods. On the other side of the world, Andaman Islanders of the Indian Ocean believe that the first human being was born inside a giant bamboo stalk. Among societies characterized by totemism, plants, animals, or other natural phenomena that represent group identities (called totems) are believed to be founding members of a unilineal society or clan. In addition to claiming descent through one sex from the group’s totem, members of the group may also observe taboos related to their particular plant or animal emblem, generally refraining from killing, eating, or disrespecting it. Spirits or deities may likewise incarnate themselves in the form of a plant or animal totem. Yet while these features of totemism are found among many of the world’s traditional societies, they are not present everywhere, nor even necessarily found together. The supernatural forces that traditional peoples associate with plants, animals, and other natural phenomena invoke more than merely special ties between a social group and its totem. Furthermore, plants play an important role in most world religions, not simply those deemed to be totemistic.

At the most basic level, religious beliefs and cosmologies encompass orientations toward the natural world that inform people’s responses to plants. Showing respect may be the most commonly prescribed behavior toward plants, and it underlies many religious tenets regarding appropriate relations with the natural world. Conversely, taboos may be imposed on the use of plants to ensure the continued availability and vitality of culturally revered species. Humanizing attitudes and feelings of respect may be interpreted more directly as anthropomorphism, the belief that plants and animals have human qualities. More commonly, religiously prescribed behaviors toward plants imply the ascription of a soul.

According to E.B. Tylor, many religious belief systems are founded upon notions of animism, or the belief in souls. The ascription of souls to plants is most likely for plants of great economic or experiential significance. Both

the Balinese of Indonesia and the Ifugao of the Philippines ascribe souls to their staple food crop, rice. Beliefs concerning the souls of rice plants form part of a complex system of religious belief and practice throughout Southeast Asia. The Huichol of Northern Mexico likewise believe that the sacred peyote cactus, which produces a powerful hallucinogenic drug, yields a soul visible to their shamans.

Perhaps more widespread than the notion that plants have a soul is the idea that spirits or deities are associated with them. Supernatural beings associated with plants include ancestor spirits as well as masters or guardian spirits that protect vital plant resources. Among the Dyak of Borneo, the sacred tree *mahong* is believed to harbor a benevolent spirit that represents the ancestral woman of Dyak legend. As with the ascription of plant souls, plant deities often represent an extremely important economic plant, especially domesticated food plants of high caloric importance. Beliefs in a deity of corn are common in ancient Mesoamerica, as are beliefs in a deity of rice in Southeast Asia. These deities are portrayed unmistakably in iconography so that they impart both human and specific plant properties to the viewer and to the worshipper. In some cases, not all indicators of a deity are plant-related; some deities with essentially human qualities have various markers, both from plants and from animals.

In addition to the spirits and deities affiliated with food plants, religious associations with stimulants and other mind-altering plants are recognized crossculturally. The psychoactive qualities of these plants, in certain instances, have given rise to beliefs in their divine origin and purpose. These plants are literally perceived of as "gifts of the gods, if not gods themselves" (Schultes and Hofmann 1992: 61). The ancient Indo-European god Soma, immortalized in the Rig-Veda manuscripts, provides the most outstanding example. Long considered a mystery, the identity of Soma was discovered by R. Gordon Wasson to be that of the hallucinogenic fly agaric mushroom (*Amantia muscaria*). Ritual use of this species may have spread from Siberia, where it is incorporated in the shamanic practices of reindeer-herding tribes, to India by the second millennium B.C.E. While most hallucinogens function as sacred mediators between humankind and the supernatural, *Amantia muscaria* was deified.

Other supernatural associations with hallucinogenic plants can be found throughout the pantheons of the ancient world. Among the Aztec pantheon of deities, *Xochipilli*, the Aztec Lord of Flowers, was also considered the divine patron of stimulants and hallucinogens. Hallucinogenic mushrooms were known to the Aztecs as *teonanacatl* ("god's flesh"), and were ritually ingested. In the neighboring Mixtec region, Seven Flower was an equivalent deity in charge of cacao, tobacco, sacred mushrooms and other poisonous substances. In the mythology of the Mediterranean, the gods of the classical world were

associated with particular plants or plant products: Athena with the olive, Apollo with the laurel, Demeter with a sheath of grain, and Dionysius with wine. Before these more common co-identifications, however, the botanical associations of the gods may have served as more than just symbolic entheogens. In particular, the Greco-Roman gods were associated with plants having chemical properties that made them function psychoactively in religious rites. Plants that lacked the original chemical properties may have been adopted as surrogates during a time when corporeal components to the experience of spiritual enlightenment were devalued. As the religious use of hallucinogenic plants in the Mediterranean was abandoned or submerged within secretive initiation practices, these plants were gradually replaced by the cultivated icons of civilization.

Religious beliefs about plant resources are clearly embedded within particular cultural and historical contexts. Religious beliefs are manifested and negotiated within ritual contexts that utilize plants both directly and indirectly (symbolically). Plants play a variety of different functions within ritual contexts crossculturally, from providing the central focus of ceremonial activity to performing numerous adjunctive roles within religious activities. Plants may be directly consumed to reach an altered state of consciousness, consulted for divination, prepared as offerings, used for ritual cleansing or healing, and may even supply the sacred landscapes or raw materials for the sanctified spaces in which such rituals are conducted.

Plants with psychoactive or hallucinogenic properties have influenced the ideology and religious practices of numerous cultural traditions throughout the course of history and continue to play an important role among contemporary indigenous religions as well as syncretic revitalization movements. Botanical hallucinogens are perceived to harbor supernatural power due to their extraordinary physiological effects, which can be attributed scientifically to the presence of alkaloids. Within ritual contexts, these properties are directly employed in order to induce altered states of consciousness that are perceived to place the individual in contact with the supernatural realm.

The basic function of the psychedelic experience in non-Western cultures is to integrate the individual into society and revalidate traditional belief systems. By ingesting hallucinogenic plants (via eating, smoking, snuffing, or the use of ritual enemas), the individual experiences symbolic death and then rebirth "in a state of wisdom" as a full member of society. The psychoactive properties in the plant transport the user to the spiritual realm, whose geography is anticipated through folklore and socially shared experiences; what is encountered on "the other side" therefore serves to substantiate the validity of the religious belief system. The use of hallucinogenic plants for magical or religious purposes is strictly controlled by

taboos or ceremonial circumscriptions, and while the general (usually adult male) population may share in their use, these sacred plants are more commonly administered by shamans or other religious specialists.

The ability to transport the user to culturally validated spirit realms is particularly important within the context of shamanic practices. Religious shamans throughout the world act as intermediaries between the seen and unseen realms, and must learn to master the induction of altered states of consciousness to do so. Although ecstatic states may be accomplished through ascetic means, plants with hallucinogenic or similar psychoactive properties may be employed to induce visions and trances. Anthropologist Michael Harner prefers to call these “shamanic states of consciousness” in order to stress the cultural and religious context of these botanical drugs, and to differentiate the experience from the more recreational use of these species. Native peoples in the New World alone have utilized nearly a hundred different psychoactive plants, not counting the numerous plants (such as corn, manioc, or mescal) brewed for alcoholic beverages that, in turn, are used to induce ritual intoxication.

Probably the most famous sacred hallucinogen in the New World is the peyote cactus (*Lophophora williamsii*), which is rich in the psychoactive alkaloid mescaline. As an important part of the peyote-deer-maize ceremonial complex of the Huichol Indians of Northern Mexico, the peyote quest serves to prepare initiates to “learn what it is to be Huichol.” The ritual use of peyote, however, has spread far from the Huichol homeland into the United States and Canada, where it functions as an important entheogen in the Native American Church. In South America, the vine *Banisteriopsis caapi*, known as *yajé* or *ayahuasca* (“vine of the soul” in Kechwa), is a powerful botanical hallucinogen used by indigenous groups, such as the Jivaro, throughout the Upper Amazon. Traditionally restricted to the Upper Amazon, the use of this hallucinogen recently has spread into the adjoining lowlands to the east of the Jivaroan area and has been incorporated into religious revitalization movements in urban Brazil. The drug is heavily used in the Santo Daime cult of Brazil, a millenarian offshoot of folk Christianity, founded by a prophet named Mestre Irineu in 1930, whose adherents profess to be able to travel, see, and know phenomena otherwise removed from them in time and space upon taking the drug. Only the proper, group-based ingestion of the “vine” (the “*cipó*”, as it is called in Portuguese) affords such visions. Outsiders who refuse to ingest the “vine” are not permitted to attend Santo Daime ceremonies.

Non-hallucinogenic, yet mildly psychoactive plants play a similar role in religious beliefs and practices. Throughout the Andes, coca (*Erythroxylum* spp.) is both a medical stimulant and a unifying cultural and religious symbol among peasant and indigenous populations. The religious and shamanistic use of coca is also very ancient

and associated with the psychoactivity produced by chewing the alkaloid rich leaves. Although mild in comparison to the physiological effect of hallucinogenic plants such as peyote or ayahuasca, or even tobacco, ritual coca chewing enabled religious practitioners to enter trance-like states and communicate with the supernatural world. Although many of these traditions disappeared from the Andes after European contact, shamanic use of coca prevails among the Kogi of Colombia and several tribes of the Northwest Amazon (who prepare coca in a powdered form), where coca consumption is considered vital for communication with the ancestors.

Despite the occurrence of true hallucinogens, and out of the wide variety of aboriginal New World stimulants and narcotics, alcoholic beverages and tobacco have the widest distribution of mind-altering plant products, being particularly associated with farming practices. From pre-contact times well into the colonial era, tobacco primarily served magico-religious and related medicinal ends. The incredible diffusion of tobacco as a ritual intoxicant may be due in part to the ability of nicotine bioactivity to furnish empirical support, in many ways, for shamanic beliefs and practices throughout the Americas. Although the vision-producing alkaloids in hallucinogenic plants are effective in inducing the imagery of the shaman's celestial journey, the biphasic qualities of nicotine as a stimulant-convulsant help to manifest the continuum of dying and rebirth that is so fundamental to shamanic practice. The consumption of large quantities of tobacco via smoking, snuffing, chewing, or eating induces physiological changes experienced mentally as a journey of the soul outside of the body. The tobacco shaman is believed to serve as an intermediary able to travel into the world of the spirits and direct the divine energies of the cosmos toward social ends. Recognizing these powerful qualities, the Warao of Venezuela consider tobacco to be an indispensable part of their spirituality, and have incorporated this pharmacological phenomenon into a complex shamanic lore that involves different ritual specialists and the reverence of a Tobacco Spirit. A parallel example of this form of tobacco religion is found in North America, where the Gitche Manitou (or Great Spirit) complex of the Eastern Woodland Indians was based on the intoxicating and healing effects of tobacco.

Aside from their direct consumption, plants may communicate important worldly and otherworldly information to people through mechanisms unknown to non-initiates in the relevant culture and religion. Through keen observation of the local environment, the behavior of particular plants may be read as portents of the weather, harvest, or community well-being. The responses of plants or plant parts to direct manipulation are also employed for the purposes of divination. Among the contemporary Maya of highland Guatemala, *tz'ite* beans (various legume seeds) are used for divination, and are considered

especially powerful when found at archeological ruins or other sacred ceremonial sites. Throughout the Andes and adjacent Amazonian regions, reverence for the sacred coca plant is reflected in the widespread use of its leaves in elaborate divination rituals, conducted for both shamanistic healing practices and predicting the future (Plowman 1984). Even tobacco smoke, or smoke produced from the ritual burning of other sacred plants, may function as a divination tool.

Plants or plant products that are considered sacred may likewise be used in ritual offerings. Offerings of coca leaves are considered necessary to appease the gods on numerous occasions. In fact, there are few domestic or social acts conducted by indigenous peoples in the Andes that are not solemnized by making offerings of, or by chewing, coca (Plowman 1984). Offerings of plants may also be likened to animal or blood offerings. For instance, the vital energies of fresh sacred plant leaves are believed to possess "blood" (as opposed to dry leaves of the same plants) needed in offerings to gods in the Afro-American Candomblé Religion of Bahia, Brazil. Several South American tribes consider tobacco to represent a food, referring to their shamans as "tobacco eaters," who offer vital tobacco substances to the spirits. Many religious traditions of egalitarian peoples involve the exchange of spiritual food between humankind and supernatural beings according to cosmological principles of reciprocity, principles that are not at all foreign to people living in non-surplus-oriented societies.

Maintaining balance between the natural, social, and spiritual worlds is an important aspect of healing practices, including purification rites that utilize plants to effect changes in the mind, body, and soul. Throughout history there has been a strong overlap between healing practices and spiritual belief systems. Medicinal plants may be directly ingested or topically applied as poultices that function to extract or suck out ailments. Plants may also be utilized by shamans and healers to blow out and expel demons or ailments in the body as well as divine their existence and location. Tobacco smoke is often employed in indigenous and folk healing practices throughout the Americas. Smoke is also blown to demonstrate visibly the life-giving breath of the healer or to feed the supernaturals, or it may be swallowed ("eaten") in enormous quantities to induce trance states that allow the healer to enter the spirit realm for guidance. Tobacco smoke is also used more generally to purify the air during religious or healing ceremonies.

Ritual purification of the air is a common aspect to many religious ceremonial practices. Fragrant plants, flowers, and derived oils and resins play an important role in many purification ceremonies. These may be carefully placed as offerings, burned to release fragrant smoke, or even placed on the floors of temples and churches to be crushed as people walk over them, releasing volatile oils

into the atmosphere. Elaborate flower carpets are laid down for *semana santa* (Holy Easter Week) and on other Catholic/synchretic processions in Mesoamerica they have such an effect. In ancient Mesopotamia, oil-producing plants, many of which may have bactericidal or mycocidal virtues, were placed on hot coals in order to produce fragrant smoke. This ancient ritual from the Near East may be rooted in the censers of contemporary Catholic churches and the spicers found in Orthodox synagogues.

In summary, the knowledge and uses people have acquired about plants have been incorporated into religions worldwide – regardless of the scale of these religions – and in a variety of ways. Plants, like people, live, reproduce, and die, thereby providing important material for religious thought and practice. Under certain circumstances, cultural traditions have devised plant models to stand for patron deities, ancestral spirits, and guardian spirits, such as of rice and maize, in societies where those crops have been very significant economically. Plants also have served to represent people totemically in their origin myths, wherein the original beings are conceived in local systems of thought as plants of one sort or another. In addition, plants may more generally stimulate attitudes of respect and deference, and are sometimes ascribed possession of souls. Sometimes, sacred plants actually contain profoundly hallucinogenic properties that are sought after in religious ceremony (as with fly agaric, ayahuasca, and peyote cactus), whereas in other contexts, the bioactive principle desired for attainment of religious ecstasy and communion with other-worldly divinities is more of a stimulant (as with tobacco and coca). In numerous religious traditions, psychoactive plants are deemed to be central and indispensable, in terms of the physiological and spiritual effects they induce, with regard to the users' ability to contact and negotiate with beings and gods in the supernatural world. Plants also play multiple biophysical and symbolic roles in ritual practices, including the sanctification of ceremonial space in many world religions. Plants represent critical aspects of ceremonial behavior and thought, not only in reference to so-called world religions, but also in the context of numerous shamanic and other egalitarian (non-state) religious systems worldwide. As such, in the comparative study of religion, a distinctive and important role exists for ethnobotany more generally.

SP Ethnoecology

Ethnoecology – the study of cultural explications of nature – generates insights into the interface between peoples and the more-than-human world. Ecology is the scientific study of the interrelationships between plants, animals, and the environment, and it has developed into the study of interdependent communities of organisms and their environments. But while most ecologists have been trained to seek knowledge solely from scholarly books or nonhuman nature, tremendous environmental information is stored in the minds, cultures, and arts of indigenous peoples. Ethnoecologists combine ecology and

ethnology to shed light on diverse cultural ways of understanding the natural world and the supranatural cosmos. They strive to formulate theories about how people perceive, organize knowledge about, and then act upon the environment.

We are human, in good part, because of the discrete ways we affiliate, not only with each other, but also with the natural world. Ethnoecology entails focused research on what is termed "traditional ecological knowledge," "indigenous knowledge," or "local knowledge." Such knowledge is being lost rapidly as elders die and their cultures undergo tremendous change. Ethnoecology – the recording, understanding, and appreciation of this knowledge – is thus a pressing matter. Traditional ecological knowledge includes those aspects of culture that relate to environmental concerns directly (such as resource exploitation) and indirectly (for example, totemic proscriptions and religious beliefs). Thus, a culture's ecological knowledge affects subsistence, adaptation, cosmology, and aesthetics, and these things in turn affect the knowledge base. Ethnoecology offers a way to record and analyze human interactions with the natural world. Emphasizing local understandings of environments, it focuses on the importance of cognition in shaping behavior. By pursuing ethnoecology, we are able to gain understanding of the interactions between humans and the natural world.

Ethnoecology entails investigation of systems of perception, cognition, belief, symbols, and uses of the natural environment. It illuminates cultural interactions with the environment, thereby giving us greater appreciation of the depth and scope of knowledge systems as they relate to the more-than-human world. Vignettes of ecological knowledge are precious in their own right, but they also provide grist for a new environmental ethic that we so urgently need. In this light, some of the goals of ethnoecology are to help us: 1) be exposed to the diversity of indigenous perceptions of "natural" divisions in the biological world; 2) understand and appreciate the origins and uses of ecological knowledge and resource management practices; 3) appreciate the connections between aesthetics, religion, and human ecology; 4) develop the tools to acquire effective ways of recording, analyzing, and applying traditional ecological knowledge; 5) discern the variant approaches that peoples have developed cognitively to understand the world around them; 6) recognize the intersections and disjunctions between knowledge and practice; and 7) explore ecological beliefs about relationships between humans and the environment that are shared by Western sciences and Native cosmologies.

Ethnoecology shows us that indigenous practices of land use and resource management are not only adapted to local ecosystems, but have sometimes shaped those ecosystems in ways that have made them more diverse and

stable. Examples of such mutualism are found more often among indigenous groups that have lived in particular places a long time than among recent arrivals. In most indigenous cosmologies, the human and the nonhuman are interdependent, and ecological limits, restraints, and responsibilities are readily apparent and cannot be externalized. The norm is that indigenous religions and cultural ecologies are based on beliefs in the intrinsic value of the land and all that it contains. Romanticized notions of traditional ecological knowledge, however, will help neither the people themselves nor the lands they inhabit, and a realistic assessment of environmental knowledge is essential for appropriate and effective conservation.

Indigenous perceptions of nature, as expressed through social and cultural processes, enrich our collective environmental understanding by providing regional specificity to global issues. Likewise, the application of ethnoecological research can benefit indigenous peoples by helping them gain greater political and economic control over their lands through articulating and exercising their unique environmental knowledge. Ethnoecology provides insight into environmental ideologies and management practices, and gives us greater appreciation of the options available in addressing contemporary concerns. Understanding ethnoecologies can also enable us to grasp more fully our collective humanity while revealing cultural differences.

Indigenous religious ideologies and ecological knowledge often translate into resource management practices, including such activities as performing ceremonies to ensure the well-being of the land, enacting restrictions to ease the strain of resource exploitation, and prescribing burns to “clean up the country.” Understanding the environmental knowledge of diverse cultures is beneficial in our consideration of issues of development, human rights, and ecological integrity. The application of ethnoecological research to conservation management and cultural survival thus warrants intensive exploration.

Etsheni Sacred Stones

Scattered about the Port Shepstone area of KwaZulu Natal's South Coast are a series of natural sandstone outcrops that have, over recent years, become the center of religious fervor among local Zulu-speaking communities.

Sandstone outcrops are typical of the lower South Coast and, being a soft stone, are easily weathered into the most curious shapes and forms. Some of these resemble human or bizarre animal shapes, while others resemble faces. On yet others are interesting markings, interpreted as numerals or mystical signs. Also characteristic of such outcrops are shelters and caves hollowed out of the rock face, some of which were inhabited by the southern San in prehistoric times. Evidence of this is still to be seen in the remains of stone tools and faded paintings, including depictions of eland, an antelope held to be sacred by the San.

It has recently been brought to national attention that some of these sites at Etsheni are being used by local communities as ritual centers and attributed religious significance. Certain caves and shelters are regarded almost as shrines, with offerings being placed and candles burnt. These sandstone outcrops act as focal points of prayer and communication with the deity and the ancestors.

Due to the church's presence in the area, a strong Catholic influence is seen in this religious center with the face of the Virgin Mary supposedly manifesting upon one particular rock face. The Virgin, in this instance, is a modern interpretation, under years of missionary influence, of an ancient Zulu deity, the goddess Nomkubulwana. This goddess, also “princess of the Heavens,” is associated with fertility of both the land and people. She is often described as an exquisite young maiden, bare-breasted and with long hair of forest plants and flowers. On occasion she is said to manifest in sacred pools as a mermaid. However, the concept of Nomkubulwana is itself a transformation of the much earlier southern San belief in the spirits of the dead who now live in their own complete world under the water. Indeed, certain Zulu traditionalists still hold that Nomkubulwana is a beautiful young San woman.

Yet other images at sacred sites in this general area are said to be apparent as fixed features, and these include, among many others, faces of baboons, an animal associated with witchcraft in Bantu-speaking belief, and even a rock shaped like a huge passenger liner and likened to the *Titanic*. Living animals, both real and mythical, are said to haunt the site. A large antelope known as reedbuck, is said to guard the likenesses of babies situated in a hollow, and a

mythical horse-headed snake, the *inkanyamba*, is said to bask on the heat of the rocks.

Clearly these sites have become a religious node, said to date to the late 1800s, but having become most significant in recent years. San paintings, widely recognized as being religious in nature, do indicate to pilgrims that at least some sites have, for hundreds of years, been used as a religious center, and in this way fuel the religious fervor exhibited by the cult's adherents. Indeed, in an attempt to establish continuity some followers claim that Zulu groups obtained their religion from the San, and that the South Coast sites were "created" by the San. However, the majority, if not all these sites are natural and not manmade formations.

Indeed, the entire area in which the particular site of Etsheni lies is perceived symbolically by adherents to this belief system. The landscape and the features upon it are interpreted in terms of Christian religious concepts. The valley in which the rocks are situated is known as *KwaSatani*, or the "place of Satan," while the river which flows through and below the rocks, is known as *nku-lunkulu*, or the "river of God." Clearly, as in the case of Nomkubulwana, these names and associated concepts are based upon a much older African belief system.

African traditional healers venerate the spirits of the autochthonous San at some rock-art sites in southern Africa. Such places are often used as training schools for apprentice diviners. It is possible that the Etsheni sites had just such an origin as African traditional religion is very fluid, incorporating new, and often alien elements, without any observed contradiction. It is this aspect of African religion that explains the presence of Christian elements today at the sacred rocks.

This fluid reorganizing and transposing of religious concepts and blurring of doctrines eliminates any possible contradiction in the adoption of novel religious concepts. Adherents apparently have no difficulty in incorporating into a single belief system elements from ancient San and Zulu belief and from the later Catholic missionary influence. Indeed, it is true that there are similarities between shamanistic religion as practiced by the San and certain aspects of Christianity and Judaism. For instance, visions and audiosonic experiences so often associated with prophetic practice in the Bible are a regular feature of shamanism.

Reusing ancient religious sites is practiced world-wide, with Stonehenge on Salisbury Plain perhaps being the best-known example. This ancient lithic site acts as the scene of a New Age Druid and Mother Earth movement but, like the South Coast cult, there is no real thread of continuity between the original builders/artists and later religious groups. However, in both instances some relationship is sought in an attempt to validate the adherents' beliefs.

Evangelical Environmental Network

Despite opposition from conservatives, the Evangelical Environmental Network (EEN) has become a consistent advocate for environmental care among United States evangelicals, engendering the support of many prominent evangelical leaders and lobbying successfully against national anti-environmental legislation. One of four religious groups comprising the National Religious Partnership for the Environment (NRPE), EEN is a ministry of Evangelicals for Social Action, a small but influential advocacy group that was founded by Ronald J. Sider to promote left-leaning politics from within a conservative theological framework. EEN was created in 1993 specifically to include evangelical representation on the NRPE.

The defining document of the EEN is the "Evangelical Declaration on the Care of Creation," which affirms such characteristic evangelical tenets as the "full authority of Scriptures" and the need for evangelism while also rejecting nature worship and positing stewardship as the biblical rationale for environmental care. Human sinfulness caused a perversion of stewardship, resulting in seven "degradations of creation": 1) land degradation; 2) deforestation; 3) species extinction; 4) water degradation; 5) global toxification; 6) the alteration of atmosphere; 7) human and cultural degradation. Christ came to "heal and bring to wholeness not only persons but the entire created order." Christians are to assist in this task by being "faithful stewards of God's good garden, our earthly home." Although attacked by conservatives minimizing environmental problems, the Declaration received the support of many mainstream evangelical leaders, who lent credibility to the EEN's tacit claim to represent evangelical opinion.

Starting in 1994, as part of an NRPE plan to provide churches and synagogues with "environmental awareness kits," the EEN mailed copies of *Let the Earth Be Glad: A Starter Kit for Evangelical Churches to Care for God's Creation* to more than 30,000 congregations. This booklet detailed contemporary environmental threats, presented a theological justification for environmental concern, and

suggested ways for churches to integrate environmental themes into worship.

Although primarily an educational outreach organization, in 1996 the EEN waged a successful campaign to prevent congressional Republicans from weakening the Endangered Species Act. At a press conference heavily covered by national media, EEN representatives called the Act the “Noah’s Ark of our day,” and charged, “Congress and special interests are trying to sink it.” Influential Republicans, who thought they could count on the support of evangelicals, were caught off guard and quickly distanced themselves from the proposed changes. The Sierra Club later acknowledged the EEN as instrumental in this fight. Such political activity raised the ire of prominent members of the Religious Right, who sought to counter the EEN and the NRPE by forming the Interfaith Council for Environmental Stewardship in 2000.

The EEN successfully weathered such criticisms and continues to promote evangelical environmentalism through its *Creation Care* magazine, its recycling programs, and its efforts to convince congregations to observe an annual, ecologically oriented, “Creation Sunday.” It has formed partnerships with 23 moderate and progressive evangelical organizations, including InterVarsity Christian Fellowship, Youth with a Mission, Habitat for Humanity, World Vision, and the Council for Christian Colleges and Universities. Attempting to capitalize on the conservative commitment to “family values,” EEN launched a Healthy Families, Healthy Environment campaign in 2001.

Evola, Julius (1898–1974)

Julius Evola is the primary Italian representative of the Traditionalist school of metaphysical thought, who further established himself as one of the most radical right-wing

and anti-modern spiritual philosophers of the twentieth century.

Born Giulio Césare Andrea Evola in Rome on 19 May 1898, little is known concerning his background or early years. As a young man Evola developed strong artistic interests, and was influenced by iconoclastic writers such as F.W. Nietzsche and Otto Weininger. In World War I he served as an officer in an Italian mountain artillery unit; these and subsequent alpine experiences provided powerful inspiration for some of his later spiritual writings. Following the war he made contact with leading avant-garde intellectuals and produced poetry and paintings as the main Italian exponent of the Dada art movement.

Evola’s subsequent philosophical period (1925–1930) saw him issuing detailed expositions of “Magical Idealism” and a theory of the “Absolute Individual.” In these works Evola posited the existence of an Absolute Self – a liberated higher Self that the awakened, active individual may become aware of and identify with only through disciplined, ascetic spiritual practices. His studies of Tantra (1925), Hermeticism (1931), and Buddhism (1943) all reflect this outlook. Of the diverse esoteric thinkers who Evola interacted with in the 1920s – often through his work as the leader of a magical order, the UR Group – the greatest impact upon him was made by French writer René Guénon, whose influence resulted in Evola’s permanent identification with the Traditionalist movement. In 1935 Evola published his own Traditionalist *magnum opus* in the form of *Rivolta contro il mondo moderno* (*Revolt Against the Modern World*).

Evola’s attitudes toward the natural world and modern life can only be fully understood within their larger Traditionalist context. Fundamental to this is a nonlinear view of time, in which history unfolds according to an immutable law of cycles. Humankind is now living in the (Hindu) Kali Yuga, or age of conflict, equivalent to the Greek Age of Iron or the Norse *ragnarök*, and thus the modern world is inevitably defined by dissolution, chaos, and rampant materialism. At the conclusion of this cycle the impure remnants will be swept away as a new Golden Age takes precedence. Some affinities may be seen between this nonlinear view and the theories of Oswald Spengler, who set forth a cyclical “organic” interpretation of history in his *Der Untergang des Abendlandes* (*The Decline of the West*, 1918–22; Evola was influenced by the work and translated it into Italian).

Traditionalism rejects evolutionism, positivism, materialism, and the entire notion of progress. It was also on spiritual-Traditionalist grounds that Evola vehemently opposed humanistic socio-political doctrines such as democracy and egalitarianism. In contrast to the biological racial theories being promoted in Germany and elsewhere, Evola formulated a spiritual doctrine of race that rested upon neither materialistic nor scientific foundations. Although Mussolini officially endorsed

Evola's racial theories in 1942, Evola himself had long harbored mixed feelings about the fascist regime. He held onto a hope that with time the new political system might suppress its plebian tendencies and strive to embody higher spiritual principles, becoming a sort of "transcendent Fascism." But the reality of the situation was a source of perpetual disappointment. In diametric contrast to modern notions of the separation of Church and state, for Evola the ideal expression of true statehood would always remain the sacrally sanctioned empire.

In accordance with its technique of "intellectual intuition," Traditionalist philosophy places greater weight on myths and legends as opposed to the details of profane history. The former are viewed as vestiges of a perennial, sacred tradition with prehistoric origins. (Evola believed that this tradition had emanated from the "Hyperborean" or polar north.) Evola was particularly fascinated by ancient Roman rites and often drew upon Indo-European pagan mythology and religion to illustrate his ideas, although he never espoused any sort of nature religion. To the contrary, his vision was always centered upon the spiritual realm of "pure being," at a vertical apex and high above the material world of "becoming." Evola goes even further in his own interpretations, characterizing the higher realm as a regal, masculine solar culture which is superior to that of the chthonic, feminine, earthly world of the "mothers."

This dualistic symbolism mirrors the physical aspects of human sexuality, but Evola's conclusions bear no commonality with a naturalistic outlook – hence his elevation of the "magical" or transcendental dynamics of sexual activity, and his insistence that mere procreation is not the aim of such drives when these are understood in the highest sense. In later writings he addressed strongly the issue of overpopulation, calling it the "problem of births." He opposed this not on strictly environmental grounds, but rather as a gross proliferation of quantity (masses of rootless individuals) at the expense of quality (higher human beings connected to a transcendent ideal).

In his writings Evola spoke of two "natures," oriented as opposing poles of existence, but "leading from one to the other." The natural world of matter represents a "fall" from the higher realm; it "included everything that was merely human, since what is human cannot escape birth and death, impermanence, dependence, and transformation, all of which characterized the inferior region" (Evola 1995: 4). The higher realm, possessed of a "superrational and sidereal brightness," represents "liberation" from the material world, which it also possesses the power to shape and consecrate. This metaphysical view parallels Platonic doctrines and is intrinsic to the Traditionalist school of thought.

He notes that unlike modern man, primordial man's impressions of nature were not "poetic and subjective," but rather "real sensations . . . of the supernatural, of the

powers (*numina*) that permeated [natural] places" (Evola 1995: 150). Evola acknowledges the importance of geomancy and the performance of rites and placement of temples in terms of "sacred orientations." Such actions established an analogous relationship to higher realms and served to sacralize human affairs by infusing spirit into matter. The relationship between traditional man and the land was, therefore, of a "living and psychic character."

For Evola there is almost nothing of value to be found in today's science, industry, or technology:

In modern civilization everything tends to suffocate the heroic sense of life. Everything is more or less mechanized, spiritually impoverished . . . The contact between man's deep and free powers and the powers of things and of nature has been cut off; metropolitan life petrifies everything, syncopates every breath, and contaminates every spiritual "well" (Evola 1998: 4).

Nevertheless, certain remote features of the natural world exist as an uncontaminated antithesis: these are the harsh and lonely mountain tops, imbued with majesty and offering a rare opportunity for select individuals to test themselves to the core of their being, thereby gaining transcendent knowledge of the spirit.

Only nature can help in this task. I mean nature in whose aspects no room is left for what is beautiful, romantic, picturesque . . . nature [that] ceases to speak to man . . . nature that is substantiated by greatness and pure forces (Evola 1998: 32).

In the icy, unforgiving realm of the peaks – accessible only to those few with the discipline and stamina to make the requisite ascent – Evola found his strongest connection to the natural world and its elemental powers.

Toward the tumultuous end of World War II, Evola left Rome and travelled to Vienna. During a 1945 Russian bombardment there, he was injured by an explosion while deliberately walking alone through the streets to "question his fate," and was permanently crippled as a result. After 1948 Evola was mainly confined to an apartment in Rome where he received visitors, some of them young neo-fascists in search of an ideological guru. In the post-war years Evola wrote critical commentaries on the fascist and National Socialist era, and *Gli uomini e le rovine* (*Men among the Ruins*, 2002), a book detailing his idealized socio-political visions. In 1951 he was arrested in Rome for allegedly "glorifying Fascism" and inspiring extremist groups through his writings; at the trial he was acquitted of all charges. In *Cavalcare le tigri* (*Ride the Tiger*) he advanced the concept of *apoliteia*, advocating a detached spiritual bearing that rises above temporal political

entanglements. Other later works include *Metafisica del sesso (Eros and the Metaphysics of Love)*, 1983) and a spiritual autobiography, *Il cammino del Cinabro (The Path of the Cinnabar)*, 1963). After stoically enduring great physical pain in his final years, he died on 11 June 1974. His final requests were to be brought to a window overlooking the Janiculum, the sacred hill where a temple to Janus had once been, and that he might die upright – for Evola this was emblematic of the heroic manner in which a man should confront his mortal end. In accordance with his wishes he was given no Christian funeral and his cremated ashes were later deposited in a crevasse on Monte Rosa, deep within a glacier covering the spot where a legendary town was said to have existed.

Interest in Evola's philosophy has grown since the time of his death, in scholarly as well as esoteric and rightist milieus. Nearly all of his main books have now been translated into the major European languages, and in Rome the Julius Evola Foundation endeavors to increase awareness of his work. As a forceful antithesis to a contemporary Western world that places great value on science, progress, and humanism, Evola's brand of Traditionalism continues to fascinate new generations of radicals who question the entire metaphysical basis of modern secular thought and behavior.

Evolutionary Biology, Religion, and Stewardship

Religious believers frequently compare their communities to single organisms and even to beehives, metaphors that invoke selfless dedication to corporate goals. Recent developments in evolutionary biology suggest that these comparisons are more than metaphors. Like single organisms and beehives, religious groups are products of evolution that are adapted to survive and reproduce in their environments. Much of the evolution is cultural in the case of religious groups, but that does not alter their fundamental nature as corporate units adapted to their local environments.

This pragmatic interpretation of religious groups is obscured by the other-worldliness of religious belief. How can religious believers function adaptively in this world when their heads are filled with beliefs about an afterlife, supernatural agents whose desires must be appeased with time-consuming rituals, and so on? The answer is that the other-worldly side of religion begins to make practical sense when we ask what these beliefs cause people to do. We must distinguish between what in *Darwin's Cathedral* I termed "factual realism" and "practical realism." A belief is factually realistic when it describes the actual structure of the world. The goal of science is to be factually realistic. A belief is practically realistic when it causes the believer to behave adaptively in the real world. The goal of religion, I claim, is to be practically realistic.

It might seem that the best way to be practically realistic is to be factually realistic, but a little thought reveals many exceptions to this rule. Fictional beliefs can be far more powerful and decisive in the behaviors that they motivate than factual beliefs. Since fictional beliefs can potentially motivate any behavior, there must be some mechanism for winnowing the few beliefs that motivate adaptive behavior from the many that do not. The raw process of natural selection provides one mechanism. If all beliefs are transmitted with equal facility (like genes), then those that cause the believer to survive and reproduce will increase in frequency and ultimately will replace maladaptive beliefs. However, brains are organs that evolved to anticipate the outcome of natural selection and arrive at adaptive solutions without a costly birth and death process. The human brain is designed to filter beliefs rather than transmit them with equal facility. These mechanisms will probably prove to be both numerous and sophisticated when understood in detail, but in many cases they need be no more sensitive to factual realism than the raw process of natural selection.

Suppose, for example, that you observe one person who is bursting with vitality and another who is sullen and withdrawn. You might be attracted to the first person and avoid the second without knowing anything about the causes of their conditions. You might find

yourself imitating the first person, not only consciously but unconsciously (e.g., speech patterns and body language). In this fashion, psychological and cultural processes might be intricately designed to identify, amplify, and transmit adaptive beliefs without knowing anything factually about why they are adaptive (Richerson and Boyd 2004).

I do not mean to underestimate the human ability to understand the factual basis of reality. According to anthropologists, all indigenous people possess the ability to reason on the basis of detailed factual knowledge that we associate with scientific thought. The important point is that practical realism has been the bottom line in human psychological and cultural evolution and that factual realism must be understood as part of this larger picture. Rational thought is not the gold standard against which all other modes of thought must be judged. Adaptation is the gold standard against which rational thought must be judged along with other forms of thought.

I have presented this evolutionary view of religious groups as adaptive units in more detail in *Darwin's Cathedral*. It is not the only evolutionary view of religion. For example, Boyer (2001) regards religion primarily as a non-adaptive by-product of mental facilities whose adaptive value resides in non-religious contexts. For the remainder of this essay, I will explore the implications of the adaptationist view for the "fundamental human question" posed by the editors of this encyclopedia: "What are the relationships between *Homo sapiens*, their diverse religions, and the Earth's living systems?"

If religious groups are well adapted to their local environments, it might seem that they would be responsible stewards of their environments. However, the relationship between adaptation in the evolutionary sense of the word and the kind of stewardship at a large temporal and spatial scale envisioned by this encyclopedia is very complex indeed. Adaptation is a relentlessly relative concept. It does not matter how well a unit of selection survives and reproduces; it only matters that it does so better than the other units in its vicinity. This gives the evolutionary concept of adaptation a short-sighted quality that often results in highly maladaptive outcomes at larger spatial and temporal scales. A male lion who takes over a pride and attempts to kill the offspring of the previous male is not benefiting the females, the group, the species, or the ecosystem – only his own reproduction – relative to males who help raise the young of other males. Virtually every behavior that we call anti-social enhances the short-term interests of the anti-social individual in the absence of punishment and other forms of social control. Similarly, the behaviors that we call prosocial typically involve benefiting others at the expense of ourselves, which make them locally maladaptive. When we appreciate the relative nature of adaptation in the evolutionary sense of the word,

we can begin to understand why it is so difficult for our species to achieve the kind of far-sighted stewardship of the environment that so clearly would be adaptive in the everyday sense of the word.

However, the situation is not hopeless. Anti-social individuals gain at the expense of prosocial individuals within their own groups, but groups of pro-social individuals robustly outcompete groups of anti-social individuals. Natural selection is a multilevel process and higher levels of selection expand the spatial and temporal horizons of biological adaptations (Sober and Wilson 1998). One of the most important recent discoveries in evolutionary biology is called the major transitions of life (Smith and Szathmary 1995). It used to be thought that evolution takes place entirely by mutational change – individuals that vary in a heritable fashion, with some surviving and reproducing better than others. Now it is known that evolution also takes place along a second pathway – by social groups becoming so functionally integrated that they become higher-level organisms in their own right. The single organisms of today, such as you and I, are the social groups of past ages. Each transition requires the evolution of mechanisms that suppress fitness differences within groups, concentrating natural selection at the group level. Social insect colonies represent another major transition, from groups of organisms to groups as organisms. Human social evolution represents the newest major transition, or rather series of major transitions, first at the scale of hunter-gatherer society and then at increasingly larger scales since the advent of agriculture (Boehm 1999). The fact that most of the recent evolution is cultural rather than genetic does not change the fundamentals.

Each transition creates a new corporate unit that manages to limit (at least to a degree) the selfish impulses of its members in favor of corporate goals. The mechanisms required to accomplish this transformation go beyond beliefs that encourage altruism and the abandonment of self-will. Successful religions bristle with social control mechanisms that reward cooperation and punish cheating in material terms, and sociological studies show that actual participation in organized religion (e.g., the number of services attended per year) is more important than religious belief *per se* (e.g., personal feelings of religiosity) in encouraging self-restraint and adherence to group goals (Stark and Bainbridge 1997).

Although a transition makes it possible for individuals to exercise self-restraint in favor of collective goals, even the collective goals are often short-sighted with respect to the kind of stewardship of the Earth that forms the inspiration for this encyclopedia. When we examine the relationship between any particular religious group and its environment, we need to ask the following question: When does self-restraint and wise stewardship of the environment actually feed back to increase the fitness of

the group, compared to groups that exercise less restraint? It quickly becomes clear that adaptive self-restraint should be highly selective and that groups will frequently be as rapacious as individuals in their treatment of the environment. This is true of indigenous religions no less than modern religions. The idea that indigenous people are more respectful of their environments in some general sense is profoundly mistaken from an evolutionary perspective and is not born out by the evidence (Krech 1999). For example, in many cases it is more productive to exploit a local area and move on rather than managing the local area for long-term productivity. Human groups that have the option of moving on should not evolve a conservation ethic, although they might exercise self-restraint in other respects such as sharing the work and profits of environmental exploitation.

The distinction between practical and factual realism makes it necessary to exercise extreme caution when evaluating the content of any religion, indigenous or otherwise. Expressions of respect toward nature cannot be accepted at face value but must be evaluated in terms of what they cause the believer to do. If we want to find examples of religions that genuinely encourage wise stewardship of nature, we need to find situations in which wise stewardship actually feeds back to increase the fitness of the group, relative to less responsible ways of interacting with the environment. Even then, the solutions that work for these groups may not work for the much longer-term and larger-scale environmental problems that confront us today.

Solving the environmental problems of today requires self-restraint and collective action at a larger temporal and spatial scale than at any other time in human history. Modern evolutionary theory and the study of religions can provide insight by showing how collective action problems can be and have been solved at smaller spatial and temporal scales. The challenges of expanding the scale further are daunting but still possible. The human mind is genetically adapted to cooperate in tiny face-to-face groups. No one could have imagined 10,000 years ago that cultural evolution would expand the size of cooperative groups to the modern nations of today and there is no reason to think that the upper limit has been reached. However, a key insight of evolutionary theory, amply supported by existing religions, is that a belief system that sanctifies the environment is only necessary and not sufficient. The Protestant reformer Martin Bucer wrote, "Where there is no discipline and excommunication, there is no Christian community" (in Wilson 2002: 105). By this he meant that even the most compelling belief system must be supplemented by a social control system to restrain the many temptations for short-term gains that undermine long-term collective welfare. Those far-sighted enough to work toward the next major transition in human cultural evolution need to adopt Bucer's tough-

minded stance to achieve the tender-minded objective of the stewardship of nature.

Evolutionary Evangelism

Evolutionary evangelism tells as an inspiring sacred narrative the 14-billion year story of cosmic, planetary life and human evolution that comes to us through mainstream science. This story is inspiring in that it helps people find meaning and connection within a universe that is vaster and older than humans have heretofore believed. Such a story is deemed sacred because it addresses the nature of ultimate reality and deals with the ultimate concern and commitments people have. It also provides an overarching context, a grand narrative, and can be used for value instruction in ways similar to the functional roles of creation stories born of pre-scientific times and situations.

Evolutionary evangelists come from a wide range of religious and philosophical traditions. They share a passion for communicating the "epic of evolution" in ways that many find inspiring. Evolutionary evangelists appeal to the heart as well as to the mind, telling our common creation story in ways that offer listeners guidance and

that respond to their emotional, cognitive, and spiritual needs, while honoring bedrock beliefs and faith structures. They seek to transform cold scientific facts and theories into narratives consistent with the science but that also uplift the soul, empower the psyche, and offer comfort and assurance of deep connection with the whole of Reality. They provide ethical exhortation as well regarding the roles each and every one of us might constructively play in the continuing saga of evolution.

Consistent with Thomas Berry's portrayal of the evolutionary narrative as a "metareligious" story, evolutionary evangelists do not see this grand narrative as threatening to replace long-standing religious traditions. Rather, they view the evolutionary story as enriching and enlivening to diverse religious and secular traditions by providing the "big picture," or "great story," that contextualizes the old stories and teachings in ways consistent with contemporary conditions and understandings.

What distinguishes evolutionary evangelism from other forms of evangelism is its grounding in mainstream evolutionary and ecological sciences rather than the Bible or any other religious text. "Evangelism" (proclaiming the "good news") is deeply rooted in American religious culture. Evangelistic revivals in the eighteenth and nineteenth centuries, often referred to as the "First and Second Great Awakenings," transformed the religious and social landscape of America on a large scale, and subsequently spread beyond its borders. History suggests considerable potential impact of a green-spirited, evolutionary evangelism within and beyond North America.

In 2002 Michael Dowd and Connie Barlow launched an itinerant teaching and preaching ministry as evolutionary evangelists, "sharing the Great News of The Great Story and fostering the Great Work" in colleges, churches, and other religious and educational settings as well as living rooms and to outdoor gatherings across North America. Their mission was to promote the marriage of science and religion for personal and planetary well-being. In the first two years of this itinerant ministry, they delivered sermons and lectures in more than 200 churches and other organizations in the United States and Canada, from environmental groups and botanical gardens, to Unitarian-Universalist and Unity/New Thought churches, to a multitude of Protestant and Roman Catholic churches and retreat centers.

Much of the strategy for this revivalism was grounded in Dowd's religious background and experience. Dowd, who grew up Roman Catholic and had a "born again" experience in his youth, becoming a devoted evangelical Christian, developed during this time an interest in and appreciation of the American revivalist tradition.

His own conversion from an anti-evolutionary form of Christianity toward the launching of a form of itinerant revivalism began while he was majoring in biblical studies and philosophy at the Assemblies of God-

Affiliated Evangel University in Springfield, Missouri. It was there he began to embrace evolution as an expression of God's creativity and began to feel God's call to devote his life to sharing the evolutionary epic as an expression of the gospel. Particularly influential was an evening in 1988 when he was first introduced to the Universe Story through a course titled "The New Catholic Mysticism," taught in Boston by Albert LaChance, who had studied with Fr. Thomas Berry.

After seminary Dowd served for a time as a United Church of Christ pastor, an ecumenical peace and justice activist, and a sustainable community organizer. He also wrote *EarthSpirit: A Handbook for Nurturing an Ecological Christianity* (23rd Publications, 1991). Today he seeks to tell the evolutionary epic in ways that audiences, regardless of their theological and philosophical beliefs, will find hopeful, inspiring, and empowering, and he stresses what he calls seven "post-biblical revelations":

1. Evolution is a grand unifying and empowering worldview.
2. Human language is inherently symbolic, meaningful, and consequential.
3. "The universe" is a sacred story of nested creativity and cooperation at ever-wider scales and levels of complexity.
4. "God" is a legitimate proper name for that Ultimate Creative which transcends yet includes all other levels of reality.
5. "Creation" (the cosmos as a whole) is in a process of becoming more than it was before and becoming more intimate with itself over time, and humanity is now an integral part of this process.
6. As a species and as individuals, we are maturing and our self-interest is expanding.
7. Death, destruction and chaos are natural and generative. Said another way, death and resurrection are integral to the cosmos and are necessary for the continuing evolution of life and consciousness.

Such understandings, Dowd believes, provide a basis for reinspiring the faith in his listeners and, with Christian audiences, they offer new ways of understanding death, resurrection, sin, salvation, heaven and hell, the apocalypse, the second coming of Christ, and the kingdom of God.

Evangelism in any form is meant to positively transform lives and lift individuals to commit to higher callings. Something of vital importance is at stake. Beyond personal salvation is a religious zeal for the common good. In the case of evolutionary evangelism, the consequence of such transformation *en masse* would be a transformed relationship between humanity and the living planet. Evolutionary evangelism invites a this-world communion with the divine and a wholehearted participation in what

Thomas Berry calls the Ecozoic Era, a vision of human beings living in “a mutually enhancing relationship with the entire community of life.”

Explorer Petroglyphs (Western United States)

Indigenous peoples were not the only ones who either inscribed rocks (petroglyphs), or painted or wrote upon stone surfaces (petrographs) to mark their presence upon the land. As Euro-American explorers, missionaries, and pioneers ventured into the western half of the North American continent, they too left many such traces. In the nineteenth century Lewis and Clark recorded in their journals several instances of men inscribing rocks or trees with their names or initials, and well-documented sites such as Names Hill and Independence Rock in Wyoming contain thousands of inscriptions carved into the soft rock surfaces by explorers, trappers, and pioneers moving west. Every western state has its own sites where people seemingly felt impelled to record their names and/or the dates of their passing through new territory.

Unlike the immense diversity of inscriptions and paintings left behind by indigenous populations, however, the overt religious context of Euro-American rock art is mostly limited to instances in which the Christian cross was either inscribed or painted onto rock surfaces. Although a few such sites may be funerary in nature, the vast majority seem not to be associated with graves at all, but with travelers employing the cross as a calling card of empire, the mark of a foreign culture staking claim in a new land.

This type of religious context may be subdivided further into two categories, the first consisting of those crosses probably carved by priests, especially those made by Spaniards in the southwestern part of the United States. These carvings come from an overt and declared religiosity, and have corollaries with ancient religions that see cultural conflict as a result of spiritual conflict. Thus, the crosses represent a physical manifestation of a new spiritual presence. The Catholicism of the eighteenth and nineteenth centuries encouraged priests to plant crosses wherever their missionaries were likely to encounter indigenous peoples, and the veneration of the cross as icon was well established as part and parcel of the missionary experience.

The second religious context bridges the gap between the widespread veneration of the cross encouraged among the Catholic laity, and the common piety and ambition exhibited by many explorers of the period. Not only were laity encouraged to erect crosses in their everyday travels, but explorers also were known to follow this practice. Kit Carson and John C. Fremont carved a cross and a date on an island in the middle of the Great Salt Lake in Utah, and Fremont himself carved another cross on Independence Rock. In his memoirs, Fremont explained he was simply following “the custom of early travelers and explorers in our country,” and this expression of religiosity is a vital link between westward expansion and how such explorers and travelers viewed nature itself. Like the Catholic priests of the Southwest, these explorers also saw the land as something to be “conquered,” but their crosses had less to do with other-worldly hopes for the salvation of natives and more to do with the opening of routes for the fur trade, commerce, and the capture of nature by European immigrants.

Faerie Faith in Scotland

Beneath formalized religious structures of many societies rests a bedrock or vestige of nature religion. In Scotland and other Celtic countries, faerielore fulfils this quasi-totemic function. The literary representation of the faeries as winged “little people” is largely a Victorian British development. Kipling’s “Puck of Pook’s Hill” maintains he was the last faerie (or fairy) in England, so a measure of reinvention may have been justified. Nineteenth-century artists like Joseph Noel Paton (National Gallery of Scotland) found inspiration in the “fairy faith” for rich erotic sublimation that might otherwise, with more worldly muses, have shocked Victorian sensibilities.

Traditionally faeries could vary in size from the miniscule to the superhuman. R.H. Cromek, in an ethnographic account, describes those of southwest Scotland as,

of small stature, but finely proportioned; of a fair complexion, with long yellow hair hanging over their shoulders and gathered above their heads with combs of gold. They wear a mantle of green cloth, inlaid with wild flowers; green pantaloons, buttoned with bobs of silk; and silver shoon . . . They ride on steeds whose hoofs “would not dash the dew from the cup of a harebell” (Cromek in McNeill: 111).

Irish legends, also influential in Gaelic Scotland, portrayed the faeries as aboriginals who were driven into hollow hills – knowes, raths or forts – when iron-age humankind conquered with tree-felling axes. As such, faerie faith conveys a submerged Arcadian or idyllic green consciousness. Various Scottish tales account for the faeries as those angels who were too good to follow Lucifer all the way to hell, but not good enough to remain in heaven. In *The Secret Commonwealth of Elves, Fauns and Fairies* (ca. 1690), the Rev. Robert Kirk documented Gaelic beliefs and provided a biblical underpinning. The faeries, Kirk believed, are a species of creation that, like humankind, also await salvation.

Care must be taken not to offend these *daoine sithe* – the “people of peace.” They can cause mishaps and even replace healthy human children with sickly, troublesome, faerie “changelings,” thereby perhaps conveniently allowing blame for genetic misfortune or parental neglect to be displaced. This has diminished the esteem in which the “gentle folk” might otherwise be held. But W.B. Yeats in *The Celtic Twilight*, first published in 1893, makes

impassioned “remonstrance with Scotsmen for having soured the disposition of their ghosts and faeries” (Yeats 1990: 92–5). Scots, he says here, have been “too theological, too gloomy.” In contrast, he continues, the Irish “exchange civilities with the world beyond,” and are accordingly more richly blessed.

In recent years some such “Twilightist” sentiments, boosted by New Age and green mystical seeking, have been attacked as inventive romanticism by such “Celtsceptic” scholars as Professor Donald E. Meek, who holds a chair of Celtic studies at Edinburgh University. Meek’s concern is with cultural appropriation, invasion and distortion, and while anger about this would be shared by many Gaelic thinkers, views of what is genuinely traditional, or authentically evolving, vary, and some thinkers understandably feel divided within themselves on such shifting numinous ground within the cultural psyche. The Faerie Hill is, suggests Gaelic scholar John MacInnes, “a metaphor of the imagination” (personal communication, 1997); a liminal and imaginary realm, where musicians or poets would fall asleep, accepting they would awake either mad, or inspired. As such the faeries may represent the interface of natural and human creativity: nature personified, true nature’s child born to be wild and perhaps being reborn in the nascent green consciousness of our times.

“Yes, about the fairies and all that . . . They say they are here for a century and away for another century. This is their century away.” So said Nan MacKinnon, tradition-bearer of the Hebridean Isle of Vatersay, interviewed for the Scottish studies journal, *Tocher* (vol. 6–38, 1983: 9). She said it in 1981!

P The Rotting Tree Faerie

What is it that keeps faerie traditions alive? One answer, suggests Alastair McIntosh, is numinous experience. The stories keep reasserting themselves, as he suggests with this account adapted from his article, "Rainforests and High Finance," in *World Rainforest Report* 26 (October 1993), 18–20.

It was our last day deep in the Australian forest. And there, like out of a child's picture book, in an arched door-like entrance to this hollow rotting tree, was quite the most exquisitely beautiful mushroom any of us had ever seen.

It had a slightly bulbous, pristine white stem, and a perfectly circular, mottled grey cap with a ring of white spots as crisp and fresh as God in the morning light.

We gazed in wonder. And I said for a laugh – for the kind of laugh that you need when wrestling with the pain of nature undergoing destruction – "What kind of a faerie lives here?"

Everyone smiled. I mean, it's kind of ridiculous, to be enquiring after . . . faeries!

The other protestors from John Seed's Rainforest Information Centre gradually move on. But I stay, alone. And again, the question, burning now: "What kind of a faerie lives here?"

In the back of the tree lay some termite-eaten wood. It was annoyingly distracting me, for I could vaguely make out in it the face of a grim old man staring, motionless, down at the soil, like a New Guinea spirit mask. This was not what I was looking for.

Again, my question. But this time, the old man spoke. Yes, he actually spoke! Clearly, subjectively objective in my mind's ear.

In a big, empowered, booming voice, he spoke. He said: "I am the faerie who lives here."

"No, no," I replied, bemused. "You're just a sour old face I'm imagining in rotting wood. I'm looking for flower faeries. You're not that!"

"Oh," he responded, quizzically. "But I thought you

were the one who's always going on to your students about radical feminist theology?"

"What's that got to do with it?"

"Just that you're always telling them about calling one-another into being; that a person becomes a person in community inasmuch as they're heard, listened to, and *allowed* to be visible."

Well! I tell you . . . he had me by my own ideals! To deny his reality would have been to deny one of the insights that I most value.

"Fair enough," I said to him. "But if I accept that, I'm going to start seeing faeries all over the place!"

He laughed and laughed. He said that faeries *are* all over the place! God has many masks and I was presently face to face with one of them.

"Tell me then," I enquired. "What kind of a faerie are you?"

He swelled with pride and delight at being asked. "I," he said, "am the Rotting Tree Faerie!"

"But," I protested, "I always thought faeries looked joyful. You look like an undertaker. So what kind of things give *you* joy in life?"

This was the question he'd been waiting for and his voice shook the forest. "Rotting trees give me joy in life! This mushroom," he said, "is at my door precisely because I AM the Rotting Tree Faerie."

And as he said it, he let me feel the great processes of death and decay going on in this old tree, indeed, in the whole forest. He let me feel the mushroom's mycelia reaching from the roots into every part of that dying tree, and beyond. I could even feel the molecular processes of rot taking place, composting what had reached the fullness of its time and had died to create new soil and therefore new life.

The mask and the mushroom were, indeed, his Janus face. One side expressed decay and death. The other, in its beauty, was his veritable flower faerie self.

The Fall

The Fall story of Genesis 1–11 is not only a theological text. It is also an aetiological narrative (a story about origins) concerning the rise of civilization in the late Neolithic period. Since the mid-nineteenth century the modernist–fundamentalist culture war in North Atlantic Christianity has generated two highly polarized

approaches to the biblical creation story: one that insists upon its putative historico-scientific content, and the other that views it as legend/folktale with no historical value. To move beyond this historicist straightjacket we might instead consider this story in terms of myth-as-memory. Might it be similar in character to origins-narratives of indigenous peoples, which postmodern anthropology is finally beginning to appreciate as legitimate "testimony" about prehistoric life?

Until recently there were few anthropological alternatives to post-Enlightenment evolutionary positivism's perspective on origins. There is no grander narrative in modern culture than the myth of "Progress," and this

ideology is grounded in the story of humanity's emergence from the swamp of ignorant *Homo erectus* to the triumph of increasingly rational, technologically adept and socially complex cultures of *Homo sapiens sapiens*. Recent revisionist paleoanthropological reconstructions of human "pre-history," however, are challenging assumptions about the intrinsic nobility (or inevitability) of the so-called "Ascent of Man."

In particular, the "Neolithic revolution" of ca. 10,000 B.C.E. that led to what the dominant historiography calls the "dawn of civilization" is being reassessed in light of a very different paradigm. It is being argued that human lifeways throughout the Pleistocene – which were universally characterized by a social, environmental and spiritual symbiosis – represented a viable and sustainable cultural model, albeit one that the rise and relentless spread of civilization dramatically and progressively disrupted and destroyed.

Below are three anthropological hypotheses regarding this traumatic transformation during the late Neolithic period:

One interpretive stream pioneered by paleoarcheologist Marija Gimbutas and popularized by Riane Eisler concentrates on gender. It sees widespread goddess-worshipping, egalitarian Neolithic cultures from Sumer to Minoan Crete to Old Europe that were peaceful, horticultural, and symbolically "advanced." It is argued that these cultures were steadily wiped out by "Kurgan" invasions from the Asian steppes beginning ca. the fifth millennium B.C.E., which imposed iron technology, patriarchal institutions and the politics of war. Cynthia Eller has critiqued this view from a different feminist perspective.

A more widely accepted hypothesis focuses on the eclipse of hunter-gatherer lifeways by the domestication of plants and animals beginning ca. 9000 B.C.E., which led inexorably to the rise of the first cities in Asia Minor and Mesopotamia from 5000 B.C.E. Jared Diamond explores environmental explanations for why domestication arose in the Middle East first, whereas Jacques Cauvin attributes it to symbolic/ideological transformations. Paul Shepard focuses on the reciprocal nature of domestication: the more humans breed out wildness, the more we become "dull and mean" like our cattle. Evan Eisenberg examines how Mesopotamian urban agriculturalists substituted the artificial mountain of the ziggurat for the traditional *axis mundi* of the mountain wilderness. Daniel Quinn posits an archetypal struggle between "Taker" and "Leaver" cultures, and like Shepard, laments the triumph of the former.

A third hypothesis moves behind agriculture to culture itself, placing the decline of Pleistocene symbiosis further back into the Middle Paleolithic with the rise of symbolic thought. Direct somatic and sensory perception of the world began to atrophy – according to David Abram due to written language, and to John Zerzan because of the

power of representation, in which symbols first mediated reality and then replaced it.

These studies differ significantly in methodology, detail and explanation, but all share one crucial perspective with the Genesis account of origins (which they each reference with varying degrees of depth). This is the conviction that there was some sort of epochal "rupture" that signaled the beginning of the end of the widely dispersed, clan-based hunter-gatherer culture that had likely prevailed since "the beginning" of human life on Earth. The implications of this rupture have been devastating not only for the natural world, but also for human social life and spiritual competence.

In the "primeval history" of Gen. 1–11, Israel's sages – redacting older sources and probably writing in the aftermath of the failed monarchy – also attempt to explain this "rupture." Eden can be interpreted as a mythic memory of the old symbiotic lifeways: humans, creatures and God dwell intimately and richly together (Gen. 2). In radical contrast to the modern view, but not to other indigenous creation myths, this primal world is described as unqualifiedly "delightful" (Hebrew *tov*, Gen. 1:31). This ancient equilibrium was/is shattered, however, by the primal human impulse to "reengineer" the world in order to control and "improve" it (Gen. 3).

What follows is a litany of woes: humans are relegated to painful agricultural toil (3:19); the first city is attributed to the murderous farmer Cain (4:17); violence spreads widely and rapidly (6:5ff.). God and nature fight back in the great flood which (temporarily) scuttles civilization (6:9ff.). Could the Flood myth – found in varying forms throughout the great cultures of the Ancient Near East – represent a collective memory of the catastrophic breach of the Bosphorous straits and creation of the Black Sea in the mid-sixth millennium B.C.E., as William Ryan and Walter Pitman have argued?

But civilization prevails again, and a "genealogy" attributes the spread of predatory imperial city-states to Nimrod, the "powerful warrior-hunter" (10:8ff.). The nadir of the "Fall" is thus narrated in the tale of the Tower of Babel (Gen. 11:1–9). It symbolizes the archetypal project of urbanism, in which human social, political and economic power is concentrated rather than dispersed. The warning fable is a thinly veiled parody of Mesopotamian ziggurats, as Eisenberg points out, in which the making of bricks (11:3) alludes to Israel's experience of slavery in Pharaoh's Egypt (Ex. 1). Such "civilizational" projects are thus resolutely "deconstructed" by the divine council in favor of the older vision of a dispersed, tribal humanity living in diverse bioregions (Gen. 11:5–9). The biblical counternarrative of redemption from the Fall then commences with Abraham's call to abandon Mesopotamian cities for the new archetypal journey of liberation: following God's call back to the wilderness (12:1ff.), a pattern that recurs in the

subsequent stories of Jacob, Moses, Elijah, Isaiah and even Jesus.

The “Fall” in Gen. 1–11, then, is not so much a cosmic moment of moral failure as a progressive “history” of decline into civilization – exactly contrary to the myth of Progress. Its polemical perspective is plausible when correlated with various aspects of the Neolithic “rupture” hypotheses noted above. The biblical primeval history thus should be considered not only as “mythic memory,” but also as perhaps the first literature of resistance to the grand project of civilization – rightly warning against its social pathologies and ecocidal consequences.

The Family (Children of God)

This international, communal missionary movement emerged in California in the late 1960s, as the family of evangelist David Brandt Berg ministered to the needs of hippies and young people who were on spiritual quests. In consequence, it is a cultural amalgam of the traditional Holiness movement and the radical youth counterculture of the sixties. For example, the Family emphasizes both spiritual communion with Jesus and erotic experimentation. It is oriented toward millenarian biblical prophecy, but it is also interested in astrology.

A journalist called the group *The Children of God*, and under this name it became famous. Hippies, religious seekers, and disaffected wanderers joined by the hundreds, as Family teams crisscrossed the continent. Calling himself *Moses David*, Berg led the dispersed group via colloquial scriptures called *Mo Letters*. A few horrified parents hired deprogrammers to rescue their sons and daughters forcibly, and a national anti-cult movement arose to combat the group. Moses David and most followers went to Europe and then spread out across the globe.

While headquartered in the Canary Islands in 1974, Moses David developed a new form of evangelizing, called *flirty fishing* or *FFing*, in which women of the Family offered their sexual love to an estimated 200,000 emotionally needy men, as a sample of God’s love. After a decade, the group abandoned this practice, for a variety of reasons which included health hazards and the vehement opposition of critics in the surrounding societies.

In 1978, police raided a commune in Mexico, and over the following years a series of government raids attacked communes in Argentina, France, Australia, and Spain. Altogether, authorities seized six hundred of the group’s children under the suspicion they were victims of sexual abuse. However, in each case the charges were eventually dropped and they were returned to their parents, after being traumatized by forced physical exams and often weeks of separation from their families.

Today, the group practices a form of open marriage. Married members feel a responsibility to meet the erotic needs of single adult members, and they view sexual intercourse as a sacrament of God’s love. With the permission of the other spouse a husband or wife will have dates with a member of the opposite sex that involve sexual sharing as well as heart-to-heart conversation and other qualities of enduring friendship. Opposed to artificial birth control, the group has a high fertility rate and considers children to be gifts from God. It raises them communally and educates them within the commune.

The death of Moses David in 1994 brought an end to what members believed was his constant channeling of messages from Jesus and lesser spirits. Therefore they undertook a vigorous campaign to develop the sensitivity of all members, and the overwhelming majority now

believe they personally receive messages from the spirit world. In their sexual sharing and spiritual channeling, they seek to integrate the natural and supernatural realms.

Fantasy Literature

Modern fantasy describes the predominantly literary/written fiction that grew out of the popular reception of J.R.R. Tolkien's *The Lord of the Rings* in Britain and the U.S.A. in the 1960s, and has since become a genre in its own right, with fantasy themes and content found in role-playing and computer games, film and television media. The basic narrative and stylistic form of literary fantasy is that of romance: generally heroic, quest-centered stories drawing on Western folk- and fairy-tale traditions, Norse and Celtic myth, Arthurian legend, and medieval romances. Its roots lie in the Romantic revival of interest in the "Gothic" Middle Ages from the second half of the eighteenth century to the Victorian medievalism of William Morris. However, as it is understood here, fantasy as a distinct literary genre is a phenomenon specific to late twentieth-century Western society. Archetypal fantasy texts often look to a mythical European medieval past, constructed as a time when people lived harmoniously with their environment. This is the inheritance of J.R.R. Tolkien's medievalist vision; but it also continues, and functions within, a Romantic philosophical and ideological framework where the "medieval" was constructed around a set of oppositions pitting nature and "the primitive" against urban civilization, the supernatural against scientific rationalism.

This Romantic construction of the medieval as iconic "Other" is one of the lasting myths of modernity, and has retained its deep symbolic and cultural value as a medium for social critique. This anti-modern impetus is exploited vigorously in modern fantasy. Sheri S. Tepper's (1991) novel, *Beauty*, uses the Sleeping Beauty fairytale as a framework to present the Middle Ages as an idyllic Eden retaining a sense of the sacred and magic which vanishes

with the advent of "electric lights" and "science" – industrialization and modernization. The discourses of both environmentalism and religion are invoked in a Romantic aesthetic conflating "beauty," the medieval, and nature, implicitly critiquing the rational materialism and skepticism of modern capitalist society. "The Creator makes whales who sing in the deep, and men kill them to put their oil in lipsticks" (1991: 438). Progress is assumed to be dependent upon the exploitation of nature, and is regarded as ultimately dehumanizing and destructive.

Concern over the ecological crisis is becoming a much more insistent and common theme in fantasy literature, particularly explicit in Sheri S. Tepper's works such as *Beauty* and *The Family Tree* (1997), also in Stephen R. Donaldson's *Chronicles of Thomas Covenant* (1977–83), Ursula K. Le Guin's *Always Coming Home* (1985) and *Buffalo Gals and Other Animal Presences* (1988) and Alan Aldridge's *The Gnole* (1991). However, most fantasy expresses these concerns indirectly through the use of myth and symbol. The creation of coherent alternative worlds such as Tolkien's Middle-Earth or Ian Irvine's Three Worlds in *The View from the Mirror* (1999–2002), is one of the hallmarks of archetypal fantasy which foregrounds to an unusual degree the importance of environment. Even when it is used predominantly as a background for human action, nature or the land in fantasy is always implicitly understood as being alive and meaningful in some way. The land or world thus becomes like a character, intimately connected to the action of the story, and more importantly, exerting a presence or consciousness demanding respect. The influence of James Lovelock's Gaia hypothesis can be felt in Sheri S. Tepper's *True Game* series (1985–1986), where the magical planet Lom is not only sentient and conscious, but actively incorporates humanity into its unique ecosystem.

Nature in fantasy is imbued with symbolic content, reflecting the emotional or moral charge of the story; a common theme is the Land which may die or thrive according to nature of its people or ruler, as in Patricia McKillip's *Riddle-Master* trilogy (1976–1979) which draws upon Robert Graves' *The White Goddess* (1948) through the notion of sacral kingship intimately tied to the land. Nature itself becomes inextricable from the ethical dilemmas and characterization presented in the story. Another common motif is the anthropomorphizing of the physical environment through magical beings closely connected with or personifying aspects of nature, such as Tolkien's Ents, sentient trees, elves, nature spirits and deities (the Green Man, the Goddess). It is notable that fantasy draws on the same corpus of myths and sources used by popular Western esotericism, and that both have their roots in Romanticism.

Fantasy should also be considered a text-centered *community* of readers, writers, critics, audiences and media producers, which has arisen as a social phenomenon

primarily in highly industrialized, urban environments among a young, socially mobile audience, paralleling the growth and mainstreaming of the New Age movement since the 1960s. Not only do the texts draw upon the same Romantic values and discourses as alternative spirituality and environmentalist movements, but there is also a considerable overlap in community: Margot Adler notes that many Pagans and Witches not only read, but also write fantasy and science fiction (e.g., Marion Zimmer Bradley, Diana Paxson, and Juliet Marillier). Fantasy can thus be understood as participating in or intersecting with the broader social movement of the “New Age” described by Wouter Hanegraaff as an identifiable (though diffuse) cultural group constituting a sub-stratum of alternative values critical of the dominant worldview in contemporary Western societies through an ideological opposition to the two main institutions of knowledge and morality: scientific rationalism and Judeo-Christian (monotheistic) religion. Concurrently, environmentalism has sought to alter humanity’s perception of nature as an exploitable resource by raising reverent awareness of human interconnectedness with the environment. Often the behaviors and goals of New Age and environmentalist movements may be indistinguishable, though their motivations may differ.

This shared Romantic ideology and attitude toward nature forms a nexus between fantasy, alternative religiosity and environmentalism. The separations between mind/body and culture/nature are seen as related aspects of the same problem: that of a fundamental duality in Western thinking brought about by the materialism and mechanization of philosophical rationalism (institutionalized in modern science) and the dualism of traditional Christianity. Hence the emphasis on holism and the idea of an organic, interconnected universe is simultaneously a solution to and a critique of these underlying dualities. Ursula Le Guin’s *Earthsea* books (1968–2001) depict a dynamic cosmos where the interconnectedness of all things is maintained through a magical equilibrium or balance. The movement is toward reestablishment of a harmonious state, where not only the individual hero/psyche is made whole, but the imbalances between men and women, humanity and nature are also overcome through the shift toward a more egalitarian and ecologically balanced society. The post-apocalyptic Australian landscape of Sean Williams’s *Books of the Change* (2001–2002) paradoxically emphasizes these interconnections by exploring the cataclysmic changes wrought on the environment through a massive rupture within the human life and psyche.

Reconnecting with nature and changing humanity’s attitude toward the natural world is seen by both environmentalists and alternative spirituality movements as the solution to relieving the existential alienation of modern Western urbanites, which is also regarded as the root of ecological destruction – the mind–body dichotomy

is echoed in the separation between human culture and nature. Fantasy problematizes this separation. J.R.R. Tolkien (“On Fairy Stories”) states that fantasy expresses the desire to communicate with other living things. Humans with “the Wit” in Robin Hobb’s *The Farseer Trilogy* (1995–1997), for example, have magical telepathic bonds with wild animals, and the dragons of *The Liveship Traders* (1998–2000) are an endangered species which not only communicate with but cause physical mutations in humans: human and nonhuman blend and merge. The emphasis is on continuity with rather than separation from nature: there are no sharp distinctions; the boundaries are blurred. However, the shapeshifters and werewolves of fantasy, such as the Metamorphs of Robert Silverberg’s *Majipoor* books (1980–) and Patricia McKillip’s Earth-Masters (in *Riddle-Master*), point to the ambiguities in humanity’s relationship to wild, chaotic, dangerous nature. As Verlyn Flieger notes, there is an acknowledgement that nonhuman life has its own agenda and survival at stake that is not necessarily compatible with human society. This uneasy coexistence reflects tensions and contradictions found within the Green Movement and in wider society, and points to the fundamental cultural paradox inherent in the cultural construction of the natural.

By tapping into the emotional and imaginative sub-stratum at the foundation of religious experience, fantasy can express alternate ways of perceiving reality. It is eminently able to express the holistic visions at the heart of New Age and environmentalist critiques centered around altering humanity’s relationship to the Other: its estranged self, and nonhuman nature. In so doing, fantasy has become one of the imaginative discourses of “alternative culture,” its motifs, symbols and ideological substructure influencing and itself feeding into what Meredith Veldman describes as a sub-current of Romantic anti-modern ideological protest. Fantasy literature can therefore be seen as part of a commercial and creative substructure that plays a part in the dissemination and acceptance of heterodox beliefs and ideas into wider society. However, fantasy is in the end a literary manifestation, not a religious one. This is an important distinction: the focus is on ethical responsibility, the individual, generalized “spirituality” not localized to any particular creed or religion. Fantasy presents internally coherent moral dramas without reference to a formal moral code or to any kind of religious institution. Its characters are faced with existential moral choices of the same quality as those faced by modern Western individuals. It works through constant adaptation to contemporary cultural contexts in order to be acceptable to modern audiences and mentalities – in short, it involves the mainstreaming of countercultural impulses.

The Farm

In 1971, a motley caravan of countercultural idealists arrived at a borrowed farm in southern Tennessee to start a commune based on the spiritual teachings of Stephen Gaskin, who had gathered about him hundreds of young seekers in a rambling series of lectures and discussions called Monday Night Class in San Francisco. Settling into their new home, the idealistic hippies began to build a commune that would eventually reach a population of some 1500. Central to their aspirations was the conviction that they could make the world a better place to live by living low-impact, cooperative lives and sharing their surplus with others. In the Farm's first dozen years its residents ran an extensive agricultural operation, worked to develop innovative kinds of natural foods (many of them based on soybeans), and operated a natural birthing

clinic whose services were offered free to the public. Central to it all was a nature-oriented religious spirit drawing on the teachings of the world's great religions and spiritual masters and articulated by Gaskin, whose Sunday morning services anchored the entire enterprise.

Economic problems led to a shift, in the early 1980s, from a large community with a completely communal economy to a smaller, more decentralized one. However, the environmental and natural commitments of Farm members have remained central. They have developed solar energy and alternative fuels for vehicles. Through Plenty, their charitable foundation, they support grassroots, low-impact construction and agricultural projects in developing countries. Their Ecovillage Training Center offers instruction in alternative building construction, permaculture, and other such things. They have preserved hundreds of acres of native forest. After three decades they continue to be proudly devoted to natural living.

SP Fascism

Fascism is a political ideology driven by a vision of the nation's total rebirth from decadence (its "palingenesis"; see Griffin 1995). In the interwar period it typically assumed a charismatic ritual form of politics that for some scholars is reminiscent of Early Modern millenarian movements, and for others represents an outstanding example of modern "political religion." Moreover, in some of its manifestations fascism has apparently exhibited a deep concern with nature and even with ecological issues. Both "religion" and "nature," the principal themes of this encyclopedia, are highly contested terms embracing a vast range of phenomena. This article sets out to convey something of fascism's complex relationship to both terms by concentrating on the degree to which it took the form of a "religion of nature." A generalized pronouncement on even this relationship is hazardous, however, since, compared to liberalism and Marxism, fascism is a peculiarly protean force, capable of assuming a wide range of sometimes contradictory forms even within the same

movement. This is because the national revolution envisaged by fascists embraces a wide range of permutations in what constitutes the nation's indestructible core, in the types and virulence of the racism which it incorporates, and in the temporal and geographical scale of the coming revolution. In the same way its relationship to established or new religions can assume many contradictory guises, as can the degree to which it deliberately seeks to incite a sense of mystic participation or self-transcendence in its followers. Equally, the place which a transformed relationship to nature occupies within the fascist scheme for national regeneration, as well as the role played in it by pagan, "immanentist," or cultic concepts of nature, can vary enormously depending on which specimen of the genus is considered.

Yet even when a particular example of fascism or moment in the "fascist experience" seems to display a profound religiosity bound up with an all-pervasive cult of nature, closer examination suggests that both are specious when compared to those authentic religions in which a significant role is played by a spontaneous sense of awe (or what is known in German as *Ehrfurcht*, a synthesis of "veneration" and "fear") at the unfathomable forces of creation and destruction which are unceasingly at work in shaping the cosmos (Griffin 1998). A true "religion of nature" cultivates a spiritual, metaphysical, and aesthetic awareness of the unimaginable scale, both microscopic and macroscopic, on which nature's laws have acted in the epic miracle play whose plot has been unfolding since the beginning of life and the universe itself, and perhaps beyond. It is a scale that dwarfs the strivings of the whole of humanity, let alone individual peoples or races, in the total scheme of things, and relegates national history to little more than a footnote in the Book of Life. This perspective shrinks to insignificance the importance of "the new order" which fascists aspire to bring about in the life of their people or race, and reveals the genius of charismatic leaders to be little more than ephemeral displays of mortal hubris. The "thousand year empires" about which their daydreams revolve, and even the realm of "immortality" to which they consign their national heroes, are but a twinkling of the cosmic eye in comparison. A chilling, but unusually lucid glimpse into the abyss which yawns between the religious, genuinely metaphysical, concept of a higher reality and the fascist one is summed up in the following pronouncement reportedly made by Adolf Hitler during one of his interminable "table talks":

To the Christian doctrine of the infinite significance of the individual human soul . . . I oppose with icy clarity the saving doctrine of the nothingness and insignificance of the individual human being, and of his continued existence in the visible immortality of the nation (in Rhodes 1980: 78).

Conceptual Problems and Premises

The problem inherent in all *ex cathedra* pronouncements of the sort made above is that their clarity and authority are achieved at the cost of drastically simplifying definitional issues of mind-teasing complexity and subtlety. An article on fascism in the context of this encyclopedia involves juggling conceptually with three terms all of which are so deeply contested that they resemble fluffballs rather than discrete objects. In other words their taxonomic boundaries are not only fuzzy to the point of evanescence but so mobile that, according to which expert is consulted, clear tracts of solid no-man's-land between "fascism," "religion" and "nature" can suddenly be engulfed, while equally unpredictably new stretches of common terrain may emerge where they all overlap.

Fortunately, a partial consensus is currently gaining ground about the definitional role played in fascism by the myth of the nation's rebirth from decadence within historical time and through human agency, the modern variant of an archetypal human preoccupation with accessing a "higher" time and "spiritual" rebirth. This allows it to be dissociated "ideal-typically" from Christianity as a creed postulating the existence of a supra-historical and supra-temporal Being. From this perspective the extensive collusion between the Churches and both Fascist Italy and the Third Reich which came about in the interwar period, and the many fascist movements (e.g., the Falange, the Romanian Iron Guard, the South African AWB) which have sought to exploit Christianity's mythic power for their own ends, point not to fascism's deep kinship with religion, but rather to the perpetual propensity of human beings and their political leaders to pervert religion by appropriating it and bending it to strictly temporal and temporary goals. Fascism thus transforms metaphysics into a form of metapolitics, whose horrendous human implications can only be fully grasped when translated into the realm of politics and social engineering.

It is when it comes to the wider question of fascism's relationship, not to the relatively concrete topic of "established religion," but to the far more nebulous notion of "a religious apprehension of nature," that the issue becomes inextricably tangled. For heuristic purposes it might be possible to locate the core of this phenomenon within what has generally been referred to under the heading of "pantheism" or "nature mysticism," but what one major authority on comparative religion and preternatural experiences, R.C. Zaehner, more precisely identified as "pan-en-henism" (Zaehner 1961). By this he referred to the non-rational, emotionally overwhelming, language-defying sense of "all-in-oneness" encountered in varied forms in the writings of countless mystics and poets the world over. It is an experience that opens up the intuitive mind ("visionary faculty," "third eye," "pineal gland," "four-fold vision," "soul," etc.) to the pullulating interconnectedness of all organic and inorganic reality, to the

intrinsic, transcendental beauty of a hypostatized "Life." It brings human beings in tune with the sacred, numinous quality of organic nature as the manifestation of a single, continually unfolding dynamic act of creation, both material and spiritual, whose origins, mechanisms, and sublime purposes can never be fully divined by the human mind.

Testimonies to such an experience can be found in the context of dualistic religions (e.g., the poetry of St. Francis of Assisi and William Blake), "monistic" or "philosophical" religions (e.g., Daoism, Zen Buddhism), shamanistic religions (e.g., the cosmology of the Navaho or Amazonian Indians), Romanticism (e.g., the poetry of Coleridge or the paintings of Caspar David Friedrich), and the types of ecology informed by "New Age" spirituality (e.g., the books of Fritjof Capra or the courses on "Buddhist ecology" taught at the Schumacher College in Devon, UK). Its hallmark is a feeling of being transfixed by the inscrutable mysteries of the cosmos in a moment of what the German poet Goethe called "Ergriffenheit," a state of being seized by awe, by the realization of Being itself. It is an ecstatic yet terrifying moment of revelation, of *anagnorisis*, of breaking through the "cloud of unknowing" to be face to face with life and see its immutable laws written on one's own flesh. It is one which in its purest form acts as an antidote to human vanity, makes the wanton destruction of life in any of its incarnations unthinkable. It is thus the arch-enemy of all forms of anthropocentric, ethnocentric or "race supremacist" mindset, stripping the senses to the point where they become receptive to a bottomless oneness and boundless compassion with all living and mortal creatures. Ecofascism is inevitably a travesty and betrayal of genuinely "green" politics.

It is the (inevitably contentious) thesis of this article that once the yardstick for a "genuine" religion of nature is established in these terms then it follows that fascism is incompatible with anything remotely resembling it. When fascism and any other form of organized ultranationalism or politicized racial hatred which is not firmly rooted in an orthodox religious tradition – whether such sentiments are not themselves perversions of religion even when rooted in a religious tradition is a matter for theologians to judge – employ the discourse of a "religion or nature" they do so *metaphorically*. In other words they create an insidious verbal register which exploits the mythic power of both constituents purely as a source of mystification and legitimation, and thereby guts them of their original or "true" significance. A venerable precedent for this procedure within the liberal tradition is the way the American Declaration of Independence of 1776, despite being purportedly based on "Reason," invokes "the Laws of Nature and Nature's God," "the Creator," and "the Protection of Divine Providence" (note again the use of hypostatizing capitals) in order to endow the idea of "self-evident truths" and "inalienable rights" with an aura

of Higher Authority and Higher Destiny, and thus the American Revolution itself with an incontrovertible legitimacy. In doing so its authors revealed themselves as true children of the Enlightenment, which made extensive use of the concept of "Nature" and the "Supreme Being" to endorse its absolutist claims for the power of rationalism. The systematic elision of "God" with "Country" to create a synthetic mobilizing myth disseminated by the propaganda machines of all the states involved in the First World War provides another instructive example both of how readily genuine religion can be contaminated and how an *ersatz* religion (in this case hyper-nationalism) can be fabricated in the modern age – though the *perversion* of religion by secular vested interests is arguably something as old as religion itself. The "higher" purpose which this ideological confabulation served between 1914 and 1918 was anything but divine, but rather the strictly down-to-Earth one of using religion as ideological bellows to sustain the white-hot patriotism vital for turning ordinary men into human weapons of mass slaughter and mutual destruction.

When encountered in the powerful gravitational field of fascist fanaticism, allusions to "the sacred" and to "nature" will generally prove on close inspection to be little more than thinly disguised simulations of a "genuinely" religious appreciation of nature and the laws of life. Wherever history throws up cases of a modern, partially secularized nation that cries out for "redemption" or "renewal" through the revitalization of the healthy forces of nature, then theocentric/metaphysical and ecocentric/biological axioms have been ideologically modified in the pursuit of narrow anthropocentric and ethnocentric ends. Just like some branches of nineteenth-century science (Darwinism, anthropology, genetics) were corrupted into scientism (Social Darwinism, Aryanism, racial hygiene), so the *mysterium tremendum* of nature mutates within the fascist mentality into a vacuous kitsch filled with sinister intent. A telling example of this is to be found in a pamphlet on the mission of the SS written by its leader, Reichsführer Heinrich Himmler, who went on to oversee the setting up and running of the Third Reich's tentacular system of extermination camps. In it he stresses the supreme importance to the cohesion of the SS of the belief in "the value and holiness of the soil" and "in a God who rules over us, who has created us and our Fatherland, our people and our Earth, and who sent us our leader" (Griffin 1995: 147–8).

Samples of Fascism's Specious Affinity with a Religion of Nature

By now it should be clear that by definition (or rather by the definitions proposed here) fascism precludes a genuinely religious sense of nature. However, it has also been implied that, like an ideological scavenger or vampire, fascism is irresistibly drawn to any vital cultural or

ideological forces which it can feed on or seduce in order to enhance its revolutionary force as a mobilizing power. On a par with history and the biological sciences, nature and religion readily provide deep reservoirs of such forces.

Thus fascism repeatedly generates images which evoke a specious kinship with a “panethnic” communion with nature: the landscapes of woods and lakes so beloved of “Aryan” painters, Blood and Soil visionaries, and the Hitler Youth; the Führer greeting Dirndl-clad peasant-girls or musing on his plans of world conquest against the backdrop of sun-kissed Bavarian mountain crests; the idyllic portraits of rural life cultivated by the *strapaese* current of fascism and the local harvest festivals or “*sagre*” celebrating the olive or the anchovy promoted by the regime; the South African Ossewabrandwag’s re-enactment of the Great Trek using ox-drawn wagons driven across the veldt in the quest to restore the Boer to his rightful place in God’s own country; the nocturnal initiation ceremonies held deep in the Transylvanian forest by so called “nests” of the Legionaries of the Archangel Michael to forge bonds of Romanian blood brotherhood; the landscapes and wildlife undefiled by the modern metropolis so lovingly described in the novels both of Henry Williamson, author of *Tarka the Otter* and propagandist for the British Union of Fascists, and Knut Hamsun, Nobel prize winner for literature and supporter of Quisling’s Nasjonalsamling. As for post-war fascism, it is symptomatic of its repeated attempts to cover tracks which lead straight back to the railway sidings of Auschwitz that contemporary Third Positionist (“Strasserite”) groups of national revolutionaries have made links with radical ecology groups such as the “Green Anarchists.” Similarly, the French (and now European) New Right embraces Green politics as part of its bid to bring about a “pagan liberation” of the modern world by reestablishing a pre-Christian cosmology and so restore a healthy “Indo-European” bond with nature.

Nor is there any shortage of texts documenting the place that an *ersatz* religion of nature has so often played in fascist ideology. Thus one of the many Nazi choral songs celebrating communal devotion to the Third Reich set to solemn, hymn-like music:

Earth creates the new, Earth takes away the old. Holy German Earth, may we alone be saved. It is she who bore us, we belong to her. Eternal loyalty is emblazoned on her banner. We walk on believing, turned towards the sun.

But it is contemporary US fascism in its more overtly pagan neo-Nazi incarnations such as Odinism and in its various hybrids with the racist heterodoxies of Christian Identity which is particularly rich in examples of bastardized fusions of fascism with the imagery of religion and nature.

Thus the tract “Aryan Destiny: Back to the Land” written in the 1970s by Jost, a Vietnam veteran and neo-Nazi, ends with the vision of a new Aryan homeland in the mountains of North Carolina, the Volksberg. There, Whites inspired by “a true idealism and a sound spiritual philosophy” would finally “begin a new life close to nature, and away from the degeneracy of the urban cesspools” (Kaplan 2000: 491). A structurally similar *Weltanschauung* (worldview) underlies David Lane’s “88 Precepts” (in neo-Nazi contexts the number 88 signifies the letters HH or Heil Hitler). These encapsulated the rationale and “vision” of the notorious US Aryan terrorist group, The Order, which was active in the early 1980s and contained such Mosaic axioms as (3) “God is the personification of Nature proved perfect by the evidence of Natural Law . . .”; (15) “In accordance with Nature’s Laws, nothing is more right than the preservation of one’s own race”; (33) “Inter-specie [sic] compassion is contrary to the Laws of Nature” (Kaplan 2000: 494–6).

To cite another contemporary example from the contemporary British racist right, David Myatt, leader of the Reichsfolk, and one of the influences on David Copeland, the London “Nailbomber,” claims that the movement is fighting

in the name of Adolf Hitler himself and for the holiest cause of all . . . that of the Cosmic being itself, manifest to us in Nature, the evolution of nature that is race and the evolution of race that is individual excellence, civilization and enlightenment (in Kaplan 2000: 514).

Elements of a mongrelized “religion of nature” also inform the “Cosmotheism” of the late William Pierce, author of the (since the Oklahoma bombing of 1995) infamous *Turner Diaries*, as well as Ben Klassen’s *Nature’s Eternal Religion* (1973). The “Sixteen Commandments” of his Church of the Creator include the injunction: “You shall keep your race pure. Pollution of the White Race is a heinous crime against Nature and your own race;” and “It is our duty and privilege to further Nature’s plan by striving towards the advancement and improvement of our future generations” (in Kaplan 2000: 474).

The Dance of Shiva

This article has adopted a consciously conservative, “purist” position on fascism’s religious credentials. As a result it takes issue with the considered judgment of several academics on this topic. It suggests, for example, that Robert Pois’ interpretation of National Socialism as a “religion of nature,” while impressively scholarly and containing many valid observations, obscures the sinister political and eugenic purposes which informed apparent acts of communion with nature staged by the Third Reich: namely to forge a racially conceived and wholly

imaginary national community or *Volksgemeinschaft* while mystifying the ritual destruction of humanist ethics and humanitarian reason. The function of Nazi “religion” was to bless and sanctify the categorization of humanity along a sliding scale stretching from the pure, “immortal” Aryan to subhuman levels of existence fit only for extermination. However, the line taken by this article broadly endorses Michael Burleigh’s account of Nazism as a “political religion” (Burleigh 2000a) because of the stress he puts on it being a modern political movement which operated as an *ersatz* theology, commenting, for example, that the ritual “Commemoration of the Movement’s fallen ‘saturated the proceedings with quasi-religious emotion,’ and must have prompted ‘nausea in any person of genuine religious faith’ ” (Burleigh 2000b: 264). At the same time, he also suggests that it would have been more fruitful to explore the links between the Nazi vision of the “new order” and the palingenetic myths of other fascist movements rather than suggest direct parallels with the millenarian fantasies of sixteenth-century Anabaptists.

The approach adopted here also rejects as wrong-headed Anna Bramwell’s attempt to portray as a forerunner of contemporary “Green” politics Walter Darré, Hitler’s Reich Farmers’ Leader and Food Minister, who reconciled his commitment to organic farming and the revitalization of the peasantry with his readiness to oversee the Aryanization of Polish farming (Bramwell 1985). It also regards as misguided Daniel Gasman’s thesis (Gasman 1971) that the genesis of Nazism is to be located in Ernst Haeckel’s “Monism” (he later extends this thesis to the whole of fascism). Monism was Haeckel’s name for the overarching “philosophy of life” which resulted from his highly syncretic fusion of Darwinism, Social Darwinism, biologism, vitalism, *völkisch* Aryanism, and anti-Semitism which became influential at the turn of the nineteenth century. The resulting pseudo-scientific (scientistic) “worldview,” whatever direct impact it had on some contemporaries, was just one of many totalizing cosmologies of decadence and rebirth which helped shape the cultural climate of the *fin-de-siècle* in which fascism’s palingenetic fantasies first crystallized as a rudimentary political vision. Moreover, though Haeckel apparently coined the neologism “ecology,” his racist brand of nationalism caused him to be unfaithful to any genuinely ecological, and hence “panenhenistic,” moments of epiphany which he might have had in the course of his meditations about the dynamic processes shaping the world.

In this respect Haeckel stayed true to the spirit of his mentor Nietzsche, who, though not a nationalist, had somehow managed to extract from a series of powerful revelations induced by direct contact with unspoiled nature the myth of the *Übermensch* or “superior man” who would redeem Western civilization from its moral decadence and loss of vision in a spirit far removed from any form of ecological humanism, articulating his vision in

texts that readily leant themselves to being appropriated by Nazi propagandists. Thereby he betrayed his fleeting experiences of the interconnectedness and intrinsic beauty which he recorded in his private correspondence and which inspired the section in *Thus Spake Zarathustra* called At Noontide:

Take care! Hot noontide sleeps upon the fields. Do not sing! Quiet! Quiet! The world is perfect . . . It is the most inconspicuous, softest, lightest thing, the rustling of a lizard in the leaves, a breath, a twinkling of an eye . . . it is the little that makes for the greatest degree of happiness. What has happened to me? Has time flown away? Listen! Did I fall – listen! – into the well of eternity? . . . Did not the world just become perfect? (Nietzsche 1969: 288)

Such epiphanic moments can act as portals leading to the realization – that has a deep resonance both with ancient Hindu cosmology and with modern astrophysics – that the whole of nature, in fact the universe itself, is one vast controlled explosion of amoral cosmic energy performing on every scale of reality the infinitely intricate and aesthetically structured “dance of Shiva” (Capra 1983). It is a vision of the world that reveals a deep structural affinity or symbiosis between the experience of the sacred, mystic religion, and nature. It is one that cannot be grasped by a mindset that finds beauty instead in the choreographed march of uniformed troops or the stage-managed acclamations of the mob celebrating the renewal of an all-too-human history in which even more demonized enemies of the new order will inevitably be persecuted and “sacrificed.”

SP Fauna Cabala

- Fauna. *n.* animal life.
 Cabala. *n.* an esoteric, secret matter or mysterious art.

Science can be a looking-glass into the sacred, a window to a world outside the confines of human perception. It can be a tool to see beauty that would otherwise remain hidden, to uncover rather than explain mystery. For some scientists, the study of nature is a means to spirituality, is delving into the secrets of the sacred, is empowering, sustaining, transformative, infused with a sense of awe. It is a discovery of what is precious and most important in life. To dabble with systems larger than self and witness the interconnectedness of life is an honor, and such research is necessarily respectful, non-invasive, and a reflection of the equality of all living beings.

Animal perceptions, ways of being, decisions in the face of ecological pressures and evolutionary constraints are where I find magic. As a behavioral and molecular ecologist I want to see the world through a beetle's eyes, I want to know what home means to a wombat. My science trundles along in the footsteps of my childhood, striving to understand questions completely unrelated to humans. I am stunned by the bee's waggle dance, by snail love darts, by senses foreign to the human experience. Often

the biggest secrets, the most important concepts, are most clearly seen in the minutiae. And often they are seen in reproductive biology and mating systems, the evolutionary currency of life. It is on these that I tend to focus in my column *Fauna Cabala*, an endeavor to convey wonder glimpsed through science.

Aphids

High overhead on cottonwood leaves, pregnant aphids are kickboxing. Springtime on the Colorado Plateau induces aphid females of the genus *Pemphigus* to emerge from eggs in the bark of cottonwood trees. The insects, who are initially wingless, march up the trunks by the thousands. When an aphid arrives at the top, she wanders about to select the perfect leaf, and when found, prods and sucks along the midrib at the leaf's base until a gall (a hollow sack of leaf tissue) forms.

Within this protective gall the female births 50 to 100 daughters parthenogenetically (that is, her egg cells do not undergo meiosis, and thus, without mating, she can produce daughters identical to herself) and feeds on phloem sap with them until they burst out at maturity. A female can increase her reproductive success by selecting a large leaf, because leaf size predicts sap content, and by settling near a leaf's base, the site of nutrient inflow. This creates a stampede for large leaves, and vicious territoriality. If a female comes along while another is forming her gall, they engage in a lethal bout of kicking, which can last for two days.

Among aphids, males are an afterthought. Even before a female is born she has daughters developing within her. Throughout the spring and summer, generations of females, some winged and others not, are cranked out every ten days. It is not until fall, when the drop in temperature prompts meiosis to occur, that females birth sons. The female's sex chromosomes separate imperfectly, such that some embryos just have one, producing sons. The males then mate with females, who lay eggs in the bark of cottonwood trees. The eggs destined to become males perish, while those that will hatch into females overwinter into spring. Thus, asexual reproduction enables a multitude of females to explode onto the scene, and sexual reproduction results in new gene combinations, some of which may be better adapted to environmental conditions the following year.

Dung Beetles

Dung beetles (superfamily Scarabaeoidea), who rival the entire class of birds in species number, have for 250 million years exploited the nutritionally rich resource that drops from intestinal tracks. Before dung beetles flourished with the radiation of mammals, their ancestors may well have trooped after terrestrial dinosaurs. Modern beetles locate excrement by odor, and for those who eat monkey poo, by that peculiar thud on the forest floor.

Thereafter, beetles eat, bury, steal, and otherwise frolic among the fecal matter according to their specialty. They are of three behavioral types: dwellers, rollers, and tunnelers. Dwellers set up their household in dung, feasting and ovipositing in the fresh globs. Rollers mold fecal balls and roll them away; tunnelers sequester caches of excrement beneath the pat. Both rollers and tunnelers make nests by burying poop for baby food, and can provide elaborate parental care. Other beetles, the kleptoparasites, thief from these nesters to maintain their coprophagous (feces-eating) lifestyle.

Driven by fierce competition for excrement, some beetles don't wait for feces to fall. Anus-dwelling dung beetles of monkeys, wallabies and sloths eat dingleberries around the anus, occasionally following the poop earthward to lay eggs in the pat. Some anus-dwellers clutch the perianal hairs of wallabies, stretching to catch that which cannonballs them to the ground. In India, several beetle species forage directly in the human intestine. Another beetle with its own fecal factory is a South American who rides large snails and sups on their slimy dung. This is unusual because most dung beetles prefer the nutritionally superior scat of mammals. In fact, mammalian population declines and extinctions have the potential to kick the crap out of dung beetle diversity.

When not plunging into poo pats for dinner, some beetles are meticulously sculpting dung balls. Males of *Kheper nigroaeneus*, a large African dung beetle, mold brood balls from carefully selected feces and flaunt them as a sexual display. Once a female is attracted, she climbs aboard the ball and the male rolls both away. At a suitable spot, the male buries himself, the brood ball and his partner, after which they mate and he leaves, closing the hole behind him. The female proceeds to remold the ball, inserting a bit of her own feces and plastering it over the ball's exterior to form a layer that decreases desiccation. She then lays a single egg within it, her sole offspring that year.

Upon hatching, the larva munches on its mother's excrement, thereby inoculating itself with the microbial strains necessary to digest dung. It then begins to mold a pupation chamber within the brood ball with its own feces. Mother and offspring spend the next three months eating and excreting, the larva from within and the mother from without. They are able to communicate through a small, unplastered region on the brood ball. A pheromone released by the larva diffuses out of this window and elicits broodcaring behavior from the mother. The solid diet of brood ball, and its own and its mother's feces, brings the young beetle into adulthood. Come the first spring rains, the new adult emerges from its subterranean haven. Thus, with an extraordinary amount of effort yielding only a single offspring, this beetle species has one of the highest levels of parental care among insects.

Gartersnakes

The red-sided gartersnake (*Thamnophis sirtalis parietalis*) is right-handed. Upon emergence from their winter dens they get down to business in a frenzied mating ball that consists of a female and ten to a hundred males. Death by smothering is a very real and common end. Within this mating mass a male must tackle four questions: how can he outcompete his rivals, how can he copulate with a cylindrical companion, which penis shall he use, and how can he keep his mate from mating again? Some males outcompete their rivals by mimicking the scent of the opposite sex. Such a male produces the female pheromone, causing other males in the mating ball to court him instead and allowing him meanwhile to get close to the true female. Once a male does so, however, he must determine which is the head end and which the tail end before he can mate, a difficult thing to do since males are much smaller than females and females are enmeshed in the male mob. He overcomes this by pressing his chin against the female's scales. If the snakes are oriented head to head, his tongue will be able to flick underneath her scales, where her pheromone is highly concentrated, and his chin will scrape onto the next overlapping scale. If not, he will simply slide smoothly over her overlapping scales.

Once oriented correctly, the male must decide which penis to use. Most animals tend to favor the use of one hand or paw or hoof over the equivalent one on the other side of the body, and, though limbless, these snakes are no exception. They just favor one penis over the other. Together called hemipenes, each hemipenis is linked to its own testis and kidney. The right unit is bigger, and the one they prefer, particularly when warmer temperatures enable them to maneuver into complex mating positions. However, if they're lucky enough to mate with a succession of females they will alternate between the two because otherwise they deplete their kidney secretions. These secretions are important because they form a hard copulatory plug that prevents females from remating. Other males find the smell of a plugged female unsexy, and leave her be as she slithers on her way.

These frequently mating males have the largest plug and the shortest copulation among snakes. Instead of trying to prevent females from remating during the fertile period by guarding them or copulating for an extensive amount of time they give them corks, which stay in place for about two days. This red-sided, right-handed, scent-parroting, mate-stopping serpent can thus rapidly re-enter a mating mob.

Anemonefish

Some coral reef fish pack a dress in their testes. Anemonefish of the genus *Amphiprion*, who inhabit the tropical and subtropical Indopacific, live out their lives protected by the swaying tentacles of sea anemones. It is thought that the anemones avoid harpooning them to death

because the fish have somehow smeared themselves with their hosts' mucus so that they are recognized as just another appendage. Though this world is sheltered from the outside, inside it is a den of aggression. A large female and smaller male form a monogamous unit, the female being older and dominant. Also present are up to eight unrelated sub-adults and juveniles who are constantly attacked by the breeding pair. They are in such a high-stress state from these attacks that their sexual organs remain tiny. The adult male is aggressive to other males because he does not want them to sneak a spawn. The female is aggressive to her mate and the other males in order to prevent them from becoming females. All males have this ability to change sex thanks to immature eggs hiding in their testes. If the female dies, her mate becomes female and the largest of the males becomes the new female's mate. It only takes a month for the male to lay an egg.

This pattern of sex change is unusual among fish. It likely evolved because the patchy and unpredictable distribution of the host anemone made it necessary to be monogamous and easier to change sex than to risk predation while searching for an anemone occupied by an unpaired member of the opposite sex. Most sex-changing fish follow the pattern of the polygynous bluehead wrasse, in which there is intense competition for access to females. Males get more matings, as many as 100 per day, as they get larger and more able to defend a territory. Because males have the potential of far greater reproductive success than females, the largest females turn into males when there are few large males and many small females around. The switch is rapid. Upon the death of a dominating male, a large female immediately begins courting smaller females, and in just over a week she sports superb sperm. Thus, though these two species differ in male-to-femaleness and female-to-maleness, their brand of sex change reflects their social system, not ambisexual chaos.

Garden Snails

In a finale of fervent foreplay, brown garden snails (*Helix aspersa*) impale each other with love-darts. Being hermaphrodites, these animals sport both male and female tackle and swap sperm in both directions during eight hours of slippery sex. Most sperm are immediately digested by a specialized sperm-destroying gland, although a few sneak past to a storage organ, where they dwell for up to four years. The point of the sharp, calcareous, centimeter-long snail nails is to short-circuit the gland. A swooning snail will aim for the genitals, located to the right of the head, and push the dart out of its body and into its partner. Darts are coated with a slimy cocktail that causes contractions in the female reproductive tract, closing the entrance to the devouring gland and allowing sperm to pass freely into storage. If a snail has a poor aim or is caught empty-handed, which is quite possible since

darts take ten days to produce, it compensates by delivering extra sperm to its prickly partner. This species exemplifies a rarity: an intersexual arms race in which individuals are both genders. The male portion has evolved to impart increasingly more sperm while the female portion has evolved to digest it.

Fairy Wrens

Superb fairy wrens (*Malurus cyaneus*) are true blue in color only. These tiny residents of eastern Australia are socially monogamous, meaning that breeding pairs cohabit and raise young, yet enjoy more romances outside this union than any other species. A male will maintain a year-round territory in which he lives either with just his mate or with subordinate males as well who assist with chick-rearing. At the commencement of the five-month breeding season he sheds his drab brown winter feathers and dons brilliant, luxurious, multi-hued blue plumage and flits about to other territories. With a yellow petal in his bill, and crown, cheek and back feather flared, he displays with fervor to all females except for his mate. A female is usually quite unimpressed but occasionally solicits copulations. She finds it particularly endearing when a beau's blue 'do is enduring. Because it is extremely costly energy-wise to sport blue feathers (especially in winter), only the most fit males can maintain blueness for a long period of time. The most successful males are those who begin their blue displays at least two months prior to the beginning of the breeding season; only the studliest of the studs can molt directly from old breeding plumage into new come the end of the breeding season in February. A female can thus, by noting how long a male is blue, assess vigor, which translates into genetic quality when making a mating decision. The result of this means that 72 percent of the chicks from her seven or so annual clutches are fathered by males other than her mate. This has, in turn, led to intense sperm competition among males. They lug around huge sperm storage containers called cloacal protuberances which, together with testes, comprise up to 10 percent of their bodyweight. When a male is lucky enough to receive a cloacal kiss, he can release a massive ejaculate, possibly swamping out the sperm of his rivals. These small, libidinal birds thus have the dual honor of being the most polyamorous of socially monogamous vertebrates and having the greatest sperm reserves, relative to weight, of any bird or mammal.

Honeybees

Honeybees (*Apis mellifera*) give precise directions while they sing and dance for a trembling crowd in the dark. After finding a particularly inspiring food source, a nectar-laden bee flies back to the hive where, on the vertical surface of the comb, she dances. Usually this is in the shape of a figure eight, and is called the waggle dance. The angle that the figure eight departs from the vertical

conveys which direction the food is from the hive. It is the same angle as between the sun and the food, from the hive. For instance, if she dances straight upward, the food is directly toward the sun, straight downward, it is directly away from the sun, and 45 degrees to the right means it is 45 degrees to the right of the sun. The bee communicates distance in addition to direction by speed: the faster she dances, the closer the food source.

As she waggles, a gaggle of her nest-mates observe, but because it is dark in the hive they do this via sound. Her song enables bees to first find her among the masses, and then to interpret the angle of her dance. They can do this because their hearing organs, in antennae, can be moved to and fro to decipher her comings and goings in relation to their position and gravity. Meanwhile, her audience members employ a signal that does not compete with hers: they vibrate the comb with their thoraxes. When there is a whole lot of shaking going on she stops to pass out titbits from the food source. Those who are suitably impressed make a beeline for the food. If these nectar collectors remain impressed they will join in the dance, so that over time many bees in the hive will be singing the same song and dancing the same dance, and the food source will be heavily used.

Potential pitfalls to this system are not problems for these bees: because they are sensitive to the plane of polarized light they can determine sun position even on overcast days, and if inclement weather or nightfall delays return to a food source, dances later compensate for the change in sun position. The refined communicative prowess of honeybees, their ability to convert gravitational information in the dark hive into visual information in the world, is unrivaled among living beings.

Mongoose/Hornbill

The dwarf mongoose (*Helogale undulate rufula*) forms a foraging community with yellow-billed (*Tockus flavirostris*) and Von der Decken's (*Tockus deckeni*) hornbills in the Taru desert of Kenya. This thornscrub habitat has a large termite population, the mounds of which are used as mongoose refuges and foraging group staging areas. The carnivorous dwarf mongoose eats insects (beetles, termites, grasshoppers) and occasionally small vertebrates. When foraging, the mongooses fan out a meter or less apart and generally walk in a straight line, thus covering as much ground as possible. The hornbills (whose diet, except for fruits and herbs, overlaps completely with their companions) follow on foot, eating the jumping and flying insects that the mongooses disturb.

The foraging day begins at a termite mound, where mongooses and hornbills rendezvous. Typically, the hornbills fly to a mound where mongooses are sleeping and wait for them to wake, although if the mongooses emerge with no birds present, the mammals will delay foraging until the birds arrive. A mongoose lookout emerges first,

followed by the rest of the group (3–32 animals). After twenty minutes or so of stretching, grooming, sunbathing and playing, the group sets off, with the hornbills in tow. If, however, the hornbills wait extraordinarily long (over an hour) for the mongooses to emerge, they fly to the mound, peek down a ventilation shaft and wake the sleepy mongooses with loud, squawking “wok”s.

The hornbills benefit from this mutualistic relationship by increased foraging efficiency, particularly of prey that would be difficult to find if not flushed out by mongooses. In return, the mongooses benefit because the hornbills are able to detect and warn of predatory raptors earlier than the mongooses are able to. The more birds in a group the fewer mongooses need to take up the dangerous job of lookout. Furthermore, hornbills and mongooses make several concessions to each other. Hornbills warn mongooses about predators even if the particular raptor does not prey on hornbills. Hornbills also refrain from consuming mongoose young, who are the same size as the rats in their diet, even though they have plenty of opportunities to do so. When competing for food, mongooses do not attack the hornbills as they do other species. Instead, they growl and hip-slam, responses normally reserved for fellow mongooses.

In other areas of Africa, the dwarf mongoose and yellow-billed and Von der Decken's hornbills live without each other's aid. Their relationship in the Taru desert is the tightest known mutualism between social vertebrates that usually live independently.

The laborious, sometimes high-tech, and often tedious methodology of scientific investigation can yield more than conventional insight. For me, using behavioral and genetic data to witness ecology and evolution in action inspires awe, engenders passion, and enables recognition of the sacred. My hope is that the above wanderings among the intricacies and refined beauty of other systems impart a sense of the magic and mystery inherent to worlds not our own.

Feminist Spirituality Movement

The name “feminist spirituality movement” is something of an “umbrella” term used for many Pagan movements that are specifically feminist in orientation. One of its best-known variants is feminist Wicca, a branch of goddess worshipping paganism that is explicitly feminist, unlike some Pagan groups. The feminist spirituality

movement is part of second-wave feminism and began in the latter third of the twentieth century. It is an Earth-oriented, pro-women spirituality that explicitly rejects male dominance in religion, solely male images of the divine, and the limited value accorded to nature in much conventional Western religion. Furthermore, many of the movement's leading spokespersons argue that male dominance in religion, exclusively male images of the divine, and indifference to the sacredness of nature are three variations on the same theme – parts of a single religious vision.

Like new religious movements throughout history, the feminist spirituality movement has generated its share of controversies. Some of the negative comments made about it are simply part of the general denunciation of pagan religions common among some more fundamentalist members of more established religions. Others, who are feminists themselves, are also unsympathetic to the feminist spirituality movement. Often their criticisms are simply part of the anti-religious sentiments that are part of much of the general feminist movement. Religions have been so bad for women, such critics claim, that spending time creating theology and ritual, a high priority for members of the feminist spirituality movement, simply takes time and energy away from more important political and economic projects.

Depending on the interests and needs of its participants, feminist spirituality can include a number of concerns. Some groups consist primarily of enthusiastic participants in ritual who believe in a matriarchal past and in “the Goddess,” generically conceptualized and named. Such practitioners care little for the scholarly and theological controversies in which others are deeply involved.

But whether it is plausible to posit a “matriarchal prehistory” is a matter that learned archeologists and historians must debate, as the work of Cynthia Eller has shown. And exactly how “the Goddess” is connected with the myriad goddesses known to historians of religion, or how naming the divine in feminine terms changes our concepts of the divine are difficult theological issues. Carol Christ, among other feminist theologians, has devoted much of her life to asking such questions.

Though most historians of religions would regard feminist Wicca and the feminist spirituality movement as a new religious movement, its own adherents often claim an ancient “matriarchal” past for it. They claim that before the rise of patriarchy, women participated fully in religion and often were religious leaders, that goddesses were worshipped by all members of society, and that people, deeply immersed in natural rhythms and in awe of nature, lived in peace and harmony with each other. This, they would say is the “old time religion” that existed before Christianity and other monotheistic religions, the “old religion” (another name Wiccans use for themselves)

which they seek to recover and restore. In their sacred history, the true “fall” occurred when male dominance came into being, when male deities completely replaced female deities, and when nature was no longer regarded as sacred and divine. Therefore, the feminist spirituality movement gives equal emphasis to women's leadership in religion, the importance of goddesses, and the religious significance of nature.

The theology of the feminist spirituality movement is a theology of immanence. That is to say, in common with many other religions, members of this movement claim that the divine is to be found within the world of nature, including human bodies and spirits, rather than in a transcendent realm separate from the world. The natural world in which we live is alive with spirits and every aspect of nature is divine and sacred. Also in common with many other religions, the feminist spirituality movement claims that it is natural and normal to imagine deity as female. They would also claim that when theologies of immanence are replaced by theologies of transcendence, when deity retreats from nature and the Earth to a transcendent and unknowable heaven and when women's bodies no longer are seen as fitting images of the divine, then human society inevitably degenerates into war, alienation and social oppression. Thus, according to feminist spirituality, questions of the religious status of nature are not merely theoretical; human well-being rides, in part, on recognition of the sacredness of nature. Human well-being also rides on appropriate recognition of the sacredness of femininity, whether divine or human. Many in the feminist spirituality movement would claim that the current difficult world situation is due to centuries and millennia of neglect of the Goddess embodied in the natural world and the oppression of her human counterparts.

The ritual practices of the feminist spirituality movement mirror its immanent theology which, while not ignoring male deities, focuses more on female deities and the natural world than do the religions more familiar to North Americans and Europeans. Ritual is more important to many in the feminist spirituality movement than are theology and other theoretical pursuits. They affirm that ritual “works,” that practicing rituals correctly and with the proper attitude does have an effect on the natural world around us. Practitioners of feminist spirituality have a very sophisticated understanding of how and why ritual works.

Proper attention to nature is an important component of the movement's understanding of ritual. The preferred arena for ritual activity is out of doors in nature, even if the only “nature” available is a city park, though a living room will do if need be. Many ritual circles celebrate the human body through ritual nudity. Every ritual opens with casting the sacred circle that honors the four directions and the four basic elements. The ritual cycle of the feminist spirituality movement is grounded in the seasonal

cycle of nature in the northern hemisphere, which is said to mimic the life of the Goddess and her consort. The major holidays are the four major points in the sun's journey through our Earth atmosphere – the solstices and the equinoxes. The minor holidays are the intermediate points between these holidays. These holidays mirror holidays familiar to many people in the contemporary world – Christmas, Easter, Passover, Halloween, Ground Hog's Day, and Thanksgiving. Wiccans would say that these familiar observances derive from pre-monotheistic celebrations characteristic of nature and goddess-centered religion. The sun at its lowest point for the northern hemisphere signals birth, the spring equinox renewal, the summer solstice abundance, and the autumn equinox death leading to renewal, the birth celebrated in winter solstice rituals. However, this basic pattern of birth, death, and rebirth is interpreted in many different ways, depending on the understandings developed by a local group of practitioners or a specific leader or teacher within the feminist spirituality movement. The human life cycle is also celebrated and ritualized. The movement is especially famous for the way in which it honors older women for their maturity and wisdom in a "crowning" ritual often performed for a woman to mark her sixtieth birthday.

Both the theology and the ritual practices of the feminist spirituality movement are grounded in a different evaluation of nature and human life than is found in many religions. Its practitioners often accuse other religions of being unduly pessimistic and negative about life. A common analogy is that nature is more like a nurturing, loving mother than like a judging, punishing father. Nature and life are basically trustworthy, not a mistake or a perilous journey on the way to better times in another world. Negative events can be experiences through which valuable lessons are learned, or they can be dispelled ritually. Even death is viewed as simply part of the overall rhythm of life, not a punishment for human errors. Thus, it is not surprising that this religious movement is attractive to many people, especially women, who find more dominant European and American religions to be unsupportive, even oppressive.

Fengshui

Fengshui is the common name for various techniques originating in China that bring good fortune to people when the environments in which they reside are properly oriented. Akin to the divinatory arts by which humans seek the assistance of gods or spirits, practitioners of fengshui seek an unseen life-force called *qi*. In Chinese cosmology, the human anatomy is a microcosm of the Earth, and the blood veins of one correspond to the rivers of the other. When the ground is broken for a new house, or when a grave is excavated, such action taps the *qi* meridians of the Earth – called dragon veins – just like an acupuncture needle. Regardless of the type of fengshui, all site-orientation methods seek to locate *qi* in the geophysical plane. When *qi* is located, in the burial tomb it energizes the bones of the ancestor, who thereby bestows good fortune on the descendants.

Two different procedures for locating *qi* were developed by the Han dynasty (206 B.C.E.–220 C.E.). Form School theories are based on the idea that water collects and stores *qi*, while wind captures and scatters it. Fengshui literally means "wind-water," but the term is shorthand for the principle of "(hindering) wind (and hoarding) water." The landscape features in a given locale that influence the flow of wind and water around a site are the primary arbiters of fortune in this theoretical system. Compass School methods, on the other hand, are based on the theory of the five elements. This correlative system analyzes *qi* as a force that progresses through five elemental processes. In the *yang* or productive phase, Earth harbors metal, metal condenses water, water nourishes wood, wood feeds fire, and fire burns to Earth. In the *yin* or destructive phase, Earth dams water, water quenches fire, fire melts metal, metal cuts wood, and wood saps Earth. These elements are correlated with the eight-directional

trigrams of the *Yijing* or *Book of Changes*, while a person's year of birth also corresponds to a particular trigram. It is thus possible to avoid destructive *qi* by orienting dwellings or arranging rooms in productive directions *vis-à-vis* an individual's natal *qi*. For example, a woman born in the year 1982 correlates to the element of metal and the trigram, *qian* (northwest). A productive direction would be southwest, the direction of the element Earth, which harbors metal. A destructive direction would be south, the direction of fire, which melts metal. So the woman in question might place her bedroom or living room in the southwest portion of her house where she spends the majority of her time, and the bathroom or closets in the south.

After the Chinese communist revolution of 1949, fengshui was branded as superstition in the People's Republic of China. The practice of fengshui was subsequently prohibited, which forced it underground for some fifty years. Although not officially rehabilitated, fengshui is now openly practiced in China and, while still vilified by most intellectuals, it is the subject of some scholarly study. During the half century of prohibition, the practice flourished in Taiwan, Hong Kong, and Singapore. Many of the purported masters in the West were born and trained in these Chinese communities.

Fengshui became accessible to the English-speaking world in the nineteenth century when the British missionary, Ernest Eitel, published his landmark study, *Fêng-Shui: Principles of the Natural Science of the Chinese* (1873). But the public at large did not discover this ancient system until the last decades of the twentieth century. One of the earliest proponents in the United States was Thomas Yun Lin who founded a temple for American Black Sect Tantric Buddhism in 1986. Lin's brand of fengshui largely dispensed with traditional practices and relied instead on intuition and mystical knowledge, thereby transforming an ancient science into a modern religion. Every major city in the Western world now has its own community of fengshui consultants, many of them trained by Lin or his disciples.

Fertility

Human *fertility* – going *wild* from a *domestic* or "cultivated" condition – is a transitional theme as deeply rooted as the nature/culture divide. In the late twentieth century, with the raising of *ecological consciousness*, and the emergence of reenchantment-seeking youth cultures in North America, Europe and Australia, *fertility* became a radical environmentalist career. As is particularly apparent in settler populations, radicalized youth minorities – heir to the idealism of 1960s counterculturalists, the confrontationalism of punk and the pantheistic sensibility of paganism – have grown conscious of their separation from nature. The eco-radical desire to reconnect, to be absolved from consumerist "needs," to transgress the nature/culture boundary, represents a deliberate response to the imperatives and consequences of late modernity. Accessing a range of ecosophies (deep ecology, ecofeminism, bio-regionalism, social ecology), they expresses outrage over the growing threat to, or "loss" of, nature, sacralized as Mother, with whom intimate connection is acknowledged, and to whom dutiful commitment is owed. While often reflecting a romantic primitivism, contemporary *fertility* evidences an empathetic post-colonialist sensibility, extending to a raised awareness of the devastating impact of corporate-driven globalization on indigenes – leading eco-radicals to identify with and defend beleaguered native ecology *and* peoples.

By the late 1980s, "feral" was employed as a self-descriptor by activists within the radical green movement. At the end of that decade of grassroots forest blockades, for US Earth First!ers (who used the rubric in the periodical *Live Wild or Die*) and their Australian counterparts, it designated an anarcho-primitivist Earth guardianship. Throughout the 1990s, the metaphor came to experience popular application in Australia, as thousands of activists protesting forest and mining industries, combating the loss of species diversity and championing Aboriginal land rights, were designated, or self-identified as, "feral." For these eco-activist youth minorities, "going feral" amounted to the development of a deep *identification* with nature under threat. Inhabiting forests for prolonged periods, where affinities with native biota were formed, enabled a strong attachment to place and, furthermore, an uncompromising commitment to its protection. The process was best conveyed by Earth First! co-founder Dave Foreman: by "reinhabiting a place, by dwelling in it, we become that place. We are *of* it. Our most fundamental duty is self-defense. We are the wilderness defending itself" (Foreman in Taylor 1994: 204).

Fertility is thus akin to a *rite of passage*, a process of becoming "closer to nature" from a "cultivated" or

domestic condition, a kind of eco-radical “conversion.” Mounting “tree-sits” in the canopy of the threatened forests of Australia’s East Gippsland in the late 1990s, the experience of Bandicoot is exemplary. Raised in Melbourne, Bandicoot worked nine-to-five as a timber and hardware salesman. His recollections are that of inherent detachment:

My life took me away from the earth. It put me into a four bedroom house, it fed me. You know, meat and three vegetables every night. Showed me a TV. Taught me how to live and how to protect myself . . . to put a roof over my head, and a doona [quilt] around me. And I wasn’t exposed to the outside. And when we did it was in a car, you know and in a cabin (Interview with the author, April 1998).

Yet, with a “desire to understand more about the earth,” in his mid-twenties Bandicoot shed his suit, grew dreadlocks and gravitated toward the temperate rainforests of East Gippsland. “Out there,” he reveals somewhat skittishly, he found “something magical,” a “specialness.” And, with a realization that we are “of the earth,” he became ensconced in the forest’s defense. Bandicoot’s nascent eco-activism saw him travelling between forest and city on a regular basis to gather support. This movement, from detachment to an awareness that “you’ve gotta live in a nice harmonic balance” with nature, coupled with the constant migration between forest and city, makes for an identity that is liminal and remarkably uncertain.

Like many other conscientious youth in the pursuit of such *terra-ist* liminality, Bandicoot found a sense of belonging in an anarchic collective formed to combat the loss of natural and cultural heritage. Emerging from blockades mounted in East Gippsland’s Goolongook Forest in 1993–1994, and recognizing the prior occupancy of the Bidawal, Geco (Goongerah Environment Centre) represents the last line of defense of remnant high-conservation-value forest in the state of Victoria. Like many other Earth First! affinity groups in Australia, Europe, and America, Geco strives to be a non-hierarchical *eco-tribe* whose members rally to the defense of local “old-growth,” water catchments and threatened species, all of which constitute sacred terrain. One Geco activist, Belalie, conveys a common perception:

[There is] a really hostile local community [in East Gippsland] . . . I mean they’re living on massacre sites. It’s just an area of such dark history. It’s an area where colonization continues. They continue to destroy the sacred things. They continue to wipe out the native species. It’s the same attitude which [early settlers] approached this country with, and it’s just ongoing (Interview with the author, December 1996).

Mobilizing and networking to combat mining, forest and road-building industries, eco-activist collectives like Geco draw on a range of ritual-like tactics. These include consumer boycotts, theatrical media stunts, and acts of civil disobedience such as blockading – where individuals choose to become flesh and blood “bargaining chips.” Usually maintaining the principles of nonviolent direct action (NVDA), common obstructions include “lock ons” (attachment to earth-moving machinery using chains, bike locks and home-made devices), “tree-sits” (occupied platforms built high up in trees marked for felling and usually in the path of access roads) and “tripods” (occupied tall structures straddling machinery and/or blocking access roads). Participation in these and other rites of endurance and dedication (like laying “hair tubes” designed to gauge the prevalence of threatened species) is commonly experienced as something of an induction rite – initiating eco-neophytes into a community of defenders. While the destruction and loss of landscape to which deep attachments have been formed occasions a devastating sense of despair and grief amongst feral eco-defenders, the perpetration of what they view as desecration effectively unites those who have borne witness to it.

The rites and practices outlined here are distinguishable from the nature/culture boundary transgressions promoted by earlier wilderness philosophers. Activists do not seek immediate encounters with remote landscapes for the singular purpose of becoming “recreated,” achieving “harmony” or *authenticity*, in the mould of a Thoreau or as a “wilderness experience.” Nor is it the case that feral activists necessarily seek the total rejection of “domestication” – the technologies, labor and leisure practices of “civilization” – for a permanent “feral embrace of wildness,” as is advocated by anarcho-primitivist John Zerzan, whose writings are sometimes cited by members of the Earth Liberation Front. Dwelling in threatened landscapes in a labor to protect the Earth, *eco-tribes* are not only organized social structures, but they adopt, for example, new digital telecommunication technologies used to form and mobilize networks and disseminate information. Furthermore, as new historical and ecological sensibilities have inspired the perception of “humanized” landscapes – that is landscapes recognized to have been occupied, altered and enchanted by First Peoples for millennia – a non-humanized “wilderness” (conceptualized as *terra nullius*, or a place untrammelled by man) has become a less than desirable theme.

Ferality embodies the desire for “heritage” guardianship in an era of mounting ecological crisis. The process involves *detachment* from the parent *culture*, and a *becoming* closer to, or identification with, beleaguered “country” (*nature*). Such is a committed practice of (re)connecting with sacralized nature – a passport toward chthonic citizenship. Undertaken by thousands of self-marginal youth over the course of twenty years, this is a contemporary rite

of passage toward reconciliation with indigenous ecology and peoples.

Fertility and Abortion

It should not be surprising that religions contribute to the desire for large families. The ancient religions were spawned in a world where the problem was depopulation. It is estimated that prehistoric persons, factoring in infant death, lived on average about eighteen years, and in ancient Rome and Greece the average was in the low twenties. The Emperor Augustus penalized bachelors and rewarded families for their fertility. Widowers and divorcees (of both sexes) were expected to remarry within one month. Only those over fifty were allowed to remain unmarried. It was a society where, as historian Peter Brown says, death fell savagely on the young. Only four out of every hundred men – and fewer women – lived beyond their fiftieth birthday. As a species, we formed our fertility habits in worlds that were, in Saint John Chrysostom's words, "grazed thin by death."

Such judgments are deep-rooted. If, as Teilhard de Chardin said, nothing is intelligible outside its history,

the fertility thrust, especially in stressful conditions, is the defining story of our species. Interestingly, the ancient religions born in these conditions also contain the cure for excess fertility, for they all came to see that fertility, which is a supreme blessing, can also in certain circumstances become a curse. Still, for most of history the concern of religions was for more not for fewer children.

Religion Defined

Religion has to be taken seriously when any social problem is addressed. Two-thirds of the world's population affiliate with some religion and the other third could not but be affected by the imaginative power of these symbol systems. Religion is difficult to define, so we may not use the term and expect a universally accepted understanding of its meaning. Often, in the social sciences, the term is used descriptively and includes everything that humans label religion, however innocent or guilty, bizarre, magical, or superstitious it may be. The advantage of this is that it allows a consideration of all of the shadow forms of expressed religiosity as well as mainstream manifestations. Many scholars of religion work out of a normative definition: *religion is a positive, life-enhancing response to the sacred*. By this definition, movements like the peace movement or the green movement can be considered religions since they are responses to the values in life that are so precious as to be called sacred.

The sacred may be interpreted theistically, as in Judaism, Christianity, and Islam, or non-theistically as in Buddhism and the Chinese religions. No religion is a pure classic; all are burdened with negative debris from their journeys through time. Good religious studies do not fudge the downside – the sexism and the patriarchy, the authoritarianism, and, at times, the unnuanced pronatalism found in religions. The critical task is to ferret out the good amid the corruption.

The world's religions are all philosophies of life. As Morton Smith says, in the ancient world there was "no general term for *religion*." Thus, as Smith notes, Judaism to the ancient world was a philosophy. It presented itself as a source of wisdom, as seen in Deuteronomy: "You will display your wisdom and understanding to other peoples. When they hear about these statutes, they will say, 'what a wise and understanding people this great nation is!'" (Deut. 4:6). Similarly, other religions, such as Hinduism, Buddhism, Daoism, and Islam were quests for enlightenment and betterment. They contain ore from which rich theories of justice and human rights can be extracted. Often these treasures have not been well applied to issues like sexuality, sexism, family planning, or ecological care, but they all contain wisdom regarding the human right and obligation to bring moral planning to our biological power to reproduce. This would include the right to contraception and to abortion when necessary.

Fertility as Blessing or Blight

It took ten thousand generations to produce the first two and a half billion people simultaneously living on Earth; it took only one generation to double that number. We also have right now the highest number of fertile persons in the history of the Earth, a number equal to the total number of people on Earth in 1960. That there are too many people in too little space with not enough to meet their needs is not a brilliant insight. Three and a half thousand years ago, Babylonian tablets, known as the Atrahasis epic, found in what is now Iraq, gave a history of humankind. The story it told was already old when it got carved on stone. It said that the gods made humans to do work unworthy of the divinities, but huge problems developed when the humans over-reproduced. So the Gods sent plagues to diminish the population and made it a religious obligation for the remaining humans to limit their fertility. Joel Cohen says that this may be the earliest account of human overpopulation and the earliest interpretation of catastrophes as a response to overpopulation. Over two thousand years ago, Aristotle sensibly insisted that the number of people should not exceed the resources needed to provide them with moderate prosperity. Thomas Aquinas, the thirteenth-century Catholic saint, agreed with Aristotle that the number of children generated should not exceed the provisions of the community, and he even went so far as to say that this should be insured by law as needed. If more than a certain number of citizens were generated, said Thomas, the result would be poverty, which would breed thievery, sedition, and chaos.

All this was centuries before Thomas Malthus in the eighteenth century proposed that human population is caught in a vicious cycle of population exceeding food supply, leading to famine and disease which would bring population back to a manageable level. Then the process would begin again. Many scholars feel that Malthus underestimated the capacity of the planet to produce food and that he was insufficiently informed on the complex dynamics of fertility increase and decline. There is enough, as Gandhi said, for our need, but not for our greed. The 2.9 million people in Chicago consume more than the more than 100 million people in Bangladesh. If, with an eye on consumption, you compare Germany with a poor African country, Germany consumes roughly the equivalent of one billion people. Around 75 percent of the world's pollution is caused by the "well salaried and well caloried." Many earlier commentators on population did not see how the need for children could be changed by technology and by the move to cities. (You don't need as many children in the city as you did on the farm. As recently as 1800, only 2.5 percent of humans lived in cities. By the 1980s that figure had risen to more than 50 percent.)

Still, numbers do count. Too many overconsuming people on a finite planet create massive problems. We also

face the problem that as the poor move toward what we call "the middle class," their patterns of consumption tend toward mimicking the consumptive patterns of the affluent.

How Many is Too Much?

Professor Joel E. Cohen in his monumental book, *How Many People Can the Earth Support?*, concluded that this is a questionable question; a question that imports an army of other questions. But it is a question that started teasing the human mind in the seventeenth century when the first estimates were made of the population that the Earth's "Land If fully Peopled Would Sustain." The estimate back then that the Earth could support at most 13 billion is not far off from contemporary estimates. Most estimates today range from four to sixteen billion. If we were content to live at the level of Auschwitz or the Artic Innuits or the Kalahari bushmen, you would get certain numbers. If you face the reality that most people today have rising not lowering expectations, you get other numbers.

Most nations live beyond their means. Take the Netherlands, for example. It is estimated that the Dutch require the equivalent of 14 times as much productive land as is contained within their own borders. To consume the way they consume takes the equivalent of 14 Hollands. Where does it get the other 13 Hollands? It imports from the rest of the world. In a significant misstatement, we refer to the gluttonous nations of the world as "developed" and the poor nations as "developing," implying they can consume like us and some day will. But if we can return to reality, where is Zimbabwe going to find 13 Zimbabwe's if it would try to match us in overconsumption.

Professor Cohen concludes sensibly that the Earth has reached, or will reach within half a century, the maximum number the Earth can support in modes of life that we would prefer. Family planning is necessary now lest population momentum carry us into chaos, and it will be necessary when population stabilizes to keep families and overall population at sustainable levels. As biologist Harold Dorn notes with elemental logic: no species can multiply without limit and there are two biological checks to stop that – a high mortality and a low fertility. Only the human species can choose the latter. When it does not do so, the other check kicks in, which has already happened in parts of the world.

Family Planning and Religion

Anruth Jain, a demographer at The Population Council, notes that most of the world religions originated at a time when the global population was 50 to 450 million people in comparison to the six billion at the beginning of the second millennium. The problem for these religions is to adjust to the new demographic realities and to the new needs for family planning.

Family planning means contraception. Since there is no perfect contraceptive, abortion as a back-up is associated with family planning. Contraception is sometimes rejected on religious grounds, especially in theistic religions where it is seen as a lack of faith in God's Providence. This can be seen, for example, in some forms of Christianity, Islam, and African native religions. Christianity was seriously affected by an anti-contraceptive bias within Stoic philosophy, which championed an emotion-free rationality as the human ideal. Sex, being emotional, had to be justified by some reason and reproduction came to be that reason.

Abortion is more of a tortured issue in religions, as elsewhere. Those religions that believe in reincarnation such as Buddhism and Hinduism would seem to have an insuperable problem with abortion since "the being about to be born" preexisted and brings with it its own distinctive karmic history. Also in Buddhism one of the rules of the Eightfold Path is: "I will not willingly take the life of a living thing." This is found also in religions such as Jainism in which some practitioners will not even swat a fly out of respect for life. How then could such religions justify abortion? Some in these religions do not. Others find ways to do so. William R. LaFleur, in his book *Liquid Life: Abortion and Buddhism in Japan*, shows how many Buddhists see abortion as deferring birth to another time where the being can be born in better circumstances. Other Buddhists say there is some negative *karma* from an abortion but that it can be neutralized by positive *karma* from other good deeds. Still other Buddhists say that abortion is morally abhorrent and they will not seek to justify it. This illustrates a pattern found in all the world religions. A conservative view banning abortion can usually be found coexisting alongside a more liberal view permitting abortion for serious reasons. This is comparable to the pluralism in world religions on issues like war, where some profess an absolute pacifism and others find in the same religion grounds for a just defensive war. Given the complexity and richness of religious moral traditions and the differing perceptions of people in changing conditions, such pluralism is inevitable and worthy of respect.

Not all religions are equally open to change. Hinduism, as some interpret it, has historically shown itself quite malleable in facing new situations. The revelations of the Vedas were not capped as final and binding for all time. The eternal demands of righteousness, *dharma*, can be seen as a river that is constantly renewed with new sources, changing course as needed while giving the appearance of changelessness. Adaptation is thus at home in the theories born of Hinduism. Even the Hindu and Jain concept of *ahimsa*, doing no harm, is sometimes interpreted to justify abortion because giving birth to a baby without the means to care for it can be more harmful, more of a violation of *ahimsa*, than an abortion. Abortion in such cases would be justified. The Hindu openness to

family planning (including abortion) translates into policy as seen in the 1971 Medical Termination of Pregnancy Act, permitting abortion in India for a variety of reasons. Hindu authorities have been supportive of this and have not opposed extending this right of choice to girls under the age of eighteen. As in other religions, there is no unanimity on the right to an abortion and there are specific prohibitions in the ancient *dharma sastras* on abortion, even of an illegitimate child. This illustrates again the pluralism in religious ethics on reproductive ethics.

Judaism's creation myth includes the divine mandate to be fruitful and multiply. However, as Jewish theologian Sharon Levy points out, the fact that there is a command given indicates that reproduction is not genetically controlled in humans. The divine mandate addresses people as reasonable moral agents with moral obligations who must respond reasonably. Thus the command can be understood to dictate reasonable, human self-control in all moral matters such as reproduction. As Professor Laurie Zoloth says, we humans are not the ones who swarm over the Earth like insects. She says that it is particularity, and not abundance, that is stressed in Judaism.

Many rabbis historically justified the use of contraceptives. They said that the *mokh*, a soft cotton pad worn internally against the cervix, may be worn during coitus or it might be used after intercourse as an absorbent. Various justifications for contraception are given, including the need for young girls to protect themselves from pregnancy since it might harm them physically.

The Oxford Companion to the Bible notes that abortion as such is not mentioned in the Bible. However it is clear that the fetus did not have the moral status of a born person. In fact, the lives of children under the age of one month were not accorded moral value, according to Leviticus 27:3-7. The Torah, in Exodus 21, speaks of two men fighting and one causing an accidental abortion. It is not treated as a capital crime as it would be if he had caused the death of the woman. Instead monetary damages are imposed as would be in a property loss. Many Jews hold that a fetus is not a fully-fledged person until the birthing process itself begins. Thus various reasons could justify its termination.

In Islam both restrictive and permissive views are found on contraception and on abortion. There was support for contraception from the beginning in Islam. There are many documents from early Islam that indicate that contraception was practiced at the time of the Prophet, that some of his companions exercised it to prevent pregnancy, and the Prophet said nothing to imply that it was unlawful. Islam stresses that it is the quality of offspring, not the quantity, that is the prime moral concern. Islamic authorities stress that human life should thrive and not merely survive and that having fewer children makes possible the thriving that all children deserve. Only the

most compelling reasons could justify sterilization in Islam since it forestalls having a child when circumstances permit it at a later time.

Many Islamic authorities also justify abortion for serious reasons. Some Hanafite and Shafiite jurists have allowed abortion within the first 120 days of pregnancy for good reasons, while the Shi'ite Azidiva approve of such early abortions even if there is no serious reason for it. Some jurists in the Malikite and Dhahireya schools would prohibit all abortions. All Islamic jurists consider abortions after four months as justifiable only to save the woman's life.

Islam illustrates again the divisions within world religions on family planning. Both the conservative and the liberal views have strong authorities supporting them. Thus civil societies that accept religious freedom should allow for both positions (i.e., permitting abortions to those who approve of them on religious grounds and protecting those who disapprove from having to have an abortion or participate in one if they are medical personnel).

The most influential Chinese religions are Daoism and Confucianism. Buddhism is also present in Chinese life. Daoism and Confucianism have been shaping Chinese culture since the Chou Dynasty (1066–256 B.C.E.). Both traditions saw peace and harmony as the ultimate goal of life. This implies the absence of conflict between nature and human beings, between heaven and Earth, and between the individual and society. This led both traditions into the issue of fertility management. The Chinese saw family planning as essential to the preservation of peace and harmony in society. This position coexisted alongside the belief that one of the worst of calamities was not to have any posterity. As in other cultural and religious traditions we can see that fertility was perceived from experience to be both potential blessing or potential blight.

The temporary and sometimes harsh "one child" policy, without which it is estimated there would be some 250 million more Chinese, was broadly accepted by the Chinese. The drop in fertility rate from six children per woman in 1970 to near replacement level in 1990 was uniquely rapid and some scholars attribute half of this to government policies. Its harsher sanctions and abuses that sometimes accompanied this policy have merited harsh criticism. Still Westerners are surprised at the general cooperation with this policy, a cooperation with deep roots in the cultural commitment to the common good. Thus the Chinese were ready to reproduce in greater numbers when that was thought by national leaders to be good for China. In a similar vein of civic virtue, the Chinese were also generally ready to restrict births by contraception and abortion when that was asked for and seen as needed.

China has been involved in family planning for thousands of years, perhaps longer than any nation in recorded history. Many rules appeared in early China regarding

marriage and reproduction, including stipulations on the right age for marriage and the spacing of children. This was seen as a matter of government concern since the government was the prime caretaker of the national family. Chinese culture has had positive attitudes toward sexuality, not seeing sex as dirty or obscene, and thus it was not something that had to be justified by reproduction. Daoism stressed its health-promoting qualities more than its reproductive potential. The influential Confucian writer Han Fei (297–233 B.C.E.) argued that the state would be happier and more prosperous if it maintained a modest population.

In Christianity, Protestantism has long been open to both contraception and abortion, and most of the mainstream Protestant churches have made statements to that effect. Increasingly, fundamentalist Protestants have opposed abortion.

Roman Catholicism is often misrepresented as opposed to both contraception and abortion. Actually, the tradition contains strong views on both sides of the question. Although Pope Paul VI in his 1968 Encyclical *Humanae Vitae* declared all artificial contraception immoral, a number of Catholic bishops' conferences offered quiet but noteworthy demurrals. They were supported by the vast majority of Catholic theologians and people, and the ban on contraception is adhered to by only a minority of Catholic people. Regarding abortion there is a long tradition espoused even by one canonized saint, Saint Antoninus, permitting abortion for serious reasons. The Catholic scholars Daniel A. Dombrowski and Robert Deltete in their book *A Brief, Liberal Catholic Defense of Abortion* demonstrate the permissive view on contraception and abortion that coexisted alongside the non-permissive view with equal credentials. They also show the long Catholic tradition of not according personal moral status to the fetus until some three months into the pregnancy or even as late as quickening. For Sts. Augustine and Thomas Aquinas, principal shapers of the Catholic moral tradition, the early fetus had the moral status of a plant or vegetable, not that of a person. It could not, if miscarried or aborted, be baptized or given Christian burial.

Religions are all characterized by their appreciation of life and the need to revere and enhance it. They all also came to recognize that family planning is essential to life. Laws that honor only the conservative religious view are therefore violative of the religious integrity of the world's major religions. The views for and against choice for abortion and family planning can find warrant in the complex tapestries of world religions.

Fertility and Secularization

Religion, which regulates family life and sexuality, would seem to be a powerful social force affecting the propensity of believers to have children. Fully nine times, Genesis reports God's wish that his creatures "be fruitful and multiply." However, different religions have different beliefs, and all of them may be fading away in modern secular society. Thus it is difficult to predict the role that religion will play in the future growth or decline of human populations.

This is especially true for new forms of spirituality that celebrate the sacredness of the Earth. If they are rooted in secular environmentalism, then they may promulgate low fertility as a way of preserving the Earth from human pollution. However, if they spring from an awareness that humanity is part of nature, they may sanctify increased fertility.

Secularization

A scholarly debate had raged for years over whether secularization is likely to bring about the demise of

religion. Perhaps the most ingenious argument holds that secularization is a real but self-limiting process. Mainstream denominations are under great pressure from secular institutions of modern society to become more worldly. For example, highly educated clergy are trained in the same values of doubt and pluralism that are promoted by the leading secular universities. Therefore, the dominant religions weaken in faith, fail to provide spiritual guidance, and lose membership.

But the collapse of one religion merely leaves room for another to expand. Dissatisfied laity and disaffected clergy in secularizing denominations launch sectarian movements that break away from the original organization. These sects revive faith in the supernatural and are able to resist the secularizing forces for a long time. If they do become more worldly, fresh sects will erupt from them as well, continuing a cycle in which the wheel of religion turns, but moves neither forward nor back.

Occasionally, as in the Roman Empire two millennia ago, an entire religious tradition secularizes, and the birth of sects is insufficient to sustain the average level of faith. But this merely opens up opportunities for wholly new religions to arise. Thus, extreme secularization stimulates religious innovation and an increased birth-rate of new religious movements that are significantly different from the surrounding religious tradition. The most successful of these movements become the standard religious traditions of future centuries.

Today, many spiritual movements, both within traditional religions and outside them, are reviving a sense of wonder, awe, and devotion toward nature. To the extent that their beliefs and practices are new, it will be difficult to predict how they will affect the fertility of their adherents. However, if they draw converts back to the conventional denominations, then it will be instructive to see how well-established religions have shaped the birth-rate.

Contrasting Theories

Demographer Nathan Keyfitz has noted that the fertility rate is dropping rapidly in most advanced industrial nations, far below the level required to sustain the population. He attributes the fertility collapse to the increased freedom women enjoy in secular society, and the economic opportunities that entice many of them away from the traditional child-bearing role. In contrast, Islamic societies have retained much higher fertility rates, and may be able to resist secularization. The reason Islamic societies have high fertility, Keyfitz says, is because the religion facilitates male dominance over females. High-fertility societies tend to overwhelm those with low fertility demographically, so male-dominant religions may ultimately conquer the world.

A distinctly different explanation of how religion might promote fertility was offered by sociologist Rodney

Stark in his analysis of the rise of Christianity. In its earliest centuries, Stark maintained, Christianity was especially favorable to women, and most Christians were female. Many of them married non-Christian men, converted them to Christianity, and raised their children in the new faith. Christianity favored nurturance and encouraged its believers to take care of sick and helpless members, thereby improving their health and reducing mortality, including among infants, pregnant women, and mothers. In addition, the relatively restrictive sexual morality Christianity inherited from Judaism discouraged a number of erotic behaviors that do not result in pregnancy, thereby channeling sexuality into fertility.

Thus, Keyfitz says religion can support fertility by suppressing women, whereas Stark claims it can do so by empowering women. One can imagine a third argument, that religion might actually reduce fertility by promulgating puritanical values and conferring spiritual honor upon people who remain celibate or who do not procreate. Thus, it is necessary to look at some empirical evidence to see whether traditional religion is in fact associated with high levels of fertility.

Empirical Evidence

The General Social Survey, administered periodically to a random sample of Americans, is ideal for examining the connection between religion and fertility in advanced industrial nations, because it includes many questions about family structure and faith. The table shows a very simple analysis, using two measures of fertility and two of religion.

Table 1: Religion and Fertility in the US General Social Survey

	<i>Ideal Number of Children is 3 or More</i>	<i>Age 45 and Over: Actual Number of Children is 3 or More</i>
Religious Preference:		
Protestant	43.2%	47.2%
Catholic	50.8%	48.8%
Jewish	47.0%	28.8%
None	32.7%	39.4%
Attend Religious Services:		
More than Once a Week	57.6%	52.8%
Never	34.7%	41.3%

The first column of figures is based on the question, "What do you think is the ideal number of children for a family to have?" Out of 25,385 people who answered this question, the largest number, 52.1 percent, said "two." A fertility rate of two children per woman is just slightly less

than the 2.1 children generally required to sustain the population from generation to generation (more than two because some die in childhood and slightly more boys than girls are born). Another 3.5 percent said "one" child was ideal or "zero" children. Other answers (three or more) would contribute to population growth. The second column of figures looks at how many children the respondent has actually had, considering just people 45 years of age or older, who have probably completed their families.

The top portion of the table reveals that Protestants, Catholics, and Jews tend to want more children than do non-religious people (who say their religion is "none"). The second column of figures confirms that Protestants and Catholics tend to have more children than the non-religious. But Jews tend to have even fewer children than the non-religious, and apparently fewer than they consider ideal. In the United States, this probably reflects a high degree of secularization among those who identify themselves as ethnically Jewish. The bottom of the table shows that people who attend religious services more often than once a week tend to favor bigger families than those who never attend.

Another way of evaluating how religion shapes fertility is to compare across nations. In the late 1990s, a team led by political scientist Ronald Inglehart administered the World Values Survey to citizens of 23 nations, asking how often respondents attended religious services. In 12 of these nations, less than a third of the population attends religious services at least every month: Russia, Sweden, Finland, Japan, Norway, Belarus, Bulgaria, Latvia, Germany, Switzerland, Australia, South Korea. Data from the United Nations show that on average in these 12 low-attendance nations, a woman will have only 1.4 children, far lower than the average 2.1 required to sustain the population.

In six other nations, more than half the population attends religious services at least monthly: Brazil, India, United States, Mexico, South Africa, Nigeria. The average woman in these nations will have 3.2 children, more than twice as high a rate. Thus, secularized nations, many of which are in Europe, seem destined to shrink in population, while more religious nations continue to grow. The statistical correlation between religion and fertility for all 23 nations is very high (0.83 out of a possible 1.00).

United Nations estimates predict that 19 nations of the world will each lose more than a million in population by the year 2050: Russia (loss of 41 million people), Ukraine (20 million), Japan (18), Italy (15), Germany (11), Spain (9), Poland (5), Romania (4), Bulgaria (3), Hungary (2), Georgia (2), Belarus (2), Czech Republic (2), Austria (2), Greece (2), Switzerland (2), Yugoslavia (2), Sweden (1), and Portugal (1 million). The United States has resisted the trend toward secularism experienced by Europe and Japan, and its population has not begun to shrink.

Meanwhile, many other societies continue to grow. The UN report notes that half the world annual population growth occurs in just six nations: India (21 percent of the annual growth), China (12 percent), Pakistan (5), Nigeria (4), Bangladesh (4), and Indonesia (3). All of these except China have the reputation of being religious. Because it has the largest population, China adds a substantial number of people each year, despite having a birth rate far lower than those of the other five countries.

Conclusion

About two-thirds of the way into the twentieth century, a consensus arose among educated people that it was vital to limit population growth. At the dawn of the twenty-first century, there is good reason to reexamine the assumptions of this orthodoxy. In many rich nations, fertility has already dropped far below the replacement level, and as a group (including the relatively fertile United States) the prosperous nations have essentially achieved zero population growth and are poised on the edge of demographic collapse. However, the poorer nations, which may also be described as developing countries or traditional societies, are experiencing population explosion.

Extreme disparities in fertility across societies would seem to be a prescription for war and other forms of conflict. Fertility is affected by secularization as well as by religious revival and innovation. Perhaps revival in the rich nations and secularization in the poor ones will achieve a peaceful balance. Perhaps innovation will create powerful new religions with unique orientations toward fertility.

Ideally, we need a new sensitivity to the human role in nature that will adjust the fertility rate so that population neither explodes nor collapses. Existing social-scientific data, such as from major surveys and government censuses, are not detailed enough to let us measure the birth rates of people who are involved in the various wings of the movement to reunite religion and nature. This is a question of the utmost importance, and new research to answer it would be extremely valuable. The future of humanity and the Earth's living systems are literally in the balance.

Findhorn Foundation/Community (Scotland)

Founded by Eileen and Peter Caddy and Dorothy Maclean in 1962, the Findhorn Foundation is an international spiritual community of approximately 150. Located in northeast Scotland, the Foundation is near the fishing village of Findhorn and Kinloss Royal Air Force Base. Cluny Hill College, the Foundation's second "campus," is in the town of Forres.

The New Findhorn Association (NFA), of which the Foundation is one group member, comprises what is loosely called the wider community. Membership in the NFA includes like-minded groups and individuals within a fifty-mile radius. Some NFA groups support green initiatives (the Eco-Village Project, "Trees for Life," etc.).

Esponsing no formal creed, the Findhorn Foundation today recognizes the essential truths of all religions and spiritual teachings. Fourteen thousand people visit the Findhorn Community per year. Predominating interests at Findhorn since its founding have included: traditional and non-traditional forms of meditation, positive thinking, healing, metaphysics, mediumistic contact, and psychological "growth" activities. Dubbed "the grandmother of the New Age" by the media, the Foundation distances itself from that distinction today. At odds with certain occult ritualizing aspects of the New Age Movement – "Atlantean crystals," for example – the Foundation prefers "sensible" techniques of spiritual transformation.

A term increasingly used by British religious studies scholars to describe the eclectic, experimental milieu of groups like Findhorn is "alternative spirituality." Religious studies researchers Steven Sutcliffe and Marion Bowman believe experientially friendly folklore methodologies may prove more successful than traditionalist ones in the area of alternative spirituality. Challenging the notion of

Dorothy Maclean (1920–)

Raised and educated in southern Ontario (Canada), Dorothy Maclean was recruited into the British Secret Intelligence Service after completing University. After working in New York, Panama, and several locations in South America she was posted to London in 1943. During this time she encountered the Sufi movement and throughout the 1940s and early 1950s studied various spiritual traditions – orthodox and otherwise. During a time of personal crisis, she experienced what she refers to as “an inner experience of knowing God.” Shortly thereafter, a repetitive prompting to “stop, listen, write” led to regular periods of meditation and writing.

Her book *To Hear the Angels Sing* describes her experiences of listening to, and then writing out, what she believes were direct communications from God. She also recounted the events that led to the creation of the Findhorn Foundation Community in northern Scotland. There Maclean experienced what she refers to as “an inner connection with the creative intelligence behind nature,” an intelligence she later named the “Devic/Angelic presence.” The practice of “listening and writing” continued, the contents providing practical instructions concerning the gardens and offering perspectives on the relationships between human and non-human realms. This connection was a significant factor in creating the extraordinarily lush and productive gardens, which generated much of the early interest in the community. Two tenants lie at the heart of what Ms. Maclean writes and teaches. Those tenets are 1) personal and direct contact with God is possible for everyone/ anyone and 2) nature has an innate intelligence and a willingness to work directly with humanity to address the ecological issues facing the planet.

scholarly “objectivity,” they argue that skepticism directed at belief stories of contemporary spiritual groups does not constitute a value-free stance, but instead may conceal strategies for securing privilege or prestige.

The miraculous story of large vegetables flourishing in poor soil made the Findhorn Community internationally famous in the 1960s. Intuitive messages received during meditation by founder Dorothy Maclean in 1963 suggested that the surprise success of the Caddy vegetable garden was due to the “co-creative activity” of devas (Theosophical Sanskrit for “shining ones”) and the Landscape Angel – each answerable to God or “the Beloved.” Invited to participate in an experiment of “co-cooperation with Nature,” Findhorn’s three founders agreed to follow practical and spiritual instructions given in the messages. At issue was the growing degradation of the planet. Results exceeded expectation. Drawn to Scotland by rumors of a fabulous garden thriving next to a garbage dump, British Soil Association consultant Professor Lindsay Robb reported: “. . . the bloom of the plants in this garden at midwinter on land which is almost barren powdery sand cannot be explained by the moderate dressings of compost . . . There are other factors, and they are vital ones” (in Hawken 1975: 170).

British adult education pioneer Sir George Trevelyan concluded similarly. In a 1968 letter to Peter Caddy, he stated that “Factor X,” the deva/elemental conscious contact, was “the most tremendous step forward, indeed the step which mankind must take” (Caddy 1996: 281).

Some Foundation and community members still engage in the original “work of Findhorn.” Through meditation, they “feel into” contact with nonhuman species believed to “overlight” and inform the spiritual direction of the Foundation. Disinterested in intellectual evaluations of direct experience, most Foundation members do not label their inner experiences as examples of nature mysticism or animism. They prefer to call it “tuning in.”

The greening of Findhorn has been a gradual process. Some members of the community perceive Foundation ecological projects as a complementary expression or “natural outgrowth” of the founders’ early spiritual commitment to God and nature. Some of these eco-initiatives include conferences, workshops on permaculture design, deep ecology (on one occasion taught by Australian deep ecology advocate John Seed), and a month-long eco-village training program offered in partnership with GEN-Europe and the Global Eco-village Network.

Begun in 1981 at Findhorn by John Talbott, the Eco-Village Project is a constantly evolving model and a synthesis of current thinking on sustainable human habitats. United by a common goal, an eco-village is based on shared ecological, social and/or spiritual values. Working with the principle of not taking more than one gives back, Talbott believes eco-villages are potentially

sustainable. The Findhorn Foundation is a founder member of the Global Eco-Village Network (GEN). In 1998, the Foundation's Eco-Village Project received the "Best Practice" designation from the United Nations Center for Human Settlements (Habitat).

Although many in the community prefer to accentuate and model "the positive" in all things (sometimes suffering from "the tyranny" of its overemphasis), some acknowledge the planet's current ecological degradation and work to relieve it. Inspired by Dorothy Maclean's early experiences with "the intelligence of nature," former Foundation member Alan Watson Featherstone believes ecological restoration is a natural process. In 1985 he founded the Scottish conservation charity "Trees for Life." Since then the charity has planted over 420,000 native trees in the Highlands of Scotland. In 2001 Featherstone received the United Kingdom's Schumacher Award in recognition for his work "conserving and restoring degraded ecosystems."

The community's impact on international green organizations continues to grow – Perelandra, a nature research center founded on Findhorn principles in the United States is a notable example. Registered as a Charitable Trust in 1972, the Findhorn Foundation was granted association with the Department of Public Information of the United Nations in December 1997 and received associate-member non-governmental organization (NGO) status in 1999. Since then it has become increasingly involved with various UN environmental initiatives. Recognizing its "green contribution" to Scotland, the Scottish Tourist Board awarded the Findhorn Foundation its highest honor – the Gold Award – in 2001.

Fire

The Primal Worship of Fire

According to Peter Byrne, the essence of primal religion is nature mysticism. Natural places, beings and objects representing the four elements (Earth, air, water, and fire) have been the object of religious devotion by primal peoples since time immemorial, but the earliest of all the elements to become imbued with mystical power and religious meaning was fire. Indeed, fire worship may be the original religion, for the life-sustaining hearth fire provided early peoples with the physical space for developing language and culture; accordingly, fire served as the psychic source for developing rituals, ceremonies, and religions.

Homo sapiens became human beings with their knowledge, control and use of fire. Along with stones and bones, fire was an essential tool that enabled early peoples to migrate into previously uninhabitable regions, alter their environments, and form sustainable hunting and gathering societies. Fire played a critical role in the development of early agriculture outside of flood plains through its ability quickly to clear and fertilize land. Fire also played a role in hunting and led to the domestication of large animals through its ability to herd game and stimulate forage for grazers. Given the many beneficial uses, effects, and products of fire that were vital to human social life, it was entirely natural for fire to become a central element of early religious ceremonies celebrating life-forces. The more ancient the religion, the more prevalent the religious role of fire seems to have been.

The life-giving qualities of fire to transform matter into energy must have been god-like to early peoples, but unlike the other basic elements which exist in the natural environment ready for use, fire must first be discovered and then maintained to be of human usefulness. Creation myths abound in many cultures describing the primordial quest for fire: first, there were "dark ages" when people were without fire, but then, fire was delivered to people, usually through a Promethean act of stealing it from other beings, spirits or gods. As Stephen Pyne observes, the Judeo-Christian myth of genesis has humankind gaining the knowledge of good and evil through tasting the forbidden fruit, but in the myths of many nature-based cultures that knowledge was gained by stealing the forbidden flame. Thus, fire has this peculiar quality of being a natural element that is part of our cultural heritage, but it is not considered part of our natural heritage. Instead, even long after people discovered how intentionally to kindle flame, the ultimate source of fire's creative and destructive powers has often been attributed to some sense of the divine.

Ceremonial Fires

Beyond the primordial worship of fire, the use of fire for various sacred rituals and ceremonies is ubiquitous to the point of becoming almost a universal religious practice. These diverse ceremonies and their associated religious institutions can be organized under the categories of the sacred altar fire, perpetual fire, new fire, and sacrificial fire. Sacred altar fires were core elements of some of the earliest monotheistic religions. For example, the ancient Egyptian worship of the sun god, Ra, kindled a sacred fire every day to reenact the rising of the sun, and the fire on the altar represented the omnipotent eye of Ra. Daily ritual lighting of sacred altar fires also played a central role in Zoroastrianism, in which fire was considered to be a visible sign of god's presence, and a symbol of Truth and Right Order in the cosmos. Among peasants in northern Siberia, all huts included a hearth in one corner for domestic purposes, and in the opposite corner a sacred altar in which the fire provided protection from evil spirits. Over the millennia, fire has played a predominant if not central role in sacred altars for a multitude of religions.

The perpetual fire was another religious institution with ancient roots. The difficulty of kindling fire for early peoples led to the institutionalization of the perpetual fire, and various rites, ceremonies, and temples were constructed around it. The occupation of fire-keeper was one of the earliest specializations in human society, and evolved into an official state function most commonly practiced by priests. The best-known example is the altar of Vesta, the Roman goddess of the hearth, where a perpetual fire was tended by the famous Vestal Virgins whose purity of the flesh symbolized the purity of the flames. The uniquely designed shrine of Vesta was the oldest Roman temple, and its perpetual fire supplied the sacred flames for lighting other temples' altars. The Olympic Games fire ceremony is a modern-day secular expression of the perpetual fire, vestigial in its essence.

The perpetual fire was sometimes extinguished in order to kindle the new fire, a ritual intended to keep the energy of fire fresh and pure, and to renew the human spirit. For example, every year at Beltane (May 1) the Druids extinguished all fires in their villages, and then lit two new sacred bonfires. Numerous spells were canted, and then their cattle were driven between the two fires in order to purify and protect them from disease. Priests would then take coals and kindle hearth fires in a ritual symbolizing new life. New fires kindled for sustaining new life were especially vital religious ceremonies for northern coastal California Indians, such as the Karuk, Yurok, and Hupa peoples. In the spring and autumn, when the salmon were running and the acorns were ripening, new fires would be lit as part of a rite that the Karuk called the "world renewal ceremony." The new fire symbolized the regenerative powers of natural fire, and, mirroring the ecological func-

tion of renewing the soil, it served a religious purpose in renewing the soul.

The sacrificial fire has deep roots in a number of religions, too, with fire being the prime force used to consume and deliver offerings to the divine. The behavior of the flames or smoke is often believed to be a sign of the divine's reaction to the burned offerings presented by believers. Gruesome examples of sacrificial fires include ancient Israelites burning their children as sacrifices to the god, Moloch. Human fire sacrifices were also practiced in ancient times by the Druids, Peruvians, and in more recent times by Euro-American Christians as part of the witch craze. The most well-known contemporary religious practice is the Hindu funeral pyre in which the body is cremated as the final sacrifice. The consumption of flesh liberates the spirit and carries it to the divine.

Vestiges of the ancient ceremonial use of fire live on in religious rituals today, such as the Jewish practice of kindling the Sabbath candles and the Chanukah Menorah, and the Buddhist practice of lighting incense. However, the votive candle and incense stick provide a very different human experience than the altar fire. Whereas a candle offers a safe, stable flame, a bonfire continuously changes in a spontaneous, unpredictable, animated dance of forms. It commands attention, and must be carefully attended with proper devotion or else it will die out. Thus, altar fires created sacred ceremonial space with a sense of great drama and potential danger, further embellished by priestly rituals. Either as a ceremonial tool or the object of worship itself, ancient fire-tenders always treated sacred altar fires with great respect and reverence.

Fire as Divine Manifestation

From Zoroastrianism to Judaism and Christianity, fire has often been deemed as a divine manifestation, symbolizing the direct presence if not virtual face of the deity. For example, the Zoroastrian deity, Ahura Mazda, resides in endless light and created fire; the sacred altar fires of the Yasna are regarded as the manifestation on Earth of this divine celestial light. Zoroastrian priests refer to their altar fires as "Avestan" or the son of God. Throughout the Hebrew Bible and New Testament, too, God and Jesus are often depicted with fiery imagery. Perhaps the most famous example is when God appeared before Moses "in the flame of fire in the midst of a bush" atop Mount Sinai, provoking both awe of God and fear in Moses. In the Psalms, "the voice of the Lord flashes forth flames of fire." Jesus is portrayed with a face "like the sun shining in full splendor" with eyes "like a flame of fire" (Apocalypse 2 and 3). The close presence of the divine can be both a gratifying and terrifying thing to experience. Fire whose heat and light both attracts and repels was a natural symbol to use to graphically depict the presence and experience of the deity.

The Fire of Heaven and Hell

In Judaism and Christianity fire is alternately associated with both heaven and hell. For example, Elijah is taken up to heaven in a chariot of fire. Daniel sees God in heaven sitting upon a throne of fiery flames, with streams of fire coming forth. In the Apocalypse, the blessed are seen in heaven as a sea of glass shot through with fire. On the other hand, Mathew associates fire with hell or “hell-fire.” Sinners condemned to hell are cast into eternal flames of many sorts: they are immersed in rivers of fire, boiled in cauldrons of fire, hung by flaming chains, pummeled with fiery stones, and officials who abused their power are forced to sit upon fiery thrones. The vision of hell as an abyss of fire has ancient origins in Gehinnom, a valley near Jerusalem in which Israelites burned their children as sacrifices to the god, Moloch, and garbage was burned by a perpetual fire. The specter of hell-fire was vividly reinforced by burning heretics at the stake during the Christian inquisition. These public executions by fire, often employing other gruesome techniques of torture sanctified by the Church, helped condition a dread fear of hell among the common people. As a precursor to hell, the souls of sinners are believed to burn from the torment of knowing they are living apart from God.

Fire as Purgatory and Apocalypse

In the Western tradition, fire is also employed as an instrument of God’s angry judgment and punishing wrath, and has come to depict visions of purgatory and the apocalypse. For example, Isaiah (66:15–16) announces to the people that,

For behold, the Lord will come with fire, and with his chariots like a whirlwind, to render his anger with fury, and his rebuke with flames of fire. For by fire and by his sword will the Lord plead with all flesh.

The legendary example of Sodom and Gomorrah, destroyed for the sinfulness of their peoples when God rained down brimstone and fire, had origins in the age-old use of fire as a weapon of war and revenge, in which the cities of the vanquished were routinely razed by fire. Fiery punishments also play a role in visions of the Apocalypse where the world ends in a vast conflagration.

The association of fire with purgatory is also prevalent, although purgatory is alternately viewed as a form of both punishment and purification. On the one hand, purgatory is seen as a meeting with the glorified Christ whose eyes are fire, penetrating, searching, and judging the soul for all sin. Woe be to the wicked and sinful who are scorched by the Lord’s fiery gaze, for purgatory as punishment condemns them to eternal damnation in the fires of hell. An alternate view of purgatory sees it as purification and spiritual maturation, a burning away of all egotistical

attachments and a cleansing of all past sins as a means of preparing the spirit to be fit to dwell in the eternal light of God’s presence. Given the power of flame to consume matter and convert it into energy, it serves as an apt metaphor to describe the process of purgatory.

Fire and Religion

Among contemporary Earth-based spiritual practitioners, such as Wiccans, Goddess-worshippers, neo-pagans, and spiritual Greens, sacred altar fires and bonfires play a central role in many religious rituals and ceremonies, particularly in outdoor gatherings. Starhawk, for example, has popularized “The Fire Song” as part of a repertoire of neo-pagan rituals for use during nonviolent civil disobedience actions protesting nuclear power and environmental destruction. As well, in the midst of a renaissance of new scientific research and discoveries emerging in the field of fire ecology, the U.S. environmental movement has developed a new-found respect for the role of wildland fire in restoring and sustaining forest and grassland ecosystems. Using assumptions that harken back to physico-theology and the belief that there is a divine design to the Earth, ecologists now consider fire to be a vital, dynamic disturbance process maintaining the diversity and sustainability of healthy forest ecosystems. Thus, against the view of industrial forestry that wildfire is an external agent of tree death and destruction, ecoforestry recognizes wildland fire as an intrinsic element of forest life and regeneration. This is exemplified by the slogan, “Ancient Forests are Born in Fire!”, which is increasingly voiced by eco-activists who articulate both spiritual and scientific discourses in their adulation of wildland fires right alongside their labeling of post-fire “salvage” logging as desecrating acts.

No discussion of religion and nature would be complete without an analysis of the important role of fire. As one of the oldest natural objects of ritual and worship, fire has played a fundamental if not foundational role in religions across the globe. The religious views of primal peoples and prehistoric cultures evolved around sacred altar fires. Embers from ancient rituals devoted to the perpetual fire, new fire, and sacrificial fire still glow in religious ceremonies today. Fiery metaphors and ceremonial practices help give vivid expression and somatic experience to religious beliefs. The creative and destructive powers of fire have inspired Western religious visions of both heaven and hell, and myths about the beginning and ending of the world. Although at each and every instant the flames of any given fire are a unique expression of spontaneous combustion, at the same time the flames offer a universal, transcendent form that has made fire an enduring if not eternal source of religious inspiration and meaning throughout the ages.

Fishers

Water is a potent symbol that may trigger nearly universal associations to life and death. All people need sweet water to quench their thirst. Plants need water to grow, but too much water and violent floods threaten to disturb many lifeways, even to extinction.

Fishermen frequent the seas, rivers and lakes to catch fish and marine mammals and to gather various other food objects. Anthropologists view the nature of fishing activities to be similar to hunting and gathering on land. With just a few exceptions, for instance among the seanomads or Bajau People in Malaysia, Indonesia and the Philippines, fishing is generally regarded as a typically male occupation. There are often culturally elaborated

restrictions to prohibit women from moving freely on board or to enter fishing vessels, even to touch fishing equipment. Women are thus regarded as matter out of place in many fishing contexts. Their presence is at times regarded as polluting and potentially spoiling to the efficiency of fishing boats and gear. Generally women may be seen to threaten the fishermen's luck. This is still the case, although the assumptions connected to the negative impact of mature women on many fishing activities are somewhat reduced in North Atlantic fishing communities. Thus some few women are allowed as crew, even skippers, for instance on small Norwegian fishing vessels (*shark*).

Whereas many mysteries of fertility and growth are more or less controlled by the science and technology of modern agriculture, this is not to the same extent the case with fish stock management. Whether agriculture or fishing is in focus, the need for luck in order to succeed is not yet under rational control, and may never be. It is repeatedly documented that luck and luck management has been and still is of central concern for hunters and fishermen across cultures. In spite of modern navigation and fish locating instruments, the success of fishermen, now as before, is regarded by the fishermen themselves and others to depend on their luck.

Supernatural beliefs and reason in the pursuit of fish

Generally speaking, there is a significant difference in the strategies that it is possible to apply in pursuit of land animals that leave tracks and other signs of activity, which hunters can observe, and the fish that leave few observable traces in the water they inhabit. The seas, rivers and lakes are more or less unknown worlds to humans. These worlds are fascinating, unreachable and mysterious. The fish sometimes abound, at other times they disappear or move to unknown depths or locations. To locate the prey, fishermen are helped by their experience, but at times even know-how is not enough to eradicate uncertainties about fish behavior and their whereabouts. It is a general tendency that fishermen, regardless of where they live, tend to compensate for lack of fish prediction with magical spells and rituals. Further, firm beliefs in supernatural intervention causing luck or misfortune, adherence to taboos, and offerings to cultural images of the rulers of the seas and waters are widespread among fishermen and in their communities. Such beliefs are generally operative regardless of the particular religious faith of the fishers.

The maritime activities of the Trobriand Islanders in Melanesia served as empirical inspiration when Bronislaw Malinowski developed his seminal analysis about the social function of ritual and magic. Malinowski observed that when the Trobrianders fished in their home lagoon, where fish were abundant and easily gathered without risk to the fishermen, use of magic was nearly absent.

However, when the islanders fished off the northern shore their success to obtain certain species was, according to them, entirely dependent upon strict observance of numerous taboos and selected rituals. Off the northern shore, the outcome of any fishing expedition was far from obvious and elements of chance and risk were prominent in the fishing activities. This observation contributed to Malinowski's classic statement in which he declared that the rituals surrounding fishing and sailing have the primary function of relieving anxiety and uncertainty. This interpretation has dominated anthropological studies of ritual in maritime settings. For instance, the documented persistence of a considerable amount of magic and ritual activities, also in technologically sophisticated fisheries, has been related to how fishing remains a risky and uncertain economic activity.

Small-scale fishers in Sulawesi, Indonesia firmly believe that all success in life, including fishing activities, is based on combinations of skill, luck, industriousness and cunning. However, no one prospers solely by their own efforts. Everybody needs help or assistance from other people and/or from spirits. Thus when some fishermen make exceptionally good catches or do well for an extended period of time, this is interpreted as a sign of supernatural support. When fish disappear, catches are bad, or accidents during fishing take place, this is usually understood as reproaches or punishments from spirits for neglecting to distribute the right offerings, breaking taboos, or trespassing a spirit-protected location.

That prayers and Christian symbols, such as holy water, crucifixes, and Bibles, are thought to influence the catch and safety among contemporary European, North American and other Protestant and Catholic fishers is well documented. Many Norwegian fishermen say they place their faith in the hands of God whose will is believed to determine the fishermen's safety, catch, and spiritual well-being. Pious fishermen accompanied by close family members always go to church before they set out for an extended expedition. On their return the church is visited again to praise the Lord.

Ethnologists and anthropologists have been more concerned with tracing ancient and pre-Christian influences on the thoughts governing modern fishermen than investigating the impact of contemporary religious beliefs. The connections between faith and fishing in any of the world religions should be a topic for future research.

Resource management, conservation, and fishing

It is often argued that fishermen, hunters and gatherers, and other people who live off the land or sea are resource conscious. This is taken to mean that these people know they must take active measures to secure their own livelihoods and those of the next generation. Some religions are taken to advocate ideologies of community sharing and sustained resource management. For

example, it may be argued that the Protestant spirit, confirmed by the church, aims at a rational management of nature. Thus an unlimited exploitation of the sea and its resources is deemed as morally unjustifiable greed. There is an inherent plea for the preservation of the natural environment to the benefit of current and future generations. However, it is well known that it is far from the case that behavior coheres with expressed ideologies.

It has also been pointed out that religious ideas and beliefs sometimes have unrecognized consequences. These consequences may serve sustainable resource harvest, for instance by protecting spawning areas for certain fish. James McGoodwin observed, for example, that this can happen when fishing certain seascapes and locations is enjoined by taboos, because they belong to spirits. This was the case at Bonerate in Indonesia, where the islanders refused to fish or collect mollusks along an extensive part of the fringe reef because the location was inhabited by aggressive spirits, some in the shape of white sharks. Near Timpaus Island, also in Indonesia, there were coral reefs located at depths of approximately fifty meters that never were fished. In the old days many fishermen had been lost in these waters and during rough weather sailors made detours to avoid the locations. These reefs, it was believed, were inhabited by a malicious sea devil (*hantu laut*) by the name of Molokoimbu. Another consequence for fishing from religion on Timpaus Island was observed when foreign fishermen arrived and made good catches at the locations where Molokoimbu previously ruled. Muslim leaders told Timpaus fishermen that they should not pay attention to ancient spirit beliefs. Then the bravest fishermen began to harvest the reefs and important fry and fish refuges were lost.

Fishermen, like most other people, tend to adjust their view on the environment and the robustness of nature in accordance to their own activities in nature. According to Mary Douglas, people live by prototypical myths about nature that contribute to legitimize their use of and value orientation toward nature. One such myth would be that the sea is robust, but only within limits. Many fishermen around the world share this view. In essence the attitude may serve to free protagonists from responsibility for stock depletions. Their own activities are not threatening the environment, but those of others do, it is often believed. Thus small-scale coastal fishermen blame the large trawlers for reduced stocks of fish. However, some owners of trawlers blame the coastal fishers for damage because they fish at the spawning grounds of many species.

At the micro level, Indonesian fishermen who fish for domestic and local markets justify their own use of explosives. They say it is impossible for them to deplete fish resources. But they are worried about the behavior of other fishermen, especially foreign ones, who are operating from larger vessels when they utilize poison and

bombs. The same local Indonesian fishermen (and many more) apply a different myth when it comes to shark fishing with long lines: the myth of the sea as unpredictable. The fishermen agree that large sharks have become rare where they used to abound. This is not because of overharvesting, but because the sharks have moved somewhere else, the fishermen say.

At the macro level, a myth about the sea as excessively robust seems to apply. Only such a myth can justify local and multinational companies massively polluting rivers, lakes and oceans with chemicals or radioactive materials.

Fisk, Pliny (1944–)

Pliny Fisk III's work in appropriate technology, systems design and sustainability has earned him international recognition and the title "Guru of Green." After graduating from the University of Pennsylvania with Master's degrees

in Architecture (1970) and Landscape Architecture (1971), and teaching in the School of Architecture at the University of Texas, Fisk's interest in environmental issues prompted him to co-found the Center for Maximum Potential Building Systems, in Austin, Texas in 1975. His practical engagement with diverse environmental issues had won him earlier the respect of R. Buckminster Fuller, who wrote to him that "your various research and development projects [are] lucid, intelligent, economic and in every way gratifying" (Fuller letter to Fisk, 1973).

Pliny Fisk's international work, which has brought him to forty states and six foreign nations, is based in the Center, a nonprofit organization engaged in research, education and demonstration projects for sustainable planning and design. Co-directed by Fisk's wife, Gail Vittori, the Center's work focuses on four areas: 1) *green architecture*; 2) ecologically balanced *land use planning*; 3) sustainable development *policy initiatives* for local, state, and federal agencies; and 4) tools and methodologies for *green development*. Fisk's projects have earned him such honors as the National Center for Appropriate Technology "Distinguished Appropriate Technology Award" for significant work in environmental protection, and the United Nations 1992 Earth Summit "Local Government Honours Programme Award," shared with the city of Austin, for developing a Green Builder Program and a "GREENRATING GUIDE" for energy, materials, water, wastewater, and solid waste for new residential and commercial construction in the Austin area.

Pliny Fisk's work links religion and nature. Around the globe, religious concerns about care for God's creation have become concretized in specific projects and programs as faith communities and environmental organizations – including the Center for Maximum Potential Building Systems – have collaborated to effect an integrated relationship between people and their regional ecosystems. Fisk sees a natural tie between religion and ecology:

Religion, in its ecumenical way of trying to bring people together on significant issues, could be the most powerful tool that we have to win the conceptual space/time race, the competition over which set of ideas will guide human life and activity in the future before nature's systems begin to fail because we lack an understanding of her needs and thus our own.

The connection that religion has with most humans on Earth is a significant tool for the future. If an environmental ethic could be folded into religious understandings, religion could become *the* significant tool in the conceptual space/time race, since it can gather and incorporate most of the other

tools used to try to restore ecological balance. If religion does not help the planet and its web of life to recover from current environmental crises, then it is possible that in the future humans would not be included among God's surviving creatures.

In the biblical story of the Garden of Eden, "God's garden" is a place with an abundance of resources which are appreciated and used by humans. It would be wonderful if that garden, representing people in past eras living in harmony with nature, could be conceptually restored and concretely realized. People at times are forced to exist on the worst land, in the worst conditions, with the worst water. But sometimes these places of total degradation in the present were once fertile garden areas in the past. People might conceptualize a relationship between past and future gardens, and consider how human behavior might be transformed such that the gardens would exist again and continue into the future (Fisk interviews with Hart, 9 March 2002 and 11 March 2002).

The Center for Maximum Potential Building Systems has numerous programs, and urban and rural projects incorporating them, that are models for responsible linkages of religion and nature and could be incorporated into or adapted to varying natural and social contexts. These include Life Cycle Environmental Design and Balancing of Energy, Water, Waste and Material Systems (Nursing & Biomedical Sciences Center, the University of Texas, Houston); establishing minimum requirements for environmental-economic conditions as the basis for the greening of public facilities using BaselineGreen, a software program CMPBS developed with Environmental Protection Agency (EPA) funding that has data on more than 12 million businesses and their products, and uses Geographic Information Systems (GIS) software to link data and digital maps to analyze the impacts of products from source to sink, region by region, throughout the U.S. (City of Seattle Government Center); revision of state Architecture and Engineering guidelines to include recycled content and "green" building material specifications, sustainable architectural practices, energy efficiency, construction site and office recycling systems, and procedures to ensure indoor air quality (State of Texas); and development of an Ecological Footprint game that enables local communities to analyze the extent of their resource use impacts on their local land base.

P Floresta

Floresta is an interdenominational Christian agency, based in California, working with local partners in developing countries to reverse deforestation and poverty by transforming the lives of the rural poor. Tom Woodard, an American businessman, founded Floresta in 1984 after working for a Christian relief agency in the Dominican Republic. Woodard, with his Dominican partners, recognized that deforestation was both a root cause of rural poverty and one of its consequences, creating a vicious cycle.

Motivated by hunger and short-term economic necessity, slash-and-burn farmers were cutting trees to clear agricultural land, or to sell as fuel wood. This resulted in catastrophic soil erosion and long-term disaster for these same farmers, who depended on the land for their livelihood. Farmers frequently knew their behavior was destructive, but without access to credit or other alternatives, they were helpless to change.

One of Floresta's first projects was Los Arbolitos, a large-scale, for-profit tree nursery, with a production capacity of five million seedlings annually, which continues to provide high-quality tree seedlings and jobs for rural Dominicans.

In 1987, Floresta began its Agroforestry Revolving Loan Fund (ARLF) to provide loans, training, and marketing services for poor farmers who wished to start tree-related agroforestry businesses, utilizing fast-growing trees. In 1996 Floresta opened programs with local partners in the state of Oaxaca in Mexico and in Haiti, offering

assistance in community forestry as well as credit for agriculture and small businesses which would help to diversify the rural economy.

Since 1997, Floresta has developed a more holistic approach to its work, recognizing that there are many factors that contribute to deforestation and poverty. In combating deforestation, Floresta uses four principal tools:

1) Community Development – Floresta works to empower the local communities, encouraging them to take responsibility for their own problems and build confidence in their own ability to change their situation. This provides long-term sustainability.

2) Sustainable Agriculture and Forestry – Floresta assists communities in sustainable agriculture, sustainable forest management and reforestation, helping farmers to move away from slash-and-burn agriculture.

3) Microcredit – Floresta provides economic alternatives to destructive forest practices. Loans may be used to implement new agricultural techniques or to diversify fuelwood-based economies.

4) Discipleship – To interested participants, Floresta offers Christian discipleship programs, sharing Christ's love and developing a biblically-based ethic of stewardship for God's creation.

As Floresta has grown, an essentially pragmatic concern for the health of forest ecosystems has developed into a better understanding of the role of stewardship and the importance of restored relationships between humankind and creation in God's ultimate plan.

Floresta has also found that the rural poor have a tremendous amount to offer in solving their own problems. When provided with economic opportunity and agricultural alternatives, subsistence farmers can prosper, live sustainably and contribute to the regeneration of their environment. As of 2003, farmers working with Floresta had planted approximately two million trees, received nearly 2000 small business loans and established ongoing community-based reforestation projects in over seventy villages in Haiti, Mexico and the Dominican Republic.

Fly Fishing

In the autobiographical story, turned 1992 Academy Award-winning motion picture, *A River Runs Through It*, Norman Maclean's family centered their lives around two sacred practices: religion and fly fishing:

In our family, there was no clear line between fly fishing and religion. We lived at the junction of great trout rivers in western Montana, and our father was a Presbyterian minister and a fly fisherman who tied his own flies and taught others. He told us about Christ's disciples being fisherman, and we were left to assume, as my brother and I did, that all first-class fishermen on the Sea of Galilee were fly fisherman and that John, the favorite, was a dry-fly fisherman (Maclean 1967: 1).

For many fly fishers, fly fishing itself is a religious practice. Just as any religious person approaches his/her respective tradition, the devout fly fisher approaches fly fishing with the same discipline and respect. It is not unusual to hear people speaking of fly fishing in ways that invoke the religious dimensions of life, as they commonly deploy terms like religious or spiritual, the sacred or divine, ritual, pilgrimage, meditation, priests, community, or notions like the sanctuary of religious space, to describe the experience.

As I reflect more deeply on the fish's history as a mythic symbol and religious icon, I begin to wonder if having fish shapes around me is a way to stay in touch with the ideas of Jesus without having to go near people who do business in his name (Duncan 2001: 14).

Reflecting on the relationship of his fishing passion to his Christian heritage, Oregon-born author and fly fisher David James Duncan turns to the words of Howell Raines in *Fly Fishing Through a Midlife Crisis*. These words recall the mysterious and divine symbolism surrounding the fish itself, referencing Jesus' miraculous act of turning two loaves of bread and two fishes into enough food to feed a large crowd in Matthew 14:17, Luke 9:13, and John 6:9, which made the fish into a divine symbol of God's provisions for humanity in the natural world. While many fly fishers are not Christian, fly fishing spirituality resonates with the sacredness of the fish in the Christian tradition.

In the quest for experience with the divine, religious persons often embark on a journey or pilgrimage. For the fly fisher this is the journey to a new fishing spot, or an old favorite. The American fly fishing writer Nick Lyons, for example, has written in a way that views the pilgrimage to rivers, streams, and their sources as a quest for life's deeper meanings.

A lot of people have been tracking rivers to their sources lately; it's surely a desire to find some further meaning in all this sloshing around in streams. People seem to be saying, "There must be more to it than catching of fish – and perhaps those meanings are to be found in the headwaters" (Lyons 1992: 139).

These words suggest that the pursuit of fish is not the only reason for fishing – that journey or pilgrimage itself can be as powerful an experience as the catching of fish. Indeed, for some fishers, fly fishing facilitates spiritual perception; it is a way to apprehend one's connections with something greater than one's self. As David James Duncan put it,

When the trout are happening, I can kneel on merciless stones *happily*, for hours and hours; I can stare into blinding glare, withstand heat or cold, be chased by bears, cow moose with calves, or redder necks than my own, and still rush gratefully back for more. I don't understand the *why* of all this. I don't try to understand. I just pull on my waders and merge via a spirituality so thrashing, splashing, cursing, casting, and Earth-engaged it doesn't feel spiritual at all: it just feeds the spirit (Duncan 2002: 303).

There is something about being out on a stream in the mountains or in the plains that draws some people to pursue experiences in such places with great passion, and I think it has something to do with the desire to directly experience and engage the Earth. The solitude and sounds of a stream, the careful turning over of rocks so as to see what bugs the fish are eating, and many other aspects of fly fishing, easily, indeed naturally, seem to foster a sense of connection with and belonging to nature.

Such feelings are not uncommon in nature-oriented religion. They are emphasized, for example, in movements such as deep ecology, as well as in a wide variety of nature-related activities not always recognized as "religious." Religion scholar Bron Taylor, for example, argues that Earth- and nature-based spiritualities generally involve experiences and perceptions of connection and belonging to a living, sacred Earth. Quoting Alan Drengson, he asserts that people and groups often turn to nature "for wisdom, for strength, for maturation, for spiritual comradeship, and for lessons in devotion and humility," creating thereby a spirituality or religious practice based upon "being-in-nature" (in Taylor 2001: 181).

Fly fishing is an example of such spirituality, a form of Earth engagement that takes place through a meditative, ritual practice. The sounds of the stream and the rhythmic casting facilitate the meditative experience of the fly

fisher. As Norman Maclean put it, fly fishing "is an art that is performed on a four-count rhythm between ten and two o'clock" (Maclean 1967: 2–3). Maclean's point is, in part, that like any other form of meditation, fly casting requires discipline and practice. "Fly fishing teaches patience and attentiveness in the most literal way imaginable: without both, you get skunked" (Duncan 2002: 302).

Like other forms of religious and spiritual practice, there is an important material aspect to fly fishing – the "gear" matters. Flies, reels, waders, vests, and ideally, an old, worn oil-cloth raincoat affect the fly fisher sensually – they become more than tools of the art. The sensuality of the experience, in a way, its earthiness, is found in the aroma wafting upward upon the opening of the storage tube to a bamboo cane rod, or in the packing and unpacking of the coat and clothes, as one's memory recalls moments on the stream in past trips. These smells function similarly to the use of incense in ritual and meditation: they focus the mind on the sacred.

Fly fishers often advise one another, especially novices, to seek out spiritual guides to lead them properly, even reverently, into the practice. Indeed, the best fly fishing guides are ritual specialists who are eagerly sought when learning the art of pilgrimaging to unknown waters. Fly fishers generally believe such guides hold secret knowledge of specific streams and their inhabitants. But beyond this, they are figures with whom they can identify, sharing sacred experiences, and reflecting on life. And this is not only of interest to the one who has sought out the guide. Once on the San Juan River in New Mexico, a guide told me how nice it is to guide someone who already knows the river and how to fish, for "this leaves room for contemplating and discussing life, philosophy, and religion."

Such activity with guides and other practitioners fosters community in a way similar to most religions. Attending the fly fishing store and patronizing guide- and other fishing-focused businesses provides concrete material support for the religious community, resembling the providing financial support congregants give to a local church or shrine. Local communities arise surrounding the practice, from hanging out at the local fly shop or bar to sharing information or stories of the day. The local fly-tying group is comparable to a Bible study, meeting regularly to sit around, tie flies, and discuss fishing and life's deeper mysteries.

American author Tom McGuane writes, "If you fish, there is an implied responsibility to care for the environment" (Lyons 1998: 120). Like all religions, there are ethical implications and dimensions to fly fishing, and specific groups have been invented as ethical expressions of them. Trout Unlimited, for example, is one of the most effective conservation and education groups in North America. Their mission is to conserve, protect, and restore North America's trout and salmon fisheries and their

watersheds. As stated in their literature, Trout Unlimited accomplishes this mission on local, state and national levels with an extensive and dedicated volunteer network. Trout Unlimited's national office, based just outside of Washington, D.C., and its regional offices employ professionals who testify before Congress, publish a quarterly magazine, intervene in federal legal proceedings, and work with the organization's 125,000 volunteers in 500 chapters nationwide to keep them active and involved in conservation issues. Groups like Trout Unlimited seek to educate the wider public on conservation and environmental issues at least in part so that generations to come can continue to have the spiritual experiences and perceptions that accompany the practice of fly fishing.

It may be that I can see the religious dimensions of the practice of fly fishing because it has long been my own practice. Like Maclean, I was taught at a very young age the importance of patience, discipline, and respect that are necessary to be a successful fly fisher. My father had me stand in the long driveway beside our house to practice my cast before we could make the journey to a stream in New Mexico or Colorado. He would tell me to be patient and feel the cast, allowing the rod to be an extension of my arm and self. On journeys to various waters he would tell me stories from his many years fly fishing, teaching me lessons on how to read the structure of a stretch of water and all its surroundings, how to approach rivers, and most importantly to fish with quiet calm, subtlety, and respect.

I was also taught, and have learned more deeply with each year of fishing, that it is not the catching of fish that is the chief objective of the practice. My cousin once remarked, for example, that he realized that he had reached a special place in his fly fishing practice when he could walk away from rising fish without feeling a desire or pressure to catch them. This seems to resemble the ideal of non-attachment associated with religions originating in Asia. What was important to him at that moment was simply to sit, watch, and lose himself in the sounds of the river, in watching the fish in their own belonging to it, sipping flies off of the surface of the water.

Fly fishing brings to many such Earth-engaged spirituality. I have often felt similarly, as the sounds of the stream and the rhythm of casting blend me into a reality so much greater than my own self. On one occasion on the Frying Pan River in Basalt, Colorado, I became so enraptured with the pursuit of a certain trout that I hardly noticed two elk who had moved into the stream not more than a few yards away. There was a moment in which we seemed to acknowledge each other's presence, neither of us spooking or running away. That day it was not the fish caught which made the day special, but the sudden realization, sharing a space on that stream with those magnificent elk, that I was a part in something more. In agreement with

McGuane, who stated "fly fishing is a road to nature based spirituality," these are among the spiritual meanings I and many others have found in the pursuit of the wonderful and mysterious trout. And like many others, these moments of engagement with nature lead me to conservation work, seeking to defend and improve the natural living habitat of all of the Earth's creatures (Lyons 1998: 12).

Fox, Matthew (1940-)

Matthew Fox is known for being the founder of the University of Creation Spirituality in Oakland, California and for authoring 24 books, including *The Coming of the Cosmic Christ*, *Original Blessing*, *Passion for Creation: The Earth-Honoring Spirituality of Meister Eckhart* and his most recent, *One River, Many Wells*. He is the founder and editor-in-chief of the magazine *Original Blessing* and hosts Techno Cosmic Masses: events intended to reinvent

worship, which are structured like a Mass including techno music and multimedia. What he is perhaps most well known and notorious for, however, is having been expelled from the Dominican order. The reasons for this expulsion are the same reasons he is important when considering religion and nature.

Fox had been an ordained priest since 1967, but in 1991, as a result of extensive research by the Catholic Church, he was ordered to leave his California school or face dismissal from the Dominican order. The Vatican objected specifically to Fox's refusal to deny his belief in pantheism, his denial of original sin, for referring to God as "mother" and for promoting a feminist theology. There were additional scandals, one of which was caused by Starhawk's presence as a staff member at the University of Creation Spirituality. Fox has now found a home within the Episcopal Church.

Fox focuses on reinventing worship, art, human sexuality and most importantly embracing wilderness, both internal and external. He emphasizes the need for humanity to change its relationship to the Earth, or else risk losing it completely to pollution and environmental destruction. One of his most potent and fascinating ideas related to this idea is presented in *The Coming of the Cosmic Christ*. He suggests that we rethink and reacquaint ourselves with the concept of the Cosmic Christ and the crucifixion story of Jesus Christ in a way that is relevant to the global environmental crisis. What he suggests is a paradigm shift, which he defines as a new Paschal Ministry for the third millennium.

This paradigm shift can be described in one way as a shift from the quest for the historical Jesus to a quest for the Cosmic Christ. The historical Jesus is the individual whom we encounter in the Bible. Fox explains that Jesus was, among other things, a mystic. He specifically cites Jesus' *Abba* experience, or his nondualistic experience of God. This nondualism is exhibited in John 10:30, when Jesus states, "The Father and I are one." This is not a mysticism of the Fall-Redemption tradition, which favors mysticism of the sacraments. It is creation-centered mysticism, which is an act of reentering the mystery of the universe and human existence in it. Power is not elsewhere, outside ourselves, but is within us, just as it was within Jesus Christ the man.

In defining the Cosmic Christ, Fox makes the basic assumption that the Cosmic Christ is cosmic, preexistent wisdom. Among the many books of the Old Testament and New Testament that he says contain passages referring to the Cosmic Christ are Job, Baruch, and Proverbs, Philippians, Romans, Colossians and Ephesians. The Cosmic Christ is not an individual, anthropomorphic character, but rather an eternal, penetrating and changing energy that has the potential greatly to affect our world and our human lives. Most importantly, Fox states that the emergence of the Cosmic Christ will usher in a paradigm

shift: a shift from the Enlightenment mentality, which denies mysticism and lacks a cosmology, to the new paradigm, which represents a return to mysticism, a reinvention of work, sacred sexuality and an immanent rather than transcendent creator.

Fox makes what the Catholic Church sees as a radical leap when he suggests that we see and understand Mother Earth as Jesus Christ crucified, as well as the "mother principle" being crucified. By mother principle, he means that nurturing and mystical part of ourselves that is intimately connected to the Earth. By proposing this, he writes that he is invoking the ancient Jewish, and Christian tradition of the Paschal Ministry, meaning, the resurrection and ascension of Christ, the salvation foreshadowed in the Old Testament and the sacraments. Fox suggests that in a Cosmic Christ context, the Paschal Ministry takes on new power, deeper meaning and moral passion. This occurs because the Paschal Ministry will be understood as Mother Earth conceived as Jesus Christ, crucified, resurrected and ascended. "It is the life, death and resurrection of Mother Earth" (Fox 1988: 149).

Fox's vision is about collective not personal salvation. It occurs on an earthly, if not universal level. Fox believes that the Cosmic Christ will usher in a new era of self-expression and "the reinvention of the human." What follows is an inevitable compassion for all creatures and the Earth itself.

Francis of Assisi (ca. 1181–1226)

Francis of Assisi through the centuries has been one of the Catholicism's most popular and inspirational saints. His embrace of a life of poverty, simplicity, and charity has inspired many both inside and outside the Roman Catholic Church. But he is perhaps best known for his exuberant stress on our kinship with animals and all of creation. Francis' life was chronicled by his followers in *The Little Flowers* and in biographies by Thomas of Celano and later by Bonaventure. These hagiographical accounts are

replete with stories of Francis preaching to “my little sisters the birds,” to fish, and to wild flowers of their need to praise God. In another famous story, Francis addresses a fierce wolf at Gubbio as “friar wolf” and miraculously persuades him to cease killing and to live in peace with his human and animal neighbors. Though these accounts mix myth and legend with biography, they remain the primary vehicle through which each generation has envisioned Francis and associated him with a vital sense of kinship with creation. Preaching was central to Francis’ mission, and the image of Francis preaching even to nature underscores a sense of identification with all of creation. Likewise the stories of Francis’ ability to speak to animals and to tame wild ones fit a common medieval hagiographical motif that sees the holiness of saints as allowing a brief recovery of the peaceableness and harmony between the species once enjoyed in Eden but lost in humanity’s fall (see Sorrell 1988: 52–4).

Francis was born in Assisi, Italy, to a wealthy cloth merchant and his wife. Francis received some liberal arts schooling and as a young man fought in Assisi’s war with Perugia. He was captured in battle and imprisoned for almost a year. He suffered a long illness and, on recovery, joined a military expedition to Apulia in the south. We are told that after a vision in a dream, he returned to Assisi and embarked soon thereafter on following the example of Jesus. After a dramatic break with his father, Francis committed himself to poverty, begging, and preaching. He gave away his (and many of his father’s) possessions, withdrew from his family and friends, served lepers and the poor, and repaired a church. A growing band of companions joined Francis and the pope gave his official blessing to the new order. This small band of friars grew over the centuries into today’s array of Franciscan orders.

In recent decades, growing environmental concern has prompted many to look to Francis’ powerful sense of kinship with nature for inspiration. Pope John Paul II in 1979 proclaimed Francis to be the patron saint of ecology. Some have called Francis a pantheist, but that misses how deeply traditional his religious views were. His vision was primarily theocentric, not ecocentric. His core focus centered on Christ, giving praise to God, and love and service to humanity. He expressed his affection for, and closeness to, animals and the rest of nature with rare exuberance, but he never wavered from the medieval church’s teachings on the hierarchy of creation with humanity as its crown.

A number of influences may have helped Francis to stress the goodness of creation. His era saw a growing interest in the observation and artistic depiction of nature. He was deeply impressed by the ideal of chivalry and he loved a number of popular French troubadour songs and poems that praised both knightly virtue and the beauty of nature. He came to refer to his friars as “God’s

troubadours.” He may well have heard stories of the lives of Irish saints which commonly depicted even animals as recognizing a saint’s gentleness and authority. Francis’ decision to become a wandering preacher and frequent hermit meant that he had close and sustained contact with nature and animals. He and his companions often lived in caves, hovels, and forest huts, and these stays likely deepened his identification with nature and its species.

Early and medieval Christianity had long emphasized the goodness of creation, but an equal emphasis on human superiority tended to undercut any emphasis on humanity’s kinship with the rest of creation. Francis and a few other Christian nature mystics were distinctive in celebrating God’s presence throughout the natural world and humanity’s kinship with the animals and the rest of nature. Francis employed chivalric and familial terms of address to animals and natural elements to emphasize the intimacy of the communal bonds between humanity and the rest of creation. For example, in *The Canticle of Brother Sun*, (also known as *The Canticle of the Creatures*), Francis spoke of “Sir Brother Sun,” “Sister Moon,” “Brother Fire,” and “Sister Mother Earth” (in Armstrong 1982: 38–9). Some interpret the *Canticle* as a call to humans to praise God for the goodness, beauty, and usefulness of creation, while others read it as an exhortation to all of nature to praise God for God’s blessing upon it. In either reading we are left with a strong sense of our need to respect the entire community of creation (Sorrell 1988: 128).

The intimacy of our connections to the rest of creation is emphasized in a number of Francis’ other writings. Francis’ prayer, *The Praises to be Said at All the Hours*, is primarily a collection of diverse biblical praises, many from the Psalms. It exhorts both humans and all of nature to praise God. Another important prayer, *The Exhortation to the Praise of God*, was at least partly written by Francis and is a compilation of biblical passages attesting to our relatedness to the rest of creation. “Heaven and Earth, praise Him (cf. Ps. 68:35). All you rivers, praise Him (cf. Dan. 3:78). All you creatures, bless the Lord (cf. Ps. 102:22). All you birds of the heavens, praise the Lord (cf. Dan. 3:80; Ps. 148:10)” (in Armstrong 1982: 42–3).

What inspires is not so much Francis’ corpus of writings, which is quite sparse, but the charm of the accounts and legends of his exuberant energy celebrating the whole of creation. Francis’ writings have not had much of an impact on the development of mainstream Catholic theology or ethics, for he had no great *Summa Theologiae* to impress later generations of the learned, but his great text was his life, which has continued to inspire many across the ages. He lacked the education to invoke Aristotelian or neo-Platonic metaphysical understandings of the natural cosmos, but he did have a literalist power in his direct appropriations of the Hebrew Scriptures, especially

Psalm 148, and the Gospels concerning specific birds, animals, fish, stars and planets. Francis was a medieval friar; not an ecologist. But it is not surprising that many today who are ecologically minded find in him a kindred spirit.
