On the other hand we invite the artists to take counsel with learned men and not to allow their discoveries to perish with them. The artists should know that to lock up a useful secret is to render oneself guilty of theft from society. It is just as despicable to prefer the interest of one individual to the common welfare in this case as in a hundred others where the artists themselves would not hesitate to decide for the common good. If they communicate their discoveries they will be freed of several preconceptions and especially of the illusion, which almost all of them hold, that their art has reached its ultimate perfection. Because they have so little learning they are often inclined to blame the nature of things for a defect that exists only in themselves. Obstacles seem insuperable to them whenever they do not know the means of overcoming them. Let them carry out experiments and let everyone make his contribution to these experiments: the artist should contribute his work, the academician his knowledge and advice, the rich man the cost of materials, labor, and time; soon our arts and our manufactures will be as superior as we could wish to those of other countries.

¹ Diderot is quoting from Francis Bacon's Latin work *Novum Organum* (1620), which discusses, in a series of aphorisms, the methods of acquiring knowledge. In the aphorism here quoted (Book I, Aphorism LXXXIII) Bacon is quoting the common view that 'the dignity of the human mind is lowered by long and frequent intercourse with experiments and particulars.'

² Jean-Baptiste Colbert (1619–83), Minister of Finance to Louis XIV, did a great deal to encourage French industry and technology and was instrumental in founding the French Academy of Sciences in 1666.

³ Charles Le Brun (1619–90) and Eustache Le Sueur (1616–55) were painters; Gerard Audran (1640–1703) was an engraver who engraved many of their paintings.

⁴ Pierre Varignon (1654–1722), French mathematician, author of *Nouvelle mécanique et statique* (1725).

8 Jean-François, Marquis de Saint-Lambert (1716–1803) 'Genius' from the *Encyclopédie*

Saint-Lambert contributed articles to the *Encyclopédie* on government and military history as well as art. Though his authorship of the article on Genius is now generally accepted, it has sometimes been attributed to Diderot, whose thought is certainly reflected in it. The separation of genius from taste is significant of a growing impatience with art's regulation by forms of decorum, whether imposed in the name of religion, of custom or of common sense. In this as in many other respects the contributors to the *Encyclopédie* give early expression to attitudes normally associated with the Romantic movement at the end of the century. 'Génie' was first published in the seventh volume of the *Encyclopédie*, issued in 1757. Our version is taken from the text printed in *Denis Diderot's The Encyclopedia*, ed. and trans. Stephen J. Gendzier, New York, Evanston and London: Harper & Row, 1967, pp. 118–24.

GENIUS (*Philosophy and Literature*). Range of mind, power of imagination, and responsiveness of soul: this is *genius*. The manner in which ideas are received determines those that are remembered. Man thrust into the universe receives with more or less vivid feelings the ideas of all beings. Most men only have vivid feelings from the impression of objects bearing directly on their needs, their tastes, etc. Everything which is foreign to their passions, everything which is not analogous to their way of existing, either is not perceived by them or is only seen for a moment without being felt and is forever forgotten.

The man of *genius* has a soul with greater range, can, therefore, be struck by the feelings of all beings, is concerned with everything in nature, and never receives an idea that does not evoke a feeling: everything stirs him and everything is retained within him.

When the soul has been moved by an object itself, it is even more affected by the memory of the object. But in a man of *genius* imagination goes further: it recalls ideas with a more vivid feeling than it received them, because to these ideas are connected a thousand others more appropriate to arouse the feeling.

The *genius* surrounded with objects that preoccupy him does not remember: he sees but does not restrict himself to seeing: he is moved; in the silence and obscurity of his room he enjoys the smiling and fertile countryside; he is chilled by the whistling of the winds; he is burned by the sun; he is frightened of storms. The soul often takes pleasure in these momentary affections; they give him enjoyment that is precious to him. The soul gives itself to everything that can increase its scope; with true colors and indelible strokes it would like to give body to the phantasms that are its work, that transport or amuse it.

When he wishes to paint a few objects that excite him, things and people sometimes shed their imperfections; only what is sublime or pleasant finds its way into his

paintings; then *genius* paints the bright side of everything: sometimes he sees in the most tragic events only the most terrible of circumstances; and in this moment *genius* spreads the most somber colors, powerful expressions of lament and sorrow; he animates matter, colors thought; in the heat of enthusiasm he neither orders nature nor arranges the sequence of his ideas; he is transported into the situation of the personages he invents; he has taken on their character: if he feels heroic passions to the highest degree, such as the confidence of a noble soul in full possession of its power rising above all danger, such as love of country carried to the point of forgetting oneself, then he produces the sublime . . .

This force of enthusiasm inspires the proper word which is striking but often sacrificed for bold figures of speech; it inspires imitative harmony, images of all kinds, the most delicate motions and imitating sounds, embodied in the words that characterize people.

Imagination can assume different forms: it borrows them from the different qualities that form the character of the soul. Some passions, the diversity of circumstances, and certain qualities of the mind give a particular turn to the imagination: it does not recall all of its ideas with feeling, because there is not always a relationship between it and all beings.

Genius is not always *genius*; sometimes it is more amiable than sublime; it feels and paints what is graceful more than what is beautiful in things; it experiences and makes us experience gentle emotions more than ecstasy.

Sometimes in a man of *genius* the imagination is gay concerning itself with the slight imperfections of humanity, with ordinary faults and follies. The opposite of order is only ridiculous to it, but in a manner which is so new that it seems the view of the man of *genius* is responsible for treating the object with ridicule which he has only just discovered there. The gay imagination of a *genius* enlarges the field of ridicule, and while the common people see and feel it in that which offends established practice, *genius* discovers and feels it in what is offensive to universal order.

Taste is often separate from *genius*. *Genius* is a pure gift of nature; what he produces is the work of a moment; taste is the product of study and time; it depends on the knowledge of a multitude of established or assumed rules; it brings about the creation of beauty that is merely conventional. For a thing to be beautiful according to the rules of taste, it must be elegant, perfect, worked on without seeming so: to be of *genius*, it must sometimes be untidy with an irregular, abrupt, savage appearance. *Genius* and the sublime sparkle in Shakespeare as flashes of lightning in a long night, and Racine is always beautiful: Homer is full of *genius*, and Virgil of elegance.

The rules and laws of taste would place shackles on *genius*: he breaks them to soar to what is sublime, pathetic, or noble. The taste of a man of *genius* is defined by his love of this eternal beauty that characterizes nature and by a passion to make his tableaux conform to some kind of model that he has created and according to which he has an idea and a sense of the beautiful. The need to express the passions that move him is continually obstructed by grammar and usage: often the idiom in which he writes hinders the expression of an image that would be sublime in another idiom. Homer could not find in a single dialect the expressions necessary for his *genius*;

Milton constantly violates the rules of his language and goes in search of powerful expressions from three or four different idioms. Finally strength and abundance, a certain kind of roughness, irregularity, the sublime, and the pathetic – this is the character of *genius* in the arts; he does not touch lightly, he does not please without astonishment, he even astonishes by his imperfections. [. . .]

The *genius* is struck with everything, and as soon as he is not possessed by his thoughts and subjugated by enthusiasm, he studies, so to speak, without being aware of it; he is forced by the impressions that objects make on him to enrich himself continually with knowledge that costs him nothing; he casts an ample eye on nature and pierces its abyss. He gathers in his breast the seeds of thought that enter there imperceptibly and that produce in time some results that are so astonishing that he is tempted to believe himself inspired: he nevertheless has a taste for observation, but he rapidly observes a great distance, a multitude of beings.

Movement, which is his natural state, is sometimes so gentle that he hardly notices it; but most often this movement stirs up a tempest, and the *genius* is rather carried away by a torrent of ideas than inclined to follow in an unstrained manner his calm reflections. In a man dominated by imagination ideas are tied together by circumstances and feeling: he often sees abstract ideas only in their relationship to perceptible ideas. He gives to abstractions an existence independent of the mind that made them; he gives reality to his phantasms, his enthusiasm increases at the sight of his creations, that is to say, of his new combinations, the only creations of man; carried away by a host of thoughts, possessed by the gift of combining them, forced to produce, he finds a thousand specious articles of evidence and is not certain of any of them; he builds audacious structures in which reason would not dare to dwell and which please him by their proportions and not by their solidity; he admires his systems as he would admire the plan of a poem, and he embraces them as objects of beauty while believing that he loves them as the truth.

Truth and falsehood, in philosophic works, are not distinct characteristics of *genius*.

There are very few errors in Locke and too few truths in Shaftesbury. The first, nevertheless, is only a far-reaching, penetrating, and judicious mind; and the second is a *genius* of the first order. Locke saw; Shaftesbury created, constructed, built: we owe to Locke some great truths coldly perceived, methodically sustained, boldly proclaimed, and to Shaftesbury some brilliant systems, often unfounded, filled nevertheless with sublime truths; and in his moments of error he pleases and even persuades by the charm of his eloquence.

The *genius* hastens, nevertheless, the progress of philosophy by the most fortunate and the least expected discoveries: he rises with the flight of an eagle toward a luminous truth, the source of a thousand truths at which the timid crowd of wise observers will subsequently arrive by crawling. And beside this luminous truth he will place the works of his imagination: incapable of following a normal course in life and of successively covering the intervals, he starts from one point and springs toward his goal; he draws a fruitful principle from out of the darkness; it is rare that he follows the chain of inferences; he is *spontaneous* [*primo-sautier*], to use the expression of Montaigne. He imagines more than he has seen; he produces more than he discovers; he sweeps along more than he leads the way: he incites the Platos, the

Descartes, the Malebranches, the Bacons, and the Leibnizes; and according to whether imagination has been more or less dominant in these great men, he causes brilliant systems to be developed or great truths to be discovered.

In the arts, the sciences, and the affairs of state the *genius* changes the nature of things; his character spreads over everything he touches, and the light of his reason flashes beyond the past and the present to illuminate the future: he surpasses the people of his century who cannot follow him; he leaves far behind him those minds who rightly criticize him but who proceed along a steady path and never depart from the uniformity of nature. The person who wishes to define him has more of a feeling and less actual knowledge about him: it is incumbent on him to speak about himself; and this article, which I should not have written, ought to be the work of one of those extraordinary men who reflect honor on this century and who would only have to look inside themselves to know the *genius*.

9 Anonymous: 'Observation' from the *Encyclopédie*

In its full text, this article betrays its author's particular interest in the areas of metallurgy and medicine. In the distinction it draws between observation and experiment or experience, however, it reveals the wider influence of natural-scientific research and of empirical philosophy on the principles of inquiry in general. It thus helps to define the larger intellectual framework within which the arts and sciences were considered by the Encyclopædists. 'Observation' was first published in 1765, when the last ten volumes of the *Encyclopédie* were issued, together with the fourth of eleven volumes of plates. Our version is taken from the text printed in *Denis Diderot's The Encyclopedia*, ed. and trans. Stephen J. Gendzier, New York, Evanston and London: Harper & Row, 1967, pp. 175–9.

OBSERVATION (*Gram. Physic. Med.*) is the attention of the soul focused on objects offered by nature. An experiment is the result of this same attention directed toward phenomena produced by the labors of man. We must, therefore, include within the meaning of the generic noun *observation* the examination of all natural effects, not only of those that present themselves at once and without intermediary to our sight but also those we would not be able to discover without the hand of a worker, provided that this hand has not changed, altered, or disfigured them. [...]

Observation is the primary foundation of all the sciences, the most reliable way to arrive at one's goal, the principal means of extending the periphery of scientific knowledge and of illuminating all its points. The facts, whatever they are, constitute the true wealth of the philosopher and the subject of *observation*: the historian collects them, the theoretical physicist combines them, and the experimenter verifies the results of their synthesis. Several facts taken separately appear dry, sterile, and unfruitful. The moment we compare them, they acquire a certain power, assume a vitality that everywhere results from the mutual harmony, from the reciprocal support, and from a chain that binds them together. The connection of these facts and the general cause that links them together are some of the objects of reasoning, theories, and systems, while the facts are the materials. The moment a certain number of them have been gathered, some people hasten to construct; and the

building is the more solid as the materials are more numerous and each one of them finds a more appropriate place. It sometimes happens that the imagination of the architect compensates for the deficiency found in the number and relation of the materials, and he manages to make them serve his plans, however defective they may be. This is the case of those audacious and eloquent theorists who, devoid of the necessary patience to observe, are content to have gathered a few facts, immediately tie them together by some ingenious system, and render their opinions plausible and attractive by the richness of their stylistic devices, the variety and force of some colorful writing, and striking and sublime images with which they know how to present their ideas. How can one resist admiring and almost believing Epicurus, Lucretius, Aristotle, Plato, and M. de Buffon? But when one is in too much of a hurry (a common shortcoming) to create a chain of all the facts that have been collected by *observation*, one constantly runs the risk of encountering some facts that cannot fit, that force a change in the system or destroy it entirely. And as the field of discovery is extremely vast, and its limits extend further as knowledge increases, it appears impossible to establish a general system that is always true. We should not be astonished to see some of the great men of antiquity attached to opinions that we find ridiculous, because there is every reason to presume that in times past those opinions took full account of all the *observations* already made and were in complete agreement with them. If we could live several centuries from now, we would see our principal systems, which appear the most ingenious and the most reliable, destroyed, scorned, and replaced by others that would then be subject to the same vicissitudes.

Observation has produced the history or the science of the facts that concern God, man, and nature. *Observation* of the works of God, of miracles, of religions, etc. has created sacred history. *Observation* of life, deeds, customs, and mankind has given rise to secular history. *Observation* of nature, of the movement of heavenly bodies, of the vicissitudes of seasons, meteors, elements, animals, vegetables, and minerals, of the mistakes of nature, of its use, of arts and crafts have all furnished the materials for the different branches of natural history. . . .

Observation and experiment¹ are the only paths that we have to knowledge, if one recognizes the truth of the axiom: *we have nothing in our minds that did not originally come from the senses.*² At least these are the only means by which one can attain knowledge of objects that fall within the province of the senses. It is only through them that we can cultivate physics, and it is not doubtful that *observation* even in the physics of inorganic bodies infinitely surpasses experimentation in certainty and usefulness, although inanimate bodies, without life and almost without action, only offer the observer a certain number of phenomena that are relatively uniform and in appearance easy to recognize and combine. Although one cannot overlook the fact that experiments, especially those in chemistry, have shed a great light on that science, we see that the parts of physics, which are entirely within the province of *observation*, are the best known and perfected. It is by *observation* that the laws of motion have been determined, that the general properties of bodies have been known. It is to *observation* that we owe the discovery of gravity, attraction, acceleration of heavy bodies, and the system of Newton; on the other hand, Descartes' system was based on experience. Finally it is *observation* that created astronomy and carried it to this point of perfection in which we see it today, and which is such that it surpasses in

certainty all the other sciences. The immense distance of the heavenly bodies, which prevented all experimentation, seemed bound to be an obstacle to our knowledge. But *observation*, to which astronomy was totally delivered, cleared this and all other obstacles. One can also say that celestial physics is the fruit and triumph of *observation*. In chemistry *observation* opened a vast field of experimentation: it threw light on the nature of air, water, fire, on fermentation, on the decomposition and spontaneous degeneration of bodies. [...]

Man ultimately, from whatever angle one considers him, is the least appropriate subject for *experimentation*. He is the most suitable, lofty, and interesting object of *observation*; and it is only by means of this method that a certain amount of progress can be made in the sciences related to man. *Experimentation* here is often more than useless. Man can be considered from two principal points of view: either in regard to the moral or in connection with the physical. The *observations* made on *moral* man are, or should be, the basis of secular history, morality, and all the sciences which are derived from it. ... *Observations* made on man considered from the physical aspect comprise the noble and divine science called *medicine*, which is concerned with the knowledge of man, health, illness, and the means to relieve and prevent one and to conserve the other.

¹ *Expérience* means 'experience' as well as 'experiment' in French. Sometimes one translation seems more appropriate than another, although a French writer might have both in mind.

² See John Locke, *An Essay Concerning Human Understanding*, ed. Alexander Campbell Fraser (Oxford, 1894), I, 124–5, for the source of the author's apparent paraphrase.

10 Friedrich Melchior Grimm (1723–1807) from the *Correspondence littéraire*

The German critic and journalist Friedrich Melchior Grimm was born in Ratisbon and educated in Leipzig. He was in Paris by the later 1740s, where he was on close terms with Diderot and Rousseau. In 1753 he assumed the role of confidential correspondent to the brothers of Frederick II, King of Prussia, employed to keep them informed about literary and artistic matters in France. His communications took the form of a privately circulated manuscript journal, the *Correspondence littéraire, philosophique et critique*, which he edited until 1773, gradually enlarging its small list of subscribers amongst the royalty and senior aristocracy of Germany, Poland, Sweden and Russia. Both through the journal and through more direct forms of agency and advice he was responsible for recommending numerous purchases of French art to buyers abroad, among them Catherine the Great of Russia. He reviewed the Salons of 1753, 1755 and 1757, and persuaded Diderot to succeed him in 1759 (see IIC 12–14 and IVA11). He was thenceforward to appear in Diderot's Salons as a frequent interlocutor, actual or imagined. In the following passage, he offers a trenchant critique of the kind of ambitious but rule-governed painting that was generally regarded as the highest form of the art, both within the Academy and by the representatives of the state. It was originally included in the *Correspondence littéraire* for 15 December 1756, and was first printed in *Correspondence littéraire, philosophique, et critique par Grimm, Diderot, Raynal, etc.*, ed. M. Tourneux, Paris, 1877–82, vol. III, pp. 317–21. The present translation by Michael Fried is taken from his *Absorption and*

Theatricality: Painting and Beholder in the Age of Diderot, Berkeley, Los Angeles and London: University of California Press, 1980, Appendix A, pp. 164–6.

I have always disliked enormous constructions in painting and in poetry. If it is true that in imitating nature the arts have no other aim than to move and to please, one must admit that the artist strays from his aim as often as he undertakes epic poems, painted ceilings, immense galleries, in a word, those complicated works that throughout the ages have received such injudicious praise. Simplicity of subject and unity of action are not only what is most difficult when it comes to genius and invention, but also what is most indispensable as regards overall effect. Our mind cannot embrace many objects or many situations at the same time. It gets lost in that infinity of details with which you believe you enrich your work. It wants to be struck at first glance by a certain ensemble, without hindrance and in a strong manner. If you miss this first instant, you will obtain nothing but those reasoned and tranquil praises that constitute the satire and the despair of genius. One thinks that one justifies those enormous constructions by saying that they are meant less to touch us than to arouse our admiration. But admiration is a rapid feeling, a sudden thrill that does not last and that becomes tiresome and cold as soon as one wants to prolong it. It is always produced by the simplicity and sublimity of a thought or a work of poetry, in painting and in music, whereas those complicated works can only cause a kind of cold astonishment. The most artistically arranged brilliance soon bores and repels. This is not to mention the numerous added ornaments and inevitably out of place accessories that a composed work of a certain size necessarily entails. The least evil that can be said of them is that they distract the mind from the principal object and that they complete the destruction of the effect of the whole. For all the praise that has been lavished on unity of action and on the subordination of details and their relation to the principal subject in all the great works of poetry and painting, there is none from which two-thirds would not be removed if it were a question of keeping only those bound essentially to the subject. How many episodes make us lose sight of the true personages of the action and introduce us to people whom we had no reason to expect and who should not occupy us! As for me, I frankly admit that I have never seen a gallery or a ceiling nor read an epic poem without a certain weariness and without feeling a diminution of that vivacity with which we receive impressions of beauty.

These reflections necessarily lead to another. It is incredible how much havoc and harm have been wrought in all the arts by imitation. Imitation alone is responsible for the audacity and the success of mediocre people, the timidity of men of true genius, and the discouragement the latter feel. Homer, obeying the divine flame that he felt burning within him, composed the story of the famous quarrel between the Greeks and the Trojans. The sublimity of his imagination, the simplicity of his soul and of his age, give all the details of his poem, however diffuse they may be, an inexpressible charm. But in listening to the muse who inspired him to sing Achilles' anger, he certainly did not intend to leave to his successors the model for an epic poem. Raphael and the great painters of his time, obliged to fill the whole length of a ceiling or a vast gallery, gave themselves over to the abundance of ideas, to the fecundity of their imagination, and, imparting to all their figures the divine inspiration by which

they themselves were animated, they left us monuments of their genius and of their glory. But they did not intend to give, through their works, the rules and theories of immense constructions in painting. Perhaps one should have admired in them only the difficulty overcome by the artist's genius. How contagious their example has been, and how high a price has been paid for their success! Their example has become so authoritative that the boldest and most determined genius would not dare to stray from it past a certain point, while the most mediocre man, by imitating them servilely, readily persuades himself that he is their equal and that he shares in their glory. Taste and criticism have completed the process of making the works of the greatest men dangerous for their successors by declaring what ought to please and by dictating the means by which to succeed in pleasing. Because of rules, genius, turned shy and timid, no longer dares to soar. It is imposed upon by authority and by examples. Men without talent, on the other hand, have become bold. They do not doubt that, to equal the achievement of a great architect, to construct edifices similar to those which excite admiration, they have only to study the scaffolding that was used to erect them. Bad copies have been made and, in spite of all the countless repetitions, the first models have remained unequalled. In that sense one can say that there has been but one epic poem, that of Homer. The most remarkable poetic genius, Virgil himself, did nothing but copy him, and the moderns have imitated him even more slavishly. Homer's construction has been used by all his successors. All epic poems resemble each other so strongly that they can only be considered reproductions of the *Iliad* and the *Odyssey*. This childish uniformity led to Dr. Swift's amusing idea of writing recipes for epic poems as one would write a medical prescription. It is certain that it would be unbecoming for an epic poem to appear without combats, without an account of some dangerous journey and frightful perils, without a descent into hell, without predictions and prophecies, etc. The most effective satire on all these puerilities is an epic poem on a comic subject. Why do *Le Lutrín* and *The Rape of the Lock* give us so much pleasure? Not because of their main subject, which is nothing, but because apart from the details that lend themselves to laughter, the poet seems to be ceaselessly mocking the construction and the scaffolding of the epic that the successors of Homer managed to render ridiculous. One does not make good jokes about something that does not lend itself to joking. Even if one wished to ridicule tragedy by parodies and by burlesque tragedies, one would never create anything but farces and insipid buffooneries, whereas the idea of comic epic poems has become a source of much amusement. The same applies to ceilings and galleries – they can be written out as recipes, and their construction is fully as puerile and even less well made than that of epic poems. Wise and enlightened criticism would have examined these works in quite a different way from that of our professional Aristarchuses. Instead of confusing the author's merit with that of his genre, of crediting the one with what belongs only to the other, it would have carefully distinguished what the *Iliad* owes to Homer's genius from what it owes to the merit of the epic in general, it would have distinguished what a gallery becomes under the brush of Raphael or Annibale Carracci from the beauty of the genre. Moreover, it is a well-known fact that a man of genius remains himself under any circumstances, that he remains great even when he errs or is put in shackles. But a genre does not become good in itself for having been treated by a great man, and in

order to appreciate it with a certain accuracy one must see what is made of it by a mediocrity. Had this method been followed in examining the genre of galleries and of ceilings in painting, perhaps enough drawbacks would have been found to have led to its abandonment.

Apart from the general reflections that we have just made, I shall conclude these remarks with two or three specific observations concerning the drawbacks of this genre. As regards galleries, the painter is almost always obliged to take a subject from history or fable and to treat it in a certain series of paintings. Now, few subjects have more than one pictorial moment; they rarely have two; almost never three or four. To get one excellent painting, the painter runs the risk of making several bad ones. Often the whole subject is poorly chosen, as in the Rubens gallery at the Luxembourg. It is the insipid story of Marie de Medici to which this great man was obliged to devote the poetry and the magic of his color. Another drawback of these grand constructions is that it was necessary to have recourse to allegory, so cold in poetry, so obscure and so unbearable in painting. Fools willingly call allegory the poetry of painters; for my part, I think that nothing so testifies to an artist's lack of genius as resorting to allegory. They have sought another resource in the supernatural, which is no less absurd. The supernatural must always be imperceptible; to bring it into view is to make it ridiculous. Thus the Assumption of the Virgin is a very bad subject, because it would be impossible to treat it without including many of those imaginary subjects that painters should never represent.

11 Etienne Falconet (1716–1791) 'Reflexions on Sculpture'

After a long apprenticeship with Jean-Baptiste Lemoyne, Falconet was received into the Académie Royale in 1754 and was made a professor seven years later. Like other approved sculptors of the time, he received occasional commissions to decorate royal buildings and gardens. The patronage of Mme de Pompadour led to his appointment in 1757 as director of the sculpture studios at the Sèvres porcelain factory, and much of his output for the next ten years took the form of models for statuettes and groups, either from his own designs or from drawings by Boucher. Between 1766 and 1778 he was in Russia, where the Empress Catherine had awarded him the most important of his commissions, for a giant equestrian statue of Peter the Great to be installed in St Petersburg. For much of this period he maintained a correspondence with Diderot, defending his belief in the immediacy and autonomy of the artist's practice against the writer's view that even a vanished work could be accorded status in posterity if it survived in the form of a literary account. Diderot left a memorable pen-portrait of his friend in the *Salon of 1765*, and was no doubt indebted to him for many of the views contained in his own essay on sculpture (see III C13). Falconet's extensive writings were published in his *Oeuvres complètes* in 1781. The 'Réflexions sur la sculpture' was composed at the request of Diderot for inclusion in the *Encyclopédie*. It was printed in 1761, and thirty years later was still regarded as sufficiently authoritative to be reprinted in Watelet's *Dictionnaire des arts*. Prior to publishing his text Falconet delivered it as a lecture at the French Academy on 7 June 1760. He must have taken a copy of his lecture with him to Russia, for it was in this original form that the 'Réflexions' was translated into English by William Tooke, Chaplain to the Factory at St Petersburg. This version was printed under the title *Pieces written by*

Mons. Falconet and Mons. Diderot on Sculpture in General, and particularly on The Celebrated Statue of Peter the Great now finishing by the former at St. Petersburg, London: printed by Bowyer and Nichols, 1777. Our text is taken from pp. 9–26 of this edition.

Gentlemen,

No one is more attentive to the admonitions of the Academy than I am. Artists have often been encouraged to communicate here the reflexions they might make on our arts. It has also been sometimes said, that an artist should not speak but with the pencil or chissel in his hand, leaving to enlightened admirers the task of discoursing on our talents.

Now, though I am very much of the latter opinion, I have one motive which determines me not to conform to it at present. I have been asked for some reflexions on Sculpture; which I think it my duty not to give to the world till they have been submitted to your judgment.

I am indebted for them partly to the lessons of my master M. Le Moyne; and if, among the rest, I should present some that stand in need of correction, to what tribunal more just and more enlightened can I submit them? It is to him that I should principally look for the correction of my mistakes.

Sculpture, next to History, is the most durable depositum of the virtues and weaknesses of men. If in the statue of Venus we have the object of a ridiculous and dissolute worship, that of Marcus Aurelius affords a famous monument of the homage paid to the benefactor of the human race.

This art, in discovering to us the deification of vices, more forcibly represents the horrible catastrophes of history; while, on the other side, the precious memorials of those uncommon mortals, who ought to have lived as long as their statues, keep alive in our hearts the sentiment of a noble emulation, animating the soul to the cultivation of those virtues which have embalmed their names. On seeing the statue of Alexander, Cæsar falls into a profound reverie; and, with eyes bathed in tears, exclaims: *How great was thy happiness! at my age thou hadst already subjugated a part of the earth; and I have yet done nothing for my glory.* – What a glory was his! – he destroyed his country.

The most noble end of Sculpture, in viewing it on the sentimental side, is that of perpetuating the memory of illustrious men, and of giving models of virtue, so much the more efficacious, as the owners of it are no longer the objects of envy. We possess the portrait of Socrates, and we reverence it. Who will answer for it that we should have the courage to love him, if he lived amongst us?

Sculpture has another object, seemingly less useful than the foregoing; I mean when it is employed on subjects of ornament or grace: it is here however no less capable of inciting the soul to good or evil propensities. Sometimes the sensations it raises are indifferent. The Sculptor, as well as the Writer, is praiseworthy or reprehensible, only as the subjects he treats of are becoming or licentious.

When the surface of the human body is the object of imitation, the powers of Sculpture are not to be confined to a cold resemblance, such as man might have been before the breath of God was blown into his nostrils. This sort of representation, although well expressed by its very exactitude, could only excite a commendation as

cold as the resemblance, and the soul of the spectator would be totally unmoved. It is living, animated, impassioned Nature, that the Sculptor is to express, in marble, in bronze, or in stone.

Whatever the Sculptor takes for the object of his imitation, ought to be the continual subject of his study. This study, enlightened by genius, conducted by taste and reason, executed with precision, encouraged by the munificent attention of sovereigns, and by the advice and eulogies of excellent artists, will not fail to produce master-pieces equal to those precious monuments which have triumphed over the barbarism of ages. In like manner such Sculptors as, not confining themselves to the payment of their share in that tribute of applause, so justly due to these sublime performances, make them the object of their profoundest study, and the rule of their labours, must arrive at that superiority which we admire in the Grecian statues. If I might be allowed to quote, as a proof of this, examples from the works of living artists, I could find them at Paris, in the gardens of Choisi [a statue of Cupid by Bouchardon], and those of Sans-souci [a Mercury and a Venus by M. Pigalle].

The mind of the Sculptor is not to dwell only on the famous statues of antiquity, but on all the productions of genius whatever they may be. — The reading of Homer, that sublime painter, will exalt the soul of the artist, and impress the ideas of grandeur and majesty so forcibly upon it, that the generality of objects which surround him will appear to him but as atoms.

Whatever the imagination of the Sculptor can create of the most majestic, of the most sublime, of the most uncommon, ought to be only the expression of the possible appearances of Nature, of her effects, of her sports, of her accidents. I mean, that the Beautiful, even the ideal Beautiful, in Sculpture, as in Painting, should be nothing else than the result of the real Beautiful of Nature. An essential Beautiful undoubtedly exists, but dispersed through the different parts of the universe. To feel, to collect, to assort, to chuse, even to imagine different parts of this Beautiful, whether in the character of a figure, as the Apollo, or in the ordonnance of a composition, like the boldnesses of Lanfranc, Correggio, and Rubens, this is to display by art, that ideal Beautiful which has its source in Nature.

Above all things, Sculpture is the enemy of those forced attitudes which Nature disavows, and which some artists have employed without necessity, and only to shew that they could sport with Design. It is the professed enemy also of those draperies whose only elegance consists in the superfluous ornaments of a confused arrangement of folds. Lastly, it abhors over-refined contrasts in composition, and an affected distribution of lights and shades. In vain will it be pretended that it is the machine: at the bottom it will be found to be only confusion, and an unfailing cause of embarrassment to the spectator, and of the little effect the performance will produce upon his soul. The more the efforts that are made to move us are discoverable, the less are we moved by them. Whence we are to conclude, that the fewer means an artist employs to produce an effect, the greater is his merit in producing it, and the spectator delivers himself up the more implicitly to the impression which it was intended to make upon him. It is by the simplicity of these means, that the master-pieces of Greece were so perfectionated as to become the models for artists to the end of time.

Sculpture has fewer objects than Painting has; but those which come within her province, and which are common to the two arts, are the most difficult to be

represented: these are, expression, the science of contours, the difficult art of disposing of draperies, and of distinguishing the different kinds of stuffs of which they are composed.

Sculpture has, moreover, difficulties which are peculiar to it. In the first place, a Statuary is not eased of any part of his work by the advantage of shades, of backgrounds, of roundings, and of fore-shortnings. Secondly, if he have well composed, and well expressed one view of his work, he has only performed a part of his business; since that work has as many points of view as there are points of space which surround it. Thirdly, a Statuary ought to possess an imagination, I do not say as abundant, but as strong as that of the Painter. Besides this, he must have a constancy of genius to put him above that disgust which the mechanism, the fatigue, and the slowness of his operations must necessarily occasion. Genius is not to be acquired; it unfolds, extends, and strengthens itself by exercise. A Statuary has not such frequent opportunities for the display of his genius as the Painter has, which is an additional difficulty, since genius must be shewn in a statue, as well as in a picture. Fourthly, the Sculptor, being deprived of the seducing charms of colours, what knowledge ought he not to have in the means of attracting attention? – To fix it, what precision, what truth, what choice of expression must he not put into his work?

We require then of the Sculptor not only the interest which results from the work entire, but also from every part of this whole; his work being generally composed of but one figure, in which it is not possible for him to unite the different causes productive of interest in a picture. Painting, independently of the variety of colours, interests by the different groups, the attributes, the ornaments, and the expressions, of the several personages which compose the subject. It interests by the ground, by the place of the scene, by the general effect: in a word, by the whole assemblage. But the Sculptor has often only one word to say: there is the more need that that word should be sublime. It is by that that he must touch the springs of the soul, in proportion to its own sensibility and to the skill which he has discovered.

Not but that many able Statuaries have borrowed that assistance which Painting draws from colours: Rome and Paris furnish examples of it. Doubtless, materials of different colours, employed with judgement, ought to produce piquet effects; but, when distributed without harmony, that assemblage renders Sculpture disagreeable, and even disgusting. The glare of gilding, the clashing of the discordant colours of different marbles, will doubtless dazzle the eye of the vulgar, always captivated by glitter; but the man of taste will turn from it in disgust. Gilding, bronze, and different-coloured marbles, ought only to be employed by way of decoration, never in order to rob Sculpture of its true character for the sake of substituting one that is false; or, at best, but equivocal. Thus, Sculpture will lose none of its advantages by being confined within the bounds prescribed by Nature; which it would certainly do, if all the advantages of Painting were employed. Either of these arts has her peculiar means of imitation: colour is by no means of that number which belongs to Sculpture.

Nevertheless, though colouring, which belongs properly to Painting, be of great advantage to her; yet how many difficulties has she to struggle with, which are entirely unknown to Sculpture! The facility with which the illusion is to be produced by colours, is itself a very formidable difficulty. The rare appearance of that talent is

but too convincing a proof of it. By how much more numerous the objects are which Painting has to represent, by so much must her particular studies be more numerous. A just imitation of different skies, of waters, of prospects, the different instants of the day, the various effects of light, and that law by which a picture is to be inlightened by only one sun, require a knowledge and an industry from which the Sculptor is intirely dispensed. Although there be studies and labours which belong exclusively to each of the two arts, it would betray a consummate ignorance to deny their relation. It would be an error to give preference to one of them at the expence of the other, because of their peculiar difficulties.

Painting is still agreeable, even when deprived of that enthusiasm and genius which characterise her; but, without the support of these two bases, the productions of Sculpture are lifeless and insipid. When equally inspired by genius, nothing disturbs their intimate union, notwithstanding there be some differences in their progress. If these sisters have not a resemblance in every thing, a family likeness is always to be perceived. [...]

The artist whose means are simple, is free and open; he gives up himself to be judged the more easily, since he uses no sleights and evasions for escaping examination, which are only assumed as a mask to ignorance. Let us then never call those *beauties* in any work whatever, which serve only to dazzle the eyes, and tend to the corruption of taste. That taste so justly boasted of among the productions of the human mind, is only the effect of good sense operating upon our ideas: when too lively, it puts a bridle on them, and restrains their career; when too languid, it animates and inspires them. It is to this happy temperament, that Sculpture, as well as all the arts invented to please, owes its true beauties; the only ones that are lasting.

As Sculpture demands the most austere exactitude, a negligent design is less supportable in that than in Painting. I do not mean, that Rafaël and Dominichino were not very correct as well as very able designers, and that all capital Painters do not look upon this as an essential part of their art; but, strictly speaking, there may be pictures, where it does not reign, which yet are interesting by other beauties. A proof of it is in several women painted by Rubens, which, in spite of the Flemish incorrect character, will always inchant by the charm of the colouring. Execute them in Sculpture on the same character of design, the charm will be considerably diminished, if not intirely destroyed. The attempt would be worse, if made on certain figures of Rembrandt.

Why is it still less allowable to the Sculptor than to the Painter, to neglect any of the parts of his art? Perhaps it may be owing to three particulars: To the time that an artist must give to his work; for we cannot endure that a man should employ a number of years, only to produce an indifferent performance: To the value of the matter employed; – what comparison is there between a piece of canvas and a block of marble? Lastly, To the duration of the piece: every thing that is about the marble will fall to decay and ruin; but the marble remains. Break it into pieces, the very fragments shall deliver down to posterity its excellences and defects.

Having thus pointed out the object and the general system of Sculpture; we must now consider it as subject to particular laws, which the artist ought to understand, lest he should infringe their jurisdiction, or extend it beyond the limits of its power.

It would be to widen too much the extent of these laws, to say that Sculpture cannot give herself up to a daring flight in her compositions, by the constraint with which she is held down to the dimensions of a block of marble. We need only to behold the Gladiator and the Atalanta; these Grecian figures prove sufficiently, that marble will readily obey, when Sculpture knows how to command.

This liberty, however, which the Sculptor has over the marble, should not extend so far as to comprehend the exterior forms of his figures, by details exceeding and contrary to the action and motion represented. The work, by detaching itself, as it were, on a back-ground of air, of a tree, or of architecture, plainly declares itself to be what it is intended to represent, from the greatest distance at which it can be distinguished. The lights and shades, copiously distributed, concur also in determining the principal forms and the general effect. From whatever distance you perceive the Gladiator and the Apollo, their action is never doubtful.

Amongst the difficulties of Sculpture, there is one very generally known, and which requires the utmost attention of the artist; and this is the impossibility of going over again and rectifying any bad touches he may have made, or of making any essential alteration in the composition, or in any one of its parts: a very good reason for obliging him to make his model, and to fix it in such a manner as to enable him to proceed with the greatest accuracy in his labour on the marble. For which reason, the generality of Sculptors make their models, or at least sketch them out, on the spot where the statue is to be placed. By this method they are invariably sure of their lights and shades, and of the proper effect of the composition; which otherwise might have a very good effect in the light of the work-shop, but a very bad one where it is to be fixed.

But this difficulty reaches farther yet. The model being at length perfectly well finished, let us suppose the Sculptor to have but one moment of drowsiness or absence of mind. If he go on with his work in that instant, he is sure to maim some important part of his figure, while he thinks he is following his model, or perhaps even rendering it more perfect. The next day, with his head in better order, he finds out the mischief, without being able to remedy it.

Happy advantage for the Painter! – Not subject to this rigorous law, he changes, corrects, and does it over again to his mind; at the very worst, he reprimés it, or he takes another. Can the Sculptor dispose thus of his marble? If it be necessary that he begin his work again, the loss of time, the fatigue, and the expence which he must suffer, are not to be compared with those of the other.

Moreover, if the Painter have traced his lines properly, placed his lights and shades as they ought to be; a different aspect, or a different light, will not entirely rob him of the fruit of his ingenuity and his pains. But, in a work of Sculpture, intended to produce a harmony of light and shade, cause only the light to strike it on the right-side, which did come from the left; or from below, that which came from above; you will find it deprived of every effect, or productive of only disagreeable ones, unless the artist have taken care to dispose them for different lights. It often happens also, that the Sculptor, in endeavouring to make every point of view agree, risks the omission of positive beauties, and at length effects but an indifferent harmony. Happy, if his repeated cares and attention do not cause him to grow cold over his work, and arrive at perfection in that particular!

To set this reflexion in a clearer light, I will relate one made by the Count de Caylus. 'Painting,' says he, 'has, out of three lights, the choice of that which will best inlighten the surface. Sculpture is dispensed from this choice; she has them all; and this abundance only occasions her an infinity of trouble and study, being obliged to consider and reflect upon all the parts of her figure, and then to make them conformable; it is she, in some sort, that inlightens herself; it is her composition which gives and which distributes her lights. In this respect the Sculptor is more a creator than the Painter; but this vanity is only satisfied at the expence of numberless reflexions and fatigues.' [From the *Mercure de France*, for April, 1759]

When a Sculptor has once overcome these difficulties, artists and true connoisseurs are, without doubt, much obliged to him. But, how many people are there, that are very agreeably affected by our arts, who, not knowing their difficulties, are not judges of the glory of having surmounted them?

The *Naked* is the proper study of the Sculptor. The principles of this study consist in the knowledge of the bones, the exterior anatomy, and an assiduous imitation of all the parts, with every possible movement of the human body. The schools of Paris and Rome require this practice, and provide their pupils with the means of acquiring it. But, as Nature herself may have her defects, the young student, by often seeing and repeatedly copying them, will be apt to transfer them to his works; he must therefore be placed under the conduct of some sure guide, to give him the knowledge of just proportions and of fine forms.

The Grecian statues are the most certain guide; they are, and will ever be, the rule of precision, of grace and elegance, as being the most perfect representations of the human body. To a man satisfied with a superficial examination of them, these statues will not appear to be very extraordinary things, nor even difficult to imitate: but the intelligent and attentive artist will discover in some of them the most profound knowledge of design, joined to all the energy of Nature. Thus those Sculptors who have most studied, with choice, the antique figures, have ever been the most distinguished in their profession. I say, *with choice*; and I believe the remark to be well founded.

However fine the statues of antiquity may be, they are still but human productions, and consequently susceptible of the imperfections of humanity: it would therefore be dangerous for an artist to bestow his admiration indifferently on every thing that bears the name of *antique*. It might happen, that, having admired the pretended wonders of certain antiques, and which they do not possess, he would make efforts to render them his own, and would fail of being admired. It is a discernment, inlightened, judicious, and unprejudiced, that must discover to him the beauties and the defects of the ancients; and, having once learned how to appreciate them, he will tread in their steps with so much the more confidence, as being convinced that they will conduct him to whatever is great and sublime. It is in this judicious discernment that a delicacy of taste appears; and the talents of the Sculptor are always in proportion to this delicacy. A very moderate knowledge of the state of our arts among the Greeks is sufficient to convince us that they too had their moments of drowsiness and languor. The same taste reigned, but an equal knowledge was not imparted alike to every artist: the pupil of an excellent Sculptor may possess the manner of his master, without having the same head. An example shall

decide whether or not this be a rash observation. We will take it from the works of Puget.

In what piece of Grecian Sculpture do we perceive the implications of the skin, the softness of the carnations, or the fluidity of the blood, so well expressed as in the works of this celebrated modern Sculptor? – It is impossible not to perceive the blood circulate in the veins of the Milo at Versailles. What man of sentiment would not be apt to be mistaken on seeing the carnations of the Andromeda? while one may produce many fine antiques in which these expressions are not to be found. It would then be a sort of ingratitude, if, while acknowledging the sublimity of the Grecian Sculptors on so many other accounts, we were to refuse our homage to a merit which is regularly superior to them in the works of a French artist.

A scandalous passion for exposing the defects of celebrated pieces is not the source of this observation. The artist, who should not know how far superior the beauties are to the negligences and defects of these invaluable monuments of antiquity, must be the child of ignorance or frenzy, or checked by that exactitude which mediocrity establishes without the participation of genius.

We have seen that it is the imitation of natural objects, in subjection to the rules of the ancients, which constitutes the true beauties of Sculpture. But the most earnest contemplation of the antique figures, the most perfect knowledge of the muscles, the greatest precision of character, even the art of expressing the concurrent action of the skin; in short, all the springs of the human body; this knowledge, I say, is only for the eyes of artists, and a very small number of connoisseurs. But, as Sculpture is not exercised for the sake of those who practise the art, or such as have acquired intelligence in it; the Sculptor, that he may catch the applause of others, must join to these necessary studies still one more talent superior to them all. This talent, so essential and so uncommon, and which nevertheless appears to be within the comprehension of every artist, is Sentiment. It must be inseparable from all his productions. It is that which gives life to them: if other studies be the basis of Statuary, it is Sentiment alone which is the soul of it. Acquired knowledge is the property of some particular people; Sentiment belongs to all mankind: and, in respect of Sentiment, all mankind are the judges of our labours.

To express the forms of bodies, and to give no Sentiment to the expression, is doing work by halves. To endeavour at distributing it throughout with regard to precision, is only making sketches or producing dreams, the impression of which is erased the moment you cease to behold them; and, if for any length of time, even while you behold them. – The union of these two properties (but how hard to bring them in conjunction!) is the sublime in Sculpture.

12 Denis Diderot (1713–1784) from the ‘Salon of 1763’

At the invitation of Melchior Grimm (see IIC10), Diderot reviewed the biennial Salons for the *Correspondence littéraire* between 1759 and 1771. At the time of the 1773 Salon he was en route to St Petersburg with Grimm. He contributed a brief review for the year 1775 and a final one at Grimm’s behest in 1781 (see IVA11). Taken together, Diderot’s ‘Salons’ constitute a remarkable contribution to the modern development of art criticism. They are

distinguished by the variety of his approaches, by the vividness of his descriptions, and by the forthrightness of his judgements. The high point of his development as a reviewer of contemporary art is reached with the Salons of 1763, 1765 and 1767, each of which is longer than the last. It should be borne in mind that these were far from being public productions. By the end of the 1750s, the printing of independent Salon reviews was being officially discouraged. The *Correspondence littéraire* circulated in manuscript, its sale was prohibited in Paris, and while its readership may have been highly select, its subscription list barely reached double figures. On the other hand, it was free from censorship. Diderot was thus able to express opinions that would have been prohibited in a printed text. His 'Salons' were not in fact issued in printed form until the appearance of Jacques-André Naigeon's *Oeuvres de Denis Diderot publiés sur les manuscrits de l'auteur*, in fifteen volumes, Paris, 1798. Our excerpts from the 'Salon of 1763' are taken from *Diderot oeuvres IV: Esthétique-Théâtre*, ed. Laurent Versini, Paris: Robert Laffont, 1996, pp. 246–7, 264–5 and 275–8. Boucher's art represented all that Diderot disapproved of in the rococo art of the *ancien régime*. The work of Chardin and of Greuze, on the other hand, prompted him to some of his most effective passages of advocacy. It is noticeable that he adapts the manner of his writing to the work under consideration. In the case of Chardin he concentrates upon the quality of colour and the substantial properties of the paint, while Greuze's work stimulates him to acts of imaginative engagement with its represented subject. The excerpts have been translated for this edition by Kate Tunstall. (See also IIC7, 13, 14 and IVA11.)

Boucher

Pastoral Scene

Imagine in the background a vase on a pedestal crowned with a bunch of heavily drooping branches; beneath it, a shepherd asleep in the lap of his shepherdess. Arrange around them a shepherd's crook, a little hat full of roses, a dog, some sheep, a bit of countryside and countless other objects piled on top of each other. Paint the lot in the brightest colours, and there you have Boucher's *Pastoral Scene*.

What a misuse of talent! How much time gone to waste! You could have had twice the effect for half the effort. With so many details all equally carefully painted, the eye doesn't know where to look. No air. No rest. And yet the shepherdess does have the right face for her station. And this bit of countryside surrounding the vase does have a delicacy, a freshness, a surprising charm. But what does this vase and its pedestal mean? What's the meaning of those heavy branches on top of it? When one writes, does one have to write everything? And when one paints, does one have to paint everything? For pity's sake, leave something to my imagination. But if you say that to a man who has been corrupted by praise and who is convinced of his own talent, he'll just nod his head in disdain; you'll say your piece and we'll move on. *Jussum se suaque solum amare* [Condemned to love nothing but himself and his own works]. It's a shame nonetheless.

When he first came back from Italy, this man did some very beautiful pieces. His sense of colour was strong and true. His compositional skill was sound but full of warmth, his style was generous and great. I know some of his early pieces which today he refers to as daubs and would happily buy back to burn.

He has old portfolios full of admirable pieces which he scorns and new ones stuffed full of sheep and shepherds *à la* Fontenelle which he is ecstatic about.

This man is the ruination of all young apprentice painters. Barely able to handle a brush and hold a palette, they torture themselves stringing together infantile garlands, painting chubby crimson bottoms, and hurl themselves headlong into all kinds of follies which cannot be redeemed by originality, fire, tenderness nor by any magic in their models. For they lack all of these.

Chardin

Here's the real painter, here's the real colourist.

There are many small pictures by Chardin at the Salon, almost all of them depicting fruit with the accoutrements for a meal. This is nature itself. The objects stand out from the canvas and they are so real that my eyes are fooled by them.

The one you can see as you go up the stairs [*The Jar of Olives*, Louvre, Paris] is particularly worthy of note. The artist has placed on a table a vase of old porcelain china, two biscuits, a jar full of olives, a basket of fruit, two glasses half full of wine, a bitter orange and a pie.

In order to look at other people's pictures, I feel as though I need different eyes; but to look at Chardin's, I need only keep the ones nature gave me and use them properly.

If I had painting in mind as a career for my child, I'd buy this one. 'Copy that for me,' I'd say, 'copy it for me again.' Yet nature itself may be no more difficult to copy.

That porcelain vase really is made of porcelain; those olives really are seen through the water they are floating in; you could simply take those biscuits and eat them; break open that bitter orange and squeeze it; pick up that glass of wine and drink it; peel that fruit; and cut a piece of that pie.

This is the man who really understands the harmony of colour and reflections. O Chardin, it's not white, red or black pigment that you grind on your palette but rather the very substance of objects; it's real air and light that you take onto the tip of your brush and transfer onto the canvas.

Once my child had copied that piece and then copied it again, I'd set her to work on *The Dead Skate* [*The Rayfish*, Paris, Louvre] by the same master. The object is revolting; but this is the real meat of the fish. Its skin, its blood; the sight of the real thing would affect you in just the same way. Mr Pierre, take a good look at this picture when you go to the Academy and if you can, learn the secret of using artistic talent to redeem the revolting aspect of certain subjects.

It's magic, one can't understand how it's done: thick layers of colour, applied one on top of the other, each one filtering through from underneath to create the effect. At times, it looks as though the canvas has misted over from someone breathing on it; at others, as though a thin film of water has landed on it. Rubens, Berghem, Greuze and Louthembourg could explain this technique better than I; they would all describe the effect as you see it. Close up, everything blurs, goes flat and disappears. From a distance, everything comes back to life and reappears.

They say that when Greuze came to the Salon and saw the Chardin I've just described, he looked at it and gave a deep sigh. This brief praise is more valuable than mine.

Who will reward Chardin's paintings when this rare man is gone? You should also know that the artist is a man of sound judgement and can talk wonderfully about his art.

Ah! my friend, spit on Apelles' curtain and Zeuxis' grapes. An impatient artist is easily fooled and animals are bad judges of painting. Haven't we seen the birds in the King's Garden go crashing into the most unconvincing of *trompe-l'œils*? But it's you and me that Chardin will fool, any time he likes.

Greuze

That Greuze really is my kind of man. Putting to one side for a moment his small compositions which will give me some nice things to say to him, I'm going straight to his painting of *Filial Piety*, a better title for which would be *On the Rewards of a Good Education*.

To begin with, I like the genre. It's moral painting. What? Hasn't the painter's brush been given over to sin and vice often enough and for far too long? Shouldn't we be pleased to see it at last competing with dramatic verse to move us, teach us, improve us and invite us to be virtuous? Keep it up, Greuze, my friend! Put moral lessons in your paintings, and keep on doing it like this. When your time comes to leave this world, there won't be a single composition you won't be pleased to look back on. If only you had heard that young girl exclaim in a lively, charming way as she was looking at the face of your *Paralytic*: 'Ah, my God, how moved I am by him; if I look at him any longer though, I think I'll cry.' And if only that young girl were mine. I would have known her to be mine by that outburst. When I saw that pathetic, eloquent, old man, I too felt my soul moved to pity and I was ready to shed tears.

Filial Piety

This painting is 4 feet 6 inches wide and 3 feet high

The main figure, occupying centre stage, and who captures our attention, is a paralysed old man, stretched out in his armchair, his head on a pillow and his feet on a stool. He is fully dressed. His feeble legs are wrapped in a blanket. He is surrounded by his children and grandchildren, most of them anxious to attend to him. His lovely face has such a touching character; he seems so moved by the help he is being given; he has such difficulty speaking, his voice is so weak, his eyes so tender, his complexion so pale, that you would have to be devoid of all feeling not to be moved by him.

To his right, one of his daughters is raising his head on his pillow.

In front of him, on the same side, his son-in-law has come to give him some food. The son-in-law is listening to what his father-in-law says, and looks very moved.

To the left, on the other side of him, a young boy is bringing him something to drink. You should see the distress in his whole body. His grief is not only to be seen in his face, it's in his legs, in every inch of his body.

A small boy's head is visible from behind the old man's armchair. He is coming closer to him; he would also very much like to listen to his grandpa, to see him and help him; the children are dutiful. You can see his little fingers on the top of the armchair.

Another older boy is at his feet, arranging the blanket.

In front of him, a very young boy has slipped in between the son-in-law and his father-in-law and is presenting him with a goldfinch. Look at the way he is holding the bird! Look at the way he is offering it to him! He thinks it'll cure his grandpa.

Further away, to the right of the old man, is his married daughter. She is listening with joy to what her father is saying to her husband. She is sitting on a stool; she is leaning her head on her hand. She has the Holy Scripture on her lap. She has stopped reading it to the old man.

Next to the daughter is her mother and the paralytic's wife. She too is seated, on a wicker chair. She is darning a shirt. I am sure she is hard of hearing. She has stopped her work, and is leaning forward to listen.

On the same side, at the far edge of the painting, a servant has abandoned her work and is also listening.

Everything relates back to the main figure, both what everyone is doing now in the present moment and what everyone was doing in the previous moment.

Even the background reveals the way the old man is being cared for. There is a large sheet hanging to dry on a rope. This sheet is well thought out both in relation to the subject of the painting and for the artistic effect it produces. You would be right in thinking that the painter has not omitted to give it ample space.

Every figure in the picture shows precisely the right degree of interest for their age and character. The number of figures assembled in quite a small space is very large; but there is no confusion, for this master excels above all else at creating order in his scene. The skin colours are true. The fabrics are very carefully done. There is no awkwardness in any of the movements. Everyone is involved in what they are doing. The youngest children are happy because they are not yet old enough to have feelings. Compassion is clearest on the faces of the older figures. The son-in-law seems to be the most deeply moved because the sick man is speaking and looking at him. The married daughter seems to be listening with pleasure rather than with pain. Sympathy is, if not absent, then invisible in the old mother; and all this is true to life. *Iam proximus ardet Ucalegon*.¹ Very soon now, her only consolation will be that same tenderness being displayed by her children. And anyway, age hardens the heart and toughens the soul.

Some say the paralytic is leaning too far back and that it is impossible for him to eat in such a position. He is not eating, he is speaking and someone is ready to lift his head for him.

Some say it should be his daughter giving him the food and his son-in-law lifting his head and pillow, since the first task requires skill and the second strength. This observation is not as well-founded as it first appears. The painter wanted his paralytic to receive particular help from the person he had the least right to expect it from.

This justifies the choice he has made for his daughter; this is the real source of the emotion shown in his face, his eyes and in the words he is saying to him. To place this figure somewhere else would have been to change the subject of the picture. To put the daughter in the place of the son-in-law would have been to undermine the whole composition; it would have meant four women's heads next to each other and the series of all those heads would have been unbearable.

They also say that the degree of consideration shown by the figures is unnatural; that some should indeed be involved with the old man, but that the rest should be getting on with their own tasks; that the scene would thereby have been simpler and truer, and that that is how it was, they are sure of it. – Those people *faciant ut nimis intelligendo nihil intelligent*.² The moment they are asking for is a general moment, without interest; the one the painter has chosen is particular. By chance it happened that day that it was the son-in-law who was bringing him his food, and the old man was moved and showed his gratitude in such a lively and profound manner that it made the rest of the family abandon their activities and fix their attention on him.

They also say that the old man is dying, that his face is that of a man breathing his last – Doctor Gatti says that those critics have never seen a sick man and that this one has a good three years left in him.

They say that the daughter who is looking up from her book lacks expression or that she has the wrong expression – I agree in part.

They say that the arms of this otherwise charming figure are stiff, scrawny, badly painted and lacking in detail. – Well, that's certainly true.

That the pillow is brand new and that it would be more natural if it had been used before. – Perhaps.

That this artist is devoid of creativity; and that all the heads in the scene are the same as those in his painting of *The Betrothal* and that the heads in *The Betrothal* are the same ones as the ones in his *Peasant Reading to his Children*. – Fine, but supposing the painter wanted it this way? Supposing he has traced the history of the same family?

That . . . damn those critics and me with them! This painting is beautiful, very beautiful, and woe betide anyone who is able to look at it for a single moment and remain unmoved! The old man's character is unique; the child who is bringing him a drink is also unique. The old lady, unique. Wherever you look, you are enchanted. The background, the blankets, the clothes are all perfectly finished; and furthermore, this man draws like a god. His use of colour is beautiful and strong, though it is not quite up to Chardin's. I'll say it again, this painting is beautiful, or I don't know what is. Moreover, it pulls in crowds of spectators; you can't get close to it. You are transported by it, and when you see it again, you realize you were right to be transported by it.

It would be very surprising if this artist did not excel. He has intelligence and sensibility. He is enthusiastic about his art; he is forever producing studies. He spares no expense and goes out of his way to get the models he needs. If he sees a striking face, he would happily go down on his knees in front of its wearer to persuade it to come into his studio. He is always observing people, in streets, in churches, in markets, in theatres, in promenades, in public assemblies. If he is thinking about a subject, he is obsessed by it, it follows him everywhere. It infiltrates his

own personality. He adopts that of his painting: he is brusque, gentle, guileful, acerbic, flirtatious, sad, gay, cold, serious or insane, depending on the subject he is preparing.

Besides the genius of his art, which you cannot deny him, you can see that he is intelligent by his choice and arrangement of secondary figures. In the painting of the *Peasant Reading the Holy Scripture to his Children*, he had placed on the floor in one corner a small child, amusing himself by pulling faces at a dog. In his *The Betrothal*, he had introduced a mother hen with her brood. In the former, next to the boy bringing a drink to his sick father, he had placed a big dog, a bitch, suckling her puppies while standing still with her nose in the air; not to mention the sheet stretched out on a rope which forms the backdrop to this painting.

He used to be criticized for painting in rather grey tones, but he has stopped making this mistake. Whatever people say, Greuze is the painter for me.

¹ Virgil, *Aeneid*, II, v. 311–12: 'The house of Ucalegon is already ablaze nearby.' Said when misfortune is at hand, here with reference to the mother's death following on from the father's.

² Terence, *Andria*, Prologue, v. 17 (slightly misquoted): 'They see to it that by understanding too much, they understand nothing.'

13 Denis Diderot (1713–1784) from the 'Salon of 1765' and 'Notes on Painting'

Diderot's 'Salon of 1765' was a far more extensive affair than its predecessor, though on his own account it was written in little more than two weeks. Many of the individual works on view drew him to expansive passages of description and speculation. He wrote at length on several works by Greuze, and included a long and virtuoso excursus on 'Plato's Cave', couched in the form of a dialogue with Grimm, which was occasioned by Fragonard's painting of *Corésus and Callirhoé*. The 'Salon' also contains a short self-contained essay on Sculpture, written to preface Diderot's account of the sculptures on show in 1765, among which were a group of works by his friend Etienne Falconet (see IIC11). We reproduce the first part of this here, together with the opening and concluding sections from the extensive 'Notes on Painting'. Diderot added these to his 'Salon of 1765' 'to serve as an Appendix', and no doubt to give expression to general thoughts and conclusions provoked by his work as a reviewer. (The 'Notes on Painting' were to be translated by Goethe and published with a commentary in the journal *Propyläen* in 1799.) In the first of these sections, on drawing, Diderot attributes unnatural and mannered effects to academic practices and priorities, and makes a case for what would later be described as realism. (See also his discussion of 'Mannerism' in IIC14.) In the last section he inquires into the nature of aesthetic experience and aesthetic value, and into the relationship of both to taste and to genius. The 'Salon de 1765' and 'Essais sur la peinture, pour fair suite au Salon de 1765' were originally written for Grimm's *Correspondence littéraire* and were first printed in Nageon (op. cit. IIC12). The English versions are taken from *Diderot on Art – I: The Salon of 1765 and Notes on Painting*, translated by John Goodman, New Haven and London: Yale University Press, 1995, pp. 156–9, 191–6, 237–40. The notes are Goodman's. (See also IIC7, 11, 12 and IVA11.)

Sculpture

I'm fond of fanatics, not the ones who present you with an absurd article of faith and who, holding a knife to your throat, scream at you: 'Sign or die,' but rather those who, deeply committed to some specific, innocent taste, hold it to be beyond compare, defend it with all their might, who go into street and household, not with a lance but with their syllogistic decree in hand, calling on everyone they meet to either embrace their absurd view or to avow that the charms of their Dulcinea surpass those of every other earthly creature. People like this are droll; they amuse me, sometimes they astonish me. When they've happened upon some truth, they advocate it with an energy that shatters and demolishes all before it. Courting paradox, piling image on image, exploiting all the resources of eloquence, figurative expressions, daring comparisons, turns of phrase, rhythmic devices, appealing to sentiment, imagination, attacking soul and sensibility from every conceivable angle, the spectacle of their efforts is always beautiful. Such a one is Jean-Jacques Rousseau when he lashes out against the literature he's cultivated all his life, the philosophy he himself professes, the society of our corrupt cities in the midst of which he burns to reside and whose acknowledgement, approbation, tribute he craves. It's all very well for him to close the window of his country retreat that faces towards Paris, but it's still the only spot in the world for which he has eyes; in the depths of his forest he's elsewhere, he's in Paris. Such a one is Winckelmann when he compares the productions of ancient artists with those of modern artists. What doesn't he see in this stump of a man we call the *Torso*? The swelling muscles of his chest, they're nothing less than the undulations of the sea; his broad bent shoulders, they're a great concave vault that, far from being broken, is strengthened by the burdens it's made to carry; and as for his nerves, the ropes of ancient catapults that hurled large rocks over immense distances are mere spiderwebs in comparison. Inquire of this charming enthusiast by what means Glycon, Phidias, and the others managed to produce such beautiful, perfect works and he'll answer you: by the sentiment of liberty which elevates the soul and inspires great things; by rewards offered by the nation, and public respect; by the constant observation, study, and imitation of the beautiful in nature, respect for posterity, intoxication at the prospect of immortality, assiduous work, propitious social mores and climate, and genius . . . There's not a single point of this response one would dare contradict. But put a second question to him, ask him if it's better to study the antique or nature, without the knowledge and study of which, without a taste for which ancient artists, even with all the specific advantages they enjoyed, would have left us only mediocre works: The antique! he'll reply without skipping a beat; The antique! . . . and in one fell swoop a man whose intelligence, enthusiasm, and taste are without equal betrays all these gifts in the middle of the Toboso.¹ Anyone who scorns nature in favor of the antique risks never producing anything that's not trivial, weak, and paltry in its drawing, character, drapery, and expression. Anyone who's neglected nature in favor of the antique will risk being cold, lifeless, devoid of the hidden, secret truths which can only be perceived in nature itself. It seems to me one must study the antique to learn how to look at nature.

Modern artists have rebelled against study of the antique because amateurs have tried to force it on them; and modern men of letters have defended study of the antique because it's been attacked by the *philosophes*.

It seems to me, my friend, that sculptors are more attached to the antique than painters. Could this be because the ancients left behind some beautiful statues while their paintings are known to us only through the descriptions and accounts of writers? There's a considerable difference between the most beautiful line by Pliny and the *Gladiator* of Agasias.

It also seems to me that it's more difficult to judge sculpture than painting, and this opinion of mine, if it's valid, should make me more circumspect. Few people other than practitioners of the art can distinguish a very beautiful work of sculpture from an ordinary one. Certainly the *Dying Athlete* will touch you, move you, perhaps even make so violent an impression on you that you can neither look away nor stop looking at it; still, if you had to choose between this statue and the *Gladiator*, whose action, while beautiful and true certainly, is nonetheless incapable of touching your soul, you'd make Pigalle² and Falconet laugh if you preferred the former to the latter. A large single figure that's all white is so simple, it has so few of the particulars that would facilitate a comparison of the work of art with that of nature! Paintings remind me a hundred times over of what I see, of what I've seen; this is not true of sculpture. I'd take the chance of buying a picture on the basis of my own taste, my own judgment; if it were a statue, I'd ask an artist's advice.

So you think, you say to me, it's more difficult to sculpt than to paint? – I don't say that. Judging is one thing and making is another. There's the block of marble, the figure is within it, it must be extracted. There's the canvas, it's flat, it's on this surface that one must create. The image must spring forth, advance, take on relief so that I can move around it; if not I myself, then my eye; it must take on life. But if it's modelled, it must live through its modelling, without resorting to the life-bestowing resources of the palette. – But these same resources, is it easy to use them? The sculptor has everything when he has drawing, expression, and facility with the chisel; with these resources he can successfully essay a nude figure. Painting requires still more. As for the difficulties inherent in more complex subjects, it seems to me they increase more for the painter than for the sculptor. The art of composing groups is the same, the art of draping is the same; but lighting, overall composition, the sense of place, skies, trees, water, accessories, backgrounds, color, the full array of accidents? 'Sed non nostrum inter vos tantas componere lites.'³ Sculpture is made for both the blind and those who can see; painting addresses itself only to the eyes. On the other hand, the first certainly has fewer objects and fewer subjects than the second: one can paint whatever one wants; sculpture – severe, grave, chaste – must choose. Sometimes it makes play with an urn or a vase, even in the grandest, most moving compositions: one sees reliefs of frolicking children on bowls about to collect human blood; but this play maintains a certain dignity: it is serious, even when striking a light note. Undoubtedly it exaggerates; exaggeration might even suit it better than it does painting. The painter and the sculptor are both poets, but the latter never makes jokes. Sculpture can't bear the facetious, the burlesque, the droll, and can sustain the comic only rarely. But it delights in fauns and sylphs; without strain it can help satyrs put the aging Silenus back on his mount or bear up the

tottering steps of a disciple. It is voluptuous but never lewd. In a voluptuous mode it retains something that's refined, rarefied, exquisite, which alerts me to how protracted, laborious, difficult the work is, and that while it's possible to brush onto the canvas a frivolous idea that can be created in an instant and painted out in the same breath, such is not true of the chisel, which, instilling the artist's idea into material that's hard, resistant, and eternal, should be governed by choices that are original and unusual. The pencil is more licentious than the brush and the brush more licentious than the chisel. Sculpture requires an enthusiasm that's more obstinate and deep-seated, more of a kind of verve that seems strong and tranquil, more of this covered, hidden fire that burns within; its muse is violent, but secretive and silent.

If sculpture cannot tolerate ordinary ideas, it's even less tolerant of middling execution; a slight imperfection in drawing that's scarcely noticeable in a painting is unforgivable in a statue. Michelangelo knew this well; when he despaired of achieving flawless perfection he preferred to leave the marble rough-hewn. – But this is proof that because sculpture can do fewer things than painting, we're more demanding with regard to what we have a right to expect of it. – My thought exactly.

* * *

My Bizarre Thoughts About Drawing

Nature does nothing that is not correct. Every form, whether beautiful or ugly, has its cause, and of all extant beings there isn't a single one that's not just as it should be.

Look at this woman who's lost her eyes while still young. The progressive deepening of her sockets hasn't increased the extent of the surrounding pockets. They've sunk into the cavities hollowed out by the organs' absence; they've shrunk. Above, a portion of her brow has been pulled in; below, her cheeks have been slightly lifted. Her upper lip, responding to this movement, has risen somewhat. These alterations have affected all parts of her face, in proportion to their proximity or distance from the principal site of the accident. But do you think that the deformity has been restricted to this oval? Do you think her neck has been completely unaffected? And her shoulders and throat? Yes, to your eyes and mine. But summon nature, show her this neck, these shoulders, this throat, and nature will tell you; this is the neck, these the shoulders, and this the throat of a woman who's lost her eyes while still young.

Direct your glance towards this man whose back and chest are hunched over. As the cartilage in front of his neck grew longer, his vertebrae bent over. His head fell forward, his hands closed into fists, his elbows pushed backwards: all his bodily members conspired to locate a center of gravity consistent with this irregular arrangement. As a result, his face assumed an air of constraint and discomfort. Cover this figure and show nature no more than its feet, and nature will pronounce, without hesitation, these feet belong to a hunchback.

If causes and effects were readily apparent to us, we'd have only to represent beings just as they are. The more perfect an imitation, the more analogous to its causes, the more it would satisfy us.

Despite our ignorance of cause and effect, and the rules of convention entailed by this ignorance, I suspect that any artist who dared neglect these rules, opting instead

for rigorous imitation of nature, would often find justification for oversized feet, short legs, swollen knees, and heavy, cumbersome heads in that refined awareness deriving from continuous observation of phenomena that makes us sensitive to secret relationships, to the natural concatenations between such deformities.

A crooked nose in nature does not offend because everything is of a piece. One arrives at this deformity by way of little adjacent alterations that sustain and redeem it. Twist the nose of the *Antinous*, leaving the rest as it is, and this nose will be unfortunate. Why? Because the *Antinous*' nose wouldn't be twisted at all, but rather broken.

We say of a man passing by in the street that he's ill made. Yes, according to our poor rules; but according to nature? That's something else again. We say of a statue that it's beautifully proportioned. Yes, according to our poor rules; but according to nature?

Allow me to transfer the veil covering my hunchback to the *Medici Venus*, leaving only the tip of her foot exposed. If nature, summoned once again, set out to complete the figure on the basis of the tip of this foot, perhaps you'd be surprised to see it sketch in a hideous, deformed monster. But as for myself, I'd be surprised if the result were otherwise.

A human figure is a system that's too carefully composed for the consequences of a tiny adjustment, apparently of little effect, not to remove the most perfect artistic production a thousand leagues from the work of nature.

If I were initiated into art's mysteries, perhaps I'd know to what extent the artist should conform to accepted proportions, and I'd tell you; I do know, however, that they don't stand up against the despotism of nature, and that age and social condition dictate that they be sacrificed in a hundred different ways. I've never heard a figure dismissed as badly drawn when its exterior organization revealed its age and its capacity and custom of fulfilling its daily tasks. It is these tasks that determine both a figure's overall stature and the true proportions of its bodily members and their mutual consistency. It's from these that I see emerge the child, and the adult, and the old man; the savage, and the civilized man; the magistrate, and the soldier, and the porter. If ever a figure would be difficult to capture, it would be that of a twenty-five-year-old suddenly formed out of clay, and who'd never done anything; but this man is a chimera.

Childhood is almost a caricature, and I'd say the same of old age. The child is a shapeless, fluid mass striving to develop; the old man is also a shapeless mass, but dried out, turning inward, tending to reduce itself to nothing. It's only in the interval between these two ages, from the beginning of perfect adolescence to the end of maturity, that the artist submits to a purity and rigorous precision of line, and that the *poco piu* or *poco meno*, the precise placement of a stroke, can make for blemish or beauty.

You'll say to me that age and customary tasks alter the forms but don't abolish the inner organs. Very well . . . One must become familiar with them . . . I agree. This is why one should study the *écorché*.⁴

Study of the *écorché* doubtless has its advantages; but is it not to be feared that this *écorché* might remain in the imagination forever; that this might encourage the artist to become enamored of his knowledge and show it off; that his vision might be

corrupted, precluding attentive scrutiny of surfaces; that despite the presence of skin and fat, he might come to perceive nothing but muscles, their beginnings, attachments, and insertions; that he might over-emphasize them, that he might become hard and dry, and that I might encounter this accursed *écorché* even in his figures of women? Since only the exterior is exposed to view, I'd prefer to be trained to see it fully, and spared treacherous knowledge I'd only have to forget.

It is said the *écorché* is studied only to learn to observe nature, but experience suggests that after such study it's very difficult to see her in any other terms.

No one but yourself, my friend, will read these pages, so I can write exactly what I please. These seven years drawing after the model at the Academy, do you consider them well spent, and would you like to know what I think about them? It's here, during these seven cruel and difficult years, that one's draftsmanship becomes mannered. All these studied, artificial, carefully arranged academic poses, all these movements coldly and ineptly imitated by some poor devil, and always the same poor devil, who's paid to appear, undress, and let himself be manipulated by a professor three times a week, what do they have in common with postures and movements in nature? What does the man drawing water in the well in your courtyard have in common with another who, not pulling the same burden, awkwardly mimics this action, his two arms raised, on the school's posing platform? What does a person pretending to die have in common with another expiring in his bed or beaten to death in the street? What does an artificial wrestler have in common with the one on my street corner? This man who begs, prays, sleeps, reflects, and faints upon request, what does he have in common with a peasant stretched out on the ground from fatigue, with a philosopher meditating at his fireside, with a suffocating man who faints in the crowd? Nothing, my friend, nothing. To complete this absurdity, students might just as well be packed off to Vestris or Gardel, or whatever dancing master you like, to learn about graceful movement. The truth of nature is forgotten, while the imagination is filled with gestures, postures, and figures that are false, forced, ridiculous, and cold. There they're stored away, re-emerging for application to the canvas. Whenever the artist takes up his chinks or brushes, these limp phantoms revive and present themselves to him; they're a perpetual distraction, and he who managed to exorcise them from his head would be a prodigy indeed. I once knew a young man of excellent taste who, before making the smallest stroke on his canvas, would get down on his knees and say, dear Lord, deliver me from the model. If today one rarely sees a picture composed of a certain number of figures without observing, here and there, a few of the academic figures, poses, movements, and attitudes so mortally disagreeable to men of taste, and convincing only to those to whom truth is foreign, blame the eternal study of the academic model.

It's not in the school that one learns about the general coordination of movements, a coordination that's sensed, that's seen, that extends, winding its way, from head to foot. If a woman allows her head to fall forward, all her bodily members acknowledge its weighty pull; if she lifts and holds it erect, there's a similar acknowledgement from the rest of the machine.

What an art, and a great one, is the posing of the model; one need only observe how proud of it is Monsieur le Professeur. No need to fear that he might say to the poor salaried devil, my friend, strike a pose on your own, do what you like. Rather

than allow him to assume a simple natural posture, he much prefers to assign him some eccentric one. And currently one has no choice but to put up with this.

A hundred times I've been tempted to say to young students I encountered on their way to the Louvre with their portfolios under their arms: My friends, how long is it you've been drawing there? Two years? Why, that's too long. Leave this shop of mannered tics. Go to the Carthusians',⁵ and there you'll see real attitudes of piety and compunction. Today is the eve of a high holy day; go to a parish church, prowl around the confessionals there, and you'll see real postures of meditation and repentance. Tomorrow go to a tavern, and you'll see the real movement of an angry man. Seek out public gatherings; be observant in the street, in public gardens, at the market, in private homes, and you'll obtain an accurate idea of true movement as it is in the activity of life. Look at your two comrades arguing with one another; note how, without their realizing it, it's the dispute that determines the placement of their limbs. Examine them carefully, and you'll take pity on your insipid professor's lessons and your insipid model's imitations. How I'll pity you, my friends, when one day you find yourselves obliged to replace all the falsehoods you've learned with the simplicity and truth of Le Sueur; and you'll certainly have to do this if you intend to amount to anything.

Posturing is one thing, action another. All posturing is false and trivializing; all action is beautiful and true.

Contrast that's poorly understood is one of the most deadly causes of mannerism. Genuine contrast derives exclusively from an action's essence, or from a diversity of agents or interests. Look at Raphael and Le Sueur; they sometimes place three, four, or five standing figures next to one another, and the effect is sublime. At Mass or Vespers at the Carthusian monastery forty or fifty monks are to be seen in two long parallel lines, with the stalls, actions, and vestments all identical, and yet no two of these monks resemble one another. No contrast should be sought out other than what's needed to individuate them; so much is genuine, any more would be shabby and false.

If these students should be inclined to profit further from my advice, I'd say to them: Hasn't it been long enough for you to see only a portion of the objects you copy? Try, my friends, to imagine that the entire figure is transparent, and that your eyes look out from its center. From there you'll observe the complete exterior disposition of the machine; you'll see how some parts are extended while others are contracted, how the former stretch out while the latter expand; and, consistently preoccupied by the overall effect, by the whole, you'll succeed in showing in that part of the object presented in your drawing everything that would correspond with it but that's not visible, and though displaying only one of its views to me you'll oblige my imagination to envision the opposite view as well; and it's then that I'll write that you're a surprising draftsman.

But it's not enough to evoke the whole successfully; the challenge lies in introducing details without destroying the mass. This is the work of verve, of genius, of feeling, and extremely delicate feeling at that.

Here, then, is how I'd like to see a drawing school run. When the student was able to draw after prints and reliefs with ease, I'd place him before male and female academic models for two years. Then I'd expose him to children, adults, mature men,

old men, subjects of all ages, of both sexes, drawn from all walks of life – in a word, to every kind of nature. The prospective models would come in droves to the door of my academy, if I paid them well; if I was in a country with slaves, I'd compel them to come too. The professor would make a point of noting in all these different models how their habitual daily tasks, their way of life, their social station, and their age had introduced accidental features into their forms. Thereafter my student would see the academic model but once every fifteen days, and the professor would allow the model to strike poses on his own. After the drawing sessions a trained anatomist would explain the *écorché* to my student, with constant references to the living, animated nude body; and he'd draw from the *écorché* no more than a dozen times a year. That would be sufficient for him to acquire a sense of how flesh supported by bone and flesh that lacks such support should not be drawn in the same way, that here the outline should be rounded, and there angular; and that if he neglects such details, the whole will seem like an inflated bladder or a ball of cotton.

There would be no mannerism, in either drawing or color, if nature were scrupulously imitated. Mannerism derives from teachers, from the academy, from drawing schools, and even from the antique.

A little corollary to the preceding

But what's the point of all these principles if taste is capricious, and if beauty is not subject to eternal, immutable rules?

If taste is capricious, if there are no rules determining beauty, then what is it that prompts these delicious feelings that arise so suddenly, so involuntarily, so tumultuously in the depths of our souls, dilating or constricting them, forcing our eyes to shed tears of joy, pain, and admiration, whether in response to some grand physical phenomenon or to an account of some great moral action? *Apage, Sophista*.⁶ You'll never convince my heart that it's mistaken in skipping a beat, nor my entrails that they're wrong to contract from profound emotion.

The true, the good, and the beautiful are very closely allied. Add some unusual, striking circumstance to one of the first two qualities and truth becomes beauty, or beauty truth. If the solution to the problem posed by three bodies is as simple as the movement of three points inscribed on a scrap of paper, this is nothing; it's a purely speculative truth. But if one of these three bodies is the star that lights up our days, another the orb that shines through our nights, and the third the globe we inhabit, suddenly the truth becomes grand and beautiful.

One poet said of another poet: He won't go far, he doesn't know the secret. What secret? That of focusing on things of inherent interest, on fathers, mothers, women, and children.

I see a high mountain covered by a deep, dark, ancient forest. I see and hear descending from it, very noisily, a stream whose rushing waters crash against steep outcrops of rock. The sun is setting; it transforms the droplets of water clinging to the rough surface of the stone into so many diamonds. But after having cleared these obstacles, the water is collected into a large, broad canal that leads to a machine. It's there that, under enormous blocks of stone, the basic material of human subsistence is ground and prepared. I glimpse the machine. I glimpse its wheels whitened by

foam. I glimpse the top of the owner's cottage through the branches of a willow. I look into myself, and I dream.

Without doubt the forest that makes me reflect on the origin of the world is a beautiful thing. Without doubt the rock that's an image of constancy and perseverance is a beautiful thing. Without doubt the droplets of water transformed by the sun's rays, broken and refracted into so many brilliant, liquid diamonds are beautiful. Without doubt the noise, the roar of the rushing stream that breaks the vast silence and solitude of the mountain, giving my soul a violent shock, instilling in it a secret terror, is also beautiful.

But these willows, this cottage, these animals grazing nearby, this spectacular display of utility, does it add nothing to my pleasure? And what of the different feelings it evokes in an ordinary man and a philosopher? It's the latter who reflects, seeing in each forest tree a mast that will one day lift high its head against wind and storm; in the mountain's bowels the raw metal that one day will boil in blast furnaces, prior to transformation into machines for cultivating the earth or destroying its inhabitants; in the rock, blocks of stone that will be used to construct the palaces of kings, the temples of the gods; in the rushing water, at one moment the source of life, at another the ravage of the countryside; then thinking on its fusion with larger streams and rivers; on commerce, the inhabitants of the universe connected to one another, their treasures transported from bank to bank, from where they're dispersed into the continental depths; and his volatile soul will pass rapidly from a tender, voluptuous feeling of pleasure to a sensation of terror, if his imagination proceeds to summon up the waves of the ocean.

It's in this way that pleasure increases proportionally with imagination, sensitivity, and knowledge. Nature and the art that copies it have nothing to say to a man who's stupid or cold, and very little to a man who's ignorant.

So what, then, is taste? A capacity, acquired through reiterated experience, to sense the true or the good, along with the circumstances rendering it beautiful, and to be promptly, vividly moved by it.

If the experiences that shape judgment remain clear in the memory, one's taste will be enlightened. If there are no such distinct memories, only vague impressions, one's taste will be instinctive.

Michelangelo gave the dome of Saint Peter's in Rome the most beautiful form possible. The geometer La Hyre, impressed by this form, plotted its arc and found that this curve was the one that offered the greatest resistance. What is it that inspired Michelangelo to use this curve, among the infinite number from which he could choose? The experience of everyday life. It's this that suggests to a master carpenter, just as surely as to the sublime Euler,⁷ the angle of support best suited to prop up a wall threatening collapse. It's this that teaches him how to give the sails on a windmill the pitch most favorable to rotation. It's this that sometimes prompts us to introduce subtle elements into our calculations that find no justification in the academy's rules of geometry.

Experience and study: these are the fundamentals of those who execute as well as those who judge. I'd be inclined to add sensitivity to the list. But as we see men acting with justice, benevolence, and virtue solely through a proper understanding of their own best interests, through intelligence and a taste for order, without deriving any

pleasure or gratification from it, it follows that there can be taste without sensitivity, just as there can be sensitivity without taste. In its extreme form sensibility is not discerning; it's moved by everything. The first will tell you coldly, That is beautiful; the other will be moved, transported, inebriated. 'Saliet tundet pede terram, ex oculis stillabit amicis rorem.'⁸ He'll stammer; he'll be unable to find words to describe the state of his soul.

The happier of the two is undoubtedly the latter. The better judge? That's another matter. Cold, austere men who are tranquil observers of nature are often better able to articulate their views. They simultaneously are and are not enthusiasts; they're both man and animal.

Reason sometimes rectifies a rapid judgment made by sensibility; it appeals against it. Thus the large number of works quickly applauded but as quickly forgotten, and the many others that, while initially either unnoticed or disdained, with passing time, advancing intelligence and sensitivity, and closer attention, come to be valued at their true worth.

Such is the uncertain prospect for any work of genius. It stands alone. It can be appreciated only by immediate comprehension of its relation to nature. And who is the only one capable of grasping this relation? Another man of genius.

¹ Toboso was a small town outside Toledo in which Cervantes [in *Don Quixote*] placed the residence of Dulcinea. . . . Diderot here seems to suggest an image of Toboso as a river in which Winckelmann, having begun to cross, stops in midstream.

² Jean-Baptiste Pigalle (1714–85). Student of J.-B. II Lemoyne. Granted provisional membership in the Royal Academy on November 4, 1741; received as a full academician on July 30, 1744.

³ 'It is not our place to compose such great strife': based on Virgil, *Ecloques*, IV, v. 108 ('non nostrum inter vos tantas componere lites').

⁴ 'Flayed figure': a male mannequin with skin and fat removed to facilitate study of the muscles.

⁵ The Carthusian monastery behind the Luxembourg Palace, now destroyed, which housed one of the most admired works of the French seventeenth century, the *Life of Saint Bruno* cycle by Eustache Le Sueur (now in the Louvre, Paris). Diderot is known to have admired these paintings; here, however, he is advising his imaginary auditors/artists to observe both the canvases and the real monks there.

⁶ 'Back, sophist!'

⁷ Leonard Euler (1707–83). Swiss physicist and mathematician.

⁸ 'He'll bounce about, he'll stamp his feet, he'll weep fervently': Horace, *Ars Poetica*, vv. 429–30 (Diderot's citation is approximate).

14 Denis Diderot (1713–1784) from 'Salon of 1767'

The 'Salon of 1767' is a *tour de force* which took Diderot over a year to complete, amounting in its finished extent to the equivalent of an entire year's normal output of the *Correspondence littéraire*. Following the listings in the official Salon booklet, he found something to say about virtually every one of some 250 works on display, no more than a dismissive sentence in a few cases, in others a lengthy excursus of several pages. Interspersing the individual commentaries are occasional passages of exposition and speculation on issues raised by them. We reproduce three characteristic passages from a work that occupies 330 pages in its modern printed form. The first serves as a conclusion to an extensive discussion of paintings by Louis-Jean-François Lagrenée. Diderot represents himself as engaged in dialogue with Grimm (see IIC10) on the question

of wealth (or luxury) and its influence on the arts – a matter on which opinions had been publicly divided since the 1720s. The second passage concerns the work of Claude-Joseph Vernet (1714–89), a painter specializing in marine landscapes who received considerable support from Diderot. We reproduce the introductory discussion and the first of seven ‘sites’. In each of these the writer describes his own peregrinations through an extensive landscape which, it transpires, is actually a composition painted by Vernet. Each of these accounts offers a remarkable demonstration of the writer’s imaginative engagement. In each case it is the specific organization and detail of the picture observed, rather than the gratuitous self-projection of the observer, that decides the elaboration of episode and detail. The final excerpt from the ‘Salon’ contains Diderot’s most sustained critique of mannerism (the French word *manière* embraces the meanings of both ‘manner’ and ‘mannerism’). The ‘Salon de 1767’ was originally written for Grimm’s *Correspondence littéraire* and was first printed in Naigeon (*op. cit.* III C12). The English versions are taken from *Diderot on Art – II: The Salon of 1767*, translated by John Goodman, New Haven and London: Yale University Press, 1995, pp. 75–8, 86–91, 320–4.

On Luxury

DIDEROT: Aren’t you tired of roaming through this immense Salon? For my part, my legs are about to give out: let’s head for the Galerie d’Apollon, which will be empty; we’ll be able to relax there as we like, and I’ll tell you about a few ideas I’ve had concerning a question of some importance.

GRIMM: And what is this important question?

DIDEROT: Luxury’s influence on the fine arts. You’ll agree that everybody’s wonderfully confused over this question.

GRIMM: Wonderfully.

DIDEROT: They’ve seen that the fine arts owe their birth to riches. They’ve seen that this same cause that produced them, strengthened them, and brought them to a level of perfection finished by degrading them, corrupting them, and destroying them. And two different factions have formed! One presents a picture of the fine arts as begotten, perfected, and capable of astonishment and defends luxury, while the other faction takes them to task, attacking the fine arts as corrupted, degraded, impoverished, and debased.

GRIMM: While still others, and not the least credible, have exploited luxury and its consequences to denigrate the fine arts.

DIDEROT: And in this dark night in which they wage war . . .

GRIMM: The aggressors and defenders have worked about equal damage, such that neither party has scored a clear victory.

DIDEROT: It’s because they’ve been dealing with only one kind of luxury.

GRIMM: Ah! You want to talk politics.

DIDEROT: And why not? Suppose there was a prince who had the good sense to understand that everything comes from the earth and that everything returns there; that accordingly he lent his support to agriculture and ceased to be the father and maker of great usurers.

GRIMM: I understand; and that he dismissed all the tax farmers, replacing them with painters, poets, sculptors, and musicians. Is that it?

DIDEROT: Yes, Monsieur, and determined to have good ones, and only good ones. Agriculture being so favored, men would pursue their best interests into her sphere, and all phantasy, passion, prejudice, and opinion concerning it would vanish. The earth would be as well cultivated as possible; its productions being so diverse, abundant, and various, great wealth would result, and this great wealth would engender great luxury: for seeing that one can't eat gold, what good is it, if not to increase pleasure, to underwrite the infinite means of attaining happiness, namely poetry, painting, sculpture, music, mirrors, tapestries, gilding, porcelain, and eccentric objects. Painters, poets, sculptors, musicians, and the crowd of related arts are born of the earth; they too are offspring of the good Ceres. And I tell you that wherever they have their origin in this kind of luxury they'll flourish forever.

GRIMM: You think so?

DIDEROT: More than that; I'll prove it to you. But first, allow me to say, from the bottom of my heart: Cursed forever be he who first put government offices up for sale.

GRIMM: And he who first advocated the superiority of industry, and its right to flourish on the ruins of agriculture!

DIDEROT: Amen.

GRIMM: And he who, after having degraded agriculture, encumbered free exchange with all kinds of fetters!

DIDEROT: Amen.

GRIMM: And he who created the first of the great extortionists and their numberless clan!

DIDEROT: Amen.

GRIMM: And he who facilitated the taking of ruinous loans by foolish, spendthrift sovereigns!

DIDEROT: Amen.

GRIMM: And he who suggested to them how they might rupture the most sacred ties holding them together by yielding to the irresistible lure of increasing their fortunes two, three, even ten times!

DIDEROT: Amen, amen, amen. At the very moment in which the nation was struck by these various scourges, the breasts of the common mother dried up, and a small portion of the nation was swimming in wealth while the remainder languished in indigence.

GRIMM: Education was lacking in vision, unmotivated, without solid foundation, without an encompassing public goal.

DIDEROT: Money, which purchases anything, became the measure of all things. It became necessary to have money, and then what? More money. And when it ran out, it was necessary to keep up appearances and create the illusion that one was still well supplied.

GRIMM: Giving birth to appalling ostentation in some cases, and in others to a kind of epidemic of hypocrisy regarding one's resources.

DIDEROT: Which is to say to another kind of luxury, and it's this kind that degrades and destroys the fine arts, for their continued health and progress require genuine opulence, whereas this brand of luxury does nothing but fatally mask a

misery that's almost general, which it aggravates and encourages. It's under the tyranny of this luxury that talents are wasted or sidetracked. It's in such circumstances that the fine arts must make do with the dregs left to those of inferior social status; it's in such extraordinary, perverse circumstances that they're either subordinated to the phantasy and caprice of a handful of rich, bored, fastidious men, their taste as corrupt as their morals, or they're abandoned to the mercy of the indigent multitude, which strives, with poor work in all genres, to take on some of the credit and the lustre associated with wealth. In the present century and under the present reign the impoverished nation has framed not a single grand enterprise, no great works, nothing that might nourish the spirit and exalt the soul. At present great artists don't develop at all or are compelled to endure humiliation to avoid dying of hunger. At present there are a hundred easel paintings for every large composition, a thousand portraits for every history painting; mediocre artists proliferate and the nation is flooded with them.

GRIMM: Such that the Belles, the Bellengers, the Voiriots, and the Brenets brush shoulders with the Chardins, the Viens, and the Vernets.

DIDEROT: And their tiresome works cover the walls of the Salon.

GRIMM: And blessed be the Belles, the Bellengers, the Voiriots, the Brenets, bad poets, bad painters, bad sculptors, picture dealers, jewelers, and prostitutes.

DIDEROT: Very good, my friend, for it is through these people that we have our revenge. They're the vermin who prey upon and destroy our vampires, and who give us back, drop by drop, the blood they've extracted from us.

GRIMM: And shamed be any minister who ventures, while surrounded by vast, fruitful stretches of soil, to create sumptuary laws, to annihilate an existing luxury, instead of supporting another kind rooted in the bowels of the earth.

DIDEROT: And who prevents the free circulation of works of art, rather than encouraging artists. It's not I alone who've arrived at this point, for you've led me here; and if there's any logic in what's preceded, it follows, as I said at the beginning, that there are two kinds of luxury: one born of wealth and general affluence, and another of ostentation and misery; and that the first kind is as favorable to development and progress of the fine arts as the second is detrimental to them . . .

* * *

Vernet

I'd inscribed this artist's name at the head of my page and was about to review his works with you, when I left for a country close to the sea and celebrated for the beauty of its sites. There, while some spent the day's most beautiful hours, the most beautiful days, their money, and their gaiety on green lawns, and others, shotguns over their shoulders, overcame their exhaustion to pursue their dogs through the fields, and others still wandered aimlessly through the remote corners of a park whose trees, happily for their young consorts in delusion, are models of discretion; while a few serious people, as late as seven o'clock in the evening, still made the dining room resound with their tumultuous discussion of the new principles of the economists, the utility or uselessness of philosophy, religion, morals, actors, actresses, govern-

ment, the relative merits of the two kinds of music, the fine arts, literature, and other important questions, the solutions to which they sought at the bottom of bottles, and returned, staggering and hoarse, to their rooms, whose doors they found only with difficulty, and, having relaxed in an armchair, began to recover from the intensity and zeal with which they'd sacrificed their lungs, their stomachs, and their reason in the hope of introducing the greatest possible order into all branches of administration; there I went, accompanied by the tutor of the children of the household and his two charges, my cane and writing pad in hand, to visit the most beautiful sites in the world. My intention is to describe them to you, and I hope that these descriptions will prove worth the trouble. My companion for these walks was thoroughly familiar with the lie of the land, and knew the best time to take in each rustic scene, and the places best viewed in the morning hours, which were most charming and interesting at sunrise and which at sunset, as well as the coolest, shadiest areas in which to seek refuge from the burning midday sun. He was the *cicerone* of this region; he did the honors for newcomers, and no one knew better than he how to maximize the impact of the spectator's first glance. We were off, and we chatted as we walked. I was moving along with my head lowered, as is my custom, when I felt my movement suddenly checked and was confronted with the following site.

First Site

To my right, in the distance, a mountain summit rose to meet the clouds. At this moment chance had placed a traveller there, upright and serene. The base of the mountain was obscured from us by an intervening mass of rock; the foot of this rock stretched across the view, rising and falling, such that it severed the scene's foreground from its background. To the far right, on an outcropping of rock, I saw two figures which could not have been more artfully placed to maximize their effect; they were two fishermen; one was seated towards the bottom of the rock, his legs dangling; the other, his catch slung over his back, bent over the first and conversed with him. On the rugged embankment formed by the extension of the lower portion of the rock, where it extended into the distance, a covered wagon driven by a peasant descended towards a village beyond the embankment: another incident which art would have suggested. Passing over the crest of this embankment, my gaze encountered the tops of the village houses and continued on, plunging into and losing itself in a landscape prospect that merged with the sky.

Who among your artists, my *cicerone* asked me, would have imagined breaking up the continuity of this rugged embankment with a clump of trees? – Perhaps Vernet. – Right, but would your Vernet have imagined such elegance and charm? Would he have been able to render the intense, lively effect of the play of light on the trunks and their branches? – Why not? – Depict the vast distances taken in by the eye? – He's done it on occasion in the past. You don't know just how conversant this man is with natural phenomena . . . I responded distractedly, for my attention was focused on a mass of rocks covered with wild shrubs which nature had placed at the other end of the rugged mound. This mass was masked in turn by a closer rock that, separate from the first one, formed a channel through which flowed a torrent of water that, having completed its violent descent, broke into foam among detached rocks . . . Well! I say

to my *cicerone*: Go to the Salon, and you'll see that a fruitful imagination, aided by close study of nature, has inspired one of our artists to paint precisely these rocks, this waterfall, and this bit of landscape. – And also, perhaps, this piece of rough stone, and the seated fisherman pulling in his net, and the tools of his trade scattered on the ground around him, and his wife standing with her back to us. – You have no idea what a jokester you are, Abbé . . . The space framed by the rocks in the torrent, the rugged embankment, and the mountains to the left contained a lake along whose shore we walked. From there we contemplated the whole of this marvellous scene; however, towards the part of the sky visible between the clump of trees on the rugged strip and the rocks with the two fishermen a wispy cloud was tossed by the wind. I turned to the Abbé: Do you believe in good faith, I said to him, that an intelligent artist could have done otherwise than place this cloud exactly where it is? Do you see that it establishes a new level of depth for the eye, that it signals expanses of space before and beyond it, that it makes the sky recede and makes other things seem closer? Vernet would have grasped all of this. Others, in darkening their skies with clouds, dream only of avoiding monotony, but Vernet wants his skies to have movement and magic like what's in front of us. – You can say Vernet, Vernet all you want, but I won't abandon nature to run after an image of it; however sublime a man might be, he's not God. – All right, but if you'd spent more time with the artist, perhaps he'd have taught you to see in nature what you don't see now. How many things you'd find there that needed altering! How many of them his art would omit as they spoiled the overall effect and muddled the impression, and how many he'd draw together to double our enchantment! – What, you believe in all seriousness that Vernet would have better things to do than rigorously transcribe this scene? – I believe so. – Then tell me how he'd embellish it. – I don't know, and if I did I'd be a greater poet and a greater painter than he; but if Vernet had taught you to see nature better, nature, for her part, would have taught you to see Vernet better. – But Vernet will always remain Vernet, a mere man. – Yes, and all the more astonishing for that, and his work all the more worthy of admiration. The universe is a grand thing, without question, but when I compare it with the energy of the cause which generated it, what seems marvellous to me is that it's not still more beautiful and more perfect. It's quite otherwise when I reflect on the weakness of man, on his limited capacities, on the travail and brevity of his life, and consider certain things which he has undertaken and achieved. Abbé, may I put a question to you? Here it is: Which would you find the more remarkable, a mountain whose peak touched and held up the sky, or a pyramid covering several square miles and whose summit disappeared into the clouds? . . . You hesitate. It's the pyramid, my dear Abbé, and the reason is that nothing coming from God, the mountain's author, is astonishing, while the pyramid would be an incredible human phenomenon.

The conversation proceeded by fits and starts. Such was the beauty of the site that from time to time we were overcome with admiration; I spoke without paying much attention to what I was saying, and my listener was equally distracted; in addition, the Abbé's young charges ran from left to right and clambered up the rocks, such that their instructor was in perpetual fear of their becoming lost or falling or drowning in the lake. He advised that next time we should leave them behind at the house, but I disagreed with him.

I was inclined to linger on in this spot, spending the rest of the day there; but the Abbé having assured me that the country was so rich in such sites that we need not economize our pleasures in this way, I allowed myself to be led further on, though not without stealing a backward glance from time to time.

The youngsters went on ahead of their teacher, while I trailed behind him. We followed narrow, twisting paths, and I complained a bit about this to the Abbé, but he, having turned around, stopped directly in front of me and, looking me straight in the eye, said to me with considerable emphasis: Monsieur, the work of man is sometimes more admirable than that of God! – Monsieur l'Abbé, I answered him, have you seen the *Antinous*, the *Medici Venus*, the *Callipygian Venus*, and other antique statues? – Yes. – Have you ever encountered figures in nature that were as beautiful, as perfect as those? – No, I can't say that I have. – Have your students never said things to you that evoked greater admiration and pleasure than the most profound sentence in Tacitus? – That has happened on occasion. – And how is that? – I'm deeply interested in them; their remarks seemed to me to indicate great sensibility, a kind of shrewdness and astute intelligence beyond their years. – Abbé, let's apply these observations. If I had a cup full of dice, and I emptied the cup, and they all landed showing the same number, would this astonish you? – Very much. – And if all the dice were loaded, would you still be astonished? – No. – Abbé, let's apply these observations. The world is but a heap of loaded molecules of infinite variety. There's a law of necessity that governs all the works of nature without design, without effort, without intelligence, without progress, and without resistance. If one were to invent a machine capable of producing paintings like Raphael's, would such paintings continue to be beautiful? – No. – And the machine? Should it become commonplace, it would be no more beautiful than the paintings. – But doesn't it follow from this that Raphael was himself such a machine? – Yes, it's true; but Raphael the machine was never commonplace; the productions of this machine were never as widespread and numerous as the leaves of an oak; but by a natural, almost irresistible inclination we attribute will, intelligence, purpose, and liberty to this machine. Suppose Raphael was eternal, fixed in front of the canvas, painting ceaselessly and of necessity. Imagine these machines to be everywhere, producing paintings in nature like the plants, trees, and fruit depicted in them, and tell me what would become of your admiration then. The beautiful order in the universe that you find so enchanting cannot be other than it is. Only one such order is known to you, the one you inhabit; you'll find it beautiful or ugly, according to whether the terms of your coexistence with it are agreeable or difficult; things would have to be quite otherwise than they are for it to seem equally beautiful or ugly independent of the pleasure or pain with which one lived in it. An inhabitant of Saturn transported to earth would feel his lungs dry up and would perish cursing nature; an inhabitant of earth transported to Saturn would feel choked, suffocated, and would perish cursing nature . . .

At this point a western wind sweeping across the landscape enveloped us in a thick, swirling cloud of dust. It momentarily blinded the Abbé, who rubbed his eyes. As he did this, I added: Although this cloud seems to you like a chaos of haphazardly dispersed molecules, in fact, my dear Abbé, it's as perfectly ordered as the world . . . I was about to demonstrate my case to him, which he was hardly in a condition to

enjoy, when the view of a new site, one no less admirable than the first, left me astonished and mute, my voice broken and my ideas thrown into confusion.

On Mannerism

A difficult subject, perhaps too difficult for one who knows no more than I; a matter calling for concise, profound reflection, for a vast range of knowledge, and above all a freedom of spirit that I lack . . .

Mannerism is a vice common to all the fine arts. Its sources are even more hidden than those of heauty. There's something intangible about it that seduces children, that impresses the crowd, and that sometimes corrupts an entire nation; but it is more unbearable to the man of taste than ugliness; for ugliness is natural, in itself it entails no pretension, nothing that's ridiculous, nothing inconsistent with common sense.

A *mannered* savage, peasant, shepherd, or artisan is a kind of monster unimaginable in nature.

It seems to me first of all, then, that *mannerism*, whether in morals, discourse, or the arts, is a vice of regulated society.

At the origin of societies one finds art that's crude, discourse that's barbaric, and morals that are countrified; but these things tend to work together in favor of perfection, until the grand style [*grand goût*] is born; but this grand style is like the edge of a razor on which it's difficult to maintain one's footing. Very soon morals decline; the empire of reason extends its boundaries; discourse becomes epigrammatic, clever, laconic, sententious; the arts are corrupted through refinement. The ancient routes are found to be blocked by sublime models one despairs of ever equalling. Poetics are composed; new genres are envisioned; the singular, the bizarre, and the *mannered* make their appearance; from which it would appear that *mannerism* is a vice that occurs in a regulated society, one in which good taste tends towards decadence.

When good taste has been carried to its highest point of development, there is much debate over the merits of the ancients, who are less read than ever before. The small number of people who meditate, who reflect, who think, who adopt the true, the good, and the useful as their sole measure of worth – in a word, the *philosophes* – have only scorn for fiction, poetry, harmony, and antiquity. Those who are sensitive, who respond to beautiful images, who have refined, delicate ears protest against this blasphemy, this impiety. The greater the contempt expressed for their idol, the greater their deference to it. If a truly original man appears, one with a subtle, inquiring, analytic, deconstructive frame of mind, corrupting poetry with philosophy and philosophy with a few poetic sallies, a *mannerism* is born that can infect an entire nation. There follows a crowd of imitators insipidly aping a hizarre model, an imitator of whom it could be said, in the words of the healer Procopius: 'Those, hunchbacks? You must be joking; they're just badly made.'

These copyists of a bizarre model are insipid because their singularity is second-hand; their vice is not their own; they're the apes of Seneca, Fontenelle, and Boucher.

The word *mannerism* can be construed favorably or unfavorably; it is usually understood as unfavorable when it is alone. It is said: *Mannerism, to be mannered* is

a vice. But it is also said: His *manner* is grand; it's the *manner* of Poussin, Le Sueur, Guido Reni, Raphael, and the Carracci.

I only cite painters here, but *mannerism* occurs in all media: in sculpture, in music, in literature. [...]

If *mannerism* is an affectation, what component of painting is not susceptible to this flaw?

Drawing? But there are draftsmen who favor rounded forms and those who favor squared ones. Some make their figures tall and slender; others make them short and heavy; their component parts are either too articulated or not at all. Those who've studied anatomy always see and depict what's beneath the skin. Some barren artists have only a small number of body poses at their disposition, only one foot, one hand, one arm, one back, one leg, and one head, which they use everywhere. Here I recognize a slave to nature, there a slave to the antique.

Light and shadow? But what is this affectation of directing all the light on a single object, leaving all the rest of the composition in shadow? It seems that these artists have never seen anything save looking through a hole. Others use more light and make their shadows weaker, but they fall endlessly into the same pattern, their sun is immobile. If you've ever observed the little curved marks thrown onto a gallery ceiling by light reflected in a canal, you'll have a pretty good idea of light's flicker effects.

Color? But art's sun is not the same as nature's sun; the painter's light as the sky's; the flesh of the palette as my own; the artist's eye as any other; how could there not be *mannerism* in color? How could one hue not be too brilliant, another too grey, a third completely wan and dark? How could there not be technical flaws resulting from misjudged juxtapositions; flaws in the school or in the teacher; flaws in the organs themselves, if different colors don't affect them all in the same way?

Expression? But it's she who's most accused of being *mannered*. In effect, expression can be *mannered* in a hundred different ways. In art, as in society, there's false grace, affectation, preciousness, artificiality, ignobility, false dignity or arrogance, false gravity or pedantry, false pain, false piety; all virtue, all vice, all passion is made to grimace; these grimaces sometimes occur in nature, but they're always unpleasant when imitated; we require that one remain human, even when suffering the most violent torture.

It rarely happens that a being less than fully committed to what it's doing is not *mannered*.

Every individual who seems to say to you: 'Look how well I weep, how well I get angry, how well I entreat,' is false and *mannered*.

Every individual who diverges from the comportment appropriate to his social position or emotional state, an elegant magistrate, a woman in distress who carefully composes her arms, a man who plays the dandy as he walks, is false and *mannered*. [...]

Because there are compulsory groupings, conventionalized masses, dispositions dictated by technical considerations, often in contradiction with the nature of the subject, exaggerated contrasts between figures, and similarly exaggerated contrasts between the limbs of a given figure, there exists a *mannerism* of composition, of the organization of a painting.

Think about it a while, and you'll concede that paltriness, shabbiness, meanness, and *mannerism* can occur even in the handling of drapery.

Rigorous imitation of nature makes art paltry, mean, and shabby, but never false or *mannered*.

It's the imitation of nature, but exaggerated or embellished, that's the basis of the beautiful and the true, the *mannered* and the false; for then the artist gives rein to his own imagination; he remains without any precise model.

* * *

Part IV

A Public Discourse

IV

Introduction

During a period in the second half of the eighteenth century, British culture was possessed of an unmistakable dynamism. Behind this lay the development of industry on an unprecedented scale. The production of textiles was becoming mechanized, Wedgwood's pottery was getting under way, there were key technological developments in the production of iron and steel, and above all there was one epoch-making invention: between 1765 and 1775 James Watt developed the steam engine. After that, it was a case of 'tomorrow, the world'. Britain was becoming the dominant imperial power, while London emerged as the first crucible of modernity (see below, VB7). We have become accustomed, perhaps too accustomed, to considering modernity as a nineteenth-century phenomenon. But Hogarth's London has a fair claim to priority as the urban birthplace of a new commodity-oriented culture. It is important that we write 'British' rather than 'English' here, because although London was the great metropolis – a magnet for that amalgam of the ambitious, the unscrupulous and the talented who made modernity – there was a flourishing provincial culture in places such as Bath and Derby, and there was also a significant dimension to the British Enlightenment that was not 'English' at all. Scottish philosophy flourished; Edinburgh and Glasgow were centres of advanced work in science, medicine and economics. And there were keynote Irish voices involved, notably those of Burke and Barry.

British intellectual life was animated by an empiricist, practical attitude, and seemed to flourish in the culture that had emerged from the revolutions of the seventeenth century. It was a culture that mixed violence with opportunity in equal measures, and conferred a sinewy resilience on its best products. The impression is one of a situation far removed from the protocols of Continental absolutism. For all that, art in England remained a problem, particularly the vexed question of a national school. For decades in the middle of the eighteenth century, argument went backwards and forwards about the desirability of a national collection of art and of an Academy on the French model, royal patronage and all. Attitudes to this question differed widely. Hogarth, as the dominant English artistic figure of the mid-century, was committed to the idea of an institution where art could be taught – and in fact ran one himself for many years – while yet being deeply opposed to patronage by royalty

(IVA2). By the 1760s, however, Hogarth was in the minority. Four years after his death, a Royal Academy was indeed constituted in London. The Academy quickly gave rise to a mini-tradition which, before it was over, had come to represent a high point of eighteenth-century academic art theory. This was the series of lectures, initially delivered annually, then from 1774 biennially, by the President, Sir Joshua Reynolds. Reynolds usually considered central theoretical issues, such as the contrasting demands of imitation and genius, of good taste and the grand style, and the competing claims of feeling and reason in the arts (IVA7). On the occasion of the Academy's move into new premises in 1780, however, he briefly addressed the more practical, even polemical, question of art's place in the national culture (IVA8). He thus entered into a wide-ranging debate in which the question of the role of art in the civilizing process intersected with more contingent, economic considerations. In the other contributions selected here, James Barry and Valentine Green introduce a polemical edge of national rivalry generally absent from Reynolds' measured argument (IVA13, 16).

The question of the public role of art and of the aims and conduct of academies was not of course restricted to England. It had long been an issue in France (see IIC *passim*), and contrasting views also emerged in Spain (IVA4 and 14). Patronage and history painting were themes of particular concern. Patronage was a pressing issue in England, where contrasts were often drawn with the situation in France, as can be seen from the comments of both Barry and Green (IVA10, 13). William Shenstone's letter to his friend Graves offers an insight into both the self-image of the patron and the power relations in play between the patron and his artist. (Further comments on the artist-patron relationship can be found in VA1.) Traditionally, it was through the genre of history painting that art was established as a forum in which matters of public moment could be rehearsed. Once again, the paradigm came from France, though the existence of a well-supported school of history painting does not necessarily ensure vivid artistic results. In England, history painting seemed unable to gain a secure foothold, as Barry once more trenchantly points out. Among those few artists who did make an impact in history painting in England, the Americans Benjamin West and John Singleton Copley and the Swiss Angelica Kauffmann had all received their art education in Italy (IVA5, 6, 9).

England had finally got its Academy in 1768, a hundred and twenty years after the French, though the system never acquired either the status or indeed the bureaucratic apparatus that it did in France. Ironically, in 1768, the Académie Royale had only another twenty-five years left. In France, the system of the arts was embedded in the wider structures of the absolutist state, and in its forms of official and aristocratic patronage. Absolutism had served a purpose in helping to centralize the nation-state in the late seventeenth century. But by the later eighteenth century French and English societies had diverged. England's flexible mercantile capitalism and its emergent industrial base gave it a decisive advantage in the struggle for global imperial domination. By contrast, the absolutism of the French state was becoming a brake on development. A story of two very different social orders emerges from the *grandes machines* of academic history painting on the one hand and the taste for portraiture and landscape on the other.

England had undergone its political transformation from feudalism in the seventeenth century. In the eighteenth it was, in effect, a fully bourgeois society, albeit the bourgeois was in alliance with the landed remnant of the old order. The necessary triumph of the bourgeoisie in France, for so long held back by absolutism, was all the more cataclysmic when it finally came. An indication that new political forces were at work in eighteenth-century society had already come from across the Atlantic. For the English, defeating the French in North America had been an expensive business. After the treaty with France in 1763, the government's subsequent attempt to make its colonists pay for their security led to a smouldering resentment over taxation and the administration of life in the new world. Things went from bad to worse in the decade or so after the end of the Seven Years War, and the calling of a Continental Congress of the American colonies in 1774, and again in 1775, led the English king to declare the existence of a state of rebellion. Fighting broke out in 1775, and on 4 July 1776 the erstwhile colonists signed their Declaration of Independence. This was only the beginning. The French joined in against the English in 1778, followed by the Spanish and Dutch. Victory and defeat alternated, until in 1781 the English were decisively defeated at Yorktown. Finally, in the Treaty of Paris in 1783, twenty years after the last treaty of Paris in which the loss of New France had been acknowledged, the existence of the United States of America was ratified by the contending parties. These events, accompanied as they were by a rhetoric of Liberty and Common Sense, had profound implications for artists' and intellectuals' sense of the nature of their calling. Nowhere is this made clearer than in the letter written by the American painter John Trumbull to Thomas Jefferson, then acting as his country's Ambassador to Paris (IVB5).

In France itself the cost of intervention in the American war put added strains on a system that was already moving into crisis. At the most basic level, the people were being inadequately fed and clothed, obviously leeches off by the institutionalized Church and the aristocracy. The bourgeoisie resented their exclusion from political power. The burgeoning radical intelligentsia, sustained by ideals of Reason and Enlightenment, found itself an expanding constituency. And now there was a financial squeeze. In 1787 and 1788, a combination of popular unrest and disaffection of the 'notables' led to an unprecedented call – for the first time in no less than 175 years – to convene the States General: the one countervailing force to the power of the monarchy. This body duly met in the early summer of 1789, was followed immediately by the Tennis Court Oath in which delegates pledged not to stand down until a new constitution was in place, and then in July by open insurrection. The Bourbon dynasty, which had been in power for 200 years, now tottered. The French Revolution had begun.

Ever since, there have been those who interpret the Revolution as a catastrophe which reached its logical conclusion in the 'Terror' of the early 1790s. There were many at the time, as there have been many since, who believe quite the opposite: that the fall of the Bastille was – and remains – a potent symbol of the fate of all structures of repression. On 26 August the Assembly adopted the Declaration of the Rights of Man and of the Citizen. Taken together with the American Declaration of Independence, the Declaration of the Rights of Man represents an attempt to realize in practice the ideals of the Enlightenment. The prospect of a new kind of world suddenly

seemed to be opening up. William Wordsworth was moved to write, 'Bliss was it in that dawn to be alive'. Three years later, after the defeat of the Prussians by the French revolutionary army at Valmy on 20 September 1792, no less a figure than Goethe remarked that 'From this place and from this day forth commences a new era in the world's history' (Fuller, 1970, p. 58). The totalizing scope of the revolution is nowhere more vividly symbolized than in two simple facts. The revolutionaries overthrew the entire traditional system of weights and measures on which economic exchange was based, and introduced a new, scientifically based system, in the metre and the gramme. And, in what had been the Christian 1793, they instituted a new calendar, beginning at Year I, with ten-day weeks and new names for the months.

No series of events on the scale of the French Revolution (as of the Russian one over a century later), could be without consequence for the arts. Already in the 1780s Jacques-Louis David had begun to compose large history paintings redolent of austere republican sympathies, a world away from the confections of Boucher and Fragonard, or indeed of court portraitists such as Elisabeth Vigée-Lebrun (see VIIA14). From 1789 onwards David was at the forefront of attempts to realign the practice of the arts in France with the priorities of the new order. The anxiety felt by the status quo over the potential impact of his painting is revealed by a letter of August 1789 to the painter Vien, the President of the Academy (IVB2). The other side of the coin is demonstrated by the 'Demand' of students at the Academy, made in the wake of the exhibition of David's *Brutus* (IVB4). In brief, the Revolution polarized opinion among artists and intellectuals no less than among citizens in other walks of life, and abroad no less than in France itself. In England, the conservative Edmund Burke composed a condemnation of the Revolution which was published in November 1790. Within days the radical feminist Mary Wollstonecraft was composing a reply, as remarkable for its criticism of Burke's underlying theoretical assumptions as for its opposition to his politics (IVB6).

In Paris, David led the criticism of the Academy, which was eventually abolished in August 1793. He did not restrict his activity to artistic politics, however. He was a member of the Jacobin Club from September 1790, a Deputy of the Convention from September 1792, and in January 1793 voted for the execution of Louis XVI. As an artist, his services to the Revolution ranged from the staging of public festivals to the commemoration of revolutionary martyrs such as Lepelletier, Bara, and above all, Marat (IVB8–12). After the fall of Robespierre in the summer of 1794, David was lucky to escape with his life. It was while he was in prison at this time that he began work on a major painting representative of reconciliation, the *Intervention of the Sabine Women*, not completed until 1799 (see below VIIB2). By then, David's position had changed. From 1795 the term 'revolutionary' was banned from descriptions of the government. The late 1790s saw the rise of Napoleon, culminating in his assumption of power as 'First Consul' on 18 Brumaire, Year VIII (9 November 1799). If the revolution of 1789 and the Declaration of the Rights of Man represented a kind of fulfilment of Enlightenment ideals of social progress and emancipation, then the anti-aristocratic Terror of the early 1790s, and, more seriously, Napoleon's imperial ambition, no less certainly represented their defeat. From the late 1790s onwards, David effectively became Napoleon's court painter, and was appointed

Premier Peintre in December 1804. Bathetically, after Napoleon's final defeat he went into exile in Belgium. Today, in the National Gallery in Brussels, his *Hommage à Marat* of 1793 hangs adjacent to his late, classicizing *Mars Disarmed by Venus* of 1824. If a picture is worth a thousand words, the gulf between these two expresses with soundless eloquence the shipwreck of the French Revolution.

IVA

Consolidation and Instruction

1 William Shenstone (1714–1763) Letter to Richard Graves

Shenstone was a poet and man of letters, the quintessential, genial, eighteenth-century 'man of taste'. He was born and died on the family estate, the Leasowes, in Shropshire. From 1743 Shenstone devoted much of his time to the development of his garden at the Leasowes. He was at the forefront of the English 'landscape garden' movement (see VB1). The present letter, written to a friend of many years standing, concerns a portrait of himself, set on a terrace at the Leasowes, with a view behind him out on to the landscape. It is of interest for what it tells us about the eighteenth-century relation between artist and patron. Shenstone is in control of the picture. He determines the classical allusions, in the form of a representation of a carved figure of Pan, and a Latin inscription. At the other end of the scale of values, his favourite dog is to be included, and he takes quite a detailed interest in the placement of this, and indeed all the other pictorial elements. In fact he has had his artist make a sketch of the picture, which he has altered for his friend's benefit, the better to indicate what he has in mind, and to seek the friend's approval or any suggestions for improvement. In a letter written the previous November, Shenstone describes the artist, Edward Alcock, as being 'esteemed to shine among the painters of Birmingham'. The finished portrait depicts Shenstone full-length and facing the viewer. In his right hand he holds a scroll as he leans on a stone plinth, the front face of which is carved with a figure of Apollo. On the plinth lie some large leather-bound volumes, above it, the head of Pan. The dog, a kind of whippet, sits at his feet in the bottom right, gazing up at him. Behind them both, across a tiled floor, a balustrade and classical arch frame the vista. The picture now hangs in the National Portrait Gallery in London. The letter, written on 8 January 1760, was published in volume 3 of Shenstone's *Works*, edited by Robert Dodsley under the title *Letters to Particular Friends*, London 1769. Our extract is from pp. 307–9 of the 1777 edition.

The Leasowes, Jan. 8, 1760

Dear Mr. Graves,

[. . .] You must not judge of my painter's abilities by the small sketch I inclose. – I desired him to give me a *slight* one; and have, perhaps, ruined even *that* by endeavouring to bring it nearer to what the picture now is, *myself*. It will give you a tolerable idea in most points, except the Pan, which has his face turned towards the front; and

is not near so considerable. — I chose to have this *term* introduced, not only as he carries my favourite reeds, but as he is the principal *sylvan* deity. — The water-nymph below has the word 'Stour' on the mouth of her urn; which, in some sort, rises at The Leasowes. On the scroll is, 'Flumina amem sylvasque inglorius,' ['The woods and streams inglorious let me haunt!'] alluding to them *both*. — The Pan, you will perhaps observe, hurts the *simplicity* of the picture — not much, as we have managed him; and the intention here is, I think, a balance.

The dog on the other side is my faithful Lucy, which you perhaps remember; and who *must* be *nearer* the *body* than she perhaps would if we had more room. However, I believe, I shall cause her head to cut off that little cluster of angles, where the balustrade joins the base of the arch. The balustrade is an improvement we made the other day: it is, I think, a great one; not only as it gives a symmetry or balance to the curtain of which you complained, but as it extends the *area* on which I stand, and shortens the *length* of this *half-arch*. The painter objected to a tree; I know not why; unless that we could introduce no *stem* without encroaching too much upon the landscape: but the reason he gave was, it would be an injury to the face. The console is an Apollo's head. The impost does not go further than the pilaster, which ends the corner; and here the drawing is erroneous. We are, I think, to have a carpet, though we know not well how to manage it.

And now, I must tell you the dimensions. The figure itself is three feet three inches and a half; the whole picture four feet eleven inches, by three feet two inches and three quarters. — The colour of the gown, a sea-green; waistcoat and breeches, buff-colour; stockings white, or rather pearl-colour; curtain a terra-sienna, or very rich reddish brown. — I think the whole will have a good effect; but beseech you to send me your opinion *directly*. There are some things we can alter; but there are others we must not.

You shall have one of the size you desire in the spring; but will you not calculate for some one place in your room? The painter takes very strong likenesses; is young; rather daring than delicate in his manner, though he paints well in enamel; good-natured; slovenly; would improve much by application. Adieu!

W. S.

2 William Hogarth (1697–1764) 'Of Academies'

Considerable confusion surrounds Hogarth's late writings. He was helped by literary friends to clarify and polish the prose of his *Analysis of Beauty* (IIIB3), which went through several drafts before its publication in 1753. None of the texts he wrote thereafter was ever brought to completion. These include a Supplement to the *Analysis*, his largely autobiographical 'Apology for Painters', and his reflections on the question of an Academy. Instead, after his death, the unpublished manuscripts passed to John Ireland, who subsequently edited them into a work known as the 'Anecdotes of William Hogarth'. This was first published by Ireland in 1798 as *A Supplement to Hogarth Illustrated*. Modern art-historical scholarship has shown that Ireland's intervention was more active than he implied. Hogarth's manuscripts were fragmentary, repetitive and discontinuous, some more so than others: the autobiographical notes are particularly splenetic and disjointed. The

reflections on the academy are rather less so, but there is still a considerable gap between Ireland's flowing prose and Hogarth's own staccato text. Nonetheless, Ireland does not actually misrepresent Hogarth, and we have chosen to reprint the comments on academies as he rendered them. The first academy to be organized in England was run by Kneller from 1711 to 1718. Others, mentioned by Hogarth, were then run by Cheron and Vanderbanck, and by Thornhill in the 1720s. Hogarth himself took over the running of the St Martin's Lane Academy from 1734, and this remained the main focus for art in London for the next twenty years. Hogarth split from it in the early 1750s, for reasons he gives in his text, and for a while he became involved with the Society for the Encouragement of Arts, Manufactures and Commerce, founded in 1754. This became the Society of Arts, and in April 1760, following a joint initiative, St Martin's Lane artists and the Society organized what has been seen as the first genuinely public art exhibition to take place in England. The situation continued confused until the Royal Academy was finally founded in December 1768, four years after Hogarth's death. Kitson (1968) argues persuasively that Hogarth's comments on academies were written in c.1760–1. Our selections have been made from chapter III of the 1833 edition of Ireland's *Anecdotes of William Hogarth, written by himself*, London: J. B. Nichols and Son, pp. 24–7, 30–1.

Much has been said about the immense benefit likely to result from the establishment of an Academy in this country, but as I do not see it in the same light with many of my contemporaries, I shall take the freedom of making my objections to the plan on which they propose forming it; and as a sort of preliminary to the subject, state some slight particulars concerning the fate of former attempts at similar establishments.

The first place of this sort was in Queen-street, about sixty years ago; it was begun by some gentlemen-painters of the first rank, who in their general forms imitated the plan of that in France, but conducted their business with far less fuss and solemnity; yet the little that there was, in a very short time became the object of ridicule. Jealousies arose, parties were formed, and the president and all his adherents found themselves comically represented, as marching in ridiculous procession round the walls of the room. The first proprietors soon put a padlock on the door; the rest, by their right as subscribers, did the same, and thus ended this academy.

Sir James Thornhill, at the head of one of these parties, then set up another in a room he built at the back of his own house, now next the playhouse, and furnished tickets gratis to all that required admission; but so few would lay themselves under such an obligation, that this also soon sunk into insignificance. Mr. Vanderbank headed the rebellious party, and converted an old Presbyterian meeting-house into an academy, with the addition of a woman figure, to make it the more inviting to subscribers. This lasted a few years; but the treasurer sinking the subscription money, the lamp, stove, &c. were seized for rent; and that also dropped.

Sir James dying, I became possessed of his neglected apparatus; and thinking that an Academy conducted on proper and moderate principles had some use, proposed that a number of artists should enter into a subscription for the hire of a place large enough to admit thirty or forty people to draw after a naked figure. This was soon agreed to, and a room taken in St. Martin's Lane. To serve the society, I lent them the furniture which had belonged to Sir James Thornhill's academy; and as I attributed the failure of that and Mr. Vanderbank's to the leading members assuming a superiority which their fellow-students could not brook, I proposed that every

member should contribute an equal sum to the establishment, and have an equal right to vote in every question relative to the society. As to electing presidents, directors, professors, &c. I considered it as a ridiculous imitation of the foolish parade of the French Academy, by the establishment of which Louis XIV. got a large portion of fame and flattery on very easy terms. But I could never learn that the arts were benefited, or that members acquired any other advantages than what arose to a few leaders from their paltry salaries, not more I am told than fifty pounds a year; which, as must always be the case, were engrossed by those who had most influence, without any regard to their relative merit. As a proof of the little benefit the arts derived from this Royal Academy, Voltaire asserts that, after its establishment, no one work of genius appeared in the country; the whole band, adds the same lively and sensible writer, became mannerists and imitators. It may be said in answer to this, that all painting is but imitation: granted; but if we go no further than copying what has been done before, without entering into the spirit, causes, and effects, what are we doing? If we vary from our original, we fall off from it, and it ceases to be a copy; and if we strictly adhere to it, we can have no hopes of getting beyond it; for if two men ride on a horse, one of them must be behind.

To return to our own Academy; by the regulations I have mentioned of a general equality, &c., it has now subsisted near thirty years; and is, to every useful purpose, equal to that in France, or any other; but this does not satisfy. The members finding his present Majesty's partiality to the arts, met at the Turk's Head in Gerrard-street, Soho; laid out the public money in advertisements, to call all sorts of artists together; and have resolved to draw up and present a ridiculous address to King, Lords, and Commons, to do for them, what they have (as well as it can be) done for themselves. Thus to pester the three great estates of the empire, about twenty or thirty students drawing after a man or a horse, appears, as it must be acknowledged, foolish enough; but the real motive is, that a few bustling characters, who have access to people of rank, think they can thus get a superiority over their brethren, be appointed to places, and have salaries as in France, for telling a lad when an arm or a leg is too long or too short.

Not approving of this plan, I opposed it; and having refused to assign to the society the property which I had before lent them, I am accused of acrimony, ill nature, and spleen, and held forth as an enemy to the arts and artists. How far their mighty project will succeed, I neither know nor care; certain I am it deserves to be laughed at, and laughed at it has been. The business rests in the breast of Majesty, and the simple question now is, — whether he will do, what Sir James Thornhill did before him, i.e. establish an Academy, with the little addition of a royal name, and salaries for those professors who can make most interest and obtain the greatest patronage. As his Majesty's beneficence to the arts will unquestionably induce him to do that which he thinks most likely to promote them, would it not be more useful, if he were to furnish his own gallery with one picture by each of the most eminent painters among his own subjects? This might possibly set an example to a few of the opulent nobility; but, even then, it is to be feared that there never can be a market in this country for the great number of works which, by encouraging parents to place their children in this line, it would probably cause to be painted. The world is already glutted with these commodities, which do not perish fast enough to want such a supply. [...]

Portrait painting . . . *ever* has, and *ever* will succeed better in this Country than in any other; the demand will be as constant as new faces arise; and with this we must be contented, for it will be in vain to attempt to force what can never be accomplished; or at least can never be accomplished by such institutions as Royal Academies on the system now in agitation. Upon the whole, it must be acknowledged that the artists and the age are fitted for each other. If hereafter the times alter, the arts, like water, will find their level.

Among other causes that militate against either painting or sculpture succeeding in this nation, we must place our religion; which, inculcating unadorned simplicity, doth not require, nay absolutely forbids, images for worship, or pictures to excite enthusiasm. Paintings are considered as pieces of furniture, and Europe is already overstocked with the works of other ages. These, with copies, countless as the sands on the sea shore, are bartered to and fro, and are quite sufficient for the demands of the curious; who naturally prefer scarce, expensive, and far-fetched productions, to those which they might have on low terms at home. Who can be expected to give forty guineas for a modern landscape, though in ever so superior a style, when he can purchase one, which, for little more than double the sum, shall be sanctioned by a sounding name, and warranted original by a solemn-faced connoisseur? This considered, can it excite wonder that the arts have not taken such deep root in this soil as in places where the people cultivate them from a kind of religious necessity, and where proficients have so much more profit in the pursuit? Whether it is to our honour or disgrace, I will not presume to say, but the fact is indisputable, that the public encourage trade and mechanics, rather than painting and sculpture. Is it then reasonable to think, that the artist, who, to attain essential excellence in his profession, should have the talents of a Shakespeare, a Milton, or a Swift, will follow this tedious and laborious study merely for fame, when his next door neighbour, perhaps a porter-brewer, or an haberdasher of small wares, can without any genius accumulate an enormous fortune in a few years, become a Lord Mayor, or a Member of Parliament, and purchase a title for his heir? Surely no; – for, as very few painters get even moderately rich, it is not reasonable to expect, that they should waste their lives in cultivating the higher branch of the art, until their country becomes more alive to its importance, and better disposed to reward their labours.

These are the true causes that have retarded our progress; and for this, shall a nation which has, in all ages, abounded in men of sound understanding, and the brightest parts, be branded with incapacity, by a set of pedantic dreamers, who seem to imagine that the degrees of genius are to be measured like the degrees on a globe, – determine a man's powers from the latitude in which he was born, – and think that a painter, like certain tender plants, can only thrive in a hot-house? Gross as are these absurdities, there will always be a band of profound blockheads ready to adopt and circulate them; if it were only upon the authority of the great names by which they are sanctioned.

3 Frans Hemsterhuis (1721–1790) from ‘Letter on Sculpture’

The Dutch philosopher and aesthete, Frans Hemsterhuis, was born in Franeker in Frisia, the son of a noted philologist and professor of Greek, Tiberius Hemsterhuis (1685–1766). He spent most of his life in The Hague and from 1755 to 1780 held the post of secretary to the Council of State. He developed a strong interest in the natural sciences, especially optics, and was a keen amateur draughtsman, taking lessons from Etienne Falconet (see IIC11) and Lorenz Natter. In his *Lettre sur la Sculpture* his initial concern is with the psychological conditions of imitation in the arts. He notes that perception is dependent upon both point of view and the possession of appropriate concepts. He also observes that while simple and coherent forms are more readily perceived, the human mind relishes variety, so that the most successful compositions will be those in which separate parts are so well unified that they can be instantaneously perceived. In the following passage he considers how complexity of subject and clarity of formal organization may be combined to maximal effect in the art of sculpture. Hemsterhuis wrote his *Lettre sur la Sculpture* in French, addressed it from The Hague and dated it 1765. It was first published in Amsterdam in 1769. Our excerpt is taken from pp. 9–12 of the original edition, translated for the present volume by Jonathan Murphy.

[...] Beauty in the arts is that which should furnish us with the greatest possible number of ideas in the smallest possible lapse of time. It follows from this that an artist can arrive at the beautiful by two different means: through the finesse and facility of his contours he can give me, in a single second, for example, the idea of beauty at rest as in the Medici Venus or in Galatea; or through a freer and more mobile line he might show me Andromeda, with all her hope and fear written on her body, and thus he could show me in the same second not only the idea of beauty but also an idea of the danger that she faces, which would set in motion not only my admiration, but almost my faculty of commiseration. It is perhaps the case that the expression of any passion in a figure diminishes slightly the freedom of the line, which makes it so easy for our eyes to scan the picture; but through the addition of action and passion to a figure there is a consequently greater concentration of ideas in the same lapse of time. Michelangelo, in his *Hercules and Antaeus* group, was attempting to reach this optimum by maximizing the number of ideas, through the perfect expression of the action of Hercules and the passion of Antaeus, rather than by reducing to a minimum the amount of time that we require to appreciate the group, through a great facility in the lines, so that our gaze is never arrested by a particular point. The opposite procedure is used by Giambologna, in the *Rape of the Sabine Women*, who sought this optimum by reducing the time lapse to a minimum through the facility of the contours, which enclose as great a number of highly contrasting members as it is possible to imagine in a composition that involves only three figures. When one examines the two groups at any distance, the *Hercules and Antaeus* is far inferior, as the magic wrought by the expression fails to work from afar, and all that remains is the relatively small number of ideas that can be achieved through a small number of contrasting poses: whereas the *Rape of the Sabine Women* has precisely the opposite effect.

What is most harmful to this optimum in all art is the idea of internal contradiction, either between different aspects of the line or between those lines which express action and those which express passion. [...]

To understand what I mean by contradiction in expression, one need only imagine the *Farnese Hercules*, and think of any of the overly tight muscles, which trouble the harmony and repose which was Glycon's aim. Or indeed think of any of the limbs in the Laocoön group, or any physiognomy expressing joy. [...]

Artists fall into this error for the reasons I have outlined above: the soul needs time, and succession of the various parts when through either words or actions it desires to convey or execute a beautiful idea that it has conceived.

It will be understood from this that it is entirely possible where the beautiful is concerned to surpass nature herself; for it would indeed be an unusual happenstance that gathered together a sufficient quantity of constituent parts to result in this *optimum* that I describe, analogous not to the essence of things themselves, but to the rapport between objects in the world and the nature of our sense organs. One may choose different objects, but the nature of our ideas concerning the beautiful will remain unchanged. But if the nature or construction of our sense organs were to change, the nature of our current ideas concerning beauty would immediately be destroyed.

There remains one observation to be made, and a humiliating one at that, but one that proves incontrovertibly that in itself beauty has no reality. One need only take a vase or group of figures which by all our standards can only be considered ugly, and a second object which meets all our standards for the beautiful. The objects should then be examined from all sides for several hours each day. The first response to this unpleasant experiment will be one of disgust; but as we continue to compare the objects, we will be amazed to find that our sensitivity to the differing degrees of beauty will swiftly diminish, and soon their nature will appear to have changed. With time we will be unable to choose between the two objects, which nonetheless differ radically from each other. The reason for the disgust derives from a property of the soul which I shall investigate in greater detail at a later date: but the reason for the change in our judgement is that our eye, during this experience, has become so accustomed to following the lines of the group whose composition was ugly, that it now completes its journey in almost exactly the same lapse of time as is required by the other object for us to have a different idea of it: what has happened in fact is that through glancing many times over the beautiful object, the eye has discovered the tiny flaws and imperfections that it passed over at first glance, and now stops to consider them in the course of each glance. An identical effect may be observed in any of the arts.

From nature, we have learnt to know things: from use of them, we learn to tell them apart; but our idea of the beauty of things is no more than a necessary consequence of the singular property of the soul that I demonstrated above.

In closing this somewhat metaphysical section of the letter, I would remark in passing that through this property, it would seem incontestable that there is some element of our soul which strongly resists the manner in which events succeed each other in our consciousness, and also resists the prolongation of any mental state.

4 Anton Raphael Mengs (1728–1799) 'A Discourse upon the Academy of Fine Art at Madrid'

In 1761 Mengs (see IIIB13) was commissioned by Charles III to work on frescos for the Palacio Real in Madrid, remaining in the city until 1769. For the last three years he enjoyed the official title of First Painter to the King. The Real Academia de Bellas Artes (Royal Academy of Fine Arts) de San Fernando had been founded in Madrid in 1752 under the patronage of Ferdinand VI, closely following the example of the French Academy, with outstanding students rewarded by scholarships to study in Rome. Within two years of his arrival in Madrid, Mengs was involved in moves to reform the Academy. He had met Winckelmann in Rome in 1755 and had been profoundly influenced by the art historian in his approach to the legacy of classical art (see IIIA5, 8). As the following text makes clear, his own concept of reform involved a reassertion of the importance of classical example and a strengthening of the established academic regime. The discourse on the Academy was originally published in Madrid in 1766 under the title *Ragionamento su l'Accademia delle Belle Arti di Madrid*. (A second discourse published in the same year concerned the means by which the fine arts might be made to flourish in Spain.) Mengs' recommendations were finally to be implemented in 1773. Twenty-four years later the Spanish painter Goya was to offer his own very different advice for the conduct of the Academy (IVA14). Mengs' writings were collected after his death and edited by G. N. d'Azara as *Opere di Antonio Raffaello Mengs, primo pittore della Maestà di Carlo III, Re di Spagna*, 2 vols, Parma, 1780; revised 4 vols., Rome, 1787. English, French, German and Spanish editions followed during the next two decades, establishing a wide reputation for Mengs as a theorist. The following text is taken from the English translation included in *The Works of Anton Raphael Mengs*, London: R. Faulder, 1796, vol. III, pp. 69–83.

By an *academy* is understood an assembly of men the most expert in science or in art, their object being to investigate truth, and to find fixed rules always conducing to progress and perfection. It is very different from a school in which able masters teach the elements of sciences or of arts. The fine arts, as liberal ones, have their fixed rules founded in reason and on experience, by which means they join to obtain their end, which is the perfect imitation of nature; from whence an academy of these arts ought not to comprehend alone the execution, but ought to apply principally to the theory and to the speculation of rules, since indeed these arts terminate in the operation of the hand; but if this is not directed by good theory, they will be deprived of the title of liberal arts.

Some erroneously think that practice alone is of more importance than all the rules together, and without them there have been great artists. False are such ideas, and so false that they merit not a confutation. Whatever is done without reason and without rules is all hazard. How is it possible to arrive to a determinate end without a sure guide to conduct us? Painting and sculpture are arts similar to poetry; and as in this last art, sensibility, imagination and genius, can never produce, without rules and knowledge, any thing but dreams and monstrous productions, the same must happen in the two first. Therefore, as the poet, without knowing profoundly the subject which he has to treat and the language in which he is to explain himself, can never produce a perfect work, neither will the painter or sculptor know how to perform a

work worthy these professions, if they know not the forms of the bodies which they imitate, and the diversity of manners with which they present them to our sight; and the same will happen if they know not the theory of the art.

I do not, however, say that theory alone ought to exclude the exercise of the hand; on the contrary, I infinitely recommend it: both ought always to be united; and in this sense ought to be understood the oracle of Michael Angelo, who was wont to say that all the art consisted in the *obedience of the hand to the conception*. This great man well understood that images ought to be well imprinted on the mind, and the idea of every thing which the hand ought to execute. From whence it is necessary always to have practice, but with the knowledge of why and wherefore.

The able professors of an academy ought to endeavour, by conferring together, to find out certain rules, by which students may be able to abbreviate the course of arts so extensive. These rules will be prescribed to youth as fundamental laws, explaining to them reasons by clear demonstrations, which not only may convince, but persuade, since without persuasion one is not capable of doing any thing perfect.

All academies of arts have begun from being schools, and afterwards have been transformed into what we call academies, that is to say, societies of professors, who by their conferences and discourses promote instructions, and have merited the protection of princes. In this manner have begun the academies of Rome, Bologna, Florence and Paris, &c. &c.

The utility of such establishments consists in the advancement of arts, and in the influence which they occasion in a nation by disseminating there a good taste: since it is the intelligence of design which directs all arts treating of figures or of forms. This utility cannot possibly be obtained by any academy, if good reasoning and the aforesaid theory of design are not publicly taught; because, without theory, design is only a practical and material action which produces the figure alone that one circumscribes, without giving to it a general intelligence, or instructing how to judge of the forms. For which reason, every academy which follows not the above-mentioned maxims, will have material designers and artisans, but not illuminated and excellent artists; and in consequence will operate against its principal end, and will waste the time that it employs in bad instructions.

* * *

Considering now the academy of Madrid as a school, it is necessary to make some reflections. Even to these latter times good examples of the arts were here wanting. In this, however, they have at last been supplied, the academy being now possessed of the best and most copious collection of casts of the antique statues that are in Europe. From this one now is in a capacity to learn proportions, the art of expressing anatomy without harshness, a selection of fine forms, and the true character of beauty. Yet according to my belief much time is wanted to acquire an uniform system of design, and some necessary parts of art which they either do not teach, or teach improperly. Upon these matters I will speak my opinion ingenuously.

Although there are found in Madrid many professors of merit, one cannot deny but there have been, and that there are now elsewhere, schools more reputable. One ought not, therefore, to give as an example to youth the particular works of the artists of this academy, but one ought to take the best works of every school, and of all the

most celebrated professors. In this manner boys, from their most tender age, will accustom themselves to a good style. Another very great advantage will result from it, which is, that the masters of the academy will be able to speak with freedom, not being led away by self-love or by human prejudices, which prevent a man from speaking frankly his sentiments, there where he speaks of his own work, or of his associates, having themselves many reasons to palliate their own opinions.

It would be also very convenient that professors should give a good example in designing and of modelling together with their scholars in the modelling room, by this means animating the youth and the professors themselves in the inferior classes: this study being much more useful to the advanced than to scholars. Above all it would be necessary that one should examine with the greatest attention every thing proposed to youth; not submitting to the caprice of particulars the introductions of vicious examples, since it is much more difficult to undo a vice acquired in early years, than to learn a thousand good things.

The time that is destined in the academy for study is neither sufficient or proper, because the hours of the night are few for a study so extensive; and the spirits of a youth, distracted by the occupations of the day, have not the necessary activity for learning, and for fixing in the memory the things that are taught him. It would be therefore necessary, since the academy is to be also a school, to do that which is practised in the schools of other branches, that is to say, to employ in study the later hours of the day, with the assistance of professors of an inferior rank, and those should give an account to the superior of the progress and of the mode of teaching. This exercise would be, besides that, very useful to themselves; and the principal masters ought to review the studies of youth, in order to change the classes according to their progress.

The exercise of night ought to serve only for those who, being already advanced in the theory of the art, have occasion to augment the practice by frequent use, because otherwise, with the solicitude with which they ought to work at night, pupils accustom themselves to an incorrectness which degenerates into a vicious negligence, there not being time to observe well the rules and the reasons of art; and those who being to copy rudiments have not sufficient time to see the fruit of their application, whence many discourage themselves and abandon the study already begun. In short, if the academy is to be a school, it is necessary to practise there all that which a vigilant and good master ought privately to do for his own disciples; otherwise it will never become an useful school.

If laws, and the maxims of public lectures, are not fixed in a manner that youth learn as if they studied under one master only, they will confuse the disciple by following different, and sometimes contradictory rules.

For that reason it would be necessary, that professors congregate themselves and well examine matters: they should consult and determine the method which ought to be followed, weighing well reasons, pro and contra, reserving nevertheless to amend them, whenever experience and reason may indicate the necessity.

The things which ought to be taught with a greater diligence are, linear and aërial perspective, selecting notwithstanding a short method. Then comes anatomy, not as physicians and surgeons learn it, but as it is suitable to the arts, which have for their

object the imitation of the exterior forms of things: and as amongst all the bodies of nature there is not for man any thing more noble, and more worthy than the human figure, it is very necessary for him to know it exactly, both in the whole and in its parts, and this is taught us by anatomy. Whence it is that perspective shews to us the manner of imitating the appearance of forms, which one cannot execute without knowing it anatomically. For this reason, this science is equally necessary to the sculptor and the painter.

Nor is less precious the study of symmetry, that is to say, of the proportions of the human body, without which it is not possible to know how to select from nature the most perfect bodies. By this the ancient Greeks distinguished themselves so superiorly from us; and they derived beauty, grace and animation from the knowledge of proportions.

The art of light and shade, which is called *clare obscure*, ought to be taught with the same accuracy, since without it painting cannot have any relief: therefore it is necessary to consider it as an essential part, so much the more as painters have not always the opportunity of seeing things according to nature; and when even they have, it is not so easy to understand the reasons of them, and to keep fast to truth by not permitting themselves to be transported by any practical rules followed by ignorant people, and learned without reflection from their masters. Finally, *clare obscure* is a part doubly useful, because it pleases the intelligent as well as those who are not so.

I know not if lessons of colouring have ever been given, notwithstanding it is a part so principal in painting, that it has its rules founded on science and reason. Without such study, it is impossible that youth can acquire a good taste in colouring, or understand harmony.

In the same manner it is necessary to teach invention and composition without omitting the art of composing drapery. All these have equally their fixed rules; rules necessary to be learned, to understand what one sees in nature. I will not say that with these rules alone, and without talents, it is possible to acquire the arts: I say, however, that without them, no one will ever arrive to be an excellent artist; and if even all the rules are not susceptible of demonstration, those indeed which respect imitation they absolutely admit, and those of election have their reasons almost evident.

Some possibly will say, that all this study that I propose for an academy, could be done by some master professor in his own house to his disciples. To me it appears otherwise, believing it impossible that any one man can know equally well so many things; and if indeed he knew them, I know not if he would have time or convenience to teach them. Besides which it might happen, that amongst those who study under a particular master one would find some of talents, which by defect of good instruction, or from some other motive, cannot arrive to make him a man of great merit; whilst in a public school he will have occasion to develop his own ingenuity, and to distinguish himself by emulation, and from a poor unhappy man render himself an artist, who may give honour to the art, and glory to his country.

5 Benjamin West (1738–1820) and John Singleton Copley (1738–1815) Correspondence 1766–7

West and Copley were both born in America, in Pennsylvania and Boston respectively, and both travelled to Italy to study before settling permanently in London. Though they were contemporaries, West's career advanced a great deal faster than Copley's, thanks in part to the early support of American patrons. He spent three years in Italy between 1760 and 1763, studying with Anton Raphael Mengs in Rome and gaining membership of academies in Bologna, Florence and Parma. He arrived in London with qualifications as a neo-classical history painter that no English artist could match, and was soon to draw attention to himself through works shown at the Society of Arts. He was among those who would serve as founder members of the Royal Academy in 1768. By the time of his correspondence with Copley he was thus already well established in professional circles, using his position to the advantage of other American artists as the opportunity arose. Copley, on the other hand, was not to leave for Europe until 1774. During his time in America he was largely restricted to the study of prints for his exemplars, and to the painting of portraits for a living, there being no market for history paintings (see ID8). By the 1760s he was established as the foremost portrait painter in the Boston area. In 1765 he sent *Boy with a Squirrel* (now in the Museum of Fine Arts, Boston) for exhibition at the Society of Arts in London the following year, consigning it to the care of his friend Captain Bruce. The painting was well received, and West took it upon himself both to encourage his compatriot and to pass on his own and Joshua Reynolds' advice and criticism, initiating the correspondence represented here. Copley's move to England was finally triggered by the American Revolution. After spending a year in Italy in 1774–5 he embarked on a second career in London. His first history painting, *Watson and the Shark*, was shown at the Royal Academy in 1779, the year of his election to membership. In *The Death of the Earl of Chatham* (1779–81), his next historical subject, he followed the precedent of West's *Death of General Wolfe* (see IVA6) in treating a modern theme in modern dress. Our text of the correspondence is taken from *Letters and Papers of John Singleton Copley and Henry Pelham, 1739–1776*, Boston: Massachusetts Historical Society, no. 71, 1914, pp. 43–5, 50–2, 56–8.

Benjamin West to Copley

London, August 4th, 1766.

Sir,

On Seeing a Picture painted by you and meeting with Captain Bruce, I take the liberty of writeing to you. The great Honour the Picture has gaind you hear in the art of Painting I dare say must have been made known to You Long before this Time. and as Your have made So great a Progr[e]ss in the art I am Persuaded You are the more desierous of hearing the remarks that might have been made by those of the Profession, and as I am hear in the Midst of the Painting world have the greater oppertunity of hearing them. Your Picture first fell into Mr. Reynolds' hands to have it Put into the Exhibition as the Proformanc of a Young American: he was Greatly Struck with the Piec, and it was first Concluded to have been Painted by one Mr. Wright [Joseph Wright of Derby], a young man that has just made his appearance in the art in a sirprising Degree of Merritt. as Your Name was not given with the

Picture it was Concluded a mistake, but before the Exhibition opened the Peticulers was recevd from Capt. Bruce. while it was Excibited to View the Criticizems was, that at first Sight the Picture struck the Eye as being to liney, which was judgd to have arose from there being so much neetness in the lines, which indeed as fare as I was Capable of judgeing was some what the Casc. for I very well know from endeavouring at great Correctness in ones out line it is apt to Produce a Poverty in the look of ones work. when ever great Desition [decision] is attended to they lines are apt to be to fine and edgy. This is a thing in works of great Painter[s] I have remark[ed] has been strictly a voyded, and have given Correctness in a breadth of out line, which is finishing out into the Canves by no determind line when Closely examined; tho when seen at a short distanc, as when one looks at a Picture, shall appear with the greatest Bewty and freedom. for in nature every thing is Round, or at least Partakes the most of that forme which makes it imposeble that Nature, when seen in a light and shade, can ever appear liney.

As we have every April an Exhibition where our works is exhibited to the Publick, I advise you to Paint a Picture of a half figure or two in one Picc, of a Boy and Girle, or any other subject you may fancy. And be shure take your Subjects from Nature as you did in your last Picc, and dont trust any resemblanc of any thing to fancey, except the dispositions of they figures and they ajustments of Draperies, So as to make an agreable whole. for in this Consists the work of fencey and Test [taste].

If you should do anything of this kind, I begg you may send it to me, when you may be shure it shall have the greatest justice done it. lett it be Painted in oil, and make it a rule to Paint in that way as much as Possible, for Oil Painting has the superiority over all other Painting. As I am from America, and know the little Opertunities is to be had their in they way of Painting, made the inducement the more in writeing to you in this manner, and as you have got to that lenght in the art that nothing is wanting to Perfect you now but a Sight of what has been done by the great Masters, and if you Could make a viset to Europe for this Porpase for three or four years, you would find yourself then in Possession of what will be highly valuable. if ever you should make a viset to Europe you may depend on my friendship in eny way thats in my Power to Sarve.

Your Friend and Humble Servent,

B. West.

my direction is Castle Street Leicester Fields. [...]

Copley to Benjamin West

Boston, Novr. 12, 1766.

Sir,

Your kind favour of Augst. 4, 1766, came to hand. It gave me great pleasure to receive without reserve Your Criticisms on the Picture I sent to the Exhibition. Mr. Powell informed me of Your intention of wrighting, and the handsom things You was pleas'd say in praise of that little performance, which has increased my estamation of it, and demands my thanks which previous to the receipt of Your favour I acknowledged in a letter forwarded by Mr. Powell. It was remarkd the Picture was too lind. this I confess I was concious of my self and think with You that it is the natural result

of two great presition in the out line, which in my next Picture I will indeavour to avoid, and perhaps should not have fallen into it in that, had I not felt two great timerity at presenting a Picture to the inspection of the first artists in the World, and where it was to come into competition with such masterly performances as generally appear in that Collection. In my last I promis'd to send another peace. the subject You have sence pointed out, but I fear it will not be in my power to comply with Your design, the time being two short for the exicution of two figures, not having it in my power to spend all my time on it, and the Days short and weither cold, and I must ship it by the middle of Feby. at farthest, otherwise it will come too late for the exibition. but I shall do something near what you propose. Your c[a]utioning me against doing anything from fancy I take very kind, being sensible of the necessity of attending to Nature as the fountain head of all perfection, and the works of the great Masters as so many guides that lead to the more perfect imitation of her, pointing out to us in what she is to be coppied, and where we should deviate from her. In this Country as You rightly observe there is no examples of Art, except what is to [be] met with in a few prints indiferently exicuted, from which it is not possable to learn much, and must greatly inhanch the Value of free and unreserved Criticism made with judgment and Candor.

It would give me inexpressable pleasure to make a trip to Europe, where I should see those fair examples of art that have stood so long the admiration of all the world. the Paintings, Sculptors and Basso Releivos that adourn Italy, and which You have had the pleasure of making Your Studies from would, I am sure, animate my pencil, and inable me to acquire that bold free and gracefull stile of Painting that will, if ever, come much slower from the mere dictates of Nature, which has hither too been my only instructor. I was allmost tempted the last year to take a tour to Philadelphia, and that chiefly to see some of Your Pictures, which I am informd are there. I think myself peculiarly unlucky in Liveing in a place into which there has not been one portrait brought that is worthy to be call'd a Picture within my memory, which leaves me at a great loss to gess the stile that You, Mr. Renolds, and the other Artists practtice. I shall be glad when you write next you will be more explicit on the article of Crayons, and why You dis[ap]prove the use of them, for I think my best portraits done in that way. and be kind enough to inform me what Count Allgarotti means by the five points that he recommends for amusement and to assist the invention of postures, and weither any prints after Corregios or Titianos are to be purchased. I fear I sball tire Your patience and mak you repent your wrighting to one who makes so many requests in one letter.

But I shall be exceeding glad to know in genrcal what the present state of Painting in Italy is, weither the Living Masters are excellent as the Dead have been. it is not possable my curiossity can be satisfied in this by any Body but Yourself, not having any corrspondance with any whose judgment is sufficent to sattsify me. I have been painting the head of a Decenting Cleargyman and his friends are desireous to subscribe for it to be scraped in mezzotinto in the common size of 14 inches by ten, but I cannot give them the terms till I know the price. I shall take it kind if when you see any artist that You approve You menshon it to him, and Let me know. I have seen a well exicuted print by Mr. [William] Pether of a Jew Rabbi. if You tbink him a good hand, be kind enough to desire him to let me know by a few lines (as soon as

convenient) his terms, as the portrait weits only for that in my hands, and I shall send it immediatly with the mony to defray the expence when I know what it is.

I am Sir with all Sincerit[y] Your friend and Humble Sert.

J: S: Copley. [...]

Benjamin West to Copley

London, June 20th, 1767.

Sir,

Dont impute the long Omission of my not writeing to you [to] any forgetfullness or want of that Friendship I first Shewd on seeing your works. My having been so much ingaged in the Study of my Bussiness, in perticuler that of history Painting, which demands the greatest Cear and intelegance in History amaginable, has so intierly Prevented my taking up the Penn to answe'r your Several Agreeable favours, and the reception of your Picture of the little Gairl you Sent for the exhibition. It came safe to hand in good time. And as I am Persuaded you must be much interested in regard to the reception it mett with from they artists and Publicks opinion in General, I as a Friend Take this oppertunity to Communicate it to you.

In regard to the Artists they Somewhat differ in Opinion from Each Other, Some Saying they thought your First Picture was the Best, others Say the last is Superior (which I think [it] is as a Picture in point of Exhe'cution, tho' not So in Subject). But of those I shall give this of Mr. Reynolds when he saw it he was not so much Pleased with it as he was with the first Picture you Exhibited, that he thought you had not mannaged the general Affect of it so Pleasing as the other. This is what the Artists in General has Criticised, and the Colouring of the Shadows of the flash wants transperency. Those are thing[s] in General that have Struck them. I Cant say but the Above remarks have some justness in them, for the Picture being at my house some time gave me an oppertunity of Examining it with more Exectness.

The General Affect as Mr. Reynolds justly Observes is not quite so agreeable in this as in the other; which arrises from Each Part of the Picture being Equell in Strenght of Coulering and finishing, Each Making to much a Picture of its silf, without that Duc Subordanation to the Principle Parts, viz they head and hands. For one may Observe in the great works of Van dyke, who is the Prince of Portrait Painter[s], how he has mannaged by light and shedow and the Couler of Dreperys made the face and hands appear allmost a Disception. For in Portrait Painting those are they Parts of Most Consequence, and of Corse ought to be the most distinguished. There is in Historical Painting this Same attention to be Paid. For if the Principl Carrictors are Suffred to Stand in the Croud, and not distinguished by light and shadow, or made Conspicuous by some Pcee of art, So that the Eye is first Caut by the Head Carrictor of the History, and So on to the next as he bears Proportion to the head Carrictor, if this is not observed the whole is Confusion and looses that dignity we So much admier in Great works. Your Picture is in Possession of Drawing to a Correctness that is very Surpriseing, and of Coulering very Brilliant, tho' this Brilantcy is Somewhat missapplyed, as for instance, the Gown too bright for the flesh, which over Came it in Brilency. This made them Critisise they Shadows of the Flesh without knowing from whence this defect arose; and so in like manner the dog and Carpet to

Conspicuous for Excesry things, and a little want of Propriety in the Back Ground, which Should have been Some Modern ornament, as the Girle was in a Modern dress and modern Cherce [skirt?]. The Back Ground Should have had a look of this time. These are Critisisms I should not mak was not your Pictures very nigh upon a footing with the first artists who now Paints, and my being sensible that Observations of this nature in a friendly way to a man of Your Talents must not be Disagreeable. I with the greater Freedom give them, As it is by this assistance the art is read to its hight. I hope I shall have the Pleasur of Seeing you in Europe, whare you will have an oppertunity of Contemplateing the great Productions of art, and feel from them what words Cannot Express. For this is a Scorce the want of which (I am senseble of) Cannot be had in Ameri[c]a; and if you should Ever Come to London my house is at Your Service, or if you should incline to go for Italy, if you think letters from me Can be of any Service, there are much at your Service. And be assurd I am with greatest Friendship, Your Most obediant Humble Servent

Benjn West.

PS. I have Spoke to Several of our Mezzotinto Scrapers, and there Prices for a Plate after a Picture of that Sise is from fifteen Guines to Twenty Guines. Thare is Scrapers of a less Price thin that, but they are reather indefirent. I hope you will fevou us with a Picture the next Exhibition. In Closed I Send you a Copy of our Royal Charter and list of fellows, amongst whom you are Chosen one. The next which will be printed your name is to be inserted.

6 Benjamin West (1738–1820) on *The Death of General Wolfe*

Having achieved success within a few years after his arrival from Italy (see IVA5), West decided to stay and to pursue a career in England. By the late 1760s he had gained a position as a leading painter of histories in a neo-classical style and was appointed as history painter to George III. Substantial commissions followed for canvases on historical themes to decorate the Royal Chapel and King's Audience Room at Windsor Castle. For his best-known work, however, West portrayed an event from recent military history. He was 33 when he painted *The Death of General Wolfe* (now in the National Gallery of Canada, Ottawa). As an American, he may be expected to have had a particular interest in the subject, since the battle in which Wolfe died did much to determine the balance of power between the French and the English on the North American continent. Wolfe had defeated Montcalm at the Heights of Abraham outside Quebec. His death at the very moment of triumph provided a ready-made subject for an ambitious modern history painting. What made the picture so pivotal, however, was not its subject, but its treatment. West decided to clothe his heroes, not in the draperies of classical Antiquity, but in the modern dress they wore on the field. This was the first time such a procedure had been followed. His decision effectively reanimated the genre of history painting by according it the potential to engage directly with matters of present and public concern. Initial opposition to the plan came from members of the Royal Academy and from King George III, in his role as the leading patron of the arts. However, West's performance won them over, and the painting was widely acclaimed on its exhibition in 1771. Together with its successor, *William Penn's Treaty with the Indians* (1771–2, Academy of Fine Arts, Philadelphia), it was to bring West both financial reward and an international reputation through the wide circulation of engravings

in Europe and America. It was cited by David as a precedent for the exhibition of his *Sabines* in 1799 (see VII B2). West's account of his triumph appears in *The Life and Works of Benjamin West*. As its subtitle indicated, this account of West's life was in part 'composed from materials furnished by himself'. There is no indication as to when the passage in question was written, but it purports to be a verbatim account of the exchange which took place in West's studio sometime in 1771, between the artist himself, the Archbishop of York, and Joshua Reynolds, then President of the Royal Academy. We have included a paragraph by Galt which sets the scene. The extract is taken from John Galt, *The Life and Works of Benjamin West Esq.*, London: T. Cadell and W. Davies, and Edinburgh: W. Blackwood, 1820, pp. 46–50.

About this period, Mr. West had finished his *Death of Wolfe*, which excited a great sensation, both on account of its general merits as a work of art, and for representing the characters in the modern military costume. The King mentioned that he heard much of the picture, but he was informed that the dignity of the subject had been impaired by the latter circumstance; observing that it was thought very ridiculous to exhibit heroes in coats, breeches, and cock'd hats. The Artist replied, that he was quite aware of the objection, but that it was founded in prejudice, adding, with His Majesty's permission, he would relate an anecdote connected with that particular point.

'When it was understood that I intended to paint the characters as they had actually appeared in the scene, the Archbishop of York called on Reynolds and asked his opinion, the result of which was that they came together to my house. For His Grace was apprehensive that, by persevering in my intention, I might lose some portion of the reputation which he was pleased to think I had acquired by his picture of *Agrippina*, and *Your Majesty's of Regulus*;¹ and he was anxious to avert the misfortune by his friendly interposition. He informed me of the object of their visit, and that Reynolds wished to dissuade me from running so great a risk. I could not but feel highly gratified by so much solicitude, and acknowledged myself ready to attend to whatever Reynolds had to say, and even to adopt his advice, if it appeared to me founded on any proper principles. Reynolds then began a very ingenious and elegant dissertation on the state of the public taste in this country, and the danger which every attempt at innovation necessarily incurred of repulse or ridicule; and he concluded with urging me earnestly to adopt the classic costume of antiquity, as much more becoming the inherent greatness of my subject than the modern garb of war. I listened to him with the utmost attention in my power to give, but could perceive no principle in what he had delivered; only a strain of persuasion to induce me to comply with an existing prejudice, – a prejudice which I thought could not be too soon removed. When he had finished his discourse, I begged him to hear what I had to state in reply, and I began by remarking that the event intended to be commemorated took place on the 13th of September, 1758, in a region of the world unknown to the Greeks and Romans, and at a period of time when no such nations, nor heroes in their costume, any longer existed. The subject I have to represent is the conquest of a great province of America by the British troops. It is a topic that history will proudly record, and the same truth that guides the pen of the historian should govern the pencil of the artist. I consider myself as undertaking to tell this great event to the eye of the world; but if, instead of the facts of the

transaction, I represent classical fictions, how shall I be understood by posterity! The only reason for adopting the Greek and Roman dresses, is the picturesque forms of which their drapery is susceptible; but is this an advantage for which all the truth and propriety of the subject should be sacrificed? I want to mark the date, the place, and the parties engaged in the event; and if I am not able to dispose of the circumstances in a picturesque manner, no academical distribution of Greek or Roman costume will enable me to do justice to the subject. However, without insisting upon principles to which I intend to adhere, I feel myself so profoundly impressed with the friendship of this interference, that when the picture is finished, if you do not approve of it, I will consign it to the closet, whatever may be my own opinion of the execution. They soon after took their leave, and in due time I called on the Archbishop, and fixed a day with him to come with Reynolds to see the painting. They came accordingly, and the latter without speaking, after his first cursory glance, seated himself before the picture, and examined it with deep and minute attention for about half an hour. He then rose, and said to His Grace, Mr. West has conquered. He has treated his subject as it ought to be treated. I retract my objections against the introduction of any other circumstances into historical pictures than those which are requisite and appropriate; and I foresee that this picture will not only become one of the most popular, but occasion a revolution in the art.¹

¹ *Agrippina with the Ashes of Germanicus* (1767), and *Regulus* (1769).

7 Joshua Reynolds (1723–1792) from *Discourses on Art*, III, VI and XI

Reynolds' *Discourses* represent the summation of eighteenth-century art theory in English. In them he offered a grand synthesis of the existing knowledge of the arts in the classical tradition: the Ancients, mediated by authors such as Junius; the Renaissance, as represented in the writings of Alberti and Leonardo; French academic theory, represented by the likes of Du Fresnoy, De Piles and Le Brun; and eighteenth-century British philosophical discussion of the arts, represented by thinkers such as Richardson from the previous generation, and Hume and Burke from his own. After a long, wrangling debate, the Royal Academy was finally founded in December 1768, and Reynolds was immediately elected its first President. His first Discourse was delivered at the opening of the new institution on 2 January 1769. After that, the Discourses were delivered in December, on the occasion of the Academy's prize-giving ceremony. Discourses II–V were given annually between 1769 and 1772. Thereafter they took place every two years until the final one, the fifteenth on 10 December 1790. The single exception to this was the additional short Discourse IX, delivered in October 1780 on the occasion of the Academy's move to new, permanent premises at Somerset House on the Strand. The Discourses were an immediate success. The first seven were published in book form as early as 1778, since when there have been well over thirty English editions. Several were translated into French, German and Italian in Reynolds' own lifetime. The present selections have been made from three Discourses: III, from 14 December 1770; VI, from 10 December 1774; XI, from 10 December 1782. (Discourse IX is included as a separate selection below, at IVA8.) The principal themes addressed in Discourse III, VI and XI are the need for a Grand Style, the pursuit of ideal

beauty rather than mechanical imitation, and a reiteration of the status of painting as a Liberal Art. Reynolds' changing views on imitation and innovation are also represented. Thus in Discourse VI he challenges the type of argument advanced by Young regarding originality and genius (see IIIB10). But by the time of Discourse XI he lays greater emphasis on genius, arguing that the main work of art is not imitation as such, but the production of effects through an integrated aesthetic totality. The extracts have been taken from Reynolds' *Discourses*, edited with an introduction and notes by Pat Rogers, Harmondsworth: Penguin Classics, 1992. Our selections are from Discourse III: pp. 102–4, 105–7, 109–13; Discourse VI: pp. 152–5, 156–8; Discourse XI: pp. 247–50, 255–6.

Discourse III

[. . .] The first endeavours of a young Painter, as I have remarked in a former discourse, must be employed in the attainment of mechanical dexterity, and confined to the mere imitation of the object before him. Those who have advanced beyond the rudiments, may, perhaps, find in reflecting on the advice which I have likewise given them, when I recommended the diligent study of the works of our great predecessors; but I at the same time endeavoured to guard them against an implicit submission to the authority of any one master however excellent: or by a strict imitation of his manner, precluding themselves from the abundance and variety of Nature. I will now add, that Nature herself is not to be too closely copied. There are excellencies in the art of painting beyond what is commonly called the imitation of nature; and these excellencies I wish to point out. The Students who, having passed through the initiatory exercises, are more advanced in the art, and who, sure of their hand, have leisure to exert their understanding, must now be told, that a mere copier of nature can never produce any thing great; can never raise and enlarge the conceptions, or warm the heart of the spectator.

The wish of the genuine painter must be more extensive: instead of endeavouring to amuse mankind with the minute neatness of his imitations, he must endeavour to improve them by the grandeur of his ideas; instead of seeking praise, by deceiving the superficial sense of the spectator, he must strive for fame, by captivating the imagination.

The principle now laid down, that the perfection of this art does not consist in mere imitation, is far from being new or singular. It is, indeed, supported by the general opinion of the enlightened part of mankind. The poets, orators, and rhetoricians of antiquity, are continually enforcing this position; that all the arts receive their perfection from an ideal beauty, superior to what is to be found in individual nature. They are ever referring to the practice of the painters and sculptors of their times, particularly Phidias, (the favourite artist of antiquity,) to illustrate their assertions. As if they could not sufficiently express their admiration of his genius by what they knew, they have recourse to poetical enthusiasm: they call it inspiration; a gift from heaven. The artist is supposed to have ascended the celestial regions, to furnish his mind with this perfect idea of beauty. 'He,' says Proclus, 'who takes for his model such forms as nature produces, and confines himself to an exact imitation of them, will never attain to what is perfectly beautiful. For the works of nature are full of disproportion, and fall very short of the true standard of beauty. So that Phidias, when he formed his Jupiter, did not copy any object ever presented to his

sight; but contemplated only that image which he had conceived in his mind from Homer's description.' And thus Cicero, speaking of the same Phidias: 'Neither did this artist,' says he, 'when he carved the image of Jupiter or Minerva, set before him any one human figure, as a pattern, which he was to copy; but having a more perfect idea of beauty fixed in his mind, this is steadily contemplated, and to the imitation of this, all his skill and labour were directed.'

The Moderns are not less convinced than the Ancients of this superior power existing in the art; nor less sensible of its effects. Every language has adopted terms expressive of this excellence. The *gusto grande* of the Italians, the *beau ideal* of the French, and the *great style, genius, and taste* among the English, are but different appellations of the same thing. It is this intellectual dignity, they say, that ennobles the painter's art; that lays the line between him and the mere mechanick; and produces those great effects in an instant, which eloquence and poetry, by slow and repeated efforts, are scarcely able to attain. [...]

It is not easy to define in what this great style consists; nor to describe, by words, the proper means of acquiring it, if the mind of the Student should be at all capable of such an acquisition. Could we teach taste or genius by rules, they would be no longer taste and genius. But though there neither are, nor can be, any precise invariable rules for the exercise, or the acquisition of these great qualities, yet we may truly say, that they always operate in proportion to our attention in observing the works of nature, to our skill in selecting, and to our care in digesting, methodizing, and comparing our observations. There are many beauties in our art, that seem, at first, to lie without the reach of precept, and yet may easily be reduced to practical principles. Experience is all in all; but it is not every one who profits by experience; and most people err, not so much from want of capacity to find their object, as from not knowing what object to pursue. This great ideal perfection and beauty are not to be sought in the heavens, but upon the earth. They are about us, and upon every side of us. But the power of discovering what is deformed in nature, or in other words, what is particular and uncommon, can be acquired only by experience; and the whole beauty and grandeur of the art consists, in my opinion, in being able to get above all singular forms, local customs, particularities, and details of every kind.

All the objects which are exhibited to our view by nature, upon close examination will be found to have their blemishes and defects. The most beautiful forms have something about them like weakness, minuteness, or imperfection. But it is not every eye that perceives these blemishes. It must be an eye long used to the contemplation and comparison of these forms; and which by a long habit of observing what any set of objects of the same kind have in common, has acquired the power of discerning what each wants in particular. This long laborious comparison should be the first study of the painter, who aims at the greatest style. By this means, he acquires a just idea of beautiful forms; he corrects nature by herself, her imperfect state by her more perfect. His eye being enabled to distinguish the accidental deficiencies, excrescences, and deformities of things, from their general figures, he makes out an abstract idea of their forms more perfect than any one original; and what may seem a paradox, he learns to design naturally by drawing his figures unlike to any one object. This idea of the perfect state of nature, which the Artist calls the Ideal Beauty, is the great leading principle by which works of genius are conducted. [...]

When the Artist has by diligent attention acquired a clear and distinct idea of beauty and symmetry; when he has reduced the variety of nature to the abstract idea; his next task will be to become acquainted with the genuine habits of nature, as distinguished from those of fashion. For in the same manner, and on the same principles, as he has acquired the knowledge of the real forms of nature, distinct from accidental deformity, he must endeavour to separate simple chaste nature, from those adventitious, those affected and forced airs or actions, with which she is loaded by modern education.

Perhaps I cannot better explain what I mean, than by reminding you of what was taught us by the Professor of Anatomy, in respect to the natural position and movement of the feet. He observed, that the fashion of turning them outwards was contrary to the intent of nature, as might be seen from the structure of the bones, and from the weakness that proceeded from that manner of standing. To this we may add the erect position of the head, the projection of the chest, the walking with straight knees, and many such actions, which we know to be merely the result of fashion, and what nature never warranted, as we are sure that we have been taught them when children.

I have mentioned but a few of those instances, in which vanity or caprice have contrived to distort and disfigure the human form; your own recollection will add to these a thousand more of ill-understood methods, which have been practised to disguise nature among our dancing-masters, hair-dressers, and tailors, in their various schools of deformity.

However the mechanick and ornamental arts may sacrifice to fashion, she must be entirely excluded from the Art of Painting; the painter must never mistake the capricious challenging for the genuine offspring of nature; he must divest himself of all prejudices in favour of his age or country; he must disregard all local and temporary ornaments, and look only on those general habits which are every where and always the same; he addresses his works to the people of every country and every age, he calls upon posterity to be his spectators, and says with Zeuxis, *in æternitatem pingo* [I paint for eternity].

The neglect of separating modern fashions from the habits of nature, leads to that ridiculous style which has been practised by some painters, who have given to Grecian Heroes the airs and graces practised in the court of Lewis the Fourteenth; an absurdity almost as great as it would have been to have dressed them after the fashion of that court.

To avoid this error, however, and to retain the true simplicity of nature, is a task more difficult than at first sight it may appear. The prejudices in favour of the fashions and customs that we have been used to, and which are justly called a second nature, make it too often difficult to distinguish that which is natural from that which is the result of education; they frequently even give a predilection in favour of the artificial mode; and almost every one is apt to be guided by those local prejudices, who has not chastised his mind, and regulated the instability of his affections by the eternal invariable idea of nature.

Here then, as before, we must have recourse to the Ancients as instructors. It is from a careful study of their works that you will be enabled to attain to the real simplicity of nature; they will suggest many observations which would probably

escape you, if your study were confined to nature alone. And, indeed, I cannot help suspecting, that in this instance the ancients had an easier task than the moderns. They had, probably, little or nothing to unlearn, as their manners were nearly approaching to this desirable simplicity; while the modern artist, before he can see the truth of things, is obliged to remove a veil, with which the fashion of the times has thought proper to cover her.

Having gone thus far in our investigation of the great style in painting; if we now should suppose that the artist has found the true idea of beauty, which enables him to give his works a correct and perfect design; if we should suppose also, that he has acquired a knowledge of the unadulterated habits of nature, which gives him simplicity; the rest of his task is, perhaps, less than is generally imagined. Beauty and simplicity have so great a share in the composition of a great style, that he who has acquired them has little else to learn. It must not, indeed, be forgotten, that there is a nobleness of conception, which goes beyond any thing in the mere exhibition even of the perfect form; there is an art of animating and dignifying the figures with intellectual grandeur, of impressing the appearance of philosophick wisdom, or heroick virtue. This can only be acquired by him that enlarges the sphere of his understanding by a variety of knowledge, and warms his imagination with the best productions of ancient and modern poetry.

A hand thus exercised, and a mind thus instructed, will bring the art to a higher degree of excellence than perhaps it has hitherto attained in this country. Such a student will disdain the humbler walks of painting, which, however profitable, can never assure him a permanent reputation. He will leave the meaner artist servilely to suppose that those are the best pictures, which are most likely to deceive the spectator. He will permit the lower painter, like the florist or collector of shells, to exhibit the minute discriminations, which distinguish one object of the same species from another; while he, like the philosopher, will consider nature in the abstract, and represent in every one of his figures the character of its species.

If deceiving the eye were the only business of the art, there is no doubt, indeed, but the minute painter would be more apt to succeed; but it is not the eye, it is the mind which the painter of genius desires to address; nor will he waste a moment upon those smaller objects which only serve to catch the sense, to divide the attention, and to counteract his great design of speaking to the heart.

This is the ambition which I wish to excite in your minds; and the object I have had in my view, throughout this discourse, is that one great idea which gives to painting its true dignity, which entitles it to the name of a Liberal Art, and ranks it as a sister of poetry.

Discourse VI

The subject of this discourse will be Imitation, as far as a painter is concerned in it. By imitation, I do not mean imitation in its largest sense, but simply the following of other masters, and the advantage to be drawn from the study of their works.

Those who have undertaken to write on our art, and have represented it as a kind of inspiration, as a gift bestowed upon peculiar favourites at their birth, seem to insure a much more favourable disposition from their readers, and have a much more

captivating and liberal air, than he who attempts to examine, coldly, whether there are any means by which this art may be acquired; how the mind may be strengthened and expanded, and what guides will show the way to eminence.

It is very natural for those who are unacquainted with the cause of any thing extraordinary, to be astonished at the effect, and to consider it as a kind of magick. They, who have never observed the gradation by which art is acquired; who see only what is the full result of long labour and application of an infinite number and infinite variety of acts, are apt to conclude, from their entire inability to do the same at once, that it is not only inaccessible to themselves, but can be done by those only who have some gift of the nature of inspiration bestowed upon them.

The travellers into the East tell us, that when the ignorant inhabitants of those countries are asked concerning the ruins of stately edifices yet remaining amongst them, the melancholy monuments of their former grandeur and long-lost science, they always answer, that they were built by magicians. The untaught mind finds a vast gulph between its own powers, and those works of complicated art, which it is utterly unable to fathom; and it supposes that such a void can be passed only by supernatural powers.

And, as for artists themselves, it is by no means their interest to undeceive such judges, however conscious they may be of the very natural means by which their extraordinary powers were acquired; though our art, being intrinsically imitative, rejects this idea of inspiration, more perhaps than any other.

It is to avoid this plain confession of truth, as it should seem, that this imitation of masters, indeed almost all imitation, which implies a more regular and progressive method of attaining the ends of painting, has ever been particularly inveighed against with great keenness, both by ancient and modern writers.

To derive all from native power, to owe nothing to another, is the praise which men, who do not much think on what they are saying, bestow sometimes upon others, and sometimes on themselves; and their imaginary dignity is naturally heightened by a supercilious censure of the low, the barren, the groveling, the servile imitator. It would be no wonder if a student, frightened by these terrific and disgraceful epithets, with which the poor imitators are so often loaded, should let fall his pencil in mere despair; (conscious as he must be, how much he has been indebted to the labours of others, how little, how very little of his art was born with him;) and consider it as hopeless, to set about acquiring by the imitation of any human master, what he is taught to suppose is matter of inspiration from heaven.

Some allowance must be made for what is said in the gaiety of rhetorick. We cannot suppose that any one can really mean to exclude all imitation of others. A position so wild would scarce deserve a serious answer; for it is apparent, if we were forbid to make use of the advantages which our predecessors afford us, the art would be always to begin, and consequently remain always in its infant state; and it is a common observation, that no art was ever invented and carried to perfection at the same time.

But to bring us entirely to reason and sobriety, let it be observed, that a painter must not only be of necessity an imitator of the works of nature, which alone is sufficient to dispel this phantom of inspiration, but he must be as necessarily an imitator of the works of other painters: this appears more humiliating, but is

equally true; and no man can be an artist, whatever he may suppose, upon any other terms.

However, those who appear more moderate and reasonable, allow, that our study is to begin by imitation; but maintain that we should no longer use the thoughts of our predecessors, when we are become able to think for ourselves. They hold that imitation is as hurtful to the more advanced student, as it was advantageous to the beginner.

For my own part, I confess, I am not only very much disposed to maintain the absolute necessity of imitation in the first stages of the art; but am of opinion, that the study of other masters, which I here call imitation, may be extended throughout our whole lives, without any danger of the inconveniences with which it is charged, of enfeebling the mind, or preventing us from giving that original air which every work undoubtedly ought always to have.

I am on the contrary persuaded that by imitation only, variety, and even originality of invention, is produced. I will go further; even genius, at least what generally is so called, is the child of imitation. But as this appears to be contrary to the general opinion, I must explain my position before I enforce it.

Genius is supposed to be a power of producing excellencies, which are out of the reach of the rules of art; a power which no precepts can teach, and which no industry can acquire.

This opinion of the impossibility of acquiring those beauties, which stamp the work with the character of genius, supposes that it is something more fixed, than in reality it is; and that we always do, and ever did agree in opinion, with respect to what should be considered as the characteristick of genius. But the truth is, that the degree of excellence which proclaims Genius is different, in different times and different places; and what shows it to be so is, that mankind have often changed their opinion upon this matter.

When the Arts were in their infancy, the power of merely drawing the likeness of any object, was considered as one of its greatest efforts. The common people, ignorant of the principles of art, talk the same language even to this day. But when it was found that every man could be taught to do this, and a great deal more, merely by the observance of certain precepts; the name of Genius then shifted its application, and was given only to him who added the peculiar character of the object he represented; to him who had invention, expression, grace, or dignity; in short, those qualities, or excellencies, the power of producing which, could not then be taught by any known and promulgated rules.

We are very sure that the beauty of form, the expression of the passions, the art of composition, even the power of giving a general air of grandeur to a work, is at present very much under the dominion of rules. These excellencies were, heretofore, considered merely as the effects of genius; and justly, if genius is not taken for inspiration, but as the effect of close observation and experience. [...]

What we now call Genius, begins, not where rules, abstractedly taken, end; but where known vulgar and trite rules have no longer any place. It must of necessity be, that even works of Genius, like every other effect, as they must have their cause, must likewise have their rules; it cannot be by chance, that excellencies are produced with any constancy or any certainty, for this is not the nature of chance; but the rules by

which men of extraordinary parts, and such as are called men of Genius, work, are either such as they discover by their own peculiar observations, or of such a nice texture as not easily to admit being expressed in words; especially as artists are not very frequently skilful in that mode of communicating ideas. Unsubstantial, however, as these rules may seem, and difficult as it may be to convey them in writing, they are still seen and felt in the mind of the artist; and he works from them with as much certainty, as if they were embodied, as I may say, upon paper. It is true, these refined principles cannot be always made palpable, like the more gross rules of art; yet it does not follow, but that the mind may be put in such a train, that it shall perceive, by a kind of scientifick sense, that propriety, which words, particularly words of unpractised writers, such as we are, can but very feebly suggest.

Invention is one of the great marks of genius; but if we consult experience, we shall find, that it is by being conversant with the inventions of others, that we learn to invent; as by reading the thoughts of others we learn to think.

Whoever has so far formed his taste, as to be able to relish and feel the beauties of the great masters, has gone a great way in his study; for, merely from a consciousness of this relish of the right, the mind swells with an inward pride, and is almost as powerfully affected, as if it had itself produced what it admires. Our hearts, frequently warmed in this manner by the contact of those whom we wish to resemble, will undoubtedly catch something of their way of thinking; and we shall receive in our own bosoms some radiation at least of their fire and splendour. That disposition, which is so strong in children, still continues with us, of catching involuntarily the general air and manner of those with whom we are most conversant; with this difference only, that a young mind is naturally pliable and imitative; but in a more advanced state it grows rigid, and must be warmed and softened, before it will receive a deep impression.

From these considerations, which a little of your own reflection will carry a great way further, it appears, of what great consequence it is, that our minds should be habituated to the contemplation of excellence; and that, far from being contented to make such habits the discipline of our youth only, we should, to the last moment of our lives, continue a settled intercourse with all the true examples of grandeur. Their inventions are not only the food of our infancy, but the substance which supplies the fullest maturity of our vigour.

The mind is but a barren soil; a soil which is soon exhausted, and will produce no crop, or only one, unless it be continually fertilized and enriched with foreign matter.

When we have had continually before us the great works of Art to impregnate our minds with kindred ideas, we are then, and not till then, fit to produce something of the same species. We behold all about us with the eyes of those penetrating observers whose works we contemplate; and our minds, accustomed to think the thoughts of the noblest and brightest intellects, are prepared for the discovery and selection of all that is great and noble in nature. The greatest natural genius cannot subsist on its own stock: he who resolves never to ransack any mind but his own, will be soon reduced, from mere barrenness, to the poorest of all imitations; he will be obliged to imitate himself, and to repeat what he has before often repeated. When we know the subject designed by such men, it will never be difficult to guess what kind of work is to be produced.

It is vain for painters or poets to endeavour to invent without materials on which the mind may work, and from which invention must originate. Nothing can come of nothing. [...]

Discourse XI

The highest ambition of every Artist is to be thought a man of Genius. As long as this flattering quality is joined to his name, he can bear with patience the imputation of carelessness, incorrectness, or defects of whatever kind.

So far indeed is the presence of Genius from implying an absence of faults, that they are considered by many as its inseparable companions. Some go such lengths as to take indication from them, and not only excuse faults on account of Genius, but presume Genius from the existence of certain faults.

It is certainly true, that a work may justly claim the character of Genius, though full of errors; and it is equally true, that it may be faultless, and yet not exhibit the least spark of Genius. This naturally suggests an inquiry, a desire at least of inquiring, what qualities of a work and of a workman may justly entitle a Painter to that character.

I have in a former discourse [Discourse III] endeavoured to impress you with a fixed opinion, that a comprehensive and critical knowledge of the works of nature is the only source of beauty and grandeur. But when we speak to Painters, we must always consider this rule, and all rules, with a reference to the mechanical practice of their own particular Art. It is not properly in the learning, the taste, and the dignity of the ideas, that Genius appears as belonging to a Painter. There is a Genius particular and appropriated to his own trade, (as I may call it,) distinguished from all others. For that power, which enables the Artist to conceive his subject with dignity, may be said to belong to general education; and is as much the Genius of a Poet, or the professor of any other liberal Art, or even a good critick in any of those arts, as of a Painter. Whatever sublime ideas may fill his mind, he is a Painter only as he can put in practice what he knows, and communicate those ideas by visible representation.

If my expression can convey my idea, I wish to distinguish excellence of this kind by calling it the Genius of mechanical performance. This Genius consists, I conceive, in the power of expressing that which employs your pencil, whatever it may be, as a whole; so that the general effect and power of the whole may take possession of the mind, and for a while suspend the consideration of the subordinate and particular beauties or defects.

The advantage of this method of considering objects, is what I wish now more particularly to enforce. At the same time I do not forget, that a Painter must have the power of contracting as well as dilating his sight; because, he that does not at all express particulars, expresses nothing; yet it is certain, that a nice discrimination of minute circumstances, and a punctilious delineation of them, whatever excellence it may have, (and I do not mean to detract from it,) never did confer on the Artist the character of Genius. [...]

The detail of particulars, which does not assist the expression of the main characteristick, is worse than useless, it is mischievous, as it dissipates the attention,

and draws it from the principal point. It may be remarked, that the impression which is left on our mind even of things which are familiar to us, is seldom more than their general effect; beyond which we do not look in recognising such objects. To express this in Painting, is to express what is congenial and natural to the mind of man, and what gives him by reflection his own mode of conceiving. The other pre-supposes nicety and research, which are only the business of the curious and attentive, and therefore does not speak to the general sense of the whole species; in which common, and, as I may so call it, mother tongue, every thing grand and comprehensive must be uttered.

I do not mean to prescribe what degree of attention ought to be paid to the minute parts; this it is hard to settle. We are sure that it is expressing the general effect of the whole, which alone can give to objects their true and touching character; and wherever this is observed, whatever else may be neglected, we acknowledge the hand of a Master. We may even go further, and observe, that when the general effect only is presented to us by a skilful hand, it appears to express the object represented in a more lively manner than the minutest resemblance would do.

These observations may lead to very deep questions, which I do not mean here to discuss; among others, it may lead to an inquiry, Why we are not always pleased with the most absolute possible resemblance of an imitation to its original object. Cases may exist in which such a resemblance may be even disagreeable. I shall only observe that the effect of figures in Wax-work, though certainly a more exact representation than can be given by Painting or Sculpture, is a sufficient proof that the pleasure we receive from imitation is not increased merely in proportion as it approaches to minute and detailed reality; we are pleased, on the contrary, by seeing ends accomplished by seemingly inadequate means.

To express protuberance by actual relief, to express the softness of flesh by the softness of wax, seems rude and inartificial, and creates no grateful surprise. But to express distances on a plain surface, softness by hard bodies, and particular colouring by materials which are not singly of that colour, produces that magic which is the prize and triumph of art.

Carry this principle a step further. Suppose the effect of imitation to be fully compassed by means still more inadequate; let the power of a few well-chosen strokes, which supersede labour by judgment and direction, produce a complete impression of all that the mind demands in an object; we are charmed with such an unexpected happiness of execution, and begin to be tired with the superfluous diligence, which in vain solicits an appetite already satiated. [...]

Those who are not conversant in works of art, are often surprised at the high value set by connoisseurs on drawings which appear careless, and in every respect unfinished; but they are truly valuable; and their value arises from this, that they give the idea of an whole; and this whole is often expressed by a dexterous facility which indicates the true power of a Painter, even though roughly exerted: whether it consists in the general composition, or the general form of each figure, or the turn of the attitude which bestows grace and eleganc. [...]

Excellence in every part, and in every province of our art, from the highest style of history down to the resemblances of still-life, will depend on this power of extending the attention at once to the whole, without which the greatest diligence is vain.

I wish you to bear in mind, that when I speak of an whole, I do not mean simply an whole as belonging to composition, but an whole with respect to the general style of colouring; an whole with regard to the light and shade; an whole of every thing which may separately become the main object of a Painter.

* * *

8 Joshua Reynolds (1723–1792) *Discourse IX*

For the first dozen years of its existence the Royal Academy shared accommodation in Somerset House. Though this included teaching rooms and a library, the annual exhibition had to be held elsewhere, at Lambe's auction rooms in Pall Mall. Following plans presented in 1776 by the architect Sir William Chambers (1726–96), work began on new premises including an exhibition space. These were ready by 1780. Reynolds painted a ceiling decoration representing an allegorical female figure of 'Theory'. He also delivered a special Discourse, the ninth in his series of fifteen, on the occasion of the opening on 16 October 1780. Paradoxically, this was the least 'theoretical' of his addresses. Discourse IX represents a different set of concerns from those which usually preoccupied Reynolds in his lectures. He used the inauguration of the new establishment not to discuss relatively abstract matters of theory and criticism, but rather to raise the question of an English School of art, and the role art could be expected to play in raising the level of public culture in the nation as a whole. These were issues of considerable moment in late eighteenth century England (cf. IVA2, 13). We reprint Reynolds' brief text in full, from *Discourses*, edited with an introduction and notes by Pat Rogers, Harmondsworth: Penguin Classics, 1992, pp. 228–31.

The honour which the Arts acquire by being permitted to take possession of this noble habitation, is one of the most considerable of the many instances we have received of His Majesty's protection; and the strongest proof of his desire to make the Academy respectable.

Nothing has been left undone, that might contribute to excite our pursuit, or to reward our attainments. We have already the happiness of seeing the Arts in a state to which they have never before arrived in this nation. This Building, in which we are now assembled, will remain to many future ages an illustrious specimen of the Architect's abilities. It is our duty to endeavour that those who gaze with wonder at the structure, may not be disappointed when they visit the apartments. It will be no small addition to the glory which this nation has already acquired from having given birth to eminent men in every part of science, if it should be enabled to produce, in consequence of this institution, a School of English Artists. The estimation in which we stand in respect to our neighbours, will be in proportion to the degree in which we excel or are inferior to them in the acquisition of intellectual excellence, of which Trade and its consequential riches must be acknowledged to give the means; but a people whose whole attention is absorbed in those means, and who forget the end, can aspire but little above the rank of a barbarous nation. Every establishment that tends to the cultivation of the pleasures of the mind, as distinct

from those of sense, may be considered as an inferior school of morality, where the mind is polished and prepared for higher attainments.

Let us for a moment take a short survey of the progress of the mind towards what is, or ought to be, its true object of attention. Man, in his lowest state, has no pleasures but those of sense, and no wants but those of appetite; afterwards, when society is divided into different ranks, and some are appointed to labour for the support of others, those whom their superiority sets free from labour, begin to look for intellectual entertainments. Thus, whilst the shepherds were attending their flocks, their masters made the first astronomical observations; so musick is said to have had its origin from a man at leisure listening to the strokes of a hammer.

As the senses, in the lowest state of nature, are necessary to direct us to our support, when that support is once secure there is danger in following them further; to him who has no rule of action but the gratification of the senses, plenty is always dangerous: it is therefore necessary to the happiness of individuals, and still more necessary to the security of society, that the mind should be elevated to the idea of general beauty, and the contemplation of general truth; by this pursuit the mind is always carried forward in search of something more excellent than it finds, and obtains its proper superiority over the common senses of life, by learning to feel itself capable of higher aims and nobler enjoyments. In this gradual exaltation of human nature, every art contributes its contingent towards the general supply of mental pleasure. Whatever abstracts the thoughts from sensual gratifications, whatever teaches us to look for happiness within ourselves, must advance in some measure the dignity of our nature.

Perhaps there is no higher proof of the excellency of man than this, – that to a mind properly cultivated whatever is bounded is little. The mind is continually labouring to advance, step by step, through successive gradations of excellence, towards perfection, which is dimly seen, at a great though not hopeless distance, and which we must always follow because we never can attain; but the pursuit rewards itself: one truth teaches another, and our store is always increasing, though nature can never be exhausted. Our art, like all arts which address the imagination, is applied to somewhat a lower faculty of the mind, which approaches nearer to sensuality; but through sense and fancy it must make its way to reason; for such is the progress of thought, that we perceive by sense, we combine by fancy, and distinguish by reason: and without carrying our art out of its natural and true character, the more we purify it from every thing that is gross in sense, in that proportion we advance its use and dignity; and in proportion as we lower it to mere sensuality, we pervert its nature, and degrade it from the rank of liberal art; and this is what every artist ought well to remember. Let him remember also, that he deserves just so much encouragement in the state as he makes himself a member of it virtuously useful, and contributes in his sphere to the general purpose and perfection of society.

The Art which we profess has beauty for its object; this it is our business to discover and to express; the beauty of which we are in quest is general and intellectual; it is an idea that subsists only in the mind; the sight never beheld it, nor has the hand expressed it: it is an idea residing in the breast of the artist, which he is always labouring to impart, and which he dies at last without imparting; but which he is yet

so far able to communicate as to raise the thoughts, and extend the views of the spectator; and which, by a succession of art, may be so far diffused, that its effects may extend themselves imperceptibly into publick benefits, and be among the means of bestowing on whole nations refinement of taste: which, if it does not lead directly to purity of manners, obviates at least their greatest depravation, by disentangling the mind from appetite, and conducting the thoughts through successive stages of excellence, till that contemplation of universal rectitude and harmony which began by Taste, may, as it is exalted and refined, conclude in Virtue.

9 Various Reviewers, on exhibitions by Angelica Kauffmann at the Royal Academy

On at least three counts, Angelica Kauffmann (1741–1807) was the exception that proves a rule. She was a female history painter, with a successful career, in England. Swiss by birth, she spent her early twenties in Florence and Rome, where she painted a portrait of Winkelmann, among others, and generally imbibed the ideal of the classically inspired history painter. Her later years, from 1781 to her death, were also passed in Italy, but her middle years, from 1766 to 1781, were spent in highly successful practice in England. She was a founder member of the Royal Academy in 1768, where she exhibited on a regular basis from the inaugural exhibition of 1769 until the 1790s. London at this time was second only to Rome as a centre of neo-classical art, and the establishment of the Academy offered Kaufmann the chance to pursue the history painting she had learned in Italy, alongside the portrait commissions that seemed more congenial to the English. Despite working in what was conventionally regarded as the most elevated and intellectual of the artistic genres, Kauffmann left no theoretical statement about her work. Nonetheless, run-of-the-mill reviews of her Academy exhibitions offer a telling insight into eighteenth-century suppositions about gender and art. The last, written after Kauffmann had moved to Italy (when she continued to send pictures to London), is no less indicative of contemporary cultural chauvinism. Selections (i), (ii), (iv) and (v) have been made from Wendy Wassying Roworth, 'Kauffmann and the Art of Painting in England' in *Angelica Kauffmann. A Continental Artist in Georgian England*, London: Reaktion, 1992, pp. 83, 84, 86, 93. Selection (iii) is taken from Gill Perry, 'Women in Disguise', in Gill Perry and Michael Rossington eds., *Femininity and Masculinity in 18th century Art and Culture*, Manchester: Manchester University Press, 1994, p. 20. We are indebted to Perry and Roworth for our bibliographical information.

(i) 'This lady has, for years, stood deservedly high in the most difficult, yet most liberal line of her profession – History Painting. She has not, in general, receded from this character in the above pictures [*Ariadne Abandoned by Theseus, Paris and Helen Directing Cupid to Inflamm each other's Hearts with Love*], though we would beg leave to observe there is too great a monotony of beauty in all her principal figures.' 'A Friend to the Arts', *Morning Chronicle*, 27 April 1772, p. 2.

(ii) 'This artist, considering her sex, is certainly possessed of very great merit. She is endued with that bold and daring genius which leads her to employ her pencil upon historical paintings which are as much superior to portraits and landscapes as an

epic poem is to a pastoral, or a tragedy to a farce.'

Anon. *The London Chronicle*, 3 May 1774 (discussing *Penelope Invoking Minerva's Aid* and *Calypso Calling to Heaven to Witness her Sincere Affection to Ulysses*).

(iii) 'Some philosophers have asserted that women have no souls. Others have maintained, and with greater probability, that they have souls but that the only difference between their souls and the souls of men depends on the greater delicacy of the bodily organs. Miss Kauffmann's genius seems to favour strongly this latter opinion; for though a woman, she is possessed of that bold and masculine spirit which aims at the grand and sublime in painting, as well as in Poetry, and a History painter is as much superior to a mere Portrait or Landscape painter as an Epic or Tragic poet is to the simple author of a Sonnet or an Epigram.'

Anon. *The London Chronicle*, 4–6 May 1775 (discussing *The Despair of Achilles*).

(iv) 'It is surely somewhat singular, that while so many of our male artists are employed upon portraits, landscapes, and other inferior species of painting, this lady should be almost uniformly carried, by the boldness and sublimity of her genius, to venture upon historical pieces; which is as great a phenomenon in the painting as it would be if our poets dealt in nothing but sonnets and epigrams while our poetesses aspired to the highest and most difficult department of their art, the producing of epic and heroic compositions. But though Miss Kauffmann possesses this masculine and daring spirit, she still retains so much of the softness natural to her sex that she always pitches upon such historical subjects as have in them a strong mixture of the tender and pathetic.'

Anon. *The London Chronicle*, 29 April 1777, p. 413.

(v) 'These pictures possess that character which usually constitutes her works, but they do not appear to be either so beautifully conceived, or so tasteful in their execution, as to drawing, characters or colour, as those which she painted in England. They seem to be done from memory of her former works, and no new beauties have been added to her style by her late tour to Italy. Here perhaps it may be proper to remark that there is now established in this country a school of art much superior to what is to be found on any part of the Continent, there being at this moment in England a greater number of living artists, excelling in different branches, envious of each other, and striving with a spirit of enthusiasm, which has left our neighbours far behind. Amongst other foreign artists this country is certainly much indebted to *Signora Angelica*. She has enriched the cabinets of the curious with many elegant performances, composed and executed in her best time; and though she has withdrawn herself from us, her best works and her taste remain with us.'

Anon. *The Public Advertiser*, 22 May 1786, p. 2 (discussing *Vergil Writing his own Epitaph at Brundisium*, *Pliny the Younger with his Mother at Misaenum* and *Cornelia, the Mother of the Gracchi, Pointing to her Children as her Treasures*).

10 James Barry (1741–1806) from *An Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England*

Barry was an outsider who nonetheless rose to become Professor of Painting at the Royal Academy, only to be expelled at the age of 58 in 1799. He was cantankerous, suffered from a persecution complex, and publicly criticized his colleagues in the Academy. But the fact that he was also Irish, Catholic and Republican cannot have endeared him to the English establishment during the French revolutionary wars. Something else which made life difficult for him in the late eighteenth-century English art world was an unswerving commitment to history painting. It was for this that he had enjoyed precocious success in Dublin at the age of 22. Barry's early work drew him to the attention of Edmund Burke, who found employment for him in London, working as an assistant on *The Antiquities of Athens* with Stuart and Revett (see IIIA7), and subsequently funded an extended visit to Europe between 1765 and 1771. Barry was elected to the Academy two years after his return, but the English market could support little more than portraiture, and his most ambitious essay in history painting was an expensive loss. This was the gigantic mural commission he voluntarily undertook between 1777 and 1784 for the Great Room of the Society of Arts, Manufactures and Commerce in the Adelphi in London. Artists had been invited to take up this challenge in 1774, but nothing came of it until Barry put himself forward in 1777. He worked alone on the project for the next seven years. Six large canvases, two of them over 12 metres wide, depicted the Enlightenment theme of the *Progress of Human Culture*. Ancient Greece and eighteenth-century England were prominent, along with a Heaven populated by over a hundred geniuses who had contributed significantly to the evolution from barbarity to civilization. In line with these commitments, Barry's first book asserted the importance of a school of history painting in the consolidation of the national culture. The present extracts review specious criticisms of the English by Continental theorists, and offer a brief historical explanation for the retardation of history painting in the country. They end with a general exhortation to improve things, and a more specific invitation to some patron to underwrite the Adelphi commission. The selections are drawn from *An Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England*, London: T. Beckett, 1775, pp. 3–6, 9–10, 121–5, 144–8.

There are many people who seem to have persuaded themselves, and are desirous of persuading others, that the arts of painting, sculpture, and architecture, are naturally and inevitably confined to particular ages; and further, that they are, like plants, only the growth of certain soils and climates. If all that they have advanced upon this head be admitted as true and decisive, it must be acknowledged that the people of the British dominions are labouring in the arts to little purpose, and they must in the end find themselves disappointed in their aims, and that they had been endeavouring to do what the order of nature and the situation of their climate had pre-determined they should not do. Opinions of this kind make no disagreeable figure in works of imagination; we often find a playful and beautiful use made of them by poets, ancient as well as modern. See Virgil, Milton, Addison, &c. but as they might be converted to a sort of weapon in the hands of national prejudice, they will be occasionally and pertinently adopted; and they have been virulently applied in plain, cool prose, with no inconsiderable amplification.

Abbé du Bos, president Montesquieu, and Abbé Wincleman, have followed one another in assigning limits to the genius of the English; they pretend to point out a certain character of heaviness and want of fancy, which they deduce from physical causes. They have either wilfully taken advantage of, or they have been ignorantly deceived by, certain impediments which happened accidentally to prevent or retard us in keeping pace with other nations, in an acquisition of some of the fine arts: because we have not hitherto done it, they chuse to find out that the thing is impossible to us; and that we are eternally incapacitated by the clouds that hang over our heads, the nervous system of our bodies, our soil, our food. They say that we can have no imagination, taste, or sensibility: that we are cold and unfeeling to the powers of music: that we can succeed in nothing that requires genius; that if ever we are worth admiring, it is for the hand and execution of the workman, and not for the design of the artist: that our climate is so distempered, that we disrelish every thing, nay even life itself; that we are naturally and constitutionally addicted to suicide; that it is a consequence of the filtration of our nervous juices; that it is in consequence of a north-east wind, that our poets cannot arrive at that particular kind of delicacy that springs from taste; that they cannot arrive at any true imagery; that they strike the ear with a great noise, and present nothing to the mind; and that our natural capacity for the fine arts, amounts to very little, to nothing at all. [...]

It may seem that such opinions, and the distorted methods of reasoning that produce them, being so little calculated to prove and to convince, the refutation of them will be proportionably unentertaining and useless. But no: I flatter myself that the discussion of this matter will lead to considerations of a weightier nature; and by developing the accidental causes that have hitherto retarded our progress in the arts, we might, besides making our apology with foreigners, hope to be also an occasion of some future advantage to our own people. In the course of this work, I hope to make it evident, that the obstructions that have hitherto lain in the way of our acquiring art, were not naturally connected with our climate, but arose from mere accident, the fluctuation of opinions, and of those things that depend upon opinions; and consequently, that although these difficulties might lie before us at one time, they might possibly be removed at another.

* * *

It appears that until the time of Edward VI. and queen Elizabeth, that whatever little painting was practised in England was of a historical nature, taken from the legends of the saints, or from the Old and New Testament. These were, as many as could be come at, destroyed, and the practice of all such things interdicted for the future. The taste of the public, and the labours of the artist, was, from this period, turned into a new chanel, and has spent itself upon portraits, landscapes, and other inanimate matters, in which the human mind, and consequently the genius of the artists, if there was any, had little or nothing to employ itself upon: so that historical painting was proscribed just at the time we were going to receive the qualifications that would have enabled us to succeed in it; at the time when Spenser, Fairfax, and numbers of other ingenious men, were cultivating and gathering in knowledge of all kinds, ancient and foreign; and when lord Bacon, like another Columbus, was leading us to the discovery of new worlds in the regions of knowledge.

It is a misfortune, never entirely to be retrieved, that painting was not suffered to grow up amongst us, at the same time with poetry and the other arts and sciences, whilst the genius of the nation was yet forming its character in strength, beauty, and refinement; it would then have received a strength and a polish; and it would, in its turn, have given to our poetry a greater perfection in one of its master features, in which (Milton and Spenser excepted) it is rather somewhat defective. But the nation is now formed, and perhaps more than formed; and there is cause to fear that it may be too late to expect the last degree of perfection in the arts, from what we are now likely to produce, in an age when perhaps frothy affectations and modish, corrupt, silly opinions, of foreign as well as of domestic growth, have but too generally taken place of that masculine vigour and purity of taste, so necessary both for the artist and for his employer.

* * *

When we reflect upon the great variety of useful institutions, which do so much honour to the public virtue of this country, it is really a matter of surprize that the arts only should have lain so long unheeded, and that no means have been yet devised, of extricating historical painting out of the confused mass of meaner arts with which it is indiscriminately jumbled. The members of the Royal Academy, conscious of the necessity of making some effort of this kind, did, with the consent of the dean and chapter, select six painters to execute each a large picture of Scripture-history, which he had the liberty of presenting to the cathedral of St. Paul: but obstacles arose which prevented its taking effect. Some time after this, the society for the encouragement of Arts and Manufactures formed another plan of placing historical pictures, of the most eminent native artists, in their new room at the Adelphi; they elected, for this purpose, the former six selected members of the Royal Academy, to whom they added four others. The design of this plan was every way worthy of that society, which had been, in great measure, the nurse of national art. It would have afforded an equitable display of whatever abilities those artists were in possession of, as they were to be ranged side by side, without any intervening pictures of landscape, portraits, fish, dogs, or other dissimilar subjects, which, in our annual exhibitions, are sometimes so introduced as to distract the eye, and in a great measure to take away the opportunity of forming any well digested comparative judgments, during the short time of their exposition. But this excellent plan, (which is so much wanting) from some defect in the manner of it, went off in smoke like the other. There is however great reason to hope that something will yet be done, and that amongst all our different societies of connoisseurs, dilettanti, colleges, corporations, and parishes, a noble public spirit will somewhere step forward, especially as it may be brought about with very little expence.

There is to be sure but few artists whose personal interests happen to be embarked in the same bottom with the dignity of the art, and consequently with the interest and wishes of the public: but there is a few, and as to the many who can have no part in this exertion of superior art, they ought in conscience to content themselves with those greater profits which in this commercial country must ever follow from the practice of the lower branches, especially as they cannot expect to keep up for ever, that false weight and importance which they have assumed in consequence of those greater gettings; for the public ignorance of these arts, behind which they have been

hitherto entrenched, is much battered and shaken, and now lets in the light at many places. It is therefore to be hoped that they will no longer find it practicable to play the part of the dog in the manger, as they have hitherto done; for indeed a great many of the blocks and impediments that were thrown in the way of superior art, have been greatly owing to the secret workings and machinations of these interested men: and, if they can do nothing else, they will at least endeavour to turn the attention of dilettanti towards the breeding up of history-painters for the next age, in hopes to prevent the necessary means of exertion being given to the present historical artists: and I will with plainness and freedom again repeat it, that any public spirited man or men, who may wish to put forth a hand towards the calling out of historical-painting amongst us, ought for every reason, to pay no manner of regard to the counsels and insinuations of those artists who can have no part in this exertion.

11 Denis Diderot (1713–1784) from ‘Disconnected Thoughts on Painting, Sculpture and Poetry’

Diderot’s last ‘Salon’ was written in 1781, after an interval of six years. An inclination to synthesize his various thoughts about art had been clearly declared both in the ‘Notes on Painting’ appended to the ‘Salon of 1765’ (IIIC13) and in the lengthy theoretical digressions in the ‘Salon of 1767’ (IIIC14). The extensive ‘Disconnected Thoughts’ were appended to the ‘Salon of 1781’ ‘to serve as a continuation of the Salons’. They thus provide a form of summation of Diderot’s writing on art. About a fifth of the individual ‘thoughts’ are derived from the *Betrachtungen über die Malerey* (Reflections on Painting) of Christian von Hagedorn, originally published in Leipzig in 1762, and itself much indebted to Gérard de Lairesse’s *Groot schilderboek* (see IIA1). A French translation of von Hagedorn’s work appeared in 1775 (as *Réflexions sur la peinture*). Though Diderot was already acquainted with the author, it may have been this publication that first prompted him to conceive a summary publication of his own. In the event the ‘Disconnected Notes’ remained just that, the fragmentary observations for a work that Diderot was never able to complete. They are nevertheless instinct with the fruits of his observation, of his reading, and of his own extensive experience as a writer on the art of his time. They were originally issued under the title *Pensées détachées sur la Peinture, la Sculpture et la Poésie pour servir de suite aux Salons*, and were printed by Naigneon (see IIIC12) from an incomplete manuscript. We have referred to the version published in *Diderot oeuvres IV: Esthétique-Théâtre*, ed. Laurent Versini, Paris: Robert Laffont, 1996, which is based on a more complete manuscript preserved in St Petersburg. Our excerpts are taken from this edition pp. 1017–24, 1034–5, 1040–1, 1051, translated for the present volume by Kate Tunstall.

On composition and on the choice of subjects

There can be no beauty without unity; and there can be no unity without subordination. This appears contradictory; but it is not.

The unity of the whole is born of the subordination of the parts; and of this subordination is born harmony which presupposes variety.

Unity is to uniformity what a beautiful melody is to continuous sound.

Symmetry is the equality of all the corresponding parts in a whole. Symmetry, which is essential in architecture, is proscribed in every genre of painting. Symmetry in the human body is always destroyed by variety in actions and positions; it does not exist even in a figure seen from the front with its arms outstretched. The life and the action of a figure are two very different things. Life is represented in a figure at rest. Artists have given the word *movement* a particular meaning. They say of a figure at rest that it possesses *movement*; that is, it is about to move.

The harmony of the most beautiful painting is but a pale imitation of the harmony of nature. Often the hardest task for the artist is not to elude the difficulty.

It is this effect that characterizes for the most part the technique or style of every master.

The more someone commissioning a painting gives details of the subject-matter, the worse the painting is sure to be. They have no idea how far they limit art in the most talented master. [. . .]

Go ahead and be terrifying; but let the terror you inspire in me be tempered by some great moral idea.

If all the pictures of martyrs so subtly painted by our great masters were passed down to a generation in the distant future, what would they take us for? Either wild animals or savages.

Why are the works of the ancient artists so great? Because they had all been to the schools of the ancient philosophers.

Every sculpture or painting should express a great maxim, convey a lesson to the spectator; without this, it is mute.

Two qualities which are essential in the artist are morality and perspective.

The most beautiful thought cannot appeal to the mind if the ear is offended by it.¹ That is why line and colour are necessary. [. . .]

In every work of art that imitates nature, there is technique and morality. Every man of taste can judge morality; only an artist can judge technique.

Wherever you look in nature, whether the place is wild or cultivated, rich or poor, deserted or populated, you will always find two magical qualities: truth and harmony.

Transport Salvator Rosa to the icy regions of the North Pole, and his genius will make them beautiful.

Proceed soberly when inventing new allegorical personæ for fear of being enigmatic.²

Give preference, whenever possible, to real characters over symbolic beings.

Allegory is rarely sublime; it is almost always cold and obscure.

Nature is more interesting to the artist than it is to me; for me, it is merely a spectacle; for him, it is also a model. [. . .]

Like dramatic verse, art has its three unities: time, either sunrise or sunset; place, in a temple, a thatched cottage, on the edge of a forest or in a public square; action, either Christ carrying the cross on his way to be crucified, or Christ rising from the dead, or Christ appearing to the pilgrims on the road to Emmaus.

The unity of time is even stricter for the painter than for the poet; the former has only a single, almost indivisible moment.

The moments which follow on one from the other in the poet's descriptions would furnish a long gallery of paintings. How many subjects there are from the moment when Jephthah's daughter goes against her father's will to the moment when that same cruel father thrusts the dagger into her breast! [. . .]

Lairese claims that the artist is allowed to have the spectator enter the scene of his painting. I don't think so at all; and there are so few exceptions that I would gladly make a general rule of the opposite. That would seem to me to be equal in bad taste as an actor playing to the stalls. The canvas is self-contained, and there is no one beyond it. When Susannah exposes her naked body to my eyes, protecting herself against the elders' gaze with all the veils she had been wrapped in, Susannah is chaste and so is the painter; neither of them knew I was there. [. . .]

In general, silent scenes appeal to us more than noisy ones. Christ in the garden at Gethsemane, his soul laden with a great sadness, forsaken by his disciples asleep around him, has a very different effect on me to the same figure being whipped, wearing a crown of thorns and abandoned to the jeers, insults and shrieks of the Jewish mob.

If you take the magic of art away from Flemish and Dutch painting, they would be atrocious daubs. But Poussin could lose all his harmony, and the *Testament of Eudamidas* [Statens Museum for Kunst, Copenhagen] would still be sublime.

What do we see in the picture of Eudamidas? The dying man on the bed; to one side, there is the doctor feeling his pulse and also the notary taking down his last requests; at the foot of the bed, there is Eudamidas' wife sitting with her back to her husband; and his daughter is on the ground between her mother's knees, her head leaning on her lap. There is no overcrowding here. Multiple figures or crowds are

akin to disorder. What accessories are there here? Nothing more than the sword and shield of the main character, hanging on the back wall. A large number of accessories is akin to mediocrity. It is called staffage in painting and padding in poetry.

Silence, majesty and dignity in a scene are things rarely felt by the common spectator. Almost all the *Holy Families* by Raphael, or the most beautiful ones at least, are situated in pastoral, solitary and wild places; and when he chose such places, he knew exactly what he was doing.

All delightful scenes depicting love, friendship, charity, generosity, outpourings of emotion are set in remote places at the ends of the earth.

Paint as people spoke in Sparta.

In dramatic verse as in painting, there should be as few characters as possible. [...]

On colour, on understanding light and on chiaroscuro

[...] How many surprising things, both beautiful and flawed, are brought to life or made to disappear by the painter's brush!

Only a musician, writer or consummate artist can say 'I know what that will be.'

Truth in nature is the basis for the verisimilitude in art.

Colour is what attracts the spectator and action is what keeps him enthralled; these are the two qualities that can make us forgive the artist any minor inaccuracies in his drawing, I say the artist, not the sculptor, for drawing is essential in sculpture; one limb, even only slightly distorted, strips a statue of almost all its value.

Daphne's hands, the fingers of which Lemoyne has painted growing out of laurel leaves, are full of charm; the leaves are arranged with an elegance that I cannot describe. I doubt he has ever done anything with Lycaon changed into a wolf.³ The antlers sprouting on Actaeon's head would have posed him fewer difficulties. It is easier to feel the difference between these two subjects than to explain it.

Lairesse gives the name *second colour* to the half-tone placed on the light side of the outline, a technique that makes the convex parts of the body fall away into the background, making them rounded.⁴

There are the tones of light and the half-tones of light; the tones of shadow and the half-tones of shadow: this system is to be found under the general heading of *the diminution of light*, running from the greatest light to the strongest shadow.

There are various technical ways of weakening and strengthening, speeding up or slowing down the path of this gradation: using accidental shadows, reflections, passing shadows or intermediary bodies; but whichever of these means you use, the gradation persists nonetheless, whether you strengthen or weaken it, speed it up or slow it down. In art as in nature, there can be no gaps; *nihil per saltum*; otherwise you run the risk of creating black holes of shadow or bright circles of light and of things looking like cut-outs.

Aren't these black holes of shadow and bright circles of light to be found in nature? I think they are. But who told you to imitate nature strictly?

What is a background? Either it is an infinite space in which all the colours of the objects merge in the distance, ultimately producing the sensation of a greyish-white; or it is a vertical plane which absorbs either direct or reflected light, and in both cases, it is subject to the rules governing diminution.

The terms *tone* and *half-tone* which we applied to light and shadow can also be applied to a single colour.

The tone which forms the bridge between light and shadow, the final term in the shading off of light, is wider than the tone of light found next to the edge of an object on its light side. Lairesse calls it a *half-tone*.⁵

All these theoretical precepts can only be properly understood by the artist who, walking round a gallery, cane in hand, should point out where they have been put into practice in different works of art.

It is a very clever piece of artistry to borrow from a reflection that half-tone which seems to lead the eye beyond the visible part of the outline. Then it really is magic, for the spectator feels the effect without being able to work out its cause.

Nothing could be more certain than the following: the constant habit of looking at near and distant objects and of using our sense of sight to measure how far away they are, has created in our eyes an enharmonic scale of tones, semi-tones and quarter-tones, which is set out very differently but which is just as strict as that of music in our ears. Things can look wrong to the eye, just as they can sound wrong to the ear.

The accord between reflections in a large composition or the action and reaction of lit bodies on each other seems to be impossibly difficult to understand owing to both the large number and the scale of their causes. On this point, I think the greatest painters owe a great deal to our ignorance. [...]

On the naïve and on flattery

To say what I mean, I need to make up a word or at least to broaden the accepted meaning of an existing word: the word is *naïve*. Beyond the simplicity that it used to

express, we must extend it to include the innocence, truth and purity of a happy childhood, free of constraints; and as such, the naïve will be essential to every work of art. The naïve will be discernible in every inch of a Raphael canvas; the naïve will be very close to the sublime; the naïve will be found in all that is very beautiful; in an attitude, a movement, a drapery, an expression. It's the real thing, absolutely the pure thing itself, without the slightest alteration. Art is no longer present.

Everything true is not naïve, but everything naïve is true, and not just true, but of a truth that is enticing, original and rare. Almost all Poussin's figures are naïve, that is, they are what they must be, perfectly and purely. Almost all Raphael's old men, his women, children and angels are naïve, that is, they have a certain natural purity, a grace they were born with, that was not given to them by education.

Manner in art is like hypocrisy in morals. Boucher is the greatest hypocrite I know; there is not one of his figures to whom you could not say: 'You want to be true, but you're not.' Naïvety applies to all kinds of people: you can be a naïve hero, a naïve villain, naïvely religious, naïvely beautiful, a naïve orator or a naïve philosopher. Without naïvety, there can be no real beauty. One may naïvely be a tree, a flower, a plant or an animal. I could almost say that water is naïvely water, and if it isn't, it is more like polished steel or crystal. Naïvety means a great resemblance between the imitation and the thing, along with a great fluency of style: it means water taken from the stream and splashed straight onto the canvas.

I've been too harsh on Boucher; I take it back. I think I've seen some children of his that are very naïvely childlike.

The naïve, according to my definition, is in violent emotions as it is in calm emotions, in action as it is in rest. It depends on something almost intangible; often the artist is very close to it; but he is not there.

12 Jean-Etienne Liotard (1702–1789) from *Treatise on the Principles and Rules of Painting*

The Swiss pastellist, painter and printmaker Jean-Etienne Liotard published his short *Treatise on the Principles and Rules of Painting* at the age of 80 after a long and varied career which had taken him to many of the principal courts of Europe. He was born in Geneva, where he was apprenticed to the miniature painter and enamellist, Daniel Gardelle.

He completed his studies in Paris, but subsequently travelled to Naples and then to Rome. He spent several formative years in Constantinople (now Istanbul) from 1738 to 1742. On his return, he continued to wear Turkish dress and a long beard, which won him the sobriquet of *le peintre turc*. The succeeding years found him in Vienna, Amsterdam, The Hague, Paris and London. He produced a large number of highly successful portraits, many of them in pastel. His work is characteristically uncluttered and simple and is marked by a strong emphasis on truthfulness of depiction. The *Treatise* dates from the end of his life, when his popularity had begun to wane. Its principal interest resides in his violent attack on *touches*, the application of pastel or paint in such a way that the marks or 'touches' remain visible on the surface of the canvas. It has been suggested that Liotard's criticisms were motivated in part by rivalry with his contemporary, Maurice de Latour, whose pastel portraits reveal an extreme vivacity of handling. The following extracts are taken from the edition edited by Pierre Cailler, *Traité des principes et des règles de la peinture*, Geneva: Vésenaz, 1945, pp. 81–8, 92–4, 127–9. They have been translated for the present volume by Jonathan Murphy. For further discussion of 'touch' in painting see IVA15.

Rule VII – Avoidance of touch

We arrive now at one of the principal objectives of this book, and I am not ashamed to say that it is the part which will require the most courage on my part, for there are so many received ideas and ingrained half-truths where the subject is concerned, so many examples propagated by a number of great masters, and so many reasons for maintaining the status quo that it will perhaps be impossible for me to destroy it alone. But I will at least have done what I think best, and shown the truth and the incontestable nature of the principle I advance; I will have done my duty, and that must suffice. Let us proceed then to the quick of the matter.

Nature, which we must always take as our model, never demonstrates the shocking inequalities that are the ruin of so many masterpieces by the great painters. The sublime picture of nature forms a harmonious whole, where all parts, even the most disparate, are imperceptibly linked; we see no touches in the work of nature, and what stronger case could there be for their absence in painting? We should never paint what we do not see. But before going into detail where touch is concerned I must explain exactly what I understand by this term.

A *touch* is a brushstroke of clear or dark colour applied on one or other of these two tones; it will lighten a pale colour, or deepen a dark one. The more perceptible a touch is, the harsher it becomes, and the more it will shock the sharp eye of anyone filled with the true beauties of nature, who is desirous of finding their reproduction in the copies presented by the artist. Such ugliness shocks even those who have no appreciation of the arts. Touch is the most ugly manner, and the one most distant from nature. Touch owes not its credit (as truly great artists have never used it), but the acceptability that it has been accorded, to an idea common to almost all European painters: that it gives strength, vigour, relief and life to painting. My intention is to try and destroy such false and dangerous prejudices, which have only been universally adopted and accredited on account of the fact that a touch is always a short cut, and a time-saving device for the painter. It is then the result of self-interest, impatience and an inability to finish paintings. All artists who have allowed

themselves to abuse touch without really considering the consequences of their actions agree that a painting with many touches is disagreeable when examined close up; but they claim that at the appropriate distance the eye will no longer notice the touches, which will blend together and lend the painting a finished effect of strength, vigour, relief and life. A prejudice that develops naturally out of the first one; once one has lost the way, every step we make takes us further from our true destination. Like stray sheep, such painters should be brought back to the fold, that they might see the simple, luminous principles that prove the uselessness, ugliness and danger of their methods.

If a painting with many touches is disagreeable when examined close up, it is even more so when examined from afar; nothing can and nothing does change regardless of the distance. The appearance may alter, but the nature of the painting remains the same, for even when one believes one can no longer see the touches they are still in place.

I would admit that from a certain distance the painting is apt to lose that shocking asperity that the abuse of touch will lend it, but touches will always be faintly distinguishable and will never disappear altogether. But I sense that this line of argument will establish the truth of my principles too slowly, and their truth will be more manifest through the following comparison.

If one places a truly finished painting side by side with a painting in which touch is the distinguishing feature, and one observes both paintings from a distance, we might think that the touches would no longer be visible, but in practice the finished quality of the first picture will be easily distinguished from the clumsiness of the other. If one takes a painting by Correggio or Raphael, and places it beside a Rubens, a Rembrandt or a Ribera [*L'Espagnolet*] then even at a distance from which touch can no longer be distinguished, one can see the Rubens, Rembrandt and Ribera are clumsily executed. Such paintings will always be ugly, and they are no less ugly for being at a distance; the finished quality can never come simply from distance alone.

But, I hear my detractors object, if you admit that both pictures, one finished and one touched, produce approximately the same effect from a distance, why should artists not take the infinitely shorter route to arrive at almost exactly the same point, for a fraction of the effort required by the longer method? The objection may seem fair, but I would answer as follows:

The painting may indeed be less ugly when seen from afar, but being less ugly through being less visible is hardly a victory. Consequently a touched painting gains nothing from distance, and certainly not a finished quality; more important still, in nature there are a thousand beauties which can never be conveyed through touch, and even if one were to allow that distance (since you seem to wish to judge from afar) established some apparent equivalence between us (a point that, needless to say, I do not in fact concede), how could it possibly be the case that your painting could ever convey the fine and light touches of nature, that uniform quality of human skin, the translucency of bodies, the colour of flowers or the velvet quality that characterizes fruit, in short, the charming details which when captured well truly imitate nature, and make painting her happy rival?

This you believe possible through touch? Come! Its inadequacy should be frankly acknowledged. Touches are heavy and ugly, and are the fruit of impatience, laziness,

self-interest and ignorance. Touch, it is claimed, lends strength and vigour, but this is simply wrong. These qualities are the result of the difficult art of painting the appreciable difference between light and shade, and of ensuring that inside the painting there are no pale tints as dark as the shadow, and no shadow as light as the faintest clear tone; the dark and the light must be clearly distinguished.

* * *

When oil painting first came into favour and was almost universally adopted, the great ease with which colours may subtly be mixed with each other, and its capacity to imitate tiny variations in colour and almost imperceptible nuances, led to its being favoured above all other forms of painting; this great advantage of subtleness, unique to painting in oils, is entirely lost through the abuse of touch.

The only occasions when it should be allowed, when it is actually a useful technique for the artist, is when a painter wishes to depict actions of very short duration in nature. Then he should use touches in order to paint more quickly, and make the best use of the space of time that the model affords; but the resulting sketch should never be passed off to real connoisseurs as a finished product. Seen from a distance, great paintings have no need of marked or exaggerated touches. Such paintings demand solely an equivalence between the masses of dark and light, and above all, as I have already noted, that the light tones be clearly distinguished from the dark. A touch on carnations, having no relation to the real colour of the object it represents, is like a burn mark, a cut or a scar. A face, or any figure, painted with an excess of touches, resembles the ugliest or most defective parts of nature. In a great painting, by contrast, all the different tints blend together as they do in nature, and such paintings have a softness and a quality of vigour and truth that immediately renders them more agreeable to our sight. There are of course great painters whose touch is highly expressive and conveys nature well, but as such works lack the most precious quality of all, the finish of the masters, they are apt to satisfy only painters themselves. In all arts perfection must be the sole goal of the artist, insofar as it is possible for imperfect humanity to attain it, for perfection alone is the unique source of true glory.

Good painting should please all in equal measure; those who aim for anything else are mistaken, for painting by the use of touch is a kind of falsification, adopted and followed only by the impatient idle, who are eager for facile gains; such painters are incapable of finish, and their work never progresses beyond the sketch. But painters who achieve a high degree of finish in their work, and attain the same degree of expression without having recourse to touch, deserve high praise; for there are few things more difficult in painting than the combination of a high degree of finish with full expression.

* * *

Rule XVIII – Seek to achieve effect

Effect is the part of painting which is most striking, and the first to catch the attention of the spectator, so much so that it is a waste of time to try and attain a finished quality in a painting if one has not sought the correct effect. If in a painting one half is light and the other is dark, and if there is the same proportional distance between the

light and the dark in the painting as there is in nature, then the painting will achieve the desired effect. . . . To attain a beautiful and grand effect, chiaroscuro must be used, by the correct grouping of the light and dark colours. The example that Titian used to demonstrate the chiaroscuro effect for his pupils was a bunch of grapes, where the light colours on one side of each grape are linked together and form a group, and the same effect is also visible with the dark colours, and thus they learnt to balance the two. All patient painters, who desire to achieve a true finish in their paintings, should study effect most carefully, if their aim is to please. Impatient painters, overly enamoured of touch, who rarely achieve the finished state, should also take note and use more effect. I have on occasion seen paintings which were badly drawn and badly coloured, which were little more than sketches, yet which caught the eye of all spectators and were greatly appreciated from afar, simply on account of their mastery of effect.

* * *

13 Valentine Green (1739–1813) from *A Review of the Polite Arts in France*

Green was an engraver and draughtsman. After apprenticeship and an early career in Worcester, he moved to London in 1765. He became established as a member of the Royal Academy and mezzotint engraver to King George III. Among his most successful productions were engravings of historical pictures by Benjamin West and of contemporary portraits by Joshua Reynolds. He also achieved success in Europe, becoming engraver to the Elector Palatine. A major project to engrave the paintings in the Düsseldorf collection proved unprofitable, and Green's later career was clouded by financial difficulties. In 1782 he wrote a lengthy pamphlet, addressed to Reynolds in his capacity as President of the Academy, contrasting the fortunes of art in France and England. In parallel with James Barry, to whom he explicitly referred in the argument, Green set out to refute charges that the English were temperamentally unsuited to the practice of the arts (see IVA10); rather, the relatively lowly status of art in England was a matter of historical circumstance which could be, and indeed should be, corrected as a matter of urgency. Green detailed the organization and ambition of the French Royal Academy not as something beyond the scope of English aspiration, but as a model for emulation. The nub of his argument was that the persistent weakness of English patronage had to be remedied if England's advance as a leading civilized nation was not to be compromised. Our selection is taken from *A Review of the Polite Arts in France at the Time of their Establishment under Louis XIV compared with their Present State in England*, London: T. Cadell, 1782, pp. 11–13, 25–7, 31–5, 65–6.

The great figure the French Academy has made in the commonwealth of the Arts, has been chiefly owing to its government being placed in the hands of Noblemen of the first rank, and in possession of the first employments of the State; and the good consequences of that system, are evident in it to the present moment. The Patron, and the Artist, were distinct characters: it was the province of the first to guide and guard; it was the wish of the last to deserve and receive Protection. Both were under the eye of the Sovereign, whose care had been not to mock the Arts, by putting them under the direction of Ignorance, or Indifference; either of which must be fatal to

their existence; but added to the Royal, they received Ministerial Protection, uncontaminated by political distinction, or the bias of party; and honoured by the Affection of the Prince, they enjoyed also the Personal Regard of his most confidential Servants. Above the littleness of contrivance to suppress Genius; too much the friend of his Country to palm pretenders on its esteem, under the shelter of his influence; the decided Patron of the Arts, its Professors had perfect repose in his counsels, and perfect reliance on his justice. Their desires made known to their Prince through such a medium, excited no jealousy, alarmed no suspicion; open and accessible to all its Members, no cabal dared to misrepresent the wishes, or impede the interest of an individual. Competent to decide, no matter was suffered to appear before the Sovereign, but had, in aid to its own propriety, the countenance of the *Protecteur* added to its recommendation and support; and the ungracious trouble of investigating their concerns, farther than an Assent to their public undertakings, or an Approbation of their finished labours, never approached the Royal Breast. The Minister stood the Palladium of rising Genius, an impracticable boundary, separating a Royal Academy from a Company of Painters, by which all combination was broke, all professional bickerings silenced, and a local tyranny, inimical to every generous principle, destroyed. To have suffered such Abilities as were enrolled in the first records of the Parisian Academy, to have remained inactive, would have been a reproach too severe for its *Protecteur* to have sustained; to have employed them on trivial objects, would have been equally disgraceful. It was a duty which had devolved on his shoulders from the nature of the Institution, and must be fulfilled without personal regard. But in the hands appointed to guide their movements, nothing of doubt remained of the most flattering issue. And so well were these points attended to, with such ardour and spirit were they entered upon, that in a very short period, so numerous were the proofs of the Ability and Industry of the French Artists; so different an aspect had the Metropolis put on; so much was the public taste improved, and private life embellished, that to the present hour it has the appearance of the Work of Ages, and has descended from them a miracle of exertion, and a national benefit. [. . .]

The Parisian Academy is now assembling the works of all their great masters; and by a thorough renovation of them, in whatsoever parts they may have been impaired by time, or accident, they will set them before an applauding people with all their original splendour, and by their ability, and care, in that useful operation, be preserved, to the benefit and admiration of future ages. To give honourable reception to those Pictures and Statues, the upper apartments of the New Louvre are under preparation; and through the whole extent of that magnificent palace, a length of upwards of 1300 feet, possessing half of the whole space between Pont Royal, and Pont Neuf, new lights are introducing from its roof and sides, in addition to those it originally possessed, some of which, will also, necessarily, undergo a reform, in order to produce a regular, impartial, and equal distribution of light, through the whole range of the gallery. In addition to those works of the French School, will be collected, the numerous and valuable Pictures, which for want of room, are huddled together in the most unfavourable manner, in and about the Palace of Versailles, to the amount of some thousands, by the best Italian, and other Masters, and of the first order. The whole suite of the Luxembourg Gallery, by Rubens, together with the

most select of those that are arranged on the floors of those apartments, among which, those of the French Ports, by Vernet, will be restored to the rank they so eminently deserve. That choice and inestimable work of Le Sueur, the life of St. Bruno, lately in the Cloister of the Chartreux, are removed, and under preparation for their re-appearance in this grand assemblage of Arts. The Battles of Alexander, by Le Brun; jointly with all such fugitive works as may be found dispersed in the different depots of the Royal Palaces, whose merits, in the opinion of the Academy, may entitle them to so honourable a distinction, will assist in forming this magnificent collection. And, in further addition, the best and most perfect Statues, Busts, and other Sculptures, of their own, and other Masters, will be selected, and with the Pictures arranged, and classed under their several and distinct Schools, affording, at one view, to the eye of the Connoisseur, the various principles and systems, on which the different Professors have founded their practice, fully illustrated, by some of their most capital productions. This resurrection of their ancient spirit, will form an epoch in the Academy of Paris, and infuse into its abated powers, an energy that may prove beneficial to future undertakings; and make its influence operate through all its classes, in a degree flattering to the importance of the Profession, [. . .].

We can, with temper, hear the Church of St. Peter at Rome extolled as the first Structure in the world, while St. Paul's ranks as second, and is so little short of the perfections of the first. We can, with patience, hear of the Rialto at Venice, and the vain-boasting of the grandeur of the lumber of Pont Neuf, threatening to dam up the meandering of the Seine, while we have a bridge of iron binding the rapid Severn within its arch, and those of Westminster, and Black-Friars, stretching themselves over the majestic tide of the Thames. L'Hotel Royal des Invalides, at Paris, may exult in its beautiful dome, and glory in the munificence of its foundation, without hurting our feelings, while the Royal Hospital of Greenwich, can vie with their Palaces in magnificence, and its ample revenues can so comfortably supply the wants of our naval defenders, worn out in the service of their country. The parallel may be carried on with advantage to Britain, in the learned Sciences, Poetry, Philosophy, the æconomical Arts, and various other instances; but in the Polite Arts, we are struck dumb, and scarcely a paltry city on the continent but insults our weakness in that vulnerable part, and looks upon the arguments of Montesquieu as irrefragable, the irony of the Abbé du Bois as founded, and the deductions of the Abbé Winckelman, to prove that nature never meant the heavy atmosphere of Britain to be productive of Original Genius, as a doctrine incontrovertibly established, notwithstanding Mr. Professor Barry has so incontestably refuted them in his able reply to the disquisitions of the philosopher, and the heterogeneous and visionary arguments of the speculating Fathers. But why this stigma is still suffered to remain upon us, and why it has not hitherto received radical refutation, is the point towards which I am now verging; namely, a review of the pursuits the English School has been forced upon, since its establishment amongst us. [. . .]

The annual Exhibitions of the result of the practice of the Artists, may be fairly understood as the barometer of their supposed importance; and the subjects which have so uniformly filled them, may be estimated as the highest idea the Public entertain of their powers. It is then, evident, from what has appeared in those Exhibitions, that they have never had the advantages in this country, which those of

others have enjoyed to the fullest extent, in the most ample practice, and under the most liberal Patronage. To what public exertion have they ever been called, or in what instance have they been invited to a trial that could put them on a scale of comparison with those of other nations? What Churches, Palaces, or other Public Edifices, have been opened to them? What King's, or Hero's Actions have they recorded, to which the Public can be referred to contemplate? What monuments of the Worth, or the Wisdom, the Patriotism, or the Virtues of Individuals, or Communities, have they been called forth to give to our imitation, or our notice? Is it the want of Subjects in the history of our country deserving to be perpetuated? Is it that we have had neither Patriot Kings, Princes, or Heroes to celebrate? Is it that our Churches, or other Public Edifices, are not suited for the reception of ornamental embellishment? Is it not, rather, the want of national policy, in not opening a free passage to a current which has been too long obstructed by the blindest of prejudices, and the most hateful of Gothic barbarisms? a current forcing its way over every impediment, impatient to fertilize the barrenness of a soil which has so long lain waste, a reproach to itself, and a bye-word among the nations.

Those Walks the Arts have been permitted to use, have been so ably filled, that the solicitude of expectation has been fully answered. But, as they have been wholly directed to local purposes, and the gratification of private taste, they assist not towards forming an object, to which the general eye can be again turned, after they have once passed the ordeal of Exhibition. And as far as Protection has been extended to those limited operations, it has been liberal; but its bounds are of too contracted dimension for the great body of Arts to revolve in. [...]

I proposed to myself in the Plan of this Address, not to draw inferences from the reputed Abilities of either School, but simply to state what has been the result of the two foundations from the Patronage they originally received.

In the French School, we find its Patronage was warm, fervent, and dignified; partaking of every stimulating principle that could invigorate, enliven, and cherish its objects, and place them on a permanent basis, beyond the reach of caprice to assail, or fashion to impair; it saw them of too much importance to be trifled with, and of too much value to be abandoned. – And the result has been a National Honour.

In the English School, Public Patronage is seen to have been attracted more by the novelty of the undertaking, than the importance of the pursuit. Engaged in an experiment, which if it failed, nothing was lost, nothing being expected. Employed on a forlorn hope, of which all the world had said, we were not to expect the fruition, and we ourselves were persuaded to believe it a presumption to attempt. – It has consequently terminated in a National Disgrace.

14 Francisco de Goya (1746–1828) 'Address to the Royal Academy of San Fernando regarding the method of teaching the visual arts'

After study in Saragossa, Goya entered competitions for the Real Academia in Madrid in 1764 and again in 1766, failing on both occasions to gain entry. He went to Rome instead, remaining there until 1771, when he returned to Saragossa. In 1774 he was called to Madrid to produce painted cartoons for the Royal Tapestry Factory, a function which he

continued to fulfil for the next eighteen years. His election to the Real Academia came in 1780. In 1785 he was appointed deputy director of painting and the following year he was made Painter to the King. During the 1780s he was much in demand as a portrait painter. His submission to the Academy was made in 1792 at a time when his intellectual interests were becoming increasingly hard to reconcile with the expectations of commissioned work, and when he felt the weight of his official success impinging on his independence as an artist. Ten years earlier he had protested at the demand that he submit his tapestry cartoons to 'correction', asserting the priority of individual imagination in the making of an artist. In the following text he defends a similar position in response to a request from the Real Academia that he state his views on the teaching of art. The contrast with Mengs' earlier discourse (IVA4) testifies to a considerable difference in temperament and approach between the two artists. It also serves to illustrate the developments in thought about art that had taken place during the intervening quarter-century, particularly in those ideas concerning individual genius and imagination that linked the Enlightenment to the Romantic movement. Our text of Goya's address is taken from the translation in J. A. Tomlinson, *Goya in the Twilight of the Enlightenment*, New Haven and London: Yale University Press, 1992, Appendix 1, pp. 193-4.

Most Excellent Sir

Fulfilling on my behalf Your Excellency's order that each of us explain what he thinks opportune about the Study of the Arts, I say: That the Academies should not be exclusive, or serve more than as an aid to those who freely wish to study in them, banishing all servile subjection of the primary school, mechanical precepts, monthly prizes, financial aid, and other trivialities that degrade, and effeminate an Art as liberal and noble as Painting; nor should a time be predetermined that they study Geometry, or Perspective to overcome difficulties in drawing, for this itself will necessarily demand them in time of those who discover an aptitude, and talent, and the more advanced in it, the more easily they attain knowledge in the other Arts, as seen from the examples of those who have risen highest in this aspect, who I do not cite since they are so well known. I will give a proof to demonstrate with facts, that there are no rules in Painting, and that the oppression, or servile obligation of making all study or follow the same path, is a great impediment for the Young who profess this very difficult art, that approaches the Divine more than any other, since it makes known all that God has created; he who has most closely approached will be able to give few rules concerning the profound operations of the understanding that are needed for it, nor explain why he has been happier perhaps with a work where less care has been taken, than with one of greater finish; What a profound and impenetrable arcanum is encompassed in the imitation of divine nature, without which there is nothing good, not only in Painting (that has no other task than its exact imitation) but in the other sciences.

Annibale Carracci, revived Painting that since the time of Raphael had fallen into decline, with the liberality of his genius, he gave birth to more disciples, and better than as many practitioners as there has been, leaving each to proceed following the inclination of his spirit, without determining for any to follow his style, or method, putting only those corrections intended to attain the imitation of the truth, and thus is seen the different styles, of Guido, Guercino, Andrea Sacchi, Lanfranco, Albano, etc.

I cannot omit another clearer proof. Of the Painters known to us of greatest ability, and who have taken the greatest pains to teach the method of their tired styles (according to what they have told us). How many students have resulted? Where is the progress? the rules? the method? From what they have written, has any more been attained than to arouse the interest of those that are not, nor cannot be Artists, with the object of more greatly enhancing their own [that is, the Artist's] works, and giving them broad authority to decide even in the presence of those versed in this very sacred Science that demands so much study (even of those who were born for it) to understand and discern what is best.

It is impossible to express the pain that it causes me to see the flow of the perhaps licentious, or eloquent pen (that so attracts the uninitiated) and fall into the weakness of not knowing in depth the material of which he writes; What a scandal to hear nature deprecated in comparison to Greek statues by one who knows neither the one nor the other, without acknowledging that the smallest part of Nature confounds and amazes those who know most! What statue, or cast of it might there be, that is not copied from Divine Nature? As excellent as the artist may be who copied it, can he not but proclaim that placed at its side, one is the work of God, and the other of our miserable hands? He who wishes to distance himself, to correct it [nature] without seeking the best of it, can he help but fall into a reprehensible [and] monotonous manner, of paintings, of plaster models, as has happened to all who have done this exactly? It seems that I stray from my original subject, but there is nothing more necessary, if there were to be a remedy for the actual decadence of the Arts but to know that they must not be dragged down by the power of knowledge of other sciences, but rather be governed by their own merit, as has always been the case when talents have flourished: then the despotic enthusiasts cease, and prudent lovers are born, who appreciate, venerate and encourage those who excel, providing them with work that can further advance their talent, helping them with greater force to produce all that their inclination promises: this is the true protection of the Arts, and it has always been shown that the works have made the men great. In conclusion, sir, I do not see any other means of advancing the Arts, nor do I believe there is one, than to reward and protect he who excels in them; to hold in esteem the true Artist, to allow free reign to the genius of students who wish to learn them, without oppression, nor imposition of methods that twist the inclination they show to this or that style, of Painting.

I have given my opinion in response to Your Excellency's charge, but if my hand doesn't govern the pen as I might wish, to explain that which I understand, I hope that your Excellency will excuse it, for my entire life has been spent in attaining the fruit of that of which I am now speaking.

Madrid 14 October 1792.

15 Claude-Henri Watelet (1718–1786) and Pierre-Charles L vesque (1736–1812) from the *Dictionnaire des arts de peinture, sculpture et gravure*

Watelet was a wealthy civil servant, collector and amateur of the arts, with an extensive acquaintance among the artists and writers of his time. He had a particularly fine collection

of prints and was himself a competent engraver. In 1760 he published *L'Art de Peindre. Poëme, avec des Réflexions sur les différents parties de la peinture* (Paris and 1761 Amsterdam), which won him election to the Académie Française. (The 'Reflections' contains an extensive section on 'Grace' – the prototype for the passage given below, in which Watelet refers to his own poem and commentary. Amongst the papers left by William Hogarth there is a partial English translation of the former text in manuscript form.) Watelet contributed several articles on the fine arts to the *Encyclopédie*, using these as the basis for a collection issued under his own name in 1784. Intended as a supplement to the *Encyclopédie*, his *Dictionnaire des Beaux-Arts* was originally published in two posthumous volumes in 1788 and 1791. It was subsequently completed by Lévésque and published in five volumes as *Dictionnaire des arts de peinture, sculpture et gravure*, Paris: Fuchs, 1792. It was to be cited as a repository of authority on technical and conceptual matters well into the nineteenth century. Our excerpts are taken from the facsimile reprint of the 1792 edition, Geneva: Minkoff, 1972, vol. I, pp. 1–11, 247–9, 478–80; vol. II, pp. 450–6; vol. IV, pp. 783–8, translated for the present volume by Jonathan Murphy.

Academy [*Académie*] (noun, feminine). What is known in artistic language as an *academy* is the drawn, painted or modelled imitation of a living model. The particular aim of this imitation is the study of the form and shape of the human body, either as a means of perfecting the imitation, or as preparation for a larger work.

One *draws, paints, or models* an academy. Students whose chosen career is painting or sculpture, and artists who already practise these arts, draw or model these imitations of the human figure in studios and in the academic schools.

Natural light or artificial light from lamps is used, depending upon the circumstances.

The drawing master poses a naked man in an attitude that he will then keep for a time proportional to the discomfort occasioned by the pose.

In the public schools, the draughtsmen sit upon steeply raked benches as in an amphitheatre, and endeavour to capture the lines and the overall effect that the model presents. The masters preside over this exercise, and assist students with words of advice, correcting the studies that they are presented with.

The origin of the word is doubtless from the place where such studies are often carried out; as such it is an example of a word taking on a particular meaning in artistic language, totally at odds with its normal sense in the rest of the language.

A good academy is one that is carried out with *easy execution*, without negligence; *fine correction*, neither too dry nor too mean; *with feeling*, finely captured; *with taste*, in an unmannered fashion; with *thoroughness*, with great care and attention; and neither too *laboured* nor too *cold*.

As the aim of the painter is ultimately to provide an imitation of the figure through the use of brush and colours, if he becomes accustomed to drawing in too painstaking a manner, he will experience great difficulty when he comes to hold a brush laden with colour, as that will come to seem less easy, less comfortable and less precise than the use of pencil.

If he is indecisive when drawing, and *lacks care for line and shape*, he will be equally undetermined, and lack correction all the more when faced with colour and *the handling of the brush*.

If his touch is heavy, affected or mannered, these faults will be all the more evident in the manner in which he paints. Unless he forces himself to acquire the precision and care in his drawing necessary to render his work agreeable, his tints will ever be muddy and unclear, and his painting will never have the bright freshness required for the imitation of nature.

If, on the other hand, the care and precision in his drawings goes so far as coldness, it may well be feared that he will develop an overly facile style, which flatters the eyes but leaves the spirit unsatisfied, and never moves the soul.

To sum up, the draughtsmen, through his academies, must demonstrate the system that he will follow once he moves on to painting.

He must have foremost in his mind the relation between the means he employs at present and the means that he will employ at a later date.

For this reason, when drawing, he must strive to indicate whenever possible the effect that colour has on his eyes, as well as the touch that he will soon use with the aid of a brush.

There are several different ways of drawing an academy, but the ones to be preferred are those which have the greatest affinity with the final aim of the artist.

The use of blue or grey coloured paper is consequently more widespread amongst those who are determined to paint; and with their use of lead pencils, *stump* is more common, to prepare shadows, form blocks and half-tones, to spread and soften the pencil strokes. Such practices have a tangible rapport with the means of employing colour, through the production of graded tones, and through the manner in which tones fade into each other.

Stump drawing, which makes strokes wider, softer and abrupt, is similar in that respect to working with a brush; and the whiteness spread by the stump adds nuance to the spread of light inside the drawing, and accustoms the practitioner to the use of luminous colour on the objects in the composition or the parts of a figure, whose place is determined by the laws of chiaroscuro. This manner of drawing is also swifter than others, and as such is particularly suitable to studies done from life, as living models can only remain immobile for a limited period of time.

Academies drawn on white paper in sanguine or pencil, with hatching or shading, demand more preparation. These manners are slower in execution as the half-tones must all be worked out, whereas blue or grey coloured paper offers them ready formed. Moreover, the overly obvious colour contrast between the red or black of the crayons and the white of the background demands long and painstaking preparation in order for it to be toned down.

The colouring of the background, which artists are obliged to do with great care, often requires a considerable amount of time, and the care required to achieve that end, in the desire to offer to view a clear and agreeable picture, can easily lead the artist into too cold a manner.

A number of masters of the first rank, from whose number one might single out Bouchardon, have executed *patient* and *clear* academies and studies skilful and artful enough to merit our admiration; but such artists are either not really destined to be painters, or worse, are wasting valuable time in this manner that they have adopted and which evidently pleases them; they would be better employed in other more important engagements. Servile imitation is particularly dangerous when one lacks

the talent of those that one imitates, and serves only to produce cold copyists, or artists whose work is overly mannered.

To return to the relationship of ideas that should be established between the manner of drawing and the projected intention to paint, I would add to what I said above that the more the artist becomes accustomed to imagining some emotion in the mind of his model fitting to the pose he has adopted, the better he will get into the habit of never representing a figure without thinking about the idea that animates it. There is no position or pose that does not reflect some state of mind or some nuance of affection. The custom, when choosing a pose for a model for an academy, is to *pose the model* in what is imagined to be a picturesque mode, with no intention other than that of arranging limbs and bodies in an agreeable or piquant aspect. The model is then drawn in similar fashion, and the result is a work which is overly mechanical and is accordingly a soulless and lifeless imitation, where even the defects of the model are reproduced, as well as his almost inevitable fatigue, and his understandably bored or indifferent countenance, whose reproduction serves no purpose whatsoever.

When the student follows such a path, there is every chance that he will wind up a journeyman.

But to become a true artist, he must not be satisfied with the reproduction of shapes and traits: he must add the truly picturesque qualities of passion and emotion, and learn to make these legible to the viewer.

A free man, who is not overburdened with excessive civilization, will never strike a pose or attitude that is not a reflection of the events that are taking shape in his soul; and it follows from this that the disposition of his limbs and features is an inevitable reflection or sign of the level of his morality or state of mind.

The artist who considers his art in depth never loses sight of this principle, and it is through accustoming himself early to these observations and to this practice that the draughtsman will oblige himself never to forget, when imitating the human form, that this form is animated with life and sentiment.

Seemliness [*Bienséance*] (noun, feminine). *Seemliness*, in painting and in all of the arts, forms part of what are more generally known as the *proprieties*.

Conformity to *good custom* is for all painters a law of propriety, and this law bears a particular relation to the ideas that we have of seemliness. The question that I will address here will be above all that of seemliness: related issues will be addressed under the entry for the proprieties.

The origin of the word in question is to be found in all that is *seemly*. Doubtless the word, in earlier times, did not carry the heavy burden of responsibility that it now bears. The meaning that it has today is largely the expression of a duty or obligation, an obligation composed of various diverse elements of modesty, shame, wisdom and reason.

Unseemliness is not merely a question of that which is unfitting for our age, our estate or our figure, but also involves our behaviour, our speech, our gestures and actions, and all that defines us. Seemliness, for obvious and related reasons, concerns modesty and honesty, and when we apply such an idea to painting, it covers not merely the nature of the work in which the artist is engaged, and the place and person

for whom the work in question is designated, but also the relation between the artist's general mores and his occupation.

Seemliness in general, where the nature of the subject-matter of painting is concerned, requires that painting should not obtrude upon public sensibility. As such it is a relation between art and nature, and between nature and ourselves.

Where artists are concerned, seemliness supposes that their profession, as is fitting, given the consideration that it is accorded when men distinguish themselves in it, is quite reciprocally engaged in a similar contract with public sensibility, which must not be offended in any manner. The public attention that artists attract to themselves when executing their work with the seemliness that will ensure success should oblige them to behave in such a manner as is likely to ensure that this consideration is not lost. It is a time-honoured principle that all men whose occupation or function places them in the public eye of the society in which they live are obliged to honour that position through whichever forms of virtue or seemliness are most appropriate to their estate.

One distinctive prerogative that artists owe to the nature of their occupation is that art customarily uplifts all those who practise it, and heightens their sensibilities, through the deep thought that is required, through the solitude and the retreat from the world that it often entails, and through the idea of perfection that artists are obliged to cherish unceasingly.

It is therefore unlikely that a republic of artists would erect public monuments in celebration of vice or barbarism. In accordance with the sentiments which motivate so many of them and fill them with enthusiasm, we might even go so far as to say that it would rather be great acts of virtue and evidence of the grandeur of the soul which would inspire their etchers' needles, their brushes and chisels. But while artists as a body are by nature republicans, and while they are virtuous through the liberating effects that their art has brought them, it is unfortunately all too often the case that they are also the slaves of circumstance, and of the requirement to earn their keep from their work.

Conventions [*Conventions*]. If the arts employed exactly the same means as nature, they would be nature itself, and the merit of their production would rest on the same basis. The arts imitate nature, they do not reproduce it; we might even claim that painting is only capable of feigning imitation, as it is one of the arts which has illusion and convention at its very heart. Such arts, which do not truly create, in order to achieve the desired effect, are obliged to employ means born out of deep consideration and perfected through much practice and hard labour, but in themselves these means would not suffice; they must be supplemented by a series of conventions, some secret, some openly avowed, which have gradually come to be established between the producers of art and its audience. The first of these conventions for those considering a painting is that they should forget for a few moments, insofar as such a thing is possible, that the painted representation is an imitation. For his part, the artist, when exhibiting his canvas, should remind his public that although he would be very pleased if they were taken in for a moment, they should never lose sight of the fact that the illusion that seduces them is an artistic effect and that it is his own work, and that they would do well to consider the preparation and care that has been

necessary for such illusionism to be possible. Such mutual pacts are indispensable: if spectators could be wholly fooled, artists would lose the one thing that they find most flattering, which is the admiration of their talent; and spectators would lose one of the principal pleasures that the arts produce, for the central aim of art, for many people, is the momentary error that it produces. Artist and spectator here must both willingly submit to this law, and even desire that painting should not deceive them entirely; but that they should deliberately allow themselves to be deceived only momentarily. If the deception is total at the outset, which may indeed arise under certain circumstances, in order for the success to be complete it is indispensable, as I have remarked above, that the error should be acknowledged to be the result of invented means deployed with great intelligence. For it is from that knowledge that the agreeable sensation effected by the arts springs, a feeling which, unbeknown to us, compounded with our admiration, is then shared between the painting, the artist, the art form itself, and even the real object behind the imitation, if it has been selected with sufficient care.

It is also often the case that the spectator joins to this pleasure a separate one, his pleasure in the foreknowledge that he possesses of the nature of the experience that he is about to undergo when looking at the imitation, in the same manner that we feel an agreeable sensation of anticipation before rereading a book that we know will satisfy our heart or our mind. A further satisfaction still is the pleasure felt by people who share the joy experienced by others in a work that they have themselves provided, and who watch again the same sensations that they themselves have already experienced.

All of which leads us to conclude that certain highly developed conventions are inseparable from the art of painting, just as they are essentially inseparable from the other liberal arts. The spectator, for instance, in order to experience exactly what the artist desires, must agree to position himself at the correct distance from the canvas and in the ideal viewpoint to allow that momentary deception to take place; he must agree to concentrate his attention on the canvas alone, which is customarily bounded by a frame, whose major advantage is to circumscribe the object, and to provide a barrier to any distraction that may be caused by nearby objects, or by comparison with real objects in nature, which may act to the detriment of the imitation.

Grace [*Grace*] (noun, feminine). If grace is born out of the harmony between the feelings of the soul and the actions of the body, the painter, in order to represent it, must learn through observation and meditation to recognize this correspondence between feeling and movement; a correspondence which at times is obvious, but on other occasions difficult to seize, either through a lack of frankness in the expression or because the feeling itself is strained or insincere.

The word in question here is one of those whose meaning is almost identical in the arts and in ordinary usage. It is a term of general theory, and it is precisely through such terms that the links between the different arts are forged, and through such common preoccupations that they form a harmonious whole.

The grace of a painted or sculpted figure, of a figure described in verse or prose, or the grace of a musical air all springs from the same principle.

At this point I must beg the reader's leave, for my intention is to reproduce here the chapter on grace to be found at the end of the poem on the art of painting [i.e. Watelet's own poem]; my thoughts and words on the subject have been confirmed by further observation that I have carried out, and have been adopted by a number of other writers on the subject, and here I shall merely provide a new formulation for ideas with which the reader is perhaps already familiar.

Grace, like beauty, seeks perfection. The two qualities come together in our minds. Their common effect is to please. At times we confuse them, at times they can be easily distinguished; they compete in our minds for supremacy and turn about are accorded pride of place.

Beauty can withstand constant and repeated attention; hence a prize may be disputed, as was the case for the three goddesses; grace by contrast flees examination, and the very project of examining it closely will cause it to disappear.

Beauty, as I have said above, is a perfect conformity among the appropriate movements.

Grace is the concordance between such movements and those of the soul.

In childhood and youth, the soul acts in a free and easy manner on all forms of expression.

The child's movements are simple, and his limbs flexible and supple. A pleasing unity and honesty results from this.

Consequently, childhood and youth are the age of grace. Flexibility and suppleness are essential requirements for grace; in maturity they begin to fade, and in old age they are lost altogether.

Simplicity and honesty in the movements of the soul are so essential for graceful movement that it is rarely the product of indecisive or complex passions.

Naivety, ingenuous curiosity, the desire to please, spontaneous joy, regret, and the suffering and tears occasioned by the loss of something much loved can all produce grace, as they are all simple movements.

Uncertainty, reserve, constraint, complex agitations of the soul, and violent passions whose movements are often compulsive do not lend themselves to the production of grace.

The female sex, suppler in its movements, more sensitive in its affections, where the desire to please arises as though of its own accord, as part of nature's great system, renders beauty more interesting, and when it escapes artifice and affectation, conveys grace in the most comely manner that it is given to us to imagine.

Overly cultivated youth causes grace to flee, while unconstrained youth possesses it without having wished to acquire it. The coming of knowledge retards or hinders the sudden movements of the soul or the body. Reflection renders them more complicated. As reason takes hold and begins to direct the spirit, and as experience grows, then the empire of spontaneous movements diminishes, relinquishing the grip it held on expressions, gestures and actions.

Maturity, which ordinarily sees the perfecting of reason and experience, also bears witness to a gradual loss of suppleness and physical control.

In old age, the fire in the soul is quenched; its orders are obeyed but haltingly, as our steps begin to falter.

Then do expression and grace both vanish, for grace takes its infinite value from that perfect conformity so absent from old age.

Yet not all simple movements of the soul are matched with an exact physical manifestation; on occasion, there is no absolute rapport between the perfection of a body and the appropriate internal state.

For that reason childhood, which one often regards as an age at which the body is unformed and imperfect, is rightly the age of grace, but is an age to which we only lend ideas of beauty by convention.

What I say here presupposes an equilibrium between the life principles that result in good health. Such a state, common to all ages, is most favourable to grace, and adds lustre to beauty.

For the rest, this accord between simple movements of the soul and those of the body can undergo an infinite variety of modifications and produce many varied effects.

For that reason there is often so much confusion that surrounds grace, and it is on that account that we speak of a certain *je ne sais quoi*, a commonly repeated but ultimately meaningless expression.

Grace is perceived and felt in varying degrees, in accordance with the extent to which the observer is disposed to remark upon its effect.

How could it not be the case that when we are highly sensitive to grace, there is some concord between our interior sensation and that which has brought about such a state? Let us explore this idea a little more fully.

Imagine a disinterested observer watching a young girl, whose perfect proportions agree exactly with the freedom and suppleness in her demeanour characteristic of her age. The young girl, who, for instance, we might imagine moved by a feeling of curiosity, receives that simple impression from her soul, and it results in a charm in her demeanour which would immediately strike the observer.

Such would be an example of natural grace, independent of any external modification.

Imagine then in the place of the disinterested observer the father of the same girl, who watches his beautiful daughter catch sight of him and walk towards him. Instead of curiosity guiding the girl's steps, we might imagine a less vague emotion which lent a more decided movement to her demeanour and her stride; what a resultant increase in grace! The object would become altogether more interesting and more lively: on the one side there would be a feeling of tender haste, and on the other the paternal perceptiveness, one hundred times more attentive to the grace than the disinterested man!

These nuances may be refined further still.

Imagine that this was neither a disinterested man nor even a father but an amorous young man, waiting and being rewarded with the arrival of the object of his affections that he cherished so, and if this were no young girl but a tender and naive lover who hurried her step the moment she caught sight of her swain; suppose the place where the two lovers met to be the most agreeable corner that nature may offer, and imagine that nature had decorated the trysting place with all the fresh green flowers of the season. Think of the charms of youth, of the perfection of its beauty, of the lusty health and the lively and natural agitation of these two souls moved by the simplest,

most direct and least constrained emotions, and imagine then the infinite variety of nuances in the representation of grace, inspired and involuntary, imprinted on their features, and expressed in their slightest action and their every movement.

Thus, amongst all the impressions of the soul depicted in our movements, when one reflects upon the various passions that we have examined here, love itself, the one most favoured by nature, produces the most agreeable and most universal expression, more easily perceived than any other. In love the relation between body and soul is most harmonious, most intimate, and most complete; and hence here more than anywhere else is grace the result.

For that reason the ancients always joined and never separated Venus, Love, and the Graces; and the mysterious belt described by Homer is perhaps nothing other than this feeling of love so productive of grace, which occupied Venus so, and which the charm of beauty alone would not have provided.

Touch [*touche*] (noun, feminine), or to **Touch**¹ [*toucher*] (verb, transitive). One speaks of a *bold touch*, a *fine touch*, a *spiritual touch*, a *heavy* or *light touch*, etc.

One also says to *touch flesh with feeling*, to *touch cloth faithfully*, to *touch a landscape with spirit*, to *touch animal paintings or still life proudly*.

These two expressions have quite different meanings which I will attempt to explore here.

Touch in drawing and painting is a means of illustrating chance irregularities or particular circumstances regarding the visible appearance of bodies, accidents or circumstances occasioned by their nature, their position, or their movements.

When a touch is *placed*, *pronounced*, or *underlined* by an artist, it is because he is particularly or unusually affected by such circumstances or chance effects.

In a representation that an artist might make of the human figure, if the touch he employs is determined solely by the outlines of the contour, which would mean that certain parts of that contour or line are less lit or are in shadow, then there is no relation to the impression made on the soul or to the passions, which inspire the most spiritual and ultimately the most interesting aspects of the touch.

If by contrast touch is marked by the artist in accordance with the impression that he has of the correct movement of the figure that he is drawing or painting, it may be fine or spiritual, and it might rightly have the aim of conveying grace or strength, according to the artist's impression.

This is not the same as an *expressive touch*, but if the touch is pronounced or insisted upon by the painter, inspired by his imagination, which provides him with a strong impression of the accidents that great passions provoke in the appearance of bodies, or if better still his touch is like that of nature itself, then his touch will be that of the great masters. That is the unmistakable sign that they imprint on their work, the sign by which they are recognized, which immediately distinguishes their original from any copy.

A trait is a line of equal weight throughout its length, with the help of which one may draw the outline of a body, as the basis of a representation in drawing or painting.

When we term such a line an even trait, we acknowledge that there is nothing in such a manner that we may term a touch. In like fashion, if when painting we

depicted a body with one uniform colour throughout, the painting would be a mere illustration offering neither character nor touch; but if, when directing his pencil, the artist takes note of particular accidents caused by the chiaroscuro effects of relief and illumination, and if, once he has observed these accidents or effects, he presses harder in certain areas to break the uniformity of the trait, and if the trait is accordingly more pronounced in some areas than others, wherever the draughtsman wished to express the shadow more fully, then he has begun to use what is known as touch, which will eventually give character to his art.

We may pursue the argument further. If from a figure at rest, showing no particular emotion, the curves, contours and habitual accidents produced by the articulations can all be captured through touch, how much more expressive will the touch of the painter or draughtsman be when more colourful movements heighten such accidents in the contours? If the quick and obedient hand captures that excitement, and follows the impression received from it in the correct manner in order to transmit it through the work, and if the pressure applied by the artist renders the trace of the pencil more significant still, and if that effect is achieved without dryness, in a generous manner, then that artist will show that touch is one of the most important elements that he has at his disposal, one that lies at the heart of all that is spiritual in art.

One notes from such details that touch is in no way arbitrary, and is not a result of what we improperly term taste, as too many young artists today seem to believe, in their thoughtless imitation of the models placed before them, or indeed as a number of so-called connoisseurs would try to convince us, with their superficial familiarity with artistic terminology.

I address myself here instead to those who wish to learn more about the degree of touch necessary in all forms of painting.

What is to be conveyed above all is the idea that touch, as it is designated here, is at once an imitative sign taken from nature, and a communicative sign demonstrating all that the artist has seen and felt, of which he then attempts an illustration.

Touch, if taken beyond a certain point, becomes a sign itself rather than a precise imitation; but it should also be noted that that perfect point beyond which exaggeration begins, and which thus forms the boundary of good taste, is perhaps never obtained in any representation.

First, because as touch is the instantaneous effect of the impression that the painter or draughtsman receives, it is susceptible to the many vagaries of imagination.

Secondly, for the reason that for that exact measure of touch to be gauged and perfectly accorded, one would also need to consider the precise distance of the object of imitation.

Most commonly, touch in drawing is overdone, either through regard to the feeling which inspired it, or through the effects of bad habits acquired over time.

This fault, which often passes unnoticed, frequently produces a superficially pleasing effect, in harmony with a number of well-established artistic conventions regarding certain elements of art; for touch, as a means of expression, is often immediately striking, and when it is artfully exaggerated, it is undoubtedly more forceful than when it is overly timid or generally insipid.

In painting as opposed to drawing, touch is inevitably more measured as its exaggeration is too obviously detrimental to the truth of the colour in the picture, and to its harmony; such exaggeration is permissible only in miniatures, or in paintings which do not have polished completion as their aim.

Yet another meaning of the word *touch* becomes apparent if one considers the verb from which it derives; the verb *to touch*, in painting, has a meaning slightly different to that of the noun.

When we say a painter perfectly *touches* flesh, fabric, landscape, trees, earth, plants, water or accessories we are speaking of the physical manner in which he applies colour in his representation of objects.

So touch, which is the means of applying colour, becomes a manner of referring to the objects themselves, different from line and colour, and taken in its own right.

Painting is not a complete imitation, but a feigned one: it does not actually reproduce relief, but rather pretends to. In this it is quite different to sculpture, where once colour is removed, it imitates in a quite palpable manner the shape of the object that it is intended to represent.

It is thus most commonly in the art of feigning the representation of objects, by whichever means they see fit, that painters are engaged; and in following that truly liberal route, in a free and ingenuous manner, that they arrive at all that is great in their art. The aim of art is not a painstakingly minute reproduction of the world; for in any case, no reproduction could ever hope to equal the majesty of nature.

When one examines closely the flesh painted by Rubens, Rembrandt or any other great master, or indeed any other aspect such as their fabrics, trees or earth, one sees only the magic signs that have been employed, the visible trace of their handling of the paint, their spiritual touch, the wise strokes of their brush, placed side by side, and not mixed; for it is distance which serves to unite and blend their nuances.

¹ In French the verb *toucher*, translated here as 'to touch' in order to maintain the similarity with the noun, is almost an exact synonym for the verb 'to paint', but for the fact that in the verb *toucher* the accent is on the feeling conveyed through the depiction, rather than on the representation itself or on the act of depiction [translator's note].

16 James Barry (1741–1806) *A Letter to the Dilettanti Society*

Barry's last publication appeared a year before his expulsion from the Academy. He continued his criticism of the state of patronage in England and the effect this was having on history painting (see IVA10). He also argued that the Academy was in default of its obligations in this regard, a claim that was shortly to be turned against him. In the present extract he appeals to the gentlemen of the Society of Dilettanti to use their influence to bring about the establishment of a national collection of art. Barry holds that the state of English painting will be improved only through familiarity with actual examples of the best work. In a passage that must have been deeply uncongenial to the majority of his English contemporaries, he goes out of his way to praise the efforts of Jacques-Louis David to build up a school of classically grounded history painting in revolutionary France (see IVB2–4, 8 and 10–12). These short extracts are taken from *A Letter to the Dilettanti Society respecting certain Matters essentially necessary for the Improvement of Public Taste, and*

for accomplishing the original Views of the Royal Academy of Great Britain, London: J. Walker, 1798, pp. 5–6, 24–6.

I have long seen, and from my situation as Lecturer on Painting in the Academy, have often pressed it on the attention of my hearers, that without some proper public collection of ancient art, to refer to occasionally, both our pupils and the public would be in the same bewildered situation, so emphatically alluded to in the New Testament, of the people without guides, exposed to every imposture of 'Lo! here is Christ. Lo! there is Christ.' – This is Titian's manner. – No, that was his manner. – Old Giacomo Bassano, did he do his works after this or after the other way? – How far is scumbling necessary in the production of the true Venetian tones? – Upon what basis, and how much and what should be done before, after it, or with it? There is no need to mention that discernment and taste must govern in the application and conduct; but with respect to the mechanic desideratum, these questions go all the length; and to obtain satisfactory oracular answers, we had best recur to the familiar inspection of the original pictures of these ancient masters; and as nothing else can satisfactorily determine researches of this kind, and prevent or detect mistakes or imposition so well as this frequent familiar inspection, I could much wish that what I have so often had occasion in the Academy to urge on this subject, was known to his Majesty; for this end I brought it forward, as it is so much and so easily in his power to gratify the wishes of the public, and complete the views of his own Institution, by graciously conferring on them this remaining favour. His royal countenance, and a very small matter, would be sufficient to begin with. But as I am not likely ever to have the honour of a hearing from his Majesty, and if I had, would unfortunately for the art and for the country have probably but little weight, I must content myself, and think it a sufficient discharge of conscience and duty, to lay the whole matter before you and your friends, who happily can have all the opportunity, weight, and consideration, that is wanting to me. You may then either lay this letter before his Majesty, as a testimony of the best discharge of humble duty within the knowledge of his Professor, or you may put the matter in any other form more agreeable and proper, without any regard to me or to what I have written. You will partly see, by what follows, how long I have laboured under the weight of this business, how far it has been carried, and through what an ordeal I have passed: my patience is now quite exhausted, and almost like the traveller mentioned somewhere in Horace, who, when with all his pains and care, he could not prevent his ass from continually going to the edge of the precipice, was at last so transported with rage and indignation, as to stretch out his hands and push him down. Before any such matter as this happens with me, I shall feel happy and delivered from a world of anxiety in placing this business under the care and direction of the Gentlemen of your Society; you can easily manage it, and will henceforward be answerable to the art and to the public for its safety and success; carry this point, and all will be done that I wish done, as, I thank God, there is nothing to ask for myself. But . . . gentlemen like those of the Dilettanti Society, possessed of all the advantages of education and foreign travel, can want no information from me respecting the importance, nature, and extent, of that collection of exemplars and materials of information and study, so absolutely and

indispensably necessary for advancing and perfecting the arts of Painting and Sculpture in a National Academy [...].

This national collection of all the materials of art, is absolutely necessary for the formation of the pupils and of the public (who ought to grow up with them), whatever style of art may be likely to obtain a settled credit, so as to be considered as constituting the taste, whether we may content ourselves with adopting the manly plan of art pursued by the Carraches, and their school at Bologna, in uniting the perfections of all the other schools, of which there remains a masterly, elegant record, in a beautiful little poem of Agostino, or whether (which I rather hope) we look further into that most essential article, the style of design, and endeavour to form it altogether in conformity with the taste of the Greeks, in which Annibal made such an illustrious beginning on his coming to Rome, as may be seen in many parts of the Farnese Gallery. Whichever of these plans of art the nation might fix in, the materials necessary towards succeeding can only be found in the collection which it has been the main object of this letter to obtain: there, and there only, shall we be enabled to find that which can qualify us to succeed, when used with genius, and superinduced upon our own (never to be lost sight of) studies after nature. [...]

[A]ccording to all the late accounts of the state of arts in France, a higher and a much better order of things has been recently substituted in the place of their former corruptions; and the sublime, venerable, majestic, genuine simplicity of the Grecian taste, utterly estranged from all mean affectation, from the *précieuse* or the grimace and blustering, and incorporated with all that might be derived from the illustrious moderns towards forming a complete and perfect totality, is now renovated, or indeed rather created, and for the first time brought into existence in that country: since it is certain that, on the one hand, Annibal Caracci, and Domenichino, had but made a beginning, and did not go far enough in the gusto of Grecian design; and on the other hand, that (every thing fairly considered and acknowledged), from all that remains of the ancient painting, it is highly probable that even the works of their best painters were very defective in some essential parts of the art, where many of the illustrious moderns have left us nothing to wish for. With hands lift up to Heaven, and a heart full of exultation, I then hail the generous exertion of David and his noble fellow-labourers in that glorious undertaking, wishing it a long and a prosperous *carrière*. How happy am I to think, that they have a public who will meet their work with correspondent feelings, who will give it the same generous, becoming, patriotic reception, which has ever so peculiarly and so exemplarily characterised that gallant nation! As this new style of painting, founded upon the Grecian character of design, is of such recent introduction in France, is so utterly the reverse of every pursuit of art that was in use with them in my time, it would be a great satisfaction (to me at least an exceeding great one) to know by what artist this revolution in the style of design was first introduced; in what picture it was first shewn; when, where, and whether the first suggestion of the idea of this revolution in the taste of art, had no other circumstance connected with it, than the general spirit of reform, and the desire of preparing and adapting art to the purity and feelings of those descendants of Brutus, Dion, and Cato, who would be likely to come forward in the cause of the public and of virtue.

IV B

Revolution

1 Anonymous: Salon Reviews from *Mémoires secrets*

The *Mémoires secrets* contains a chronological collection of carefully dated notices, reviews and items of gossip, covering the theatrical, literary, artistic and political events in France during the years from 1762 to 1789 – which is to say during the final stages of the *ancien régime*, when censorship was liable to prevent the open publication of sceptical and dissenting views (see also III C7 and 13). It was published in England in thirty-six volumes between 1777 and 1789, with the full title, *Mémoires secrets pour servir à l'histoire de la république des lettres en France, depuis 1762 jusqu'à nos jours, ou Journal d'un observateur* (Secret Memoirs to Serve the History of the Republic of Letters in France, from 1762 until the Present, or Journal of an Observer), London: John Adamson. Volume 13, published in 1780, contains a succession of six unsigned Salon reviews, covering the years 1767 to 1779. Further 'Salons' are spread throughout the remaining volumes. Their traditional attribution to M. de Bachaumont, the addressee of La Curne de Sainte-Palaye's *Lettre sur le bon goût* (III C6), has been shown to be erroneous (other considerations apart, he died in 1771). Bernadette Fort has made the point that the 'Salons' themselves both invoke and represent a multiplicity of voices and views and thus tend to evade identification with any individual author (Fort, 1999). What can be said is that the 'Salons' reveal a considerable familiarity both with the canonical art-theoretical texts of the previous hundred years and with the priorities of academic practice, albeit the ensuing commentaries are far from respectful of those priorities. The earlier reviews tend to be critical of the authority of the Academy and of its luminaries, holding them to account for the stultification of French painting. In 1781, however, the reviewer greets the positive contributions of a new generation, notably of Jacques-Louis David, who exhibited his *Belisarius receiving Alms* (Louvre, Paris) and *Socrates taking the Hemlock* (Metropolitan Museum of Art, New York) in the Salon of that year. We reproduce excerpts from the 'Salons' of 1783 and 1785. The first is remarkable for the somewhat arch attention given to the work of Elisabeth Vigée-Lebrun, the second for the author's condemnation of Boucher's influence and for his interest in David's *Oath of the Horatii* (Louvre, Paris). Our excerpts are taken from the text of the 'Salons' in Bernadette Fort ed., *Les Salons des 'Mémoires Secrets'*, Paris: Ecole Nationale Supérieure des Beaux-Arts, 1999, pp. 249–54, 283–4, 295–6, translated for this volume by Kate Tunstall.

On the paintings, sculptures and engravings exhibited in the Louvre Salon
on 25th August 1783

Since the imitative arts, however perfect they may be, Sir, can never be equal to the inexhaustible fecundity and infinite variety of their model, nature, the fear for the historian of the works of the former would seem to be that in returning too often to the same objects, he might eventually become monotonous and tiresome. Until now, however, the Salon has always offered us some unexpected event, various new combinations of events and above all, the odd anecdote to add excitement and interest to the diary of this periodical collection. Today, for instance, in spite of the unprecedented abundance of history paintings to be found in this place and in spite of the excellence of the numerous masters competing in the arena of the grand genre, would you believe it, – and is it not a blasphemy? – Apollo's sceptre seems to have become a distaff and a woman has carried off the palm. Let me explain: this does not mean that there is more genius in a painting of two or three three-quarter-length figures than there is in a vast composition with ten or twelve life-size figures, nor that there is more genius in a painting based on an utterly simple idea than in one whose complicated structure is equivalent to a whole poem; it only means that the works by the modern Minerva attract the spectator's attention first, call it back constantly, seize it, take it over and wring from him those cries of pleasure and admiration that artists are so eager for and which are usually the mark of superior works. The paintings in question are also the most highly praised, the most talked about, the ones most discussed in court and in town, at dinner parties, in clubs, even in artists' studios. When someone says they have just returned from the Salon, the first questions people ask are: did you see Madame Lebrun? What do you think of Madame Lebrun? And at the same time, they suggest the answer: Madame Lebrun is an astonishing woman, isn't she? Such, Sir, is the name of the woman I am thinking of, who has risen to fame in such a short space of time, for it was only a few months ago that she was swiftly made an Academician and given the right to one of the four places that are specially reserved for women.

Anyway, what has in no small measure helped to increase Madame Lebrun's reputation is the fact that she is a pretty young woman, very pleasant, witty and charming, who keeps the best company in Paris and Versailles, gives fine dinner parties to artists, writers and persons of quality, and that her house is a refuge for the Polignacs, the Vandreuils, the Polastrons, the most respected and refined courtiers, a retreat from the troubles of the court and a place where they can find the happiness that eludes them elsewhere. Only with such powerful protection was she able to cross the threshold of the Academy which would not have allowed her in, despite her merits, because her husband degrades art with his commercial activities and this is sufficient reason to exclude her. But having introduced you to her person, it is now time to analyse her works.

I don't know in which class the Academy has put Madame Lebrun, history, genre or portraits, but she is worthy of any of them, even the first. I consider the painting for which she was received into the Academy [her *tableau de réception*] very likely to gain her admission into the first class. It is *Peace restoring Plenty* [Louvre, Paris], an

allegory as natural as it is ingenious: one could have chosen no better in terms of the details. The first figure, noble, proper and modest like the peace which France has just signed, is characterized by the olive, her favourite tree: she is holding a branch of it in her right hand as she places her right arm gently round the second figure who is looking at her with a kind expression and seeming to give in to her influence without any resistance. The second figure is shown with a bundle of ears of corn in her left hand that she is ready to scatter on the ground. With the other hand, she is generously pouring the different fruits of the land out of a cornucopia. Finally, goatskin gourds filled with wine complete the basic pleasures required to meet the needs of the people upon whom the blessings of peace are principally bestowed.

Moreover, the figure representing Plenty is a superb woman, in the style of Rubens, in those robust proportions which are the mark of health, strength and happiness. The flesh is firm and supple and her breast is rising up, as it were, underneath the canvas. Her complexion has a freshness, a radiance which we find more beautiful than real life because we compare this woman to our Parisian coquettes and because the model, by contrast, has doubtlessly been drawn, as she should be, from the healthiest and strongest aspects of rural women, and then adapted nonetheless with a kind of art that has nothing fake about it, and embellished with those true charms that a good bourgeois townswoman calls upon when she is at her toilet.

If one goes on to examine these figures as an artist, one judges them to be grouped in a superior manner; one admires the ample forms, the smooth outlines, the picturesque attitude of the skilfully posed Plenty; whilst Peace, daughter of heaven, is drawn with a more precise line. Spread across her face, we see that gentleness, that calm, that repose of the inhabitants of Olympus; her simple and severe clothing contrasts wonderfully with the shiny fabrics that her wholly earthly companion is casually draped in. The latter has a more elegant headdress; she is wearing a thousand flowers in her hair, whilst the former wears only a crown of olive leaves. These various contrasts produce a harmony in this painting which induces in the spectator that pleasure whose origins are unknown to the vulgar man but are soon grasped by the connoisseur.

If this composition, Sir, were still not enough to earn Madame Lebrun the honour of a seat amongst the history painters, it would be difficult to resist granting it to her for another painting the motif of which, taken from Homer, proves that she is able, like her masters, to derive enthusiasm from the divine works of the prince of poets and painters, for the latter do not cease to take him as their inspiration. The subject is *Juno Borrowing the Belt of Venus*. There are three figures in this subject, in which Cupid has a part and enjoys playing with this belt, which has already been handed over to the Queen of Olympus. It pains him to let it go, as though he is aware of its full importance and fears that his mother will lose her most precious charms along with it. In fact, either as a development of this idea or as an act of homage, the artist has thought she should make the chief goddess her principal figure, preferring Juno to Venus as no amateur would do in these circumstances. The former, a brunette, brings all the excitement of beauty to the majesty of the throne; the latter is a blonde, with nothing of a goddess's nobility, even verging on the grisette, a bit dull and consequently unenticing. Except for this flaw in the face, which is a serious error

with regard to the classical story, her body is very alluring; she is a nude in the style of Boucher, painted very lovingly and using his colour tone. To judge by the price it fetched, this painting must be of a very high quality, since the Count d'Artois was advised to pay 15,000 francs for it; he did so and His Royal Highness is now the owner.

What confirms to me that Madame Lebrun had the idea of subordinating Venus to Juno and of drawing the spectator's attention to the latter in the painting of which I have just spoken is the fact that in her third piece, *Venus Binding Cupid's Wings*, the mother of the little god is clearly divine. Her face looks more noble and her body is of richer proportions. The artist felt that she had to dignify the maternal act being performed in an appropriate manner, for in painting, as in poetry, it is not enough to express a person's general character, it must be modified by local character, that is, by the kind of emotion the person is feeling. Thus Cupid, usually represented as a sweet, naughty, laughing, sprightly child, has something sulky and sullen about him here. Viewed in the right way, this pretty allegory is charming, and the criticism of the cold expression on the face of one figure and of the scowl on the face of the other is found to be unfair and no longer stands up.

In addition to these three pieces, Madame Lebrun has exhibited three *Portraits* of the Royal Family, those of *The Queen*, of *Monsieur* and of *Madame*. The two princesses are *en chemise*, a form of dress recently created by women. Quite a number of people have thought it out of place to show these august personages in public in a form of dress which is reserved for the privacy of the palace; it is to be presumed, however, that the artist was authorized to do so and would not have taken such a liberty of her own accord. Whatever the case may be, Her Majesty is very good; she has that alert and assured look, that ease that she prefers to the discomfort of a public performance, and which does no harm to the nobility of her role. Some critics find her neck too long and thin: that may be a slight mistake in the drawing. Apart from that, there is much freshness in her face, elegance in her bearing and naturalness in her pose which make this a portrait a success. It even attracts those who would not, at first glance, recognize it as the queen.

Madame has something more severe, more reserved, more serious about her; these attributes are her dominant characteristics. She is also a very good likeness; one might wish only that her arms moved and that they were not stuck on to her body, making her look like a puppet. As for the Prince, to judge by the gaiety his face is exuding, something which is very rare in portraits, he was not ill at ease when he was being painted. That is easy to believe when you see her *Self-Portrait*. Nevertheless, there she has tried less to show off her charms than to display her artistic talents.

She is wearing a hat with a very wide, turned-down brim, the shadow of which is skilfully arranged to fall on her face, leaving us to imagine her rather than see her, though this involves a momentary lack of common sense, given the kind of occupation she is currently engaged in, as indicated by the palette and paintbrush she is holding, which would require her to be able to see in an unencumbered way. Nor does the short cape she is wearing go with the freedom of movement that her hands and arms would also require to the full at this moment. But that, so painters have told me, is more picturesque and moreover, it is not about conventions but artistic *tours de force*. Madame Lebrun was not in need of any when she painted *Madame la Marquise*

de la Guiche Dressed as a Gardener. Such figures serve the artist very well. And the accessories are no less charming; the flowers, the clothes, the arrangement of her fichu alone is delightful, and the bright colour of this painting, which one would at first be tempted to view as being out of place in this rustic subject, is a subtlety revealing, beneath this simple disguise, if one were deceived by it, a noble woman's fancy.

In finishing this article on Madame Lebrun, on which I would not have spent so much time, had I not known your liking for the opposite sex and were it not really a phenomenon worthy of remark, I will not conceal from you a rumour which is given credit amongst her fellow artists: people insinuate that she does not paint her paintings or at least that she does not finish them, and that an artist who is in love with her helps her. I will admit that his living arrangements, the fact that he lives under the same roof as her, greatly strengthens these suspicions, but it should be added that the painters are excessively jealous, sometimes even to the point of slandering others. Jealousy might therefore play a large part in this anecdote and even be the inspiration for it. Whatever the case may be, Madame Lebrun's paintings will belong to her as long as the real accomplice does not contest them, and it is up to her to justify her reputation and to deny these shameful claims by defending herself with new masterpieces and, if possible, by surpassing herself.

On the paintings, sculptures and engravings exhibited in the Louvre *Salon*
on 25th August 1785

Artists, Sir, are like certain sick men who, unable to overcome their revulsion at the sight of a particular cure, choose suffering and sometimes even death over a momentary unpleasantness. They are lucky if they meet some relations or a friend interested enough in keeping them alive to exercise some salutary constraint and save them in spite of themselves. With regard to artists, criticism is that supreme cure, though loathsome to their pride, and yet how infinitely they have gained by it! In fact, is it not criticism that, by protesting against the unworthiness of the room, the ridiculously named *Salon* which has for a long time been the theatre of their rivalries, has succeeded in having it converted into a nobler, more appropriate place, equal to that lavish name. Is it not criticism that, in relentlessly groaning at the huge numbers of obscure portraits, puerile *bambochades*¹ and at worthy genre paintings that stifle genius, has awakened the government's zeal, provoked its munificence and given birth to that host of history painters that is the pride of the French School today? Is it not criticism that, in mercilessly hounding bad taste, artificiality and the dazzling but out of place and always exaggerated manner for which Boucher instilled a passion in his pupils, has brought the young athletes back to the true principles of the grand genre and to the beautiful and male ideals of Antiquity? Finally, in short, is it not criticism that is responsible for producing the current *Salon*, cited as the most magnificent and by all accounts the most impressive *Salon* in its history? No trivialities, no fripperies, no grotesqueries, no caricatures, none of those feeble and effeminate scenes the usual effect of which is to debilitate the talent while corrupting the heart. A severe tone reigns there which makes it less agreeable to frivolous and superficial people, but which appeals to the true friends of art and the supporters of

morals that uplift and expand the soul, that provide something for genius to meditate on, perfecting it through exercise. This is certainly the aim of more than thirty history paintings, the majority of which are vast machines, fourteen of them commissioned by the king. One would wish only that in accordance with what had been agreed, the subjects had been chosen from our annals, and one is sorry to find only one of this kind: anyway, it is time that the Romans, Greeks, Egyptians and Jews who have held centre stage for 4,000 years made way for figures who are closer to us, whose customs are more like ours and are more interesting to the French. Still, at least I can see elements of heroism, patriotic actions and sweet virtues, social or religious, everywhere. [. . .]

I was going to finish and seal this letter about history paintings, Sir, when, back at the Salon to visit it once again and to examine scrupulously whether I had left anything out of this genre that could be of interest to you, I see the crowd of spectators that had until then been so dispersed and restless, reduced to, as it were, a stupefied mass, united in admiration of a masterpiece that had just been hung. You will not be surprised when I tell you that it comes from Italy, but make no mistake: it is not a Raphael, nor a Guido, nor a Titian nor a Correggio but a David. This young painter is in Rome and has composed his work, *The Oath of the Horatii between the Hands of their Father*, for the king. Once they return to their senses, everyone pours forth praise and extols what they found most beautiful: 'What a simple and sublime composition,' says the man of letters! 'What a noble design! What elevated ideas in the father's mind! How steadfastly patriotic the first of the young men is!' 'What drawing!' the artist replies. 'How skilfully those muscles have been accentuated and how intelligently those of the father's legs differ from the son's! What energy! What harmony! What colour! This painting crushes all the others.' 'I like the architecture above all,' one of our Vitruvii says; 'it fills the background well, it is in a grand style, with no ornaments, as the fashions of the time demanded, deriving all its beauty from its exact proportions.' 'What a good person the sister is!' a young man adds, 'what gentleness, how moving she is in her sadness! What beautiful eyes, though they are full of tears! *Si dolci nei pianti che savan nel riso!*' 'The poor mother!' an old lady replies tearfully. 'How painful for her to watch her sons leave for a battle they may be going to die in!' 'Yes, but it's a Roman woman's pain,' says a man of a philosophical mind standing next to her, who is used to dissecting and nuancing the passions. Finally, the connoisseur goes into ecstasies over the draperies and the clothing which are all he could ask for. A hundred times this concert of praise is repeated, but when it is over, I hear envy say in muffled tones, its snakes hissing: 'The painting is rather yellow in colour, the groups are disjointed; the most prominent of the Horatii swears his oath with his legs apart as if he were about to start fencing. There is something uneasy about the outstretched arms of the three brothers, and in particular, the profile of the last brother's hand is drawn badly. Yes, I repeat, there is a general confusion in those arms and it is hard to work out which hody each one belongs to. The elder Horatius, rather than presenting the swords to his sons, keeps them held tight, seeming to fear handing them over. The swords are not overly well done, there is too dark a shadow on one of them; the father's left leg that, despite being set back, should be in the foreground, seems to be in the middle ground, making the old man

lose his balance and appear unsteady; the painting is in general too light; there is not enough contrast in the shadows. Mr David paints daylight so as best to bring out the brilliance of his talents, not as it is in nature. The architecture is too well proportioned for the time of the Horatii, the stage is too bare; the action would have been more persuasive if one had seen the two armies in the background, the Roman army at least. . . . It may be that there is some truth in these criticisms, but even if there were Mr David's painting would, I repeat, be no less of a masterpiece, which does not mean a work without flaws, but a work that enchants, transports and so delights the spectator that he does not notice the flaws at first, seeing them only afterwards in discussion.

¹ From the Italian *bambocciata*: 'childish action or remark' [translator's note].

2 Charles-Étienne-Gabriel Cuvillier (active 1780s) Letter to Joseph-Marie Vien

Cuvillier's letter is that of a functionary, written on 10 August 1789 according to the instructions of the General Director of Fine Arts, the royalist Comte d'Angiviller. The painter Joseph Vien (1716–1809) was President of the Académie Royale, with responsibility for the Salon exhibition of 1789, due to take place at a moment of utter precariousness in the political fortunes of the country. The date of the composition of the letter is between the fall of the Bastille on 14 July and the Declaration of the Rights of Man and Citizens on 26 August. It has been described by Robert L. Herbert as 'the key document for the interpretation of David's *Brutus*' (Herbert 1972). It should be acknowledged, however, that the text reveals more about the anxieties attendant on the exhibition of the painting, and about the reasons for its subsequent effect, than it does about David's intentions. His *Oath of the Horatii* had been the success of the 1785 Salon (see IVB1), and the *Brutus* was planned in response to a request from d'Angiviller that the painter should submit a subject for a further royal commission. For all that the painting invokes an extreme republican patriotism, it seems unlikely that it was planned as an anti-royalist demonstration. It is clear, however, that d'Angiviller had reasons to be nervous. At the time the letter was written the authorities responsible for control of the theatre were already under pressure from the radical press. On the one hand, Cuvillier makes clear that the Academy is expected to ensure wholesale support for the exhibition; on the other, he transmits d'Angiviller's concern about the potential for provocation of public opinion if certain actual or imagined images were to appear. The portrait of the chemist Lavoisier and his wife had been painted by David in 1788 (Metropolitan Museum of Art, New York). As Commissioner for Gunpowder, Lavoisier had recently been suspected of acting to equip aristocrats in exile. M. de Tollendahl's 'terrifying painting' was *The Marquis de Lally-Tollendahl unveiling the Bust of his Father* (by J. B. C. Robin). The father in question was a military leader and a victim of royal injustice whose honour the son had eventually been able to vindicate. David's *Brutus* (Louvre, Paris) was finally delivered to the Salon two weeks after the opening (see IVB3). His politically innocuous *Paris and Helen* (Louvre, Paris) was also shown, though without reference to its owner, the king's brother, the Comte d'Artois. The letter was originally published in M. Furcy-Raynaud ed., 'Correspondance de M. d'Angiviller avec Pierre', *Nouvelles Archives de l'Art Français*, volumes 20 and 22, 1906, no. 763,

pp. 263–5. It is translated in full in Robert L. Herbert, *David: Brutus*, London: Allen Lane, The Penguin Press, 1972, pp. 124–5, from which our text is taken.

Versailles, 10 August 1789

At our last meeting, Monsieur, about the coming opening of the Salon, the idea of which preoccupies Monsieur the General Director almost as much as making use of the waters, I expressed to you the justified and entire confidence he places in the prudence and caution of the Academy in organizing this Salon. I will not repeat here the reasons and the motives that unhesitatingly determine Monsieur the General Director to deprive neither the capital nor the artists of an event interesting for the pleasures of the former, valuable for the glory of the latter, and which, in the present moment, can serve morale as a useful diversion. None of that will have escaped your notice and will be equally understood by Messieurs of the Academy, hence it is only in a certain measure to complete the instructions prepared by Monsieur the General Director that I will offer a few observations here.

Monsieur the General Director thinks that one could not exercise too much caution in the choice of subjects which will be exhibited, relative to the interpretations which might escape from an observer and which could be awakened by others. The theatre provides us each day with the most unexpected examples. I only feel all the more how difficult it is to predict all that might be imagined, and my unique aim is to urge the committee to use all possible precaution.

The heading of portraits lets one more readily put oneself on guard, because in general the sitters being known, one is in the position of measuring public opinion and of not risking anything; I imagine that concerning this, M. Lavoisier will be the first to wish not to show his portrait. It is not that he could in any sense be ranked among those whom one could think badly of, but one can let him judge that. On the subject of portraits I am inclined to fear that Monsieur de Tollendal might renew the project of exhibiting this terrifying painting which it was so difficult to set aside in 1787; but, at the same time, I am reassured by the very virtue of Monsieur de Tollendal and by the loftiness of his views which will let him see at a glance the danger of furnishing more food to the fermentation. It is in this regard that I am comforted, as much as I could be, by learning that Monsieur David's painting is still far from finished; and, à propos this artist, I think as you, Monsieur, that his painting of *Paris and Helen* can be exhibited without remaining fears, by suppressing the owner's name. In this the only concern I see is the glory of the Academy and that of the artist.

I ought to express very particularly to you, Monsieur, the really deep distress which Monsieur the General Director would feel at the decision some of the artists might take not to contribute to the exhibition, and Monsieur the General Director urges you to press them on his behalf not to follow that course. In case there were too much empty space, the precise wish of Monsieur the General Director is that it be occupied by paintings sent to previous exhibitions that were not seen, or poorly seen. Messieurs *Roslin* and *Durameau* are in a position to respond to both cases, and I rely on them to be ready for the next committee meeting.

I have the honor, etc.

CUVILLIER

P.S. – Will you permit me to make the personal observation that it will perhaps be well to arrange the pictures so that the little ones will not be within reach of certain hands?

3 Comte de Mende Maupas (active 1780s) Review of the Salon of 1789

The title of the painting exhibited by David in the 1789 Salon is *The Lictors returning to Brutus the Bodies of his Sons* (Louvre, Paris). The Brutus referred to is not the more familiar Marcus Brutus, assassin of Julius Caesar, but Lucius Junius Brutus, credited by the Latin historian Livy with a decisive role in ending the rule of the Tarquins and in establishing the Roman republic as a community of free citizens living under the rule of law. In the episode on which David based his painting, Brutus had found his sons guilty of a royalist conspiracy against the new republic, and had himself condemned them to death. Brutus' extraordinary expression at the moment of execution is remarked on by both Livy and Plutarch. David made the hero's stern but troubled features the focus of his composition, but shifted the moment represented to an imagined aftermath of the actual execution. This allowed him to set the scene in an interior and to include a tragic female chorus. It also provided the context for his most original imaginative move. In the normal conventions of history painting, the effects of light would be organized so as to pick out the main player in the pictorial drama, who could also be expected to occupy the centre of the pictorial space. David locates Brutus at the extreme left foreground of his composition and sets him in deep shadow, thereby engaging the spectator more immediately with the emotional content of the painting. This was just the point that caught the attention of one writer on the 1789 Salon, the Comte de Mende Maupas, who presumably added the following supplement to his review in order to take account of the late delivery of David's work. While he pays due credit to the originality of the composition, he is noticeably very cagey in drawing conclusions from its historical theme. *Supplément aux remarques sur les ouvrages exposés au Salon par le C. de M. M.* (Comte de Mende Maupas), is preserved in the *Collection Deloynes*, volume 16, no. 414. The English version is taken from Robert L. Herbert, *David: Brutus*, London: Allen Lane, The Penguin Press, 1972, p. 127.

To appreciate the sublime beauties of this composition, one must go back to the time when Rome built its liberty on the coarseness of its customs, when would-be citizens only dethroned kings in order to reign themselves, when natural feelings gave way to ardent ambition, when a republican phantom consoled the people for the tyranny of its consuls. Then one will understand the merits of M. David's painting: strength of composition, nobility of expression, decisiveness of movement, agony of pose and, more than all that, originality of conception, because the principal subject is found in the dark portion of the picture, as though to mark the suffering of a being whom the republican morgue cannot prevent from being a father. In effect this production is more that of a great poet than of a painter, and the reproach that I heard of *seeing two paintings in the subject* is the very cause of my admiration. I think I see J. Brutus, removing himself from this family, but not yet reproaching himself for his severity; I think I see him wavering between nature and ambition, hence I admire this painting. But, since my enthusiasm never blinds me, I think I should remark to the celebrated

M. David that the uncertainty of the light in this painting could serve as pretext for the criticism of envious and malicious mediocrity.

4 Students of the Académie Royale des Beaux-Arts: ‘Artists’ Demand’

The ‘Vœu des Artistes’ was published as a pamphlet addressed to the Assembly on 12 September 1789, a few days after David’s *Brutus* had appeared at the Salon. David’s initial participation in revolutionary politics was less a cause of his work than a consequence of its reception. It is clear, however, that his opposition to authority within the Academy had already made him a figurehead for dissident students. If he did not actually have a hand in composition of the pamphlet, it is likely that the radical demands expressed in it came from those who had been closest to him. Our complete text is taken from the original edition, issued in Paris, Chez Gueffier jeune, 4 pp., translated for this volume by Akane Kawakami.

At this happy time when the regeneration of the nation is taking place, when she has just announced solemnly that henceforth only merit will lead to high places, will the artists, who hold such a distinguished rank in the nation, be the only ones not to enjoy the happy revolution which has come to pass; and is it not time for them to have at last, at their head, a man whose knowledge of the arts has placed him there? The public knows that artists are governed by a head known as the Director of His Majesty’s Buildings, Arts and Manufactures. This pompous title would seem to require, in him who is graced by it, a meeting of knowledge and wisdom which would make him worthy of giving orders to men whose works do honour to their century and their country. For many years, kings regarded these qualities as completely useless, and favour alone guided their choice. Thus, since Colbert, ignorance, ineptitude, and that haughtiness which is such a convenient mask for the nullity of the nobility, have been the only qualities constantly displayed by the Directors of Buildings. Some, having arrived in their new position, and wishing to ape the Ministers, sketched out a code of laws, in which only justice, reason and common sense were lacking, but in which everything favoured their greed and despotism; others, blind protectors of rampant mediocrity, would pitilessly crush those artists who, permeated by the nobility of their art and their independence, scorned to pay them court assiduously; but all of them, in general, driven by a ridiculous pride, and incapable of comprehending the honour of their task, distanced themselves from the artists, and broke off all communication with them; and, left with a collection of base subalterns, ceased to give any signs of their existence, save by the ridiculous orders which emanated from their offices.

The class of artists, abundant and respectable as they are, thus invokes the National Assembly; the artists ask that it employ its good offices to deliver them from a yoke which is as ridiculous as it is unbearable. The king has had the goodness and justice to follow the wishes of the nation for the nomination of his new Ministers; may he now complete his creation, and finally bestow upon the artists a Leader worthy of them. Their deference for noble birth, if supported by personal merit and a

solid knowledge of the arts, would lead them to desire the choice of the prince to fall on a member of the noble order of Citizens, who have recently made so many sacrifices for the country; and it is also the case that their merits, their thorough studies in painting and architecture, their travels and assiduous projects, have resulted in their most distinguished members sitting in the artists' seats at the Academy; it is a nomination from their ranks that would do honour to the justice and wisdom of his Majesty, at the same time as being infinitely agreeable to the artists, with whom they have always shared the most intimate links of brotherhood.

5 John Trumbull (1756–1843) Letter to Thomas Jefferson

Trumbull's principal claim to fame as an artist lies in his series of large contemporary history paintings of the American Revolution: images such as the *Battle of Bunker's Hill* and the *Declaration of Independence*, painted only about a decade after the events they depicted. Trumbull came from an affluent New England family and his choice of a career in art was strongly opposed by his father, with the result that he was, at first, largely self-taught as a painter. In 1780, however, he came to Europe on family business and when in London sought out Benjamin West, who agreed to become his tutor. Trumbull was actually imprisoned and deported as a spy, and may only have been spared because of West's personal intercession with the king. He returned in 1784 to study both with West and at the Royal Academy. It was at this time that he came into contact with Thomas Jefferson, then American Ambassador in Paris, who suggested the series of paintings based on the War of Independence. The occasion of the present letter was Jefferson's invitation to Trumbull to become his personal secretary. Trumbull declined, and speaks of his dedication to commemorating the events of the Revolution in an art worthy of its epoch rather than one that merely offered frivolous entertainment. Later in 1789 Trumbull returned to America, where his plan to make money from engravings of his paintings failed. He gave up art for a while, but eventually recovered to become a leading portrait painter and a pillar of the American art establishment. Ironically, the conservatism he brought to his role as President of the Academy of Fine Arts led in 1830 to the secession of the National Academy of Design. The latter claimed for itself the American tradition of independence and condemned Trumbull's Academy for its allegiance to Old World tradition (see *Art in Theory 1815–1900*, IID3). We have taken Trumbull's letter from the text reprinted in John W. McCoubrey ed., *American Art 1700–1960*, Englewood Cliffs, New Jersey: Prentice-Hall, 1965, pp. 40–3.

London, June 11th, 1789

Dear Sir:

I have received yours of the 1st, by the last post, and am happy that you find the account correct; since writing that, you will have received by Mr. Broome, the bill of exchange. You will receive by the diligence to-morrow, Stern's Sermons, Tristram Shandy, and the Sentimental Journey, unbound; being all of his works which have been published by Wenman, in his very small size; they cost eight shillings, sixpence.

If my affairs were in other respects as I could wish them, I should have given at once a positive answer to your proposition. It would have been an answer of thankfulness and acceptance, for nothing could be proposed to me more flattering to my pride, or more consonant, at least for a time, to my favorite pursuit. The

greatest motive I had or have for engaging in, or for continuing my pursuit of painting, has been the wish of commemorating the great events of our country's revolution. I am fully sensible that the profession, as it is generally practiced, is frivolous, little useful to society, and unworthy of a man who has talents for more serious pursuits. But, to preserve and diffuse the memory of the noblest series of actions which have ever presented themselves in the history of man; to give to the present and the future sons of oppression and misfortune, such glorious lessons of their rights, and of the spirit with which they should assert and support them, and even to transmit to their descendants, the personal resemblance of those who have been the great actors in those illustrious scenes, were objects which gave a dignity to the profession, peculiar to my situation. And some superiority also arose from my having borne personally a humble part in the great events which I was to describe. No one lives with me possessing this advantage, and no one can come after me to divide the honor of truth and authenticity, however easily I may hereafter be exceeded in elegance. Vanity was thus on the side of duty, and I flattered myself that by devoting a few years of life to this object, I did not make an absolute waste of time, or squander uselessly, talents from which my country might justly demand more valuable services; and I feel some honest pride in the prospect of accomplishing a work, such as had never been done before, and in which it was not easy that I should have a rival.

With how much assiduity, and with what degree of success, I have pursued the studies necessarily preparatory to this purpose, the world will decide in the judgment it shall pass on the picture (of Gibraltar) which I now exhibit to them; and I need not fear that this judgment will deceive me, for it will be biased here, to a favorable decision, by no partiality for me, or for my country.

But, while I have done whatever depended upon my personal exertions, I have been under the necessity of employing, and relying upon the exertions of another. The two paintings which you saw in Paris three years ago, (Bunker's Hill and Quebec,) I placed in the hands of a print-seller and publisher, to cause to be engraved, and as the prospect of profit to him was considerable, I relied upon his using the utmost energy and dispatch; instead of which, three years have been suffered to elapse, without almost the smallest progress having been made in the work. Instead therefore of having a work already far advanced to submit to the world and to my countrymen, I am but where I was three years since, with the deduction from my ways and means of three years' expenses, with prospects blighted, and the hope of the future damped by the experience of past mismanagement. And the most serious reflection is, that the memory and enthusiasm for actions however great, fade daily from the human mind; that the warm attention which the nations of Europe once paid to us, begins to be diverted to objects more nearly and immediately interesting to themselves; and that France, in particular, from which country I entertained peculiar hopes of patronage, is beginning to be too much occupied by her own approaching revolution, to think so much of us as perhaps she did formerly.

Thus circumstanced, I foresee the utter impossibility of proceeding in my work, without the warm patronage of my countrymen. Three or four years more must pass before I can reap any considerable advantage from what I am doing in this country,

and as I am far from being rich, those years must not be employed in prosecuting a plan, which, without the real patronage of my country, will only involve me in new certainties of great and immediate expense, with little probability of even distant recompense. I do not aim at opulence, but I must not knowingly rush into embarrassment and ruin.

I am ashamed to trouble you with such details, but without them, I could not so well have explained my reason for not giving you at once a decided answer. You see, sir, that my future movements depend entirely upon my reception in America, and as that shall be cordial or cold, I am to decide whether to abandon my country or my profession. I think I shall determine without much hesitation; for although I am secure of a kind reception in any quarter of the globe, if I will follow the general example of my profession by flattering the pride or apologizing for the vices of men, yet the ease, perhaps even elegance, which would be the fruit of such conduct, would compensate but poorly for the contempt which I should feel for myself, and for the necessity which it would impose upon me of submitting to a voluntary sentence of perpetual exile. I hope for better things. Monuments have been in repeated instances voted to her heroes; why then should I doubt a readiness in our country to encourage me in producing monuments, not of heroes only, but of those events on which their title to the gratitude of the nation is founded, and which by being multiplied and little expensive, may be diffused over the world, instead of being bounded to one narrow spot?

Immediately therefore upon my arrival in America, I shall offer a subscription for prints to be published from such a series of pictures as I intend, with the condition of returning their money to subscribers, if the sum received shall not prove to be sufficient to justify me in proceeding with the work; and I shall first solicit the public protection of Congress.

I am told that it is a custom in France, for the king to be considered as a subscriber for one hundred copies of all elegant works engraved by his subjects; that these are deposited in the Bibliothèque du Roi, and distributed as presents to foreigners of distinction and taste, as specimens of the state of the fine arts in France. Would this be a mode of diffusing a knowledge of their origin, and at the same time a lesson on the rights of humanity, improper to be adopted by the United States? And if the example of past greatness be a powerful incentive to emulation, would such prints be improper presents to their servants? The expense would be small, and the purpose of monuments and medals as rewards of merit, and confirmations of history, would receive a valuable support, since perhaps it may be the fate of prints, sometimes to outlast either marble or bronze.

If a subscription of this sort should fill in such a manner as to justify me, I shall proceed with all possible diligence, and must of course pass some years in Europe; and as I have acquired that knowledge in this country which was my only object for residing here, and shall have many reasons for preferring Paris hereafter, I shall in that case be happy and proud to accept your flattering proposal. But if, on the contrary, my countrymen should not give me such encouragement as I wish and hope, I must give up the pursuit, and of course I shall have little desire to return for any stay in Europe. In the mean time, viewing the absolute uncertainty of my situation, I must beg you not to pass by any more favorable subject which may

offer, before I have the happiness to meet you in America, which I hope will be ere long.

I have the honor to be, very gratefully,
Dear sir, your most faithful servant,
John Trumbull

6 Mary Wollstonecraft (1759–1797) Response to Edmund Burke

Wollstonecraft was part of a radical circle of English intellectuals active at the end of the eighteenth century, which included William Godwin, Thomas Paine and William Blake. Although radicalized by the French Revolution, she had already written on women's place in society before 1789. Burke's hostile *Reflections on the Revolution in France* appeared in November 1790. Wollstonecraft immediately began to compose a reply, which was printed by the page as she wrote it, and which was published in December. Wollstonecraft took issue not just with Burke's condemnation of the Revolution but with his wider scale of values as manifest in his earlier *Enquiry into the Origin of our Ideas of the Sublime and the Beautiful* (see IIIB6). For Wollstonecraft, Burke's gendered language – in which beauty was a feminine attribute while the sublime was masculine – was evidence of a value system which excluded women from the sphere of moral action and truth by aestheticizing them. Indeed she goes further, and argues that the consistent application of Burke's principles would effectively dehumanize men too. Wollstonecraft's text thus offers an early example of reading aesthetic categories for evidence of the material and political interests lying behind them. The extract is taken from *A Vindication of the Rights of Men in a Letter to the Right Honourable Edmund Burke* (1790), as reprinted in *The Works of Mary Wollstonecraft*, volume 5, edited by Janet Todd and Marilyn Butler, London: Pickering and Chatto 1989, pp. 29–30, 45–7. We have included one of the editors' explanatory footnotes.

It is an arduous task to follow the doublings of cunning, or the subterfuges of inconsistency; for in controversy, as in battle, the brave man wishes to face his enemy, and fight on the same ground. Knowing, however, the influence of a ruling passion, and how often it assumes the form of reason when there is much sensibility in the heart, I respect an opponent, though he tenaciously maintains opinions in which I cannot coincide; but, if I once discover that many of those opinions are empty rhetorical flourishes, my respect is soon changed into that pity which borders on contempt; and the mock dignity and haughty stalk, only reminds me of the ass in the lion's skin.

A sentiment of this kind glanced across my mind when I read the following exclamation. 'Whilst the royal captives, who followed in the train, were slowly moved along, amidst the horrid yells, and shrilling screams, and frantic dances, and infamous contumelies, and all the unutterable abominations of the furies of hell, in the abused shape of the vilest of women.' Probably you mean women who gained a livelihood by selling vegetables or fish, who never had had any advantages of education; or their vices might have lost part of their abominable deformity, by losing part of their grossness. The queen of France – the great and small vulgar, claim our pity; they have almost insuperable obstacles to surmount in their progress towards true dignity of character; still I have such a plain downright understanding that I do

not like to make a distinction without a difference. But it is not very extraordinary that *you* should, for throughout your letter you frequently advert to a sentimental jargon, which has long been current in conversation, and even in books of morals, though it never received the *regal* stamp of reason. [. . .]

Where is the dignity, the infallibility of sensibility, in the fair ladies, whom, if the voice of rumour is to be credited, the captive negroes curse in all the agony of bodily pain, for the unheard of tortures they invent? It is probable that some of them, after the sight of a flagellation, compose their ruffled spirits and exercise their tender feelings by the perusal of the last imported novel. How true these tears are to nature, I leave you to determine. But these ladies may have read your Enquiry concerning the origin of our ideas of the Sublime and Beautiful, and, convinced by your arguments, may have laboured to be pretty, by counterfeiting weakness.

You may have convinced them that *littleness* and *weakness* are the very essence of beauty; and that the Supreme Being, in giving women beauty in the most super-eminent degree, seemed to command them, by the powerful voice of Nature, not to cultivate the moral virtues that might chance to excite respect, and interfere with the pleasing sensations they were created to inspire. Thus confining truth, fortitude, and humanity, within the rigid pale of manly morals, they might justly argue, that to be loved, women's high end and great distinction! they should 'learn to lisp, to totter in their walk, and nick-name God's creatures' [*Hamlet*]. Never, they might repeat after you, was any man, much less a woman, rendered amiable by the force of those exalted qualities, fortitude, justice, wisdom, and truth; and thus forewarned of the sacrifice they must make to those austere, unnatural virtues, they would be authorized to turn all their attention to their persons, systematically neglecting morals to secure beauty. – Some rational old woman indeed might chance to stumble at this doctrine, and hint, that in avoiding atheism you had not steered clear of the mussulman's creed;¹ but you could readily exculpate yourself by turning the charge on Nature, who made our idea of beauty independent of reason. Nor would it be necessary for you to recollect, that if virtue has any other foundation than worldly utility, you have clearly proved that one half of the human species, at least, have not souls; and that Nature, by making women *little, smooth, delicate, fair* creatures, never designed that they should exercise their reason to acquire the virtues that produce opposite, if not contradictory, feelings. The affection they excite, to be uniform and perfect, should not be tintured with the respect which moral virtues inspire, lest pain should be blended with pleasure, and admiration disturb the soft intimacy of love. This laxity of morals in the female world is certainly more captivating to a libertine imagination than the cold arguments of reason, that give no sex to virtue. If beautiful weakness be interwoven in a woman's frame, if the chief business of her life be (as you insinuate) to inspire love, and Nature has made an eternal distinction between the qualities that dignify a rational being and this animal perfection, her duty and happiness in this life must clash with any preparation for a more exalted state. So that Plato and Milton were grossly mistaken in asserting that human Love led to heavenly, and was only an exaltation of the same affection; for the love of the Deity, which is mixed with the most profound reverence, must be love of perfection, and not compassion for weakness.

To say the truth, I not only tremble for the souls of women, but for the good natured man, whom every one loves. The *amiable* weakness of his mind is a strong argument against its immateriality, and seems to prove that beauty relaxes the *solids* of the soul as well as the body.

It follows then immediately, from your own reasoning, that respect and love are antagonist principles; and that, if we really wish to render men more virtuous, we must endeavour to banish all enervating modifications of beauty from civil society. We must, to carry your argument a little further, return to the Spartan regulations, and settle the virtues of men on the stern foundation of mortification and self-denial; for any attempt to civilize the heart, to make it humane by implanting reasonable principles, is a mere philosophic dream. If refinement inevitably lessens respect for virtue, by rendering beauty, the grand tempter, more seductive; if these relaxing feelings are incompatible with the nervous exertions of morality, the sun of Europe is not set; it begins to dawn, when cold metaphysicians try to make the head give laws to the heart.

But should experience prove that there is a beauty in virtue, a charm in order, which necessarily implies exertion, a depraved sensual taste may give way to a more manly one – and *melting* feelings to rational satisfactions. Both may be equally natural to man; the test is their moral difference, and that point reason alone can decide.

Such a glorious change can only be produced by liberty. Inequality of rank must ever impede the growth of virtue, by vitiating the mind that submits or domineers; that is ever employed to procure nourishment for the body, or amusement for the mind. And if this grand example be set by an assembly of unlettered clowns, if they can produce a crisis that may involve the fate of Europe, and ‘more than Europe,’ you must allow us to respect unsophisticated reason, and reverence the active exertions that were not relaxed by a fastidious respect for the beauty of rank, or a dread of the deformity produced by any *void* in the social structure.

¹ The very low status of woman in Muslim countries gave rise to the widespread Christian misconception that Islam denied that women had souls.

7 Antoine Quatremère de Quincy (1755–1849) ‘On the System of Teaching’ from *Considerations on the Arts of Design in France*

Quatremère de Quincy trained as a sculptor after leaving the study of law, though much of his written work was devoted to the subject of architecture. He eventually became an eminent administrator of the arts. He spent much of the period 1776–84 in Rome and in 1779 was in Naples with David. On the basis of recent archaeological discoveries, he later came to see classical Greek style as an ideal expression of ‘character’ in the society that produced it, and in that sense as a model to be followed in the present. He put these ideas into effect in the remodelling of the church of Ste Geneviève in Paris in the early 1790s, when it was renamed the Pantheon and transformed into a temple to the martyrs and heroes of the Revolution. His *Considerations on the Arts of Design in France* was offered to the National Assembly at a time when the question of the continuing existence of the (formerly royal) academies was under discussion but as yet unresolved. The question

Quatremère addressed was 'Does France need to maintain the expense of a public academy or school of Design? And what would be the most advantageous method to adopt in such an institution?' (p. viii). In response, he argued for a post-revolutionary renewal of the arts along neo-classical lines. He made two proposals of particular significance: that the exclusive Royal Academy of Painting and Sculpture should be liberalized through reform of its teaching programme; and that there should be an end to the monopoly by which only members of the Academy were permitted to exhibit in the official Salon. His arguments were generally well received. A decision to open the Salon to all comers was formalized by the Assembly in August 1791, with effect from the Salon of 1793, while the royal academies were dissolved by decree in 1793. However, Quatremère was soon to become detached from the cultural politics of the Revolution. He was briefly imprisoned during the Terror in 1794 and grew increasingly anti-republican, opposing the removal of art from Italy for the Louvre and from the French provinces for Lenoir's Musée des Monuments Français (see IVB13). He was eventually exiled to Germany, returning in 1800 at the time of the Consulate. *Considérations sur les arts du dessin en France, Suivies d'un plan d'Académie, ou d'Ecole publique, et d'un système d'encouragemens*, was originally published in Paris: Chez Desenne, in 1791. Our text is taken from this edition, Part II, chapter III, pp. 121–37, translated for the present volume by Jonathan Murphy. (For excerpts from Quatremère's later work, *An Essay on the Nature, the End and the Means of Imitation in the Fine Arts*, 1823, see *Art in Theory 1815–1900*, IB5.)

On the Teaching System

Under this title I do not include the organizational and disciplinary requirements that will no doubt be necessary from a legal point of view, but which have no place in a preliminary study. My subject instead will be the ideas that lie behind the teaching, and its methodology.

The spirit of teaching

There is no one spirit that informs all teaching: teaching should vary according to the different types of institution, their nature and objectives, and their means. An art school, by which I mean a place where one teaches the imitation of the beautiful and the true, in accordance with principles which depend on the intelligence, and methods that aim at both the head and the heart; a school whose students, once they have arrived at the age of reason, should be allowed to follow the inspiration that reason brings, and should only be subjected to public teaching if that teaching brings a desire to learn and spurs on ambition. Such a school should have as its principle a spirit of great liberty in all its procedures and in all the forms of teaching that it offers. All that might remind the students of the scholastic regime of a children's school should be removed, so that the students instead should be inspired to all forms of emulation, and teaching itself through this free and simple instruction will in itself be ennobled. Such an institution should resemble more the Lyceum of the ancients than it should a modern school.

All men filled with the desire for the passion and glory of a career in the most noble of the arts should find here all that they require to facilitate their progress and speed

them on their way, and our school should present students with all the necessary lessons and examples, so that they should never be in a position to reproach it for any lack of culture nor for the teaching of any practice that might ultimately be harmful to their nature. Thus the school must teach neither too much nor too little, and it is in this idea of balance that the true spirit of our institution should be found.

The errors at the present Academy

The main problem at the present academy is that it teaches both too much and too little. It teaches too much in that it has reduced teaching to a series of exclusive procedures, outside which the students receive almost no assistance whatsoever, and it thus clips the wings of the students who are forced to suffer under a monotonous and quite forbidding regime. It teaches too much in that it relies on an extremely narrow ideal of emulation, towards which there is only one path, which all students are forced to follow. It teaches too much in that it controls too tightly the direction that talent might take, instituting a multitude of irrelevant fine distinctions, all of which in its opinion must be mastered if the student is to arrive at a peak of perfection, and be accorded the title of Academician. Perhaps I am wrong to say it teaches too much; closer to my meaning is the idea that it regulates too closely the activities of the pupils.

But I am clear in my mind that it teaches too little. We might even go so far as to say that there is very little true teaching at all.

All individual teaching by the masters is carried out by a dozen or so teachers and assistants who take turns to choose the pose for the model for a month, and in practice watch over the students far more than they actually correct their work. However zealously the teachers may desire to correct the students' work, the large numbers of students and the short hours kept by the school reduce the act of teaching itself to an extremely brief encounter.

The action of teaching, such as it is carried out by the academic body, is reduced to little more than the act of judging the periodic competitions between the students, which were originally introduced to bolster the enthusiasm of the students. Thus their role is to adjudicate places and distribute medals and prizes. No shadow of theory haunts these puerile proceedings, and the whole enterprise is flawed from the outset and overly fastidious throughout. One could teach thus for thirty years without ever making a single useful suggestion, and this leads to a form of teaching which is both passive and wordless.

So much for the teachers. Where the students are concerned, the only assistance they receive from this public teaching is the free study of the model. This is the sole object of their work and their only means of advancement, as it is only on this form of imitation that the majority of the competitions are founded. This means of learning is so exclusive that one might claim that this model posed on the table, like the rule of Polyctetes, is the whole academy, and that one might as well simply dispense with the masters altogether.

Misuse of the study of the model

Doubtless some of these drawing masters would reply that the lessons of nature are far more valuable than any teaching they themselves might bring. In principle I agree with this view, but we need to be quite clear about what we understand by the study of nature, as it is clearly one of the most essential elements in the art of drawing.

They are strangely mistaken if they take the study of the model to be the study of nature. The model is part of nature, but it does not necessarily follow that all of nature is in the model; nature is species, while the model is no more than a specimen. The study of nature should always be the study of the species itself. Thus the study can never be limited by a single specimen, unless that individual could somehow encapsulate all types of beauty and perfection. Such perfection of course can exist nowhere other than in a work of art, and there only in a certain measure. Nature, in the creation of beings, is subject to too many accidents. Join to those the accidents of education and all the circumstances which surround man and society, and one quickly has proof that the idea of a perfect model is a chimera of the imagination. Only art can bring such a chimera into being, by reuniting these parts scattered throughout nature in different specimens, and this search for the perfect form that might reunite these disparate elements is what the true study of nature really is.

That being the case, any other form of study, and any study whose aim is simply the copying of one particular individual form, is inevitably the study of imperfection.

The great cause of the superiority of the Greeks in the imitative arts was the facility that they had to study perfection in nature. All their monuments demonstrate tremendous resourcefulness in this area. Looking at their art, one never gets the impression that it was ever the copy of one particular isolated individual, as is regrettably so often the case when one examines modern figures.

The difference between the Greeks and ourselves in that respect is that they had nature for a model, whereas we have only a model for nature.

The results of this study of the figure, where so much of the students' energies are at present concentrated, serve to demonstrate its inadequacy and insufficiency. It would be pointless to begin to draw up a list of the damage done by this exclusive study, and it may well be that no single student ever escapes its ravages. Independent of this aberrant principle, we should also note that the practice of copying and recopying ceaselessly the same individual, who is paid to contort himself into the most bizarre and improbable positions, serves to pervert the faculties of imagination and invention, when it does not severely reduce them. From this endless copying of lifeless figures devoid of character and expression results the style empty of truth, character and expression, which artists themselves have identified with a word that indicates the cause – the *academic style*.

The reform and improvement of figure drawing

One of the first things to be improved in our new school, both in terms of the spirit that will lie behind it and the methods used to propagate the ideas, is then this study of the model.

As artists are deprived of the habitual sight of nature, the school must provide the answer, and use all the imperfect means at its disposal to fill this lack. My intention is not to suppress figure study at all, but to improve it, and there are principally two means of bringing about this improvement.

The first is to increase several-fold the number of models used, and to ensure that a wide variety of models, both male and female, young and old, of all character types pass before the students' eyes. Is it not ridiculous to believe oneself to be well instructed in nature simply on account of having studied one man for nearly a decade? The same man, moreover, that successive generations of artists have studied, and will otherwise continue to do until he passes on from old age. Why should one particular man be the universal model for all the gods, the heroes and all the men painted? For in turn he plays the role of Apollo, Mars, Jupiter, Adonis, Hercules, Narcissus, etc. The art of a whole half-century can be identified simply through the portrait of one man.

It is my contention that the choice and variation of models should be one of the responsibilities devolved to those whose task it is to teach the drawing of the model in question. There is no reason for them all to be employed for the whole year, or even to be salaried employees of the Academy.

The second means of removing the disadvantages of the present system without harming the students' taste or individuality would be to remove one of the particularities which characterize it, and reorganize the internal competitions. In place of the puerile scholastic competitions on which the pupils squander so much of their energy, other competitions should be instituted, which would serve as a corrective to the present over-used formula.

Classical study

Until now the students have been forced to study a single model, and this has led to an often biased and usually incomplete form of imitation. The only sure means of expanding the students' capabilities would be to offer them far greater access to the spectacle of antique monuments and classical models. For it is there that nature seems most clearly to have imprinted her timeless proportions, and writ large the principles of beauty and the elements of perfection.

A gallery of antique statuary

It is my desire to create a gallery of original antique statuary, for in these original monuments there is to be found an ineffable beauty impossible to characterize, together with an immutable quality of authenticity most fruitful for study and quite absent from any plaster models taken of such statues. The gallery could be instituted for a relatively small sum, simply through the bringing together of monuments which are at present dispersed and forgotten throughout the country. I have drawn up a list of a number of such monuments which could be gathered together in the space of three months, and it is my belief that, without any expenditure whatsoever, more than a hundred original classical statues could be brought together, not including numerous other antique monuments which have largely been forgotten or

allowed to fall into a state of disrepair obscuring their real value, through the negligence of our forebears.

A gallery of antique plaster casts

A gallery of plaster casts taken from classical figures and other objects of value apt to instruct the pupils would admittedly require a certain outlay. Out of the powdery debris which at present fills the present so-called antique gallery barely five or six whole figures could be salvaged, and no greater number than that will be found anywhere else inside the Academy. This expense could perhaps be met through a few simple savings on revenues at present destined to go to the school in Rome; but it must be recognized that this gallery will have a fundamental role to play in the formation of our new school.

A gallery of classical ornamentation

An equally indispensable source of models to be presented to the students would be a collection of classical ornamentation, with a selection of the most beautiful foliated scrolls, volutes, capitals, architectural friezes, vases, candelabra and other objects relating to decoration and of general use to those who study ornamentation. Such a gallery would be invaluable to students of drawing: at present ornamentation is learnt through the copying of other drawings, and the original models are quite unknown both to those whose task it is to teach drawing and to those who take the lessons.

The architectural school which forms part of our institution would profit even more directly from the immediate improvement in the students' abilities brought about by their increased study of nature and antique models. I have written elsewhere of how the two parts which make up this art should be brought closer together under a single leadership, and the only changes that I would envisage for the school of architecture would be those naturally engendered by this general change in the spirit that informs our teaching methods in the arts.

Five types of practical classes

The main body of the teaching would thus be divided into five different types of study, which we might usefully term practical classes.

- The study of nature and the figure
- The study of Antiquity
- The study of ornamentation
- The study of architecture
- The study of composition.

I use the term practical classes because the students who follow the classes will want to try the practices for themselves, and they are thus manual exercises; they will proceed through the imitation of examples rather than through instructions that are to be retained.

Despite the improvements in all these different fields, the school would still be quite incomplete if such practical courses were not accompanied by a series of theoretical lectures, for which the establishment of a certain number of professorships would almost certainly be required.

Such an innovation is all the more necessary, given that the practice of the arts is founded upon a certain stock of knowledge, the acquisition of which requires a certain amount of assistance, together with solid advice and an often not inconsiderable period of time, a combination which, left alone, many students are unable to find. It is often objected that the study required for such knowledge is sometimes prejudicial to the practical study of the arts; our institution must therefore come to the assistance of the students and ensure that they are spared these often fruitless efforts.

Five types of theoretical classes

There should also be five types of theoretical classes, to run in parallel with the above improvements. These classes would require a smaller number of masters, as they would only take place on certain days each week.

History

The first class would be the history class. This would consist of an accelerated course through the learning of peoples both ancient and modern, particularly where that learning had a bearing on the arts of the time, or on the content of that art. The historical component of the arts should be quite developed here.

Costume and Antiquity

The second class would cover costume and Antiquity. Here the master would be required to make a study of all ancient art, and garner a collection of the different clothing of different peoples. The costumes should then be recreated and demonstrated with various different cloths on models. The study of costume is not simply limited to clothing, but should also include a knowledge of the customs of the time, of religious and civil ceremonies, of furniture and tools, of different tastes in architecture, and of all that which is often the cause of error and anachronism in the work of the artists of today.

Optics and perspective

The third class would be for optics and perspective. To demonstrate the necessity of this one need look no further than the work of some of the best painters of the present time, who through a lack of learning in this area often find themselves caught between two alternatives. Either they are forced to sin against the most elementary principles, as they do in all but a few of their pictures, or they call in a different artist to draw the lines on the buildings which form the background in their pictures. Unfortunately no one can deny that this is the truth of the present situation.

Anatomy

An anatomy class would also be a requirement. The need for this is all too apparent. The course should be divided up into practical study, which would take place for part of the year, and theoretical study with lessons and demonstrations which could run the whole year long, using works of art, anatomical copies, and books and learned writings upon the subject.

Geometry and mathematics

Geometry and mathematics would be the object of study in the last class, disciplines which might well be accorded pride of place if the subjects were to be ranked in order of their true importance. These sciences are one of the foundations of the art of drawing. The nature of their relationship with sculpture is quite unequivocal; as we already study architecture in our institution, there is no necessity to demonstrate their relevance here.

Each of these classes would be accorded a particular day and hour, and should be combined so that the students could link their lessons with the practical studies mentioned above.

The Academy of the Arts of Design would thus propose two sorts of classes or types of study, and would be a mixture of the practical and the theoretical. The practical classes demand much closer supervision, and would require a greater number of teachers, who could rotate each month or each quarter. The other classes, which would depend more directly on oral communication, would require only one teacher whose lessons could take place on one or several fixed occasions each week or month, in accordance with the nature of the discipline.

A public school, along the lines that I have drawn up here, has as its purpose the supplementing of insufficient resources available at any given moment, either where teaching or learning is concerned. I hope I have demonstrated clearly that there has rarely been a more pressing moment for the creation of such an institution.

Once more I must stress that such an institution requires as much liberty within its confines as the law may allow. Nothing should constrict the students in their choice of studies, in the lessons that they prefer, or in how they choose to spend their time.

As mentioned above, the constant internal competitions to which students are subjected at present should be abolished, as such competitions serve only to make schoolchildren rather than men. They may foster competitiveness, but they inspire too little else besides, and encourage students too early in their careers to care only for a form of public recognition, and learn to use the art of their peers as the sole standard against which their own art should be measured, leading to excessive ambition and petty jealousies and diverting the true course of learning merely to satisfy the forces of vanity and pride. In such a manner the soul will never be rightly proud of genuinely excellent execution.

The Prix de Rome

One competition must nonetheless be maintained, and that is the greatest prize of all. It is highly laudable as an institution, and fits its purpose in an admirable fashion. The Prix de Rome is the best of all possible recompenses, offering young artists the means to grow and strengthen their painting. Few changes are necessary here: one might only extend the competition slightly by opening it to a wider audience. This might be brought about by a small change in the regulations, enabling anyone who applied several days in advance to be considered for a sort of preliminary competition. The winners of the first competition, who might number a dozen or more, would then be allowed to enter the main competition and compete for the great prize. There are of course other detailed points to be taken into consideration here, but this memoir is not the place to address them.

The Ecole de Rome

The main point to make about the Ecole de Rome is that it should be left largely untouched, so that its unique authenticity should remain. Although some small economies could be made they would be quite out of place. Time itself will no doubt expedite them. But while I do feel that we must keep our institution in Rome, we should find a way of enabling our students to study elsewhere in Italy too. Each should be allowed, in accordance with the taste and style that he has developed, to select a number of Italian cities to visit, providing that there be some sort of affinity between his style and choice of town. To this end, rather than being attached to the academy in Rome, as is the case at the present time, each student should be allowed to transport his emoluments to a destination of his choice. The task of the director of the academy in Rome would be to ensure that his individual requirements were met. The influence of the director on students' studies at present counts for little in any case, and the student's own personal interest would be a far more important tool in assisting his progress. He would thus be obliged to submit each year one work, enabling the authorities to check on his progress: the maintaining of the bursary accorded would depend on the manner in which these obligations were met.

I would also note that it would be fitting if each subject were given one additional year of funding, at least equal to what he received in Italy, on his return to France, to begin immediately he came back. The reasons for this need no further explanation.

8 Jacques-Louis David (1748–1825) on his picture of Le Peletier

In the Salon of 1791, David was represented by *The Oath of the Horatii*, *The Death of Socrates*, the *Brutus* and his sketch for *The Oath in the Tennis Court*, which recorded the National Assembly's formal act of resistance to the authority of the king. Much as the most notable among his predecessors had been designated Painters to the King, David was now clearly if informally identified as painter and designer to the Revolution. In the spring of 1792 he directed a public Festival of Liberty and during the same year became a

representative on the Convention's Committee of Public Instruction – effectively a member of the Revolution's general staff. Michel Le Peletier (or Lepelletier) de Saint-Fargeau was among those who had voted for the execution of Louis XVI (as was David himself). On the day before the execution took place in January 1793 he was stabbed to death by a member of the former royal guard. At the request of the National Convention, David stage-managed a public display of Le Peletier's corpse, presenting him in classical style as a martyr to the cause of liberty. Two months later, in March, he offered the Convention his own painting of Le Peletier, represented as he had been posed in death. (The work was subsequently destroyed by Le Peletier's family.) That summer David was to paint the posthumous picture of another assassinated hero of the Revolution, his still surviving and better-known *Death of Marat* (Musée Royaux des Beaux-Arts, Brussels). On the day of Marie-Antoinette's execution, 16 October 1793, the two paintings were set up on sarcophagi in the courtyard of the Louvre, where a funeral service for the two martyrs was held as the climax to a procession of the Museum Section through the streets of Paris. David's *Discours prononcé à la Convention Nationale le 29 Mars 1793* was issued by the Imprimerie Nationale, Paris, in 1793. It was reprinted in J.-L. Jules David, *Le Peintre Louis David 1748–1825*, Paris: Victor-Havard, 1880, p. 117, from which the following translation has been made for this volume by Akane Kawakami.

Representative Citizens,

Each one of us is accountable to our country for the talents that we have received from nature; the forms they take may differ, but their goal should be the same for all of us. The true patriot must seize eagerly every opportunity to enlighten his fellow citizens, and ceaselessly proffer the sublime features of heroism and virtue to their eyes.

This is what I have attempted to do in the homage that I offer today to the National Convention, in this painting of Michel Lepelletier who was basely assassinated for having voted for the death of the tyrant.

Citizens, God, who divided up His gifts amongst all His children, willed that I should express my soul and my thoughts through the medium of painting, and not through that persuasive eloquence whose sublime accents resound amongst you, issuing from the energetic sons of freedom. Filled with respect for His immutable decrees, I will be silent, and I will have achieved my task, if one day I cause an aged father, surrounded by the numerous members of his family, to say: 'Come, my children, come and see the first of your representatives who died to give you your freedom; see his features, see how serene they are; when one dies for one's country one has nothing with which to reproach oneself. Do you see that sword above his head, hanging by nothing but a hair? My children, that is a sign of the fortitude shown by Michel Lepelletier and his brave companions when they sent to his death the odious tyrant who had oppressed us for so long; for the slightest hesitation, breaking the hair, would have destroyed them all.

'Do you see that deep wound? You are crying, my children, you are looking away! But look too at that crown, it is the crown of the immortals; it is kept in readiness by our country for each one of her children; learn to become worthy of it; opportunities are never lacking for noble souls. If ever, for instance, an ambitious scoundrel were to come to you about a dictator, a tribunal, a regulator, or to attempt to usurp the tiniest portion of the sovereignty of the people, or if a coward dared to offer a king to you, do

battle and die as did Michel Lepelletier, rather than consent to it; then, my children, the crown of the immortals shall be your reward.'

I humbly ask the National Convention to accept the homage of my meagre talent. I will think myself too happy if it deigns to receive it.

9 Gazat, Minister of the Interior/Anonymous: preliminary statement to the Official Catalogue of the Salon of 1793

Following the execution of Louis XVI, the Salon of 1793 opened in a Louvre redesignated the Palais National des Arts. With the dissolution of the Academy already decided, its organization was undertaken by a General Commune of Artists, formed along lines proposed by David. Open as it was to all comers of all nationalities, the size of the exhibition exceeded that of any previous Salon, with over 1,400 separate entries. This was the only Salon to take place under the regime of the Committee for Public Safety, during the period of the Terror. The inclusion of an introduction to the official catalogue was an innovation in line with the times, serving to remind artists of their obligation to the state. The introduction is preserved in the *Collection Deloynes*. Our text is taken from the English version printed in Elizabeth Gilmore Holt ed., *The Triumph of Art for the Public 1785–1848*, Princeton, New Jersey: Princeton University Press, (1979) 1983, pp. 45–7.

Introduction:

The forms of the arts, like the political system, must change: art should return to its first principle – to the imitation of nature, that unique model for which unfaithful copies have so long been substituted. Genius, once more, should no longer drag itself along the beaten track, but, flying with its own wings, should offer us its productions with an originality of character suitable to it. If this is accomplished we shall no longer see a long succession of artists who copy each other in servile fashion, hut a varied imitation of nature, according to the diversity of the genius of nature's imitators. There will no longer be style or academic manner, hut in their place the true and the natural in a thousand forms, in a thousand different characters, multiplied to the infinite from an inexhaustible source.

The arts should never limit themselves to the single aim of pleasing by faithful imitation. The artist must remember that the goal which he has set before him is, like that of all work of genius, to instruct men, inspire in them the love of goodness and to encourage them to honorable living. The artist should not abuse his gift of charming the eye in order to let slip into his heart the poison of vice and the fires of passion: he will rather set himself to extinguish these and to light instead the enthusiasm of generous and social virtues.

This is the moment when we must bring back the arts to the memory of their noble beginnings, when the nation should once more turn her gaze upon them, when she should use them as powerful instruments to bring about the moral regeneration essential to her happiness and her new Constitution. Let her raise statues to the great men who have deserved well of their country: following the example of the Greeks and the Romans, let her gardens and her public walks be filled with these, so that in the place of the unreal, sometimes insignificant and often immoral monuments we

have seen, we shall behold those of greater worth, that shall continually place before our eyes the events of our national history and those of ancient peoples worthy to serve us as examples. May the arts speak to us always of the love of country, of humanity and of virtue; may these cold marbles warm in every heart the seeds of good that we have received from nature. May our warriors, following the example of the Athenians, come to the tombs of our heroes who have died for their country, and there sharpen the iron destined to avenge them. Mothers shall bring their children, so that their hearts may early be formed by the sentiments of magnanimity and of courage, and like new Hannibals swear, from earliest infancy, an eternal hatred for the devastators of the world. . . .

It may seem strange to austere republicans that we occupy ourselves with the arts, while Europe in coalition assails the territory of Liberty. Artists do not fear at all the reproach of heedlessness of the interests of their country. They are free by their very nature. Independence is the property of Genius. Surely we have seen them, in this memorable Revolution, as the most zealous partisans of a regime which gives to man the dignity long refused by the class that was the protectress of the ignorance which flattered it.

We do not accept the well-known adage: 'At the rattle of arms the arts fall silent.'

More willingly we would remember Protogenes, tracing a masterpiece during the siege of Rhodes, or Archimedes meditating upon a problem during the sack of Syracuse. Such deeds have the sublimity of character which belongs to Genius; and Genius must always soar over France and raise herself to the level of liberty. Wise laws shall prepare her for new flights; the National Convention has just enlarged her field, she is now free at last. With enlightenment, Liberty is no longer bound. The Usurper alone fears this light. He commands us to forget science, but a free government encourages and honors it. A Decree of September 1, 1791, sufficiently proves that the legislators understood this eternal truth. But they desired that mediocrity, often reckless, not lay claim to national rewards where merit alone has place and that the artists, following the public judgment of their peers, be charged to produce works which are a part of the exhibition and for which the artists have been paid by the nation: these are the ones that are referred to under the title of Works Belonging to the Nation. The public will judge.

10 Jacques-Louis David (1748–1825) 'The Jury of Art'

With the abolition of the Academy and the Prix de Rome, there was now no formal mechanism for rewarding those French students who showed particular merit. On 15 November 1793 David presented to the Convention his recommendations for the composition of a jury to award prizes for competitions in sculpture, painting and architecture. The recommendations were accepted and the jury was duly assembled. No prize was awarded for sculpture. The prize for painting was awarded to a pupil of David's, for a work on the theme of *The Death of Brutus*. The *Rapport fait au nom du Comité d'instruction publique par David sur la nomination des cinquante membres du Jury* was printed in J.-L. Jules David, *Le Peintre Louis David 1748–1825*, Paris: Victor-Havard, 1880, pp. 149–51, from which the following translation has been made for this volume by Akane Kawakami.

Citizens,

In decreeing that those works of art entered into competitions for national awards be judged by a jury named by the Representatives of the People, you have paid homage to the unity and indivisibility of the Republic. You commissioned your Committee of Public Instruction to present you with a list of candidates; your Committee then considered the arts in the light of all the ways in which they could help to spread the progress of the human spirit, to propagate and pass on to posterity the striking example of an immense people's sublime efforts, guided by reason and philosophy, restoring to earth the reign of liberty, equality and the law.

The arts should therefore contribute forcefully to the instruction of the public, but through their own regeneration; artistic genius must be worthy of the people it enlightens; it must always walk in the company of philosophy, which counsels it with great and useful ideas.

For too long, tyrants, who fear the very image of the virtues, had encouraged licentious mores by enchaining even our thoughts; art served only to satisfy the pride and whims of a few sybarites gorged with gold, and despotic corporations circumscribed genius in the narrow circle of their thought, proscribing anyone who came forward with pure ideas of morality and philosophy. How many nascent geniuses have been smothered in their cradles! How many have fallen victim to the arbitrariness, prejudices and passions of those schools that caprice and fashion perpetuated! Let us examine what principle should regenerate good taste in the arts, and from that we shall conclude who should be their judge.

The arts are the imitation of nature in those aspects of it which are most beautiful and most perfect; a natural sentiment in man attracts him to the same objective.

It is not only in charming the eyes that works of art have achieved their end; it is in penetrating the soul, in making a profound impression on the mind, like that of reality. It is then that the traits of heroism, and of the civic virtues, offered to the eyes of the people, will electrify their souls and bring forth in them the passion for glory, for devotion to the good of the nation. The artist, therefore, must have studied all the qualities of mankind; he must have a great knowledge of nature; he must, in a word, be a philosopher. Socrates, an able sculptor; Jean-Jacques [Rousseau], a fine musician; and the immortal Poussin, tracing on his canvas the most sublime lessons of philosophy, are witnesses enough to prove that genius must have no other guide than the torch of reason. And if the artist must be imbued with these sentiments, the judge must be even more so.

Your Committee has decided that in this epoch of ours, when the arts need to be regenerated along with morality, to leave the judgement of works of genius to artists alone would be to abandon them in the rut of routine, the rut through which they once crawled on their knees, singing the praises of despotism. It is for the hardy souls, those who have a sense of the true and the great derived from the study of nature, to give a new impulse to the arts by restoring to them the principles of true beauty. Thus the philosopher, the poet, the scholar, that is, the man with a naturally fine sensibility in the different realms that make up the art of judging the artist, the student of nature, will be the most capable of representing the taste and knowledge of an entire people when, in the name of these people, the palms of glory are to be awarded to Republican artists. It is in accordance with these views that your

Committee has charged me to present to you the following list, to form the national jury of the arts.

Dufourny, member of the department;
 Monvel, actor;
 Fragonard, painter;
 Fragonard, anatomist;
 Julien, sculptor;
 Pache;
 Varon, man of letters;
 David-Leroy, architect;
 Fleuriot, assistant public prosecutor;
 Pasquier, sculptor;
 Rondelet, architect;
 Topino-Lebrun, painter;
 Cietty, artist;
 Monge;
 Naigeon, painter;
 Balzac, architect;
 Gérard, painter;
 Lussault, architect;
 Lebrun, man of letters;
 Hazard, shoemaker;
 Hubert, architect;
 Belle, fils, painter;
 Prud'hon, painter;
 Haroux-Romain, architect;
 Neveu, painter;
 Thouin, gardener;

Deputies:

Talma, doctor;
 Desroches, painter;
 Vic d'Azir, anatomist;
 Mercerau, engraver;
 Michot, actor;

Bonvoisin, painter;
 Dardel, sculptor;
 Taillason, painter;
 Boichot, sculptor;
 Lesueur, painter;
 Dupré, engraver;
 Ronsin, general commander of the
 Revolutionary Army;
 Caraffe, painter;
 Laharpe, man of letters;
 Hébert, assistant prosecutor of the
 Commune;
 Delannoy, architect;
 Hassenfratz;
 Chaudet, sculptor;
 Lebrun, seller of paintings;
 Cels, agriculturalist;
 Poidevin, architect;
 Michallon, sculptor;
 Dorat-Cubières, man of letters;
 Ramey, sculptor;
 Lais, actor;
 Goust, architect;
 Seguy, doctor;
 Lesueur, sculptor;
 Allais, architect.

Arni, man of letters;
 Dejoux, sculptor;
 Boullé, architect;
 Willemin, painter;
 Toucaty, engraver.

11 Jacques-Louis David (1748–1825) Proposal for a monument to the French people

On 10 August 1793 David organized a fête of Republican Reunion on the first anniversary of the storming of the Tuileries, an event in which many citizens had lost their lives. Like other artists charged in later historical moments with propagandizing in the interests of the state, he tended to idealize the people in the image of a massive body. In the course of two sessions of the Convention that November he presented proposals for a giant monument to the French people, to be sited on the Ile de la Cité in Paris and to be erected on the rubble from dismantled royal monuments. (For more on the consequences of revolutionary iconoclasm see IVB13.) A competition would be held and judged in two stages, the first for the conception of the monument and the second for its execution. During the same month David was responsible for the design of a Festival of Reason in Paris. His proposals for the monument and the subsequent supporting decree were enshrined in the records of the Convention, though the project was never put into effect. The documents were reproduced in full in J.-L. Jules David, *Le Peintre Louis David 1748–1825*, Paris: Victor-Havard, 1880, pp. 154–8, from which the following translation, including David's editorial comment, has been made for this volume by Akane Kawakami.

The kings of yore, being unable to usurp the place of Divinity in the temples, took possession of the porticos; there they placed their own effigies, doubtless so that the adoration of the people would stop at them before reaching the sanctuary. It was thus that, accustomed to invade everywhere and everything, they even dared to compete with God for His incense.

You have overthrown the insolent usurpers; at this very moment they lie stretched out on the earth that they sullied with their crimes, objects of the laughter of the people, who have finally been cured of their long superstition.

Citizens, let us make eternal this triumph of reason over prejudice; let a monument raised in the heart of the Commune of Paris, not far from that same church which they had turned into their Pantheon, pass on to our descendants the first trophy erected by the sovereign people, in memory of their immortal victory over the tyrants; let disorderly piles of the truncated debris of their statues form a lasting monument to the glory of the people and to their debasement, so that he who travels through this new land with a didactic purpose, will say: 'I once saw kings in Paris, the objects of a humiliating idolatry; I went there again, and they were there no more.'

I propose to place this monument, composed of the broken-up pieces of these statues, on the square of the Pont-Neuf, and to seat above it the image of the giant people, the French People. Let this imposing image, imposing by its character of strength and simplicity, have *Light* written in large characters on its forehead; on its breast, *Nature* and *Truth*; on its arms, *Strength*; on its hands, *Labour*. Let there be placed on one of its hands the figures of Liberty and Equality, standing close together and ready to set forth into the world, proving to all that they depend wholly on the genius and virtue of the people. Let this image of the people, *standing upright*, hold in its other hand that true and terrifying truncheon, of which the ancient Hercules' club was but a symbol. Such are the monuments worthy of us; all those who have

worshipped freedom have erected them; not far from the battlefield of Granson, there lie still the bones of the slaves and tyrants who wished to suffocate Swiss liberty; they are *there*, raised up into a pyramid, to menace the foolhardy kings who would dare to violate the land of free men.

Thus, in Paris, the effigies dreamt up and deified by royalty and superstition over a period of 1400 years will be made up into rough piles and serve as pedestals for the emblem of the people.

Following this speech, the Assembly adopted the proposal presented by David, barring some editing; on 27th Brumaire, the project, edited thus, was submitted to the Convention:

Citizens,

You have recently decreed that there be erected a monument to the glory of the French People, a monument which will pass on to farthest posterity the memory of its triumph over despotism and superstition, the two cruellest enemies of the human race.

You have given your consent to the idea of building a foundation for this monument out of the debris of the double tyranny of kings and priests.

When I explained to you that the Parisian authorities had taken down from the raised section of the portico of this church, this church which has now become the temple of Reason, the long line of kings of all races, who still seemed to reign over the whole of France; when I explained this to you, you decided, together with your Committee of Public Instruction, that these worthy predecessors of Capet, who had until this very moment escaped the law with which you struck down royalty and all that reminds us of it, should undergo, in the form of their Gothic effigies, the terrible and revolutionary judgement of posterity. You decided that their statues, mutilated by national justice, could for the first time today serve the cause of liberty and equality by becoming the foundation of the monument suggested to you by patriotism; you thought that the National Convention of France, penetrated by the greatness of its mission, and of the epoch in which Fate has placed it, should hold up the torch of Reason at its proper height and let it shine forth in all its splendour; finally, you decided that this Assembly, in the impetuous torrent of its liberating energy, should free the present, the future, even the past; complete its task of clearing France's name of the opprobrium of a long slavery, inasmuch as it is still possible to free even our ancestors, that is to say to plant the tree of liberty on their tombs, and above all to obliterate from their white hairs the images of their oppressors.

The idea of the monument seemed to you, Citizens, to be great and useful; the opinion that you formed of it became for you yet another motive for giving to this idea all the support that it could receive from patriotic enthusiasm; it was for this purpose that, having decreed that the monument be erected, you ordered your Committee of Public Instruction to examine the means of its execution. It is the result of this examination, for which the Committee enlisted artists as enlightened as they are patriotic, that I bring to you in its name.

Your Committee was of the opinion that everything in the proposed monument, both in the material and the form, should express the great memories of our revolution in a forceful yet sensitive fashion, and especially to consecrate the victory

of the French People over despotism and superstition, its inseparable companion; that the people, trampling underfoot the debris of tyranny, should be represented by a colossal statue in bronze, carrying various inscriptions and emblems destined to remind us of the regenerative principles that we have made our own.

With regard to the material for the statue, we hesitated for a moment to deprive the Republic of a precious metal necessary for its defence, a metal intended to bring terror and death to the enemy ranks; but having made some calculations concerning both the period in which this project, after a double competition, could definitively be executed, and the infallible and glorious result of the courage of your Republican legions, the Committee concluded that bronze would do honour both to the artists and to your glory; it did not allow itself to doubt for a moment that the intrepid French soldiers would bring you a sufficient quantity of it for the construction of the monument; it felt that it was equally worthy of those who represent the country as of those who defend it, to set your brave warriors the task of obtaining all the necessary bronze from the allied despots.

It is up to each one of our Republican armies, each one of our soldiers in the armies, to work together towards this monument and to co-operate through their generous efforts: *it will represent a proportion of all the victories.*

This statue that you will raise to the French People, Citizens, will in some way make our glory one and indivisible like the Republic itself: each citizen, each defender of the nation, will be able to see in it an honourable monument to his courageous and patriotic perseverance. A bundle, which brings together disparate parts, is a symbol of union; the statue, through fusion, will be the symbol of unity; at the same time it will be, dare I say it, its guarantee and its means of conservation.

If it is the task of courage to furnish the material of the monument, it is the task of artistic and patriotic genius to imprint upon it form and life.

Since it is a kind of representation of the nation, it is not possible for it to be too imposing or too beautiful. To this end every Republican artist must be called upon, only too happy for this new occasion to repair the wrongs of the arts, which have too often comforted tyranny.

A competition must first be set up for the model. Working on the premisses offered to them by the decreed project, the artists will give life to their subject through adornments suggested to them by their imagination, a suitable attitude and character, and the choice of forms that are both calm and bold.

But he who has the best idea is not always he who will execute it best. Genius conceives rapidly, the instant of creation is imperceptible, it is a flash of light, a sudden illumination. In its execution, by contrast, what is needed is a continuous ardour, a passionate slowness, an enthusiasm fixed by patience, which will often spend six months rendering faithfully the idea of a moment. The talent for execution must therefore be inflamed by a second competition set up solely for this object: this is also the recommendation of the Committee of Public Instruction.

But in the second competition, the number of participants will be limited by the Committee to the four artists who will have been most successful in the first competition for the model. To judge their merit in execution, they will be called to execute a certain part of the monument; this part will be determined by one of the articles of the project that we submit to you, and it will suffice to reveal the talent of

the artists. The one who is most successful in this work will definitely be chosen to execute the statue. As these attempts will require of those artists who are not ultimately victorious a sacrifice of time and payment, it has seemed just to your Committee to promise these artists an indemnity which will compensate them honourably for this sacrifice.

These, Citizens, are the thoughts of your Committee of Public Instruction on this subject. I feel that I ought to end this report on a point of instruction, one which your wisdom and patriotism cannot fail to appreciate: slaves did everything for the tyrants; the genius of liberty should do everything for the people.

Decree

FIRST ARTICLE. – The people have triumphed over tyranny and superstition; a monument will consecrate this memory.

ARTICLE II. – The monument will be colossal.

ARTICLE III. – The people will be represented by a statue.

ARTICLE IV. – Victory will furnish the bronze.

ARTICLE V. – It will hold in one hand the figures of Liberty and Equality; it will lean, with the other hand, on its truncheon; on its forehead will be the word Light; on its breast, Nature and Truth; on its arms, Strength; on its hands, Labour.

ARTICLE VI. – The statue will be 15 metres or 46 feet tall.

ARTICLE VII. – It will be erected on the debris of the idols of tyranny and superstition, built up to create a foundation.

ARTICLE VIII. – The monument will be erected at the westernmost point of the Ile de Paris.

ARTICLE IX. – The nation calls on all the artists of the Republic to present, within two months, models which will give an idea of the form, the attitude and the character of this statue, following the decrees which will serve as a plan.

ARTICLE X. – These models will be sent to the Minister of the Interior, who will deposit them in the Museum, where they will be exhibited for twenty days.

ARTICLE XI. – A jury, nominated by the Assembly of the Representatives of the People, will publicly judge the competition, in the ten days following the exhibition.

ARTICLE XII. – The four competitors who are most successful in the competition will compete with each other for the execution.

ARTICLE XIII. – The statue, made in plaster or clay in the proportions prescribed by Article VI, will be the required test for the second competition.

ARTICLE XIV. – A new jury will pronounce publicly on the result after an exhibition lasting twenty days.

ARTICLE XV. – He who wins the prize will be entrusted with the execution.

ARTICLE XVI. – The other three competitors will be indemnified by the state.

ARTICLE XVII. – The declaration of rights, the constitutional Act engraved on steel, the medal of 10 August and this decree will be deposited in the truncheon of the statue.

ARTICLE XVIII. – This decree, as well as the report, will be inserted in the Bulletin and sent to the armies.

12 Jacques-Louis David (1748–1825) Project for the apotheoses of Barra and Viala

In April 1794, as the Terror intensified in Paris, the ashes of Jean-Jacques Rousseau were moved to the Pantheon to join those of Voltaire, installed three years before. In June Robespierre instituted a Festival of the Supreme Being in celebration of the revolutionary religion by which the people were to be bound together. David was responsible for the design of the programme. This involved the construction of an artificial mountain and the orchestration of mothers and daughters on one side, fathers and sons on the other. For the following month David proposed a further festival to serve as a commemoration and apotheosis of two young 'martyrs of the Revolution', Barra and Viala. (His unfinished painting of the former is now in the Musée Calvet, Avignon.) On acceptance of the proposal by the Convention it was decreed that it should be printed and that copies should be circulated to Convention members, to primary schools, to popular organizations and to the armies of the revolution. This was to be the artist's last initiative on behalf of the revolutionary regime, and it came too late to be put into effect. During the same month Robespierre fell from power. His execution followed on the day before the proposed fête. As a close associate, David was also arrested and was imprisoned for two separate periods between August 1794 and August 1795. He was fortunate to escape with his life. A year later a decree was promulgated forbidding the use of the word 'revolutionary' in reference to the government. David's proposal is printed as *Plan de la Fête qui aura lieu le 10 Thermidor [28 July] pour décerner les honneurs du Panthéon à Barra et à Viala*, in J. -L. Jules David, *Le Peintre Louis David 1748–1825*, Paris: Victor-Havard, 1880, pp. 149–51, from which the following translation has been made for this volume by Akane Kawakami.

At three o'clock in the afternoon, an artillery salvo will be discharged from the easternmost point of the Ile de Paris; this announces the beginning of the ceremony.

The people immediately assemble in the National Garden; the members of the Convention make their entry into the amphitheatre, attired in their official garb as Representatives of the People; each member carries in his hands the symbol of his mission. They are preceded by martial music; the musicians sing a refrain mirroring the spirit of the occasion.

After the song, the President of the Convention ascends the tribune and delivers a speech in which he describes to the people the heroic traits of Barra and Agricol Viala, their filial piety; in a word, the reasons for which they have been deemed worthy of the honours of the Pantheon. He then hands the urn containing Viala's ashes to a deputation of children, selected from all the sections of Paris and of the same age as our young Republicans, that is to say between 11 and 13 years old.

The mortal remains of Barra, sealed in the other urn, are to be put into the hands of the mothers whose children have died gloriously in defence of our liberty: it will be the task of these respectable Citizens, also from the different sections of Paris, to carry the precious remains, an eternal pledge of the filial tenderness which this heroic child demonstrated so perfectly.

At precisely five o'clock, a second artillery salvo is heard. The deputations of mothers and children begin to march, divided into two columns. The procession is preceded by a large number of drums, whose lugubrious and majestic sounds are

expressive of both the movement and emotion of a great people assembled for this most august of ceremonies.

Each column is to be headed by paintings of Barra and Viala, depicting their actions.

The column on the right will consist of the deputations of children; that on the left, of the deputations of mothers.

The space in between the columns will be occupied by artists of the theatre, arranged in six groups, which will process in the following order:

The first group is to consist of instrumental musicians, the second of male singers, the third of male dancers, the fourth of female singers, the fifth of female dancers, the sixth of poets who will recite verses composed by them in honour of the young heroes.

Next follow the Representatives of the People, surrounded by courageous soldiers, wounded in the defence of their country. The President of the Convention gives his right hand to one of them, who has been chosen by lot, his left hand to the mother of Barra and her daughters.

The people bring up the rear of the march.

From time to time, there will be a funeral drum roll, and the music will wail. The singers will express our grief in plaintive tones, the dancers with lugubrious or warlike mime.

Suddenly, everyone stops; all is silent; all at once, the people raise their voices in unison and cry out three times: *They have died for their country.*

On arriving at the Pantheon in this order, the two columns will group themselves into two semicircles, in order to leave a space in the centre through which the members of the Convention will pass to take their places on the steps of the Temple. The children, musicians, male singers and dancers, and poets will stand on the side of Viala; the mothers, the women singers and dancers on the side of Barra.

In the meantime, the two urns are to be placed on an altar erected in the middle of the square. Around this altar, the young female dancers will perform funeral dances expressive of deepest grief; they will scatter cypress branches on the urns. At the same time, the musicians and the singers will deplore, through their music, the ravages of fanaticism which have deprived us of these young Republicans.

The cries of grief are followed by a new silence. The President of the Convention steps forward, kisses the urns, and, raising his eyes to the heavens, proclaims in the presence of the Supreme Being and of the people that the honour of immortality be bestowed upon Barra and Agricol Viala. In the name of the grateful nation, he places them in the Pantheon, whose doors are thrown open at this instant.

Suddenly, everything changes; grief disappears and is replaced by public rejoicing, and thrice the people let loose this cry: *They are immortal!*

The great bell booms, and the games commence.

The drums make the very air resound with their warlike rumblings, the female dancers, dancing joyously, scatter flowers on the urn, covering up the cypress branches. The male dancers strike martial attitudes to the accompaniment of the music, celebrating the glory of the two heroes; the poets recite verses in their honour, and the young soldiers display their military flourishes.

The President of the Convention steps forward into the crowd; he gives a speech, after which the mothers carry Barra's urn into the Pantheon, and the children that of Viala.

The President closes the doors of the temple, and gives the signal to depart. The same order is observed for the departure as for the entrance.

Upon arriving at the National Garden, the Convention takes up its place again in the amphitheatre; the President gives another speech, in which he recounts to the mothers the lessons of virtue with which they are to inspire their children from an early age, so that one day they too may be worthy of the glorious honours that the nation has just bestowed on Barra and Viala. He exhorts the young soldiers to avenge their death swiftly, and to show themselves to be, like them, ever ready to devote themselves to the defence of the nation.

The people end this memorable and moving ceremony with repeated cries: *Long live the Republic!*

The Committee of Public Instruction is charged with the execution of the fête.

13 Alexandre Lenoir (1761–1839) Foreword to the 'Historical and Chronological Description of the Monuments of Sculpture'

In November 1789 the French Church was nationalized by the revolutionary government. The closure of the religious houses followed. In 1790 the revolutionary Commission des Arts established that confiscated objects should be housed in Paris in the Hôtel de Nesles and the former convent of the Petits Augustins. Alexandre Lenoir was appointed keeper of the latter depot in June 1791 and set about making inventories of paintings and statues as they arrived. In the same month it was decreed that objects of value should be sold and metal objects melted down. Though the decree was not to be put into systematic effect, revolutionary iconoclasm led to the partial or wholesale destruction of a large number of monuments, statues and tombs. On his own account Lenoir worked heroically to salvage what he could, Michelangelo's two *Slaves* among them (now in the Louvre). He was also increasingly motivated by his desire to assemble a survey of monumental sculpture and religious art from the Middle Ages to the recent past, along chronological lines influenced by his reading of Winckelmann's *History of Ancient Art* (IIIA8). In 1795 he was officially appointed 'Conservateur' of what a year later was to be named the Musée des Antiquités et Monuments Français. Under the circumstances of the time no clear line distinguished salvage from appropriation, and by one means or another, latterly by purchase and exchange, the collection grew from 250 items recorded in 1793 to the several thousand which the museum housed by the time of its dissolution in 1816. Once the Terror was over and a measure of stable government had been restored, travellers from all over Europe visited Lenoir's museum. His installations were influential in two important respects. In arranging the assembled artefacts in separate areas by centuries, he initiated the tradition of organizing artefacts into period rooms which was thereafter to be widely followed in major museums of the fine and decorative arts; and in grouping a number of removed and reconstructed tombs in a 'Jardin Elysée', he provided an ideal location for the meeting of sculptural interests with romantic antiquarianism. Lenoir was also responsible for a considerable programme of publications. The first of these to be started was the four-volume *Description historique* of 1795–1806. A catalogue in five volumes was issued between 1800 and 1805, the first being translated into English in 1803, and a historical survey of

sculptures and tombs in 1810. There were studies of painted and stained glass, and of Egyptian hieroglyphs, and an engraved volume of decorative arabesques. The museum had its opponents, among them Quatremère de Quincy and Chateaubriand, who each for their separate reasons argued against the displacement of the monuments from their original locations. After the restoration of the monarchy Louis XVIII decreed that objects taken from French churches should be restored, and the museum was closed. The principles underlying its organization were to be pursued when Alexandre du Sommerard opened his collection in Paris in 1832 in what was to become the Musée de Cluny. Lenoir's 'Avant-propos' was originally published in *Description historique et chronologique des Monumens de Sculpture, réunis au Musée des Monuments français*, volume 1, Paris: Musée de Monumens, 1795. Our excerpt is taken from the fourth edition, revised and corrected, 1797, pp. 1-17, translated for the present volume by Jason Gaiger.

The culture of the arts amongst a people increases its commerce and its resources, purifies its morals, and renders it more gentle and pliant in following the laws which govern it. Convinced by this maxim and having decreed that the possessions of the clergy belonged to the *public property*, the National Assembly charged its committee of alienation to oversee the conservation of those monuments of the arts which were contained within these domains. 'The Athenians found themselves in more favourable circumstances. After the expulsion of the tyrants they changed their form of government and declared a democracy. Henceforth all of the people participated in public affairs, the character of every inhabitant grew stronger, and Athens was raised above all the other cities of Greece. Good taste having become universal and the wealthy citizens having attracted the esteem of their fellow citizens by erecting superb public monuments, all the different talents flourished at one and the same time, just as many rivers flow into the sea. The arts were joined to the sciences which formed their centre, and it was from here that they spread out into other countries. The prosperity of the state was the principal cause of the progress of taste. Florence attests to the truth of this proposition in modern times: once it became wealthy this city saw the shadows of ignorance disappear and the arts and sciences flourish.' (Winckelmann, *History of Ancient Art*, volume 1).

The philanthropist, La Rochefoucauld, president of the aforesaid committee, selected a group of learned individuals and artists whom he united under the title of the *Commission des savants*. This commission distinguished itself by its assiduous labours, by the number of its inquiries and, soon enough, by the quantity of monuments which were transported and preserved in the building in the rue des Petits-Augustins which the commission had chosen to receive them. The National Convention also gave proof of its love for the arts by making several decrees in their favour. Its Committee of Public Instruction created a commission formed of men of letters and artists of different kinds, distinguished by their work, to oversee the conservation of artistic monuments. This esteemed group of individuals soon produced a considerable number of memoranda, petitions and reports which brought reason to the departments and succeeded in arresting the arm of that idiocy which was toppling statues, tearing up the most precious paintings and melting down the most beautiful bronzes.

In 1790 I was charged with the administration of the depot at Petits-Augustins. This became a place of asylum for the monuments of our history which, at certain

periods, barbarians have pursued with axes in their hands. I was fortunate to be able to take in a large number of these monuments. I obtained from the Committee of Public Instruction, and then from the Ministry of the Interior, permission to establish the depot as the Museum of French Monuments. This was organized under the dual aspect of history and of the history of art in respect of France. It is with gratitude that I mention here the Director of Public Instruction (Citizen Ginguené) whose kindness has been of great help to me in establishing this museum, which I have sought to classify in a methodical way, since this alone is useful for study. His intelligence and his love for the arts are unequivocal and his goodwill towards artists is boundless. It is undoubtedly the case that if the services which the present government and its administration have rendered to the arts and sciences over the last three years are examined impartially and compared with those of the regime which is not missed, we will no longer be embarrassed to have to judge which way the balance will tip.

How great will be the astonishment of people from abroad when they see how many precious objects have been preserved and that in one and the same place it is possible to move successively from one century to another. The Museum of French Monuments has been erected under the auspices of a government which is devoted to the arts and to the prosperity of the people. Despite the envy and jealousy of others, it has been given a form which is useful; and with the greatest economy, I have succeeded in rebuilding and restoring more than 200 monuments. Already three centuries have been finished, each with their own respective rooms fitted with the features appropriate to each century. These are the XIIIth, the XVIth and the XVIIth centuries. At present I am working on the XIVth and the XVth centuries, and for the last three years the museum has remained open permanently to students and lovers of the arts. I have just augmented the collection, which is unique in Europe, with a burial chamber in which the tomb of the Restorer of letters and of the arts, erected in 1550, has been restored under my direction. [. . .] The chamber has been constructed with freestone in accordance with the architecture of the time, by Citizen Peyre, the architect. . . He has been charged with ensuring that the construction remains solid and with verifying the accuracy of the reports. The erection and the location of the monuments is carried out in accordance with my designs and under my direction. Since the distribution of the different locations, the colours and all those things which give to each century its proper character are the object of my special attention, this artist is obliged to consult me on this aspect of his work. Such an agreement serves the general good.

Certain reasons, which I could publish if necessary, have led me to confirm in writing these facts concerning the history of the museum. If one were obliged to read or to listen to the projects and plans of the innovators which emerge in a government, nothing would ever get finished. The mania for novelty and the spirit of versatility which for too long have governed the arts is the reason why so many of our public monuments have yet to be completed. Life passes with the rapidity of a river and the public good that an honest man can achieve in a short period of time offers gentle consolation to his soul.

* * *

It is this chronological sequence of statues in marble and bronze, the bas-reliefs and the tombs of famous men and women – monuments which have escaped the axe of the destroyers and the scythe of time – which I propose to describe in this work. I have also added an exact description of the antique monuments which no longer belong to this museum, which is given over exclusively to French monuments, and which have recently been returned to their respective museums. These include statues and bas-reliefs from which I have drawn archetypes to be placed in a special room devoted to the chronology of art, which I consider the principal foundation of my work. This precious continuation of the museum is composed of an Egyptian monument seen from two sides, a series of antique tombs brought to France by Ambassador Nointel, who travelled to Greece and its archipelago on behalf of Louis XIV, and several antique statues which Robert Strozzi gave to François I.

In the first part of the *Museum of French Monuments*, I give a description of the monuments of ancient Gaul, followed by those erected to the kings of the first race, such as those of Dagobert, Clovis, Fredegond, Chilbert, and so forth.

Continuous wars and ignorance have left a long interval in the culture of the arts. We will pass on to the thirteenth century when timid artists, servile copiers of nature and of the costumes of the time, began to establish some sort of unity and to give form to their statues. Here we find the origins of Moorish architecture in France, introduced after the Crusades.

The fourteenth century witnessed the interesting monuments to wise Charles V, to the good constable (Duguesclin), to the brave Sancerre, to Isabeau de Bavière, and so forth.

The tombs of Orléans, of Juvenal des Ursins, of Philippe de Commines, of Pierre de Navarre and of Tannegui du Châtel form the introduction to the fifteenth century.

The second part is composed of monuments from the sixteenth century through to the beginning of the nineteenth.

Before François I created the arts in France, our school was plunged into the most hideous barbarism. Painting and sculpture were already flourishing in Italy; and Albrecht Dürer had founded a school of art in Germany whilst we were dominated by superstition and did not dare even to draw a line. On the tomb of Louis XII we find the beginnings of worked-out forms and of good taste. Next comes that of François I, who established the first epoch of the restoration of the arts in France. The monument erected by Catherine de Médicis to the Valois family, carried out by Germain Pilon after designs by Philibert de l'Orme, also represents a great achievement.

You, Gougeon and Cousin, worthy founders of the French school, you too helped the arts to develop, and the erection of your tombs is a debt that I would like to pay to the centuries to come. These monuments have been executed according to my plans and designs along with a large number of other monuments which are kept in this museum, which I was obliged to rebuild and to adapt according to their age because of the terrible mutilations which they had suffered.

Without doubt, a benevolent genius gave birth to the seventeenth century for the honour of the French nation: warriors, poets, statesmen, painters, sculptors and engravers all marched in the same rank towards immortality. Undoubtedly we will recover with interest the monuments of Richelieu, Mazarin, Turenne, Condé,

Bignon, Lully, Le Brun and Mignard, and the statues of Le Sueur, Sarrazin, and Pujet, and of Nicolas Poussin, the painter of poets and of philosophers.

The eighteenth century, too, has its own particular character and although its art degenerated somewhat through the introduction of a false taste, it presents features which are of interest to the historian. Costou, Bouchardon, Lemoine and Pigalle have left us monuments which remain of interest for the persons they represent and it will undoubtedly be with pleasure that we see Crébillon, Maupertius, Chevett and Caylus adorn our collection.

Oh Drouais! son of an estimable artist, you too render your century illustrious! You no longer live to contribute to the arts, but you have left your name to posterity and your *Woman of Cana* and your *Marius*. Yes, your tomb will honour this work and those who are sufficiently sensitive will recognize the friendship which guides its author.

The third and last part of the work offers a historical dissertation on painting on glass and a chronology of the principal stained-glass windows which have been made since the origin of this art, especially those made after designs by Raphael, Primaticcio, Albrecht Dürer, Jean Cousin, the Belgian Elia and so forth.

Lovers of art and letters should hope to find in this collection several monuments from our history scattered throughout the departments, which until now it has been impossible to preserve from the mutilations of time and of ill-will.

* * *

At this time, a peace which is glorious for the French Republic is in the process of reuniting all the peoples of Europe under the sanctuary of liberty (France) and which leads those who admire the arts to our great city. It has become a duty on those who cultivate the arts to exert themselves to make their studios active and to give a new life to their work which can only be advantageous to society and which must necessarily honour a great nation and stimulate trade. [...]

An Elysium seemed to me to suit the character which I have given to this establishment, and the garden in the courtyard offered everything I needed to carry out my project. In this calm and peaceful garden more than forty statues can be seen; tombs placed here and there upon a green lawn stand with dignity in the midst of the silence and tranquillity. Some pines, some cypresses and some poplars keep them company; funerary urns placed upon the walls give to this place of happiness that sweet melancholy which speaks to the sensitive soul. Finally, there is a stone, a fragment of the tomb of Héloïse, on which I have had engraved the names of this unfortunate couple; there are the cenotaphs and the reclining statues of the good Constable and of Sancerre, his illustrious friend; further back a vase atop a column contains the heart of Jacques Rohault, worthy rival of Descartes. Next to the heart of this philanthropist is the touching and modest epitaph of Jean-Baptiste Brizard, the favourite of Melpomene who made the French stage popular.

In this work you will find careful engravings of the most interesting points of view which give onto this Elysium.

Part V

Nature and Human
Nature

V

Introduction

The closing decades of the eighteenth century formed a period of transition, marked above all by the final stages of the European Enlightenment and by the impact of the American and French Revolutions. Enlightenment confidence in the power of reason, the inevitability of historical progress and the universality of the ideals of freedom, tolerance and rational perspicuity gave way to an increasingly self-critical and self-reflective tendency. This should not be understood to mean that the Enlightenment was in any sense complete or that its goals and aspirations had been fulfilled. Rather, the fundamental values and assumptions underlying the very project of Enlightenment were increasingly subject to question. This process of revision was given powerful impetus by the French Revolution. Much of the revolutionary rhetoric was drawn from Enlightenment ideals of popular sovereignty, equality before the law and freedom from arbitrary abuse of power. As the Revolution descended into the Terror, and as the revolutionary wars spread to neighbouring states, the legitimacy and practical application of these ideals were cast into doubt. By 1793 France was at war with Britain, Austria, Prussia, the Dutch Republic, Spain, Portugal and the Kingdoms of Sardinia and Naples. In 1792 French armies had invaded the territories of the Holy Roman Empire, and by the end of 1794 all of Germany west of the Rhine was under French rule. Though the French forces thought of themselves as 'liberators', freeing oppressed peoples from the burden of aristocratic rule, they appeared to the victims of military conquest as unwanted invaders whose real goal was the territorial extension of a French empire.

Many early supporters of the Revolution came to reconsider their views when faced by the turmoil that followed. During September 1792 over a thousand people were killed at the hands of the crowds, and during 1793 revolutionary violence became incorporated into the apparatus of state power. Special courts were established to try those suspected of disloyalty. It has been estimated that between 11,000 and 18,000 people died in France in the period now known as the Terror, up to the fall of Robespierre in the summer of 1794. News of these events had a marked effect on the support for the Revolution among foreign radicals. In England, Coleridge abandoned his Jacobinism and subsequently turned back to religion, whilst Wordsworth was disappointed in his early hopes for social and political justice (see VIA5, 6, 11).

In Germany, Friedrich Schiller (see VA12 and 13) initially welcomed the Revolution as the practical instantiation of the ideas of the *philosophes*, as did many of his contemporaries. However, he subsequently declared himself 'sickened by these abominable butchers' and feared that the events in France would plunge Europe back into 'barbarism and slavery'. He saw the violence of the Terror as a symptom of the failure of the Enlightenment. It showed that the education of reason alone was not sufficient to ensure humanity's progress to moral and political freedom. The 'urgent need of the age' was the 'development of man's capacity for feeling'. By pitting duty against inclination, the Enlightenment had created a disastrous separation between the demands of rationality and of sensibility. Schiller's radical solution to this problem was to propose the 'Aesthetic Education of Man' as the means to reconcile the divided aspects of human nature. (Though the German *Mensch* of Schiller's original title is normally translated as 'Man', its reference is to human beings in general, and not specifically to the male sex.) It is only through beauty that true freedom can be realized since beauty alone provides a *sensuous* image of human freedom and wholeness. Similar thoughts are echoed by the author of the 'Earliest System Programme of German Idealism', who contrasts the 'mechanical' character of the state with a living ideal of genuine 'humanity'. For Hegel, the presumed author of this fragment, 'the highest act of reason . . . is an aesthetic act and . . . *truth and goodness only become sisters in beauty*' (VA15).

An earlier expression of protest against the perceived deficiencies of the 'age of reason' is to be found in the *Sturm und Drang* (Storm and Stress) movement in Germany. Taken from the title of a play by a now-forgotten author, the term 'Sturm und Drang' has come to stand for the new spirit of exuberance and extravagance which flourished in German literature in the brief period from 1771 to 1778. Through a series of literary and theoretical writings, Johann Gottfried Herder (VA7), the young Goethe (VA4 and VB7) and others developed a powerfully anti-rationalistic aesthetic. In opposition to the prevailing spirit of classicism, they exalted the freedom of individual and national 'genius' to break with fixed rules and conventions, emphasizing all that is 'sensuous, vital, powerful, immense, tangible and independent'. The true model for artistic creativity is to be found in the creativity of nature herself. Karl Philipp Moritz was later to claim that the beauty of the work of art should be seen as a microcosm of the rationally ordered whole of nature (VA9). The 'Sturm und Drang' also led to the 'discovery' of indigenous folk songs and poetry, which were valued for their apparent spontaneity and immediacy. In an essay on Strasbourg cathedral, published in the movement's 'manifesto', *Von deutscher Art und Kunst*, Goethe sought to awaken appreciation for the Gothic art of his own country, identifying it with the expression of *feeling* rather than calculation (VA4).

Despite these heady declarations of artistic freedom, the reality for most practising artists in the last decades of the eighteenth century was one of dependence upon the wishes of noble patrons or, if they chose the path of independence, of exposure to the inconsistencies and insecurities of the open market. It was still a hazardous enterprise to seek to support oneself through the sale of works of art and there was a genuine risk of falling into penury. Thomas Gainsborough was obliged to neglect his landscape studies for the more profitable business of 'face painting', or portraiture. As his

letters reveal, he was heavily dependent even here upon the wishes of his patrons (see VA1). In the case of the German artist Asmus Jacob Carstens, an irreconcilable clash of views followed from his belief that his obligations to art and to humanity took priority over the requirements of his paymasters in the royal household of the Prussian state (VA14). Despite the receipt of a stipend which funded his studies in Rome, he insisted upon the right to retain and to display his work as he wished. In asserting the moral independence of the artist's role, Carstens took support from the ideas of Immanuel Kant (VA8 and 10), to which he had been introduced by his friend and biographer Carl Ludwig Fernow (see VIIA6). However, if one's point of departure was Kant's formal analysis of those powers of the mind which constitute genius, some distance still remained to be travelled before one arrived at social and economic conditions granting full freedom of self-expression to artists.

It was both a symptom and a consequence of the secularization of art during the later eighteenth century that claims for the independence of the artist's practice tended to coincide with appeals to the natural world. With increasing emphasis, notably in Germany and in England, nature was regarded both as a source of significant motifs and as the final arbiter of art's moral value. Under these circumstances discussion of landscape served to focus debate both about the artist's role in the representation of the natural world and about the aesthetic properties of natural scenery. In their separate ways, Salomon Gessner (VB3) and Thomas Gainsborough (VA1, 2) both worked to establish landscape painting as a branch of art capable of conveying significant content. There was considerable variance in the styles of work that developed in separate European countries, as might be expected given that the respective artists were working under very different circumstances, both geographically and culturally. On the other hand, there was some exchange of ideas through the circulation of translations. Gessner's writing was well known in England in the early nineteenth century, and was studied by John Constable among others, while the taste for rustic scenes that Gainsborough did much to establish was transmitted to both French and German readers through versions of William Gilpin's essays (VB2, 11).

The art of landscape served as the focus for one particular issue that was to remain central to art-theoretical debate through the entire modern period. It concerned the relationship between responses to nature and responses to art. Among German writers, this issue was typically addressed through argument about the possibility of a moral response to natural scenery. Thus Sulzer argued that landscape painting was capable of eliciting ethical responses not only through the artist's insertion of moralizing elements, but because natural scenery could itself be morally elevating (VB6), a view which Goethe opposed on the grounds that nature has no moral aspect (VB7). In England debate focused on the nature of the Picturesque, a concept given particular currency by Gilpin. His argument was that the distinction between the Sublime and the Beautiful as advanced by Burke (IIIB6) was insufficient for the purposes of aesthetic categorization, since it failed to recognize that, while a particular motif might appear neither Sublime nor Beautiful, it might yet be highly suitable as material for an artistic picture. The idea of the picturesque was in turn referred back to the natural landscape (VB5). Scenery was self-consciously viewed for its potential to generate pleasing pictures, and differences of taste in pictures became

implicated in exchanges between members of the English landed gentry, who argued over the best means to 'improve' their estates (VB13–15).

The debate over the picturesque generated a considerable literature and provided some rich material for satire (VB19). Yet at the heart of both English and German writing on the relationship of art to nature there lay the same fundamental issue. On what basis was the value of artistic representations to be established, and how great a degree of autonomy was to be accorded to their emotional effects? In the principally French theory of the early and mid-eighteenth century, the concept of the 'tableau' had served to mark a requirement of formal virtue in composition, more or less independent of any moral content that might be conveyed by subject-matter (see IIC4). In other words, a painting could in principle be assessed as a good or bad composition, irrespective of its particular narrative or moral content. For Reynolds the capacity to abstract general principles from painted particulars was the sign of a properly qualified public (IVA7, 8). In practice, however, it was virtually assumed by all concerned that a 'tableau' deserving of the name would be instilled with some elevated theme – that it would not merely serve to reflect a given natural scene. But what was now at issue was whether the merit of a painted landscape was dependent ultimately upon the scene it pictured, or whether its virtue might be said to reside in its own achieved effects (VB11). A discourse surrounding what has subsequently come to be termed the 'autonomy' of art thus preceded the relevant application of the concept. The central issue at stake was nonetheless the degree of independence to be accorded to artistic effects, and the extent to which these could be considered in abstraction from any edifying content.

Whatever might have been the merits of the case for art's independence in this respect, we should note one significant implication of its being advanced at all. So long as the value of art was inextricably connected to the themes it illustrated, effective authority in aesthetic judgement was always liable to lie with a constituency competent in the relevant areas of reference, whether a religious authority versed in the scriptures, an aristocracy versed in the mythology of its own lineage, or an educated nobility versed in the classics. But if art was to be measured in terms of its emotional effect, then any sensitive subject could in principle claim to be a competent judge – so long, that is, as they had leisure to devote to the experience (see Alison, VA11) and could find words in which to communicate the effect in question.

Major cultural developments tend to entail significant changes in the relationship between art and its audience. Since the mid-seventeenth century the development of a literate middle class in Europe had been a factor of growing influence in the development of artistic culture. In the second half of the eighteenth century the modern form of art's relationship to its audience finally came to dominate in the cultures of the principal European countries. One telling expression of this relationship was the growth of a market in which works of art could be traded as commodities. Another was the growth of a sophisticated aesthetic literature addressed primarily to the emotional effects of works of visual art, rather than to their religious or historical or mythological references. It was in its capacity both to make significant choices between comparable goods and to articulate a range of emotional effects that the constituency in question established its distinctive competences.

In doing so, that constituency marked the clear alignment of its interests with those basic material and economic forces which bore directly upon the circumstances and character of modern artistic production. These were such as to reveal a growing contradiction between the traditional values cited in support of art's cultural standing and the actual conditions under which works of art were now produced and paid for. However central Christian mythology remained to notions of elevated subject-matter, the Church was virtually inconsiderable as a source of patronage in late eighteenth-century France, Germany and England, while however determinedly the status of history painting was upheld in the academies, it formed only a small percentage of the wares on show in their exhibitions and had little effective presence in the market-place. As Gainsborough knew only too well, the one secure means for a painter to earn a living was through commissions for portraits. Insofar as the painter could afford to work speculatively, it would make sense to concentrate on relatively modest and portable pictures which might attract in an increasingly open market by virtue of their decorative properties. It would also make sense to ensure some accompanying written justifications. As might be expected under these conditions, the artists themselves were among those who argued for the relative independence of artistic value. Though it would be some time before these arguments were taken to their logical conclusion, there is a clear sequence of developments connecting late eighteenth-century debates over the picturesque to the theoretical justifications of abstract art, and to the formalist tendencies of twentieth-century art criticism.

VA

The Human as Subject

1 Thomas Gainsborough (1727–1788) Letters

Along with Reynolds, Gainsborough was one of the two most significant English artists of his time. In many ways they form a contrasting pair. Where Reynolds was intellectual, elevated and academic, Gainsborough's approach leaned more to the spontaneous and informal; where Reynolds composed the *Discourses* which are a cornerstone of academic art theory, Gainsborough left nothing except letters to friends and patrons. He is said to have loved music and disliked reading. Nonetheless, the letters reveal an acute consciousness that is by turns charming, witty and self-deprecating, and very down-to-earth about the practical business of making art. Gainsborough is known both as a landscapist and for his portraits. The majority of the letters we have selected concern the business of portrait painting, throwing interesting light on the artist-patron relationship. They vividly represent the portrait painter as a singular combination of sought-after purveyor of a scarce commodity and a virtual servant required to adhere to his master's dictates. Nowhere is this combination more evident than in the letter to Stratford about the inclusion of a dog in his wife's portrait. In the letter to the Earl of Dartmouth, Gainsborough also discusses the fashion for dressing up portrait subjects in historical clothes and the difficulties this caused for the achievement of a likeness. In two further letters (those of 13 March 1758 and 29 January 1773) Gainsborough touches on questions of technique: issues which are further explored by Reynolds in his *Discourse on Gainsborough* (see VA2). Gainsborough also comments on Reynolds in a brief discussion of his fourth *Discourse*. That letter is undated, but given that the *Discourse* was delivered on 10 December 1771, it is most likely to have been written in 1772. Our selections have been made from *The Letters of Thomas Gainsborough*, ed. Mary Woodall, Birmingham: Cupid Press, 1961–3. In the chronological order in which we have reproduced them they are letters 25 (to Edgar, pp. 61–3); 73, 74, 75 (to Stevens, pp. 135, 139); 91 (to Unwin, p. 167); 16, 17, 18 (to Dartmouth, pp. 49–53); 46 (to Hoare, pp. 95–7); 77, 78 (to Stratford, pp. 141, 143); 103 (to Jackson, pp. 177–9).

To Robert Edgar, Ipswich, 13 March 1758

Sir,

I am favor'd with your obliging letter, and return you many thanks for your kind intention; I thought I should have been at Colchester by this time, as I promis'd my

sister I would the first opportunity, but business comes in and being chiefly in the Face way, I'm afraid to put people off when they are in the mind to sit. You please me much by saying that no other fault is found in your picture than the roughness of the surface, for that part being of use in giving force to the effect at a proper distance, and what a judge of painting knows an original from a copy by; in short being the touch of the pencil, which is harder to preserve than smoothness. I am much better pleas'd that they should spy out things of that kind, than to see an eye half an inch out of its place, or a nose out of drawing when viewed at a proper distance. I don't think it would be more ridiculous for a person to put his nose close to the canvas and say the colours smell offensive, than to say how rough the paint lies; for one is just as material as the other with regard to hurting the effect and drawing of a picture. Sir Godfrey Kneller used to tell them that pictures were not made to smell of: and what made his pictures more valuable than others with the connoisseurs was his pencil or touch. I hope, Sir you'll pardon this dissertation upon pencil and touch, for if I gain no better point than to make you and Mr. Clubb laugh when you next meet at the sign of the Tankard, I shall be very well contented. [...]

I am,
 Sir, your most obed^t & obliged hum. serv^t.
 Tho. Gainsborough

To Richard Stevens, MP, Bath, 13 September 1767

Sir,

The least I can do when told of my faults in a genteal and friendly manner, is to acknowledge them, and ask pardon: I was tempted to exceed the bounds of good manners in keeping Mrs. Awse so long as my situation now requires all the *sail* I can crowd: the truth is Sir, I suffered some hardships in the first part of my Voyage and fancying now that I see *Land* makes me forget myself. I will send it immediately and happy I shall be if you think the care & pains I have taken in the finishing part at all compensates for my faults in other respects.

I had the Frames made at the time I received your first Letter with the Drawing, and though doubtless there may appear some small difference upon immediate comparison with that it is design'd to match, yet the dimensions being pretty exact, I hope it will pass, especially Sir whilst the Eyes of your Friends are employ'd in admiring the Excellence of my Performances. I wish I could make you laugh till you forget how deficient I have been in point of good manners. [...]

I am
 (hoping Mrs. Awse is well)
 Sir your Obedient humble Serv-
 Tho. Gainsborough

To Richard Stevens, MP, Bath, 2 October 1767

Sir,

I hope by this time you have received Mrs. Awse's Picture, and that it meets with your approbation. I this morning paid the Frame-maker, and am sorry to say that I

think it a dear one, but he says the trouble he had in working after a limited scale and pattern in Drawing Occupied the additional charge; he set it at four Guineas, and for 3 Guineas & $\frac{1}{2}$ I have the Burnish'd Gold sort. However if you, Sir, think it dear too I shall be willing to become a fellow sufferer as My Profits in the Portrait way is a little upon apothecray order – I shall be glad to hear it comes safe to hand, and suits pretty well with the other.

I am Sir your most obedient Servt
Tho. Gainsborough

ps. Packing Case cost me 7 shillings which my Wife desires me always to remember and I often forget voluntarily because I'm afraid to mention it.

To Richard Stevens, MP, Bath, 28 January 1768

Sir,

I have recd. the favor of your inclosing a Bill Value £15 which when pd. I acknowledge to be in full for Mrs. Awse's Picture and Frame & all Demands.

I am sorry Sir I have not been so happy in Mrs. Awse's Picture as to give satisfaction to yourself & Friends, but I believe nobody can always succeed alike at all times. I can only say it was not for want of either pains or Inclination; & as to the Frame it was done after the Drawing you sent, by the best frame-maker at Bristol. If at any time you should have a convenience of bringing Mrs. Awse's Picture with you to Bath I shall very willingly make any alterations which you or Mrs. Awse may think proper, without any additional charge – and am Sir Your most Obedient & humble Servant

Tho. Gainsborough

To James Unwin, Bath, 10 July 1770

My Dear Friend, – Ever since the receipt of your last *undeserv'd* favor, I have been tossed about like a ship in a storm: I went by appointment only to spend two or three Days at Mr. George Pitt's Country House, by way of taking leave of him, as a staunch Friend of mine before his going to Spain, and behold he had got two whole length canvasses, and his son and daughter, *Lord & Lady Ligonier*, in readiness to take me prisoner for a month's work – you'll say I might have wrote to you from thence, and so I certainly should but that I left your Letter at home, and forgot your direction. [...]

I have been just going to write to your Brother many times for your direction, but have been always prevented by the curs'd Face Business – If you'll believe me, my Dear Friend, there is not a man in the World who has less time to call his own, and that would so willingly spend some of it in the enjoyment of an Old Acquaintance. My Regard for you was originally built upon such a foundation that you know no time can shake, nor ought not; but the nature of face painting is such, that if I was not *already cracked*, the continual hurry of one fool upon the back of another, just when the magot bites, would he enough to drive me crazy. [...]

I'm so ashamed to mention Mrs. Unwin's Picture that D——m me, I wish I was a Razor-grinder – I'll begin a new one of Her and you together if you'l come. Poor Mrs. Saumarez too, O Lord – that I should behave worst to my best friends and best to my worst – I hate myself for this, tho' even my Enemies say I have some good qualities. If there is any one Devil uglier than another, 'tis the appearance of Ingratitude join'd to such a Face as mine. Let me before I get more out of patience with myself, tell you that my Wife and Daughters desire their best Respects to yourself and Mrs. Unwin; and hope you'l agree to my proposal.

Believe me, Dear Sir, Yours Affectionately,
Tho. Gainsborough

To the Earl of Dartmouth, Bath, 8 April 1771

My Lord

I recd the honour of your Lordships letter acquainting me that I am to expect Lady Dartmouth's Picture at Bath, but it is not yet arrived – I shall be extremely willing to make any alterations your Lordship shall require, when Her ladyship comes to Bath for that purpose, as I cannot (without taking away the likeness) touch it unless from the Life.

I would not be thought by what I am going to observe that I am at all unwilling to do anything your Lordship requires to it or even to paint an entire new picture for the money I received for that, as I shall always take pleasure in doing anything for Lord Dartmouth, but I should fancy myself a great blockhead if I was capable of painting such a Likeness as I did of your Lordship, and not have sense enough to see why I did not give the same satisfaction in Lady Dartmouths Picture; & I believe your Lordship will agree with me in this point, that next to being able to paint a tollerable Picture, is having judgment enough to see what is the matter with a bad one. I don't know if your Lordship remembers a few *impertinent* remarks of mine upon the ridiculous use of fancied Dresses in Portraits about the time that Lord North made us laugh in describing a *Family Piece* His Lordship had seen somewhere, but whether your Lordship's memory will reach this trifling circumstance or not, I will venture to say that had I painted Lady Dartmouths Picture, dressed as her Ladyship goes, no fault (more than in my Painting in general) would have been found with it. Believe me, My Lord, 'tho I may appear conceited in saying it so confident^{ly}.

I never was far from the mark, but I was able before I pull'd the trigger to see the cause of my missing and nothing is so common with me as to give up my own sight in my Painting room rather than hazard giving offence to my best Customers. You see, my Lord, I can speak plainly when there is no danger of having my bones broke, and if your Lordship encourages my giving still a free opinion upon the matter, I will do it in another Line.

I am your Lordships most obliged & obedient
humble servant
Tho. Gainsborough

To the Earl of Dartmouth, Bath, 13 April 1771

My Lord

I can see plainly your Lordships good nature in not taking amiss what I wrote in my last, 'tho 't is not so clear to me but your Lordship has some suspicion that I meant it to spare myself the trouble of painting another Picture of Lady Dartmouth which time & opportunity may convince your Lordship was not the intention, and I here give it under my hand that I will most willingly begin upon a new Canvas. But I only for the present beg your Lordship will give me leave to try an Experiment upon that Picture to prove the amazing Effect of dress – I mean to treat it as a cast off Picture and dress it (contrary I know to Lady Dartmouths taste) in the modern way; the worst consequence that can attend it will be Her Ladyships being angry with me for a time – I am vastly out in my notion of the thing if the Face does not immediately look like; but I must know if Lady Dartmouth Powders or not in common: I only beg to know that, and to have the Picture sent down to me – I promise this, my Lord, that if I boggle a Month by way of Experiment to please myself, it shall not in the least abate my desire of attempting another to please your Lordship when I can be in London for that purpose or Lady Dartmouth comes to Bath.

I am
your Lordships
most obedient humble
servant
Tho. Gainsborough

My Lord I am very well aware of the Objection to modern dresses in Pictures, that they are soon out of fashion & look awkward; but as that misfortune cannot be helpd we must set it against the unluckiness of fancied dresses taking away Likenesses, the principal beauty and intention of a Portrait.

To the Earl of Dartmouth, Bath, 18 April 1771

Here it is then – nothing can be more absurd than the foolish custom of painters dressing people like Scaramouches, and expecting the likeness to appear. Had a picture voice, action, etc. to make itself known as Actors have upon the Stage, no disguise would be sufficient to conceal a person; hut only a face confined to one view and not a muscle to move to say, 'Here I am' falls very hard upon the poor Painter who perhaps is not within a mile of the truth in painting the Face only. Your Lordship I'm sure, will be sensible of the effect of the dress thus far, but I defy any hut a Painter of some sagacity (and such you see I am, my Lord) to be well aware of the different Effects which one part of a picture has upon another, and how the Eye may be cheated as to the appearance of size, and by an artful management of the accompaniments. A Tune may be so confused by a false Bass – that is if it is ever so plain, simple and full of meaning, it shall become a jumble of nonsense, and just so shall a handsome face be overset by a fictitious bundle of trumpery of the foolish Painter's own inventing. For my part (however your Lordship may suspect my

Genius for Lying) I have that regard for truth, that I hold the finest invention as a mere slave in Comparison, and believe I shall remain an ignorant fellow to the end of my days, because I never could have patience to read Poetical impossibilities, the very food of a Painter; especially if he intends to be KNIGHTED in this land of Roast Beef, so well do serious people love froth. But, where am I, my Lord? this my free Opinion in another Line with a witness – forgive me my Lord, I'm but a wild goose at best – all I mean is this, Lady Dartmouth's Picture will look more like and not so large when dressed properly; and if it does not, I'll begin another.

To Mr. Hoare [undated]

Mr. Gainsborough's Respects to Mr. Hoare, and is much obliged for the sight of Sir Joshua's Discourse which he thinks amazingly clever, and cannot be too much admired (together with its Ingenious Author) by every candid lover of the Art. The truth of what he observes concerning Fresco, and the Great style, Mr. G. is convinced of by what he has often heard Mr. Hoare say of the works of Raffaele and Michel Angelo – But betwixt Friends Sir Joshua either forgets, or does not chuse see that his Instruction is all adapted to form the History Painter, which he must know there is no call for in this country. The Ornamental style (as he calls it) seems form'd for Portraits. Therefore he had better come *down to Watteau* at once (who was a very fine Painter taking away the french conceit) and let us have a few Tints; or else why does Sir Joshua put tints equal to Painted Glass, only to make the People talk of Colors flying when the great style would do. Every one knows that the grand style must consist in plainness & simplicity, and that silks & satins, Pearls and trifling ornaments would be as hurtfull to simplicity, as flourishes in a Psalm Tune; but Fresco would no more do for Portraits than an Organ would please Ladies in the hands of Fischer; there must be variety of lively touches and surprizing Effects to make the Heart dance, or else they had better be in a Church – so in Portrait Painting there must be a Lustre and finishing to bring it up to individual Life.

As Mr. G. hates of all things the least tendency to the sour Critic, hopes to talk over the affair some Evening over a Glass, as there is no other Friendly or sensible way of settling these matters except upon *Canvas*.

To Edward Stratford, Bath, 1 May 1772

Dear Sir,

When you mention *Exhibition Pictures*, you touch upon a string, which once broke, all is at an End with me; but I do assure you, nay I swear by Saint Luke's Pencil, I have not dress'd nor sent a finished half length out of my doors since yours have been in hand so that I beg you to have patience to hear me, and I beg Mrs. Stratford to keep you in good nature for a moment, I do solemnly promise you to finish your Pictures in my best manner before any other from this time. I was obliged to cobble up something for the Exhibition or else (so far from being knighted) I should have been expel'd the Society, and have been look'd upon as a deserter, unworthy my *Diploma* sign'd with the King's own hand, which I believe you have seen most beautifully framed & hung up in my Painting-Room, *behind the Door*. Do good Sir let me know

for certain when you think of returning home from abroad and if I disappoint you of *seeing* your Pictures hung in their Places *with my own Eyes*, I'll give you leave to boil me down for Painters Drying oil, and shiver my Bones into Pencil Sticks – could Shakespeare with his Mother Madam fancy say more – I wish you would recollect that Painting & Punctuality mix like Oil & Vinegar, & that Genius & regularity are utter Enemies, & must be to the end of Time – I would not insinuate that *I* am a genius any further than as I resemble one in your Opinion, who think I have no such thing as punctuality about me – In short Sir, I throw myself at your Feet, & thank God most sincerely that I am not any nearer to them, for surely you could not help kicking me – However Sir depend upon this, that I am most sincerely,

Your ever obedient & humble Servant
Tho. Gainsborough

To Edward Stratford [undated]

Mr. Gainsborough presents his comp^{ts} to Mr. Stratford; He does not understand whether Mr. Stratford means to have the Dog painted separate by Monsieur Dupont, or again put into Mrs. Stratford's Picture to spoil it; so cannot say anything about it to Day.

But with regard to Mrs. Stratford's Drawing, Mr. G- will expect the honor of seeing Mrs. Stratford to morrow Evening (*Dress'd*) at any hour agreeable to Mrs. Stratford.

To William Jackson, Bath, 29 January 1773

Dear Jackson of Exeter

There is not a man living that you can mention (besides *yourself* and one more, living) that shall ever know my secret of making those studies you mention – I have a real regard for you, and would tell you anything except one [word erased, fact ?] in the world & that shall die with me.

You may acquaint your Friend that you tried your strength with me for the secret, but the *fixing the white chalk* previous to tinging the Drawing with waterColors, you find I am determined never to tell to anybody; and here you'll get off, for no Chalk is used, and so keep it close for your own use; and when you can make a Drawing to please your self by my direction send it to me, & I'll tell you if they are right.

Mind now – take half a sheet of blotting paper such as the Clerks and those that keep books put upon writing instead of sand; 'tis a spongy purple paper, paste that and half a sheet of white paper, of the same size, together, let them dry, and in that state keep them for use – take a Frame of deal about two Inches larger every way, and paste, or glue, a few sheets of very large substantial paper, no matter what sort, thick brown, blue, or any; then cut out a square half an Inch less than the size of your papers for Drawing; so that it may serve for a perpetual stretcing Frame for your Drawings; that is to say after you have dipt your drawing as I shall by & by direct in a liquid, in that wet state you are to take, and run some hot glue and with a brush run round the border of your stretcher, gluing about half an Inch broad, which is to receive your half an Inch extraordinary allow'd for that purpose in your drawing

paper, so that when that dries, it may be like a drum. Now before you do anything by way of stretching, make the black and white of your drawing, the Effect I mean, and disposition in rough, Indian Ink shadows & your lights of *Bristol* made *white lead* which you buy in lumps at any house painters; saw it the size you want for your white chalk; the *Bristol* is harder and more the temper of chalk than the *London*. When you see your effect, dip it all over in skim'd milk; put it wet on your Frame just glued as before observed let it dry; and then you correct your Effects with Indian Ink when dry & if you want to add more lights or alter, do it and dip again, til all your effect is to your mind; then tinge in your greens, your browns with sap green & Bistre, your yellows with Gall stone & blues with fine Indigo [word illegible] – when this is done, float it all over with Gum water, 3 ounces of Gum Arabic to a pint of water with a Camels pencil let that dry & varnish it 3 times with spirit varnish such as I sent you; tho only Mastic & Venice Turpentine is sufficient, then cut out your drawing but observe it must be varnished both sides to keep it flat trim it round with a pen knife & Ruler, and let any body produce the like if they can; stick them upon a white paper leaving a Margin of an Inch and half round.

Swear now never to impart my secret to any one living –

Yours sincerely
Tho. Gainsborough

2 Joshua Reynolds (1723–1792) on Thomas Gainsborough

Gainsborough died on 2 August 1788. That year Reynolds chose to dedicate his Royal Academy Discourse to an appreciation of his deceased colleague. His Discourse, the fourteenth in what was to be a series of fifteen, was delivered on 10 December 1788. Reynolds gives interesting information about Gainsborough's technique, particularly with regard to his landscape painting. He also comments on Gainsborough's lack of involvement with the classical tradition, and on his gravitation towards alternative northern models. His remarks on the surfaces of Gainsborough's portraits complement the painter's own letter of March 1758, reproduced above. The following extracts are taken from Reynolds' *Discourses*, edited with an introduction and notes by Pat Rogers, Harmondsworth: Penguin Classics, 1992, pp. 301, 303–5, 306–8, 312–14.

[...] We have lately lost Mr Gainsborough, one of the greatest ornaments of our Academy. It is not our business here, to make panegyrics on the living, or even on the dead who were of our body. The praise of the former might bear appearance of adulation; and the latter, of untimely justice; perhaps of envy to those whom we have still the happiness to enjoy, by an oblique suggestion of invidious comparisons. In discoursing therefore on the talents of the late Mr Gainsborough, my object is, not so much to praise or to blame him, as to draw from his excellencies and defects, matter of instruction to the Students in our Academy. If ever this nation should produce genius sufficient to acquire to us the honourable distinction of an English School, the name of Gainsborough will be transmitted to posterity, in the history of the Art, among the very first of that rising name. [...]

It may not be improper to make mention of some of the customs and habits of this extraordinary man; points which come more within the reach of an observer; I however mean such only as are connected with his art, and indeed were, as I apprehend, the causes of his arriving to that high degree of excellence, which we see and acknowledge in his works. Of these causes we must state, as the fundamental, the love which he had to his art; to which, indeed, his whole mind appears to have been devoted, and to which every thing was referred; and this we may fairly conclude from various circumstances of his life, which were known to his intimate friends. Among others he had a habit of continually remarking to those who happened to be about him whatever peculiarity of countenance, whatever accidental combination of figure, or happy effects of light and shadow, occurred in prospects, in the sky, in walking the streets, or in company. If, in his walks, he found a character that he liked, and whose attendance was to be obtained, he ordered him to his house: and from the fields he brought into his painting-room, stumps of trees, weeds, and animals of various kinds; and designed them, not from memory, but immediately from the objects. He even framed a kind of model of landscapes on his table; composed of broken stones, dried herbs, and pieces of looking glass, which he magnified and improved into rocks, trees and water. How far this latter practice may be useful in giving hints, the professors of landscape can best determine. Like every other technical practice, it seems to me wholly to depend on the general talent of him who uses it. Such methods may be nothing better than contemptible and mischievous trifling; or they may be aids. I think upon the whole, unless we constantly refer to real nature, that practice may be more likely to do harm than good. I mention it only, as it shows the solicitude and extreme activity which he had about every thing that related to his art; that he wished to have his objects embodied as it were, and distinctly before him; that he neglected nothing which could keep his faculties in exercise, and derived hints from every sort of combination.

We must not forget whilst we are on this subject, to make some remarks on his custom of painting by night, which confirms what I have already mentioned, – his great affection to his art; since he could not amuse himself in the evening by any other means so agreeable to himself. I am indeed much inclined to believe that it is a practice very advantageous and improving to an artist; for by this means he will acquire a new and a higher perception of what is great and beautiful in Nature. By candle-light, not only objects appear more beautiful, but from their being in a great breadth of light and shadow, as well as having a greater breadth and uniformity of colour, nature appears in a higher style; and even the flesh seems to take a higher and richer tone of colour. Judgement is to direct us in the use to be made of this method of study; but the method itself is, I am very sure, advantageous. [. . .]

When such a man as Gainsborough arrives to great fame, without the assistance of an academical education, without travelling to Italy, or any of those preparatory studies which have been so often recommended, he is produced as an instance, how little such studies are necessary; since so great excellence may be acquired without them. This is an inference not warranted by the success of any individual; and I trust it will not be thought that I wish to make this use of it.

It must be remembered that the style and department of art which Gainsborough chose, and in which he so much excelled, did not require that he should go out of his

own country for the objects of his study; they were every where about him; he found them in the streets, and in the fields; and from the models thus accidentally found, he selected with great judgement such as suited his purpose. As his studies were directed to the living world principally, he did not pay a general attention to the works of the various masters, though they are, in my opinion, always of great use, even when the character of our subject requires us to depart from some of their principles. It cannot be denied, that excellence in the department of the art which he professed may exist without them; that in such subjects, and in the manner that belongs to them, the want of them is supplied, and more than supplied, by natural sagacity, and a minute observation of particular nature. If Gainsborough did not look at nature with a poet's eye, it must be acknowledged that he saw her with the eye of a painter; and gave a faithful, if not a poetical, representation of what he had before him.

Though he did not much attend to the works of the great historical painters of former ages, yet he was well aware that the language of the art – the art of imitation – must be learned somewhere; and as he knew that he could not learn it in an equal degree from his contemporaries, he very judiciously applied himself to the Flemish School, who are undoubtedly the greatest masters of one necessary branch of art; and he did not need to go out of his own country for examples of that school: from that he learnt the harmony of colouring, the management and disposition of light and shadow, and every means which the masters of it practised, to ornament and give splendour to their works. And to satisfy himself as well as others, how well he knew the mechanism and artifice which they employed to bring out that tone of colour which we so much admired in their works, he occasionally made copies from Rubens, Teniers, and Vandyck, which it would be no disgrace to the most accurate connoisseur to mistake, at the first sight, for the works of those masters. What he thus learned, he applied to the originals of nature, which he saw with his own eyes; and imitated, not in the manner of those masters, but in his own.

Whether he most excelled in portraits, landscapes, or fancy-pictures, it is difficult to determine: whether his portraits were most admirable for exact truth of resemblance, or his landscapes for a portrait-like representation of nature, such as we see in the works of Rubens, Ruysdaal, and others of those schools. In his fancy-pictures, when he had fixed on his object of imitation, whether it was the mean and vulgar form of a wood-cutter, or a child of an interesting character, as he did not attempt to raise the one, so neither did he lose any of the natural grace and elegance of the other; such a grace, and such an elegance, as are more frequently found in cottages than in courts. This excellence was his own, the result of his particular observation and taste; for this he was certainly not indebted to the Flemish School, nor indeed to any School; for his grace was not academical or antique, but selected by himself from the great school of nature [...].

A novelty and peculiarity of manner, as it is often a cause of our approbation, so likewise it is often a ground of censure; as being contrary to the practice of other painters, in whose manner we have been initiated, and in whose favour we have perhaps been prepossessed from our infancy, for, fond as we are of novelty, we are upon the whole creatures of habit. However, it is certain, that all those odd scratches and marks, which on a close examination, are so observable in Gainsborough's

pictures, and which even to experienced painters appear rather the effect of accident than design; this chaos, this uncouth and shapeless appearance, by a kind of magick, at a certain distance assumes form, and all the parts seem to drop into their proper places, so that we can hardly refuse acknowledging the full effect of diligence, under the appearance of chance and hasty negligence. That Gainsborough himself considered this peculiarity in his manner, and the power it possesses of exciting surprise, as a beauty in his works, I think may be inferred from the eager desire which we know he always expressed, that his pictures, at the Exhibition, should be seen near, as well as at a distance.

The slightness which we see in his best works cannot always be imputed to negligence. However they may appear to superficial observers, painters know very well that a steady attention to the general effect takes up more time, and is much more laborious to the mind, than any mode of high finishing, or smoothness, without such attention. His *handling, the manner of leaving the colours*, or, in other words, the methods he used for producing the effect, had very much the appearance of the work of an artist who had never learned from others the usual and regular practice belonging to the art; but still, like a man of strong intuitive perception of what was required, he found out a way of his own to accomplish his purpose.

It is no disgrace to the genius of Gainsborough, to compare him to such men as we sometimes meet with, whose natural eloquence appears even in speaking a language which they can scarce be said to understand; and who, without knowing the appropriate expression of almost any one idea, contrive to communicate the lively and forcible impressions of an energetick mind.

I think some apology may reasonably be made for his manner without violating truth, or running any risk of poisoning the minds of the younger students, by propagating false criticism, for the sake of raising the character of a favourite artist. It must be allowed, that this hatching manner of Gainsborough did very much contribute to the lightness of effect which is so eminent a beauty in his pictures; as on the contrary, much smoothness, and uniting the colours, is apt to produce heaviness. Every artist must have remarked, how often that lightness of hand which was in his dead-colour, or first painting, escaped in the finishing, when he had determined the parts with more precision; and another loss he often experiences, which is of greater consequence; whilst he is employed in the detail, the effect of the whole together is either forgotten or neglected. The likeness of a portrait, as I have formerly observed, consists more in preserving the general effect of the countenance, than in the most minute finishing of the features, or any of the particular parts. Now Gainsborough's portraits were often little more, in regard to finishing, or determining the form of the features, than what generally attends a dead colour; but as he was always attentive to the general effect, or whole together, I have often imagined that this unfinished manner contributed even to that striking resemblance for which his portraits are so remarkable. Though this opinion may be considered as fanciful, yet I think a plausible reason may be given, why such a mode of painting should have such an effect. It is pre-supposed that in this undetermined manner there is the general effect; enough to remind the spectator of the original; the imagination supplies the rest, and perhaps more satisfactory to himself, if not more exactly, than the artist, with all his care, could possibly have done.

3 William Duff (1732–1815) 'Of the Effects of Genius'

Duff graduated from the University of Aberdeen in 1750 at a time when the college was celebrated for having revived the study of classical literature in Scotland. Five years later he was licensed by the presbytery and spent the rest of his career as a minister of religion in Aberdeenshire. During his lifetime he published six books on a variety of subjects, ranging from 'the hermit of Mount Ararat' to the 'moral character of women'. Two of them were on the subject of Genius in philosophy and the fine arts. Questions of imagination, genius and originality came to play an increasingly prominent role in debate about the arts in the late eighteenth century (see IIB10 and IVA7 for different approaches to the question). The present extracts on the personality of the genius are taken from the final chapter, 'Of the Effects of Genius on the Temper and Character', of Duff's book *Critical Observations on the Writings of the Most Celebrated Original Geniuses in Poetry*, London: T. Becket and P. A. de Hont, 1770, pp. 339–47, 355–9.

A man of Genius is really a kind of different being from the rest of his species. The bent of his disposition, the complexion of his temper, the general turn of his character, his passions and his pursuits are for the most part very dissimilar from those of the bulk of mankind. Hence partly it happens that his manners appear ridiculous to some, and disagreeable to others; that most people, though they treat him with a ceremonious respect, behave in his presence with an uneasy restraint; and that his company is seldom courted, except by those persons who have penetration enough to discern his merit, as well as candour to acknowledge it, or by those others who hope to derive some credit to themselves from their acquaintance with him. These consequences indeed, likewise, partly arise from *Envy*, that despicable passion of little minds; but as Genius is not an object of *Envy* to every one, we cannot suppose this passion the sole cause of that indifference and neglect which it meets with from many: we must therefore attribute the mortifications to which it is exposed, in a considerable measure, to those peculiar manners which generally distinguish it, and to its being unfit for entering with any degree of order or relish, into those amusements and occupations which engross the attention of a great part of mankind, promote a kind of social intercourse, and form those bonds of attachment which render men necessary and agreeable to each other. [...]

True Genius, we may observe, naturally produces a warmth and sensibility of temper. It is indeed incompatible with a cold, or plegmatic constitution of mind. All its sensations, and all its affections are ardent, lively and exquisite. Neither its pleasures, nor its pains are of the common kind: there is a delicacy and refinement in its sensibility of either, which is utterly unknown and inconceivable by the vulgar. This extreme sensibility is the effect of a vivacity and strength of fancy, which throws an additional lustre of its own on every object it contemplates with pleasure, as it casts a dark shade on such as are calculated to excite disquietude and pain, by which means the feeling of either is rendered more intensely affecting. [...]

At the same time that Genius has a natural tendency to produce a chearful and sanguine temper of mind, which is its usual attendant, and which, if not saddened by reiterated disappointments, it studiously preserves, it is distinguished by another more remarkable and invariable characteristic, a sublime, soothing, and pensive

melancholy. This disposition is indeed the inseparable concomitant of true Genius. Perhaps, it may at first view be imagined, that such a temper of mind is inconsistent with that ardor and cheerfulness which we have above observed to be an usual attendant of Genius; but it is by no means really so. We may observe, that as the minds of the more unfeeling part of mankind, who are not susceptible of very high degrees of pain or pleasure, are however at different times in very different dispositions; sometimes pleased with themselves, and with all around them, at other times oppressed with sadness, of which they know not the cause, and experiencing a deplorable vacancy of thought which they are utterly at a loss to supply, so the mind of a man of Genius is subjected to the same kind of vicissitudes, though he feels them more intensely; and while at one time he rises in his enjoyments to a degree of rapture, at another he relapses into a pensive, but pleasing melancholy. This last mentioned disposition, as it is the constant attendant of Genius, so it becomes the predominating feature of the mind, and gives a tincture to the whole character, rendering it rather serious than gay, rather thoughtful than desultory.

That pensive melancholy which so remarkably characterizes exalted Genius, appears to be produced by a sublimity of imagination united with a contemplative turn of mind, both co-operating with a tender and sympathetic sense of human misery. Objects that are in themselves great and awful, as well as dismal and terrific, whether they are the works of nature or of art, are peculiarly calculated to sooth and gratify the disposition of which we are treating. Thus the mouldering towers, the rocking battlements, the roaring billows, the howling wilderness, and the dreary waste, as they are objects awfully grand, at the same time that they are attended with circumstances of calamity and danger, are for these reasons perfectly suited to the indulgence of a sublime melancholy. [. . .]

Having considered the influence of Genius on the temper and character, we shall now point out some of the peculiarities or foibles which usually attend it.

Among these we may reckon its powerful bent to project romantic and ideal schemes of future felicity. It is difficult to determine whether this strange disposition, which retains its tendency and much of its strength after many fatal disappointments, is upon the whole desirable or otherwise. It provides indeed in the mean time a delicious repast to the mental appetite, but unthinkingly prepares along with it a bitter draught, arising from the anguish of deceived hope. This tendency to contrive visionary schemes, it is obvious, arises from imagination, but from an imagination irregular and unchastised.

Precipitate temerity in judgment and conduct is likewise in some instances annexed to the possession of Genius. A man endued with this quality is sometimes apt to say and to do things which to the rest of mankind appear ridiculous, and are really so. This foible, by no means a necessary effect of the quality above mentioned, proceeds from a volatility of imagination, untamed by the chastening power of the reasoning faculty.

We may farther remark that Genius is sometimes debased by an unbecoming union with *Irresolution* and *Inconstancy* of mind. These qualities, it must be confessed, are none of its constant attendants. They are often the effects of a too pliant temper, discovering a disposition to oblige, devising expedients for reconciling different views and interests, hesitating concerning the means of accomplishing its

purposes, making concessions, and repenting of the concessions it has made. Thus they may sometimes be resolved into goodnature; but it is goodnature degenerating into weakness. When these qualities are connected with Genius, they are effects of a volatility of imagination, and a natural imbecillity of the mind.

Abstraction of thought may be considered as another more usual concomitant of Genius. It is commonly very conspicuous in the behaviour of persons distinguished by this quality while they are in company. One can perceive from their fixed and thoughtful looks a certain alienation of mind from the subject of conversation, and a continued employment of the thoughts on one particular object, without attending to any thing else. This peculiarity appears to be the offspring of imagination, united with a contemplative turn of mind, which is generally the attendant of Genius, and often discovers itself very remarkably both in the Poet and Philosopher, though their minds are differently employed; that of the former being busied in creating the images of Poetry, that of the latter in devising solutions of the phænomena of nature; while perhaps the rest of the company, regardless of both, are engaged in learned disputes concerning a case in quadrille, the comparative excellence of hounds and horses, or other subjects of like importance. We need not at all wonder while such topics are discussed that they should both sometimes choose to indulge their own reveries, and leave it to others who are better qualified for it to support the spirit of the conversation.

The last peculiarity of Genius of which we shall take notice, is an ignorance of and indifference to the common affairs of life. These qualities, though not universally connected with Genius, are however its ordinary attendants, and indeed naturally enough result from the particular pursuits in which it is engaged. The taste and manner of life of a man of Genius being generally so different from that of the rest of mankind, it is impossible he should enter with any degree of relish into their favourite occupations, or that he should adopt their maxims, and conform to their mode of living, without doing the utmost violence to his own inclinations. [...]

4 Johann Wolfgang Goethe (1749–1832) ‘On German Architecture’

Goethe was born in Frankfurt am Main and studied at the University of Leipzig. His early writing on art forms part of an emerging Romantic reaction against the traditional view of the classical heritage. He was by no means indifferent to the art of the Greeks, but he followed other German writers, Herder, Winckelmann and Lessing foremost among them, in conceiving of it as a guide to fullness of expression rather than as a model of rationalism. This revision in the understanding of classical art went hand in hand with a reconsideration of past cultural forms that had previously been disparaged as barbaric – or ‘Gothic’ – simply because they were unclassical. As Goethe was later to write, ‘What we must do is recognize achievement in whatever shape or form it may appear, always remembering not to expect roses in winter and grapes in spring.’ His essay ‘On German Architecture’ is written as though addressed to Erwin von Steinbach, architect of the first stage of Strasbourg Cathedral (actually founded not in 1318, but in 1277. The ‘D.M.’ is short for *Divis Manibus*, an invocation to the spirits found on Roman tombs). Goethe affirms a defiant pride in the Gothic art of his own country, arguing that it derives from feeling rather than

calculation and is therefore a *natural* achievement. In the process he takes issue with the Abbé Laugier's *Essai sur l'architecture* (see IIC5). Goethe was to make two further pilgrimages to Erwin's grave, the second of which, in 1775, gave rise to a brief text published the following year, in which he referred back to 'a pamphlet which seemed less inwardly felt than it was, which few read, and those few did not understand it, though some good spirits saw glimmerings of what made them inexpressibly happy.' 'On German Architecture' was originally published as *Von deutscher Baukunst* in November 1772 by Johann Conrad Deinert in Frankfurt (dated 1773). It was reprinted alongside essays by Herder, Frisi and Möser in *Von Deutscher Art und Kunst* (Hamburg: Bode, 1773), a publication which is widely recognized as the 'manifesto' of the *Sturm und Drang*. The English text is taken from *Goethe on Art*, edited and translated by John Gage, London: Scolar Press, 1980, pp. 103–12; some of Gage's footnotes have been omitted. (See also VB7, VIIA9.)

D. M.

Ervini a Steinbach

As I wandered about your tomb, noble Erwin, looking for the stone which should have told me *Anno domini 1318 XVI Kal. Febr. obiit Magister Ervinus, Gubernator Fabricae Ecclesiae Argentinensis*, and could not find it, and none of your fellow-townsmen could show it to me, so that I could pour out my veneration at that holy place – then was I deeply grieved in my soul, and my heart, younger, warmer, more innocent, better than now, vowed to you a memorial of marble or sandstone (according to what I could afford) as soon as I should come into the quiet enjoyment of my inheritance.

Yet what need you a memorial! You have erected the most magnificent one for yourself, and although your name does not bother the ants who crawl about it, you have the same destiny as that Architect who piled up his mountains to the clouds.

It was given to few to create the idea of Babel in their souls, whole, great, and with the beauty of necessity in every smallest part, like trees of God. To even fewer has it been granted to encounter a thousand willing hands to carve out the rocky ground, to conjure up steepes on it, and when they die, to tell their sons, 'I am still with you in the creations of my spirit; complete what is begun, up to the clouds.'

What need have you of a memorial! And from me! When the rabble utters holy names, it is superstition or blasphemy. The feeble aesthete will forever be dizzied by your Colossus, and those whose spirits are whole will recognize you without need of an interpreter.

Now then, excellent man, before I risk my patched-up little ship on the ocean again, and am more likely to meet death than profit, look at this grove where all about the names of my loved ones are still green.¹ I cut yours on a beech tree, reaching upwards like one of your slender towers, and hang this handkerchief of gifts by its four corners on it. It is not unlike the cloth that was let down to the Holy Apostle out of the clouds, full of clean and unclean beasts;² also flowers, blossoms, leaves and dried grass and moss, and night-sprung toadstools – all of which I gathered, botanizing to pass the time, on a walk through some place or other, and now dedicate to your honour until they rot away.

'It is in a niggling taste,' says the Italian, and passes on. 'Puerilities,' babbles the Frenchman childishly after him, and triumphantly snaps open his snuffbox, *à la grecque*.³ What have you done, that you should dare to look down your noses?

Has not the genius of the Ancients risen from its grave to enslave yours, you dagoes? You scramble over the ruins to cadge a system of proportions, you cobble together your summer-houses out of the blessed rubble, and think yourselves the true guardians of the secrets of art if you can reckon the inches and minutest lines of past buildings. If you had rather felt than measured, if the spirit of the pile you so admire had come upon you, you would not simply have imitated it because *they* did it and it is beautiful; you would have made your plans because of truth and necessity, and a living, creative beauty would have flowed from them.

You have given your practical considerations a colour of truth and beauty. You were struck by the splendid effect of columns, you wanted to make use of them, and walled them in. You wanted colonnades, too, and ringed the forecourt of St Peter's with alleys of marble which lead nowhere, so that mother nature, who despises and hates the inappropriate and unnecessary, drove the rabble to convert your splendour into public cloaca, and men avert their eyes and hold their noses before the wonder of the world.⁴

That is the way it goes. The whim of the artist serves the obsession of the rich: the travel writer gapes, and our *bels esprits*, called philosophers, spin out of the raw stuff of fairy tales the history of art up to our times, and the evil genius murders true men in the forecourt of the sanctuary.

Rules are more damaging to the genius than examples. Before he arrives on the scene, some individuals may have worked out some parts, but he is the first from whose soul those parts emerge as an everlasting whole. But school and rule fetter all power of perceiving and acting. What does it matter to us, you new-fangled French philosophizing connoisseurs, that the first man – whose needs made him ingenious – hammered in four stakes, lashed four posts over them, and put branches and moss on the top?⁵ From this you deduce the needs of today, and it is just as if you wanted to rule your new Babylon⁶ according to the feelings of simple patriarchal societies.

It is also wrong to think that your hut was the first. Two stakes at each end, crossed at their apex, with another as ridgepole are, as you may daily see in the huts of field and vineyard, a far more basic invention, from which you could not even extract a principle for your pig-sty.

So none of your conclusions can rise to the sphere of truth. They all swim in the atmosphere of your system. You want to teach us what we should use, because what we do use cannot be justified according to your principles.

The column is close to your heart, and in another part of the world you would be a prophet. You say, 'The column is the first and most important component of the building, and the most beautiful. What sublime elegance of form, what pure and varied greatness, when they stand in rows!'⁷ Only be careful not to use them out of turn: their nature is to stand free. Woe to those wretches who have wedded their slender growth to lumpish walls! And yet it seems to me, my dear Abbé, that the frequent repetition of this impropriety of walling columns in, by which the moderns even stuff the intercolumnia of ancient temples with masonry, might have given you

pause. If your ear was not deaf to truth, these stones at least might have preached it to you.

The column is, on the contrary, no part of our dwellings; rather it contradicts the essence of all our buildings. Our houses do not arise from four columns in four corners, but from four walls as four sides, which are in place of columns, and exclude them, and where you tack them on, they are a tiresome excrescence. That goes, too, for our palaces and churches, except for a few instances which I need not notice. So your buildings present surfaces which, the more extensive they are, and the higher they soar, the more they oppress the soul with intolerable monotony. It would be a sad day for us if the genius of Erwin von Steinbach did not come to our rescue: 'Diversify the enormous walls; you should so build towards heaven that they rise like a sublimely towering, wide-spreading tree of God which, with its thousand branches, millions of twigs and leaves more numerous than the sands of the sea, proclaims to the surrounding country the glory of its master, the Lord.'

The first time I went to the Minster, my head was full of the common notions of good taste. From hearsay I respected the harmony of mass, the purity of forms, and I was the sworn enemy of the confused caprices of Gothic ornament. Under the term Gothic, like the article in a dictionary,⁸ I threw together all the synonymous misunderstandings, such as undefined, disorganized, unnatural, patched-together, tacked-on, overloaded, which had ever gone through my head. No less foolish than the people who call the whole of the foreign world barbaric, for me everything was Gothic that did not fit my system, from the lathe-turned gaudy dolls and paintings with which our *bourgeois gentilshommes* decorate their homes to the sober remains of early German architecture, on which, on the pretext of one or two daring curlicues, I joined in the general chorus: 'Quite smothered with ornament!' And so I shuddered as I went, as if at the prospect of some mis-shapen, curly-bristled monster.

How surprised I was when I was confronted by it! The impression which filled my soul was whole and large, and of a sort that (since it was composed of a thousand harmonizing details) I could relish and enjoy, but by no means identify and explain. They say it is thus with the joys of heaven, and how often have I gone back to enjoy this heavenly-earthly joy, and to embrace the gigantic spirit of our ancient brothers in their works. How often have I returned, from all sides, from all distances, in all lights, to contemplate its dignity and his magnificence. It is hard on the spirit of man when his brother's work is so sublime that he can only bow and worship. How often has the evening twilight soothed with its friendly quiet my eyes, tired-out with questing, by blending the scattered parts into masses which now stood simple and large before my soul, and at once my powers unfolded rapturously to enjoy and to understand. Then in hinted understatements the genius of the great Master of the Works revealed itself to me. 'Why are you so surprised?' he whispered to me. 'All these shapes were necessary ones, and don't you see them in all the old churches of my city? I have only elevated their arbitrary sizes to harmonious proportions. How the great circle of the window opens above the main door which dominates the two side ones: what was otherwise but a hole for the daylight now echoes the nave of the church! How, high above, the belfry demands the smaller windows! All this was necessary, and I made it beautiful. But ah! if I float through the dark and lofty openings at the side that seem

to stand empty and useless, in their strong slender form I have hidden the secret powers which should lift those two towers high in the air – of which, alas! only one stands mournfully there, without its intended decoration of pinnacles, so that the surrounding country would pay homage to it and its regal brother.'

And so he left me, and I sank into a sympathetic melancholy until the dawn chorus of the birds who lived in the thousand openings rejoiced at the rising sun and woke me from my slumber. How freshly the Minster sparkled in the early morning mist, and how happily I could stretch out my arms towards it and gaze at the harmonious masses, alive with countless details. Just as in the eternal works of nature, everything is perfectly formed down to the meanest thread, and all contributing purposefully to the whole. How the vast building rose lightly into the air from its firm foundations; how everything was fretted, and yet fashioned for eternity! Genius, it is to your teaching that I owe it that I am no longer dazzled by your profundities, that a drop of the rapturous quiet of the spirit sinks into my soul, which can look down over such a creation and say, as God said, 'It is good.'

And now I ought not to be angry, holy Erwin, if the German art expert, on the hearsay of envious neighbours, fails to recognize his advantage and belittles your work with that misunderstood word 'Gothic'. For he should thank God that he can proclaim that this is German architecture, our architecture. For the Italian has none he can call his own, still less the Frenchman. And if you do not wish to admit this advantage yourself, at least prove to us that the Goths already built like this: you will find it difficult. And if in the end you cannot demonstrate that there was a Homer before Homer, we will willingly leave you the story of lesser efforts that succeed or fail, and come to worship before the work of the master who first welded the scattered elements into a living whole. And you, my dear spiritual brother in the search for truth and beauty, shut your ears to all the blather about fine art; come, look, and enjoy. Take care that you do not profane the name of your noblest artist, and hasten here to see his excellent work. If it makes an unpleasant impression on you, or none at all, good luck to you, harness your horses and be off to Paris!

But it is to you, beloved youth, that I feel closest, for, standing there, you are moved and cannot reconcile the conflicting feelings in your soul. At one moment you feel the irresistible power of this vast whole, and the next chide me for being a dreamer since I see beauty where you see only rugged strength. Do not let us be divided by a misunderstanding. Do not let the effete doctrine of modern pretty-prettytyness spoil you for roughness that is full of meaning, so that in the end your sickly sensibility can only tolerate meaningless polish. They would have us believe that the fine arts arise from our desire to beautify the objects around us.⁹ This is not true! For not the philosopher, but the man in the street and the artisan use the word in the only way it could be true.

Art is formative long before it is beautiful, and it is still true and great art, indeed often truer and greater than 'fine art' itself. For in man's nature there is a will to create form which becomes active the moment his survival is assured. As soon as he does not need to worry or to fear, like a demi-god, busy even in his relaxation, he casts around for a material into which he can breathe his spirit. And so the savage articulates his coconut shell, his feathers, his body with fantastical lines, hideous

forms and gaudy colours. And even if this making visibly expressive is made up of the most arbitrary forms, they will still harmonize without any obvious relationship between them, for a single feeling has created a characteristic whole.

Now this characteristic art is the only true art. If it becomes active through inner, unified, particular and independent feeling, unadorned by, indeed unaware of, all foreign elements, whether it be born of savagery or of a cultivated sensibility, it is a living whole. Hence among different nations and individuals you will see countless different degrees of it. The more the soul is raised to a feeling for those proportions which alone are beautiful and eternal, whose principal harmonies may be proved but whose secrets can only be felt, in which alone the life of godlike genius is whirled around to the music of the soul – the more, I say, this beauty penetrates the being of the mind, so that it seems to be born within that mind, so that nothing satisfies the mind but beauty, so that the mind creates nothing but beauty out of itself, so much the happier is the artist, and the more magnificent, and the lower we prostrate ourselves and worship the Lord's anointed.

And no one will remove Erwin from his high place. Here is his creation. Come up and acknowledge the deepest feeling for truth and beauty of proportion, brought about by the strong, rugged German soul on the narrow, gloomy, priest-ridden stage of the *medii aevi*.

And our *aevum*? That has renounced his genius, has driven its sons about after strange growths, to its ruin. The frivolous Frenchman who gleans far worse at least has the wit to pull his loot into a single whole; he does build a magic temple of a Madeleine for his Greek columns and German vaults. But I have seen one of our artists, when he was asked to devise a porch to an old German church, prepare a model with stately Antique columns.

I do not wish to rehearse how much I hate our tarted-up doll-painters. With their stagey poses, false complexions and gaudy clothes they have caught the eye of the ladies. Your wood-carved face, O manly Dürer, whom these novices mock, is far more welcome to me.

And you yourselves, excellent people, to whom it was given to enjoy the highest beauty, and now step down to proclaim your happiness; even you harm genius, for it will be raised and moved on no other wings than its own, not even the wings of the morning. It is our own power, unfolded in a childhood dream, and developed in youth until it is strong and agile like the mountain lion as he rushes on his prey. Hence nature is the best teacher, for your pedagogues can never create the diversity of situations in which genius may exert and enjoy its present powers.

Hail to you, youth, with your sharp eye for proportion, born to adapt yourself easily to all sorts of form! When, little by little, joy in the life around you wakes and you feel a jubilant and human pleasure after the fears and hopes of toil: the delighted shout of the wine-harvester when the fulness of autumn swells his vats, the lively dance of the mower when he hangs his sickle, now idle, on the beam. If the strong nerve of desire and suffering becomes more manfully alive in your brush, then you have striven and lived enough, and enjoyed enough, and are sated with earthly beauty; you are worthy to rest in the arms of the goddess, worthy to feel at her breast that by which the deified Hercules was reborn. Receive him, heavenly Beauty,

you mediatrix between gods and men, so that he may, more than Prometheus, bring down the bliss of the gods upon earth.

¹ In the woods at Sesenheim, near Strasbourg, Goethe had fixed a tablet with the names of himself and his friends on a tree.

5 Georg Christoph Lichtenberg (1742–1799) on London, from Letter to Baldinger

Lichtenberg studied mathematics and natural science at the University of Göttingen, and from 1770 was a professor there. He taught physics and mathematics but is now best known as a writer, winning the subsequent acclaim of figures as eminent as Goethe, Schopenhauer, and Nietzsche. His most lasting work has been the *Aphorisms*, which he began writing as a student and continued until the end of his life. They were first published after his death, in 1800–6, and are now often seen as a key text of the German Enlightenment. Before taking up his professorial appointment, Lichtenberg had acted as a private tutor to a group of wealthy young Englishmen who were studying in Germany. This in turn led to his visiting England in the early summer of 1770. He developed a lifelong Anglophilia which was fuelled by a second, longer visit in 1774–5. This gave rise to his *Letters from England*, published in Germany in 1776 and 1778, and later to an extensive study of Hogarth which appeared in parts between 1784 and 1796. Lichtenberg's treatment of Hogarth evolves a coherent and powerful overall narrative from minutely detailed descriptions of the subjects of individual prints. In effect, he proposes Hogarth as a visual equivalent of Shakespeare, narrowing the distinction between visual art and narrative literature which so much modern criticism has been concerned to emphasize. The same powers of description are evident in the present letter, a compelling evocation of late eighteenth-century modernity as witnessed on the streets of London in 1775. Lichtenberg's correspondent, Ernst Gottfried Baldinger, was a colleague at Göttingen University. Our extract is taken from the text of the letter as published in *Lichtenberg's Visits to England*, translated and annotated by Margaret L. Mare and W. H. Quarrell, Oxford: Clarendon Press, 1938, pp. 61 and 63–5.

Kew, 10 January 1775.

My dear Sir,

[...] I will make you a hasty sketch of an evening in the streets of London; I will not merely paint it for you in words, but fill in my picture with some groups, which one does not care to paint with such a lasting pigment as ink. For this purpose I will take Cheapside and Fleet Street, as I saw them last week, when I was going from Mr. Boydell's house to my lodging in the evening rather before 8 o'clock. Imagine a street

about as wide as the Weender in Göttingen, but, taking it altogether, about six times as long. On both sides tall houses with plate-glass windows. The lower floors consist of shops and seem to be made entirely of glass; many thousand candles light up silverware, engravings, books, clocks, glass, pewter, paintings, women's finery, modish and otherwise, gold, precious stones, steel-work, and endless coffee-rooms and lottery offices. The street looks as though it were illuminated for some festivity: the apothecaries and druggists display glasses filled with gay-coloured spirits, in which Dieterich's lackey could bathe; they suffuse many a wide space with a purple, yellow, verdigris-green, or azure light. The confectioners dazzle your eyes with their candelabra and tickle your nose with their wares, for no more trouble and expense than that of taking both into their establishments. In these hang festoons of Spanish grapes, alternating with pineapples, and pyramids of apples and oranges, among which hover attendant white-armed nymphs with silk caps and little silk trains, who are often (here's the devil to pay) too little attended. Their masters wisely associate them with the cakes and tarts, to make the mouth of even the most replete water, and to strip the poor purse of its last shilling but one; for to entice the hungry and rich, the cakes and their brilliant surroundings would suffice. All this appears like an enchantment to the unaccustomed eye; there is therefore all the more need for circumspection in viewing all discreetly; for scarcely do you stop than, crash! a porter runs you down, crying 'By your leave,' when you are lying on the ground. In the middle of the street roll chaises, carriages, and drays in an unending stream. Above this din and the hum and clatter of thousands of tongues and feet one hears the chimes from church towers, the bells of the postmen, the organs, fiddles, hurdy-gurdies, and tambourines of English mountebanks, and the cries of those who sell hot and cold viands in the open at the street corners. Then you will see a bonfire of shavings flaring up as high as the upper floors of the houses in a circle of merrily shouting beggar-boys, sailors, and rogues. Suddenly a man whose handkerchief has been stolen will cry: 'Stop thief,' and every one will begin running and pushing and shoving – many of them not with any desire of catching the thief, but of priggling for themselves, perhaps, a watch or purse. Before you know where you are, a pretty, nicely dressed miss will take you by the hand: 'Come, my Lord, come along, let us drink a glass together,' or 'I'll go with you if you please.' Then there is an accident forty paces from you; 'God bless me,' cries one, 'Poor creature,' another. Then one stops and must put one's hand into one's pocket, for all appear to sympathize with the misfortunes of the wretched creature: hut all of a sudden they are laughing again, because some one has lain down by mistake in the gutter; 'Look there, damn me,' says a third, and then the procession moves on. Suddenly you will, perhaps, hear a shout from a hundred throats, as if a fire had broken out, a house fallen down, or a patriot were looking out of the window. In Göttingen one hastens thither and can see from at least forty yards off what has happened; here a man is fortunate (especially by night and in this part of the town – the City) if he can weather the storm unharmed in a side street. Where it widens out, all hasten along, no one looking as though he were going for a walk or observing anything, but all appearing to be called to a deathbed. That is Cheapside and Fleet Street on a December evening.

Up to this point I have written without taking breath, as they say, with my thoughts more on those streets than here. Pray excuse me, therefore, if it is at

times harsh and difficult reading, for that is the manner of Cheapside. I have exaggerated nothing; on the contrary, I have omitted a great deal which might have heightened the effect of my picture, so that, among other things, I have said nothing about the ballad singers who, forming circles at every corner, dam the stream of humanity which stops to listen and steal. Moreover, I have only once put on the stage the lewd females who should really have appeared in every scene and in all the intervals. Every ten yards one is beset, even by children of twelve years old, who by the manner of their address save one the trouble of asking whether they know what they want. They attach themselves to you like limpets, and it is often impossible to get rid of them without giving them something. Often they seize hold of you after a fashion of which I can give you the best notion by the fact that I say nothing about it. On that account the passers-by never look about them, and that is 'liberty' and 'property'. [...]

6 Johann Kaspar Lavater (1741–1801) from *Essays on Physiognomy*

One of the enduring preoccupations of artists has been to invest their pictures with more life than can be conveyed by mimesis pure and simple. In the seventeenth century, drawing on Descartes' study of the passions, Charles Le Brun codified an entire range of facial expressions for the use of artists (IB14). By the late eighteenth century the relation between inner feeling and outward manifestation was increasingly the subject of scientific enquiries. The most notable of these was Lavater's 'physiognomy', a kind of pseudo-science which purported to read character and personality from physical characteristics, notably those of the human head. Although discredited by subsequent developments in science and medicine, not least by psychoanalysis, Lavater's physiognomy overlapped with crucial areas of art practice such as observation, and proved of considerable interest to artists in the nineteenth century (see *Art in Theory 1815–1900* IVA8). Lavater was a Swiss writer and cleric with an abiding interest in art, which ran to a well-known collection of paintings and drawings. He had eminent friends in the world of art, notably Henry Fuseli, though he also had a deep and long-running feud with Goethe, whom he kept trying to convert in order to save his 'heathen soul'. His *Physiognomische Fragmente* were published in four volumes in 1775–8, illustrated with engravings by the Polish-German artist Daniel Nikolaus Chodowiecki (1726–1801). The publication was an immediate success and translation into other languages followed rapidly, both in full and in a variety of abridged, paraphrased and pirated versions: it has been calculated that by 1810 over fifty editions had appeared, including twenty in English. We have made three selections from the English edition of 1789: an emphatic assertion of the human as the proper subject of study; a lament on the rarity of precise and accurate observation; and a group of case studies in which Lavater deduces character from the close scrutiny of a range of facial and cranial types. We have retained the appropriate illustrations for the case studies. They are taken from *Essays on Physiognomy for the Promotion of the Knowledge and the Love of Mankind*, translated by Thomas Holcroft, London: G. G. J. Robinson, 1789, pp. 10–12, 106–7, 110–15.

Of all earthly creatures man is the most perfect, the most imbued with the principles of life.

Each particle of matter is an immensity; each leaf a world; each insect an inexplicable compendium. Who then shall enumerate the gradations between insect and man? In him all the powers of nature are united. He is the essence of creation. The son of earth, he is the earth's lord; the summary and central point of all existence, of all powers, and of all life, on that earth which he inhabits.

Of all organized beings with which we are acquainted, man alone excepted, there are none in which are so wonderfully united the three different kinds of life, the animal, the intellectual, and the moral. Each of these lives is the compendium of various faculties, most wonderfully compounded and harmonized.

To know – to desire – to act – Or accurately to observe and meditate – To perceive and to wish – To possess the powers of motion and of resistance – These, combined, constitute man an animal, intellectual, and moral being.

Man endowed with these faculties, with this triple life, is in himself the most worthy subject of observation, as he likewise is himself the most worthy observer. Considered under what point of view he may, what is more worthy of contemplation than himself? In him each species of life is conspicuous; yet never can his properties be wholly known, except by the aid of his external form, his body, his superficies. How spiritual, how incorporeal soever, his internal essence may be, still is he only visible and conceivable from the harmony of his constituent parts. From these he is inseparable. He exists and moves in the body he inhabits, as in his element. This material man must become the subject of observation. All the knowledge we can obtain of man must be gained through the medium of our senses.

This threefold life, which man cannot be denied to possess, necessarily first becomes the subject of disquisition and research, as it presents itself in the form of body, and in such of his faculties as are apparent to sense.

There is no object in nature the properties and powers of which can be manifest to us in any other manner than by such external appearances as affect the senses. By these all beings are characterized. They are the foundations of all human knowledge. Man must wander in the darkest ignorance, equally with respect to himself and the objects that surround him, did he not become acquainted with their properties and powers by the aid of their externals; and had not each object a character peculiar to its nature and essence, which acquaints us with what it is, and enables us to distinguish it from what it is not.

All bodies which we survey appear to sight under a certain form and superficies. We behold those outlines traced which are the result of their organization. I hope I shall be pardoned the repetition of such common-place truths, since on these are built the science of physiognomy, or the proper study of man.

* * *

Nothing can appear more easy than to observe, yet nothing is more uncommon. By observe I mean to consider a subject in all its various parts: first to consider each part separately, and, afterwards, to examine its analogy with contiguous or other possible objects; to conceive and retain the various properties which delineate, define, and constitute the essence of the thing under consideration; to have clear ideas of these properties, individually and collectively, as contributing to form a whole, so as not to confound them with other properties, or things, however great the resemblance.

We need only attend to the different judgments of a number of men, concerning the same portrait, to be convinced of the general want of a spirit of accurate observation: nor has any thing so effectually, so unexpectedly convinced me, of the extreme rarity of the true spirit of observation, even among men of genius, in famed, and fame-worthy, observers, in far greater physiognomists than I can ever hope to become, nothing, I say, has so perfectly convinced me of the rarity of this spirit, as the confounding of widely different portraits and characters, which, notwithstanding their difference, have been mistaken for the same. To make erroneous remarks is a very common thing; and, probably, has often befel myself. This all tends to prove how uncommon an accurate spirit of observation is, and how often it forsakes even those who have been most assiduous in observing. [. . .]

II

These four caricature profiles, of broken Grecian busts, will, to many hasty observers, though they should not be wholly destitute of physiognomical sensation, seem nearly alike in signification. Yet are they essentially different. The nose excepted, the first has nothing in common with the rest. The manly closing, and firmness, of the mouth, as little permits the physiognomical observer to class this countenance with the others, as would the serious aspect, the arching, and motion, of the forehead, and its descent to the nose. Let any one, further, consider this descent of the forehead to the nose; afterward, the nose itself, and the eye, in 2, 3, and 4. Let

him compare them, and the scientific physiognomist will develop characters almost opposite. In the nose of 3, he will perceive more taste and understanding than in the rest. The whole under part of the countenance, the general traits of voluptuousness excepted, is, in each of them, different. 4 is the most sensual and effeminate of the whole, although it is deprived of much of its grace by the ill drawn mouth. [. . .]

VII. VIII.

However similar these two shades of the same person may appear; to the physiognomist, that is, to a rare and accurate observer, they are not so. In the forehead, the bones above the eye, and the descent to the nose, in VIII. there is something more of understanding than in the same parts of VII. although the difference is scarcely that of a hair's breadth. How few will find in the bending and point of the nose of VIII. a quicker perception of sensual beauty; and superiour understanding in VII.! Yet this does not escape the physiognomist, to whom, likewise, the mouth, in VIII. betokens firm powers. The descent of the under lip, at the corner, of VII. is, by a hair's breadth, more pure and noble, than VIII.

VII

VIII

XI.

Four additional profiles, in the Grecian style, a few remarks on which may show the enquiring reader how minute are traits which have great signification; and how difficult it is, to the inexperienced eye, not to confound things in themselves very dissimilar. [*See overleaf.*]

The two upper have a great resemblance to each other; as likewise, have the two lower. Physiognomical sensation would generally pronounce them to be four sisters. All will find the two upper more noble than the two lower. The forehead of 2 will be found to possess a small superior degree of delicacy over that of 1; the forehead of 3 much inferior to 2, and the forehead of 4 still inferior to 3. The physiognomist will read more of affection in 4 than in 3, and something less of delicacy; and more of voluptuousness, in 3 than in 4.

The converse of the proposition we have hitherto maintained will, in certain countenances, be true. The observer will perceive similarity in a hundred countenances which, to the inexperienced, appear entirely dissimilar.

XI

7 Johann Gottfried Herder (1744–1803) from *Sculpture: Some Observations on Form and Shape from Pygmalion's Creative Dream*

The German critic and poet Johann Gottfried Herder was a key figure of the *Sturm und Drang*, helping to shape its characteristic interests in folk poetry and the role of language. His writings contributed to a growing awareness of the importance of national and historical influences in the formation of aesthetic experience. He was born in Mohrungen in East Prussia and studied at Königsberg, where he met Hamann (see IIB12) and Kant (see VA8 and 10). In 1764 he moved to Riga on the Baltic coast to take up an appointment as a schoolteacher and an assistant pastor. It was here that he began writing his essay, *Sculpture*, intended as an extension of the 'analytic method' of the natural sciences into the domain of aesthetics. As in his earlier *Fragmente* (1767) and *Kritische Wäder* (1769), Herder sought to analyse the complex experience of beauty into its more basic parts. His principal aim is to establish the primacy of our sense of touch where sculpture is concerned and to show that this fundamentally distinguishes it from the art of painting. He starts out from Lessing's identification of the different laws governing poetry and painting

in his *Laocoön* (see IIIA10), but critically revises and extends this account, arguing that sculpture should be recognized as a separate art form with its own laws and principles. Painting can only give us images arrayed across a surface, whereas sculpture works 'in depth', treating objects in the round. The one is the art of dream and 'illusion', the other of 'truth' and tactile physical presence. Herder's *Plastik: Einige Wahrnehmungen über Form und Gestalt aus Pygmalions bildendem Traume* was first published by Johann Friedrich Hartknoch in Riga in 1778. The following excerpt has been translated for this volume by Jason Gaiger from *Herders Sämtliche Werke*, ed. Bernard Suphan, vol. 8, Berlin: Weidmannsche Buchhandlung, 1892, pp. 14–18.

If we are to allow ourselves to speak about *works of art* and to *philosophize about art*, then our philosophy must at least be exact and, where possible, extend to the *simplest concepts*. When it was still fashionable to philosophize about the fine arts, I sought to discover the *specific concept* by which *beautiful forms* and *beautiful colours, sculpture and painting*, could be *distinguished* from one another – but I could not find it. Painting and sculpture are always confused with one another; they are placed under a *single sense*, under a *single organ* of the soul, which is supposed to register and to create the same beauty in both. A *single type* of beauty is recognized, which *operates* through the *same natural signs*, placed alongside one another in the same physical space, the one on surfaces, the other in forms. I confess that I understand but little of this. Two art forms which belong to the domain of a *single sense* must be bound by the *same subjective laws* of truth and beauty, for they enter through the same portal, just as they must both leave by it, both existing only for a *single sense*. Painting should be able to sculpt, and sculpture to paint, as much as each will, and the result must be *beautiful*. Both are supposed to serve a single sense and to touch just one point in our soul. Nothing can be falser than this! I have closely considered both art forms and have found that no *single law*, no observation, no effect of the one fits the other without some difference or delimitation. I discovered that the more something is *proper* to a particular art form, the more *native* it is to the most powerful effects of that art, the less it can simply be carried over and applied to a different art form without the most dreadful consequences. I found wretched examples of this in the execution of art works, but it is incomparably worse in the theory and philosophy of art, which is often written by those who know nothing about either art or science. Here everything is curiously mixed up; the two art forms are regarded not as sisters or half-sisters but simply as a *doubled unity* and no nonsense is said about the one that is not also imposed upon the other. From this arises that miserable criticism, that wretched attempt to impose *ensorious* and *restrictive* rules, that bitter-sweet nonsense about *universal beauty*, which corrupts the young and appals the master craftsman, but which is taken up in the mouths of the informed masses as if it were true wisdom. Finally I arrived at my own idea of the matter, which seemed to me so true and to conform so accurately to the nature of our senses and to the two art forms, and to a hundred other aspects of our experience, that, like a subjective boundary stone, it was able to distinguish in the most delicate way between these two *arts* and their corresponding *effects* and *rules*. I discovered a point from which I could identify what was proper and what was foreign to each of these arts, their potentials and their requirements, what was a dream and what was the truth. It was as if I acquired a *sense*

which could allow me, fearfully and from a distance, to understand the nature of beauty, where . . . but I say too much and too soon. Here is the bare outline of how, in my opinion, the different *arts of beauty* are related to one another:

We have one sense which perceives *external things alongside one another*; a second sense perceives things in *succession*; a third sense perceives things in *depth*. These senses are: *sight, hearing, and touch*.

Things *alongside one another* constitute a *surface*. Things in *succession* in their purest and simplest form constitute *sounds*. Things in *depth* are *bodies* or *forms*. Thus it is that we have distinct senses for surfaces, sounds, and forms; and when it comes to beauty, we have three senses relating to three different *genres of beauty* which must be distinguished from one another, just as we distinguish *surfaces, sounds, and bodies*. And if there are art forms whose proper domain is to be found in one of these genres of beauty, then we know both their internal and external fields of application: on the one hand, *surfaces, sounds, and bodies*, on the other, *sight, hearing, and touch*. These limits or boundaries are imposed by *nature* herself. They are not a matter of convention or agreement, and no decision can be made to alter them without nature taking its revenge. Music which paints, a painting which produces sounds, a sculptor who uses colour, a painter who carves stone, these are monstrosities whether or not they employ false effects. All three arts are related to one another as *surface, sound, and body*, or as *space, time, and force*, the three great media of the Creation, which encompasses and embraces everything.

Let us now consider a second consequence which concerns the way in which *sculpture* and *painting* are related to each other in general.

If painting is the art directed to the eye, and if it is true that the eye can only perceive *surfaces*, if it sees *everything* as a plane, as a picture, then a painting is indeed a *tabula*, a *tavola*, a *tableau*, an image on a panel, on which the artist's creation stands like a dream, in which everything depends upon *appearance*, upon things placed *alongside one another*. It is here that invention and composition, unity and multiplicity begin (together with the rest of the litany of artistic terms), and here that they return; no matter how many chapters and volumes may be written on the subject, the artist can easily see that this follows from a *very simple principle*, that is, from the *nature of his art*. This forms the artist's royal command, beyond which he knows no other, the divine goddess to whom he pays homage. In the faithful execution of his work, all philosophy on this subject must appear to him as something so *elementary* and so *simple* that it does not merit so much discussion.

Sculpture creates *in depth*, it creates *one* living thing, an animate *work*, which *stands there* and which endures. Sculpture cannot imitate shadows or the light of dawn, it cannot imitate lightning or thunder, rivers or flames, any more than the feeling hand can grasp them. But why on this account should these subjects be denied to the painter? The painter follows another law, possesses different powers and a different vocation; why should he not be able to paint the *great panel of nature* in all its different *aspects*, in its *vast, beautiful visibility*? And with what magic he does so! Those who hold landscape painting in contempt, with its depiction of the great *unity* of nature, belittling its achievements and even, with ridiculous gravity, forbidding its practice, lack intelligence. A painter who is forbidden to be a painter? A descriptive artist who is forbidden to describe? The painter is required to turn out sculptures with his brush

and to embellish them with colour as the true taste for Antiquity would have it. It is considered ignoble to depict the panel of Creation; as if the sky and the earth were something worse and of less importance than the cripple who drags himself between them, whose effigy is, by force, to be made the *sole* subject worthy of painting.

Sculpture creates *beautiful forms*, it forms *shapes in depth* and *places* the object *there before us*. Of necessity, it must create that which merits such presentation and which possesses *independent existence*. It cannot gain anything by placing objects *alongside one another*, so that one object assists another and the *whole* profits thereby. For in sculpture the *one object* is the whole and the whole is *one object*. If this object is unworthy, lifeless, ill-chosen, irrelevant, all the worse for the marble and chisel! Nothing is gained from sculpting toads and frogs, rocks and mattresses, if they do not serve some higher work as accessories without raising any *claim* to be the principal subject. What sculpture should create, and what it has succeeded in creating, is forms in which the living soul animates the entire body, forms in which art can compete in the task of representing the *embodied soul*, that is to say, gods, human beings, and noble animals. – But whoever, driven by the high idealistic rigour of this law, seeks to impose it on *depiction*, on *painting the great panel of nature*, is obliged to ask himself how he would go about depicting this.

Finally, we may say that sculpture is *truth*, whereas painting is a *dream*. The former is all *presentation*, the latter story-telling *magic*. What a difference! How little the two stand upon a common ground! A sculpture before which I kneel can embrace me, it can become my friend and companion: it is *present*, *it is there*. The most beautiful painting is a magnificent story, the dream of a dream. It can transport me, making other moments present, and, like an angel dressed in light, lead me away with it. But the impression of the one is quite different from that of the other. The ray of light wanes, it is *brilliance, image, thought, colour*. – I can think of no theorist, who responds as a human being, who can believe that these two things derive from a *single ground*.

* * *

8 Immanuel Kant (1724–1804) ‘What is Enlightenment?’

The German philosopher Immanuel Kant was born to parents of modest means in Königsberg and spent his entire life in East Prussia. He studied at the university before being appointed a lecturer, and then, in 1770, a full professor. His most important works were all published relatively late in life, including the *Critique of Pure Reason* in 1781 and the *Critique of Practical Reason* in 1788. Kant sought to preserve what was sound in rationalism and empiricism by constructing a new epistemological framework which emphasized the importance both of sensory knowledge and of the active role played by the mind. In his moral writings he insisted on the autonomy of the will and on the possibility of action based on respect for the moral law. Kant’s assertion of the independence of the individual from external authority and on the irreducibility of human freedom have been connected with the ideas behind the American and French Revolutions. In his political writings he sought to establish rational principles for a secular national order and for the achievement of ‘perpetual peace’ on the international stage. His essay ‘*Was heißt Aufklärung?*’ was first published in the *Berlinische Monatsschrift* in December 1783. It should be seen as a

contribution to a widespread debate about the exact meaning and character of the Enlightenment. Kant himself describes the Enlightenment as an ongoing and dynamic process which is still in the course of unfolding. He takes as its motto the Horatian tag *Sapere aude* (literally, 'dare to be wise'): we should learn to think for ourselves rather than following custom or authority. However, he also distinguishes between the private and the public use of reason, and refuses to countenance revolution as a legitimate political instrument. The ruler to whom he refers on a number of occasions is Frederick the Great, who ruled Prussia from 1740 to 1786. This translation of the complete essay is by H. B. Nisbet. It has been taken from *Kant's Political Writings*, ed. Hans Reiss, Cambridge: Cambridge University Press, 1970, pp. 54–60.

Enlightenment is man's emergence from his self-incurred immaturity. Immaturity is the inability to use one's own understanding without the guidance of another. This immaturity is self-incurred if its cause is not lack of understanding, but lack of resolution and courage to use it without the guidance of another. The motto of enlightenment is therefore: Sapere aude! Have courage to use your own understanding!

Laziness and cowardice are the reasons why such a large proportion of men, even when nature has long emancipated them from alien guidance (*naturaliter maiorennes*), nevertheless gladly remain immature for life. For the same reasons, it is all too easy for others to set themselves up as their guardians. It is so convenient to be immature! If I have a book to have understanding in place of me, a spiritual adviser to have a conscience for me, a doctor to judge my diet for me, and so on, I need not make any efforts at all. I need not think, so long as I can pay; others will soon enough take the tiresome job over for me. The guardians who have kindly taken upon themselves the work of supervision will soon see to it that by far the largest part of mankind (including the entire fair sex) should consider the step forward to maturity not only as difficult but also as highly dangerous. Having first infatuated their domesticated animals, and carefully prevented the docile creatures from daring to take a single step without the leading-strings to which they are tied, they next show them the danger which threatens them if they try to walk unaided. Now this danger is not in fact so very great, for they would certainly learn to walk eventually after a few falls. But an example of this kind is intimidating, and usually frightens them off from further attempts.

Thus it is difficult for each separate individual to work his way out of the immaturity which has become almost second nature to him. He has even grown fond of it and is really incapable for the time being of using his own understanding, because he was never allowed to make the attempt. Dogmas and formulas, those mechanical instruments for rational use (or rather misuse) of his natural endowments, are the ball and chain of his permanent immaturity. And if anyone did throw them off, he would still be uncertain about jumping over even the narrowest of trenches, for he would be unaccustomed to free movement of this kind. Thus only a few, by cultivating their own minds, have succeeded in freeing themselves from immaturity and in continuing boldly on their way.

There is more chance of an entire public enlightening itself. This is indeed almost inevitable, if only the public concerned is left in freedom. For there will always be a few who think for themselves, even among those appointed as guardians of the

common mass. Such guardians, once they have themselves thrown off the yoke of immaturity, will disseminate the spirit of rational respect for personal value and for the duty of all men to think for themselves. The remarkable thing about this is that if the public, which was previously put under this yoke by the guardians, is suitably stirred up by some of the latter who are incapable of enlightenment, it may subsequently compel the guardians themselves to remain under the yoke. For it is very harmful to propagate prejudices, because they finally avenge themselves on the very people who first encouraged them (or whose predecessors did so). Thus a public can only achieve enlightenment slowly. A revolution may well put an end to autocratic despotism and to rapacious or power-seeking oppression, but it will never produce a true reform in ways of thinking. Instead, new prejudices, like the ones they replaced, will serve as a leash to control the great unthinking mass.

For enlightenment of this kind, all that is needed is *freedom*. And the freedom in question is the most innocuous form of all – freedom to make *public use* of one's reason in all matters. But I hear on all sides the cry: *Don't argue!* The officer says: *Don't argue, get on parade!* The tax-official: *Don't argue, pay!* The clergyman: *Don't argue, believe!* (Only one ruler in the world says: *Argue* as much as you like and about whatever you like, *but obey!*) All this means restrictions on freedom everywhere. But which sort of restriction prevents enlightenment, and which, instead of hindering it, can actually promote it? I reply: The *public* use of man's reason must always be free, and it alone can bring about enlightenment among men; the *private use* of reason may quite often be very narrowly restricted, however, without undue hindrance to the progress of enlightenment. But by the public use of one's own reason I mean that use which anyone may make of it *as a man of learning* addressing the entire *reading public*. What I term the private use of reason is that which a person may make of it in a particular *civil* post or office with which he is entrusted.

Now in some affairs which affect the interests of the commonwealth, we require a certain mechanism whereby some members of the commonwealth must behave purely passively, so that they may, by an artificial common agreement, be employed by the government for public ends (or at least deterred from vitiating them). It is, of course, impermissible to argue in such cases; obedience is imperative. But in so far as this or that individual who acts as part of the machine also considers himself as a member of a complete commonwealth or even of cosmopolitan society, and thence as a man of learning who may through his writings address a public in the truest sense of the word, he may indeed argue without harming the affairs in which he is employed for some of the time in a passive capacity. Thus it would be very harmful if an officer receiving an order from his superiors were to quibble openly, while on duty, about the appropriateness or usefulness of the order in question. He must simply obey. But he cannot reasonably be banned from making observations as a man of learning on the errors in the military service, and from submitting these to his public for judgement. The citizen cannot refuse to pay the taxes imposed upon him; presumptuous criticisms of such taxes, where someone is called upon to pay them, may be punished as an outrage which could lead to general insubordination. Nonetheless, the same citizen does not contravene his civil obligations if, as a learned individual, he publicly voices his thoughts on the impropriety or even injustice of such fiscal measures. In the same way, a clergyman is bound to instruct his pupils and his congregation in

accordance with the doctrines of the church he serves, for he was employed by it on that condition. But as a scholar, he is completely free as well as obliged to impart to the public all his carefully considered, well-intentioned thoughts on the mistaken aspects of those doctrines, and to offer suggestions for a better arrangement of religious and ecclesiastical affairs. And there is nothing in this which need trouble the conscience. For what he teaches in pursuit of his duties as an active servant of the church is presented by him as something which he is not empowered to teach at his own discretion, but which he is employed to expound in a prescribed manner and in someone else's name. He will say: Our church teaches this or that, and these are the arguments it uses. He then extracts as much practical value as possible for his congregation from precepts to which he would not himself subscribe with full conviction, but which he can nevertheless undertake to expound, since it is not in fact wholly impossible that they may contain truth. At all events, nothing opposed to the essence of religion is present in such doctrines. For if the clergyman thought he could find anything of this sort in them, he would not be able to carry out his official duties in good conscience, and would have to resign. Thus the use which someone employed as a teacher makes of his reason in the presence of his congregation is purely *private*, since a congregation, however large it is, is never any more than a domestic gathering. In view of this, he is not and cannot be free as a priest, since he is acting on a commission imposed from outside. Conversely, as a scholar addressing the real public (i.e. the world at large) through his writings, the clergyman making *public use* of his reason enjoys unlimited freedom to use his own reason and to speak in his own person. For to maintain that the guardians of the people in spiritual matters should themselves be immature, is an absurdity which amounts to making absurdities permanent.

But should not a society of clergymen, for example an ecclesiastical synod or a venerable presbytery (as the Dutch call it), be entitled to commit itself by oath to a certain unalterable set of doctrines, in order to secure for all time a constant guardianship over each of its members, and through them over the people? I reply that this is quite impossible. A contract of this kind, concluded with a view to preventing all further enlightenment of mankind for ever, is absolutely null and void, even if it is ratified by the supreme power, by Imperial Diets and the most solemn peace treaties. One age cannot enter into an alliance on oath to put the next age in a position where it would be impossible for it to extend and correct its knowledge, particularly on such important matters, or to make any progress whatsoever in enlightenment. This would be a crime against human nature, whose original destiny lies precisely in such progress. Later generations are thus perfectly entitled to dismiss these agreements as unauthorised and criminal. To test whether any particular measure can be agreed upon as a law for a people, we need only ask whether a people could well impose such a law upon itself. This might well be possible for a specified short period as a means of introducing a certain order, pending, as it were, a better solution. This would also mean that each citizen, particularly the clergyman, would be given a free hand as a scholar to comment publicly, i.e. in his writings, on the inadequacies of current institutions. Meanwhile, the newly established order would continue to exist, until public insight into the nature of such matters had progressed and proved itself to the point where, by general consent (if not unan-

imously), a proposal could be submitted to the crown. This would seek to protect the congregations who had, for instance, agreed to alter their religious establishment in accordance with their own notions of what higher insight is, but it would not try to obstruct those who wanted to let things remain as before. But it is absolutely impermissible to agree, even for a single lifetime, to a permanent religious constitution which no-one might publicly question. For this would virtually nullify a phase in man's upward progress, thus making it fruitless and even detrimental to subsequent generations. A man may for his own person, and even then only for a limited period, postpone enlightening himself in matters he ought to know about. But to renounce such enlightenment completely, whether for his own person or even more so for later generations, means violating and trampling underfoot the sacred rights of mankind. But something which a people may not even impose upon itself can still less be imposed on it by a monarch; for his legislative authority depends precisely upon his uniting the collective will of the people in his own. So long as he sees to it that all true or imagined improvements are compatible with the civil order, he can otherwise leave his subjects to do whatever they find necessary for their salvation, which is none of his business. But it is his business to stop anyone forcibly hindering others from working as best they can to define and promote their salvation. It indeed detracts from his majesty if he interferes in these affairs by subjecting the writings in which his subjects attempt to clarify their religious ideas to governmental supervision. This applies if he does so acting upon his own exalted opinions – in which case he exposes himself to the reproach: *Caesar non est supra Grammaticos* [Caesar is not above the grammarians] – but much more so if he demeans his high authority so far as to support the spiritual despotism of a few tyrants within his state against the rest of his subjects.

If it is now asked whether we at present live in an *enlightened* age, the answer is: No, but we do live in an age of *enlightenment*. As things are at present, we still have a long way to go before men as a whole can be in a position (or can even be put into a position) of using their own understanding confidently and well in religious matters, without outside guidance. But we do have distinct indications that the way is now being cleared for them to work freely in this direction, and that the obstacles to universal enlightenment, to man's emergence from his self-incurred immaturity, are gradually becoming fewer. In this respect our age is the age of enlightenment, the century of *Frederick*.

A prince who does not regard it as beneath him to say that he considers it his duty, in religious matters, not to prescribe anything to his people, but to allow them complete freedom, a prince who thus even declines to accept the presumptuous title of *tolerant*, is himself enlightened. He deserves to be praised by a grateful present and posterity as the man who first liberated mankind from immaturity (as far as government is concerned), and who left all men free to use their own reason in all matters of conscience. Under his rule, ecclesiastical dignitaries, notwithstanding their official duties, may in their capacity as scholars freely and publicly submit to the judgement of the world their verdicts and opinions, even if these deviate here and there from orthodox doctrine. This applies even more to all others who are not restricted by any official duties. This spirit of freedom is also spreading abroad, even where it has to struggle with outward obstacles imposed by governments which

misunderstand their own function. For such governments can now witness a shining example of how freedom may exist without in the least jeopardising public concord and the unity of the commonwealth. Men will of their own accord gradually work their way out of barbarism so long as artificial measures are not deliberately adopted to keep them in it.

I have portrayed *matters of religion* as the focal point of enlightenment, i.e. of man's emergence from his self-incurred immaturity. This is firstly because our rulers have no interest in assuming the role of guardians over their subjects so far as the arts and sciences are concerned, and secondly, because religious immaturity is the most pernicious and dishonourable variety of all. But the attitude of mind of a head of state who favours freedom in the arts and sciences extends even further, for he realises that there is no danger even to his *legislation* if he allows his subjects to make *public* use of their own reason and to put before the public their thoughts on better ways of drawing up laws, even if this entails forthright criticism of the current legislation. We have before us a brilliant example of this kind, in which no monarch has yet surpassed the one to whom we now pay tribute.

But only a ruler who is himself enlightened and has no fear of phantoms, yet who likewise has at hand a well-disciplined and numerous army to guarantee public security, may say what no republic would dare to say: *Argue as much as you like and about whatever you like, but obey!* This reveals to us a strange and unexpected pattern in human affairs (such as we shall always find if we consider them in the widest sense, in which nearly everything is paradoxical). A high degree of civil freedom seems advantageous to a people's *intellectual* freedom, yet it also sets up insuperable barriers to it. Conversely, a lesser degree of civil freedom gives intellectual freedom enough room to expand to its fullest extent. Thus once the germ on which nature has lavished most care – man's inclination and duty to *think freely* – has developed within this hard shell, it gradually reacts upon the mentality of the people, who thus gradually become increasingly able to *act freely*. Eventually, it even influences the principles of governments, which find that they can themselves profit by treating man, who is *more than a machine*, in a manner appropriate to his dignity.

9 Karl Philipp Moritz (1756–1793) from 'On the Creative Imitation of Beauty'

Karl Philipp Moritz was born into poverty in Hameln, in Germany, and educated in Hannover. He originally served an apprenticeship as a hatter, and later worked as a schoolmaster in Berlin. He escaped the hardship of his upbringing to become a writer, publishing memoirs of his travels in England and France and the important, semi-autobiographical *Anton Reiser* (1785–90), subtitled 'a psychological novel'. Between 1783 and 1793 he edited a pioneering psychological periodical, *Know Thyself; or, Magazine of Experimental Psychology*. He wrote two short but influential treatises on aesthetics, 'On the Concept of That Which is Perfect in Itself' (1785) and 'On the Creative Imitation of Beauty' (1788). In 1789 he was appointed professor of the Theory of Fine Arts in Berlin, but died just four years later from tuberculosis. 'On the Creative Imitation of Beauty' was written under the influence of Goethe, whom Moritz met in Italy late in 1786. Goethe himself published part of

the treatise in his *Italian Journey*, where he observes that it was the result of conversations the two men enjoyed together at that time. The thesis of Moritz's essay is that the creative genius produces in the work of art a beautiful whole which is, at the same time, a microcosm of the rationally ordered whole of nature. This quasi-religious interpretation of artistic activity establishes a metaphysical correspondence between artistic creation and the work of the Creator. However, the conception of nature which underpins Moritz's account is closer to the pantheistic vision celebrated in Christof Tobler's essay of 1783 on nature (see VB8), which was long thought to be by Goethe himself. *Über die bildende Nachahmung des Schönen* was first published in Braunschweig in 1788. The following passages are taken from the excerpt reproduced by Goethe in his *Italian Journey*, translated by Robert R. Heitner, Princeton: Princeton University Press, 1994, pp. 431–3.

In the case of a creative genius, however, the horizon of his active power must be as broad as nature itself: that is, his organic structure must be so finely textured and offer so many points of contact with all-circumfluent nature that, so to speak, the outermost ends of all relations in nature on the grand scale, placed beside each other here on a small scale, have room enough not to crowd each other out.

Now if an organic structure of this finer texture, when fully developed, suddenly, in dim awareness of its active power, grasps a whole entity that came in neither through its eye nor its ear, neither through its imagination nor its thoughts, then a commotion, a tension, will necessarily arise between the swaying forces, until they regain their balance.

If a mind, with dim presentiment, has already grasped the grand, noble entirety of nature solely with its active power, then its clearly discerning power of thought, its still more vividly graphic power of imagination, and its most brightly mirroring external sense can no longer be satisfied with viewing individual things in nature's continuum.

All the relations of that great whole that are only dimly sensed by the active power must necessarily in some way become either visible, audible, or, at any rate, comprehensible to the imagination; and in order for this to happen the active power, in which they slumber, must form them in its own fashion, out of itself. – This power must take all the relations of the great whole and bring the highest beauty in them, as though from the point of its rays, into focus – Out of this focus, within the precise range of the eye, a fragile, yet faithful image of the highest beauty must be rounded out and include in its small compass the most complete relations of the great whole of nature, just as truly and accurately as nature itself does.

Now, however, because this image of the highest beauty must necessarily adhere to something, the creative power, determined by its individuality, chooses some object that is visible, audible, or, at any rate, comprehensible to the imagination, onto which it transfers, on a reduced scale, the reflection of the highest beauty. – And again, because if this object were really what it represents it could not go on existing in the continuum of nature, which tolerates no really independent whole outside itself, this leads us to the point where we were before: namely, that the inner essence must always first be transformed into phenomenon before it can be shaped by art into an independently existing whole and mirror unhindered and in their full scope the relations of the great whole of nature.

Since, however, those great relations, in whose complete compass beauty resides, lie outside the jurisdiction of the power of thought, the living concept of the creative imitation of beauty can only emerge when one is conscious of the active power producing the imitation, in the first moment of origin, when the work, as though already completed, suddenly, in dim presentiment, appears before the mind in all the degrees of its gradual development, and, in this moment of its first conception, is there, so to speak, before it really exists. From this, then, springs that inexpressible charm which impels the creative genius to continue producing art perpetually.

Thanks to our reflections on the creative imitation of beauty, combined with our pure pleasure in the beautiful artworks themselves, something like that living concept can, to be sure, arise in us and enhance our enjoyment of the beautiful artworks. – But nevertheless, since our highest enjoyment of beauty cannot possibly depend on our own power for its genesis, the only supreme enjoyment of it always belongs to the creative genius who produces it; and therefore beauty has already attained its highest goal in its emergence, in its becoming. Our subsequent enjoyment of it is simply a result of its existence – and, consequently, in the great plan of nature the creative genius exists first for his own sake, and only then for ours. For, of course, there are other beings besides him, who themselves do not create and produce art, but nevertheless can grasp the work with their imagination, once it is produced.

The nature of beauty consists in the very fact that its inner essence lies in its emergence and becoming, outside the boundaries of the power of thought. Beauty is beautiful for the very reason that the power of thought cannot inquire of it *why* it is beautiful. – For the power of thought completely lacks a point of comparison by which it could judge and view beauty. What other point of comparison is there for true beauty except the sum of all the harmonious relations of the great whole of nature, which no power of thought can grasp? Every individual beauty strewn here and there in nature is only beautiful insofar as this sum of all the relations of the great whole is more or less revealed in it. Therefore it can never serve as the point of comparison for the beauty of the fine arts, nor as a model for the true imitation of beauty; because the highest beauty in individual things in nature is still not beautiful enough for the proud imitation of the grand and majestic relations of the all-inclusive whole of nature. Consequently, beauty is not discerned, it must be produced – or felt.

Because beauty, with its total lack of a point of comparison, is not a matter for the power of thought, and since we cannot produce it ourselves, we would have to forgo enjoyment of it altogether, for we could never be certain of what was more beautiful, or less so – if the productive power were not replaced in us by something that comes as close to it as is possible without actually being it – this, now, is what we call taste, or the ability to *feel* beauty. When this remains within its bounds, it can replace our lack of the higher pleasure of producing beauty with the undisturbed peace of quiet contemplation.

That is to say, if our organic structure is not textured finely enough to offer the inflowing whole of nature as many points of contact as are needed to mirror completely all its great relations in miniature, and we lack one point for complete closure of the circle, then all we can have, instead of the creative power, is the ability

to feel beauty; our every attempt to represent it outside ourselves would fail and make us the more dissatisfied with ourselves, the more closely our ability to feel beauty borders on the creative ability we lack.

That is to say, because the essence of beauty consists in its being complete within itself, the last missing point damages it as much as a thousand, for this shifts all the other points out of the position where they belong. – And if this point of completion is missing, then an artwork is not worth the trouble of beginning it and the time of its formation; it descends below inferiority to uselessness, and its existence is inevitably canceled out again by the oblivion into which it sinks.

10 Immanuel Kant (1724–1804) from *Critique of Judgement*

Kant published the *Critique of Judgement* in 1790 as the third and last of his three great *Critiques* (see the introduction to VA8). In the first part of this work, entitled the 'critique of aesthetic judgement', he turns to problems of taste and beauty. His principal concern is to establish the independent significance and validity of judgement of taste in distinction from both cognitive and moral judgements. Our first set of excerpts is taken from his discussion of the two 'peculiarities of the judgement of taste'. Here Kant summarizes his own arguments concerning the distinctive character of aesthetic judgement. In contrast to a mere expression of liking or preference, when we claim that something is beautiful we speak in a 'universal voice', asserting something that we hold to be valid for everyone else. A judgement of taste raises a claim to 'subjective universality'. Kant further develops this idea in relation to the notion of a *sensus communis*, or 'common sense'. Our second set of excerpts is taken from his discussion of the fine arts. A work of art is the product of genius, an innate capacity to create new rules rather than follow existing ones. Kant represents 'aesthetic ideas' as promoting a rich train of associations but as incapable of being captured by any determinate thought or concept. This account was highly influential on later thinkers, emerging, for example, in Karl Ludwig Fernow's writing on landscape painting (see VIIA6). Kant's *Kritik der Urtheilskraft* was first published in Berlin and Libau in 1790. A second edition was published in 1793 and a third, with only minor modifications in 1799. We have used the translation of the second edition by J. H. Bernard, *Kant's Critique of Judgement*, London: Macmillan, 1914, pp. 154–9, 169–73, 185–90, 197–202.

§32. First peculiarity of the judgement of Taste

The judgement of taste determines its object in respect of satisfaction (in its beauty) with an accompanying claim for the assent of *every one*, just as if it were objective.

To say that 'this flower is beautiful' is the same as to assert its proper claim to satisfy every one. By the pleasantness of its smell it has no such claim. A smell which one man enjoys gives another a headache. Now what are we to presume from this except that beauty is to be regarded as a property of the flower itself, which does not accommodate itself to any diversity of persons or of their sensitive organs, but to which these must accommodate themselves if they are to pass any judgement upon it? And yet this is not so. For a judgement of taste consists in calling a thing beautiful

just because of that characteristic in respect of which it accommodates itself to our mode of apprehension.

Moreover, it is required of every judgement which is to prove the taste of the subject, that the subject shall judge by himself, without needing to grope about empirically among the judgements of others, and acquaint himself previously as to their satisfaction or dissatisfaction with the same object; thus his judgement should be pronounced *a priori*, and not be a mere imitation because the thing actually gives universal pleasure. One would think, however, that an *a priori* judgement must contain a concept of the Object, for the cognition of which it contains the principle; but the judgement of taste is not based upon concepts at all, and is in general not a cognitive but an aesthetical judgement.

Thus a young poet does not permit himself to be dissuaded from his conviction that his poem is beautiful, by the judgement of the public or of his friends; and if he gives ear to them he does so, not because he now judges differently, but because, although (in regard to him) the whole public has false taste, in his desire for applause he finds reason for accommodating himself to the common error (even against his judgement). It is only at a later time, when his Judgement has been sharpened by exercise, that he voluntarily departs from his former judgements; just as he proceeds with those of his judgements which rest upon Reason. Taste merely claims autonomy. To make the judgements of others the determining grounds of his own would be heteronomy.

That we, and rightly, recommend the works of the ancients as models and call their authors classical, thus forming among writers a kind of noble class who give laws to the people by their example, seems to indicate *a posteriori* sources of taste, and to contradict the autonomy of taste in every subject. But we might just as well say that the old mathematicians, – who are regarded up to the present day as supplying models not easily to be dispensed with for the supreme profundity and elegance of their synthetical methods, – prove that our Reason is only imitative, and that we have not the faculty of producing from it in combination with intuition rigid proofs by means of the construction of concepts. There is no use of our powers, however free, no use of Reason itself (which must create all its judgements *a priori* from common sources) which would not give rise to faulty attempts, if every subject had always to begin anew from the rude basis of his natural state, and if others had not preceded him with their attempts. Not that these make mere imitators of those who come after them, but rather by their procedure they put others on the track of seeking in themselves principles and so of pursuing their own course, often a better one. Even in religion – where certainly every one has to derive the rule of his conduct from himself, because he remains responsible for it and cannot shift the blame of his transgressions upon others, whether his teachers or his predecessors – there is never as much accomplished by means of universal precepts, either obtained from priests or philosophers or got from oneself, as by means of an example of virtue or holiness which, exhibited in history, does not dispense with the autonomy of virtue based on the proper and original Idea of morality (*a priori*), or change it into a mechanical imitation. *Following*, involving something precedent, not 'imitation,' is the right expression for all influence that the products of an exemplary author may have upon others. And this only means that we draw from the same sources as our

predecessor did, and learn from him only the way to avail ourselves of them. But of all faculties and talents Taste, because its judgement is not determinable by concepts and precepts, is just that one which most needs examples of what has in the progress of culture received the longest approval; that it may not become again uncivilised and return to the crudeness of its first essays.

§33. Second peculiarity of the judgement of Taste

The judgement of taste is not determinable by grounds of proof, just as if it were merely *subjective*.

If a man, *in the first place*, does not find a building, a prospect, or a poem beautiful, a hundred voices all highly praising it will not force his inmost agreement. He may indeed feign that it pleases him in order that he may not be regarded as devoid of taste; he may even begin to doubt whether he has formed his taste on a knowledge of a sufficient number of objects of a certain kind (just as one, who believes that he recognises in the distance as a forest, something which all others regard as a town, doubts the judgement of his own sight). But he clearly sees that the agreement of others gives no valid proof of the judgement about beauty. Others might perhaps see and observe for him; and what many have seen in one way, although he believes that he has seen it differently, might serve him as an adequate ground of proof of a theoretical and consequently logical judgement. But that a thing has pleased others could never serve as the basis of an aesthetical judgement. A judgement of others which is unfavourable to ours may indeed rightly make us scrutinise our own with care, but it can never convince us of its incorrectness. There is therefore no empirical *ground of proof* which would force a judgement of taste upon any one.

Still less, *in the second place*, can an *a priori* proof determine according to definite rules a judgement about beauty. If a man reads me a poem of his or brings me to a play, which does not after all suit my taste, he may bring forward in proof of the beauty of his poem *Batteux* or *Lessing* or still more ancient and famous critics of taste, and all the rules laid down by them; certain passages which displease me may agree very well with rules of beauty (as they have been put forth by these writers and are universally recognised): but I stop my ears, I will listen to no arguments and no reasoning; and I will rather assume that these rules of the critics are false, or at least that they do not apply to the case in question, than admit that my judgement should be determined by grounds of proof *a priori*. For it is to be a judgement of Taste and not of Understanding or Reason.

It seems that this is one of the chief reasons why this aesthetical faculty of judgement has been given the name of Taste. For though a man enumerate to me all the ingredients of a dish, and remark that each is separately pleasant to me and further extol with justice the wholesomeness of this particular food – yet am I deaf to all these reasons; I try the dish with *my* tongue and my palate, and thereafter (and not according to universal principles) do I pass my judgement.

In fact the judgement of Taste always takes the form of a singular judgement about an Object. The Understanding can form a universal judgement by comparing the Object in point of the satisfaction it affords with the judgement of others upon it: *e.g.* 'all tulips are beautiful.' But then this is not a judgement of taste but a logical

judgement, which takes the relation of an Object to taste as the predicate of things of a certain species. That judgement, however, in which I find an individual given tulip beautiful, *i.e.* in which I find my satisfaction in it to be universally valid, is alone a judgement of taste. Its peculiarity consists in the fact that, although it has merely subjective validity, it claims the assent of *all* subjects, exactly as it would do if it were an objective judgement resting on grounds of knowledge, that could be established by a proof.

* * *

§40. Of Taste as a kind of *sensus communis*

We often give to the Judgement, if we are considering the result rather than the act of its reflection, the name of a sense, and we speak of a sense of truth, or of a sense of decorum, of justice, etc. And yet we know, or at least we ought to know, that these concepts cannot have their place in Sense, and further, that Sense has not the least capacity for expressing universal rules; but that no representation of truth, fitness, beauty, or justice, and so forth, could come into our thoughts if we could not rise beyond Sense to higher faculties of cognition. *The common Understanding of men*, which, as the mere sound (not yet cultivated) Understanding, we regard as the least to be expected from any one claiming the name of man, has therefore the doubtful honour of being given the name of common sense (*sensus communis*); and in such a way that by the name *common* (not merely in our language, where the word actually has a double signification, but in many others) we understand *vulgar*, that which is everywhere met with, the possession of which indicates absolutely no merit or superiority.

But under the *sensus communis* we must include the Idea of a *communal* sense, *i.e.* of a faculty of judgement, which in its reflection takes account (*a priori*) of the mode of representation of all other men in thought; in order *as it were* to compare its judgement with the collective Reason of humanity, and thus to escape the illusion arising from the private conditions that could be so easily taken for objective, which would injuriously affect the judgement. This is done by comparing our judgement with the possible rather than the actual judgements of others, and by putting ourselves in the place of any other man, by abstracting from the limitations which contingently attach to our own judgement. This, again, is brought about by leaving aside as much as possible the matter of our representative state, *i.e.* sensation, and simply having respect to the formal peculiarities of our representation or representative state. Now this operation of reflection seems perhaps too artificial to be attributed to the faculty called *common* sense; but it only appears so, when expressed in abstract formulae. In itself there is nothing more natural than to abstract from charm or emotion if we are seeking a judgement that is to serve as a universal rule.

The following Maxims of common human Understanding do not properly come in here, as parts of the Critique of Taste; but yet they may serve to elucidate its fundamental propositions. They are: 1^o to think for oneself; 2^o to put ourselves in thought in the place of every one else; 3^o always to think consistently. The first is the maxim of *unprejudiced* thought; the second of *enlarged* thought; the third of *consecutive* thought. The first is the maxim of a Reason never *passive*. The tendency to such

passivity, and therefore to heteronomy of the Reason, is called *prejudice*; and the greatest prejudice of all is to represent nature as not subject to the rules that the Understanding places at its basis by means of its own essential law, *i.e.* is *superstition*. Deliverance from superstition is called *enlightenment*; because although this name belongs to deliverance from prejudices in general, yet superstition specially (*in sensu eminenti*) deserves to be called a prejudice. For the blindness in which superstition places us, which it even imposes on us as an obligation, makes the need of being guided by others, and the consequent passive state of our Reason, peculiarly noticeable. As regards the second maxim of the mind, we are otherwise wont to call him limited (*borné*, the opposite of *enlarged*) whose talents attain to no great use (especially as regards intensity). But here we are not speaking of the faculty of cognition, but of the *mode of thought* which makes a purposive use thereof. However small may be the area or the degree to which a man's natural gifts reach, yet it indicates a man of *enlarged thought* if he disregards the subjective private conditions of his own judgement, by which so many others are confined, and reflects upon it from a *universal standpoint* (which he can only determine by placing himself at the standpoint of others). The third maxim, *viz.* that of *consecutive* thought, is the most difficult to attain, and can only be attained by the combination of both the former, and after the constant observance of them has grown into a habit. We may say that the first of these maxims is the maxim of Understanding, the second of Judgement, and the third of Reason.

I take up again the threads interrupted by this digression, and I say that Taste can be called *sensus communis* with more justice than sound Understanding can; and that the aesthetical Judgement rather than the intellectual may bear the name of a communal sense, if we are willing to use the word 'sense' of an effect of mere reflection upon the mind: for then we understand by sense the feeling of pleasure. We could even define Taste as the faculty of judging of that which makes *universally communicable*, without the mediation of a concept, our feeling in a given representation.

The skill that men have in communicating their thoughts requires also a relation between the Imagination and the Understanding in order to associate intuitions with concepts, and concepts again with those concepts, which then combine in a cognition. But in that case the agreement of the two mental powers is *according to law*, under the constraint of definite concepts. Only where the Imagination in its freedom awakens the Understanding, and is put by it into regular play without the aid of concepts, does the representation communicate itself not as a thought but as an internal feeling of a purposive state of the mind.

Taste is then the faculty of judging *a priori* of the communicability of feelings that are bound up with a given representation (without the mediation of a concept).

If we could assume that the mere universal communicability of a feeling must carry in itself an interest for us with it (which, however, we are not justified in concluding from the character of a merely reflective Judgement), we should be able to explain why the feeling in the judgement of taste comes to be imputed to every one, so to speak, as a duty.

* * *

§44. Of beautiful Art

There is no Science of the Beautiful, but only a Critique of it; and there is no such thing as beautiful Science, but only beautiful Art. For as regards the first point, if it could be decided scientifically, *i.e.* by proofs, whether a thing was to be regarded as beautiful or not, the judgement upon beauty would belong to science and would not be a judgement of taste. And as far as the second point is concerned, a science which should be beautiful as such is a nonentity. For if in such a science we were to ask for grounds and proofs, we would be put off with tasteful phrases (*bon-mots*). – The source of the common expression, *beautiful science*, is without doubt nothing else than this, as it has been rightly remarked, that for beautiful art in its entire completeness much science is requisite; *e.g.* a knowledge of ancient languages, a learned familiarity with classical authors, history, a knowledge of antiquities, etc. And hence these historical sciences, because they form the necessary preparation and basis for beautiful art, and also partly because under them is included the knowledge of the products of beautiful art (rhetoric and poetry), have come to be called beautiful sciences by a confusion of words.

If art which is adequate to the *cognition* of a possible object performs the actions requisite therefor merely in order to make it actual, it is *mechanical art*: but if it has for its immediate design the feeling of pleasure, it is called *aesthetical art*. This is again either *pleasant* or *beautiful*. It is the first, if its purpose is that the pleasure should accompany the representations [of the object] regarded as mere *sensations*; it is the second if they are regarded as *modes of cognition*.

Pleasant arts are those that are directed merely to enjoyment. Of this class are all those charming arts that can gratify a company at table; *e.g.* the art of telling stories in an entertaining way, of starting the company in frank and lively conversation, of raising them by jest and laugh to a certain pitch of merriment; when, as people say, there may be a great deal of gossip at the feast, but no one will be answerable for what he says, because they are only concerned with momentary entertainment, and not with any permanent material for reflection or subsequent discussion. (Among these are also to be reckoned the way of arranging the table for enjoyment, and, at great feasts, the management of the music. This latter is a wonderful thing. It is meant to dispose to gaiety the minds of the guests, regarded solely as a pleasant noise, without any one paying the least attention to its composition; and it favours the free conversation of each with his neighbour.) Again, to this class belong all games which bring with them no further interest than that of making the time pass imperceptibly.

On the other hand, beautiful art is a mode of representation which is purposive for itself, and which, although devoid of [definite] purpose, yet furthers the culture of the mental powers in reference to social communication.

The universal communicability of a pleasure carries with it in its very concept that the pleasure is not one of enjoyment, from mere sensation, but must be derived from reflection; and thus aesthetical art, as the art of beauty, has for standard the reflective Judgement and not sensation.

§45. Beautiful Art is an art, in so far as it seems like nature

In a product of beautiful art we must become conscious that it is Art and not Nature; but yet the purposiveness in its form must seem to be as free from all constraint of arbitrary rules as if it were a product of mere nature. On this feeling of freedom in the play of our cognitive faculties, which must at the same time be purposive, rests that pleasure which alone is universally communicable, without being based on concepts. Nature is beautiful because it looks like Art; and Art can only be called beautiful if we are conscious of it as Art while yet it looks like Nature.

For whether we are dealing with natural or with artificial beauty we can say generally: *That is beautiful which pleases in the mere act of judging it* (not in the sensation of it, or by means of a concept). Now art has always a definite design of producing something. But if this something were bare sensation (something merely subjective), which is to be accompanied with pleasure, the product would please in the act of judgement only by mediation of sensible feeling. And again, if the design were directed towards the production of a definite Object, then, if this were attained by art, the Object would only please by means of concepts. But in both cases the art would not please *in the mere act of judging*; *i.e.* it would not please as beautiful, but as mechanical.

Hence the purposiveness in the product of beautiful art, although it is designed, must not seem to be designed; *i.e.* beautiful art must *look* like nature, although we are conscious of it as art. But a product of art appears like nature when, although its agreement with the rules, according to which alone the product can become what it ought to be, is *punctiliously* observed, yet this is not *painfully* apparent; the form of the schools does not obtrude itself – it shows no trace of the rule having been before the eyes of the artist and having fettered his mental powers.

§46. Beautiful Art is the art of genius

Genius is the talent (or natural gift) which gives the rule to Art. Since talent, as the innate productive faculty of the artist, belongs itself to Nature, we may express the matter thus: *Genius* is the innate mental disposition (*ingenium*) through which Nature gives the rule to Art.

Whatever may be thought of this definition, whether it is merely arbitrary or whether it is adequate to the concept that we are accustomed to combine with the word *genius* (which is to be examined in the following paragraphs), we can prove already beforehand that according to the signification of the word here adopted, beautiful arts must necessarily be considered as arts of *genius*.

For every art presupposes rules by means of which in the first instance a product, if it is to be called artistic, is represented as possible. But the concept of beautiful art does not permit the judgement upon the beauty of a product to be derived from any rule, which has a *concept* as its determining ground, and therefore has at its basis a concept of the way in which the product is possible. Therefore, beautiful art cannot itself devise the rule according to which it can bring about its product. But since at the same time a product can never be called Art without some precedent rule, Nature

in the subject must (by the harmony of its faculties) give the rule to Art; *i.e.* beautiful Art is only possible as a product of Genius.

We thus see (1) that genius is a *talent* for producing that for which no definite rule can be given; it is not a mere aptitude for what can be learnt by a rule. Hence *originality* must be its first property. (2) But since it also can produce original nonsense, its products must be models, *i.e. exemplary*; and they consequently ought not to spring from imitation, but must serve as a standard or rule of judgement for others. (3) It cannot describe or indicate scientifically how it brings about its products, but it gives the rule just as nature does. Hence the author of a product for which he is indebted to his genius does not himself know how he has come by his Ideas; and he has not the power to devise the like at pleasure or in accordance with a plan, and to communicate it to others in precepts that will enable them to produce similar products. (Hence it is probable that the word genius is derived from *genius*, that peculiar guiding and guardian spirit given to a man at his birth, from whose suggestion these original Ideas proceed.) (4) Nature by the medium of genius does not prescribe rules to Science, but to Art; and to it only in so far as it is to be beautiful Art.

* * *

§49. Of the faculties of the mind that constitute Genius

We say of certain products of which we expect that they should at least in part appear as beautiful art, they are without *spirit*; although we find nothing to blame in them on the score of taste. A poem may be very neat and elegant, but without spirit. A history may be exact and well arranged, but without spirit. A festal discourse may be solid and at the same time elaborate, but without spirit. Conversation is often not devoid of entertainment, but yet without spirit: even of a woman we say that she is pretty, an agreeable talker, and courteous, but without spirit. What then do we mean by spirit?

Spirit, in an aesthetical sense, is the name given to the animating principle of the mind. But that whereby this principle animates the soul, the material which it applies to that [purpose], is that which puts the mental powers purposively into swing, *i.e.* into such a play as maintains itself and strengthens the [mental] powers in their exercise.

Now I maintain that this principle is no other than the faculty of presenting *aesthetical Ideas*. And by an aesthetical Idea I understand that representation of the Imagination which occasions much thought, without, however, any definite thought, *i.e.* any *concept*, being capable of being adequate to it; it consequently cannot be completely compassed and made intelligible by language. – We easily see that it is the counterpart (pendant) of a *rational Idea*, which conversely is a concept to which no *intuition* (or representation of the Imagination) can be adequate.

The Imagination (as a productive faculty of cognition) is very powerful in creating another nature, as it were, out of the material that actual nature gives it. We entertain ourselves with it when experience proves too commonplace, and by it we remould experience, always indeed in accordance with analogical laws, but yet also in accordance with principles which occupy a higher place in Reason (laws too which are just as natural to us as those by which Understanding comprehends empirical nature). Thus we feel our freedom from the law of association (which attaches to the empirical em-

ployment of Imagination), so that the material which we borrow from nature in accordance with this law can be worked up into something different which surpasses nature.

Such representations of the Imagination we may call *Ideas*, partly because they at least strive after something which lies beyond the bounds of experience, and so seek to approximate to a presentation of concepts of Reason (intellectual Ideas), thus giving to the latter the appearance of objective reality, – but especially because no concept can be fully adequate to them as internal intuitions. The poet ventures to realise to sense, rational Ideas of invisible beings, the kingdom of the blessed, hell, eternity, creation, etc; or even if he deals with things of which there are examples in experience, – *e.g.* death, envy and all vices, also love, fame, and the like, – he tries, by means of Imagination, which emulates the play of Reason in its quest after a maximum, to go beyond the limits of experience and to present them to Sense with a completeness of which there is no example in nature. It is, properly speaking, in the art of the poet, that the faculty of aesthetical Ideas can manifest itself in its full measure. But this faculty, considered in itself, is properly only a talent (of the Imagination).

If now we place under a concept a representation of the Imagination belonging to its presentation, but which occasions solely by itself more thought than can ever be comprehended in a definite concept, and which therefore enlarges aesthetically the concept itself in an unbounded fashion, – the Imagination is here creative, and it brings the faculty of intellectual Ideas (the Reason) into movement; *i.e.* a movement, occasioned by a representation, towards more thought (though belonging, no doubt, to the concept of the object) than can be grasped in the representation or made clear.

Those forms which do not constitute the presentation of a given concept itself but only, as approximate representations of the Imagination, express the consequences bound up with it and its relationship to other concepts, are called (aesthetical) *attributes* of an object, whose concept as a rational Idea cannot be adequately presented. Thus Jupiter's eagle with the lightning in its claws is an attribute of the mighty king of heaven, as the peacock is of its magnificent queen. They do not, like *logical attributes*, represent what lies in our concepts of the sublimity and majesty of creation, but something different, which gives occasion to the Imagination to spread itself over a number of kindred representations, that arouse more thought than can be expressed in a concept determined by words. They furnish an *aesthetical Idea*, which for that rational Idea takes the place of logical presentation; and thus as their proper office they enliven the mind by opening out to it the prospect into an illimitable field of kindred representations. But beautiful art does this not only in the case of painting or sculpture (in which the term 'attribute' is commonly employed): poetry and rhetoric also get the spirit that animates their works simply from the aesthetical attributes of the object, which accompany the logical and stimulate the Imagination, so that it thinks more by their aid, although in an undeveloped way, than could be comprehended in a concept and therefore in a definite form of words. [. . .]

In a word the aesthetical Idea is a representation of the Imagination associated with a given concept, which is bound up with such a multiplicity of partial representations in its free employment, that for it no expression marking a definite concept can be found; and such a representation, therefore, adds to a concept much ineffable thought, the feeling of which quickens the cognitive faculties, and with language, which is the mere letter, binds up spirit also.

The mental powers, therefore, whose union (in a certain relation) constitutes *genius* are Imagination and Understanding. In the employment of the Imagination for cognition it submits to the constraint of the Understanding and is subject to the limitation of being conformable to the concept of the latter. On the other hand, in an aesthetical point of view it is free to furnish unsought, over and above that agreement with a concept, abundance of undeveloped material for the Understanding; to which the Understanding paid no regard in its concept, but which it applies, though not objectively for cognition, yet subjectively to quicken the cognitive powers and therefore also indirectly to cognitions. Thus genius properly consists in the happy relation [between these faculties], which no science can teach and no industry can learn, by which Ideas are found for a given concept; and on the other hand, we thus find for these Ideas the *expression*, by means of which the subjective state of mind brought about by them, as an accompaniment of the concept, can be communicated to others. The latter talent is properly speaking what is called spirit; for to express the ineffable element in the state of mind implied by a certain representation and to make it universally communicable – whether the expression be in speech or painting or statuary – this requires a faculty of seizing the quickly passing play of Imagination and of unifying it in a concept (which is even on that account original and discloses a new rule that could not have been inferred from any preceding principles or examples), that can be communicated without any constraint of rules.

* * *

11 Archibald Alison (1757–1839) from *Essays on the Nature and Principles of Taste*

Archibald Alison was born in Scotland and educated at Glasgow and Oxford. After taking orders in the Church of England he received his first preferment at Brancepeth in Durham. He later held two ecclesiastical sinecures and a prebend at Salisbury, which allowed him to pursue his interest in natural history and in questions of taste and beauty. His *Essays on the Nature and Principles of Taste* attempts to explain the 'pleasures of the imagination' on rigorously empiricist and associationist principles, following the work of Locke (see IIB1). His chief concern is the 'state of mind' which allows us to appreciate beauty and sublimity. The simple perception of an object is not sufficient to explain our aesthetic responses. Rather, the emotions of sublimity and beauty are attendant upon the awakening of a 'train of thought' in our imagination, that is to say, a series of associations which are kindled in us by the object. To respond in this way, however, requires the right sort of attention. Someone who is in pain or grief, or even the critic who reasons, will remain insufficiently sensitive to such experiences. Alison concludes that 'It is upon the vacant and unemployed, accordingly, that the objects of taste make the strongest impression.' For this reason, his theory has been seen as an important precursor of the idea of a specific 'aesthetic attitude'. The following excerpts are taken from the first chapter of Essay 1, 'Of the Effect produced upon the Imagination, by objects of Sublimity and Beauty' and from the third chapter of Essay 2, 'Of the Sublimity and Beauty of the Objects of Sight', which discusses the associative beauty of colours. We have used the first edition, *Essays on the Nature and Principles of Taste*, Edinburgh: J. J. G. and G. Robinson, 1810, pp. 1–9, 15–18, 29–30, 204–10.

Essay I. Chapter I. Section I

The emotions of sublimity and beauty are uniformly ascribed, both in popular and in philosophical language, to the imagination. The fine arts are considered as the arts which are addressed to the imagination, and the pleasures they afford, are described, by way of distinction, as the Pleasures of the Imagination. The nature of any person's taste, is, in common life, generally determined from the nature or character of his imagination, and the expression of any deficiency in this power of mind, is considered as synonymous with the expression of a similar deficiency in point of taste.

Although, however, this connection is so generally acknowledged, it is not perhaps as generally understood in what it consists, or what is the nature of that effect which is produced upon the imagination, by objects of sublimity and beauty. I shall endeavour, therefore, in the first place, to state, what seems to me the nature of this effect, or, in what that exercise of imagination consists, which is so generally supposed to take place, when these emotions are felt.

When any object, either of sublimity or beauty, is presented to the mind, I believe every man is conscious of a train of thought being immediately awakened in his imagination, analogous to the character or expression of the original object. The simple perception of the object, we frequently find, is insufficient to excite these emotions, unless it is accompanied with this operation of mind, unless, according to common expression, our imagination is seized, and our fancy busied in the pursuit of all those trains of thought, which are allied to this character or expression.

Thus, when we feel either the beauty or sublimity of natural scenery, the gay lustre of a morning in spring, or the mild radiance of a summer evening, the savage majesty of a wintry storm, or the wild magnificence of a tempestuous ocean, we are conscious of a variety of images in our minds, very different from those which the objects themselves can present to the eye. Trains of pleasing or of solemn thought arise spontaneously within our minds, our hearts swell with emotions, of which the objects before us seem to afford no adequate cause; and we are never so much satiated with delight, as when, in recalling our attention, we are unable to trace either the progress or the connection of those thoughts, which have passed with so much rapidity through our imagination.

The effect of the different arts of taste is similar. The landscapes of Claude Lorrain, the music of Handel, the poetry of Milton, excite feeble emotions in our minds, when our attention is confined to the qualities they present to our senses, or when it is to such qualities of their composition that we turn our regard. It is then, only, we feel the sublimity or beauty of their productions, when our imaginations are kindled by their power, when we lose ourselves amid the number of images that pass before our minds, and when we waken at last from this play of fancy, as from the charm of a romantic dream. [. . .]

Section II

That unless this exercise of imagination is excited, the emotions of beauty or sublimity are unfelt, seems capable of illustration, from many instances of a very familiar kind.

I

If the mind is in such a state, as to prevent this freedom of imagination, the emotion, whether of sublimity or beauty, is unperceived. In so far as the beauties of art or nature affect the external senses, their effect is the same upon every man who is in possession of these senses. But to a man in pain or in grief, whose mind, by these means, is attentive only to one object or consideration, the same scene, or the same form, will produce no feeling of admiration, which, at other times, when his imagination was at liberty, would have produced it, in its fullest perfection. Whatever is great or beautiful in the scenery of external nature, is almost constantly before us; and not a day passes, without presenting us with appearances, fitted both to charm and to elevate our minds; yet it is in general with a heedless eye that we regard them, and only in particular moments that we are sensible of their power. There is no man, for instance, who has not felt the beauty of sunset; yet every one can remember many instances, when this most striking scene had no effect at all upon his imagination; and when he has beheld all the magnificence with which nature generally distinguishes the close of day, without one sentiment of admiration or delight. There are times, in the same manner, when we can read the *Georgics*, or the *Seasons*, with perfect indifference, and with no more emotion, than what we feel from the most uninteresting composition in prose; while in other moments, the first lines we meet with, take possession of our imagination, and awaken in it such innumerable trains of imagery, as almost leave behind the fancy of the poet. In these, and similar cases of difference in our feelings, from the same objects, it will always be found, that the difference arises from the state of our imaginations; from our disposition to follow out the train of thought, which such objects naturally produce, or our incapacity to do it, from some other idea, which has at that time taken possession of our minds, and renders us unable to attend to any thing else. That state of mind, every man must have felt, is most favourable to the emotions of taste, in which the imagination is free and unembarrassed, or in which the attention is so little occupied by any private or particular object of thought, as to leave us open to all the impressions, which the objects that are before us, can create. It is upon the vacant and the unemployed, accordingly, that the objects of taste make the strongest impression. It is in such hours alone, that we turn to the compositions of music, or of poetry, for amusement. The seasons of care, of grief, or of business, have other occupations, and destroy, for the time at least, our sensibility to the beautiful or the sublime, in the same proportion, that they produce a state of mind unfavourable to the indulgence of imagination.

II

The same thing is observable in criticism. When we sit down to appreciate the value of a poem, or of a painting, and attend minutely to the language or composition of the one, or to the colouring or design of the other, we feel no longer the delight which they at first produce. Our imagination in this employment is restrained, and instead of yielding to its suggestions, we studiously endeavour to resist them, by fixing our attention upon minute and partial circumstances of the composition. How much this

operation of mind tends to diminish our sense of its beauty, every one will feel, who attends to his own thoughts on such an occasion, or who will recollect how different was his state of mind, when he first felt the beauty either of the painting or the poem. It is this, chiefly, which makes it so difficult for young people, possessed of imagination, to judge of the merits of any poem or fable, and which induces them so often to give their approbation to compositions of little value. It is not, that they are incapable of learning in what the merits of such compositions consist, for these principles of judgment are neither numerous nor abstruse. It is not, that greater experience produces greater sensibility, for this every thing contradicts; but it is, because every thing, in that period of life, is able to excite their imaginations, and to move their hearts, because they judge of the composition, not by its merits, when compared with other works, or by its approach to any abstract or ideal standard, but by its effect in agitating their imaginations, and leading them into that fairy land, in which the fancy of youth has so much delight to wander. It is their own imagination, which has the charm, which they attribute to the work, that excites it; and the simplest tale, or the poorest novel, is, at that time, as capable of awakening it, as afterwards the eloquence of Virgil or Rousseau. All this, however, all this flow of imagination, in which youth, and men of sensibility, are so apt to indulge, and which so often brings them pleasure at the expence of their taste, the labour of criticism destroys. The mind, in such an employment, instead of being at liberty to follow whatever trains of imagery the composition before it can excite, is either fettered to the consideration of some of its minute and solitary parts; or pauses amid the rapidity of its conceptions, to make them the objects of its attention and review. In these operations, accordingly, the emotion, whether of beauty, or sublimity, is lost, and if it is wished to be recalled, it can only be done by relaxing this vigour of attention, and resigning ourselves again, to the natural stream of our thoughts. The mathematician who investigates the demonstrations of the Newtonian philosophy, the painter who studies the design of Raphael, the poet who reasons upon the measure of Milton, all, in such occupations, lose the delight which these several productions can give; and when they are willing to recover their emotion, must withdraw their attention from those minute considerations, and leave their fancy to expatiate at will, amid all the great or pleasing conceptions, which such productions of genius can raise.

* * *

Section III

There are many other instances equally familiar, which are sufficient to shew, that whatever increases this exercise or employment of Imagination, increases also the emotion of beauty or sublimity.

I

This is very obviously the effect of all Associations. There is no man, who has not some interesting associations with particular scenes, or airs, or books, and who does not feel their beauty or sublimity enhanced to him, by such connections. The view of the house where one was born, of the school where one was educated, and where the

gay years of infancy were passed, is indifferent to no man. They recal so many images of past happiness, and past affections, they are connected with so many strong or valued emotions, and lead altogether to so long a train of feelings and recollections, that there is hardly any scene which one ever beholds with so much rapture. There are songs also, that we have heard in our infancy, which, when brought to our remembrance in after years, raise emotions, for which we cannot well account; and which, though perhaps very indifferent in themselves, still continue from this association, and from the variety of conceptions which they kindle in our minds, to be our favourites through life. The scenes which have been distinguished by the residence of any person, whose memory we admire, produce a similar effect. [. . .] The scenes themselves may be little beautiful; but the delight with which we recollect the traces of their lives, blends itself insensibly with the emotions which the scenery itself, excites; and the admiration which these recollections afford, seems to give a kind of sanctity to the place where they dwelt, and converts every thing into beauty which appears to have been connected with them. There are scenes, undoubtedly, more beautiful than Runnymede, yet to those who recollect the great event which passed there, there is no scene, perhaps, which so strongly seizes upon the imagination; and although the emotions this recollection produces, are of a very different kind from those which the mere natural scenery can excite, yet they unite themselves so well with these inferior emotions, and spread so venerable a charm over the whole, that one can hardly persuade one's self, that the scene itself is not entitled to this admiration. [. . .]

The Sublime is increased, in the same manner, by whatever tends to increase this exercise of imagination. The field of any celebrated battle becomes sublime from this association. No man, acquainted with English history, can behold the field of Agincourt, without some emotion of this kind. The additional conceptions which this association produces, and which fill the mind of the spectator on the prospect of that memorable field, diffuse themselves in some measure over the scene, and give it a sublimity which does not naturally belong to it. The majesty of the Alps themselves is increased by the remembrance of Hannibal's march over them; and who is there, that could stand on the banks of the Rubicon, without feeling his imagination kindle, and his heart beat high?

* * *

II

The effect which is thus produced, by Associations, in increasing the emotions of sublimity or beauty, is produced also, either in nature, or in description, by what are generally termed Picturesque Objects. Instances of such objects are familiar to every one's observation. An old tower in the middle of a deep wood, a bridge flung across a chasm between rocks, a cottage on a precipice, are common examples. If I am not mistaken, the effect which such objects have on every one's mind, is to suggest an additional train of conceptions, beside what the scene or description itself would have suggested; for it is very obvious, that no objects are remarked as picturesque, which do not strike the imagination by themselves. They are, in general, such circumstances, as coincide, but are not necessarily connected, with the character of the scene

or description, and which at first affecting the mind with an emotion of surprise, produce afterwards an increased or additional train of imagery. The effect of such objects, in increasing the emotions either of beauty or sublimity, will probably be obvious from the following instances.

The beauty of sunset, in a fine autumnal evening, seems almost incapable of addition from any circumstance. The various and radiant colouring of the clouds, the soft light of the sun, that gives so rich a glow to every object [on] which it falls, the dark shades with which it is contrasted, and the calm and deep repose that seems to steal over universal nature, form altogether a scene, which serves perhaps better than any other in the world, to satiate the imagination with delight: Yet there is no man who does not know how great an addition this fine scene is capable of receiving from the circumstance of the evening bell. In what, however, does the effect of this most picturesque circumstance consist? Is it not in the additional images which are thus suggested to the imagination? images indeed of melancholy and sadness, but which still are pleasing, and which serve most wonderfully to accord with that solemn and pensive state of mind, which is almost irresistibly produced by this charming scene.

Essay 2. Chapter III

Of the Object of Sight

The greatest part of the external objects, in which we discover Sublimity or Beauty, are such as are perceived by the Sense of Sight. It has even been imagined by some Philosophers, that it is to such objects only that the name of Beauty is properly applied, and that it is only from analogy that the same term is applied, to the objects of our other Senses. This opinion, however, seems at first sight ill founded. The terms Beauty and Sublimity are applied by all men to Sounds, and even sometimes to Smells. In our own experience, we very often find, that the same Emotion is produced by Sounds, which is produced by Forms or Colours; and the nature of language sufficiently shows, that this is conformable also to general experience. There seems no reason therefore for limiting the objects of Sublimity or Beauty to the sole class of visible objects.

It must, however, be acknowledged, that by far the greatest number of these objects are such as we discover by means of this Sense; nor does it seem difficult to assign the reason of this superiority. By the rest of our senses, we discover only single qualities of objects; but by the Sense of Seeing, we discover all that assemblage of qualities which constitute, in our imaginations, the peculiar nature of such objects. By our other senses, we discover, in general, such qualities, only when the bodies are in contact with us; but the Sense of Sight affords us a very wide field of observation, and enables us to make them the objects of attention, when they are at very considerable distances from ourselves. It is natural, therefore, that the greater power of this Sense should dispose us to greater confidence in it, and that the qualities of bodies which we discover by means of it, should more powerfully impress

themselves upon our imagination and memory, than those single qualities which we discover by the means of our other Senses. The visible qualities of objects, accordingly, become to us not only the distinguishing characteristics of external bodies, but they become also in a great measure the Signs of all their other qualities; and by recalling to our minds the qualities signified, affect us in some degree with the same Emotion which the objects themselves can excite. Not only the smell of the Rose, or the Violet, is expressed to us by their Colours and Forms; but the utility of a Machine, the elegance of a Design; the proportion of a Column, the speed of the Horse, the ferocity of the Lion, even all the qualities of the human mind are naturally expressed to us by certain visible appearances; because our experience has taught us, that such qualities are connected with such appearances, and the presence of the one immediately suggests to us the idea of the other. Such visible qualities, therefore, are gradually considered as the Signs of other qualities, and are productive to us of the same Emotions with the qualities they signify.

But, besides this, it is also to be observed, that by this sense, we not only discover the nature of individual objects; and therefore naturally associate their qualities with their visible appearance; but that by it also we discover the relation of objects to each other; and that hence a great variety of objects in nature become expressive of qualities which do not immediately belong to themselves, but to the objects with which we have found them connected. Thus, for instance, it is by this sense we discover that the Eagle inhabits among Rocks and Mountains; that the Red-breast leaves the Woods in Winter, to seek shelter and food among the dwellings of Men; that the song of the Nightingale is peculiar to the Evening and the Night, &c. In consequence of this permanent connection, these animals acquire a character from the scenes they inhabit, or the seasons in which they appear, and are expressive to us in some measure of the character of these seasons and scenes. It is hence that so many objects become expressive, which perhaps in themselves would never have been so; that the Curfew is so solemn from accompanying the close of day, the twitter of the Swallow so cheerful, from its being heard in the Morning, the bleating of Sheep, the call of the Goat, the lowing of Kine, so beautiful from their occurring in pastoral or romantic Situations; in short, that the greatest number of natural objects acquire their expression from their connection with particular or affecting scenes.

As, in this way, the visible qualities of objects become expressive to us of all the qualities which they possess; and besides, in so many cases receive expression from their connection with other objects, it is extremely natural, that such qualities should form the greatest and most numerous class of the objects of Material Beauty.

I proceed to a more particular investigation of the Sublimity and Beauty of some of the most remarkable Classes of these Qualities.

Of the Beauty of Colours.

The greatest part of Colours are connected with a kind of established Imagery in our Minds, and are considered as expressive of many very pleasing and affecting Qualities.

These Associations may perhaps be included in the following Enumeration: 1st, Such as arise from the nature of the objects thus permanently coloured. 2dly, Such as

arise from some analogy between certain Colours, and certain Dispositions of Mind; and, 3dly, Such as arise from accidental connections, whether national or particular.

1. When we have been accustomed to see any object capable of exciting Emotion, distinguished by some fixed or permanent Colour, we are apt to extend to the Colour the Qualities of the object thus coloured; and to feel from it, when separated, some degree of the same Emotion which is properly excited by the object itself. Instances of this kind are within every person's observation. White, as it is the colour of Day, is expressive to us of the Cheerfulness or Gaiety which the return of Day brings. Black, as the colour of Darkness, is expressive of Gloom and Melancholy. The Colour of the Heavens, in serene Weather, is Blue: Blue therefore is expressive to us of somewhat of the same pleasing and temperate character. Green is the colour of the Earth in Spring: It is consequently expressive to us of some of those delightful Images which we associate with that Season. The colours of Vegetables and Minerals acquire, in the same manner, a kind of character from the character of the species which they distinguish. The expression of those colours, which are the signs of particular passions in the human Countenance, and which, from this connection, derive their effect, every one is acquainted with.

2. There are many Colours which derive expression from some analogy we discover between them and certain affections of the human Mind. Soft or Strong, Mild or Bold, Gay or Gloomy, Cheerful or Solemn, &c. are terms in all Languages applied to Colours; terms obviously metaphorical, and the use of which indicates their connection with particular qualities of Mind. In the same manner, different degrees or shades of the same Colour have similar characters, as Strong, or Temperate, or Gentle, &c. In consequence of this Association, which is in truth so strong that it is to be found among all Mankind, such Colours derive a character from this resemblance, and produce in our Minds some faint degree of the same Emotion, which the qualities they express are fitted to produce.

3. Many Colours acquire character from accidental Association. Purple, for instance, has acquired a character of Dignity, from its accidental connection with the dress of Kings. The colours of Ermine have a similar character from the same cause. The colours in every country which distinguish the dress of Magistrates, Judges, &c. acquire dignity in the same manner. Scarlet, in this country, as the Colour which distinguishes the dress of the Army, has, in some measure, a character correspondent to its employment; and it was perhaps this Association, (though unknown to himself,) that induced the blind man, mentioned by Mr Locke, to liken his notion of Scarlet to the Sound of a Trumpet. Every person will, in the same manner, probably recollect particular Colours which are pleasing to him, from their having been worn by People whom we loved, or from some other accidental Association.

In these several ways, Colours become significant to us of many interesting or affecting Qualities, and excite in us some degree of the Emotions which such qualities in themselves are fitted to produce.

12 Friedrich Schiller (1759–1805) from *Letters on the Aesthetic Education of Man*

The German poet, dramatist, historian and philosopher Friedrich Schiller was born in Marbach on the Neckar. His first play, *The Robbers* (1781), has been described as 'the great revolutionary drama' of German literature and as the first political tragedy of the *Sturm und Drang*. This impassioned protest against tyranny brought him into disfavour and he was obliged to flee Württemberg. In hiding in Bauerbach, he finished the plays *Fiesko* and *Kabale und Liebe* (1783). On the basis of his work on the Thirty Years War, he was appointed professor of history at Jena in 1788. But three years later he suffered a breakdown in his health. It was at this time that he began a close reading of Kant (see VA8 and 10), temporarily abandoning creative work for the study of philosophy. Perhaps the most significant product of this period is his *Letters on the Aesthetic Education of Man*. The letters are addressed to the Duke of Augustenberg, who supported Schiller's work through a three-year stipend. The *Letters* are, in part, a reaction to the events of the French Revolution and its descent into the Terror. Schiller defends his decision to write on problems of aesthetics at a time of political crisis, insisting that the only way to achieve true freedom is through beauty. He offers a powerful criticism of the fragmentary and dehumanizing qualities of modern society, in which the individual is reduced to a mere part in an 'ingenious clockwork'. For Schiller, rational enlightenment alone is not enough to ensure the proper development of humanity. It is necessary to educate the heart as well as the head. As the bridge between our sensuous and our rational nature, beauty offers a model of human wholeness. The 'aesthetic education of man' is thus an education to unity and completeness. The letters were first published in a series of three instalments in Schiller's own journal, *Die Horen*, between 1795 and 1796 under the title *Über die Ästhetische Erziehung des Menschen in einer Reihe von Briefen*. The following excerpts are taken from the translation by Elizabeth M. Wilkinson and L. A. Willoughby, *On the Aesthetic Education of Man in a Series of Letters*, Oxford: Clarendon Press, 1967, pp. 3, 7–9, 31–7, 49–53, 161–9.

First Letter

I have, then, your gracious permission to submit the results of my inquiry concerning Art and Beauty in the form of a series of letters. Sensible as I am of the gravity of such an undertaking, I am also alive to its attraction and its worth. I shall be treating of a subject which has a direct connexion with all that is best in human happiness, and no very distant connexion with what is noblest in our moral nature. I shall be pleading the cause of Beauty before a heart which is as fully sensible of her power as it is prompt to act upon it, a heart which, in an inquiry where one is bound to invoke feelings no less often than principles, will relieve me of the heaviest part of my labours.

* * *

Second Letter

* * *

I would not wish to live in a century other than my own, or to have worked for any other. We are citizens of our own Age no less than of our own State. And if it is deemed unseemly, or even inadmissible, to exempt ourselves from the morals and customs of the circle in which we live, why should it be less of a duty to allow the needs and taste of our own epoch some voice in our choice of activity?

But the verdict of this epoch does not, by any means, seem to be going in favour of art, not at least of the kind of art to which alone my inquiry will be directed. The course of events has given the spirit of the age a direction which threatens to remove it ever further from the art of the Ideal. This kind of art must abandon actuality, and soar with becoming holdness above our wants and needs; for Art is a daughter of Freedom, and takes her orders from the necessity inherent in minds, not from the exigencies of matter. But at the present time material needs reign supreme and bend a degraded humanity beneath their tyrannical yoke. Utility is the great idol of our age, to which all powers are in thrall and to which all talent must pay homage. Weighed in this crude balance, the insubstantial merits of Art scarce tip the scale, and, bereft of all encouragement, she shuns the noisy market-place of our century. The spirit of philosophical inquiry itself is wresting from the imagination one province after another, and the frontiers of art contract the more the boundaries of science expand.

Expectantly the gaze of philosopher and man of the world alike is fixed on the political scene, where now, so it is believed, the very fate of mankind is being debated. Does it not betray a culpable indifference to the common weal not to take part in this general debate? If this great action is, by reason of its cause and its consequences, of urgent concern to every one who calls himself man, it must, by virtue of its method of procedure, be of quite special interest to every one who has learnt to think for himself. For a question which has hitherto always been decided by the blind right of might, is now, so it seems, being brought before the tribunal of Pure Reason itself, and anyone who is at all capable of putting himself at the centre of things, and of raising himself from an individual into a representative of the species, may consider himself at once a member of this tribunal, and at the same time, in his capacity of human being and citizen of the world, an interested party who finds himself more or less closely involved in the outcome of the case. It is, therefore, not merely his own cause which is being decided in this great action; judgement is to be passed according to laws which he, as a reasonable being, is himself competent and entitled to dictate.

How tempting it would be for me to investigate such a subject in company with one who is as acute a thinker as he is a liberal citizen of the world! And to leave the decision to a heart which has dedicated itself with such noble enthusiasm to the weal of humanity. What an agreeable surprise if, despite all difference in station, and the vast distance which the circumstances of the actual world make inevitable, I were, in the realm of ideas, to find my conclusions identical with those of a mind as unprejudiced as your own! That I resist this seductive temptation, and put Beauty before Freedom, can, I believe, not only be excused on the score of personal

inclination, but also justified on principle. I hope to convince you that the theme I have chosen is far less alien to the needs of our age than to its taste. More than this: if man is ever to solve that problem of politics in practice he will have to approach it through the problem of the aesthetic, because it is only through Beauty that man makes his way to Freedom. But this cannot be demonstrated without my first reminding you of the principles by which Reason is in any case guided in matters of political legislation.

* * *

Sixth Letter

* * *

Closer attention to the character of our age will, however, reveal an astonishing contrast between contemporary forms of humanity and earlier ones, especially the Greek. The reputation for culture and refinement, on which we otherwise rightly pride ourselves *vis-à-vis* humanity in its merely natural state, can avail us nothing against the natural humanity of the Greeks. For they were wedded to all the delights of art and all the dignity of wisdom, without however, like us, falling a prey to their seduction. The Greeks put us to shame not only by a simplicity to which our age is a stranger; they are at the same time our rivals, indeed often our models, in those very excellences with which we are wont to console ourselves for the unnaturalness of our manners. In fullness of form no less than of content, at once philosophic and creative, sensitive and energetic, the Greeks combined the first youth of imagination with the manhood of reason in a glorious manifestation of humanity.

At that first fair awakening of the powers of the mind, sense and intellect did not as yet rule over strictly separate domains; for no dissension had as yet provoked them into hostile partition and mutual demarcation of their frontiers. Poetry had not as yet coquetted with wit, nor speculation prostituted itself to sophistry. Both of them could, when need arose, exchange functions, since each in its own fashion paid honour to truth. However high the mind might soar, it always drew matter lovingly along with it; and however fine and sharp the distinctions it might make, it never proceeded to mutilate. It did indeed divide human nature into its several aspects, and project these in magnified form into the divinities of its glorious pantheon; but not by tearing it to pieces; rather by combining its aspects in different proportions, for in no single one of their deities was humanity in its entirety ever lacking. How different with us Moderns! With us too the image of the human species is projected in magnified form into separate individuals – but as fragments, not in different combinations, with the result that one has to go the rounds from one individual to another in order to be able to piece together a complete image of the species. With us, one might almost be tempted to assert, the various faculties appear as separate in practice as they are distinguished by the psychologist in theory, and we see not merely individuals, but whole classes of men, developing but one part of their potentialities, while of the rest, as in stunted growths, only vestigial traces remain.

I do not underrate the advantages which the human race today, considered as a whole and weighed in the balance of intellect, can boast in the face of what is best in the ancient world. But it has to take up the challenge in serried ranks, and let whole

measure itself against whole. What individual Modern could sally forth and engage, man against man, with an individual Athenian for the prize of humanity?

Whence this disadvantage among individuals when the species as a whole is at such an advantage? Why was the individual Greek qualified to be the representative of his age, and why can no single Modern venture as much? Because it was from all-unifying Nature that the former, and from the all-dividing Intellect that the latter, received their respective forms.

It was civilization itself which inflicted this wound upon modern man. Once the increase of empirical knowledge, and more exact modes of thought, made sharper divisions between the sciences inevitable, and once the increasingly complex machinery of State necessitated a more rigorous separation of ranks and occupations, then the inner unity of human nature was severed too, and a disastrous conflict set its harmonious powers at variance. The intuitive and the speculative understanding now withdrew in hostility to take up positions in their respective fields, whose frontiers they now began to guard with jealous mistrust; and with this confining of our activity to a particular sphere we have given ourselves a master within, who not infrequently ends by suppressing the rest of our potentialities. While in the one a riotous imagination ravages the hard-won fruits of the intellect, in another the spirit of abstraction stifles the fire at which the heart should have warmed itself and the imagination been kindled.

This disorganization, which was first started within man by civilization and learning, was made complete and universal by the new spirit of government. It was scarcely to be expected that the simple organization of the early republics should have survived the simplicity of early manners and conditions; but instead of rising to a higher form of organic existence it degenerated into a crude and clumsy mechanism. That polypoid character of the Greek States, in which every individual enjoyed an independent existence but could, when need arose, grow into the whole organism, now made way for an ingenious clock-work, in which, out of the piecing together of innumerable but lifeless parts, a mechanical kind of collective life ensued. State and Church, laws and customs, were now torn asunder; enjoyment was divorced from labour, the means from the end, the effort from the reward. Everlastingly chained to a single little fragment of the Whole, man himself develops into nothing but a fragment; everlastingly in his ear the monotonous sound of the wheel that he turns, he never develops the harmony of his being, and instead of putting the stamp of humanity upon his own nature, he becomes nothing more than the imprint of his occupation or of his specialized knowledge. But even that meagre, fragmentary participation, by which individual members of the State are still linked to the Whole, does not depend upon forms which they spontaneously prescribe for themselves (for how could one entrust to their freedom of action a mechanism so intricate and so fearful of light and enlightenment?); it is dictated to them with meticulous exactitude by means of a formulary which inhibits all freedom of thought. The dead letter takes the place of living understanding, and a good memory is a safer guide than imagination and feeling.

When the community makes his office the measure of the man; when in one of its citizens it prizes nothing but memory, in another a mere tabularizing intelligence, in a third only mechanical skill; when, in the one case, indifferent to character, it insists

exclusively on knowledge, yet is, in another, ready to condone any amount of obscurantist thinking as long as it is accompanied by a spirit of order and law-abiding behaviour; when, moreover, it insists on special skills being developed with a degree of intensity which is only commensurate with its readiness to absolve the individual citizen from developing himself in extensity – can we wonder that the remaining aptitudes of the psyche are neglected in order to give undivided attention to the one which will bring honour and profit? True, we know that the outstanding individual will never let the limits of his occupation dictate the limits of his activity. But a mediocre talent will consume in the office assigned him the whole meagre sum of his powers, and a man has to have a mind above the ordinary if, without detriment to his calling, he is still to have time for the chosen pursuits of his leisure. Moreover, it is rarely a recommendation in the eyes of the State if a man's powers exceed the tasks he is set, or if the higher needs of the man of parts constitute a rival to the duties of his office. So jealously does the State insist on being the sole proprietor of its servants that it will more easily bring itself (and who can blame it?) to share its man with the Cytherean, than with the Uranian, Venus.

Thus little by little the concrete life of the Individual is destroyed in order that the abstract idea of the Whole may drag out its sorry existence, and the State remains for ever a stranger to its citizens since at no point does it ever make contact with their feeling. Forced to resort to classification in order to cope with the variety of its citizens, and never to get an impression of humanity except through representation at second hand, the governing section ends up by losing sight of them altogether, confusing their concrete reality with a mere construct of the intellect; while the governed cannot but receive with indifference laws which are scarcely, if at all, directed to them as persons. Weary at last of sustaining bonds which the State does so little to facilitate, positive society begins (this has long been the fate of most European States) to disintegrate into a state of primitive morality, in which public authority has become but one party more, to be hated and circumvented by those who make authority necessary, and only obeyed by such as are capable of doing without it.

* * *

Eighth Letter

Is Philosophy then to retire, dejected and despairing, from this field? While the dominion of forms is being extended in every other direction, is this, the most important good of all, to remain the prey of formless chance? Is the conflict of blind forces to endure for ever in the political world, and the law of sociality never to triumph over hostile self-interest?

By no means! Reason herself, it is true, will not join battle directly with this savage force which resists her weapons. No more than the son of Saturn in the *Iliad* will she descend to personal combat in this gloomy arena. But from the midst of the warriors she chooses the most worthy, equips him, as Zeus did his grandson, with divine weapons, and through his victorious strength decides the great issue.

Reason has accomplished all that she can accomplish by discovering the law and establishing it. Its execution demands a resolute will and ardour of feeling. If Truth is

to be victorious in her conflict with forces, she must herself first become a force and appoint some drive to be her champion in the realm of phenomena; for drives are the only motive forces in the sensible world. If she has hitherto displayed so little of her conquering power, this was due, not to the intellect which was powerless to unveil her, but to the heart which closed itself against her, and to the drive which refused to act on her behalf.

For whence comes this still so prevalent rule of prejudice, and this obscuring of minds in the face of all the light which philosophy and empirical science have kindled? Our Age is Enlightened; that is to say, such knowledge has been discovered and publicly disseminated as would suffice to correct at least our practical principles. The spirit of free inquiry has dissipated those false conceptions which for so long barred the approach to truth, and undermined the foundations upon which fanaticism and deception had raised their throne. Reason has purged herself of both the illusions of the senses and the delusions of sophistry, and philosophy itself, which first seduced us from our allegiance to Nature, is now in loud and urgent tones calling us back to her bosom. How is it, then, that we still remain barbarians?

There must, therefore, since the cause does not lie in things themselves, be something in the disposition of men which stands in the way of the acceptance of truth, however brightly it may shine, and of the adoption of truth, however forcibly it may convince. A Sage of old felt what it was, and it lies concealed in that pregnant utterance: *sapere aude*.

Dare to be wise! It is energy and courage that are required to combat the obstacles which both indolence of nature and cowardice of heart put in the way of our true enlightenment. Not for nothing does the ancient myth make the goddess of wisdom emerge fully armed from the head of Jupiter. For her very first action is a warlike one. Even at birth she has to fight a hard battle with the senses, which are loath to be snatched from their sweet repose. The majority of men are far too wearied and exhausted by the struggle for existence to gird themselves for a new and harder struggle against error. Happy to escape the hard labour of thinking for themselves, they are only too glad to resign to others the guardianship of their thoughts. And if it should happen that higher promptings stir within them, they embrace with avid faith the formulas which State and Priesthood hold in readiness for such an event. If these unhappy men deserve our compassion, we are rightly contemptuous of those others whom a kindlier fate has freed from the yoke of physical needs, but who by their own choice continue to bow beneath it. Such people prefer the twilight of obscure ideas, where feeling is given full rein, and fancy can fashion at will convenient images, to the rays of truth which put to flight the fond delusions of their dreams. It is on precisely these illusions, which the unwelcome light of knowledge is meant to dissipate, that they have founded the whole edifice of their happiness – how can they be expected to pay so dearly for a truth which begins by depriving them of all they hold dear? They would first have to be wise in order to love wisdom: a truth already felt by him who gave philosophy her name.

It is not, then, enough to say that all enlightenment of the understanding is worthy of respect only inasmuch as it reacts upon character. To a certain extent it also proceeds from character, since the way to the head must be opened through the heart. The development of man's capacity for feeling is, therefore, the more urgent

need of our age, not merely because it can be a means of making better insights effective for living, but precisely because it provides the impulse for bettering our insights.

* * *

Twenty-Third Letter

[...] The transition from a passive state of feeling to an active state of thinking and willing cannot ... take place except *via* a middle state of aesthetic freedom. And although this state can of itself decide nothing as regards either our insights or our convictions, thus leaving both our intellectual and our moral worth as yet entirely problematic, it is nevertheless the necessary pre-condition of our attaining to any insight or conviction at all. In a word, there is no other way of making sensuous man rational except by first making him aesthetic.

But, you will be tempted to object, can such mediation really be indispensable? Should truth and duty not be able, of and by themselves alone, to gain access to sensuous man? To which I must answer: they not only can, they positively must, owe their determining power to themselves alone; and nothing would be more at variance with my previous assertions than if they should seem to support the opposite view. It has been expressly proved that beauty can produce no result, neither for the understanding nor for the will; that it does not meddle in the business of either thinking or deciding; that it merely imparts the power to do both, but has no say whatsoever in the actual use of that power. In the actual use of it all other aid whatsoever is dispensed with; and the pure logical form, namely the concept, must speak directly to the understanding, the pure moral form, namely the law, directly to the will.

But for them to be able to do this at all, for such a thing as a pure form to exist for sensuous man at all, this, I insist, has first to be made possible by the aesthetic modulation of the psyche. Truth is not something which, like actuality or the physical existence of things, can simply be received from without. It is something produced by our thinking faculty, autonomously and by virtue of its freedom. And it is precisely this autonomy, this freedom, which is lacking in sensuous man. Sensuous man is already (physically speaking) determined, and in consequence no longer possesses free determinability. This lost determinability he will first have to recover before he can exchange his passive determination for an active one. But he cannot recover it except by either losing the passive determination which he had, or by already possessing within himself the active determination towards which he is to proceed. Were he merely to lose the passive determination, he would at the same time lose the possibility of an active one, since thought needs a body, and form can only be realized in some material. He will, therefore, need to have the active determination already within him, need to be at one and the same time passively, and actively, determined; that is to say, he will have to become aesthetic.

Through the aesthetic modulation of the psyche, then, the autonomy of reason is already opened up within the domain of sense itself, the dominion of sensation already broken within its own frontiers, and physical man refined to the point where spiritual man only needs to start developing out of the physical according to

the laws of freedom. The step from the aesthetic to the logical and moral state (i.e., from beauty to truth and duty) is hence infinitely easier than was the step from the physical state to the aesthetic (i.e., from merely blind living to form). The former step man can accomplish simply of his own free will, since it merely involves taking from himself, not giving to himself, fragmenting his nature, not enlarging it; the aesthetically tempered man will achieve universally valid judgements and universally valid actions, as soon as he has the will to do so. But the step from brute matter to beauty, in which a completely new kind of activity has to be opened up within him, must first be facilitated by the grace of Nature, for his will can exert no sort of compulsion upon a temper of mind which is, after all, the very means of bringing his will into existence. In order to lead aesthetic man to understanding and lofty sentiments, one need do no more than provide him with motives of sufficient weight. To obtain the same results from sensuous man we must first alter his very nature. Aesthetic man often needs no more than the challenge of a sublime situation (which is what acts most directly upon our will-power) to make of him a hero or a sage. Sensuous man must first be transported beneath another clime.

It is, therefore, one of the most important tasks of education to subject man to form even in his purely physical life, and to make him aesthetic in every domain over which beauty is capable of extending her sway; since it is only out of the aesthetic, not out of the physical, state that the moral can develop. If man is, in every single case, to possess the power of enlarging his judgement and his will into the judgement of the species as a whole; if out of his limited existence he is to be able to find the path which will lead him through to an infinite existence, out of every dependent condition be able to wing his way towards autonomy and freedom: then we must see to it that he is in no single moment of his life a mere individual, and merely subservient to the law of nature. If he is to be fit and ready to raise himself out of the restricted cycle of natural ends towards rational purposes, then he must already have prepared himself for the latter within the limits of the former, and have realized his physical destiny with a certain freedom of the spirit, that is, in accordance with the laws of beauty.

And this he can indeed accomplish without in the least acting counter to his physical ends. The claims which nature makes upon him are directed merely to what he does, to the content of his actions; in the matter of how he does it, the form of his actions, the purposes of nature offer no directives whatsoever. The claims of reason, by contrast, are directed strictly towards the form of his activity. Necessary as it is, then, for his moral destiny that he should be purely moral, and display absolute autonomy, for his physical destiny it is a matter of complete indifference whether he is purely physical, and behaves with absolute passivity. In respect of the latter, it is left entirely to his own discretion whether he realizes it merely as sensuous being and natural force (i.e., as a force which only reacts as it is acted upon), or whether he will at the same time realize it as absolute force and rational being; and there should be no question as to which of these two ways is more in keeping with his human dignity. On the contrary, just as it debases and degrades him to do from physical impulse what he should have decided to do from pure motives of duty, so it dignifies and exalts him to strive for order, harmony, and infinite freedom in those matters where the common man is content merely to satisfy his legitimate desires. In a word: in the realm of

truth and morality, feeling may have no say whatsoever; but in the sphere of being and well-being, form has every right to exist, and the play-drive every right to command.

It is here, then, in the indifferent sphere of physical life, that man must make a start upon his moral life; here, while he is still passive, already start to manifest his autonomy, and while still within the limitations of sense begin to make some show of rational freedom. The law of his will he must apply even to his inclinations; he must, if you will permit me the expression, play the war against Matter into the very territory of Matter itself, so that he may be spared having to fight this dread foe on the sacred soil of Freedom. He must learn to desire more nobly, so that he may not need to will sublimely. This is brought about by means of aesthetic education, which subjects to laws of beauty all those spheres of human behaviour in which neither natural laws, nor yet rational laws, are binding upon human caprice, and which, in the form it gives to outer life, already opens up the inner.

* * *

13 Friedrich Schiller (1759–1805) from 'On Naive and Sentimental Poetry'

At first sight, Schiller's 'On Naive and Sentimental Poetry' appears to be a reprise of the themes which animated the French *querelle des anciens et des modernes* in the late seventeenth century (see IA6 and 7). German classicism is distinguished from that of seventeenth-century Italy and France, however, by its orientation towards an ideal vision of ancient Greece rather than of Rome. This vision was in large part inspired by the writings of Winckelmann (see IIIA5 and 8). It projected a notion of ideal harmony and simplicity prior to the divisions of modernity. As Lesley Sharpe has observed, whereas the values of ancient Rome were called upon to reinforce those of contemporary France, ancient Greece was consistently held up as a challenge to modern society (Sharpe, 1991). Although Schiller's distinction between the 'naive' and the 'sentimental' starts out as an opposition between two different historical periods, the tendency of his essay is to recognize these two categories as belonging to different psychological types. Indeed, Schiller believed that in Goethe he had encountered the naive poet of the modern age, gifted with an intuitive capacity to grasp the underlying unity beneath its divisions and conflicts. By contrast, Schiller saw himself as incorrigibly 'sentimental', forced to traverse the path of philosophy and reflection in order to return to nature and art. *Über naive und sentimentalische Dichtung* was first published in a series of instalments in Schiller's journal, *Die Horen*, between 1795 and 1796. The following excerpts are taken from the translation by Helen Watanabe-O'Kelly, *On the Naive and Sentimental in Literature*, Manchester: Carcanet New Press, 1981, pp. 21–5, 31–5, 38–40. The reader should bear in mind that Schiller's use of 'naive' and 'sentimental' differs from our own, and that the meaning of these terms is closer to our 'immediate' and 'reflective'.

There are moments in our life when we accord to nature in plants, minerals, animals, landscapes, as well as to human nature in children, in the customs of country people and of the primitive world, a sort of love and touching respect, not because it pleases our senses nor because it satisfies our intellect or taste (the opposite of both can often

be the case) but merely *because it is nature*. Every sensitive person who is not wholly lacking in feeling experiences this when he wanders in the open air, when he lives in the country or lingers among the monuments of ancient times, in short, when in artificial conditions and situations he is surprised by a sight of simple nature. This interest, elevated quite often to a need, is what lies at the bottom of many of our fancies for flowers and animals, for simple gardens, for walks, for the country and its inhabitants, for many a product of distant antiquity and such like things; always presupposing that neither affectation nor any other accidental interest plays a part here. This sort of interest in nature, however, only comes to pass under two conditions. Firstly, it is absolutely necessary that the object which inspires it in us should be *natural* or at least should be held by us to be so; secondly, that it should (in the widest sense of the word) be *naive*, i.e., that nature should stand in contrast to art and put it to shame. As soon as the last is joined to the first and not before, the natural becomes the naive.

In this way of looking at things, nature for us is nothing other than voluntary existence, the continuation of things through themselves, existence according to its own unchangeable laws.

This concept is absolutely necessary if we are to take an interest in such phenomena. If one could give an artificial flower the appearance of nature so that it deceived completely, if one could push the imitation of the naive in manners and customs to the highest degree of illusion, then the discovery that it was imitation would completely destroy the feeling under discussion. From this it emerges that this sort of pleasure in nature is not an aesthetic but a moral one; for it is conveyed by means of an idea, not produced directly by observation; nor is it governed at all by the beauty of natural forms. What could a modest flower, a spring, a mossy stone, the twittering of the birds, the humming of the bees, etc. have in themselves that would be so pleasing to us? What could give them a claim on our love, even? It is not these objects, it is an *idea* represented by them which we love in them. In them we love the calm, creative life, the quiet functioning from within themselves, the existence according to their own laws, the inner necessity, the eternal unity with themselves.

They *are* what we *were*; they are what we *should become* again. We were natural like them and our culture should lead us back to nature along the path of reason and freedom. They are, therefore, at the same time a representation of our lost childhood, which remains eternally most precious to us and thus they fill us with a certain sadness. At the same time they are representations of our highest perfection in the ideal, so that they transport us into a state of elevated emotion.

But their perfection is no merit of their own, since it is not the product of their own choice. They accord us, therefore, the quite singular pleasure of being our models without putting us to shame. As a constant divine manifestation they surround us, but more to revive than to dazzle. The essence of their character is exactly that which is lacking to the perfection of our own; what distinguishes us from them is exactly what is lacking to the divinity of theirs. We are free and they are necessary; we change, they remain one. But only when both are combined, one with another – when the will freely follows the law of necessity and when reason enforces its rules in spite of all the flux of the imagination, then the divine or the ideal emerges. *In them*, therefore, we eternally see what eludes us, but for which we are

called upon to struggle and which we may hope to approach in a never-ending progression, although we never reach it. *In ourselves* we see a merit which they lack but which they can either never possess, like the unreasoning, or only if they travel on the same path *as us*, like children. They therefore provide us with the sweetest enjoyment of our humanity as an idea, even if they must necessarily humble themselves with regard to that *particular* condition of our humanity.

Since this interest in nature is based on an idea, it can only manifest itself in dispositions which are receptive to ideas, i.e. in moral ones. By far the greatest number of people only affect it, and the commonness of this sentimental taste in our day, which especially since the appearance of certain works expresses itself in sentimental journeys, sentimental gardens, walks and other fancies of this kind, is no proof of the commonness of this type of sentiment. Yet nature will always impress something of this effect even on the most insensitive, because that *predisposition* towards the moral which is common to all men conduces to it, and no matter how distant our *deeds* are from the simplicity and truth of nature we are all without exception impelled towards it *in the idea*. This sensitivity to nature is called forth especially strongly and in the most general way by those objects, for example children and childlike races, which stand in close connection with us and which encourage us to look at ourselves and what is *unnatural* in us. We are wrong if we think that it is merely the idea of helplessness which causes us in certain moments to linger among children with so much emotion. This may perhaps be the case with those who never feel anything else in the face of weakness except their own superiority. But the feeling of which I speak (it is only to be found in particular moral moods and is not to be confused with that which is evoked in us by the cheerful activity of children), rather humbles than flatters one's self-love; and even if there is a merit to be considered here, then it is not on our side. Not because we look down on the child from the height of our strength and perfection but because, from the *limitation* of our condition which is inseparable from the *determination* which we have reached, we *look up* to the limitless *indeterminable nature* of the child and to his pure innocence, we are moved and our emotion in such a moment is too obviously mingled with a certain sadness to allow us to mistake its source. The child represents *disposition* and *destiny*, we represent the *fulfilment* which always lags immeasurably far behind the former. For us, therefore, the child is a representation of the ideal, not the fulfilled but the abandoned one, and it is therefore in no way the concept of his insufficiency and limitations, it is on the contrary the concept of his pure, free strength, of his wholeness, of his boundlessness which touches us. To the moral and sensitive person for this reason the child will become a *sacred* object, an object which, by the power of an idea, destroys any power of experience and which will richly regain when judged by reason what it has lost when judged by common sense.

From just this contradiction between judgments of reason and common sense proceeds the unique phenomenon of the mixed feeling which is aroused in us by the *naive* way of thinking. It connects *child-like* and *childish* simplicity; through the latter it exposes itself to the common sense and calls forth that smile by which we bear witness to our (*theoretical*) superiority. As soon, however, as we have cause to believe that the childish simplicity is at the same time a child-like one, that consequently not lack of understanding, not lack of ability but a higher (*practical*) strength, a heart full

of innocence and truth is the source of it, a heart which despised the assistance of art from an inner greatness, then that triumph of the common sense is over, and mockery of foolishness turns into admiration of simplicity. We feel compelled to respect the object at which we previously smiled and, by taking a look into ourselves at the same time, to accuse ourselves of not being the same. In this way the unique phenomenon of an emotion which unites cheerful mockery, respect and sadness comes into existence. It is a prerequisite of the naive that nature is victorious over art, whether this happens without the knowledge and will of the person or in the full consequence of it. In the first case it is the naiveté of *surprise* and causes merriment; in the second it is the naiveté of disposition and moves one.

In the naiveté of surprise, the person must be *morally* capable of denying nature, in the naiveté of disposition he should not be so, yet we should not imagine him as *physically* incapable of it if it is to affect us as naive. The actions and speech of children, therefore, only give the pure impression of the naive as long as we do not remember their inability in the realm of art and only take account of the contrast between their naturalness and artificiality. The naive is a *childlike quality where it is no longer expected* and cannot therefore be attributed in the strictest sense to real childhood.

However, in both cases, in the naiveté of surprise as well as in the naiveté of disposition, nature must be right, art wrong.

Only with this last statement is the definition of the naive complete. Emotion is natural too and the rules of decorum are something artificial; yet the victory of emotion over decorum is not at all naive. If on the other hand the same emotion conquers affectation, false decorum, pretence, then we have no hesitation in calling it naive. It is therefore necessary that nature should not triumph over art through its blind power as a *dynamic* force but through its form as a *moral* force, in short, that it should triumph over art as an *inner necessity* not as an *outward need*. Not the *inadequacy* but the *invalidity* of art must have given nature the prize, for inadequacy is a deficiency and nothing which springs from a deficiency can call forth respect. Though in the case of the naiveté of surprise it is always the predominance of emotion and a *lack* of recollection which causes nature to betray itself, yet this lack and that predominance by no means constitute the naive by themselves but merely give nature an opportunity to follow *its moral disposition*, i.e. *to follow the law of harmony unhindered*.

* * *

The naiveté of disposition can, strictly speaking, only be attributed to man as a being not absolutely subject to nature, although only in so far as pure nature really still acts in him; but through an effect of the poeticising imagination, it is often transferred from the rational to the unreasoning. Thus we often ascribe to an animal, a landscape, a building, even to all nature in contrast to the arbitrariness and the fantastic ideas of man, a naive character. This, however, always demands that we, in our thoughts, provide what has no will with a will and notice its strict organisation according to the law of necessity. The dissatisfaction over our own badly-used moral freedom and the lack of moral harmony in our own actions easily puts us into a mood in which we address the inanimate like a person and, as though it had really had to fight a temptation towards the opposite, we make a virtue out of its eternal sameness and

envy its calm demeanour. In such a moment, we tend to consider the privilege of our reason a curse and an evil and, because of a lively feeling of the imperfection of our real achievements, we lose from sight a sense of justice towards our disposition and destiny.

We then see in irrational nature only a happier sister who remained behind in the parental home from which we rushed forth to foreign climes, in the arrogant high spirits of our freedom. With a painful longing we wish we were back there as soon as we begin to experience the afflictions of culture, and in the distant exile of art we hear the touching voice of our mother. As long as we were mere children of nature, we were happy and perfect; we have become free and have lost both. From this emerges a double and very unequal longing for nature, a longing for her *happiness* and a longing for her *perfection*. Only the sensual person laments the loss of the former. Only the moral person laments the loss of the latter.

Ask yourself therefore, tenderhearted friend of nature, whether your laziness thirsts for her peace, whether your offended moral code thirsts for her harmony? Ask yourself carefully, when art disgusts you and the abuses of society drive you to inanimate nature in solitude, whether it is society's deprivations, burdens and trials, or whether it is her moral anarchy, her arbitrariness, her disorder which you loathe in her. Your courage must throw itself joyfully into the former and your reward must be the very freedom from which they come. You may indeed set quiet happiness in nature up as a distant goal but only that happiness which is the reward of your worthiness. Therefore no complaints about the difficulty of life, about the inequality of conditions, about the pressure of circumstances, about the uncertainty of possession, about ingratitude, oppression, persecution; you must submit to all the *evils* of culture with voluntary resignation, you must respect them as the natural conditions of the sole Good; you must lament only the *evil* in it but not merely with weak tears. Take care rather that you act purely in the midst of that defilement, freely under that slavery, steadfastly under that capricious change, lawfully in the midst of that anarchy. Do not be afraid of the confusion around you but only of the confusion within you; strive for unity but do not seek it in monotony; strive for peace but through equilibrium, not by a cessation of activity. That nature for which you envy the unreasoning is not worthy of any respect, any longing. It lies behind you, it must always lie behind you. Abandoned by the ladder which carried you, there is now no other choice open to you than to seize the law consciously and voluntarily or to sink without hope of salvation into a bottomless pit.

But when you are comforted over the lost *happiness* of nature, then let her *perfection* serve your heart as a model. When you step out to her from your artificial circle, and she stands before you in her great stillness, in her naive beauty, in her childlike innocence and simplicity, then linger before this picture, cultivate this feeling; it is worthy of your best humanity. Think no more of *changing places* with her but receive her into yourself and strive to wed her endless superiority to your endless privilege and from the two conceive the divine. Let her surround you like a delightful *idyll* in which you always find yourself again after the aberrations of art, in which you gather courage and new confidence for the race and kindle anew in your heart the flame of the *ideal* which extinguishes itself so easily in the storm of life.

When one remembers the beauties of nature which surrounded the ancient Greeks; when one considers how intimately this people could live under its happy sky with free nature, how much nearer its way of imagining things, its way of feeling, its customs lay to simple nature and what a true impression of it its literary works are, then one is unpleasantly surprised to notice that one meets with so few signs of the *sentimental* interests with which we moderns cling to natural scenes and natural characters. The Greek is indeed in the highest degree exact, faithful, detailed in the description of nature, but yet no more and with no greater participation of the heart than in the description of a costume, a shield, a suit of armour, a household utensil or any mechanical product. In his love for the object he seems to make no difference between what exists through itself and what exists through art and the human will. Nature seems more to interest his understanding and his desire for knowledge than his moral sense; he does not cling with inwardness, with emotion, with sweet sorrow to her as we moderns do. Indeed, by personifying and deifying her individual phenomena and representing her effects as the actions of free beings, he does away with her calm necessity which is just what makes her so attractive to us. His impatient imagination carries him on past her to the drama of human life. Only what is alive and free, only characters, actions, fates and morals satisfy him and if *we* can wish in certain moral moods to substitute for the superiority of our freedom of will, which exposes us to so many struggles with ourselves, to so much unease and confusion, the choiceless but calm necessity of the irrational, the imagination of the Greek is preoccupied on the contrary with seeing the beginning of human nature already in the inanimate world and with seeing the influence of the will where blind necessity reigns.

Where does this dissimilarity of spirit come from? How does it come to pass that we, who are so immeasurably surpassed in everything that is nature by the ancients, at just this point can pay homage to nature to a higher degree, cling to her with fervour and embrace even the inanimate world with the warmest emotion? It comes *from this*, that nature for us has vanished from humanity and we only meet it in its true form outside of humanity in the inanimate world. Not our greater *accord with nature*, quite on the contrary our *opposition to nature* in our relationships, circumstances and customs, drives us to seek a satisfaction in the physical world which is not to be hoped for in the moral world, for the awakening desire for truth and simplicity which, like the moral disposition from which it comes, lies incorruptible and ineradicable in every human heart. For this reason, the feeling with which we cling to nature is so closely related to the feeling with which we lament the vanished age of childhood and childlike innocence. Our childhood is the only unmutilated piece of nature which we can still find in civilised humanity and therefore it is no wonder if every footprint of nature outside ourselves leads us back to our childhood.

It was very different with the ancient Greeks. With them culture had not degenerated so much that nature was abandoned for it. The whole structure of their social life was built on feelings, not on the inferior construction of art; even their theology was the inspiration of a naive feeling, the product of a happy imagination, not of brooding reason, as is the ecclesiastical belief of more modern nations. Since, therefore, the Greeks had not lost nature in humanity, they could not be astonished by it outside of humanity and had no such urgent need for objects in which they found it

again. United with themselves and happy in the feeling of their humanity, they had to stop at humanity as their highest value and try to bring everything else nearer to it, while *we*, in discord with ourselves and unhappy in our experience of humanity, have no more urgent interest than to flee out of it and to remove such an unsuccessful form from our eyes.

The feeling of which we are speaking here is, therefore, not that which the ancients had; it is rather one with that which we have *for the ancients*. They felt in a natural way, we feel the Natural. It was without doubt a quite different feeling which filled Homer's soul when he had his divine swineherd play host to Ulysses, from that which moved the soul of the young Werther when he read those verses after an irritating social gathering. Our feeling for nature is like that of the feeling of the sick man for health.

Just as nature began gradually to vanish from human life as *experience* and as the (active and feeling) *subjectivity*, so we see it emerge in the world of the poet as an *idea* and as *subject-matter*. That nation which has gone farthest towards unnaturalness and the consciousness of it would have to be the first to be touched the most strongly by the phenomenon of the *naive* and the first to put a name to it. This nation was, as far as I know, the *French*. But the experience of the naive and the interest in it is naturally much older and dates already from the beginning of moral and aesthetic corruption. This change in the kind of emotion is, for example, already very striking in *Euripides* when you compare him with his predecessors, especially with Aeschylus, and yet the former poet was the darling of his time. The same revolution can be shown among the ancient *historians*. *Horace*, the poet of a civilised and corrupt era, praises the calm contentment of his Tivoli and one could call him the true founder of this type of sentimental poetry, just as he is still the unsurpassed model for it. In *Propertius* and *Virgil*, among others, we also find traces of this way of feeling, less in *Ovid* who lacked the fullness of heart for it and who in his exile in Tomi misses painfully the contentment which Horace did without so gladly in his Tivoli.

Poets everywhere are by definition the *preservers* of nature. Where they can no longer be so completely and already experience in themselves the destructive influence of arbitrary and artificial forms or have even had to fight against them, then they appear as the *witnesses* and the *avengers* of nature. They therefore will either *be* nature or they will *look for* lost nature. From this stem two quite different types of poetry, by which the whole poetic territory is exhausted and measured. All poets who really are poets, according to the nature of the period in which they flourish or according to what accidental circumstances have an influence on their general education and on their passing mental state, will belong either to the *naive* or the *sentimental* type.

* * *

The poet, as I have said, either *is* nature or he will *seek* it. The former constitutes the naive, the second the sentimental poet.

The poetic spirit is immortal and inalienable in humanity. It can be lost in no other way than together with humanity and with the disposition to it. For if man distances himself through the freedom of his fantasy and his understanding from the simplicity, truth and necessity of nature, then not only is the way back to nature always open but a powerful and ineradicable drive, the moral drive, impels him increasingly back to it, and it is with this drive that the poetic gift stands in the closest relation-

ship. This, therefore, is not lost at the same time as natural simplicity but simply takes effect in another direction.

Now, too, nature is still the only flame at which the poetic spirit is kindled. From nature alone it draws its whole power, to nature alone it speaks even in the artificial man involved in culture. Every other kind of effect is foreign to the poetic spirit. Therefore, by the way, all so-called works of wit are quite wrongly called poetic, although we have confused the two for a long time, led astray by French literature. Nature, I say, is still now, in the artificial state of culture, the force by which the poetic spirit is powerful; only that it now has quite a different relationship to nature.

As long as man consists of pure, not of course of crude, nature, then he gives the impression of an undivided sensual unit and of a harmonious whole. The senses and the reason, the receptive and the spontaneous capacity, have not yet separated in their function, much less are they in opposition to each other. His emotions are not the formless play of accident, his thoughts are not the meaningless play of the imagination; the former proceed from the law of *necessity*, the latter from *reality*. If man has entered into a state of culture and if art has placed her hand on him, then that *sensual* harmony has been removed from him and he can only express himself as a *moral* unit, i.e., as someone striving for unity. The correspondence between his feeling and his thinking which existed *in reality* in the first state, now only exists *as an ideal*; it is no longer in him but outside of him, as an idea which must first be realised, no longer as a fact of his life. If one now applies the concept of poetry, which means nothing else than *to give humanity its most complete expression possible*, to both of these states, then in the state of natural simplicity, where man still functions together with all his powers as a harmonious unit, where the whole of his nature expresses itself completely in reality, the result is that the most complete possible *imitation of the real* must constitute the poet – that, on the other hand, here in the state of culture where that harmonious cooperation of his whole nature is merely an idea, it is the elevation of reality to the ideal or, what comes to the same thing, the *representation of the ideal which must make the poet*. And these are the two sole possible ways in which the poetic spirit can ever express itself. They are, as one can see, extremely different from each other, but there is a higher concept which subsumes both of them and it should not surprise us when this concept coincides with the idea of humanity.

Here is not the place to pursue this idea which can only be displayed in its full light by a separate discussion. He who knows how to institute a comparison between ancient and modern poets according to some spiritual criterion and not just according to accidental forms will easily be able to convince himself of the truth of it. The older poets touch us through nature, through sensual truth, through the living present; the modern ones touch us through ideas.

This path on which the modern poets are moving is, moreover, the same one on which man individually and mankind as a whole must travel. Nature makes him one with himself, art separates and divides him, through the ideal he returns to that unity. Because, however, the ideal is an infinite one which he never attains, the cultivated man can never become perfect in *his own way* as the natural man is able to do in his. He would, therefore, necessarily be immeasurably inferior to the latter in perfection if one were only to consider the relationship of both to their type and to their maximum potential. If, on the other hand, one compares the types themselves with

each other, then it emerges that the goal for which man *strives* through culture is immeasurably preferable to that which he *reaches* through nature. One, therefore, has his value because of his absolute attainment of a finite greatness, the other because of his approximation to an infinite one. However, because only the latter has *degrees* and a *progression*, then the relative value of him who is caught up in culture is on the whole never determinable, although looked at individually he must always find himself at a disadvantage compared to him in whom nature is functioning in all her perfection. In so far, however, as the ultimate goal of humanity cannot be reached except by means of that progression and the natural man cannot progress except by cultivating himself and as a result merges with the former, then there is no question as to which of the two deserves greater merit with regard to that ultimate goal.

14 Asmus Jakob Carstens (1754–1798) Letter to Karl Friedrich von Heinitz

Asmus Jakob Carstens was born in Sanct Gûrgen near Schleswig in what was then Denmark, but is now part of Germany. In 1776 he entered the Copenhagen Academy to study fine art, but showed an early resistance to academic training. After travelling to Rome in 1783, he returned to Berlin where he was appointed as a teacher at the Academy. He was supported by the minister of education, Karl Friedrich von Heinitz, who commissioned him to provide murals for his own rooms and for those of the royal family. It was under Heinitz's auspices that Carstens was granted leave of absence from his teaching duties and a stipend from the Prussian government to travel to Rome. Once there, however, he neglected his obligations to the Academy, omitting to send the required reports and examples of his work. The ensuing correspondence with Heinitz forms a key document in changing conceptions of the artist's role and relation to the state. Carstens had been influenced by the ideas of Kant (see VA8 and 10), whose teachings were transmitted to him by his friend and biographer Carl Ludwig Fernow (see VIIA6). Challenging the prevailing assumption that the proper role of the artist is as a functionary of the royal household, he declares his independence as a private citizen whose only obligation is to art and to humanity. Indeed, Carstens maintains that by exhibiting his work to the public he has effectively repaid the money given to him. The exhibition referred to in the letter opened in Berlin in April 1795. It contained drawings as well as works in tempera and watercolour, but no oils, since Carstens was unwilling to compare himself with the great artists of the past. The exhibition was favourably received and was reviewed in the *Deutscher Merkur*. However, in a letter of 19 December, Heinitz wrote to Carstens demanding that he fulfil the conditions of their agreement and return immediately to Berlin. Carstens stayed on in Rome, but died just a few years later. The high seriousness which he brought to his work and his adoption of a rigorously linear neo-classical style influenced a subsequent generation of artists, including Bertel Thorvaldsen, Joseph Anton Koch and Peter Cornelius (see VIIB7). The correspondence with Heinitz is reproduced in Carl Ludwig Fernow, *Leben des Künstlers Asmus Jakob Carstens. Ein Beitrag zur Kunstgeschichte des 18. Jahrhunderts*, Leipzig: Johann Friedrich Hartknoch, 1806. The full text of this letter has been translated for the present volume by Jason Gaiger from pp. 199–206.

20 February 1796

From the letter which was sent to me by Your Most Noble Excellency on the 19th of December of last year, and which was delivered by Herr Rehberg on the 8th of this month, I learn that my canvases have been well received not only by the Academy but by the public as a whole. In your letter of the 23rd of February 1795 it is written:

‘And afterwards (that is, after the examination of my paintings by Your Excellency, together with other experts) further details will follow as to whether your stipend can continue to be paid, or whether it is better for you henceforth to work on your own account.’

At the end of the same letter it is written:

‘As has already been stated, it still remains the case that your stipend will come to an end *ultimo Mai* of this year, unless the paintings which you send on to us receive as appreciative a judgement as you yourself have passed on them.’

In accordance with this letter, then, and considering the warm reception which my paintings received, I should have expected a further extension of my pension rather than my discharge. In a letter of the 18th of July 1795 it is written:

‘This will provide the hoped-for opportunity to present the paintings which were so highly praised in the above journal to his Royal Majesty Himself, and to your future advantage, to bring you, with your nobly born talent and ability, into closer acquaintance with His Majesty.’

However, what in fact took place was not only quite the opposite of my expectations, but I was treated with great injustice. I was even charged with having placed a burden upon the accounts of the Academy through the costs incurred in transporting my paintings, even though this took place in accordance with the will of Your Excellency, as can be seen from the aforementioned letter:

‘If my assumption (that is, that my paintings had already been sent on) should prove ungrounded, then I must request that as soon as you receive this letter you send these works by the quickest means possible, so that they can arrive in time for the exhibition which is due to open here in the middle of September.’

Every impartial judge will see that I have done exactly what was demanded of me, and that the above charge cannot justly be made against me. Moreover, the considerate tone of this letter is quite different from that of the other two, which has led me to suspect that the Academy was seeking only to find a way to seize my paintings – as has now in fact taken place – before abandoning me to my fate.

In the last letter which was sent to me I was reproached with ingratitude towards the Curatorium. By this I can only understand ingratitude towards His Excellency, for to this day I do not know if it consists of any other members. Against this charge it

should be remembered that I have had to study here for one and a half years with weak eyes as a consequence of the service which I have already provided. Here I can allow the hall in the house of Field Marshal von Dorville which I painted for Your Excellency to speak for me. As I painted the first figure, Your Nobleness, out of Your Own free will promised to send me to Rome to develop my talent, and, once the considerable work in the hall had been completed, this was granted to me by His Most High Majesty. My presence here in Rome is testament to the truth of what I say. Whilst I have made useful and conscientious employment of the pension granted to me by His Royal Majesty, this is something which lies outside the concerns of Your Excellency as keeper of the state finances. That which His Majesty has given to me, no matter from which purse, cannot be demanded back from me by anyone; with what right does the Academy confiscate my paintings after it has already profited from them by putting them on display?

As concerns the depleted state of the academic fund, I have never had any knowledge of its income and expenditure. However, that this fund must be considerable is revealed by the number of subjects who are supported by it. And if Your Excellency treats others as I have been treated, the fund can surely only increase.

Since the talk is of mutual obligation, it is only appropriate for me to answer that I have never had obligations towards the Academy. As an independent employee of the Directorium I provided good lessons for a modest salary. Nor have I ever even been a member. If I have obligations, then it is to Your Excellency. But in this letter I have already shown how these mutual obligations are now dissolved and how this is required by the demands of justice to myself.

In Your letter there next follows an untruth, or at least an error. There it is written:

‘After your repeated requests, you were appointed an official lecturer at the Academy.’

Is there a single line to prove that this is the case? On the contrary, I was obliged to turn down the appointment which was offered to me by Your Excellency. I had no desire to take up this position other than under the condition of independence from the Directorium which was promised to me by Professor Moritz. Your Excellency then enabled me to accept the position again by speaking to Professor Moritz and making proper arrangements; and this is what then in fact took place. But this can scarcely be termed making repeated requests.

And now, in the name of His Royal Majesty, I have received notification of my dismissal. I have been informed that the stipend to further my talents, for which I have worked with great zeal, and which was generously awarded by His Royal Majesty, has, as of the 19th of December of last year, been withdrawn. I am required to pay back to the account of the Academy 100 Taler which were lent me to cover my debts and for which my signature has been given. However, for the months of August, September, October and November, and up to the 19th of December, the Academy still owes me the sum of approximately 75 Taler from the stipend, bestowed on me for the furtherance of my artistic abilities by His Most High Majesty. Subtracted from 100 Taler this leaves 25 Taler, which I will pay back as soon as my paintings are returned to me without charges for transport. As long as this

does not take place, I must demand, in coinage, the sum of 300 zecchini from the Berlin Academy which has no right to my paintings and is entitled neither to take them into its possession nor to auction them off. I do not wish for them to be sold beneath this moderate price, and should this take place I will make a public complaint against the injustice of a public body against a private citizen.

Incidentally, I must inform Your Excellency that I do not belong to the Berlin Academy but to humanity. I have never thought of, nor have I ever promised, to put myself into bondage to the Academy for the rest of my life for a stipend which was given to me for a number of years for the progress of my talents. I can only develop as an artist here in Rome, amongst the greatest works of art in the world, and, as far as my strength allows, I will seek to justify myself to the world through my art. In order to remain true to my duty and calling as an artist I am prepared to relinquish all the privileges of the Academy and to choose instead poverty, an uncertain future and perhaps, considering my already weak condition, an invalid and helpless old age. God has bestowed upon me what talents I possess, and I must be a responsible housekeeper, so that when it is said: 'Give a good account of your housekeeping!' I need not reply: Lord, the Talers which you gave me I have buried in Berlin.

Since I have always known and valued Your Excellency as someone who values the truth I have not hesitated to write the truth frankly. If need be, I will declare this truth publicly in order to justify myself to the world as I am justified to myself.

With deepest respect I remain
Your Most Noble Excellency's
Wholly devoted
Carstens

15 Georg Wilhelm Friedrich Hegel (1770–1831) The 'Earliest System-Programme of German Idealism'

The authorship of the so-called 'Earliest System-Programme of German Idealism' remains a subject of dispute. The paper was first discovered amongst a bundle of Hegel's papers in his handwriting in 1917. However, although Hegel seems the most likely author, it has also been attributed to Friedrich Schelling (see VIA8), and to the poet Friedrich Hölderlin, both of whom studied with Hegel at the same theological seminary in Tübingen. This very uncertainty reveals the proximity between the ideas of these three thinkers at the time. What remains is only a fragment, but it provides a vivid expression of the nascent interests of German idealism at the end of the eighteenth century. The principal influences are Kant (see VA8 and 10) and Schiller (see VA12 and 13). Following Schiller's criticism of the dehumanizing and mechanical structure of the modern state, the author seeks to ground the idea of an ethical community in a new 'mythology of reason'. This is to be effected through the idea of beauty, which alone can reconcile the division of knowledge and morality which still characterizes Kant's philosophical system. The abstract ideas of philosophy first gain genuine motivating force when they are made into 'sensible truths', that is, when they are expressed in a form which appeals to the senses as well as to the mind. For the author, 'truth and goodness only become sisters in beauty – the philosopher must possess just as much aesthetic power as the poet.' In his later writings, Hegel sought to distinguish more clearly between art, religion and philosophy, ultimately claiming that

philosophy 'stands higher' than art (see *Art in Theory 1815–1900*, IA10). The following translation of the entire fragment is by H. S. Harris and is taken from his *Hegel's Development: Towards the Sunlight, 1770–1801*, Oxford: Clarendon Press, 1972, pp. 510–12.

[1] ... an *Ethics*. Since the whole of metaphysics falls for the future within *moral theory* – of which Kant with his pair of practical postulates has given only an *example*, and not *exhausted* it, – this *Ethics* will be nothing less than a complete system of all Ideas [*Ideen*] or of all practical postulates (which is the same thing). The first Idea is, of course, the presentation [*Vorst<ellung>*] of *my* self as an absolutely free entity [*Wesen*]. Along with the free, self-conscious essence there stands forth – out of nothing – an entire *world* – the one true and thinkable creation out of nothing – Here I shall descend into the realms of physics; the question is this: how must a world be constituted for a moral entity? I would like to give wings once more to our backward physics, that advances laboriously by experiments.

[2] Thus – if philosophy supplies the Ideas, and experience the data, we may at last come to have in essentials the physics that I look forward to for later times. It does not appear that our present-day physics can satisfy a creative spirit such as ours is or ought to be.

[3] From nature I come to the *work of man*. The Idea of mankind [being] premised – I shall prove that it gives us no Idea of the *State*, since the State is a mechanical thing, any more than it gives us an Idea of a *machine*. Only something that is an objective [*Gegenstand*] of *freedom* is called an *Idea*. So we must go even beyond the State – for every State must treat free men as cogs in a machine; and this it ought not to do; so it must *stop*. It is self-evident that in this sphere all the Ideas, of perpetual peace etc., are only *subordinate* Ideas under a higher one. At the same time I shall here lay down the principles for a *history of mankind*, and strip the whole wretched human work of State, constitution, government, legal system – naked to the skin. Finally come the Ideas of a moral world, divinity, immortality – uprooting of all superstition, the prosecution of the priesthood which of late poses as rational, at the bar of Reason itself. – Absolute freedom of all spirits who bear the intellectual world in themselves, and cannot seek either God or immortality outside themselves.

[4] Last of all the Idea that unites all the rest, the Idea of *beauty* taking the word in its higher Platonic sense. I am now convinced that the highest act of Reason, the one through which it encompasses all Ideas, is an aesthetic act, and that *truth and goodness only become sisters in beauty* – the philosopher must possess just as much aesthetic power as the poet. Men without aesthetic sense is what the philosophers-of-the-letter of our times [*unsre Buchstabenphilosophen*] are. The philosophy of the spirit is an aesthetic philosophy. One cannot be creative [*geistreich*] in any way, even about history one cannot argue creatively – without aesthetic sense. Here it ought to become clear what it is that men lack, who understand no ideas – and who confess honestly enough that they find everything obscure as soon as it goes beyond the table of contents and the index.

[5] Poetry gains thereby a higher dignity, she becomes at the end once more, what she was in the beginning – the *teacher of mankind*; for there is no philosophy, no history left, the maker's art alone will survive all other sciences and arts.

[6] At the same time we are told so often that the great mob must have a *religion of the senses*. But not only does the great mob need it, the philosopher needs it too. Monotheism of Reason and heart, polytheism of the imagination and of art, this is what we need.

[7] Here I shall discuss particularly an idea which, as far as I know, has never occurred to anyone else – we must have a new mythology, but this mythology must be in the service of the Ideas, it must be a mythology of *Reason*.

[8] Until we express the Ideas aesthetically, i.e. mythologically, they have no interest for the *people*, and conversely until mythology is rational the philosopher must be ashamed of it. Thus in the end enlightened and unenlightened must clasp hands, mythology must become philosophical in order to make the people rational, and philosophy must become mythological in order to make the philosophers sensible [*sinnlich*]. Then reigns eternal unity among us. No more the look of scorn [of the enlightened philosopher looking down on the mob], no more the blind trembling of the people before its wise men and priests. Then first awaits us *equal* development of *all* powers, of what is peculiar to each and what is common to all. No power shall any longer be suppressed for universal freedom and equality of spirits will reign! – A higher spirit sent from heaven must found this new religion among us, it will be the last [and] greatest work of mankind.

VB

Landscape and the Picturesque

1 William Shenstone (1714–1763) ‘Unconnected Thoughts on Gardening’

Besides being a poet and patron of art (see IVA1), Shenstone played a prominent part in the eighteenth-century English landscape-gardening movement. From the mid-1740s much of his effort was devoted to landscaping the family estate at the Leasowes in Shropshire, turning it into a *ferme ornée* (ornamental farm), offering a series of picturesque views over fields and waterways. Thomas Whately, author of *Observations on Modern Gardening* (1770), described the Leasowes as like Shenstone’s mind, ‘simple, elegant and amiable’. That is to say, it was an evocation of an arcadian landscape, and as such a departure from the formality of the prevailing neo-classical style. Shenstone drew on landscape descriptions by Virgil and Milton, as well as the classical landscape painting of Poussin and Claude, to produce varied prospects of the kind he approved in his ‘Unconnected Thoughts on Gardening’. Shenstone considers the landscape painter to be the best potential composer of a garden, and uses Montesquieu’s description of the avenue between Moscow and St Petersburg (see IIIB7) to exemplify what the English landscapist was to avoid. The point is, so to speak, that art should become natural, rather than that nature should be forced into the regularity of art (see also VB13–15). Yet for all that, Shenstone is scarcely a proto-romantic. Though he is critical of too much regularity and order, his sense of a humane variety is still nourished by the classical tradition; the gothic remains a step too far. ‘Unconnected Thoughts on Gardening’ was published in *The Works in Verse and Prose of William Shenstone* in two volumes, London: R. and J. Dodsley, 1764. Our extracts are taken from volume II, pp. 128–43.

In designing a house and gardens, it is happy when there is an opportunity of maintaining a subordination of parts; the house so luckily placed as to exhibit a view of the whole design. I have sometimes thought that there was room for it to resemble an epick or dramattick poem. It is rather to be wished than required, that the more striking scenes may succeed those which are less so.

Taste depends much upon temper. Some prefer Tibullus to Virgil, and Virgil to Homer – Hagley to Persfield, and Persfield to the Welsh mountains. This occasions the different preferences that are given to situations – A garden strikes us most, where the grand, and the pleasing succeed, not intermingle, with each other.

I believe, however, the sublime has generally a deeper effect than the merely beautiful.

I use the words *landskip* and *prospect*, the former as expressive of home scenes, the latter of distant images. Prospects should take in the blue distant hills; but never so remotely, that they be not distinguishable from clouds. Yet this mere extent is what the vulgar value.

Landskip should contain variety enough to form a picture upon canvas; and this is no bad test, as I think the *landskip* painter is the gardiner's best designer. The eye requires a sort of ballance here; but not so as to encroach upon probable nature. A wood, or hill, may ballance a house or obelisk; for exactness would be displeasing. We form our notions from what we have seen; and though, could we comprehend the universe, we might perhaps find it uniformly regular; yet the portions that we see of it, habituate our fancy to the contrary.

It is not easy to account for the fondness of former times for strait-lined avenues to their houses; strait-lined walks through their woods; and, in short, every kind of strait-line; where the foot is to travel over, what the eye has done before. This circumstance, is one objection. Another, somewhat of the same kind, is the repetition of the same object, tree after tree, for a length of way together. A third is, that this identity is purchased by the loss of that variety, which the natural country supplies every where; in a greater or less degree. To stand still and survey such avenues, may afford some slender satisfaction, through the change derived from perspective; but to move on continually and find no change of scene in the least attendant on our change of place, must give actual pain to a person of taste. For such an one to be condemned to pass along the famous vista from Moscow to Petersburg, or that other from Agra to Lahor in India, must be as disagreeable a sentence, as to be condemned to labour at the gallies. [. . .]

Let us examine what may be said in favour of that regularity which Mr. Pope exposes. Might he not seemingly as well object to the disposition of an human face, because it has an eye or cheek, that is the very picture of it's companion? Or does not providence who has observed this regularity in the external structure of our bodies and disregarded it within, seem to consider it as a beauty? The arms, the limbs, and the several parts of them correspond, but it is not the same case with the thorax and the abdomen. I believe one is generally sollicitous for a kind of ballance in a *landskip*, and, if I am not mistaken, the painters generally furnish one: A building for instance on one side, contrasted by a group of trees, a large oak, or a rising hill on the other. Whence then does this taste proceed, but from the love we bear to regularity in perfection? After all, in regard to gardens, the shape of ground, the disposition of

trees, and the figure of water, must be sacred to nature; and no forms must be allowed that make a discovery of art. [...]

Art should never be allowed to set a foot in the province of nature, otherwise than clandestinely and by night. Whenever she is allowed to appear here, and men begin to compromise the difference – Night, gothicism, confusion and absolute chaos are come again. [...]

Art, indeed, is often requisite to collect and epitomize the beauties of nature; but should never be suffered to set her mark upon them: I mean in regard to those articles that are of nature's province; the shaping of ground, the planting of trees, and the disposition of lakes and rivulets. [...]

Why, fantastically endeavor to humanize those vegetables, of which nature, discreet nature thought it proper to make trees? Why endow the vegetable bird with wings, which nature has made momentarily dependent upon the soil? Here art seems very affectedly to make a display of that industry, which it is her glory to conceal. The stone which represents an asterisk, is valued only on account of it's natural production: Nor do we view with pleasure the laboured carvings and futile diligence of Gothic artists. We view with much more satisfaction some plain Grecian fabric, where art, indeed, has been equally, but less visibly, industrious.

2 William Gilpin (1724–1804) 'The Principles of Painting considered, so far as they relate to prints'

William Gilpin was a clergyman, schoolteacher and amateur artist who became a leading theorist of the Picturesque movement. The following excerpt is taken from the first chapter of his *Essay upon Prints, containing remarks upon the Principles of picturesque Beauty; the Different Kinds of Prints; and the Characters of the most noted Masters*. . . Prints were the principal means of reproduction of paintings and drawings before the invention of photography and were also potentially collectable works of art in their own right. In this, his first substantial publication, Gilpin married his appreciation of prints to his reading in standard aesthetic treatises to establish general principles for an understanding of the 'picturesque'. At this stage in the development of his ideas, many of his points of reference were drawn from the established canon of paintings, Raphael's often-cited tapestry cartoons providing the majority of examples for his first chapter. In a context of debate largely conditioned by Burke's *Essay on the Sublime and the Beautiful*, published in 1757 (IIB6), 'the picturesque' added a third term to those apparently required in establishing standards of taste. While a given scene might appear neither beautiful nor sublime to the ordinary perception, it might nevertheless provide material attractive to the eye of the painter or to the connoisseur of pictures. Of course, what then counted as picturesque in nature would be likely to be influenced by taste in paintings. Gilpin more than any other English writer was responsible for shifting the reference of the picturesque away from the classically harmonious landscape as represented by Poussin and for redefining it in terms of the rough, the rugged and the unshaped. His work is thus significant of a substantial shift in taste in the later eighteenth century, coinciding with Gainsborough's attempts to gain recognition for

pictures of rural scenes and subjects. In the end, however, Gilpin's most sustained influence was derived from his subsequent use of the picturesque as a category in the analysis and appreciation of natural scenery (see VB5, 11). The theme of the picturesque was taken up by Reynolds and by Uvedale Price and Richard Payne Knight (see VB13–15). The *Essay upon Prints* . . . was originally published anonymously, London: J. Robson, 1768 (though in a preface to the second edition Gilpin claimed that it had been written fifteen years earlier). It was translated into German in the year of its first publication and went through several editions in English. Our excerpts are taken from the second edition of 1768, pp. 1–8 and 15–21.

A Painting, or picture, is distinguished from a print only by the colouring, and the manner of execution. In other respects, the foundation of beauty is the same in both; and we consider a print as we do a picture, in a double light, with regard to the *whole*, and with regard to its *parts*. It may have an agreeable effect as a *whole*, and yet be very culpable in its *parts*. It may be likewise the reverse. A man may make a good appearance upon the *whole*; tho his *limbs*, examined separately, may be wanting in exact proportion. His *limbs*, on the other hand, may be exactly formed, and yet his person, upon the *whole*, disgusting.

To make a print agreeable as a *whole*, a just observance of those rules is necessary, which relate to *design, disposition, keeping*, and the *distribution of light*: to make it agreeable in its *parts*, of those which relate to *drawing, expression, grace*, and *perspective*.

We consider the whole before its parts, as it naturally precedes in practice. The painter first forms his general ideas; and disposes them, yet crude, in such a manner, as to receive the most beautiful form, and the most beautiful effect of light. His last work is to finish the several parts: as the statuary shapes his block, before he attempts to give delicacy to the limbs.

By *design*, (a term which painters sometimes use in a more limited sense) we mean the general conduct of the piece as a representation of such a particular story. It answers, in an historical relation of a fact, to a judicious choice of circumstances, and includes a *proper time, proper characters, the most affecting manner of introducing those characters, and proper appendages*.

With regard to a *proper time*, the painter is assisted by good old dramatic rules; which inform him, that *one* point of time only should be taken – the most affecting in the action; and that no other part of the story should interfere with it. [. . .]

With regard to *characters*, the painter must suit them to his piece by attending to historical truth, if his subject be history; or to heathen mythology, if it be fabulous.

He must farther *introduce them properly*. They should be ordered in so advantageous a manner, that the principal figures, those which are most concerned in the action, should catch the eye *first*, and engage it *most*. This is very essential to a well-told story. In the first place, they should be the least embarrassed of the group. This alone gives them distinction. But they may be farther distinguished, sometimes by a *broad light*; sometimes by a *strong shadow*, in the midst of a light; sometimes by a remarkable *action, or expression*; and sometimes by a combination of two or three of these modes of distinction.

The last thing included in *design* is the use of *proper appendages*. By *appendages* are meant animals, landskip, buildings, and in general, what ever is introduced into the piece by way of ornament. Every thing of this kind should correspond with the subject, and rank in a proper subordination to it. . . . We often see a landskip well adorned with a story in miniature. The *landskip* here is principal; but at the same time the figures, which tell the story, tho subordinate to the landskip, are the *principal figures*. . . .

When all these rules are observed, when a proper point of time is chosen; when characters corresponding with the subject are introduced, and these ordered so judiciously as to point out the story in the strongest manner; and lastly, when all the appendages, and underparts of the piece are suitable, and subservient to the subject, then the story is well told, and of course the *design* is perfect.

The second thing to be considered with regard to a *whole*, is *disposition*. By this word is meant the art of grouping the figures, and of combining the several parts of a picture. *Design* considers how each part, *separately taken*, concurs in producing a *whole* – a *whole*, arising from the *unity of the subject*, not the *effect of the object*. For the figures in a piece may be so ordered, as to tell the story in an affecting manner, which is as far as *design* goes, and yet may want that agreeable *combination*, which is necessary to please the eye. To produce such a combination is the business of *disposition*. In the cartoon of St. Paul *preaching at Athens*, the *design* is perfect; and the characters in particular, are so ordered, as to tell the story in a very affecting manner: yet the several parts of the picture are far from being agreeably combined. If Rubens had had the *disposition* of the materials of this picture, its effect as a *whole* had been very different.

* * *

A third thing to be considered in a picture, with regard to a *whole*, is *keeping*. This word implies the different degrees of strength and faintness, which objects receive from nearness and distance. A nice observance of the gradual fading of light and shade contributes greatly towards the production of a *whole*. Without it, the distant parts, instead of being connected with the objects at hand, appear like foreign objects, wildly introduced, and without meaning. Diminished in *size* only, they put you in mind of Lilliput and Brobdignag united in one scene. *Keeping* is generally found in great perfection in Della Bella's prints: and the want of it as conspicuously in Tempesta's.

Nearly allied to *keeping* is the doctrine of *harmony*, which equally contributes towards the production of a *whole*. In *painting*, it has amazing force. A judicious arrangement of according tints will strike even the unpracticed eye. The *effect* of every picture, in a great measure, depends on one principal and master-tint, which, like the key-tone in music, prevails over the whole piece. Sometimes the purple tint is chosen: sometimes the mellow, brown one; and in some subjects the greenish hue is most proper. Of this ruling tint, whatever it is, every object in the picture should in a degree participate. This theory is founded on principles of truth, and produces a fine effect from the *harmony*, in which it unites every object. Harmony is opposed to gaudy colouring, and glare. Yet the skilful painter fears not, when his subject allows it, to employ the greatest variety of tints; and tho he may depreciate their value in shadow, he will not scruple, in his lights, to give each its utmost glow. His art lies

deeper. He takes the glare from one vivid tint by introducing another; and from a nice assemblage of the brightest colours, each of which alone would stare, he creates an united glow, in the highest degree harmonious. He resolves even the most discordant tints into union, and makes them subservient to his grand effect; as the able musician will often dare to introduce notes foreign to his key, and even from apparent discord derive exquisite harmony. But these great effects of harmony are only to be produced by the magic of colours. The harmony of a print is a more simple production: and yet unless a print be harmonized by the same *tone of shadow*, if I may so express myself, there will always appear a great deficiency in it. By the same *tone of shadow*, I mean not only the *same manner* of execution, but an *uniform* degree of strength. We often meet with hard touches in a print, which, standing alone, are unharmonious; but when every contiguous part is touched up to that *tone*, the effect is harmony. – *Keeping* then proportions a proper degree of strength to the near and distant parts, in respect to *each other*. *Harmony* goes a step farther, and keeps each part quiet, with respect to itself, and the *whole*. I shall only add, that in sketches, and rough etchings no *harmony* is expected: it is enough, if *keeping* be observed. *Harmony* is looked for only in finished compositions. If you would see the want of it in the strongest light, examine a worn-print, harshly retouched by some bungler.

The last thing, which contributes to produce a *whole*, is a proper *distribution of light*. This, in a print especially, is most essential. An harmony in the colouring may, in some measure, supply its place in painting; but a print has no succedaneum. Were the *design*, *disposition*, and *keeping* ever so perfect, beautiful, and just, without this essential, instead of a whole, we should have only a piece of patch-work. Nay, such is the power of *light*, that by an artificial management of it we may even harmonize a bad disposition.

The general rule, which regards the distribution of *light*, is, that it should be spread in *large masses*. This gives the idea of a *whole*. Every grand object catches the light only upon one large surface. Where the light is in spots, we have the idea of several objects; or at least of an incoherent one, if the object be single; which the eye surveys with difficulty. It is thus in painting. When we see, upon a *comprehensive* view, *large masses* of light and shade, we have, of course, the idea of a *whole* – of *unity* in that picture. But where the light is scattered, we have the idea of several objects, or at least of one broken and confused. Titian's known illustration of this point by a bunch of grapes is beautiful, and explanatory. When the light falls upon the *whole bunch* together (one side being illumined, and the other dark) we have the representation of those large masses, which constitute a *whole*. But when the grapes are stripped from the bunch, and scattered upon a table (the light shining upon each separately) a *whole* is no longer preserved.

3 Salomon Gessner (1730–1788) 'Letter on Landscape Painting'

Salomon Gessner was born in Zurich, where his father was a bookseller. At the age of 19 he went to Berlin to study his father's trade, but returned to Zurich in 1750 to devote himself to writing, painting and engraving. His first written works were published at this

time and he subsequently achieved enormous success with his finely wrought prose descriptions of pastoral life. His collection of *Idylls* (1756 and 1772) was the most popular German book in Europe prior to Goethe's *Sorrows of Young Werther* and his epic prose poem *The Death of Abel* (1758), which mounted a moral critique of civilization, was widely translated into other European languages. Despite his literary success, Gessner retained his interest in the visual arts. He took up the study of painting and engraving with renewed vigour after 1757 when his friendship with his future wife, Judith Heidegger, gave him access to her father's art collection. His 'Letter on Landscape Painting' records his own evolution as a landscape painter and details the method he pursued to acquire the appropriate skills. It was frequently reprinted and exercised a considerable influence on artists such as Ferdinand Kobell and Johann Christian Reinhart, who were seeking to combine the achievements of the Dutch and Italian schools of landscape painting. The English painter John Constable is recorded as giving it his careful attention in 1816. Gessner himself achieved a certain renown as a painter and etcher, receiving praise from the art theorist and connoisseur, Christian Ludwig Hagedorn. The artists mentioned by Gessner in the text include: Antonie Waterloo (Dutch, c.1610–90), Herman van Swaneveld (Dutch, c.1600–55), Nicolaes Berchem (Dutch, 1620–83), Salvator Rosa (Italian, 1615–73), Felix Meyer (Swiss, 1653–1715), Johann Ermels (German, 1641–93), Jacob Philipp Hackert (German, 1737–1807), Claude Lorrain (French, 1600–82), Philips Wouerman (Dutch, 1619–68), Allaert van Everdingen (Dutch, 1621–75), Christian Dietrich (German, 1712–74), and Matthäus Merian (Swiss, 1593–1650). The addressee of the letter is the Swiss art historian, Johann Casper Füßli. Gessner's *Brief über die Landschaftsmahlerey* was first published as part of the preface to the third volume of his *Geschichte der besten Künstler in der Schweiz* (Zurich: Gessner, 1770). It was frequently reprinted in Gessner's own lifetime and was added to the 1772 edition of his *Idylls*. The following English translation by M. J. Hope is taken from *The Death of Abel in Five Books, Attempted from the German of Mr Gessner*, London: T. Heptinstall, 1797, pp. 235–49.

You think then, sir, that I may be entertaining, perhaps even useful, by pointing out the route I have taken to attain some proficiency in the arts of design, in an age but little favourable to great success. It certainly is to be wished that a project of this kind had been executed by some celebrated artists. What advantage should we not reap from an history of painters, if, with the events of their lives, it contained an account of the progress of their talents? We shou'd there see the different routes that lead to the same end; the obstacles there are to encounter, and the means of surmounting them; the developement of science, relative to the display of genius, and to the observations that arise from practice. Now, if these sorts of details had been wrote by the artists themselves, they wou'd undoubtedly have presented that important and useful truth, and that engaging entertainment which constantly attend it.

Perhaps, it is true, we shou'd not find in these simple recitals those profound researches which they labour to make, who descant on arts they never practise; but they who practise them would there find the resources and informations that experience alone can give.

Thus, the work of Lairese, so useful to young practitioners, has justly acquired him the title of benefactor to those arts his labours have adorn'd. Thus, also, the work of Mengs may assist his rivals to equal him, by affording more opportunity for reflection, in a few lines, on the principles of painting, than is to be found in large works. If he sometimes give us occasion to wish that he had been more perspicuous as

a philosopher, what amends does he not make us as an artist, when he explains his method of proceeding, and his principles, and makes us admire the energy, the pure taste, and refined art which we ought to expect from him whom his cotemporaries call the Raphael of his age.

May I be permitted to descend to myself, after having soar'd thus high? Shall I dare to fulfil my promise? I, who have advanced only a few paces in the career, and, perhaps, shall find myself stopp'd by compulsive circumstances and occupations. But I am engaged. It is in the name of friendship, and friendship shall be my excuse.

You know that fortune did not seem to have intended me for the practice of painting. A natural inclination, however, shewn in early youth by continual essays, seem'd to indicate that Nature, in this matter, did not agree with those circumstances of situation that depend not on her. I drew, therefore, in my infancy, all objects that occur'd, without being then able to guess what this disposition meant, and without an attention being paid to it sufficient to render it useful. I made no progress, my taste declined, and my choicest days pass'd away; but the beauties of nature, and the excellent imitations of that grand model, made incessantly the most vivid impressions on my mind. I had abandon'd the pencil; a secret impulse made me take up the pen, and, by the aid of that which appear'd to me to have less difficulty in the practice, I imitated artless scenes and picturesque beauties; in a word, the charms of Nature that struck me most.

A select collection, however, that belonged to my father-in-law, awaken'd in me the passion for drawing; and, toward my thirtieth year, I attempted to deserve, in this sort of imitation, the indulgence, and if it might be, the approbation of artists and connoisseurs.

My natural inclination led me to landscapes; I sought with ardour, the means of satisfying my desire, and embarrassed in the route I should take, I said to myself; there is but one model, there is but one master; and I determined to draw after Nature. But I soon found, that this great and sublime master does not explain himself clearly but to those that have learnt to comprehend him. My precision in following him everywhere led me astray. I lost myself in those minute details that destroy the effect of the whole. I had not catch'd that manner which, without being servile or slight, expresses the true character of objects. My trees were dryly design'd, and not detach'd in masses. The whole was disturbed by a labour without taste. In a word, my eye, confined too closely to one point, was not accustomed to embrace a large extent. I was ignorant of that address which adds to or diminishes in the parts that art cannot equal. My first progress, therefore, was to discern what I was not able to perform; the second was, to have recourse to the great masters, and to the principles they have established by their precepts and their works; and is not this the natural progress in all arts? The first who practised them fell into that dryness with which they are reproach'd, by a too great accuracy in imitating nature, whose beauties they consider'd too much in detail. In fact, these details are executed by our first painters in a manner sufficiently finish'd, as well in the subordinate objects as in the most striking parts. They that follow'd them remark'd these defects, and discovered that a characteristic imitation was more interesting than an imitation of parts. The ideas of masses, of effects and disposition, offer'd themselves; these ideas produced principles, and the great painters have aim'd at a general effect, as the poets have at a principal object.

I employed myself, therefore, in studying the great masters, in distinguishing them from each other; and, above all, in attaching myself to the best works only; for I perceived, that in the study of model, the most prejudicial quality is mediocrity. The bad strike and disgust; but those that are not good, nor absolutely bad, deceive us by offering a flattering and dangerous facility. It is for this reason that engraving, which may contribute to the progress of the arts, when it is employ'd on subjects that are judiciously chosen; and, in copying them justly, may become prejudicial by the indifferent works it multiplies without number. How many productions of that art have required the labour of a year, and do not deserve a moment's attention! But let Raphael be copy'd by skilful engravers, let a young artist profit by his labours, and works, without dignity and expression, will soon become intolerable to him; he will perceive to what an elevation the excellence of the art can raise him. The way to know and to avoid mediocrity, is by the study and imitation of beautiful productions; or, in want of them, of the most finished translations that have been made from them – for so we may call beautiful prints. Let a young draughtsman study the heads of Raphael, and he will not see without disgust, the sordid figures of indifferent painters. But if you first feed him with those insipid substances, he will soon lose the taste necessary to relish the excellence of Antinous and Apollo. In the one case, he will advance firmly in his career; in the other, he will continually totter, and even not be sensible of his own weakness.

It was from these reflections, that, following the steps of the masters, I dared to form a method of my own. My first precept was to pass from one principal part to another, without staying to attempt at once the numberless details that I perceiv'd in each of them. By this method I accustomed myself to design, or rather dispose the trees in masses, chusing Waterloo for my model; and the more I studied this artist, the more I found in his landscapes the true character of nature; and the more that discovery struck me, the more pleasure I found in imitating him: so that it was to him I owed at last the felicity of expressing my own ideas, but it was by borrowing his style. Then, to avoid what they call a manner, I ventured to insert more variety in my studies, and to associate with my first master those artists whose tastes differ from his; but who, at the same time, have, like him, nature and truth for their object.

Swanefeld and Berchem, by turns, presided over my labours. Like the bee, I search'd honey from many flowers. I consulted, I imitated – and, returning to nature, wherever I found a tree, a trunk, or foliage, that attracted my regard, that fix'd my attention, I made a sketch of it, more or less finish'd. By this method, I join'd to facility the idea of character, and I form'd a manner that became more personal to me. It is true, an original inclination frequently brought me back to my first guide; I return'd to Waterloo, when the disposition of the trees was to be regulated; but Berchem and Salvator Rosa obtain'd the preference in disposing the grounds, and characterising the rocks. Meyer, Ermels, and Hakert assisted me in distinguishing the truth of nature, and Lorrain instructed me in a bappy choice of vistas, and a fine harmony of the grounds. I learnt, by studying him, to imitate the verdure of the fields, the soft distances, and admirable gradations, by the secret artifice of their shades. To conclude – I had recourse to Wouermans for those light and sweet transient scenes that, illuminated with a moderate light, and cover'd with a tender verdure, have no defect, but the appearing sometimes too tufted.

Thus passing from various imitations to continual reflections, and then returning to nature, I found, at last, that my efforts became less laborious. The principal masses and forms laid themselves open to my sight. Effects, that I had not perceiv'd, struck me. I was at last able to express, by a single stroke, what art cou'd not detail without prejudice. My manner became expressive. How often, before this first progress, have I search'd, without finding them, objects favourable to imitation; and how often did they present themselves to my sight! Not, however, that every view, or every tree, contains all that picturesque beauty I sought after; but my experienced eye no longer beheld objects without distinguishing forms that pleased me, or characters that fix'd my attention. I saw no shade that had not some branch well disposed, some mass of foliage agreeably group'd, some part of a trunk whose singularity was not striking. A detach'd stone gave me the idea of a rock; I exposed it to the sun in the point of view that best agreed with my design, gave it in my mind a proportionable larger extent, and then discover'd the most brilliant effects in the clare obscure, the demi-tints, and the reflections. But when, in this manner, we investigate our subjects in nature, we shou'd take care not to let them lead us away by their singularity. Let us seek for the beautiful and noble in the forms, and manage with taste those that are merely fantastic. It is the idea of a noble simplicity in nature that must moderate a flight that wou'd carry the artist to a taste for the marvellous, to exaggeration, perhaps even to chimeras; and lead him away from that probability in which the truth of imitation consists.

With regard to the manner in which I executed my studies, they were not finished drawings, nor mere sketches. The more interesting any part of my subject appear'd, the more I finish'd it at the first attempt.

There are painters who content themselves with making, in haste, a mere sketch of a finish'd picture that nature presents them, and lay it aside to be finish'd at leisure. What is the consequence? Their accustomed manner takes place of the idea too lightly impress'd on the mind; the characteristic of the object disappears, and is lost. What can supply this? Neither the magic of the colouring, nor the effects of the clare obscure; they may amuse for a moment, but the critical eye will search for the true and natural, and, finding it not, will turn away from the work with disdain.

But when I wou'd have used my studies, made after nature, in the invention of a whole, I found myself embarrassed and intimidated. I fell into factitious details which wou'd not agree with the simplicity and truth of those parts I had taken from nature. I cou'd not find in my landscapes the great, the noble, the harmonious, and the striking effect of the whole. I was, therefore, obliged to have recourse to those masters who appear'd to me to excel in composition.

Everdinghen, whom I have not yet mentioned, frequently presented me with that rural simplicity, which pleases even in those countries where reigns the greatest variety. In his works I found impetuous torrents, rocks broken and cover'd with the thickest brambles, and rustic spots, where poverty finds a happy retreat in the most simple cottage. Though his bold and spirited touches were capable of inspiring me, I did not think that he was the only one whose example I should follow. It even appear'd to me not unprofitable to have learnt, before imitating him, to paint rocks in a better style. Dietrich taught me. The pieces he has composed of this kind are such, that one wou'd say they are Everdinghen's; but he has surpass'd himself.

Swanefeld, in his turn, offer'd me the dignity of ideas. I admired the prodigious effect of his execution, and that of his reflected lights, which dart in so striking a manner on the large masses of shades. Salvator Rosa often attracted me by the warmth and fury of his genius. Rubens, by the boldness of his compositions, by the brilliancy of his colours, and by the choice of his subjects. But the two Poussins, and Claud Lorrain, at last possess'd me entirely. It was in their works that I found dignity and truth united. Not a simple and servile imitation of nature, but a choice of the most sublime and interesting beauty. A poetic genius united in the two Poussins all that is great, all that is noble. They transport us to those times for which history, and especially poetry, fill us with veneration; into those countries where nature is not savage, but surprising in her variety; where, under the most happy sky, every plant acquires its utmost perfection. The buildings that adorn the pictures of those celebrated artists are in the true taste of the antique architecture. The figures have a noble air, and a firm attitude. It is thus the Greeks and Romans appear to us, when our imagination, render'd enthusiastic by their great actions, transports itself to the ages of their prosperity and glory. Repose and amenity reign throughout all the countries the pencil of Lorrain has created. The mere view of his pictures excites that sweet emotion, those delicious sensations that a well-chosen prospect has the power to produce in the mind. His fields are rich without confusion, and variegated without disorder; every object presents the idea of peace and prosperity; we continually behold a happy soil that pours its bounteous gifts on the inhabitants; a sky serene and bright, under which all things spring forth, and all things flourish.

Not content to fill my mind with the principles and beauties that the works of these great masters of the art presented me, I endeavour'd to draw from my memory, the principal parts that had struck me in these beautiful models. I sometimes copy'd one of their works, and I preserve these essays, as they bring to my mind the route I took, and the guides that conducted me to it. By forming this method, I have acquired the useful habit of tracing, in order to remember them the better, the compositions and plans of those works that have particularly engaged my attention. Perhaps this labour may be thought superfluous, as the engravings made after those beautiful pictures contain their exact representations. But the pains I have taken in copying them myself has imprinted a more durable idea on my mind. How many collections of prints and drawings resemble those large libraries, whose possessors reap not the least advantage from them!

I found, however, that when I apply'd myself too long in meditating on the masters I had chosen, a too great timidity. When I wou'd invent, overcharg'd, so to say, with the great ideas of the celebrated artists, I felt my weakness, and humbled by my want of strength, I perceiv'd how difficult it was to equal them. I observ'd how much a too continued imitation weakens the flight of fancy. Of this the celebrated Frey is an instance; and the greatest part of engravers confirm this observation. In reality, their own compositions are in general the most indifferent part of their works. Incessantly employed in expressing the ideas of others, and obliged to copy them with the most scrupulous exactitude, that boldness, that warmth of imagination, without which there can be no invention, is either enfeebled, or totally lost. Startled by these reflections, I abandon'd my originals, I left my guides, and deliver'd myself up to my own ideas. I prescrib'd myself subjects, and laid down problems for my solution,

and I thus endeavour'd to find out what might best agree with my feeble talents. I remark'd what I found most difficult, and discover'd to what studies I must for the future apply my greatest attention. Then the difficulties began to disappear. My courage increased. I perceiv'd that my imagination was extended by perseverance. Wretched are the artists and poets who are the servile copiers of their models; they resemble the shadow that follows the body in its most trifling movements. I took care, however, not to forsake the practice of copying from nature, a sketch, or memorandum of any thing singular, striking, or agreeable. Constantly furnish'd with the necessary apparatus, and always attentive to every object that occur'd, I was not ashamed to retire a moment in order to fill my tablets. A picture, a print, a view, an effect, a group, an aspect, all paid me tribute, and my sketches, or drawings, were a sort of cypher, that recall'd to my mind those ideas whose rapid and slight impressions wou'd have been otherwise infallibly lost. A thought conceiv'd in the first warmth, an effect with which we are struck at the first view, is never so well express'd as by the strokes that are drawn at that instant. In these first emotions, so important to be seized, a happy thought will not produce mediocrity merely. What poet has not sometimes conceiv'd a good verse, of which an indifferent one has given him the idea! The latter was a rough diamond, which he polished. The works of Merian, to which sufficient justice is not done, contain the most happy choice of truths taken from nature; what then can disguise their merit? The insipid tone of the execution. Give to his trees and his grounds the legerity of Waterloo; insert among his rocks, and the whole of his compositions, more variety, and you will see brilliant effects arise, whose splendour and harmony will do honour to genius, and of which the disposition and groundwork are all to be found in Merian.

But it is not sufficient to have always before our eyes both nature, and the finish'd works of the great masters. We shou'd also read the history of the art, and of the artists. This reading will extend the circle of our knowledge, and render us attentive to the different revolutions that have arrived in the empire of the arts. It will lead those who exercise the arts, to employ themselves more vigorously to what should be their principal object. How can we refrain from being interested in the fate of a man whose talents we admire? How can we avoid searching after, and beholding with attention, the works of a man whose character and fate has affected us? Can we perceive the veneration with which they talk of the great artists, and their immortal works, without conceiving the highest idea of the importance of the art? Can we be informed of the indefatigable ardour with which they labour'd to attain perfection, without being unconcern'd at the pains we have taken? Even their defects instruct us, and their misfortunes endear them to us.

But since I have digressed from the practice of the art, to theoretic ideas, and have indicated the means of improving the imagination, and elevating the genius, I must here recommend to the young artists the reading of the good poets. What can be of more use in refining their taste, exalting their ideas, and enriching their imagination? The poet and the painter, friends and rivals, draw from the same source; they both borrow from nature, and communicate their riches by rules that are analogous: variety without confusion. That is the grand principle of all their compositions. In short, the same delicacy of sensation and taste shou'd guide them in the choice of circumstances and images, the detail and the whole. How many artists wou'd be more

happy in their choice, how many poets wou'd put more truth in their pictures, and be more picturesque in their expressions, if the one and the other knew how to unite a profound knowledge of the two arts.

* * *

4 Salomon Gessner (1730–1788) and Konrad Gessner (1764–1826) Exchange of letters on landscape painting

Salomon Gessner's son, Konrad, was born in Zurich and from any early age he pursued his father's interests in painting and etching. In 1784 he travelled to Dresden to continue his studies under the Swiss artist, Adrian Zingg (1734–1816). At this time, Dresden had become a leading centre for landscape painting in Germany, attracting artists such as Anton Graff (1736–1813) and Johann Christian Klengel (1751–1824). Konrad Gessner left Dresden in 1786 and travelled to Rome before returning to Zurich. He enjoyed a successful career as a painter of landscapes and horse pictures, submitting works to the Royal Academy in London and living for a period in Scotland. The publication of this exchange of letters with his father provides an intimate glimpse into the practice of landscape painting pursued in Dresden at the time. It also reveals the existence of an interested public audience. The 'painter's mirror' described in one of the letters (sometimes known as a 'Claude glass') was a small tinted convex mirror which was used to give a painterly quality to the landscape by simplifying and reducing the colour and tonal range of the scene it reflected. The letters were first published by Salomon Gessner as *Briefwechsel mit seinem Sohne* in Berne in 1801. The following excerpts are taken from the English translation, *The Letters of Gessner and his Family*, London: Vernor and Hood, 1804, pp. 27–8, 40–6, 50–1, 112–16.

K. Gessner to his parents.

Dresden, July 29, 1784.

We returned yesterday from a little excursion to Hohenstein. It was a little tour, which four artists besides myself agreed to make for the purpose of sketching from nature. This country, covered with wood and intersected with mountains, is quite a paradise for landscape painters. Every step offers a romantic, or at least an interesting scene. At every turn you meet with a picturesque rock, or a pretty cottage, or a fine tree; and the ruins, which are scattered over the country, add a fresh charm by the great variety of objects. It is impossible to draw from nature here without having permission expressly for that purpose; and to this circumstance, which was very unpleasant in itself, we owe the satisfaction of becoming acquainted with the bailiff, who is a very amiable man; and the inhabitants, where we took up our quarters, shewed us every possible kindness. We made a rich harvest in this journey; and though all were equally industrious, each found time to contribute to the amusement of the rest of the party. Our return was attended with some whimsical circumstances. We did not limit ourselves to any hour, and even the bad weather, which overtook us, had no influence over our spirits. When we arrived at Königstein we were condemned to pass the night in a hayloft; we were wet to the skin, and the wind hlew in

at every corner. Entertaining no hopes of getting any sleep in this situation, we endeavoured to dissipate our sorrows by acting a play: this was sufficient to confirm our landlord in the suspicion he had already formed, that we were actors. The report was soon spread through the country, and, during the whole of our voyage on the Elbe, the people ran in crowds to see us, whenever we stopped. I believe too, that I had the honour to be taken for the Punch of the party, for all the children seemed to view me with particular satisfaction. I intend shortly to return to that spot with all my apparatus, that I may paint from nature.

* * *

K. Gessner to his Parents.

Dresden, September 5, 1784.

[...] I begin to dispose of my time so economically, that I think I can now give a tolerable account of myself. The proofs you give me of your satisfaction inspire me with the wish to deserve it more every day, by employing every moment to advantage. I will give you a sketch of my daily occupations. I begin by reading; then, after hastily taking a dish of coffee, I arrange my room, and employ myself in painting till the gallery opens. When I leave the latter, I go into the country to draw from nature, or return home to continue my painting. Now, that I am so fully aware of the importance of studying from nature, how much I regret having neglected those beauties, which Sihlwald and other delightful spots in my own country, daily presented to my eyes.

I have made some sketches in chalk, and a great number in colours; but the gallery has occupied so much of my time, that I have not yet been able to finish any. M. Graaf is of opinion, that it is useful to begin many things at once, and to finish them afterwards successively. I find this an excellent method, for, by fixing the attention a long time on the same object, we often fall into a style quite different from that, which was at first intended. When the gallery closes, I shall have sufficient leisure to finish what I have begun.

My room is already entirely covered with my works. The first picture, I painted here, represents a cannon on its carriage, and near it some peasants' horses with their saddles and harness; the second picture, four horses drinking at a cistern, and some grooms standing by them. These two are only sketches, done very hastily, but M. Graaf was so pleased with them, that he would not let me finish them more. I bestowed more care and attention on a little view of a stable, in which, in a distant perspective, another stable is distinguishable, filled with horses like the first. The principal object is a white horse, and near him is a groom preparing to put on his saddle; in the middle of the stable stands the officer, to whom the horse belongs; the light comes from the door and falls on these three figures alone. I do not mention some other pictures, which are much in the same style, because I wish to give you a description of a moonlight. The landscape of it is painted from nature; the moon, glittering through the trees, casts her beams on a pond where some horses have been bathing, and the trees are reflected in the water. A peasant's cottage appears on a little sandy hill. The sky is dark and stormy, like those which Ruysdael was so fond of

painting, but the cottage and hill have a strong light thrown on them. I am painting at present another picture, in which the warmth of the setting-sun is still discernible behind the mountains, and gilds some clouds scattered over the sky; in the distance, the eye loses itself in the bosom of a dark valley: the middle of the scene presents a forest, in which may be distinguished a group of sportsmen assembled round a large fire; and a skirmish between some hussars, is seen through the branches of the oaks and fir-trees in the foreground.

I must confess, that hitherto I have passed my time in the gallery more in looking at the pictures than in copying them, for I think, that the greatest advantage, which perhaps I can derive from this establishment, is the opportunity of seeing so many fine works, of comparing them with nature, and then consigning the result of my observations either to canvas or to paper. All, that I have copied, amounts to nothing more than some horses, from Blomaert, and a group from Wouverman. I intend very shortly to begin some more copies; M. Graaf is not dissatisfied with what I have done; and he approves of the method, which I have just now mentioned.

M. Klengel has had the goodness to accompany me sometimes to the gallery, and I am indebted to him for having made me observe several things, which, without him, would probably have escaped my notice, or which I should not have felt or understood so well. He has made me almost adore Wouverman. With what a wonderful facility every thing is grouped and arranged, as if without any trouble in his compositions! The most insignificant objects are expressed with neatness and taste, yet they never appear to be the productions of minute labour. His figures and horses possess all the delicacy of a miniature, yet are not wanting in fire and animation. I always feel very forcibly those sensations, which he must himself have experienced, when composing his works; yet my admiration of this great master does not render me blind to the merit of other artists, who have pursued the same style. Borgognone probably surpasses him in correctness, and in point of design. Rugendas is, in my opinion, the Raphael of horse painters; his are all in the same style, full of fire and character, and, abating only the fine colouring of Wouverman, I prefer them to the horses in his pictures. These, to be sure, possess a great share of grace and truth; but setting aside the elegant touch and magical colouring of Wouverman, it must be acknowledged, that the horses of Rugendas are drawn with more correctness and greater dignity. I have insisted so much the more on the observation, because M. Klengel, whose knowledge has in other respects been of so much assistance to me, wishes to persuade me to study Wouverman as my only model, even for the manner of painting horses. I cannot, in this respect, conform to his opinion. Why should I study Wouverman, or any one besides, and not attend to nature, by which Wouverman himself formed his style? Why should I undergo the slavery of copying his horses perpetually, without being able to give them that inimitable grace, which his pencil alone could bestow, and perhaps still more incorrectly than he has drawn them? No, in this respect I will not copy any master exclusively, neither Wouverman, nor even Rugendas; I will endeavour to acquire, as much as I can, the grace of the one and the correctness of the other, and profit from them as guides to assist me in discovering the best models in nature. I leave to those, who copy by profession, that scrupulous exactness, and the ambition to imitate, even the faults of their original. In

my mind he only deserves the name of a painter, who makes nature his great model, and attends to the impulse of those feelings, which are characteristically his own.

Most artists appear to me to be guilty of one common error, which is, that of forming a sort of arbitrary theory, which they adopt in their works, and which often seduces them from the truth of nature. This fault certainly cannot be attributed to Wouverman. He may be said to be free from art. His clouds are not geometrically carved into pyramids or other regular forms; his figures are grouped, as if by accident, and not arranged by the side of each other according to the prismatic order of colours. Generally speaking, I have never observed a striking contrast of colours in nature; all the tints are harmonized by an airy vapour and softly blended together as we see in the pictures of Ruysdael, of Claude Lorraine, and of Wouverman. How different from this is the usual system of landscape painters, who begin with a resplendent sky streaming with yellow and blue, then some beautiful blue mountains finely melting into grey; from grey to green, thus following every gradation of colour till they reach a fine coffee brown! and this is called harmony, and is the receipt to make a picture! You might suppose, after seeing one of this description, that they do not understand any other harmony than that of their pallet; or that their eyes can distinguish nothing but that false brilliancy, which in fact some artists have offered them as a model. A person must be totally dead to all feeling, not to observe in nature what a truly good picture represents. I am not surprised to meet with artists, who, after having tired themselves, as they describe it, in running after nature, at last stumble in the road, and overlook some of her most striking beauties; while others perhaps, who observe her, like painters, and contemplate every scene as a picture, draw some advantage from every object which presents itself.

* * *

S. Gessner to his son

Sihlwald, 5th September, 1784

* * *

I am perfectly satisfied with the distribution of your time, and the plan you have laid down for pursuing your studies. I recommend to you, above all things, to make it your principal object to become familiarly acquainted with all the best examples of good painting, which the gallery affords. I do not mean by this, to advise the servile labour of a copyist; indeed your sentiments on that subject perfectly correspond with mine. The copyist, deprived of the animating stimulus of imagination, is obliged to tread with tedious exactness in the footsteps of his models. He is their slave, even when he wishes to do justice to his own ideas, and he will always remain below those whom he imitates, because he works without inspiration, without fire, and neither dares to think nor to act from the impulse of his own mind. I approve extremely of the rule, you intend to observe, of seeking in nature as much as possible for the originals of those objects, which are presented to you by art, and of comparing them with each other. When you are become familiar with the form and character of objects, you will never be led astray by any style; and you will adopt that only which will appear to you the best chosen, and most appropriate to the subject. Endeavour also to distinguish in each master those parts, in which he most excelled, and study

them with attention, until you have acquired perfect facility in the execution of them. It will frequently happen to you, even in your own works, to meet with difficulties, which will stop your progress. Observe thoroughly those objects, which are the cause of them; search both in nature and in works of art for such as are analogous, and study them without intermission, that you may thus combat with every difficulty, till you have overcome all that may arise.

You tell me, that in your drawings from nature, you endeavour not to fall into a stiff and finished style. I think you are perfectly right. Your drawings should be a faithful representation of every object, and they must be modified according to the nature of each. Exactness of imitation is too often sacrificed to composition. Endeavour as much as possible to unite them both, but be careful never to neglect that most essential point, of procuring in each object the truth and variety of its character, for any attainment of an inferior magnitude.

* * *

K. Gessner to his father

Dresden, October 12th, 1785.

Just at the moment, when Reinhard and myself were setting out on an expedition towards Leibthal, which is the very appropriate name of the valley I described to you in my last letter, I received the painters-mirror, which you have had the goodness to send me; it will henceforth be the constant companion of my picturesque excursions, and I improve daily in the use of it. I prefer it infinitely to all kinds of Camera-obscura, because it may be so easily carried in the pocket, and also because it reflects objects with perfect distinctness even in shade. I must now give you an account of our journey. Our persons being well packed up in a post-chaise, together with our colour boxes, and all the implements of our trade, we set out for our favorite retreat, which we explored in every direction, sometimes meeting with fine scenes in Ruysdael's style, but more frequently with views and perspectives, such as Everdingen delighted in. One would suppose, that the latter had made frequent visits to this spot, and had taken from it the subject of his best pictures. We established ourselves in a hut with some good honest peasants, whose habitation is situated amidst the trees of a fine orchard, which surround it with a pleasing shade. At break of day we left our bed of clean straw, where we had enjoyed a refreshing sleep, to descend into a valley where a little stream winds its course, and which, impeded in its progress by some fragments of rocks, falls here and there in a small cascade. At the bottom of the valley, in a recess formed by high rocks, large firs, and thick beech trees, the same stream precipitates itself from the top of a mass of rocks with the most picturesque effect. It was in this spot, truly worthy of a poet's eye, that we established our apparatus; the sun's rays in various parts pierced through the tufted foliage, and added fresh brilliancy to the objects which already wore all the different tints of autumn, and formed a mixed scene, which, in its confused variety, presented to the eye a softer harmony of colours. The tone of colouring, and the water, were precisely the same as in Ruysdael's pictures, and therefore, I studied them with particular attention.

We were agreeably surprised in the midst of our studies by a visit from Messrs. Graaf and Zingg. They applauded our courageous perseverance in working from nature, and admired our contrivance as a substitute for an easel, which we could not have made use of in the situation we were in, seated on pieces of rock in the middle of the river. I will tell you how we managed; we tied a string to two corners of the picture, and putting it over our necks, resting the picture on our knees, we painted with tolerable facility, although the attitude was not the most elegant. It was in this way that we passed our time from the dawn of day till night. As we had eaten a very small portion for dinner, we transferred all our appetite to the supper, which, added to our usual gaiety, furnished an excellent sauce to the frugal repast provided for us by our host.

It must be confessed, that it is very humiliating to an artist to work with nature immediately before his eyes; he then feels his insufficiency to represent it; and the difficulty of the task diminishes the pleasure. Thus, in a fit of too well-founded despair, I was going to efface what I had done, when M. Graaf arrived just in time to save it from destruction; and the satisfaction which he expressed, having reanimated my courage, I continued and finished my picture. Now that I see it in my room, I am better pleased with it than I was in the open air; I observe in it some touches of nature, and a tone of colouring which I could never have acquired, even with the greatest efforts, if I had painted it in my room. I am now more than ever convinced, that although this may be the most difficult mode, yet it is the most certain; and since I have employed myself in studying attentively the pictures in the gallery, instead of merely looking at them, I feel also how much that circumstance has improved me, by enabling me to study nature with more ease, and teaching me to distinguish and make choice of its principal beauties.

How rare are those artists, who excel in this respect! the greatest part of them do not begin to observe nature, until they are accustomed to a style of their own, which they blindly follow even in the imitation of nature; thus it is, that they always fail in the object of their wishes, that of expressing it with truth and accuracy. They indeed paint the stones and the trees, which present themselves to their eyes one after the other, and with such scrupulous exactness that you would suppose they had counted them; but they have not the least idea of giving the real character to each object; and notwithstanding their exactness in all the parts, their pictures do not possess any truth or effect. I confess I cannot endure any thing like mannerism. Claude Lorraine, Berghem, and Ruysdael, are the only painters, to whom I can turn with pleasure, even after examining nature, for they are the only ones, who admire it in all its purity, and who present it to my eyes chaste and undefiled. Each tree, each stone, each plant, in short every thing in their works, has its true and appropriate character; in my opinion, this is the excellence of the art, and it shall be, throughout my life, that which I shall be most ambitious to acquire. I praise your works, my dear father, as much as I do those of these great artists, and I assure you, my judgment is not biassed by partiality. I admire in your paintings those trees so full of life, if I may be allowed the expression, yet characterised by such a light and easy touch; those scenes so rich and varied, yet without a glaring profusion; in short, that attention to simple, unadorned nature, which must ever please, because it is true.

5 William Gilpin (1724–1804) from *Observations on the River Wye*

Having developed his concept of the picturesque and provided the general principles for its definition (see VB2), Gilpin proceeded to apply it in a series of summer tours made between 1768 and 1776 through the scenery of the British Isles. The results were published between 1782 and 1791 in a series of localized 'Observations relative to picturesque beauty', variously illustrated with aquatints of the kinds of pictures that might result. At a time when outdoor drawing and sketching were widely practised as polite and improving activities, this was a highly successful move. Equipped with Gilpin's directions and with his eloquent analyses, his readers could go out into the countryside and elevate sightseeing to the status of a high-cultural pursuit. They might even return with some sketches that would look like Art. Among those who made a 'picturesque tour' of the River Wye were Sir Uvedale Price (VB13, 15) and the landscape designer Humphry Repton (in 1790/1). Gilpin's various 'Observations' were to be continually reprinted over the next half-century. The tour of the River Wye was the first to be published, as *Observations on the River Wye, and several parts of South Wales, &c., relative chiefly to Picturesque beauty; made In the Summer of the Year 1770*, London: R. Blamire, 1782. Our excerpts are taken from the original edition, Section I, pp. 1–2 and Section II, pp. 7–14.

SECTION I.

We travel for various purposes; to explore the culture of soils; to view the curiosities of art; to survey the beauties of nature; to search for her productions; and to learn the manners of men; their different polities, and modes of life.

The following little work proposes a new object of pursuit; that of not barely examining the face of a country; but of examining it by the rules of picturesque beauty: that of not merely describing; but of adapting the description of natural scenery to the principles of artificial landscape; and of opening the sources of those pleasures, which are derived from the comparison.

Observations of this kind, through the vehicle of description, have the better chance of being founded in truth; as they are not the offspring of theory; but are taken warm from the scenes of nature, as they arise.

* * *

SECTION II.

The Wye takes its rise near the summit of Plinlimmon; and dividing the counties of Radnor, and Brecknoc, passes through Herefordshire. From thence becoming a second boundary between Monmouth, and Gloucestershire, it falls into the Severn, a little below Chepstow. To this place from Ross, which is a course of near 40 miles, it flows in a gentle, uninterrupted stream; and adorns, through its various reaches, a succession of the most picturesque scenes.

The beauty of these scenes arises chiefly from two circumstances – the *lofty banks* of the river, and its *mazy course*; both which are accurately observed by the poet [Alexander Pope], when he describes the Wye, as *echoing* through its *winding* bounds. It could not well *echo*, unless its banks were *lofty*.

From these two circumstances the views it exhibits, are of the most elegant kind of perspective; free from the formality of lines.

Every view on a river, thus circumstanced, is composed of four grand parts; the *area*, which is the river itself; the *two side-screens*, which are the opposite banks, and mark the perspective; and the *front-screen*, which points out the winding of the river.

If the Wye ran, like a Dutch canal, between parallel banks, there could be no front-screen: the two side-screens, in that situation, would lengthen to a point.

If a road were under the circumstance of a river winding like the Wye, the effect would be the same. But this is rarely the case. The road pursues the irregularity of the country. It climbs the hill; and sinks into the valley: and this irregularity gives the views it exhibits, a different character.

But the views on the Wye, though composed only of these *simple parts*, are yet *infinitely varied*.

They are varied, first, by the *contrast of the screens*. Sometimes one of the side-screens is elevated; sometimes the other; and sometimes the front. Or both the side-screens may be lofty; and the front either high, or low.

Again, they are varied by the *folding of the side-screens over each other*; and hiding more or less of the front. When none of the front is discovered, the folding-side either winds round, like an amphitheatre; or it becomes a long reach of perspective.

These *simple* variations admit still farther variety from becoming *complex*. One of the sides may be compounded of various parts; while the other remains simple: or both may be compounded; and the front simple: or the front alone may be compounded.

Besides these sources of variety, there are other circumstances, which, under the name of *ornaments*, still farther increase them. *Plain* banks will admit all the variations we have yet mentioned: but when this *plainness is adorned*, a thousand other varieties arise.

The *ornaments* of the Wye may be ranged under four heads – *ground – wood – rocks – and buildings*.

The *ground*, of which the banks of the Wye consists, (and which hath thus far been considered only in its *general effect*;) affords every variety, which ground is capable of receiving; from the steepest precipice, to the flattest meadow. This variety appears in the line formed by the summits of the banks; in the swellings, and excavations of their declivities; and in the unequal surfaces of the lower grounds.

In many places also the ground is *broken*; which adds new sources of variety. By *broken ground*, we mean only such ground, as hath lost its turf, and discovers the naked soil. Often you see a gravelly earth shivering from the hills, and shelving down their sides in the form of water-falls: or perhaps you see dry, stony channels, guttering down precipices; the rough beds of temporary torrents. And sometimes so trifling a cause, as the rubbing of sheep against the sides of little banks, or hillocks, will often occasion very beautiful breaks.

The *colour* too of the broken soil is a great source of variety; the yellow, or the red oker; the ashy grey; the black earth; or the marley blue. And the intermixtures of these with patches of verdure, blooming heath, and other vegetable tints, still increase that variety.

Nor let the fastidious reader think, these remarks descend too much into detail. Were an extensive distance described, a forest-scene, a sea-coast view, a vast semi-circular range of broken mountains, or some other grand display of nature, it would be trifling to mark these minute circumstances. But here the hills around exhibit little, except foregrounds; and it is necessary, where we have no distances, to be more exact in finishing objects at hand.

The next great ornament on the banks of the Wye, are its *woods*. In this country there are many works carried on by fire; and the woods being maintained for their use, are periodically cut down. As the larger trees are generally left, a kind of alternacy takes place: what is, this year, a thicket; may, the next, be an open grove. The woods themselves possess little beauty, and less grandeur; yet, as we consider them as the *ornamental*, not as the *essential* parts, of a scene, the eye must not examine them with exactness; but compound for a *general effect*.

One circumstance, attending this alternacy, is pleasing. Many of the furnaces, on the banks of the river, consume charcoal, which is manufactured on the spot; and the smoke, which is frequently seen issuing from the sides of the hills; and spreading its thin veil over a part of them, beautifully breaks their lines, and unites them with the sky.

The chief deficiency, in point of wood, is of large trees on the *edge of the water*; which, clumped here and there, would diversify the hills, as the eye passes them; and remove that heaviness, which always, in some degree, (though here as little as possible) arises from the continuity of ground. They would also give distance to the more removed parts; which, in a scene like this, would have peculiar advantage: for as we have here so little distance, we wish to make the most of what we have. — But trees *immediately on the foreground* cannot be suffered in these scenes; as they would obstruct the navigation of the river.

The *rocks*, which are continually starting through the woods, produce another *ornament on the banks of the Wye*. The rock, as all other objects, though more than all, receives its chief beauty from contrast. Some objects are beautiful in themselves. The eye is pleased with the tuftings of a tree: it is amused with pursuing the eddying stream; or it rests with delight on the shattered arches of a Gothic ruin. Such objects, independent of composition, are beautiful in themselves. But the rock, bleak, naked, and unadorned, seems scarcely to deserve a place among them. Tint it with mosses, and lichens of various hues, and you give it a degree of beauty. Adorn it with shrubs, and hanging herbage, and you still make it more picturesque. Connect it with wood, and water, and broken ground; and you make it in the highest degree interesting. Its colour, and its form are so accommodating, that it generally blends into one of the most beautiful appendages of landscape.

Different kinds of rocks have different degrees of beauty. Those on the Wye, which are of a greyish colour, are in general, simple, and grand; rarely formal, or fantastic. Sometimes they project in those beautiful square masses, yet broken and shattered in every line, which is the characteristic of the most majestic species of rock. Sometimes they slant obliquely from the eye in shelving diagonal strata: and sometimes they appear in large masses of smooth stone, detached from each other, and half buried in the soil. Rocks of this latter kind are the most lumpish, and the least picturesque.

The various *buildings*, which arise every where on the banks of the Wye, form the last of its *ornaments*; abbeys, castles, villages, spires, forges, mills, and bridges. One or other of these venerable vestiges of the past, or cheerful habitations of the present times, characterize almost every scene.

These *works of art* are however of much greater use in *artificial*, than in *natural* landscape. In pursuing the beauties of nature, we range at large among forests, lakes, rocks, and mountains. The various scenes we meet with, furnish an inexhausted source of pleasure. And though the works of art may often give animation and contrast to these scenes; yet still they are not necessary. We can be amused without them. But when we introduce a scene on canvas – when the eye is to be confined within the frame of a picture, and can no longer range among the varieties of nature; the aids of art become more necessary; and we want the castle, or the abbey, to give consequence to the scene. And indeed the landscape-painter seldom thinks his view perfect, without characterizing it by some object of this kind.

6 Johann Georg Sulzer (1720–1779) ‘Landscape (arts of design)’ from *General Theory of the Fine Arts*

The Swiss aesthetician and philosopher Johann Georg Sulzer was born in Winterthur in Switzerland. He studied theology, philosophy, mathematics and botany in Zurich before taking up an appointment as a teacher of mathematics in Berlin in 1747. In 1750 he was elected to the Berlin Academy of Science, where he came into contact with the ideas of many of the leading figures of the Enlightenment. He was particularly influenced by the new study of psychology inaugurated sixty years earlier by Locke’s empiricism (see II B1). In 1755 he produced an annotated translation of David Hume’s *Essay on Human Understanding*. Inspired by the *Encyclopédie* of Diderot and D’Alembert (see III C7–9), he set out to produce a comprehensive and alphabetically ordered synthesis of the aesthetics of the period. Work was begun on the project in 1762, but the first volume of his *General Theory of the Fine Arts* did not appear until 1771. The second volume, covering the letters K–Z, was published in 1774. Sulzer provides essays on a vast range of topics, including general aesthetic concepts and processes, as well as articles on technical aspects of all the different branches of art. Some of the articles were later translated and included in the supplement to Diderot’s *Encyclopédie* of 1776/7 and the book remained an influential reference work well into the nineteenth century. However, Sulzer was also criticized by leading figures of the *Sturm und Drang* for the prescriptive character of his writing and for his moral interpretation of art (see VB7). The essay on ‘Landscape’ is of particular interest for his treatment of the natural landscape not only as a source of spontaneous emotional responses but as a means of moral elevation. Our moral response to landscape painting can be heightened or reinforced through the representation of moral actions – such as the story of the Good Samaritan – but the effects of the landscape itself are already to be understood in emotional and ethical terms. This article has been translated for the present volume by Jason Gaiger from the first edition of Sulzer’s *Allgemeine Theorie der schönen Künste*, Leipzig: M. G. Weidmanns Erben und Reich, 1774, pp. 653–5.

Among the arts of design, this branch, which presents us with so many agreeable views of inanimate nature, commands considerable respect. The fact that nearly

everyone takes pleasure in beautiful views already indicates that the beauties of nature stand in an intimate relation to the human soul. I have already discussed the general influence which this pleasure has on the formation of man's ethical character.¹ However, we need to consider this subject in more detail if we are to illuminate the particular branch of art which is under consideration here. Although painters do, of course, introduce ideas from the ethical domain into their landscapes, I want first of all to consider those ideas which are proper to inanimate nature and which, even on their own, possess a great diversity of aesthetic power.

Nowhere does our pleasure in the beautiful find so much satisfaction as in the contemplation of inanimate nature. Wherever we turn our eyes we are charmed by an infinite variety of colours, combined in the most delightful harmonies and pleasing tones; we meet every conceivable shape and form, whether pleasant, stimulating, or great and wondrous. Although a landscape is made up of a thousand different shapes in endlessly varied arrangements, these combine to form a whole in which everything is unified; each impression possesses its own character without conflicting with any other, and these are joined together in indescribable diversity. Here man feels for the first time that he does not merely respond as does an animal to the powerful impressions of his baser senses; he is made aware that he possesses a more noble feeling which penetrates his inner being and which has nothing in common with the material world. He learns to recognize needs other than hunger, thirst and the necessity of sustaining his purely material existence. He discovers an invisible essence within himself which takes pleasure in order, harmony and diversity. As yet unlearned in thinking, he is instructed by the beauties of nature to recognize that he is more than the mundane matter out of which he is formed.

Through the contemplation of inanimate nature man also develops more specific ethical and emotional responses. Nature reveals to us scenes in which we learn to admire what is great, original and extraordinary. There are aspects of nature which awaken fear and dread, others which invite us to silent prayer and to a festive elevation of our souls, and yet others which awaken quiet sadness or lively pleasure. Poets, pious hermits and other enthusiasts have long recognized this and in all ages have taken advantage of it. Who does not respond with a feeling of pious gratitude when he sees the richness of nature spread out before him in the fertile countryside? Who does not sense his weakness and his dependence on higher powers when he sees the powerful masses of overhanging cliffs, or when he bears the roaring of a mighty waterfall, the terrifying raging of the wind or the surge of the sea? Who does not register in these scenes the all-powerful force which steers the whole of nature? It is undoubtedly true that primitive man created his first concept of the divinity from such scenes.

A quiet and graceful spot, the gentle murmur of a stream, the sound of a small waterfall – such solitary spots unvisited by human beings awaken in us a gentle shudder of loneliness whilst at the same time filling us with a sense of awe for the invisible power at work in these abandoned places. In short, every sort of feeling is aroused in us by the variety of natural scenes. Philosophers, who find everywhere traces of an infinite wisdom and goodness, are convinced that these powers have not been given to nature without some higher purpose. They provide man's first education before he has learnt the language of reason. Through this education his character is gradually formed and his mind filled with concepts which are initially weak and

obscure but which subsequently develop and become clearer. The attentive contemplation of nature represents man's first step towards reason and the realization of his own proper character.

Thus painters find that inanimate nature offers them an inexhaustible store of material through which they can exercise a positive effect on men's character. A landscape painter can give us pleasure in a variety of beneficial ways. This is the case above all when a knowledge of the higher skills of his art allows him to combine the depiction of human passions and moral action with scenes of inanimate nature. Who is not affected in a salutary way when he sees someone who has been robbed and cruelly wounded by assassins in a desolate place helped onto his horse and taken back to his people by a Good Samaritan? What person of feeling can look upon the pleasures of simple shepherds in a rural scene marked by innocence and simplicity without experiencing the most joyful stirrings of the heart?

Through selecting appropriate actions from man's moral and ethical life and integrating them into his landscapes, the painter can give his landscapes a value which allows them to stand alongside the best history painting. Nicolas Poussin was entitled to be as proud of his Arcadian landscape as of the invention of a good history painting. I have observed elsewhere that the achievement of great effects does not always depend upon great events.² Something which initially appears to possess little significance can exercise a considerable effect upon a mind which is properly disposed. A single figure, such as Adam, who admires the beauty of creation in the midst of a paradisiacal landscape and who, through his posture and gesture, allows us to recognize that he is aware of the presence of the Creator, can awaken in a sensitive viewer powerful feelings of adoration for the all-bountiful Creator. Even the poorly drawn and badly engraved illustrations of fearsome places found in descriptions of journeys to Greenland or to Hudson's Bay awaken in us melancholy and dread. How much stronger these feelings would be and how much more support they would give to our moral ideas were they to be painted in nature's own proper colours and were they to depict appropriate historical events. From this it is easy to see that landscape too can achieve the greatest effects of which art is capable if only it is carried out by the hand of a master. As a great authority on art has rightly observed,³ landscapes by Poussin, Salvator Rosa, and Everdingen possess such greatness that they awaken in us a sense of awe and terror which comes close to that of the sublime.

These observations provide us with the principles by which to judge the inner perfection of landscape, which derives from the value of the depicted object. Just as a history painting is to be considered good when it succeeds in depicting a scene from ethical life which awakens salutary feelings in us, stimulating and reinforcing our ethical beliefs, so a landscape is to be considered good when it depicts comparable scenes from inanimate nature, and, above all, when it improves these scenes with appropriate objects from the ethical domain. Just as we do not see in the human body a mere aggregate of dead forms arranged in contingent proportion, but register the existence of an inner force, a living soul which follows its own inclinations and can act according to principles, so a landscape should reveal more than mere dead matter. It should possess something which does not merely flatter our eyes but which awakens our ideas, animating our desires and our responsive capacity. This is the reason why nature has clothed her raw material in so many varied colours and forms. She speaks

a language which, though mute, can yet be understood by responsive souls, a language through which she educates and shapes mankind. We must be able to read some words of this language in every landscape to which we attach value:

When Heaven and Earth, as if contending, vye
To raise his Being, and serene his soul;
Can he forbear the general Smile
Of Nature? Can fierce passions vex his Breast
While every Gale is Peacc, and every Grove
Is Melody?⁴

Nature is inexhaustible in such articulate scenes, and the landscape painter must seek them out for us. He must invite us to contemplative seriousness and then rouse us to joyousness, lead us into solitariness away from the din of the world and then rouse us from drowsy lethargy. Through the ever-active, universal power of nature, he should spur us on to contribute to the universal good. The painter who does not understand the language of nature and who seeks to delight us merely with a diversity of colours and forms, does not know the power of his art. If he does not, like Haller, Thomson and Kleist, lead us to the many different domains of the ethical world through the contemplation of nature, he achieves nothing with his use of line and colour.

⁴ James Thomson (1700-48), from *Spring*. Sulzer provides a German translation in the text, but gives the original in a footnote.

7 Johann Wolfgang Goethe (1749–1832) Review of *The Fine Arts in their Origin, their True Nature and Best Application*, by J. G. Sulzer

In 1772 Johann Georg Sulzer published the key ideas behind his *General Theory of the Fine Arts* (see VB6) in a small booklet entitled *The Fine Arts in their Origin, their True Nature and Best Application*. Johann Heinrich Merck (1741–91), a close friend of Goethe's, had already written a highly negative review of the first volume of Sulzer's encyclopaedia in the same journal. Both authors reject the Enlightenment assumptions on which Sulzer's work rests. Goethe challenges the idea that nature is essentially benevolent, pointing out its violent and destructive aspects. He thereby resists the moralizing interpretation which Sulzer seeks to place upon the natural world. Above all, however, he is hostile to the notion that the arts can be systematically taught, rejecting the very idea of a lexicon of the arts. The figure of Pococurante, referred to in the text, is the rich Venetian senator described by Voltaire in *Candide*, who, despite being able to gratify any pleasure he wishes, remains unsatisfied with life. Goethe's review was published on 18 December 1772 in the *Frankfurter Gelehrte Anzeigen*. It is reprinted in Johann Wolfgang Goethe, *Schriften zur Kunst*, Gedenkausgabe, volume XIII, Zurich: Artemis Verlag, 1954. The following translation of the

complete review is taken from Timothy J. Chamberlain, *Eighteenth Century German Criticism*, New York: Continuum, 1992, pp. 175–9.

Very easy to translate into French, could also very well be translated from French. Sulzer, according to the testimony of one of our *famous* men just as great a philosopher as any from antiquity, seems in his theory, in the manner of the ancients, to fob the poor public off with an esoteric doctrine, and these sheets are, if possible, less significant than everything else he has written.

The *fine arts*, an article in his general theory, take central stage here, in order to put both amateurs and connoisseurs in a position to judge of the whole so much the sooner. Reading the great work until now we have already had many a doubt; but now that we investigate the very principles on which it is built, the lime that is supposed to stick together the scattered limbs of the lexicon, we find our opinion confirmed only too much: nothing is done for anyone here except the student seeking a basic primer, and the quite superficial fashionable dilettante.

We have already previously voiced our thoughts that a theory of the arts might not yet be ready for our times in Germany. We do not presume to expect such an opinion to be able to prevent the publishing of such a book; we can only, indeed we must, warn our good young friends against works of this kind. Anyone who lacks sensuous experience of the arts should rather leave them alone. Why should he occupy himself with them? Because it's fashionable? Let him consider that all theory bars his way to true enjoyment, for a more harmful nullity than theory has not been invented.

The *fine arts*, the fundamental article of Sulzer's theory. So there they are, of course, all together again, whether they're related or not. What doesn't stand listed in the lexicon? What cannot be connected by means of such a philosophy? Painting and dance, oratory and architecture, poetry and sculpture, all conjured by the magic light of a little philosophical lantern through a single hole onto the white wall, they dance up and down in the marvelous light, many-colored, and the delighted spectators pant for breath in their joy.

That some man who reasoned rather badly hit on the idea that certain human occupations and joys that became a labor and an effort for unspontaneous imitators without genius, could be classified under the rubric of arts, fine arts, for the benefit of theoretical sleight of hand – on account of its convenience this idea then remained the main theme for philosophy about the arts, even though they bear no closer relation to one another than the seven liberal arts of the old priestly schools.

We are astonished that Sulzer, even without reflecting on it, didn't become aware during the execution of his work of the great inconvenience that as long as one keeps to generalities one says nothing, and at most can conceal the lack of material from the inexperienced by means of declamation.

He wants to oust the indefinite principle of *imitation of nature*, and gives us in its place an equally meaningless one: *the embellishment of things*. He wants, in the traditional manner, to make inferences from nature to art: 'Everything in all creation is in harmony, to touch the eye and the other senses from all sides with pleasant impressions.' So does that which makes unpleasant impressions on us not belong just as much to nature's plan as her most lovely aspects? Are the raging storms, floods,

rains of fire, subterranean glow, and death in all the elements not just as much true witnesses of her eternal life as the sun rising in splendor over full vineyards, and fragrant orange groves? What would Sulzer say to the loving mother nature if it were to swallow into its belly a metropolis he had built up and populated with all the fine arts and their handmaidens?

This inference stands up just as little: 'In general, nature wanted to educate our hearts to gentleness and sensitivity by means of the pleasant impressions streaming in on us from all sides.' *In general* it never does that, rather, it hardens its genuine children, thank God, against the pains and evils it continually causes them, so that we can call that man the happiest who was able to encounter evils with the greatest strength, turn them away from him, and in defiance of them proceed according to his own will. Now that is too arduous, indeed impossible, for a great part of humankind; hence most of them, particularly the philosophers, beat a hasty retreat and retrench; which is why they then *in general* argue with such adequacy.

How selective and limited is the following observation, and how much it is supposed to prove! 'Above all, this tender mother has placed all the charms of attractiveness in those objects that are most necessary to our happiness, in particular in the blissful union in which the man finds a spouse.' We honor beauty with all our heart, have never been insensitive to its attractions; but to make it the prime mover in this sphere is only possible for one who has no inkling of the mysterious powers by which each is drawn to *its like*, and everything under the sun mates and is happy.

So even if it were true that the effect of the arts is the embellishment of things around us, it is nonetheless false to say that they do so following the example of nature.

What we see of nature is power, this power devours; nothing is present, everything passing, a thousand seeds are crushed, a thousand born each moment, it is great and significant, infinitely diverse; beautiful and ugly, good and evil, all exists side by side with equal right. And *art* is precisely the opposite; it arises from the endeavors of the individual to preserve itself from the destroying power of the whole. Even the animal by its artful instincts *sets itself apart, preserves itself*; the human being in all conditions fortifies himself against nature in order to avoid its thousandfold evils and enjoy only the measure of goodness it accords; until he finally succeeds as far as possible in encasing the circle of all his genuine and acquired needs within a palace, in holding all the scattered beauty and happiness spellbound within its glass walls, where he then becomes softer and softer, substitutes joys of the soul for joys of the body, and his powers, with nothing disagreeable to tauten them to natural uses, melt away into virtue, beneficence, sensibility.

Sulzer continues on his way, which we would rather not follow; he cannot lack a great troop of disciples, for he feeds them with milk, not strong foods; talks a lot about the essence of the arts, their purpose; and praises their great usefulness as a means to the furtherance of human happiness. Anyone who knows human nature just a little, and the arts, and happiness, will have little hope of this; the many kings will occur to him who were eaten to death by ennui in the midst of the glory of their splendor. For if only connoisseurship is envisaged, if one does not enjoy with active participation, hunger and disgust, the two most inimical drives, must soon combine to torment the wretched *Pocourante*.

Following this he embarks on a portrayal of the history of the fine arts and their present condition, projected imaginatively with the finest colors, just as good and no better than the histories of mankind to which we are so accustomed these days, in which the fairy tale of the four ages of the world always suffices; and told in the tone of history rewritten for practical application – as a novel.

Now Sulzer comes to our times and, as befits a prophet, scolds his own century roundly; admittedly doesn't deny that the fine arts have found more than enough promoters and friends, but because they have still not been used to the great end, the *moral improvement* of the people, our rulers have done nothing. He dreams, with others, that a wise legislature would both animate geniuses and be able to indicate the true goal to work towards, and more along those lines.

Finally he raises the question whose answer is supposed to open the way to the true theory: 'What initiatives can be taken so that man's innate sensual tendencies can be used to elevate his way of thinking and can be employed in specific cases as a means to attract him irresistibly to his duty?' As half- and misunderstood and vain as Cicero's wish to lead virtue to his son in the form of physical beauty. And Sulzer doesn't answer the question, but rather merely suggests what is important here – and we close his little book. His audience of disciples and petty connoisseurs may remain faithful to him, we know that all true artists and lovers of art are on our side, and will laugh at the philosopher just as until now they have complained about the academics. And to these listeners a few words more, confined to a few arts, which may apply to as many as it can.

If any speculative endeavor is to benefit the arts, it must address the artist directly, provide a draft to his natural fire, so that it can spread and prove active. For it's all a matter of the artist, that he feels no bliss in life but in his art, that he lives sunk in the instrument of his art, with all his feelings and powers. What does the gaping audience matter, what does it matter whether or not it can account for why it gaped, when it has done with gaping?

So anyone who in writing, speech, or by means of example – in ascending order – could raise the so-called amateur, the artist's only true audience, nearer and nearer to the spirit of the artist, so that his soul might also flow into the instrument of his art, would have done more than all psychological theorists. These gentlemen are so high up there in the empyrean of transcendental virtuous beauty that they don't care about petty details down here, which are all that matter. Which of us sons of the earth, on the other hand, doesn't see with deep regret how many good souls remain stuck with meticulous mechanical execution, e.g., in music, and perish beneath it?

May God preserve our senses, and preserve us from the theory of sensuousness, and give every beginner a good master! And since these are not to be had everywhere and always, and yet one has to write, let the artist and amateur give us a *περὶ ἑαυτοῦ* [report] of his endeavors, of the difficulties that delayed him most, the powers with which he overcame them, the chance events that helped him, the spirit that in certain moments came over him and gave him light for his life, until in the end, always growing, he swung himself up to mighty possession and as king and conqueror compelled the neighboring arts, indeed the whole of nature, to pay tribute.

In this way we would gradually assemble a living theory, passing from the mechanical to the intellectual, from the mixing of paints and the tuning of strings

to the true *influence of the arts on heart and mind*, would give the amateur joy and courage, and perhaps help the genius a little.

8 Georg Christof Tobler (1757–1812) ‘Nature’

The fragment ‘Nature’ appeared in Goethe’s *Tiefurter Journal* at the end of 1782 or early in 1783 and it has often mistakenly been assumed to be Goethe’s own work. It was in fact written by the young Swiss theologian and classical scholar, Georg Christof Tobler. Tobler first met Goethe in Geneva in 1781 and between May and September of that year he visited Weimar, where the two became friends. Goethe was particularly impressed by Tobler’s translations of Attic drama and Orphic hymns. The composition of the fragment dates from this time. Like Moritz’s ‘On the Creative Imitation of Beauty’ (see VA9), it is the product of conversations with the poet, in this case on natural science and natural theology. When asked about the fragment in later years, Goethe agreed that it captured well a certain stage in his thinking. The piece is an emotional and pantheistic hymn to all-embracing nature. Whilst the form owes much to Tobler’s translations from the Greek, the ideas are indebted to the spirit of pantheism which provided one of the animating forces of the *Sturm und Drang*. The lasting influence of these ideas is evidenced by Sigmund Freud’s claim that his decision to study medicine rather than law was taken in response to the fragment, which he believed to be the work of Goethe. It is reprinted in Johann Wolfgang Goethe, *Naturwissenschaftliche Schriften*, Hamburger Goethe-Ausgabe, volume XIII, Hamburg: Christian Wegner Verlag, 1955, pp. 45–7. The complete text has been translated for this volume by Nicholas Walker.

Nature! We find ourselves at once surrounded and embraced by her – powerless to leave her, and powerless to fathom her more deeply. Unasked and unforeshadowed, she draws us into her dancing round, spins on and on with us until we are wearied and her arms can let us drop.

She creates ever new shapes for herself; what is there now was never there before, and what was there before never comes again – everything is new and yet forever ancient.

We live within her but are strangers to her. She speaks unceasingly to us but never once betrays her secret. We work upon her constantly yet over her possess no power.

She seems to strive for individuality in everything and brings all individuals to ruin. She builds unceasingly, destroys unceasingly, and her inner workshop is quite closed to us.

She lives in all her teeming children, but then where is this mother? – She is the one and only artist: she brings the simplest of material to the greatest contrasts, and without the slightest sign of effort to the greatest perfection – to the most precise articulation, though always with a gentle touch of delicacy. Each of her works has an essence of its own, each of her manifestations a singular concept peculiar to itself, but all still constitutes a single unity.

She playfully enacts a spectacle: whether she beholds all this herself we cannot know, although she plays it out before us in our little corner as we are.

There is in her eternal life and motion and becoming, although she also always stays unmoved. She transforms herself eternally and cannot rest for a moment. She

has no concept of the permanent, has cast her curse upon repose. She nonetheless stands firm. Her step is measured, her exceptions rare, her laws immutable.

She has taken thought and constantly reflects, although as Nature and not as man. She has retained a comprehensive meaning of her own, which no one can extract from her.

All human beings inhabit her and she inhabits them. She makes a friendly play with all of them, and rejoices all the more the more men gain from her. She plays in such mysterious ways with many and brings them to their end before they know it.

Even what is most unnatural is nature too. He who cannot see her working everywhere cannot find her rightly anywhere.

She loves herself and clings eternally to herself with countless hearts and eyes. She has parted herself the better to enjoy herself. She lets new creatures ceaselessly arise to enjoy and to share in her insatiably.

She delights in illusion. He who crushes this within himself or others, him she punishes as if she were the harshest tyrant. He who follows her in trust, him she presses to her heart as if he were a child.

Her children are without number. In general she is niggardly with none, but she has her favourites on whom she lavishly bestows her gifts and to whom she sacrifices much. She has expressly lent her protection to what is great.

She flings her creatures forth out of nothing, but never tells them whence they come or whither they are going; their task is but to run, she knows the course.

She has few springs of action but they are never worn away, are always active, always various in effect.

The spectacle she enacts is ever new because she constantly creates new onlookers for the play. Life is her fairest invention, and death her artful way of multiplying life.

She shrouds mankind in ignorance and spurs him ceaselessly towards the light. She makes him heavy and inert, dependent on the earth, and yet incites him constantly.

She bestows needs because she loves all movement. It is miraculous with what scarce means she has provoked such movement. Every need is a gift, quickly gratified, emerging quickly once again. When she bestows another need, this now becomes a novel source of pleasure. But she soon returns once more to equilibrium.

In each and every moment she starts upon the longest course and attains her goal in each and every moment.

She is vanity itself, though not to us, for whom she has made herself the most important thing of all.

She lets every child behave as it likes and every fool pass judgement on himself, lets thousands go obtusely on their way though understanding nothing, takes joy in all and makes her reckoning with all.

We obey her laws even when we strive to resist them; we work with her even when we want to go against her.

She turns everything she gives into an act of kindness for she makes it henceforth indispensable. She tarries that we might desire her, she hastens lest we ever tire of her.

She has neither language nor speech, but she creates tongues and hearts through which to feel and speak.

Her regal crown is love. Only through love can we approach her. She makes the sharpest division between all beings, yet everything desires to swallow up everything else into itself. She has individuated everything in order to draw everything together. She can recompense a life of ceaseless toil with a little draught from the goblet of love.

She is everything. She rewards herself and punishes herself, she delights in herself and tortures herself. She is harsh and gentle, lovely and terrifying, impotent and omnipotent. She harbours everything within herself for ever. She knows neither past nor future. To her the present is eternity. She is bountiful. I praise her and all her works. She is wise and calm. We can force no explanation from her, and exact from her no gifts that she does not willingly give. She is cunning, but to good purpose, and it is best of all to be ignorant of her cunning.

She is whole and yet ever incomplete. As she acts now, so she will always be able to act.

She appears to everyone in a unique shape. She conceals herself under a thousand names and titles and is always the same.

She has brought me here and she will likewise take me hence. I trust in her. She may scold me but she will not hate her own work. It was not I that have spoken of her. No, for what is true and what is false, she has spoken it all. She is to blame for everything, she is to thank for everything. [*Alles ist ihre Schuld, alles ist ihr Verdienst.*]

9 Alexander Cozens (1717–1786) from ‘A New Method of Assisting the Invention in Drawing Original Compositions of Landscape’

Alexander Cozens' father was a master shipbuilder to Peter the Great, and much of his early life was spent in Russia. In 1746–8 he was in Italy, where he spent some time in the Roman studio of Claude-Joseph Vernet (see III C14). Though he studied oil painting with Vernet, the majority of his work was done in pencil, pen or ink wash and was based on landscape themes, actual or invented. For his remaining years he worked in England, earning his living principally as a drawing master. During his long career his pupils included orphans at Christ's Hospital, schoolboys at Eton and members of the royal family. In 1759 he published *An Essay to Facilitate the Invention of Landscips, Intended for Students in the Art*, setting out in brief his method for composing with the aid of ink blots and citing the precedent of Leonardo da Vinci, who had recommended looking for images in crumbling walls as a means of assisting the invention. He also worked on categorizing the types of landscape found in nature, leaving a list of sixteen ‘Kinds of Composition’ to each of which a particular range of moral effects was to be attached. The *New Method of Assisting the Invention* was his last publication and the most complete demonstration of his system for the use of ink blots. It was originally accompanied by sixteen aquatint plates. In Cozens' own eyes the potential of his method far exceeded its capacity to generate appealing novelties. In line with contemporary theories of the sublime and the picturesque, he believed that the resulting pictures would be stimulating to taste and understanding in the perception both of art and of nature. One of the most notable beneficiaries of Cozens' teaching was his own son, John Robert Cozens (1752–98), who accompanied Richard Payne Knight on a tour of the Alps in 1776 (see VB14), and whose landscapes in water-colour were admired by Fuseli, Turner and Constable, among others. *A New Method...* was first published in London by the author in 1785. It was reprinted in A. P. Oppé, *Alex-*

ander and John Robert Cozens, London: Adam and Charles Black, 1952, pp. 166–84. Our text is taken from the latter edition, pp. 167–77.

By way of introduction to the following treatise, I venture to avail myself of the just observation in the commentary on the first book of that beautiful poem, ‘the English Garden’ [by William Mason]; but at the same time, I take the liberty of altering the words in favour of composition of landscape by invention, that being, in great measure, the subject of the present work.

The powers of art and invention, impart picturesque beauty, and strength of character to the works of an artist in landscape painting; as a noble and graceful deportment confers a winning aspect on the human frame. Composing landscapes by invention, is not the art of imitating individual nature; it is more; it is forming artificial representations of landscape on the general principles of nature, founded in unity of character, which is true simplicity; concentrating in each individual composition the beauties, which judicious imitation would select from those which are dispersed in nature.

I am persuaded, that some instantaneous method of bringing forth the conception of an ideal subject fully to the view (though in the crudest manner) would promote original composition in painting; and that the want of some such method has retarded the progress of it more than impotence of execution.

Hence proceeds the similarity, as well as weakness, of character, which may be seen in all compositions that are bad, or indifferently good: they may be also owing more particularly to the following causes;

1. To the deficiency of a stock of ideas originally laid up in the mind, from which might be selected such as suit any particular occasion;
2. To an incapacity of distinguishing and connecting ideas so treasured up;
3. To a want of facility, or quickness, in execution; so that the composition, how perfect soever in conception, grows faint and dies away before the hand of the artist can fix it upon the paper, or canvas.

To one or more of these causes may be imputed that want of nature and originality, which is visible in many productions.

How far the incapacity of combining our ideas with readiness and propriety in the works of art, may arise from neglecting to exercise the invention, or from not duely cultivating the taste and judgment, cannot perhaps be easily determined: but it cannot be doubted, that too much time is spent in copying the works of others, which tends to weaken the powers of invention; and I scruple not to affirm, that too much time may be employed in copying the landscapes of nature herself.

I here find myself tempted to communicate an accident that gave rise to the method now proposed of assisting the imagination in landscape composition, which I have constantly pursued, as well in my private studies as in the course of my teaching, ever since; and which I now lay before the public, after a full proof of its utility, from many years experience.

Reflecting one day in company with a pupil of great natural capacity, on original composition of landscape, in contradistinction to copying, I lamented the want of a

mechanical method sufficiently expeditious and extensive to draw forth the ideas of an ingenious mind disposed to the art of designing. At this instant happening to have a piece of soiled paper under my hand, and casting my eyes on it slightly, I sketched something like a landscape on it, with a pencil, in order to catch some hint which might be improved into a rule. The stains, though extremely faint, appeared upon revisal to have influenced me, insensibly, in expressing the general appearance of a landscape.

This circumstance was sufficiently striking: I mixed a tint with ink and water, just strong enough to mark the paper; and having hastily made some rude forms with it, (which, when dry, seemed as if they would answer the same purpose to which I had applied the accidental stains of the 'forementioned piece of paper) I laid it, together with a few short hints of my intention, before the pupil, who instantly improved the blot, as it may be called, into an intelligible sketch, and from that time made such progress in composition, as fully answered my most sanguine expectations from the experiment.

After a long time making these blots for composition with light ink, the method was improved by making them with black ink; and the sketches from these are produced by tracing them on transparent paper.

In the course of prosecuting this scheme, I was informed, that something of the same kind had been mentioned by Leonardo da Vinci, in his Treatise on Painting. It may easily be imagined how eagerly I consulted the book; and from a perusal of the particular passage which tended to confirm my own opinion, I have now an authority to urge in its favour; an authority, to which the ingenious will be disposed to pay some regard. The passage is as follows.

'Among other things I shall not scruple to deliver a new method of assisting the invention, which, though trifling in appearance, may yet be of considerable service in opening the mind, and putting it upon the scent of new thoughts; and it is this. If you look upon an old wall covered with dirt, or the odd appearance of some streaked stones, you may discover several things like landscapes, battles, clouds, uncommon attitudes, humorous faces, draperies, &c. Out of this confused mass of objects, the mind will be furnished with abundance of designs and subjects perfectly new.'

I presume to think, that my method is an improvement upon the above hint of Leonardo da Vinci, as the rude forms offered by this scheme are made at will; and should it happen, that a blot is so rude or unfit, that no good composition can be made from it, a remedy is always at hand, by substituting another. But, according to Leonardo, the rude forms must be sought for in old walls, &c. which seldom occur; consequently, the end of the composer may sometimes be defeated.

An artificial blot is a production of chance, with a small degree of design; for in making it, the attention of the performer must be employed on the whole, or the general form of the composition, and upon this only; whilst the subordinate parts are left to the casual motion of the hand and the brush.

But in making blots it frequently happens, that the person blotting is inclined to direct his thoughts to the objects, or particular parts, which constitute the scene or subject, as well as to the general disposition of the whole. The consequence of this is an universal appearance of design in his work, which is more than is necessary to a true blot. But this superabundance of design is of no disadvantage to the drawing that

is to be made from it, provided it is done with judgment and spirit; for if what is intended for a blot, proves to be a spirited sketch, the artist has only the less to invent in his drawing, when he is making it out.

A true blot is an assemblage of dark shapes or masses made with ink upon a piece of paper, and likewise of light ones produced by the paper being left blank. All the shapes are rude and unmeaning, as they are formed with the swiftest hand. But at the same time there appears a general disposition of these masses, producing one comprehensive form, which may be conceived and purposely intended before the blot is begun. This general form will exhibit some kind of subject, and this is all that should be done designedly.

It was thought necessary to give this particular description of a true blot, in order to compare it with one, in which too much attention has been paid to the constituent parts.

The blot is not a drawing, but an assemblage of accidental shapes, from which a drawing may be made. It is a hint, or crude resemblance of the whole effect of a picture, except the keeping and colouring; that is to say, it gives an idea of the masses of light and shade, as well as of the forms, contained in a finished composition. If a finished drawing be gradually removed from the eye, its smaller parts will be less and less expressive; and when they are wholly undistinguished, and the largest parts alone remain visible, the drawing will then represent a blot, with the appearance of some degree of keeping. On the contrary, if a blot be placed at such a distance that the harshness of the parts should disappear, it would represent a finished drawing, but with the appearance of uncommon spirit.

To sketch in the common way, is to transfer ideas from the mind to the paper, or canvas, in outlines, in the slightest manner. To blot, is to make varied spots and shapes with ink on paper, producing accidental forms without lines, from which ideas are presented to the mind. This is conformable to nature: for in nature, forms are not distinguished by lines, but by shade and colour. To sketch, is to delineate ideas; blotting suggests them. [...]

In order to produce the drawing, nothing more is required than to place a piece of paper, made transparent, upon the blot; or if the practitioner chooses to make the sketch upon paper not so transparent, he should procure a frame, made on purpose, with a glass for small drawings, and strained gauze for larger, to stand on a table, as is mentioned hereafter. The blot with the paper is to be put on it. The first operation in composing from the blot, is to make out the sketch, by giving meaning and coherence to the rude shapes, and aerial keeping to the casual light and dark masses of the blot.

I conceive, that this method of blotting may be found to be a considerable improvement to the arts of design in general; for the idea or conception of any subject, in any branch of the art, may be first formed into a blot. Even the historical, which is the noblest branch of painting, may be assisted by it; because it is the speediest and the surest means of fixing a rude whole of the most transient and complicated image of any subject in the painter's mind.

There is a singular advantage peculiar to this method; which is, that from the rudeness and uncertainty of the shapes made in blotting, one artificial blot will suggest different ideas to different persons; on which account it has the strongest tendency to enlarge the powers of invention, being more effectual to that purpose

than the study of nature herself alone. For instance, suppose any number of persons were to draw some particular view from a real spot; nature is so precise, that they must produce nearly the same ideas in their drawings; but if they were one after the other, to make out a drawing from one and the same blot, the parts of it being extremely vague and indeterminate, they would each of them, according to their different ideas, produce a different picture. One and the same designer likewise may make a different drawing from the same blot; as will appear from the three several landscapes taken from the same blot, which are given in the four last plates or examples.

To the practitioner in landscape it may be farther observed, that in finishing a drawing from a blot, the following circumstance will occur, viz. in compositions where there are a number of grounds or degrees of distance, several of them will be expressed in the sketch by little more than tracing the masses that are in the blot, the last ground of all perhaps requiring only an outline: for the greatest precision of forms will be necessary in the first or nearest ground; in the next ground the precision will be less, and so on.

There must doubtless be left a power of rejecting any part of the blot which may appear improper, or unnatural, while the sketch is making; for which no previous directions can be given: in this case imagination leads, while the judgment regulates.

However it is still evident, that, notwithstanding the variety which chance may suggest, and this discretionary power of rejecting any part of a blot, a very indifferent drawing may yet be produced from other causes, such as want of capacity, inattention, &c. the effects of which are not to be counteracted by any rules or assistance whatever.

It hath been already observed, that the want of variety and strength of character may be owing either, first;

To a scantiness of original ideas: or, secondly,

To an incapacity of distinguishing and connecting such as are capable of being properly united: or, thirdly,

To a want of facility and quickness in execution.

But to each of these defects, the art of blotting, here explained, affords, in some degree, a remedy. For it increases the original stock of picturesque ideas;

It soon enables the practitioner to distinguish those which are capable of being connected, from those which seem not naturally related; and

It necessarily gives a quickness and freedom of hand in expressing the parts of a composition, beyond any other method whatever.

It also is extremely conducive to the acquisition of a theory, which will always conduct the artist in copying nature with taste and propriety.

This theory is, in fact, the art of seeing properly; it directs the artist in the choice of a scene, and to avail himself of all those circumstances and incidents therein which may embellish or consolidate his piece.

But there is a farther, and a very material purpose that may be attained by it, which is, that of taking views from nature. In doing which, as well as composing landscapes by invention, the following principles are necessary, viz. A proper choice of the subject, strength of character, taste, picturesqueness, proportion, keeping, expression

of parts or objects, harmony, contrast, light and shade, effect, &c. All these may be acquired by the use of blotting; so that what remains necessary, for drawing landscapes from nature, is only a habit in the draughtsman, of imitating what he sees before him, which any one may learn through practice, assisted by some simple method.

In short, whoever has been used to compose landscapes by blotting, can also draw from nature with practice. But he cannot arrive at a power of composing by invention, by the means of drawing views from nature, without a much greater degree of time and practice.

In order to encourage those who wish to design original compositions, it may be remarked, that there is to be discerned, in all whole compositions in nature, a gradation of parts, which may be divided into several classes; for instance, the class of the smaller parts, the class of those of larger dimensions, and so on to the largest. The curious spectator of landscape insensibly acquires a habit of taking notice, or observing all the parts of nature, which is strengthened by exercise. It may be perceived, that the application of this notice in youth is directed to the smaller parts (which are also the most strongly retained in idea), from which it is gradually transferred to the larger as we approach to age, at which time we generally take notice of whole compositions. By the means of this propensity we lay up a store of ideas in the memory, from whence the imagination selects those which are best adapted to the nature of her operations. All the particular parts of each object may not be preserved in the memory, yet general ideas of the whole may be thrown as it were into the repository, and there retained.

Every one knows, that the youthful and the ignorant, as well as the mature and the refined, express their approbation (frequently from their own feelings) of performances that are worthy of praise. What can this proceed from? . . . There must be an inward criterion by which they are led to judge and approve. This criterion is the store of ideas before-mentioned, which are in the possession of all who have been used to the proper subjects. Some of these ideas are drawn forth by the merits of such performances as are presented, and so become the scale or rule of judgment and taste, by which the operations of criticism are carried on.

Ideas may also be revived by recollection, whether casual or intended. To these may be added, the method of blotting now offered, which has a direct tendency to recal landscape ideas.

On the foregoing principles, very few can have reason to suspect in themselves a want of capacity sufficient to apply the use of blotting to the practice of drawing, nor can they be totally ignorant of the parts of composition in nature, for as they are previously prepared with ideas of parts, as before proved, so this art affords an opportunity of calling them forth, and likewise presents an ocular demonstration of the principles of composition. Previous ideas, however acquired (of which every person is possessed more or less) will assist the imagination in the use of blotting; and on the other hand, the exercise of blotting will strengthen and improve the ideas which are impaired for want of application.

I beg to consider this matter in a further light. It is probable, that all persons retain ideas of what they have seen, but that there are many who have no aptitude for imitating what they do see, in order to make a copy of it. So that in regard to

composing landscapes by invention, there is only required a method (as blotting) to bring out those ideas visibly on paper, &c. But no method can give an aptness, or an eye, for copying to a person who is not possessed of it from nature, which may be compared to a want of ear in music.

If it be said, that a person must have genius in order to be able to make out designs from blots; the truth of this assertion may be examined by enquiring what genius is, and to what principal purpose genius is indispensably necessary; and on the other hand, what are the requisites necessary to make designs from blots.

A definition of genius may be attempted as follows. Strength of ideas; power of invention; and ready execution. – So that a man of true genius conceives strongly, invents with originality, and executes readily.

It is to be suspected, that the world entertains but confused notions concerning genius. This probably arises from mistaking certain qualities for genius, which are totally distinct from it; as perception, judgement, imagination, partiality for an art, experience, memory, taste, perseverance, industry, attention, knowledge, &c. Any one of these, or any number, or even all of them together, cannot produce such transcendent beauties as are the fruits of genius, when furnished with proper materials. Yet much is, and may be done by the force of those qualities alone, without any proof of the existence of real and original genius.

When a person shews a very great inclination to any profession, employment, or art, &c. and pursues it with unremitting perseverance, and even enthusiasm; this is not really a proof of genius, but merely of a strong attachment.

When a person, by being inured to the perception of beauty, has acquired taste, suppose it in the greatest degree, so as to be a consummate judge of the highest style of beauty; this also is not a proof of genius.

But when a person frequently and readily performs works which are novel, and these with precision of meaning; this is a proof of genius; which, as beforementioned, consists of strength of ideas, with power of invention, and ready execution.

Lastly, when a person endued with genius has, from some incidental cause, directed his attention steadily to any pursuit, and feels a strong attachment to it; and has acquired taste, by inuring himself to the sight and perception of beauty; then enthusiasm and taste thus combined with genius, invest him with triple power, to create and execute works transcending in beauty and perfection.

The principal purpose to which genius is indispensably necessary is, the production of whole compositions new to the performer.

As to the requisites necessary for making out designs from blots, they may be seen in this treatise, where they are particularly set forth in many places. There it may be clearly understood, that it is in the power of most capacities to make designs from blots, to a considerable degree of perfection, and that genius is not indispensably necessary for that purpose. But it must be confessed, that if a person possesses genius, according to the definition, he will avail himself more of those accidental forms, &c. which the blot presents to him, and consequently will compose with greater facility and meaning from them, than one who has no genius. From this it may be presumed, that the use of blotting may be a help even to genius; and where there is latent genius, it helps to bring it forth.

10 Johann Kaspar Lavater (1741–1801) ‘On Landscape Painting’

The Swiss poet, priest and theologian Johann Kaspar Lavater was a prolific writer in many genres, but he is principally known for his writings on physiognomy (see VA6). In 1790 he published two volumes of letters, composed in response to oral and written requests for help in religious, philosophical and moral matters. The following letter gives advice to a young landscape artist, addressed as Herr Steiner of Winterthur. As in the study of physiognomy, Lavater insists that close attention be paid to the determining characteristics of individual objects. No two blades of grass are alike and the idea of a tree in general is an empty abstraction that can have no place in painting. However, direct study of nature is to be combined with the recognition that the rules of composition and the means of attaining an overall effect are best derived from the work of other artists. Lavater repeatedly refers his correspondent to Claude Lorrain's *Liber Veritatis*, a collection of 200 compositions which Claude made from his own paintings to serve as a record of his work. Lavater's advice is remarkably similar to that given by Salomon Gessner in his ‘Letter on Landscape Painting’ (see VB3). Both men recommend close attention to nature, which is nonetheless guided by the practice of the great artists of the past. ‘Ueber das Landschaftsmalen. An Herrn Steiner in Winterthur’ was first published in volume 2 of Lavater's *Antworten auf wichtige und würdige Briefe weiser und guter Menschen*, Zürich: Heinrich August Rottmann, 1790, pp. 536–9. The complete text has been translated for the present volume by Jason Gaiger.

A man such as you with so much talent and taste, with so much feeling and understanding for art, has the divine vocation of bringing himself as near as possible to perfection! Never to stand still, but always to move forwards! Always to study nature herself, and to study nature through the medium of her most brilliant and exact imitators! What is most difficult for you is also the most necessary, or rather, the easiest is the most difficult: always to study with exactitude exactly one thing and to study this exhaustively. I strongly advise that you undertake a course of study just of trees, of their trunks, their branches, their boughs, and particularly of the point at which they connect with the earth and of the way in which the earth clothes each trunk as it rises up out of the ground; indeed, I advise a special course on each type of tree, on their particular skeletons and foliage, on the way in which they group together, how they stand alone, and how they appear when they grow alongside trees of another type.

To you, a man of taste, I do not need to say: always seek out the most beautiful groups of trees, well chosen and upright. It pleases me greatly that you take your easel into the fields and the woods and paint from nature with watercolours – this is what Aberlin does, who remains unsurpassed in the achievement of naturalness.

I also ask that you bridle your bold genius and do not seek to achieve too much with a single work; with every new attempt at enrichment ask yourself ‘Will the beauty of the work remain the same? Will it lose? Or will it gain?’

That which damages the harmony and the manifold unity of the work should always be left undone, even if it is beautiful in itself and can easily be achieved.

In every landscape the character of the landscape painter should be clearly and immediately visible.

The *foreground* should be strongly worked in definite, large masses, but also delightful. Composition and firmness of execution will remove everything which is not unified. Alongside nature, both night and day, early and late, study the work of Claude Lorrain. It goes without saying that I would never tell you, 'Imitate him exactly.' For whoever is possessed of originality can never merely imitate.

Try to answer the following questions clearly and exactly – Do we not see here the superior plan of the whole? the gentle division of light and shadow? the exact distinction of foreground, middle ground and background? the strongly shadowed foreground, the lightly shadowed middle ground and the scarcely touched, light background? Do not the majority and the best of his landscapes oppose conspicuous masses against one another, which stand out clearly from the light in the centre, and are broken only by a slender tree, a ship, the arch of a bridge, a hill or some such?

Consider here his *Liber veritatis*, particularly numbers 1, 2, 3, 5, 17, 23, 27, 31, 43, 111, 122, 139.

How he loves the bright sun in the centre! He starts from the brightest point which he never hides from the viewer; he represents it as bright and gentle and does not blind us – and then proceeds to the darkest shadows in the foreground.

How impossible for him is all confusion and overworking! – and how far he is from any poverty of execution! what serenity he brings even to the most casually thrown off piece! how everything is clear! everything has been examined – and for that reason is easy to see! everything has been felt, and for that reason is easy to experience!

With what success he knows how to oppose areas of light against areas of shadow, as in 1, 31, 38, 58, 62; he knows how to lead us from the closest proximity to the most infinite distance through gentle progressions, as in 112, 113, 114, 122, 124. How is it that he manages to give his trees the effect of massiveness without making them massive? Look here at 7, 8, 13, 35, 40, 41, 56, 82, 83, 84.

Again and again I come back to the peculiar freedom from confusion which reigns in his landscapes! Everything is so light, so verdant, so free, so simple in nature and in Claude Lorrain. But enough of this.

One last thing: everything which is a mere mannerism for you is a sin! You must always know *what* you want to draw and *why* you draw it as you do. A mannerism which intrudes is as intolerable as declamation in speech, which makes the listener forget what is being spoken about.

You should always seek to achieve the greatest possible simplicity and the greatest possible harmony! No blade of grass is like any other, not to speak of any tree! – And yet every blade of grass bears the character of grass! and every tree is a tree, an individual tree in all its leaves and features. There is no such thing as a tree in general. – Every tree is a particular tree which possesses its own unique character or type. I see so many trees in paintings which are neither oaks nor pines, neither beeches nor limes. They are neither A nor B, nor X, Y, Z – therefore they are not trees. Enough for today.

11 William Gilpin (1724–1804) from ‘On Picturesque Beauty’ and ‘On Picturesque Travel’

In 1792 Gilpin published *Three Essays: on Picturesque Beauty; on Picturesque Travel; and on Sketching Landscape: to which is added a poem on Landscape Painting* (London: R. Blamire), having completed a first draft some twenty years earlier. A French translation was published in 1799. In the first two of these essays, represented here, the ideas sketched out in Gilpin’s ‘Essay on Prints’ (VB2) are developed with a confidence acquired during his series of ‘Observations’, and with specific reference to Burke’s ‘Essay on the Sublime and the Beautiful’ (IIIB6). His argument is that those properties which lead us to see an object as beautiful are not necessarily consonant with those which might render it suitable and attractive as an object to be pictured – that is, which render it picturesque. While a Palladian villa might be the last word in taste and elegance, a picture of a Palladian villa might be thoroughly tedious. In noting that the beautiful was not necessarily an adequate measure of the picturesque, Gilpin revealed just how narrow was the set of positive aesthetic predicates generally admitted into academic discourse. By enlarging the range of terms available for describing naturalistic effects he encouraged the appreciation of landscape paintings – and by extension of other kinds of pictures as well – that were intentionally unclassical in style. Further, in proposing nature as the archetype of all picturesque experience, he offered a measure by which actual pictures were always in danger of falling short. It would not be appropriate, however, either to see Gilpin as a straightforward naturalist, or to associate him with the taste for experience of ‘sublime’ landscapes that fuelled Alpine travels of the kind Richard Payne Knight undertook in 1776. Knight was accompanied on that occasion by John Robert Cozens, who produced a pictorial record of the journey. Philippe de Louthembourg and J. M. W. Turner were among the artists whose subsequent travels to the Alps resulted in pictures of lowering mountains, yawning chasms and raging torrents. In marked contrast to such scenes, the world Gilpin conceived of as picturesque was one in which ‘the ruined tower, the Gothic arch, the remains of castles, and abbeys’ might be contemplated in reasonable comfort. The debate on the ‘picturesque’, and on its relation to the ‘sublime’ and the ‘beautiful’, was taken up and pursued by a younger generation of English writers during the 1790s and early 1800s, among them Sir Uvedale Price (VB13, 15) and Richard Payne Knight (VB14). Our text is taken from the original edition of the *Three Essays*, pp. 1, 5–8, 15–21 and 41–6. Gilpin’s footnotes have been omitted.

Essay I.

Disputes about beauty might perhaps be involved in less confusion, if a distinction were established, which certainly exists, between such objects as are *beautiful*, and such as are *picturesque* – between those, which please the eye in their *natural state*; and those, which please from some quality, capable of being *illustrated in painting*.

* * *

Mr. Burke, enumerating the properties of beauty, considers *smoothness* as one of the most essential. ‘A very considerable part of the effect of beauty, says he, is owing to this quality: indeed the most considerable: for take any beautiful object, and give it a broken, and rugged surface, and however well-formed it may be in other respects, it pleases no longer. Whereas, let it want ever so many of the other constituents, if it

want not this, it becomes more pleasing, than almost all the others without it.'— How far Mr. Burke may be right in making smoothness the *most considerable* source of beauty, I rather doubt. A considerable one it certainly is.

Thus then, we suppose, the matter stands with regard to *beautiful objects in general*. But in *picturesque representation* it seems somewhat odd, yet we shall perhaps find it equally true, that the reverse of this is the case; and that the ideas of *neat* and *smooth*, instead of being picturesque, in fact disqualify the object, in which they reside, from any pretensions to *picturesque beauty*. — Nay farther, we do not scruple to assert, that *roughness* forms the most essential point of difference between the *beautiful*, and the *picturesque*; as it seems to be that particular quality, which makes objects chiefly pleasing in painting. — I use the general term *roughness*; but properly speaking roughness relates only to the surfaces of bodies: when we speak of their delineation, we use the word *ruggedness*. Both ideas however equally enter into the picturesque; and both are observable in the smaller, as well as in the larger parts of nature — in the outline, and bark of a tree, as in the rude summit, and craggy sides of a mountain.

Let us then examine our theory by an appeal to experience; and try how far these qualities enter into the idea of *picturesque beauty* and how far they mark that difference among objects, which is the ground of our inquiry.

A piece of Palladian architecture may be elegant in the last degree. The proportion of it's parts — the propriety of it's ornaments — and the symmetry of the whole, may be highly pleasing. But if we introduce it in a picture, it immediately becomes a formal object, and ceases to please. Should we wish to give it picturesque beauty, we must use the mallet, instead of the chissel: we must beat down one half of it, deface the other, and throw the mutilated members around in heaps. In short, from a *smooth* building we must turn it into a *rough* ruin. No painter, who had the choice of the two objects, would hesitate a moment.

Again, why does an elegant piece of garden-ground make no figure on canvas? The shape is pleasing; the combination of the objects, harmonious; and the winding of the walk in the very line of beauty. All this is true; but the *smoothness* of the whole, tho right, and as it should be in nature, offends in picture. Turn the lawn into a piece of broken ground: plant rugged oaks instead of flowering shrubs: break the edges of the walk: give it the rudeness of a road: mark it with wheel-tracks; and scatter around a few stones, and brushwood; in a word, instead of making the whole *smooth*, make it *rough*; and you make it also *picturesque*. All the other ingredients of beauty it already possessed.

* * *

The art of painting allows you all you wish. You desire to have a beautiful object painted — your horse, for instance, led out of the stable in all his pampered beauty. The art of painting is ready to accommodate you. You have the beautiful form you admired in nature exactly transferred to canvas. Be then satisfied. The art of painting has given you what you wanted. It is no injury to the beauty of your Arabian, if the painter think he could have given the graces of his art more forcibly to your cart-horse.

But does it not depreciate his art, if he give up a beautiful form, for one less beautiful, merely because he could have given it *the graces of his art more forcibly* — because it's sharp lines afford him a greater facility of execution? Is the smart touch of

a pencil the grand desideratum of painting? Does he discover nothing in *picturesque objects*, but qualities, which admit of being *rendered with spirit*?

I should not vindicate him, if he did. At the same time, a free execution is so very fascinating a part of painting, that we need not wonder, if the artist lay a great stress upon it. – It is not however intirely owing, as some imagine, to the difficulty of mastering an elegant line, that he prefers a rough one. In part indeed this may be the case; for if an elegant line be not delicately hit off, it is the most insipid of all lines: whereas in the description of a rough object, an error in delineation is not easily seen. However this is not the whole of the matter. A free, bold touch is in itself pleasing. In elegant figures indeed there must be a delicate outline – at least a line true to nature: yet the surfaces even of such figures may be touched with freedom; and in the appendages of the composition there must be a mixture of rougher objects, or there will be a want of contrast. In landscape universally the rougher objects are admired; which give the freest scope to execution. If the pencil be timid, or hesitating, little beauty results. The execution then only is pleasing, when the hand firm, and yet decisive, freely touches the characteristic parts of each object.

If indeed, either in literary, or in picturesque composition you endeavour to draw the reader, or the spectator from the *subject* to the *mode of executing* it, your affectation disgusts. At the same time, if some care, and pains be not bestowed on the *execution*, your slovenliness disgusts, as much. Tho perhaps the artist has more to say, than the man of letters, for paying attention to his *execution*. A truth is a truth, whether delivered in the language of a philosopher, or a peasant: and the *intellect* receives it as such. But the artist, who deals in lines, surfaces, and colours, which are an immediate address to the *eye*, conceives the *very truth itself* concerned in his *mode* of representing it. Guido's angel, and the angel on a sign-post, are very different beings; but the whole of the difference consists in an artful application of lines, surfaces, and colours.

It is not however merely for the sake of his *execution*, that the artist values a rough object. He finds it in many other respects accommodated to his art. In the first place, his *composition* requires it. If the history-painter threw all his draperies smooth over his figures, his groups, and combinations would he very awkward. And in *landscape-painting* smooth objects would produce no composition at all. In a mountain-scene what composition could arise from the corner of a smooth knoll coming forward on one side, intersected by a smooth knoll on the other; with a smooth plain perhaps in the middle, and a smooth mountain in the distance. The very idea is disgusting. Picturesque composition consists in uniting in one whole a variety of parts; and these parts can only be obtained from rough objects. If the smooth mountains, and plains were broken by different objects, the composition might be good, on a supposition the great lines of it were so before.

Variety too is equally necessary in his composition: so is *contrast*. Both these he finds in rough objects; and neither of them in smooth. Variety indeed, in some degree, he may find in the outline of a smooth object: but by no means enough to satisfy the eye, without including the surface also.

From *rough* objects also he seeks the *effect of light and shade*, which they are as well disposed to produce, as they are the beauty of composition. One uniform light, or one uniform shade produces no effect. It is the various surfaces of objects, sometimes turning to the light in one way, and sometimes in another, that give the painter his

choice of opportunities in massing, and graduating both his lights, and shades. – The *richness* also of the light depends on the breaks, and little recesses, which it finds on the surfaces of bodies. What the painter calls *richness* on a surface, is only a variety of little parts; on which the light shining, shews all it's small inequalities, and roughnesses; and in the painter's language, *enriches* it. – The beauty also of *catching lights* arises from the roughness of objects. What the painter calls a *catching light* is a strong touch of light on some prominent part of a surface, while the rest is in shadow. A smooth surface has no such prominences.

In *colouring* also, *rough* objects give the painter another advantage. Smooth bodies are commonly as uniform in their colour, as they are in their surface. In glossy objects, the smooth, the colouring may sometimes vary. In general however it is otherwise; in the objects of landscape, particularly. The smooth side of a hill is generally of one uniform colour; while the fractured rock presents it's grey surface, adorned with patches of greensward running down it's guttered sides; and the broken ground is every where varied with an okery tint, a grey gravel, or a leaden-coloured clay: so that in fact the rich colours of the ground arise generally from it's broken surface.

From such reasoning then we infer, that it is not merely for the sake of his *execution*, that the painter prefers *rough* objects to *smooth*. The very essence of his art requires it.

Essay II.

Enough has been said to shew the difficulty of *assigning causes*: let us then take another course, and amuse ourselves with *searching after effects*. This is the general intention of picturesque travel. We mean not to bring it into competition with any of the more useful ends of travelling: but as many travel without any end at all, amusing themselves without being able to give a reason why they are amused, we offer an end, which may possibly engage some vacant minds; and may indeed afford a rational amusement to such as travel for more important purposes.

In treating of picturesque travel, we may consider first it's *object*; and secondly it's sources of *amusement*.

It's *object* is beauty of every kind, which either art, or nature can produce: but it is chiefly that species of *picturesque beauty*, which we have endeavoured to characterize in the preceding essay. This great object we pursue through the scenery of nature; and examine it by the rules of painting. We seek it among all the ingredients of landscape – trees – rocks – broken-grounds – woods – rivers – lakes – plains – vallies – mountains – and distances. These objects *in themselves* produce infinite variety. No two rocks, or trees are exactly the same. They are varied, a second time, by *combination*; and almost as much, a third time, by different *lights, and shades*, and other aerial effects. Sometimes we find among them the exhibition of a *whole*; but oftener we find only beautiful *parts*.

That we may examine picturesque objects with more ease, it may be useful to class them into the *sublime*, and the *beautiful*; tho, in fact, this distinction is rather inaccurate. *Sublimity alone* cannot make an object *picturesque*. However grand the mountain, or the rock may be, it has no claim to this epithet, unless it's form, it's

colour, or it's accompaniments have *some degree of beauty*. Nothing can be more sublime, than the ocean: but wholly unaccompanied, it has little of the picturesque. When we talk therefore of a sublime object, we always understand, that it is also beautiful: and we call it sublime, or beautiful, only as the ideas of sublimity, or of simple beauty prevail.

The *curious*, and *fantastic* forms of nature are by no means the favourite objects of the lovers of landscape. There may be beauty in a *curious* object; and so far it may be picturesque: but we cannot admire it merely for the sake of it's curiosity. The *lusus naturæ* is the naturalist's province, not the painter's. The spiry pinnacles of the mountain, and the castle-like arrangement of the rock, give no peculiar pleasure to the picturesque eye. It is fond of the simplicity of nature; and sees most beauty in her *most usual* forms. The *Giant's causeway* in Ireland may strike it as a novelty; but the lake of Killarney attracts it's attention. It would range with supreme delight among the sweet vales of Switzerland; but would view only with a transient glance, the Glaciers of Savoy. Scenes of this kind, as unusual, may please *once*; but the great works of nature, in her simplest and purest stile, open inexhausted springs of amusement.

But it is not only the *form*, and the *composition* of the objects of landscape, which the picturesque eye examines; it connects them with the atmosphere, and seeks for all those various effects, which are produced from that vast, and wonderful storehouse of nature. Nor is there in travelling a greater pleasure, than when a scene of grandeur bursts unexpectedly upon the eye, accompanied with some accidental circumstance of the atmosphere, which harmonizes with it, and gives it double value.

Besides the *inanimate* face of nature, it's *living forms* fall under the picturesque eye, in the course of travel; and are often objects of great attention. The anatomical study of figures is not attended to: we regard them merely as the ornament of scenes. In the human figure we contemplate neither *exactness of form*; nor *expression*, any farther than it is shewn in *action*: we merely consider general shapes, dresses, groups, and occupations; which we often find *casually* in greater variety, and beauty, than any selection can procure.

In the same manner animals are the objects of our attention, whether we find them in the park, the forest, or the field. Here too we consider little more, than their general forms, actions, and combinations. Nor is the picturesque eye so fastidious as to despise even less considerable objects. A flight of birds has often a pleasing effect. In short, every form of life, and being has it's use as a picturesque object, till it become too small for attention.

But the picturesque eye is not merely restricted to nature. It ranges through the limits of art. The picture, the statue, and the garden are all the objects of it's attention. In the embellished pleasure-ground particularly, tho all is neat, and elegant – far too neat and elegant for the use of the pencil; yet, if it be well laid out, it exhibits the *lines*, and *principles* of landscape; and is well worth the study of the picturesque traveller. Nothing is wanting, but what his imagination can supply – a change from smooth to rough.

But among all the objects of art, the picturesque eye is perhaps most inquisitive after the elegant relics of ancient architecture; the ruined tower, the Gothic arch, the remains of castles, and abbeys. These are the richest legacies of art. They are

consecrated by time; and almost deserve the veneration we pay to the works of nature itself.

Thus universal are the objects of picturesque travel. We pursue *beauty* in every shape; through nature, through art; and all its various arrangements in form, and colour; admiring it in the grandest objects, and not rejecting it in the humblest.

12 Friedrich Ramdohr (1752–1822) ‘On Landscapes and Sea Pieces’ from *Charis, or on Beauty and the Beautiful in the Imitative Arts*

Friedrich Ramdohr was born in Hoya, near Bremen, in Germany. From 1775 to 1778 he studied law and classical archaeology at Göttingen. As a young man he wrote and published a tragedy, *Kaiser Otto der dritte* (1783), and he remained a keen amateur painter and draughtsman throughout his life. Extensive travel in Germany, Denmark, France and Italy enabled him to extend his knowledge of art, and in 1787 he published a guide to the painting and sculpture of Rome (*Ueber Mahlerei und Bildhauerkunst in Rom*). His major work, *Charis, or on Beauty and the Beautiful in the Imitative Arts* (1793) was a more ambitious attempt to provide a theoretical account of beauty on the basis of a sensualistic theory of the drives, followed by a detailed study of the different domains of art. In a letter to Goethe (7 September 1794), Schiller criticized the abstract section of the book, but maintained that he had gained a great deal from the empirical parts, where the author discussed the different arts. However, Ramdohr’s work became a target of attack for the early German Romantics, who sought to distance themselves from the normative aesthetics of the Enlightenment. Wilhelm Wackenroder, for example, offers his own *Confessions from the Heart of an Art-Loving Friar* as a self-conscious alternative to Ramdohr’s ‘cold, critical gaze’ (see VIB1). Ramdohr was subsequently to become involved in a dispute over Caspar David Friedrich’s painting, *The Cross in the Mountains* (see VIB12 and 13). The section of *Charis* devoted to landscape painting reveals a remarkable sensitivity to nature and to the distinctive qualities of landscape art. Ramdohr holds elevated or striking subject-matter to be less important than the overall effect, and maintains that our moral responses to nature are more likely to be awoken by a rapid sketch than by a finished work. The artists mentioned in the text include Johannes Glauber (Dutch, 1646–1726) and either Fredrick de Moucheron (German/Dutch, 1633–86) or Isaac de Moucheron (Dutch, 1667–1744). All three artists specialized in Italianate landscape views. The following translation has been made for this volume by Jason Gaiger from *Charis, oder ueber das Schöne und die Schönheit in den nachbildenden Künsten*, volume 2, Leipzig: Verlag der Deutschen Buchhandlung, 1793, pp. 124–31.

A landscape painting may only be considered beautiful when the viewer has the feeling that he has seen something similar before in nature or if he believes that something similar could exist in nature and that he would immediately recognize it as a real place. Here too, individuality is necessary. But if there is no unity or relation between the parts, and if beauty is to be found neither in the whole nor in the details, then we cannot speak of a beautiful painting. No matter how poetically composed the landscapes of Origonte, Moucheron and others, they cannot be considered beautiful.

Alongside individuality, care must be taken over the painterly effect. The profiles of the foreground, the middle ground and the background must clearly be distinguished from one another to form bands along which the eye runs gladly. The trees, buildings, rocks and mountains must form groups whose twists and turns the eye follows happily. The forms, the colours, the disposition of light and shadow must form groups which in turn are unified into a pleasing whole. Particular care must be taken over aerial perspective, so that we believe that we can walk deep into the place depicted. If, beyond this, the individual features are captured with striking truth and the execution is carried out with consummate skill, then the painting can be said to have spirit. If it awakens in us a festive mood, or one of tenderness or delight, then the painting also has expression and the whole may be considered beautiful.

A landscape is able to express festiveness, tenderness and delight solely through the character of the place it represents.

There are romantic places, such as those depicted by Poussin, Salvator Rosa, Everdingen, and others, with rocks, waterfalls, forest streams and so forth. There are also Arcadian places such as those painted by artists such as Claude Lorrain, with wind-ruffled groves, flower-strewn meadows, winding rivers and mirrored lakes. Finally, there are lively and amusing landscapes such as those which are often painted by Dutch artists, flat landscapes with plentiful staffage. Here I may be allowed to observe that the expression of a landscape depends as much on the handling, the tones of the colours, and the distribution of light across the entire canvas as it does on the character of the place depicted. Orizonte, Glauber, Moucheron, and all those others who have sought to make their landscapes romantic or Arcadian do not succeed in awakening in me either festive or tender feelings. By contrast, a place without any definite character when depicted by the hand of a great master takes on character. The light, the choice of colours, and even the handling of the brush – in places bold and vigorous, in others gentle and soft – contribute infinitely to achieving this.

A landscape painting is viewed in parts and success here depends far more on the particular forms given to the groups, on the truth of the colours, the faithful rendering of light, on the harmony of light and colour, and on aerial perspective, than it does on giving distinctness to the forms of individual objects in the landscape. For this reason, the drawing of individual figures and buildings, and even the exact representation of foliage, is scarcely seen. The greatest landscape painter who has ever lived, Claude Lorrain, had only an average gift for depicting these things. Exaggerated correctness in the drawing of details is counter-productive and easily leads to hardness. The detail does not need to be any truer than the view of the canvas as a whole requires. However, actual distortions constitute a fault. This is, perhaps, also true of the colouring. No tree or building should be coloured in a way that would be true only if it were seen in isolation. It is the colouring of everything as a whole, unified with the other objects, which must appear true. To expend more trouble on the details than on the truth of the whole is evidence of a meagre and fastidious style of landscape painting.

It is very dangerous to believe that a beautiful place in nature will necessarily provide a beautiful subject for a painting. Often the most beautiful natural sites cannot be captured in painting and it is rare that they are the occasion for a genuinely painterly effect. Often they lack either a beautiful middle ground, or a beautiful foreground or background. Very rarely do the objects form good groups of shapes

and it is even more rare for the colours and the light to be just right. I have already had occasion to observe elsewhere (in the first part of my study on Denmark) that some natural sites which are beautiful and interesting in nature, especially when looked down on from a height, lose this interest and this beauty when depicted in a painting. When we walk through a landscape our view constantly shifts from a vertical through to a horizontal and even to a perpendicular perspective. We twist our bodies around, make fine divisions, order the masses to compensate for something that is missing, often without thinking of the painterly effect. Richness and diversity make up for the lack of proper order.

The shape of the earth, the life and customs of its people, the scent of the plants and their individual forms, the aromatic breeze, the warmth of the sun, the cool of the shade, the melancholy groves, the murmuring of a stream, the spirit of nature as a whole, the expression of its benevolent love – all of this and yet more makes a place in nature into something beautiful. The painter cannot reproduce for me all that I experience before nature and all that I believe I see. Or, if he has tried, he will have produced an extremely compressed assemblage of quite heterogeneous things, which is, in general, cold and hard.

Still more dangerous for the painter is to attempt to depict those natural scenes which achieve their effect on us through their vastness or through the movement which animates them. Examples are the falls of the Rhine at Schaffhausen, the cascades at Tivoli, Mont Blanc, Lake Geneva and so forth. For what is genuinely great and breathtaking about these places can only be achieved inadequately in painting.

On these grounds too, I believe that the landscape painter should not rely too heavily on the morally beautiful influence which the actual countryside exercises upon us. This influence is also present in painting, but only to a subordinate degree. Feelings of gratitude and awe towards the Creator, a sense of calm, an indifference in the face of ambitious and selfish desires, an increased capacity to love and to be loved which delight in nature brings with it – alas! these can be awakened only rarely by the flat, painted surface of a canvas. For those who are able to transport themselves fully into the depicted scene and for those who have known such feelings before, this effect may still be possible. But powers of the imagination and memories such as these are too rare to be relied upon.

Images and memories such as we have spoken of are awakened just as effectively, and often more so, by quick sketches as by completely realized paintings. A sketch directs the mind towards what is not present; what is actually there serves only as an aid. In the case of a painting, however, our attention is drawn principally to the representation itself. A painting is too finished for it to offer us the opportunity for such activity.

Without doubt the landscape painter proceeds most securely when, like his brothers who are masters in the other genres of this art, he does not rely too heavily on the imagination and the sympathy of the viewer of his work. He should seek instead to engage and to satisfy the viewer's intelligence through the truth of his depiction.

If at the same time his work pleases the eye through its painterly effect, if his handling shows spirit, and if the tone of the whole has expression, then he will, without doubt, have produced a beautiful landscape painting. I have seen paintings

by Ruysdael, Claude Lorrain, Poussin and others, which depict a few trees, a farm, a section of a corn field, and a marshy lake, which yet awaken a feeling of beauty. By contrast, I have seen paintings of the Bay of Naples, Lake Geneva with Mont Blanc behind it, and other landscapes of great interest to the heart and to the imagination which do not contain any beauty surplus to their subject.

Nonetheless, if the artist, regardless of these preferences, is able to reveal to me a place which is already considered beautiful in nature; if he can represent the particular objects which adorn it, the buildings, the trees, the people, the mountains and so forth as individually beautiful; if he can give the place a romantic, tender or amusing character; and if he can add historical interest by making it the site of a significant event – all the better. I prefer to see the Bay of Naples, the gardens at Armida, the villa of Cicero, Dido occupied with the building of Carthage, and Marius sitting before its ruins. But only if all these sites of poetic and historical interest are made into beautiful landscapes. Otherwise, without a second thought, I will return directly to the marsh depicted by Ruysdael.

13 Uvedale Price (1747–1829) from ‘An Essay on the Picturesque’

Price's essay was published in 1794 as a contribution to a debate for which Burke (III B6) and Gilpin (VB2, 5 and 11) had provided the principal terms of reference. Gilpin had employed principles derived from the study of pictures in order to extend the appreciation of natural scenery. If that appreciation was directed to any practical end, it was to be found in the *painted* landscapes that might ensue. To discover the picturesque in landscape, in other words, was to equip oneself to produce a painted representation. For Price, however, as for William Shenstone (see VB1), the purpose of studying pictures was to produce actual landscapes. Price's priorities are declared in the full title of his work: *An Essay on the Picturesque, as Compared with the Sublime and the Beautiful; and, on the Use of Studying Pictures, for the purpose of Improving Real Landscape* (London: J. Robson). Having inherited a large estate in Herefordshire on his father's death in 1761, he was in a position to give practical effect to his views on the improvement of natural scenery. He had known Gainsborough in his youth, the landscape architect Humphry Repton – a leading ‘improver’ – was an acquaintance and correspondent, and Richard Payne Knight (VB14) was a neighbour and fellow landowner, who shared his interests in both art and gardening. It should not be assumed that Price's taste lay with the kind of formalized parkland for which ‘Capability’ Brown had been responsible, and for which the paintings of Claude Lorrain had in the past been cited as prototypes. As the following passage makes clear, he was on the contrary concerned to argue that the landscapes of Claude's paintings were closer to reality than those of the improvers. It did not follow that he believed in leaving nature to its own devices. Rather, he opposed an aesthetic of benevolent dilapidation, of irregularity and of variety to the taste for organized clumps, for open prospects and for serpentine lines, associating the picturesque with an idealized rusticity at some remove from the material reality of rural existence. Price's clear writing style and his preference for straightforward contrasts made his writing on landscape approachable if not profound. The *Essay on the Picturesque* was frequently reprinted. A revised and expanded edition was issued as late as 1842. Our text is taken from the first edition of 1794, pp. 7–16. All footnotes but one have been deleted. Payne Knight's response to the publication of the essay was contained in the second edition of his poem *The Landscape* (see VB14). In

a 'Letter to Mr. Price', printed in July 1794, Repton responded to what he saw as criticism of his practice by both Price and Knight in the first edition of his poem.

Had the art of improving been cultivated for as long a time, and upon as settled principles, as that of painting, and were there extant various works of genius, which, like those of the other art, had stood the test of ages (though from the great change which the growth and decay of trees must produce in the original design of the artist, this is hardly possible) there would not be the same necessity of referring and comparing the works of reality to those of imitation; but as the case stands at present, the only models that approach to perfection, the only fixed and unchanging selections from the works of nature, united with those of art, are in the pictures and designs of the most eminent masters.

It may be objected, that there are many pleasing circumstances in nature, which, in painting, would appear flat and insipid, as there are others that have a striking effect in a picture, which yet in nature (by a common observer at least) would be unnoticed, or even disliked; but, however true this may be in particular instances, the great leading principles of the one art, as general composition – grouping the separate parts – harmony of tints – unity of character, are equally applicable to the other: I may add also, what is so very essential to the painter, though at first sight it seems hardly within the province of the improver – breadth and effect of light and shade.

Nothing can be more directly at war with all these principles (founded as they are in truth and in nature) than the present system of laying out grounds. A painter, or whoever views objects with a painter's eye,¹ looks with indifference, if not with disgust, at the clumps, the belts, the made water, and the eternal smoothness and sameness of a finished place; an improver, on the other hand, considers these as the most perfect embellishments, as the last finishing touches that nature can receive from art; and consequently must think the finest composition of Claude (and I mention him as the most ornamented of all the great masters) comparatively rude and imperfect; though he probably might allow, in Mr. Brown's phrase, that it had 'capabilities.'

No one, I believe, has yet been daring enough to improve a picture of Claude, or at least to acknowledge it; but I do not think it extravagant to suppose that a man, thoroughly persuaded, from his own taste, and from the authority of such a writer as Mr. Walpole, that an art, unknown to every age and climate, that of creating landscapes, had advanced with master-steps to vigorous perfection; that enough had been done to establish such a school of landscape as cannot be found in the rest of the globe; and that Milton's description of Paradise seems to have been copied from some piece of modern gardening; – that such a man, full of enthusiasm for this new art, and with little veneration for that of painting, should chuse to shew the world what Claude might have been, had he had the advantage of seeing the works of Mr. Brown. The only difference he would make between improving a picture and a real scene, would be that of employing a painter instead of a gardener.

What would more immediately strike him would be the total want of that leading feature of all modern improvements, the clump; and of course he would order several of them to be placed in the most conspicuous spots, with, perhaps, here and there a patch of larches, as forming a strong contrast, in shape and colour, to the Scotch firs.

– His eye, which had been used to see even the natural groupes of trees in improved places made as separate and clump-like as possible, would be shocked to see those of Claude, some quite surrounded, some half concealed by bushes and thickets; others standing alone, but, by means of those thickets, or of detached trees, connected with other groupes of various sizes and shapes. All this rubbish must be cleared away, the ground made every where quite smooth and level, and each groupe left upon the grass perfectly distinct and separate. – Having been accustomed to whiten all distant buildings, those of Claude, from the effect of his soft vapoury atmosphere, would appear to him too indistinct; the painter of course would be ordered to give them a smarter appearance, which might possibly be communicated to the nearer buildings also. – Few modern houses or ornamental buildings are so placed among trees, and partially hid by them, as to conceal much of the skill of the architect, or the expence of the possessor; but in Claude, not only ruins, but temples and palaces, are often so mixed with trees, that the tops over-hang their balustrades, and the luxuriant branches shoot between the openings of their magnificent columns and porticos: as he would not suffer his own buildings to be so masked, neither would he those of Claude; and these luxuriant boughs, and all that obstructed a full view of them, the painter would be told to expunge, and carefully to restore the ornaments they had hid. – The last finishing both to places and pictures is water: in Claude it partakes of the general softness and dressed appearance of his scenes, and the accompaniments have, perhaps, less of rudeness, than in any other master; yet, compared with those of a piece of made water, or of an improved river, his banks are perfectly savage; parts of them covered with trees and bushes that hang over the water; and near the edge of it tussucks of rushes, large stones, and stumps; the ground sometimes smooth, sometimes broken and abrupt, and seldom keeping, for a long space, the same level from the water: no curves that answer each other; no resemblance, in short, to what he had been used to admire; a few strokes of the painter's brush would reduce the bank on each side to one level, to one green; would make curve answer curve, without bush or tree to hinder the eye from enjoying the uniform smoothness and verdure, and from pursuing, without interruption, the continued sweep of these serpentine lines; – a little cleaning and polishing of the fore-ground would give the last touches of improvement, and complete the picture.

There is not a person in the smallest degree conversant with painting, who would not, at the same time, be shocked and diverted at the black spots and the white spots, – the naked water, – the naked buildings, – the scattered unconnected groupes of trees, and all the gross and glaring violations of every principle of the art; and yet this, without any exaggeration, is the method in which many scenes, worthy of Claude's pencil, have been improved. Is it then possible to imagine that the beauties of imitation should be so distinct from those of reality, nay, so completely at variance, that what disgraces and makes a picture ridiculous, should become ornamental when applied to nature?

¹ When I speak of a painter, I do not mean merely a professor, but any man (artist or not) of a liberal mind, with a strong feeling for nature as well as art, who has been in the habit of comparing both together.

A man of a narrow mind and little sensibility, in or out of a profession, is always a bad judge; and possibly (as that ingenious critic the Abbé du Bos has well explained) a worse judge for being an artist.

14 Richard Payne Knight (1751–1824) from *The Landscape: A Didactic Poem*

Richard Payne Knight was a wealthy collector and amateur of the arts with a good classical education and extensive experience of other cultures. Like his neighbour Uvedale Price (VB13, 15) he inherited a large estate and was responsible for planning both house and grounds. His poem was first published in 1794 and was dedicated to Price. Knight was on common ground with his friend in his advocacy of a 'natural' landscape for which the paintings of Claude provided the template. But in a second edition of his poem, published in 1795, he added two new passages of admonition specifically directed at Price (Book I, lines 257–70 and Book II, lines 200–25). In the first he makes the point that while the 'tattered rags' of miserable poverty are all very well in a painting, it does not follow that 'art' and 'nature' – or reality – can be altogether prised apart. In the second he cautions against the dangers of anti-utilitarianism and of affectation which attend on a taste for the picturesque. Knight's principal targets, however, were the 'improvers' Lancelot 'Capability' Brown and Humphry Repton (the 'ingenious professor'), whom he characterized as enemies alike of Nature and of Art. In his 'Letter to Mr. Price', Repton responded both to Price's *Essay on the Picturesque* and to the first edition of Knight's poem (Repton, 1794). In his turn Knight sharpened his attack on Repton in two lengthy footnotes added to the new edition. In the second of these he makes trenchant use of a notable passage from the novel *Tom Jones* (Book XVI, chapter 5), in which Fielding satirizes the errors of unsophisticated naturalism. Our text is taken from R. P. Knight, *The Landscape: A Didactic Poem. In three books. Addressed to Uvedale Price, Esq., The Second Edition*, London: G. Nicol, 1795. The following excerpts are from Books I and II of the poem and from the new footnotes added to lines 257–70 and 200–25 respectively. (See also VIB13.)

Book I

The composition ranged in order true,
 Brings every object fairly to the view;
 And, as the field of vision is confined, 255
 Shews all its parts collected to the mind.
 Yet often still the eye disgusted sees
 In nature, objects which in painting please;
 Such as the rotting shed, or fungous tree,
 Or tatter'd rags of age and misery: 260
 But here restrain'd, the powers of mimic art
 The pleasing qualities alone impart;
 For nought but light and colour can the eye,
 But through the medium of the mind, descry;
 And oft, in filth and tatter'd rags, it views 265
 Soft varied tints and nicely blended hues,
 Which thus abstracted from each other sense,
 Give pure delight, and please without offence:
 But small attention these exceptions claim;
 In general, art and nature love the same. 270

Hence then we learn, in real scenes, to trace
 The tints of beauty, and the forms of grace;
 To lop redundant parts, the coarse refine,
 Open the crowded, and the scanty join.
 But, ah! in vain: – See yon fantastic band, 275
 With charts, pedometers, and rules in hand,
 Advance triumphant, and alike lay waste
 The forms of nature, and the works of taste!
 To improve, adorn, and polish, they profess;
 But shave the goddess, whom they come to dress; 280
 Level each broken bank and shaggy mound,
 And fashion all to one unvaried round;
 One even round, that ever gently flows,
 Nor forms abrupt, nor broken colours knows;
 But, wrapt all o'er in everlasting green, 285
 Makes one dull, vapid, smooth, unvaried scene.

V. 257 to 270 inclusive, have been added since the first edition. It is now, I believe, generally admitted, that the system of picturesque improvement, employed by the late Mr. Brown and his followers, is the very reverse of picturesque; all subjects for painting instantly disappearing as they advance; whence an ingenious professor, who has long practised under the title of *Landscape Gardener*, has suddenly changed his ground; and taking advantage of a supposed distinction between the picturesque and the beautiful, confessed that his art was never intended to produce landscapes, but some kind of *neat, simple, and elegant effects*, or non-descript beauties, which have not yet been named or classed. (See Letter to Mr. Price, p. 9.) '*A beautiful garden scene,*' he says, '*is not more defective because it would not look well on canvas, than a didactic poem, because it neither furnishes a subject for the painter or the musician.*' (ibid. p. 5 and 6.) Certainly not: – for such a poem must be void of imagery and melody; and therefore more exactly resembling one of this professor's improved places than he probably imagined when he made the comparison. It may, indeed, have all the *neatness, simplicity, and elegance of English gardening* (ibid. p. 9.); but it will also have its vapid and tiresome insipidity; and, however it may be esteemed by a professor or a critic, who judge every thing by rule and measure, will make no impression on the generality of readers, whose taste is guided by their feelings.

I cannot, however, but think that the distinction, of which this ingenious professor has thus taken advantage, is an imaginary one, and that the picturesque is merely that kind of beauty which belongs exclusively to the sense of vision; or to the imagination, guided by that sense. It must always be remembered in inquiries of this kind, that the eye, unassisted, perceives nothing but light variously graduated and modified: black objects are those which totally absorb it, and white those which entirely reflect it; and all the intermediate shades and colours are the various degrees in which it is partially absorbed or impeded, and the various modes in which it is reflected and refracted. Smoothness, or harmony of surface, is to the touch what harmony of colour is to the eye; and as the eye has learnt by habit to perceive form as instantaneously as colour, we perpetually apply terms belonging to the sense of touch to objects of sight; and

while they relate only to *perception*, we are guilty of no impropriety in so doing; but we should not forget that *perception* and *sensation* are quite different; the one being an operation of the mind, and the other an impression on the organs; and that therefore, when we speak of the pleasures and pains of each, we ought to keep them quite separate, as belonging to different classes, and governed by different laws.

Where men agree in facts, almost all their disputes concerning inferences arise from a confusion of terms; no language being sufficiently copious and accurate to afford a distinct expression for every discrimination necessary to be made in a philosophical inquiry, not guided by the certain limits of number and quantity; and vulgar use having introduced a mixture of literal and metaphorical meanings so perplexing, that people perpetually use words without attaching any precise meaning to them whatever. This is peculiarly the case with the word *beauty*, which is employed sometimes to signify that congruity and proportion of parts, which in composition pleases the understanding; sometimes those personal charms, which excite animal desires between the sexes; and sometimes those harmonious combinations of colours and smells, which make grateful impressions upon the visual or olfactory nerves. It often happens too, in the laxity of common conversation or desultory writing, that the word is used without any pointed application to either, but with a mere general and indistinct reference to what is any ways pleasing.

This confusion has been still more confounded, by its having equally prevailed in all the terms applied to the constituent properties both of beauty and ugliness. We call a still clear piece of water, surrounded by shaven banks, and reflecting white buildings, or other brilliant objects that stand near it, *smooth*, because we *perceive* its surface to be smooth and even, though the impression, which all these harsh and edgy reflections of light produce on the eye, is analogous to that which roughness produces on the touch; and is often so violently irritating, that we cannot bear to look at it for any long time together. In the same manner we call an agitated stream, flowing between broken and sedgy banks, and indistinctly reflecting the waving foliage that hangs over it, *rough*; because we know, from habitual observation, that its impression on the eye is produced by uneven surfaces; at the same time that the impression itself is all of softness and harmony; and analogous to what the most grateful and nicely varied smoothness would be to the touch. . . . The same analogy prevails between shaven lawns and tufted pastures, dressed parks and shaggy forests, neat buildings and mouldering walls, &c. &c. as far as they affect the senses only. In all, our landscape gardeners seem to work for the touch rather than the sight.

When harmony, either in colour or surface becomes absolute unity, it sinks into what, in sound, we call monotony; that is, its impression is so languid and unvaried, that it produces no further irritation on the organ than what is necessary for mere *perception*; which, though never totally free from either pleasure or pain, is so nearly neutral, that by a continuation it grows tiresome; that is, it leaves the organ to a sensation of mere existence, which seems in itself to be painful.

If colours are so harsh and contrasted, or the surface of a tangible object so pointed or uneven, as to produce a stronger or more varied impression than the organ is adapted to bear, the irritation becomes painful in proportion to its degree, and ultimately tends to its dissolution.

Between these extremes lies that grateful medium of grateful irritation, which produces the sensation of what we call *beauty*; and which in visible objects we call *picturesque beauty*, because painting, by imitating the visible qualities only, discriminates it from the objects of other senses with which it may be combined; and which, if productive of stronger impressions, either of pleasure or disgust, will overpower it; so that a mind not habituated to such discriminations, or (as more commonly expressed,) a person not possessed of a painter's eye, does not discover it till it is separated in the artist's imitation. Rembrandt, Ostade, Teniers, and others of the Dutch painters, have produced the most beautiful pictures, by the most exact imitations of the most ugly and disgusting objects in nature; and yet it is physically impossible that an exact imitation should exhibit qualities not existing in its original; but the case is, that, in the originals, animal disgust, and the nauseating repugnance of appetite, drown and overwhelm every milder pleasure of vision, which a blended variety of mellow and harmonious tints must necessarily produce on the eye, in nature as well as in art, if viewed in both with the same degree of abstracted and impartial attention.

In like manner, properties pleasing to the other senses often exist in objects disgusting or insipid to the eye, and make so strong an impression, that persons who seek only what is generally pleasing, confound their sensations, and imagine a thing beautiful, because they see in it something which gives them pleasure of another kind. I am not inclined, any more than Mr. Repton, *to despise the comforts of a gravel walk, or the delicious fragrance of a shrubbery*; (see his Letter to Mr. Price, p. 18.) neither am I inclined to despise the convenience of a paved street, or the agreeable scent of distilled lavender; but nevertheless, if the pavier and perfumer were to recommend their works as delicious gratifications for the eye, I might be tempted to treat them both with some degree of ridicule and contempt. Not only the fragrance of shrubs, but the freshness of young grass and green turf, and the coolness of clear water, however their disposition in modern gardens may be adverse to picturesque beauty, and disgusting to the sense of seeing, are things so grateful to the nature of man, that it is impossible to render them wholly disagreeable. Even in painting, where freshness and coolness are happily represented, scenes not distinguished by any beautiful varieties of tints or shadows, please through the medium of the imagination, which instantly conceives the comforts and pleasures which such scenes must afford; but still, in painting, they never reconcile us to any harsh or glaring discords of colour; wherefore I have recommended that art as the best criterion of the mere visible beauties of rural scenery, which are all that I have pretended to criticise.

If, however, an improver of grounds chooses to reject this criterion, and to consider picturesque beauty as not belonging to his profession, I have nothing more to do with him; the objects of our pursuit and investigation being entirely different. All that I beg of him is, that if he takes any *professional title*, it may be one really descriptive of his profession, such as that of *walk maker, shrub planter, turf cleaner, or rural perfumer*; for if *landscapes* are not what he means to produce, that of *landscape gardener* is one not only of *no mean*, but of *no true pretension*.

As for the beauties of congruity, intricacy, lightness, motion, repose, &c. they belong exclusively to the understanding and imagination; and though I have slightly

noticed them in the text, a full and accurate investigation of them would not only exceed the limits of a note, but of my whole work. The first great obstruction to it is the ambiguity of language, and the difficulty of finding distinct terms to discriminate distinct ideas. The next is the habit which men are in of flying for allusions to the inclination of the sexes towards each other; which, being the strongest of our inclinations, draws all the others into its vortex, and thus becomes the criterion of pleasures, with which it has no further connection than being derived from the same animal functions with the rest. All male animals probably think the females of their own species the most beautiful part of the creation; and in the various and complicated mind of civilized man, this original result of appetite has been so changed and diversified by the various modifications of mental sympathies, social habits, and acquired propensities, that it is impossible to analyze it: it can therefore afford no lights to guide us in exploring the general principles and theory of sensation.

Book II

To show the nice embellishments of art,
 The foreground ever is the properest part;
 For e'en minute and trifling objects near,
 Will grow important and distinct appear:
 No leaf of fern, low weed, or creeping thorn, 180
 But, near the eye, the Landscape may adorn;
 Either when tufted o'er the mouldering stone;
 Or down the slope in loose disorder thrown;
 Or, richly spread along the level green,
 It breaks the tints and variegates the scene. 185

But here again, ye rural nymphs, oppose
 Nature's and Art's confederated foes!
 Break their fell scythes, that would these beauties shave,
 And sink their iron rollers in the wave!
 Your favourite plants, and native haunts protect, 190
 In wild obscurity, and rude neglect;
 Or teach proud man his labour to employ
 To form and decorate, and not destroy;
 Teach him to place, and not remove the stone
 On yonder bank, with moss and fern o'ergrown; 195
 To cherish, not mow down, the weeds that creep
 Along the shore, or overhang the steep;
 To break, not level, the slow-rising ground,
 And guard, not cut, the fern that shades it round.

But let not still the o'erbearing pride of taste 200
 Turn fertile districts to a forest's waste:
 Still let utility improvement guide,
 And just congruity in all preside.
 While shaggy hills are left to rude neglect,
 Let the rich plains with wavy corn be deck'd; 205

And while rough thickets shade the lonely glen,
 Let culture smile upon the haunts of men;
 And the rich meadow and the fertile field
 The annual tribute of their harvests yield.
 Oft pleased we see, in some sequester'd glade, 210
 The cattle seek the aged pollard's shade;
 Or, on the hillock's swelling turf reclined,
 Snuff the cool breeze, and catch the passing wind:
 Oft too, when shelter'd from the winter's cold,
 In graceful groups they crowd the litter'd fold, 215
 Their varied forms and blended colours gay
 Mild scenes of simple elegance display,
 And with faint gleams of social comfort charm
 The humble beauties of the lonely farm.
 But never let those humble beauties try 220
 With the neat villa's tinsel charms to vie,
 Or spoil their simple unaffected grace
 With frippery ornaments and tawdry lace;
 For still to culture should its use belong,
 And affection's always in the wrong. 225

V. 200 to 225 inclusive have been added since the first edition.

After having recommended the preservation of inclosures and cottages (see Book II. v. 17 and 262), and condemned the practice of sacrificing extensive tracts of arable land to unproductive lawn (*ibid.* v. 73.), I did not expect that misrepresentation would have been carried so far as even to insinuate that my system of improvement tended to *turn this beautiful kingdom into one huge picturesque forest*; (Mr. Repton's Letter to Mr. Price, note in p. 1.) but persons who read to condemn, rather than to understand, will always interpret as best suits their own purposes.

What I have endeavoured to prove, and what I still assert, is, *that ground which is sacrificed to picturesque beauty ought to be really picturesque*; and, I think, it may be fairly presumed that the person who first dignified himself with the title of *Landscape Gardener*, meant to produce *landscapes*, and make picturesque places, when he assumed that title; whatever he may choose to profess, now that it has been proved that all his labours, as well as those of *the great self-taught master* who preceded him, have had a direct contrary tendency. In general, however, I believe that very small sacrifices are necessary; for, as I have stated in the text, (Book II. v. 176.) the foreground is the proper place for picturesque decoration, which need not therefore ever be extended far from the eye; and the kinds of ground best adapted to it are those least suited to the purposes of agriculture. Hedges are never very offensive to the eye, unless marked with lines of shredded elms, seen from great heights, in what are called bird's-eye views; or spread along the sides of mountains, where they give the inclosures the appearance of square divisions cut on the surface, than which nothing can be more harsh, meagre, and unpleasant. When seen horizontally in a flat country, they enrich and embellish, especially if their lines be occasionally broken by full-headed and well preserved trees. The custom of removing them to a great

distance from the house, in order to throw open to the eye a wide space of unbroken and undivided turf, may show magnificence and gratify vanity; but how it can add to the comfort or beauty of the dwelling, I cannot conceive.

The usual features of a cultivated country are the accidental mixtures of meadows, woods, pastures, and corn fields; interspersed with farm houses, cottages, mills, &c.; and I do not know that in this country better materials for middle grounds and distances can be obtained, or are to be wished for; and why they should be separated by a belt of plantation from the foreground, or even from the middle ground, when that is formed of smooth lawn or shrubbery, I cannot imagine. A *landscape painter* would, in all instances, wish to connect them; and it is to be hoped that the *landscape gardener* will some time or other be able to find better reasons than he has hitherto given for always separating them. Comfort and convenience are out of the question; for a fence which guards from trespass, affords all the separation that *they* require; and though the belt may conceal the materials of that useful boundary, and keep the spectator in doubt whether it be a hedge, a pale, or a wall, it so decidedly marks the line of it, that it renders it perceptible at a distance, where it would not otherwise be distinguishable from other adjoining fences. This line is exactly what an improver, who aimed at picturesque beauty and harmony of composition, would wish to hide: — why then is it so studiously, and often so expensively marked? By looking to a principle of improvement, which I have before glanced at, (Book I. v. 159.) and which Mr. Price has anticipated me in applying to the present subject, (Letter to Mr. Repton, p. 101.) we may, I believe, solve the difficulty without imputing any peculiar perversity of taste to its author. Mr. Brown, though ignorant of painting, and incapable of judging of picturesque effects, was a man of sense and observation, and had studied mankind attentively: he therefore knew that when a large sum of money had been expended in inclosing, levelling, and dressing (or rather undressing) a very extensive demesne, the proprietor would not dislike to have the great extent of his supposed improvements so distinctly marked, that all who came within sight of his place might form just notions of his taste and magnificence: for this purpose the belt is admirably contrived; and, if so intended, does honour to the sagacity and ingenuity of the inventor.

* * *

Scarcely any parts of our island are capable of affording the compositions of Salvator Rosa, Claude, and the Poussins; and only the most picturesque parts those of Rysdael, Berghem, and Pynaker; but those of Hobbima, Waterloe, and Adrian Vandervelde (which have also their beauties) are to be obtained every where. Pastures with cattle, horses or sheep grazing in them, and enriched with good trees, will always afford picturesque compositions; and inclosures of arable are never completely ugly, unless when lying in fallow, which, I believe, is very generally disused in the present improved state of husbandry. Clean and comfortable walks and rides may be made through fields, without any stiffness or formality; and by means of honeysuckles and creepers, even hedges may be made picturesque and beautiful. This is perhaps the best style of improvement for a tame flat country. The late Mr. Southgate's farm near Weybridge, though in many parts too finely dressed, is, both in design and execution, far preferable to any of the works of Kent or Brown; and is a proof of what may be done in this humble style: but in this, as in every other, picturesque effects can only be obtained by watching accidents, and profiting by

circumstances, during a long period of time. The line of a walk, the position of a seat, or limits of an inclosure, must often depend upon the accidental growth of a tree; and we must always make things, which we can command, conform to those which we cannot. The improver in his plan presupposes every thing to succeed as he chooses; and if he plants only clumps and belts of firs, he may certainly foresee the effect which they will have when arrived at maturity: but if he plants trees of less regular growth, and aims at picturesque effects in the distribution of them, he must watch the annual increase and variation in their forms; and cut down, prune, transplant, and vary his plan accordingly: the difference of a single branch in the foreground, or even in the middle distance, where the scene is on a small scale, may materially affect a whole composition.

Mr. Repton has observed that *there are a thousand scenes in nature to delight the eye, beside those which may be copied as pictures; and that one of the keenest observers of picturesque scenery (Mr. Gilpin), has often regretted that few are capable of being so represented, without considerable license and alteration.* (Letter to Mr. Price, p. 6.) I have heard many landscape painters express the same regret; but I must add, that it has always been in an inverse proportion to their merit. Unskilful artists, like unskilful musicians, are apt to omit whatever they cannot execute; and, what is worse, to supply its place with something of their own. Confirmed mannerists, both in music and painting, are apt to go still farther; and to substitute their own for the whole of what they pretend to execute or represent. The finest pieces of Italian scenery, as represented by many French and German, (and I am sorry to add) some English artists, have exactly the same resemblance to nature, as the finest pieces of Italian music executed by the performers of the *grand opera* at Paris have to the original works of the composer: yet all these artists (and I have conversed with many of them) insisted that they improved nature, and only altered such parts as were incapable of being advantageously represented in their genuine state. They made, however, a trifling mistake, which men of all professions, from statesmen to ploughmen, are very apt to make. They attributed their own incapacity to the subject on which they were employed. This I often ventured to hint in the most delicate manner I could, by citing the example of Claude, whose landscapes are more highly esteemed than those of any other master, though always composed of parts copied from nature with the most minute and scrupulous exactitude, both in the forms and colours. Claude, however, was treated by them as a slow mechanic genius, void of spirit and invention, and incapable of any higher exertion than that of tamely copying what nature and accident placed before him. They aimed at a more exalted style of excellence, and by that means got into a *style*, which rendered them incapable of any kind of excellence in art.

I do not, however, mean to insinuate that the landscape painter is to confine himself to a servile imitation of the particular scenes that he finds in nature: on the contrary, I know that nature scarcely ever affords a complete and faultless composition; but nevertheless she affords the *parts* of which taste and invention may make complete and faultless compositions; and it is by accurately and minutely copying these parts, and afterwards skilfully and judiciously combining and arranging them, that the most perfect works in the art have been produced.

By working on the same principle; by carefully collecting and cherishing the accidental beauties of wild nature; by judiciously arranging them, and skilfully combining them with each other, and the embellishments of art; I cannot but think that the landscape gardener might produce complete and faultless compositions in nature, which would be as much superior to the imitations of them by art, as the acting of a Garrick or a Siddons is to the best representation of it in a portrait. Those, indeed, who think only of making *fine places*, in order to gratify their own vanity, or profit by the vanity of others, may call this mode of proceeding *a new system of improving by neglect and accident*; yet those who have tried it know, that, though to preserve the appearance of neglect and accident be one of its objects, it is not by leaving every thing to neglect and accident, that even that is to be obtained. *Profiting by accident*, is very different from *leaving every thing to accident*; and *improving by neglect*, very different from *neglecting*. Apelles by throwing his brush at the picture of Alexander's horse, which he was painting, marked the foam at his mouth more to his own satisfaction than he had been able to do by repeated trials in the regular process of his art; yet surely no one will think this an instance of negligence or inattention; but rather a proof of that refined taste and judgment which is always watchful to take advantage of every casual incident; and thus to catch those delicate graces of execution, which the regular efforts of art, however excellent, can never reach; and which persons wholly unskilled can never feel. The *ut sibi quis speret idem, &c.* characterizes the highest degree of perfection in every art as well as that of poetry. Partridge thinks that he should look as Garrick did in Hamlet, if he saw a ghost; (Tom Jones, B. XVI. c. 5.) and I have known many a *young gentleman*, who had learned to draw a little, and thought himself a profound judge of the art, pass coldly by a brilliant sketch of Salvator Rosa or Rembrandt, without noticing it; but dwell with the warmest expressions of delight and approbation on a laboured drawing of Pillement or Worlidge. The refined delicacy of that art, which conceals itself in its own effects, is above the reach of such critics; who, looking only for the artifice of imitation, are pleased in proportion as that artifice is glaring and ostentatious; in the same manner as Partridge approves the actor most who never conceals his skill in the easy expression of nature, but performs his part throughout with such stiff pomposity that *every one might see that he was an actor*.

As this admirable scene in Fielding's most excellent novel has been misunderstood, and consequently misrepresented, by the best writer on art, as well as the best artist of the present age, I cannot resist the opportunity of vindicating it from what I consider as the unmerited censure of a person whose authority as a critic, both in art and literature, will always stand as high, as his memory as a man will be dear to those who had the happiness of knowing that his private virtues were equal to his professional talents. Partridge does not, as Sir Joshua Reynolds in one of his discourses supposes him to do, mistake, for a moment, the play for reality: on the contrary, he repeatedly says, *that he knows it is but a play, and that there is nothing at all in it*; and as *imitation* was all that he looked for, the most glaring and obvious imitation of the most dignified and imposing personage, was, to him, the most undoubted test of excellence in acting. The ghost he knows to be *only a man in a strange dress*, as he repeatedly observes; but, nevertheless, as the fear of ghosts is his predominant passion, when he sees that fear expressed by another in a manner so exactly consonant to his own

feelings, and with such unaffected truth and simplicity, that all the artifice of imitation disappears, his feelings overpower his understanding, and he sympathizes involuntarily with what he sees expressed, though he knows that all the circumstances which excite it are fictitious. This is a perfectly natural and exact picture of the effects which the different kinds of imitative expression have upon minds just cultivated enough to have their judgments perverted, without having their feelings destroyed. They admire extravagantly every artifice of imitation, which is sufficiently gross for them to perceive and comprehend; but when it is so refined as no longer to appear artifice, they entirely disregard it; unless when some strong expression happens to accord with some prominent, or ruling passion of their own, which being thus suddenly roused by a cause neither expected nor understood, so confounds and astonishes them, that it suspends, for the moment, the operation of every other faculty.

Theatrical amusements, indeed, have long been so general in this country that there are few, even among the lowest class of the people, whose judgment in them has not been corrected and refined by habitual exercise; but in landscape gardening, as well as landscape painting, there are many such critics as Partridge is represented to have been in acting; and, in *their* estimation, the stiff and tawdry glare of a modern improved place will appear as much preferable to the easy elegance and unaffected variety of natural scenery, as the stately strut and turgid declamation of the mock monarch of the stage did in *his*, to the easy dignity of deportment and grace of utterance, which a good actor would have given to the same character.

15 Uvedale Price (1747–1829) from ‘A Dialogue on the Distinct Characters of the Picturesque and the Beautiful’

Price’s dialogue was written in response to Knight’s criticism, or at least to the principle that he believed was at issue: the question of the separability of the interests of art, as represented by the picturesque, and of nature, as represented by the beautiful. (In the context of this debate ‘Nature’ tends to carry a positive moral connotation; the ‘beautiful’ is therefore not simply that which is attractive but that which is seen as good in itself.) In his poem (VB14) Knight had argued that the eye may occasionally respond positively to ‘artistic’ arrangements of light and colour, in abstraction from those other senses which might attach meaning to the forms in question. These arrangements might be conceived of as picturesque rather than beautiful. On the other hand, he regarded such occasions as exceptions: ‘In general, art and nature love the same,’ which is to say that individuals normally find picturesque that which they are disposed to approve and to find agreeable in reality, so that the distinction between the picturesque and the beautiful tends to collapse. Price wished to maintain the distinction. In this dialogue Knight’s words are put into the mouth of ‘Mr. Howard’, while Price’s own arguments are voiced by ‘Mr. Hamilton’. ‘Mr. Seymour’ acts as straight man, mostly to Mr. Hamilton. In face of such material, it is not hard to understand why the debate over the picturesque should have drawn the attention of literary satirists. And yet certain of the issues at stake were to remain matters of substantial controversy throughout the modern period, seriously dividing the advocates of opposed positions. Can we judge representations independently of our responses to that which they picture? Modernist theory has tended to say that we can and should. On the

other hand, the modern Mr Seymour feels a justifiable anxiety at the separation of aesthetic judgements from political positions and social concerns. Our text is taken from *A Dialogue on the Distinct Characters of The Picturesque and the Beautiful in answer to the Objections of Mr. Knight. Prefaced by An Introductory Essay on Beauty; with Remarks on the ideas of Sir Joshua Reynolds & Mr. Burke, upon that subject*, London: J. Robson, 1801, pp. 101–5, 107, 114–21.

Mr. Howard and Mr. Hamilton, two gentlemen remarkably fond of pictures, were on their return from a tour they had been making through the north of England. They were just setting out on their walk to a seat in the neighbourhood, where there was a famous collection of pictures, when a chaise drove to the inn door; and they saw, to their great delight, that the person who got out of it was Mr. Seymour, an intimate friend of their's. After the first rejoicings at meeting so unexpectedly, they told him whither ther they were going, and proposed to him to accompany them. You know, said he, how ignorant I am of pictures, and of every thing that relates to them; but, at all events, I shall have great pleasure in walking with you, and shall not be sorry to take a lesson of connoisseurship from two such able masters.

Mr. Hamilton had formerly been a great deal at the house they were going to, and undertook to be their guide: the three friends however conversed so eagerly together, that they missed their way, and got into a wild unfrequented part of the country; when, suddenly, they came to a ruinous hovel on the outskirts of a heathy common. In a dark corner of it, some gypsies were sitting over a half-extinguished fire, which every now and then, as one of them stooped down to blow it, feebly blazed up for an instant, and shewed their sooty faces, and black tangled locks. An old male gypsey stood at the entrance, with a countenance that well expressed his three-fold occupation, of beggar, thief, and fortune-teller; and by him a few worn-out asses: one loaded with rusty panniers, the others with old tattered cloaths and furniture. The hovel was propt and overhung hy a blighted oak; its bare roots staring through the crumbling bank on which it stood. A gleam of light from under a dark cloud, glanced on the most prominent parts: the rest was buried in deep shadow; except where the dying embers

‘Taught light to counterfeit a gloom.’

The three friends stood a long while contemplating this singular scene; but the two lovers of painting could hardly quit it: they talked in raptures of every part; of the old hovel, the broken ground, the blasted oak, gypsies, asses, panniers, the catching lights, the deep shadows, the rich mellow tints, the grouping, the composition, the effect of the whole; and the words beautiful, and picturesque, were a hundred times repeated. The uninitiated friend listened with some surprise; and when their raptures had a little subsided, he begged them to explain to him how it happened, that many of those things which he himself, and most others he believed, would call ugly, they called beautiful, and *picturesque* – a word, which those who were conversant in painting, might perhaps use in a more precise, or a more extended sense, than was done in common discourse, or writing. Mr. Howard told him that the picturesque, was merely that kind of beauty which belongs exclusively to the sense of vision, or to

the imagination guided by that sense. Then, said Mr. Seymour, as far as visible objects are concerned, what is picturesque is beautiful, and vice versâ; in short, they are two words for the same idea. I do not, however, entirely comprehend the meaning of *exclusively*, to the sense of vision.

* * *

'We have all learned to distinguish by the sight alone, not only form in general, but, likewise, its different qualities; such as hardness, softness, roughness, smoothness, &c. and to judge of the distance and gradation of objects: all these ideas, it is true, are originally acquired by the touch; but from use, they are become as much objects of the sight, as colours. *You* may possibly be able, so to abstract your attention from all these heterogeneous qualities, as to see light and colours only; but, for my part, I plainly see that old gypsey's wrinkles, as well as the colour of his skin; I see that his beard is not only grizzle, but rough and stubbed, and, in my mind, very ugly; I see that the hovel is rugged and uneven, as well as brown and dingy; and I cannot get these things out of my mind by any endeavours: in short, what I see and feel to be ugly, I cannot think, or call beautiful, whatever lovers of painting may do.'

* * *

'Tell me, then, how you account for this strange difference between an eye accustomed to painting, and that of such a person as myself? If those things which Howard calls beautiful, and those which I should call beautiful, are as different as light and darkness, would it not be better to have some term totally unconnected with that of beauty, by which such objects as we have just been looking at, should be characterised? By such means, you would avoid puzzling us vulgar observers with a term, to which we cannot help annexing ideas of what is soft, graceful, elegant, and lovely; and which, therefore, when applied to hovels, rags, and gypsies, contradicts and confounds all our notions and feelings.'

'The term you require,' answered Mr. Hamilton, 'has already been invented, for, according to my ideas, the word Picturesque, has exactly the meaning you have just described.'

'Then,' said Mr. Seymour, '*you* do not hold picturesque and beautiful to be synonymous.'

'By no means,' said he; 'and that is the only difference between Howard and me: in all the effects that arise from the various combinations of form, colour, and light and shadow, we agree; and I am truly sorry that we should disagree on this distinction.'

'No matter,' said Mr. Seymour; 'a friendly discussion of this kind, opens the road to truth; and, as I have no prejudice on either side, I shall take much delight in hearing your different opinions and arguments. Tell me, then, what is your idea of the picturesque?'

'That is no easy question,' said Mr. Hamilton, 'for to explain my idea of it in detail, would be to talk a volume; but, in reality, you have yourself explained a very principal distinction between the two characters: the set of objects we have been looking at, struck you with their singularity; but instead of thinking them beautiful, you were disposed to call them ugly: now, I should neither call them beautiful, nor ugly, but picturesque; for they have qualities highly suited to the painter and his art, but which are, in general, less attractive to the bulk of mankind; whereas the qualities of beauty, are universally pleasing and alluring to all observers.'

'I must own,' said Mr. Seymour, 'that it is some relief to me to find, that, according to your doctrine, I am not forced to call an ugly thing beautiful; yet, still, by the help of a middle term, may avoid the offence I must otherwise give to painters. But what most surprises me, and what I wish you to explain, is, that those objects which you and Howard so much admired, and which he called beautiful, not only appeared to me ugly, but very strikingly so: am I, then, to conclude that the more peculiarly and strikingly ugly an object is, the more charms it has for the painter?'

'You will be surprised,' said Mr. Hamilton, 'when I tell you, that what you have, perhaps ironically, supposed, is in great measure the case.'

Just at this time, a man, with something of a foreign look, passed by them on the heath, whose dress and appearance they could not help staring at. 'There,' said Mr. Seymour, after he had passed them, 'I hope, Hamilton, you are charmed with that figure! I hope he is sufficiently ugly for you: I shall not get his image out of my head for some time; what a singularly formed nose he has, and what a size! what eyebrows! how they, and his black raven hair, hung over his eyes, and what a dark designing look in those eyes! then the slouched hat that he wore on one side, and the sort of cloak he threw across him, as if he were concealing some weapon!'

'Need I now explain,' interrupted Mr. Hamilton, 'why an object peculiarly and strikingly ugly, is picturesque? Were this figure, just as you saw him, to be expressed by a painter with exactness and spirit, would you not be struck with it, as you were just now in nature, and from the same reasons? What indeed is the object of an artist, in whatever art? Not merely to represent the soft, the elegant, or the dignified and majestic; his point is to fix the attention; if he cannot by grandeur or beauty, he will try to do it by deformity: and indeed, according to Erasmus, *'quæ naturâ deformia sunt, plus habent et artis et voluptatis in tabulâ.'* It is not ugliness, it is insipidity, however accompanied, that the painter avoids, and with reason; for if it deprives even beauty of its attractions, what must it do when united to ugliness? Do you recollect a person who passed by us, a little before you saw this figure that struck you so much? you must remember the circumstance, for he bowed to me as he passed, and you asked me his name, but made no further remark, or enquiry. I, who have often seen him, know that he is as ugly, if not uglier, than the other; a squat figure; a complexion like tallow; an unmeaning, pudding face, the marks of the small-pox appearing all over it, like bits of suet through the skin of a real pudding: a nose like a potatoe; and dull, heavy, oyster-like eyes, just suited to his face and person. A figure of this kind, dressed as he was, in a common coat and waistcoat, and a common sort of wig, excites little or no attention; and if you do happen to look at it, makes you turn away with mere disgust. Such ugliness, therefore, neither painters, nor others, pay any attention to; but the painter, from having observed many strongly marked peculiarities and effects, which, in the human species, though mixed with ugliness, attract in some degree the notice of all beholders, is led to remark similar peculiarities and effects in inanimate, and consequently less interesting objects; while those persons, who have not considered them in the same point of view, pass by them with indifference.'

16 Katherine Plymley (1758–1829) Notebook and diary entries

The diarist Katherine Plymley lived in the West Midlands near Shrewsbury. Her brother Joseph was Archdeacon for Shropshire, and her friends and acquaintances included the Wedgwood family, the Darwins, the Gilpins (VB2, 5 and 11), Archibald Alison (VA11) and his wife Dorothea, Richard Payne Knight and Thomas Pennant. Other contacts came from the world of science and industry and included Quaker industrialists from nearby Coalbrookdale. She engaged in a systematic process of self-improvement, including the cultivation of her aesthetic awareness. Her extensive notebooks and diaries provide plentiful evidence of her familiarity with contemporary theories of taste and of the picturesque. We have included three short excerpts from her notebooks, which reflect her reading of theorists such as Archibald Alison and James Beattie (1735–1803). Two further excerpts from her diaries describe visits in 1794 to Coalbrookdale, where the Quaker ironmaster Richard Reynolds had made walks for his workers to enjoy the romantic scenery juxtaposed with dramatic effects of industry, and in 1797 to Downton in Herefordshire, where the grounds had been laid out by Richard Payne Knight (see VB14). Plymley's notebooks and diaries are kept in the Shropshire Research and Records Office. The following excerpts have been transcribed and edited by Jo Dahn, who also provided this introduction.

On imagination

The Human Soul is essentially active; & none of our faculties are more restless than this of Imagination . . . the right government of this faculty must be a matter of the greatest importance to all men. [One should] repress every disagreeable passion, as anger, revenge, envy, suspicion, & discontent; & cherish Piety, humanity, forgiveness, patience, & a lowly mind. For the latter bring along with them sweet & soothing ideas, as painful thoughts & misery are the inseparable companions of the former.

On the association of ideas

The Association of Ideas is commonly referred to imagination, but appears to be owing in part to habits affecting the memory, & the outward senses . . . a tune . . . will give pleasure when heard again, by recalling those ideas of delight that accompanied the first performance . . . A present, however trifling, preserved as the memorial of a friend, derives inestimable value from its power of enlivening our idea of the giver, & renewing those kind emotions, whereof that person is the object.

On the constituency of taste

. . . to be a person of taste, it seems necessary that one have 1st, a lively & correct imagination; which however, will avail but little if it is not regulated by the knowledge of nature, both external or material, & internal or moral; 2ly, the power of distinct apprehension; for obtaining which he recommends, to study with accuracy, & with method, everything we apply to, whether books or business. 3ly, the capacity of being easily, strongly, & agreeably affected, with sublimity, beauty, harmony, exact imitation, &c. these he calls secondary senses, & observes no person ever possessed

the faculty of being equally skilled in them all. 4ly, Sympathy, or that sensibility of heart, by which, on supposing ourselves in the condition of others, we are conscious in some degree of those very emotions, pleasant or painful, which would arise within us if we were really in that condition, & 5ly, judgement, or good sense, which is the principal thing, & may not very improperly be said to comprehend all the rest . . . no man will ever acquire good taste, unless nature has made him a man of senses.

Downton in Herefordshire

. . . here is charming natural scenery, & it is pleasant to see such places in the hands of taste, Mr Knight is contented not to interfere with its natural charms, all he does is only to shew it to advantage, the principal beauty is a river that winds beautifully in a narrow vale between rocky eminences wooded to their tops, walks are cut in the rock above the river, that rolls its clear water over a rocky bed, an elegant stone bridge of three arches over it, is one approach to the house; I lamented to find that the floods of last winter had destroy'd a wooden bridge of a very singular construction, it appear'd to be nothing more than some large trees fallen across the river, & had a most picturesque effect . . . when I crossed it in my walk about Downton Castle some years ago . . . I was greatly struck with it, the view up & down the river when you stood upon the bridge was highly picturesque & beautiful – In conformity with the rules he has given in his poem of the Landskip Mr Knight leaves his walks, even those near the house, in a very rude state, he is an enemy to all appearance of art in his grounds yet it may be urged that an house being an artificial object, it cannot be un[a]vailable to keep the walks & grounds about it in neat order – In further conformity to his own rules he has clear'd away the Firs, having a violent quarrel with that species of tree – [. . .] The situation is fine, & the view from the house remarkably well wooded. The smoke from Brinswood forge rising among trees has a good effect, & reminds me of the immense wealth that is sometimes acquired when industry & an invariable attention to self-interest are united with ability; for in this forge the founder of several families all possessing large estates, or immense monied fortunes, was originally a wheeler of charcoal, & rose to be the greatest Iron master of the kingdom, he was the grandfather of the present Mr Knight . . . We reach'd home the same evening, so well pleased with all we have seen as scarcely to allow us to reflect how much more beautiful the face of the country will appear a little while hence.

Coalbrookdale

. . . got to the Ironbridge Inn late in the evening, walked through part of the walks planted by Mr Reynolds, & which he permits the public to enjoy, till we reach'd the Rotunda placed on Lincoln Hill, the pillars of it are cast Iron – from whence we had a fine view of the Dale by night – the numerous fires have a fine effect, not only there in the Dale but several other works towards Broseley, Madeley &c. The next morning after a delightful walk through other plantations of Mr Reynolds we reach'd the Dale & look'd at the works of which though I have before seen them I am too ignorant to speak; it is wonderful to see the vivid green of the plantations so near the smoke of the

works, in the close walks it may be supposed that we are in a rural & retired spot, at convenient distances are placed seats which command views of a romantic country & discover how near we are to busy life; there is something in this contrast very pleasing – What pleases me much is a vast cavern of lime stone which they work under Lincoln Hill, as they take out the stone they leave massy pillars of it for support, they are formed into grand rude arches no caverns or made grottoes that I have seen can bear the least comparison with it. – what is striking is that it is seen by the light of day led in through some of the outward arches – there is light sufficient to look through these fine caverns & yet gloom sufficient to accord with the scene.

17 François-René, Comte de Chateaubriand (1768–1848) ‘Letter on Landscape Painting’

The French writer and statesman Chateaubriand was born in Saint-Malo of a noble Breton family. After witnessing the beginnings of the Revolution, he set sail in 1791 for North America. His memoirs vividly reveal the contrast between his experiences of the end of the *ancien régime* and his encounter with the New World. He travelled as far west as Ohio and was greatly moved by the wildness and vastness of the natural landscape: ‘Never has God more stirred me with his grandeur than in those nights, when I had immensity over my head and immensity under my feet.’ On his return to France he joined the army of the royalist émigrés, but was severely wounded at the battle of Thionville. He managed to make his way to Jersey and from there to England, where he remained in exile from 1793 to 1800. Despite continuing problems with his health, he occupied himself with writing and translating. In 1797 he published his highly pessimistic *Essai sur les révolutions*. This was followed in 1801 by *Atala*, a Romantic epic of American Indian life, which established his literary reputation, and in 1803, *Génie du christianisme*, in which he sought to restore the role of the Catholic Church in the moral and intellectual life of post-revolutionary France (see VIIB4). The ‘Letter on Landscape Painting’ was written during his stay in England. The letter was first published by Chateaubriand himself in 1828 in volume 22 of his collected works (*Œuvres complètes*, Paris: Ladvocat, 31 vols, 1826–31). In 1795 he was actually in Beccles in Suffolk rather than London, and it is likely that he subsequently changed the address for its greater resonance abroad. Chateaubriand has been seen as an important precursor of Romanticism. This short letter adumbrates many of its principal concerns. The unknown addressee is urged to correct art by reference to nature and to trust to his own direct responses to the natural world. The complete letter has been translated for the present volume by Jason Gaiger from *Correspondance générale, I, 1789–1807*, ed. B. d’Andlau, P. Christophorov and P. Riberette, Paris: Gallimard, 1977, pp. 69–73.

To Monsieur * * *

London, 1795

Here is the small landscape you asked me for. I have made you wait for it, but you know the sad circumstances which require that I devote myself to other studies. If the doctors are to be believed, however, this will not last long; I am ready when and however it may please God. These same studies have also caused me to abandon the large *prospect* of Canada which gave me such pleasure as a reminder of my travels.

What a difference between those times and these! When my thoughts return to the past my sorrows become so vivid that I do not know what will become of me. Forgive this baring of my soul. It is a great pleasure to speak of one's sufferings when you know that those who are listening can understand you. There are few people who understand me here.

The small drawing I am sending you encouraged me to develop some thoughts on the art of landscape which may be of some use to you. In any case, it is winter and you will have a fire lit – a great resource against scribblers.

Brought up amongst forests, I have been struck by the faults of the art and the dryness of landscapes ever since my childhood, without my being able to say wherein these faults consist. From the time when I myself began to draw, I was aware that something was wrong when I copied from models. I was better pleased with myself when I followed my own ideas. Imperceptibly, I was led to consider the cause of this strange state of affairs; for after all what I produced in accordance with the rules was worth more than what I created out of my own head. Here is what I gained from these deliberations; it is the most satisfactory solution to this problem that I have been able to find.

In general, landscape painters do not love nature sufficiently and they possess little knowledge of her. Here I do not refer to the great masters, about whom in any case there would be much more to say. I speak only of ordinary painters and of amateurs like ourselves. We are taught to intensify or to brighten shadows, to draw pure, clean lines, and so forth; but we are not taught to study the objects themselves which flatter us so agreeably in our paintings of nature. We are made only to observe features of the paintings which give us delight, to attend to the harmonies and the contrasts between old woods and bocage, or between dry rocks and meadows adorned with all the fresh youth of flowers. It seems as if the study of landscape consists in nothing but the study of pencil-marks and brushstrokes; the entire art is reduced to bringing together certain traits in such a way that the appearance is given of trees, houses, animals and other objects. The landscapist who draws in this fashion resembles a lace-maker who passes her small sticks on top of each other whilst chatting away or looking elsewhere; the result is something which is made up of holes and solid parts, and which forms a fabric of greater or lesser variety: this may be termed a craft, but not an art.

The first concern of students must be with the study of nature herself. Their first lessons should be taken in the open countryside. Let a young man be struck by the effect of a waterfall which cascades from the summit of a rock and by the way in which the water seethes and flows away. The movement, the noise, the shafts of light, the grouping of the shadows, the dishevelled plants, the froth which forms like snow at the bottom of the fall, the fresh grass which runs along the banks of the stream – all this will be engraved in the student's memory. These memories will pursue him to his studio; before he even picks up his brush he will burn with desire to reproduce what he has seen. The first thing he produces is a misshapen sketch; he is unhappy with what he has done; he starts all over again and then tears it up once more. He realizes that there are certain principles of which he is ignorant and he is forced to recognize that he needs a master. But such a student will not remain long at the level

of principles and he will proceed with the steps of a giant on a career in which inspiration will be his first guide.

The painter who seeks to represent human nature must study the passions: if we do not know a man's heart, we will not know his face. Landscape, too, has its moral and intellectual part just as a portrait does. It too must speak. Through the material execution of a landscape we must be made aware of the different sort of reveries and sentiments to which different locations give rise. It is not a matter of indifference, for example, if a landscape is depicted with oak trees or with willows: oak trees have a long life, *durando sæcula vincit*, with their rough bark, strong branches and tall peaks, *immota manet*, they inspire beneath their shade sentiments quite different from those produced by the light foliage of willows, which live for only a short time and which possess the freshness of the waters from which they draw their sap: *umbræ irrugui fontis amica salix*.¹

For want of having studied nature, the landscape painter, like the poet, sometimes violates the character of her sites. He places pine trees on the banks of a stream and poplars on the side of a mountain; he scatters a basket of flowers taken from a garden across a meadow; the eglantine of a wild hedge bears a rose from one of our flowerbeds – a crown which it cannot support.

In my opinion, the study of botany is useful for the landscape painter, even if only so that he learns to understand *foliage* and does not give the same outline and the same shape to the leaves of all the trees. The painter who wishes to express on his canvas the melancholy passions of man is obliged to use anatomy to study the organs of the body. The landscape painter, more fortunate, need only occupy himself with the innocent generation of flowers, the nodding of plants and the placid habits of rustic animals.

Once the student has made his way past these first stages, and once he has become sufficiently confident with his brush to allow him to follow the direction of his thoughts without a guide, he must take himself into solitude and abandon the fields which have been degraded by the proximity of towns. Otherwise, his imagination, which is greater than this small circle of nature, would end up despising nature herself; he would begin to believe that he can create something better than Creation: a dangerous error which would lead him far from the truth and into bizarre productions which he would take for genius.

Let us beware of believing that our imagination is richer and more fecund than nature herself. That which we call *great* in our minds is almost always disorder. Similarly in the art which forms the subject of this letter, when we imagine what is *great* we think of mountains piled up to the sky, torrents, precipices, the heaving ocean, waves so huge that we can see them only in the turbulence of our thoughts, wind and thunder. What else? A million things, incoherent and verging on the absurd, if we are to be honest and give a frank and clear account of our ideas.

Should all this not serve as proof of man's penchant for destruction? It is far easier for us to imagine chaos than the proper proportions of the universe. Unless it is combined with a memory of terror, it is only with great difficulty that we can picture to ourselves the calm of the sea. This can be seen from those descriptions of calm which are almost always accompanied by words such as *menacing*, *profound silence*, and so forth. When a landscape painter, full of these ridiculous ideas of the sublime,

arrives during a storm at the shore of the sea which he has never seen before, he is astonished to observe that the swelling waves approach and recede with order and majesty one after another, instead of the violence and chaos which he had imagined. He hears a dull noise mixed with clear and harsh sounds interspersed with short periods of silence instead of that din which our painter had imagined in his mind. Everywhere there are glaring colours, but these conserve their harmonies right up to the point at which they disappear. The dazzling spray of the waves splashes up against the black rocks; vast clouds roll before a dark horizon. But they are all pushed in the same direction; a thousand unchained winds do not fight against each other, nor do colours intermix or waves climb to the skies, with the light terrifying the dead through chasms hollowed out between the waves.

Our young poet or young painter will cry 'But I imagine it better than that!' and he will turn his back with disdain. But if his character is good, he will soon retreat from these extravagant ideas; he will correct his imagination and nothing will appear to him greater than the work which was formed by the first Great Power. He will topple over the mountains ranged up in his head in which every locale, every character and every plant are mixed up together. These ideal mountains will never reach up again to the stars, but snow will still cover the peaks of the Alps and torrents will pour from its summit; in a less elevated region, larks will begin to adorn the sides of the rocks; more fragile plants will end their sojourn amongst the tempests and gradually descend into the valleys; and the hut of the Swiss farmer and soldier will smile under greyish willows by the side of a stream.

Made strong by his studies and by this purification of his taste, the student will give himself up to his genius. He will lead the eyes of the amateur under pine trees or perhaps a tomb covered in ivy will call in vain for his favour. In a narrow valley surrounded by bare rocks he will place the ruins of an old château; through the fissures of the towers will be seen the trunk of a solitary tree which has invaded this place where once there was noise and battle; samphire will cover the fallen debris with its white crosses and ferns will carpet the pieces of wall which still remain upright. Perhaps a young herdsman will guard his goats there, and they will leap from ruin to ruin.

Cheerful landscapes, too, will receive their turn, even though such compositions are generally less engaging. This may be because happiness is little suited to man or because painting provides few resources for depicting rustic pleasures which are reduced for the most part to dancing and singing. There are, however, certain general features proper to these sorts of *prospects*: the foliage should be light and mobile, the distant view should be indeterminate without being hazy, shadows should not be emphasized too strongly, and over the whole scene there should reign a gentle light which softens the surfaces of objects.

The landscape painter will learn the effect of different horizons upon the colour of his paintings. Imagine two perfectly identical valleys, one of which faces south, the other north. The tone, the physiognomy and the moral expression of these two prospects will be completely different.

Aerial perspective is prodigiously difficult. Nonetheless, one must know how to situate linear perspective on the surface of the earth and how to capture the transient features of clouds which vary so much at different times of day. Night too has its

colours. It is not enough to make the moon pale to make it beautiful; chaste Diana too has her loves and the purity of the moon's rays should not take anything away from the inspiration of its light.

This letter is already of an extreme length and I have only begun to touch upon this inexhaustible subject. All that I wanted to say to you here is that landscape must be *drawn* from the *nude* if one wants to depict it accurately and to reveal, so to speak, its muscles, its bones, its forms. Studies after the work of others, copies of copies, can never replace study from nature herself. *Atticæ plurinam salutem.*²

¹ The first two Latin citations are from Virgil's *Georgics*, Book II, lines 294–5: ... *immola manet multosque nepotes/ Multa virum volvens durando saecula vincit* (... unmoved it abides, and many generations, many ages of men it outlives). The second quotation remains untraced, but means 'the willow loves the source which bathes the trees.'

² 'A thousand compliments to Attica' (Cicero, *Attica*, XIV, 20).

18 Mary Wollstonecraft (1759–1797) 'On Poetry, and our Relish for the Beauties of Nature'

Wollstonecraft remains best known for her *Vindication of the Rights of Women* (1792), and for her early writings on education. But she also wrote on a variety of other subjects, notably in the wide range of reviews she contributed to the *Analytical Review*. These tended to be on more broadly 'cultural' themes, such as novels, travel literature, collections of correspondence, poetry, drama and so on. She also wrote the present free-standing essay, 'On Poetry, and Our Relish for the Beauties of Nature' which appeared in the *Monthly Magazine* for April 1797 (pp. 279–82). Despite its title, the essay's concerns are restricted neither to poetry nor to nature. It has implications for the other arts, particularly the visual arts, and what it addresses is less nature per se than a certain myth or stereotype of nature entertained by modern town-dwellers. The paradox Wollstonecraft explores is that a taste for nature is an artificial sentiment, part of a would-be refined taste. Nonetheless, she is convinced of the virtue of an art which *really* draws its inspiration from nature, rather than from other art and polite convention – as did poetry in what she calls 'the infancy of society'. The qualities she values are those of spontaneity and truth rather than those of images 'selected from books'. The essay was included by William Godwin in volume IV of *Posthumous Works of the Author of a Vindication of the Rights of Women* (1797). We have taken our extracts from that text as reprinted in *The Works of Mary Wollstonecraft*, volume 7, edited by Janet Todd and Marilyn Butler, London: William Pickering, 1989, pp. 7–10.

A taste for rural scenes, in the present state of society, appears to be very often an artificial sentiment, rather inspired by poetry and romances, than a real perception of the beauties of nature. But, as it is reckoned a proof of refined taste to praise the calm pleasures which the country affords, the theme is never exhausted. Yet it may be made a question, whether this romantic kind of declamation, has much effect on the conduct of those, who leave, for a season, the crowded cities in which they were bred.

I have been led to these reflections, by observing, when I have resided for any length of time in the country, how few people seem to contemplate nature with their own eyes. I have 'brushed the dew away' in the morning; but, pacing over the

printless grass, I have wondered that, in such delightful situations, the sun was allowed to rise in solitary majesty, whilst my eyes alone hailed its beautifying beams. The webs of the evening have still been spread across the hedged path, unless some labouring man, trudging to work, disturbed the fairy structure; yet, in spite of this supineness, when I joined the social circle, every tongue rang changes on the pleasures of the country.

Having frequently had occasion to make the same observation, I was led to endeavour, in one of my solitary rambles, to trace the cause, and likewise to enquire why the poetry written in the infancy of society, is most natural: which, strictly speaking (for *natural* is a very indefinite expression) is merely to say, that it is the transcript of immediate sensations, in all their native wildness and simplicity, when fancy, awakened by the sight of interesting objects, was most actively at work. At such moments, sensibility quickly furnishes similes, and the sublimated spirits combine images, which rising spontaneously, it is not necessary coldly to ransack the understanding or memory, till the laborious efforts of judgment exclude present sensations, and damp the fire of enthusiasm.

The effusions of a vigorous mind, will ever tell us how far the understanding has been enlarged by thought, and stored with knowledge. The richness of the soil even appears on the surface; and the result of profound thinking, often mixing, with playful grace, in the reveries of the poet, smoothly incorporates with the ebullitions of animal spirits, when the finely fashioned nerve vibrates acutely with rapture, or when, relaxed by soft melancholy, a pleasing languor prompts the long-drawn sigh, and feeds the slowly falling tear.

The poet, the man of strong feelings, gives us only an image of his mind, when he was actually alone, conversing with himself, and marking the impression which nature had made on his own heart. – If, at this sacred moment, the idea of some departed friend, some tender recollection when the soul was most alive to tenderness, intruded unawares into his thoughts, the sorrow which it produced is artlessly, yet poetically expressed – and who can avoid sympathizing?

Love to man leads to devotion – grand and sublime images strike the imagination – God is seen in every floating cloud, and comes from the misty mountain to receive the noblest homage of an intelligent creature – praise. How solemn is the moment, when all affections and remembrances fade before the sublime admiration which the wisdom and goodness of God inspires, when he is worshipped in a *temple not made with hands* [Revelation 21–2], and the world seems to contain only the mind that formed, and the mind that contemplates it! These are not the weak responses of ceremonial devotion; nor, to express them, would the poet need another poet's aid: his heart burns within him, and he speaks the language of truth and nature with resistless energy.

Inequalities, of course, are observable in his effusions; and a less vigorous fancy, with more taste, would have produced more elegance and uniformity; but, as passages are softened or expunged during the cooler moments of reflection, the understanding is gratified at the expence of those involuntary sensations, which, like the beautiful tints of an evening sky, are so evanescent, that they melt into new forms before they can be analyzed. For however eloquently we may boast of our reason, man must often

be delighted he cannot tell why, or his blunt feelings are not made to relish the beauties which nature, poetry, or any of the imitative arts, afford.

The imagery of the ancients seems naturally to have been borrowed from surrounding objects and their mythology. When a hero is to be transported from one place to another, across pathless wastes, is any vehicle so natural, as one of the fleecy clouds on which the poet has often gazed, scarcely conscious that he wished to make it his chariot? Again, when nature seems to present obstacles to his progress at almost every step, when the tangled forest and steep mountain stand as barriers, to pass over which the mind longs for supernatural aid; an interposing deity, who walks on the waves, and rules the storm, severely felt in the first attempts to cultivate a country, will receive from the impassioned fancy 'a local habitation and a name' [*A Midsummer Night's Dream*].

It would be a philosophical enquiry, and throw some light on the history of the human mind, to trace, as far as our information will allow us to trace, the spontaneous feelings and ideas which have produced the images that now frequently appear unnatural, because they are remote; and disgusting, because they have been servilely copied by poets, whose habits of thinking, and views of nature must have been different; for, though the understanding seldom disturbs the current of our present feelings, without dissipating the gay clouds which fancy has been embracing, yet it silently gives the colour to the whole tenour of them, and the dream is over, when truth is grossly violated, or images introduced, selected from books, and not from local manners or popular prejudices.

In a more advanced state of civilization, a poet is rather the creature of art, than of nature. The books that he reads in his youth, become a hot-bed in which artificial fruits are produced, beautiful to the common eye, though they want the true hue and flavour. His images do not arise from sensations; they are copies; and, like the works of the painters who copy ancient statues when they draw men and women of their own times, we acknowledge that the features are fine, and the proportions just; yet they are men of stone; insipid figures, that never convey to the mind the idea of a portrait taken from life, where the soul gives spirit and homogeneity to the whole. The silken wings of fancy are shrivelled by rules; and a desire of attaining elegance of diction, occasions an attention to words, incompatible with sublime, impassioned thoughts. [...]

It may sound paradoxical, after observing that those productions want vigour, that are merely the work of imitation, in which the understanding has violently directed, if not extinguished, the blaze of fancy, to assert, that, though genius be only another world for exquisite sensibility, the first observers of nature, the true poets, exercised their understanding much more than their imitators. But they exercised it to discriminate things, whilst their followers were busy to borrow sentiments and arrange words. [...]

[T]hough it should be allowed that books may produce some poets, I fear they will never be the poets who charm our cares to sleep, or extort admiration. They may diffuse taste, and polish the language; but I am inclined to conclude that they will seldom rouse the passions, or amend the heart.

And, to return to the first subject of discussion, the reason why most people are more interested by a scene described by a poet, than by a view of nature, probably

arises from the want of a lively imagination. The poet contracts the prospect, and, selecting the most picturesque part in his *camera*, the judgment is directed, and the whole force of the languid faculty turned towards the objects which excited the most forcible emotions in the poet's heart; the reader consequently feels the enlivened description, though he was not able to receive a first impression from the operations of his own mind.

Besides, it may be further observed, that gross minds are only to be moved by forcible representations. To rouse the thoughtless, objects must be presented, calculated to produce tumultuous emotions; the unsubstantial, picturesque forms which a contemplative man gazes on, and often follows with ardour till he is mocked by a glimpse of unattainable excellence, appear to them the light vapours of a dreaming enthusiast, who gives up the substance for the shadow. It is not within that they seek amusement; their eyes are seldom turned on themselves; consequently their emotions, though sometimes fervid, are always transient, and the nicer perceptions which distinguish the man of genuine taste, are not felt, or make such a slight impression as scarcely to excite any pleasurable sensations. Is it surprising then that they are often overlooked, even by those who are delighted by the same images concentrated by the poet?

19 Jane Austen (1775–1817) from *Northanger Abbey*

Jane Austen wrote *Northanger Abbey* in 1798–9 and sold it to the publisher Richard Crosby in 1803. He failed to publish it, however, and it was not printed until 1818, a year after the author's death, when it was issued together with *Persuasion*. We include an excerpt here as a telling representation of contemporary conversation about the picturesque. In the later *Mansfield Park*, Austen's characters are given the best part of a chapter in which to reveal themselves through what they have to say about the 'improvement' of parks and gardens. *Northanger Abbey* was provoked in part by the contemporary taste for 'Gothic' novels, the most successful of these being *The Mysteries of Udolpho* by Mrs Radcliffe. Our text is taken from the Everyman's Library edition, London: Dent, (1906) 1966, pp. 89–90. Austen's disingenuous heroine, Catherine Morland, is staying in Bath and is befriended by the more sophisticated Mr Tilney and his sister Eleanor. In chapter XIV, the trio take a walk on Beechen Cliff, 'that noble hill, whose beautiful verdure and hanging coppice render it so striking an object from almost every opening in Bath'. After conversation about *The Mysteries of Udolpho* and novels in general, the Tilneys embark on another subject upon which Catherine is at a loss.

They were viewing the country with the eyes of persons accustomed to drawing, and decided on its capability of being formed into pictures, with all the eagerness of real taste. Here Catherine was quite lost. She knew nothing of drawing – nothing of taste: – and she listened to them with an attention which brought her little profit, for they talked in phrases which conveyed scarcely any idea to her. The little which she could understand however appeared to contradict the very few notions she had entertained on the matter before. It seemed as if a good view were no longer to be taken from the top of an high hill, and that a clear blue sky was no longer a proof of a

fine day. She was heartily ashamed of her ignorance. A misplaced shame. Where people wish to attach, they should always be ignorant. To come with a well-informed mind, is to come with an inability of administering to the vanity of others, which a sensible person would always wish to avoid. A woman especially, if she have the misfortune of knowing any thing, should conceal it as well as she can.

The advantages of natural folly in a beautiful girl have been already set forth by the capital pen of a sister author; – and to her treatment of the subject I will only add in justice to men, that though to the larger and more trifling part of the sex, imbecility in females is a great enhancement of their personal charms, there is a portion of them too reasonable and too well-informed themselves to desire any thing more in woman than ignorance. But Catherine did not know her own advantages – did not know that a good-looking girl, with an affectionate heart and a very ignorant mind, cannot fail of attracting a clever young man, unless circumstances are particularly untoward. In the present instance, she confessed and lamented her want of knowledge; declared that she would give any thing in the world to be able to draw; and a lecture on the picturesque immediately followed, in which his instructions were so clear that she soon began to see beauty in every thing admired by him, and her attention was so earnest, that he became perfectly satisfied of her having a great deal of natural taste. He talked of fore-grounds, distances, and second distances – side-screens and perspectives – lights and shades; – and Catherine was so hopeful a scholar, that when they gained the top of Beechen Cliff, she voluntarily rejected the whole city of Bath, as unworthy to make part of a landscape. Delighted with her progress, and fearful of wearying her with too much wisdom at once, Henry suffered the subject to decline, and by an easy transition from a piece of rocky fragment and the withered oak which he had placed near its summit, to oaks in general, to forests, the inclosure of them, waste lands, crown lands and government, he shortly found himself arrived at politics; and from politics, it was an easy step to silence.

Part VI

Romanticism

VI

Introduction

As an artistic movement, Romanticism is characterized by its extraordinary diversity. Unlike neo-classicism, with which it is most often contrasted, Romanticism seems not to have been associated with a unifying visual language or a recognizable 'style' in painting. Indeed, if we consider the work of artists such as Friedrich (VIB13, 18), Runge (VIB5, VIIA8), Fuseli (VIB19), Goya (VIB3), Blake (VIB8, 9), Turner (VIIA10) and Constable (VIIA4), all of whom may with some justice be identified as Romantic artists, the most striking thing is the sheer variety of styles we encounter. Yet underlying the diversity of subject-matter and technique is a surprisingly unified set of concerns and preoccupations. These artists worked during a period when many long-standing assumptions about the role and status of the arts were subject to question, and when the concept of art itself underwent rapid and irreversible transformation. A new emphasis was placed on the expressive potential of the individual and on the seemingly limitless resources of the creative imagination. If there is a unity to be found beneath the apparent heterogeneity of Romantic art practice, then it resides in a shared body of beliefs and ideals concerning the possible emancipation of art from established rules and conventions. According to this view, the individual is bound by neither schools nor principles and possesses a sovereign right to pursue his or her own vision of art.

The origin of this 'Romantic aesthetic' can be traced to the last few years of the eighteenth century in Germany, in particular to the small university town of Jena. Although important precedents are to be found in the work of Rousseau (IIIA2, 3), Herder (VA7) and Schiller (VA12, 13), amongst others, it was the short-lived journal *Athenaeum* that first established the idea of 'Romantic poetry'. Published by Friedrich and August Wilhelm Schlegel from 1798 to 1800, the journal encouraged an extremely wide variety of literary and critical styles. The most characteristic of its forms was the 'fragment', developed as a medium of expression. Rather than a piece of some larger whole, the Romantic fragment is conceived as something independent and self-sufficient. At the same time, its very brevity and episodic character allow it to resist the appearance of completeness or 'closure' attendant upon a worked-out system. This same approach is carried through to the very definition of Romanticism itself. In fragment 116 of the *Athenäum*, Friedrich Schlegel defines Romantic poetry as 'a progressive, universal poetry' (VIA2). In place of the static model of artistic

'perfection' derived from Antiquity, Schlegel offers a model of artistic creativity based on the idea of constant becoming, or 'infinite perfectibility', which places no constraints upon the nature or form of the future work of art.

Throughout most of the period covered by this anthology, two assumptions remained in force. The first of these was that the goal of art is the imitation of nature, albeit informed by some ideal standard. And the second was that it is possible to establish a set of unchanging norms for the production and critical evaluation of works of art. In challenging both of these assumptions, the Romantic movement can be said to have introduced a new paradigm for understanding both the work of art and the role of the artist. Rather than explaining the task of the artist in terms of the *imitation* of external reality, Romanticism places new emphasis on the artist's capacity to *express* his or her own moods, feelings and responses. Primacy is accorded to what is unique, distinctive and authentic as opposed to what is necessary or universal. Much of the value of art is seen to reside in the privileged access it affords to an intensively cultivated domain of private experience. At the same time, theorists of Romanticism challenged the view that there is a fixed set of artistic forms or genres which stand in a hierarchical relation to one another. Equal value is accorded to different forms of art. Unstructured prose may surpass the most elaborately constructed poetry, and the hastiest pencil drawing or sketch may possess greater significance than the fully elaborated 'machine' of a history painting. Indeed, many Romantic artists overtly set out to break down the barriers between the different genres and to render them interchangeable. Rule is not something that can be imposed on the work of art from without. Rather, each individual work is capable of establishing a new form or mode of existence on the basis of its own inner unity and coherence.

These changes were accompanied by an acute awareness of the differences which separated the present from the past. When Goethe struggled belatedly to sustain the exemplary standing of Greek and Roman art by organizing a series of annual art competitions in Weimar, Philipp Otto Runge was roused to a powerful rejection of classicism (VIB5). For Runge, the 'highest point of perfection' is to be sought in a new kind of art which has yet to be developed and which 'will perhaps prove even more beautiful than what has gone before'. This renewed attempt to throw off the weight of the ancients may recall the *querelle des anciens et des modernes* which raged at the end of the seventeenth century (see section IA). However, the self-conscious modernity of the Romantics was informed by a new and different historical awareness: the recognition that human nature itself is subject to change and that the art of different cultures and historical periods needs to be judged according to the standards of its own time and place. In the writings of Wilhelm Wackenroder this characteristically Romantic insight issues in a recognition that 'artistic feeling is only one and the same divine ray of light which . . . is refracted into a thousand different colours by the diversely polished glass of sensuality' and that Rome and Germany are 'situated on one Earth'. That is to say, each culture or form of expression possesses its own intrinsic value.

Wackenroder was one of the first German writers to express enthusiasm for the medieval period and for the art of his own native country, bestowing particular praise on the work of Dürer. In the early years of the nineteenth century this re-evaluation

of the importance of non-classical art developed into a veritable cult of the Middle Ages, finding further expression in the writings of Ludwig Tieck (VIB2), Novalis (VIB4) and Friedrich Schlegel (VIA7). It led directly to the founding of the Brotherhood of St Luke and to the artistic ideals of the Nazarenes (see VIIB5–7; and *Art in Theory 1815–1900*, IIB8, IIC7, 8).

The Romantic period also saw the emergence of a cultural nationalism which frequently took the form of an interest in indigenous songs and folk-tales. Joseph Görres (VIA4) and Clemens Brentano (VIB15) were among those who formed important written collections of this predominantly oral tradition and helped to awaken a sense of regional cultural identity. There remained a strong literary emphasis to Romanticism in Germany. Many artists drew upon or illustrated themes from medieval romances and from collections of folk-tales.

In England too, some of the earliest proponents of the new ideas were writers and poets. Wordsworth had been in France at the time of the Revolution. His libertarian ideals of that period are exemplified in his composition of an elegy to Toussaint L'Ouverture, the leader of the Haitian slave revolt. However, Wordsworth's main contribution to early Romanticism in England is to be found in the small book he published with Coleridge in 1798: *Lyrical Ballads*. These poems, many of them on deliberately un- or anti-heroic subjects, such as 'The Female Vagrant', 'The Convict', or 'The Idiot Boy', were written in a style which approximated more closely to the rhythms and patterns of ordinary speech than had been the case in earlier, classically influenced verse. The two prose pieces Wordsworth wrote for this collection, a short 'Advertisement' for the first edition, and a longer 'Preface' to the second, in 1800, function as kinds of manifesto for the new aesthetic (VIA5 and 6). William Blake was another who found suitable material for Romantic poetry in the French Revolution: 'Glams of fire streak the heavens / ... the peasant looks over the sea and wipes a tear; / Over his head the soul of Voltaire shone fiery, and over the army Rousseau his white cloud / Unfolded' (*The French Revolution*, 1791, lines 278–82). Blake's Romanticism pervades his entire output, from the poetry to his letters, from prose descriptions of his own works to the fierce marginalia in which he assaulted the legacy of Joshua Reynolds, the Academician par excellence (VIB7, 8, 9). Somewhat later another poet, Percy Bysshe Shelley, composed an enduring slogan applicable to the Romantic artist in every medium and genre, when he described poets as 'the unacknowledged legislators of the world' (VIA12).

It is scarcely surprising that uncompromising originality of this kind should have produced a reaction. Resistance to innovation in the visual arts is nowhere more clearly exemplified than in the debate surrounding Caspar David Friedrich's *The Cross in the Mountains*. Friedrich himself described the subject of the painting as: 'An upright cross, green ivy clinging around its stem, and surrounded by evergreen fir trees... on the summit of a rocky outcrop' (VIB13). What made this apparently innocuous image so challenging to the accepted conventions of classical landscape painting was, first, Friedrich's willingness to prioritize allegorical meaning over fidelity to the rules of composition and aerial perspective, and second, his intention that the painting be hung as a devotional altarpiece in a private chapel. Shortly after it was exhibited in Friedrich's studio in 1808, Friedrich Ramdohr published a coruscating attack in which he enumerated the failings of the work from the standpoint of

classical art theory (VIB12). Ramdohr rejects that 'mysticism which is now creeping into everything and enveloping art as well as science... with a haze of narcotic intoxication'. However, his detailed analysis of the painting is paradoxically sensitive to what is genuinely new in Friedrich's art. Read *ex negativo*, his account serves as a remarkable guide to the aims and ambitions of the younger generation of Romantic artists. That Friedrich's work continued to give rise to significant problems of interpretation is revealed by the incomprehension which greeted his *The Monk by the Sea* when it was exhibited in Berlin in 1810. Confronted by a painting which defies the rules of classical landscape composition and which invites the spectator to contemplate a seemingly infinite expanse of land, sea and sky, viewers were thrown upon their own often confused responses before the work itself (VIB14, 15).

Romanticism has been appositely described as an attempt to re-enchant the world and to invest it with a higher spiritual meaning. However, it would be unjust to the work of Friedrich, as of many other Romantics, to regard it as a retreat into apolitical subjectivism and mysticism. As his letter to Arndt reveals (VIB18), Friedrich was a committed patriot and supported his country's struggles against Napoleonic troops in the Wars of Liberation. Responses to the rise of Napoleon and to the subsequent course of the French Revolution were complex and ambiguous. Whilst there was continued opposition to French rule, the introduction of the Napoleonic Code and the abolition of serfdom in the occupied territories brought about much-needed social reform. In 1806 Napoleon formally dissolved the now essentially meaningless Holy Roman Empire, but occupied Europe still remained under French control and the newly created Confederation of the Rhine enjoyed little real autonomy.

Disillusionment with the intellectual and moral ideals of the Enlightenment and the frustration of the political ideals of the French Revolution are often cited as important factors in the genesis of Romanticism. However, as Ernst Behler has pointed out, there are remarkable parallels between the overthrow of the old social and political order by the Revolution in France, on the one hand, and the literary and artistic revolution brought about by Romanticism on the other (Behler, 1993). Romanticism's challenge to established rules and conventions, its dismantling of the hierarchy of the genres, its appreciation of popular forms of artistic expression and its emphasis on individual self-expression may be correlated with similar modes of political radicalism. This thought finds its definitive formulation in the words of Friedrich Schlegel, from the 'Critical Fragments' of 1798: 'Poetry is republican speech: a speech which is its own law and end unto itself, and in which all the parts are free citizens and have a right to vote' (VIA1).

VIA

Romantic Aesthetics

1 Friedrich Schlegel (1772–1829) from ‘Critical Fragments’

Friedrich Schlegel was one of the leading figures of the movement of Early German Romanticism which flourished in Jena in the closing years of the eighteenth century. He was born in Hannover and studied law, philosophy and classics at the universities of Göttingen and Leipzig. His early works were devoted to classical Antiquity and it has been said that he sought to do for the history of Greek poetry what Winckelmann (see IIIA5 and 8) had done for Greek sculpture. Prompted by Schiller’s ‘On Naive and Sentimental Poetry’ (see VA13) he later came to reject the idea that we should imitate the ancients, accepting that the distinctive character of modern art and literature requires new forms and categories if it is to be properly understood. In 1798 he joined his brother, August Wilhelm, in Jena, where he set about articulating his conception of ‘romantic poetry’. The ‘Critical Fragments’ were first published in 1797 in the journal *Lyceum der Schönen Künste*. Schlegel’s employment of the ‘fragment’ as a mode of writing was, in part, an attempt to block the moment of completion or closure and to sustain the dynamism and protean character which he attributed to Romanticism itself. Interpretation is an ongoing process which draws upon the creative powers of the reader or viewer. The following selection has been made from the translation by Peter Firchow in Friedrich Schlegel, *Philosophical Fragments*, Minneapolis and Oxford: University of Minnesota Press, 1991, pp. 1–16.

1. Many so-called artists are really products of nature’s art.

4. There is so much poetry and yet there is nothing more rare than a poem! This is due to the vast quantity of poetical sketches, studies, fragments, tendencies, ruins, and raw materials.

9. Wit is absolute social feeling, or fragmentary genius.

12. One of two things is usually lacking in the so-called Philosophy of Art: either philosophy or art.

14. In poetry too every whole can be a part and every part really a whole.

16. Though genius isn't something that can be produced arbitrarily, it is freely willed – like wit, love, and faith, which one day will have to become arts and sciences. You should demand genius from everyone, but not expect it. A Kantian would call this the categorical imperative of genius.

20. A classical text must never be entirely comprehensible. But those who are cultivated and who cultivate themselves must always want to learn more from it.

21. Just as a child is only a thing which wants to become a human being, so a poem is only a product of nature which wants to become a work of art.

26. Novels are the Socratic dialogues of our time. And this free form has become the refuge of common sense in its flight from pedantry.

27. The critic is a reader who ruminates. Therefore he ought to have more than one stomach.

28. Feeling (for a particular art, science, person, etc.) is divided spirit, is self-restriction: hence a result of self-creation and self-destruction.

29. Gracefulness is life lived correctly, is sensuality intuiting and shaping itself.

34. A witty idea is a disintegration of spiritual substances which, before being suddenly separated, must have been thoroughly mixed. The imagination must first be satiated with all sorts of life before one can electrify it with the friction of free social intercourse so that the slightest friendly or hostile touch can elicit brilliant sparks and lustrous rays – or smashing thunderbolts.

40. In the sense in which it has been defined and used in Germany, aesthetic is a word which notoriously reveals an equally perfect ignorance of the thing and of the language. Why is it still used?

42. Philosophy is the real homeland of irony, which one would like to define as logical beauty: for wherever philosophy appears in oral or written dialogues – and is not simply confined into rigid systems – there irony should be asked for and provided. And even the Stoics considered urbanity a virtue. Of course, there is also a rhetorical species of irony which, sparingly used, has an excellent effect, especially in polemics; but compared to the sublime urbanity of the Socratic muse, it is like the pomp of the most splendid oration set over against the noble style of an ancient tragedy. Only poetry can also reach the heights of philosophy in this way, and only poetry does not restrict itself to isolated ironical passages, as rhetoric does. There are ancient and modern poems that are pervaded by the divine breath of irony throughout and informed by a truly transcendental buffoonery. Internally: the mood that surveys everything and rises infinitely above all limitations, even above its own art, virtue, or genius; externally, in its execution: the mimic style of an averagely gifted Italian *buffo*.

44. You should never appeal to the spirit of the ancients as if to an authority. It's a peculiar thing with spirits: they don't let themselves be grabbed by the hand and shown to others. Spirits reveal themselves only to spirits. Probably here too the best and shortest way would be to prove one's possession of the only true belief by doing good works.

47. Whoever desires the infinite doesn't know what he desires. But one can't turn this sentence around.

48. Irony is the form of paradox. Paradox is everything simultaneously good and great.

54. There are writers who drink the absolute like water; and books in which even the dogs refer to the infinite.

55. A really free and cultivated person ought to be able to attune himself at will to being philosophical or philological, critical or poetical, historical or rhetorical, ancient or modern: quite arbitrarily, just as one tunes an instrument, at any time and to any degree.

56. Wit is logical sociability.

57. If some mystical art lovers who think of every criticism as a dissection and every dissection as a destruction of pleasure were to think logically, then 'wow' would be the best criticism of the greatest work of art. To be sure, there are critiques which say nothing more, but only take much longer to say it.

60. All the classical poetical genres have now become ridiculous in their rigid purity.

63. Not art and works of art make the artist, but feeling and inspiration and impulse.

65. Poetry is republican speech: a speech which is its own law and end unto itself, and in which all the parts are free citizens and have the right to vote.

68. How many authors are there among writers? Author means creator.

70. People who write books and imagine that their readers are the public and that they must educate it soon arrive at the point not only of despising their so-called public but of hating it. Which leads absolutely nowhere.

73. What is lost in average, good, or even first-rate translations is precisely the best part.

84. From what the moderns aim at, we learn what poetry should become; from what the ancients have done, what it has to be.

90. Wit is an explosion of confined spirit.

93. In the ancients we see the perfected letter of all poetry; in the moderns we see its growing spirit.

96. A good riddle should be witty; otherwise nothing remains once the answer has been found. And there's a charm in having a witty idea which is enigmatic to the point of needing to be solved: only its meaning should be immediately and completely clear as soon as it's been hit upon.

100. The poetry of one writer is termed philosophical, of another philological, of a third, rhetorical, etc. But what then is poetical poetry?

103. Many works that are praised for the beauty of their coherence have less unity than a motley heap of ideas simply animated by the ghost of a spirit and aiming at a single purpose. What really holds the latter together is that free and equal fellowship in which, so the wise men assure us, the citizens of the perfect state will live at some future date; it's that unqualifiedly sociable spirit which, as the beau monde maintains, is now to be found only in what is so strangely and almost childishly called the great world. On the other hand, many a work of art whose coherence is never questioned is, as the artist knows quite well himself, not a complete work but a fragment, or one or more fragments, a mass, a plan. But so powerful is the instinct for unity in mankind that the author himself will often bring something to a kind of completion at least directly with the form which simply can't be made a whole or a unit; often quite imaginatively and yet completely unnaturally. The worst thing about it is that whatever is draped about the solid, really existent fragments in the attempt to mug up a semblance of unity consists largely of dyed rags. And if these are touched up cleverly and deceptively, and tastefully displayed, then that's all the worse. For then he deceives even the exceptional reader at first, who has a deep feeling for what little real goodness and beauty is still to be found here and there in life and letters. That reader is then forced to make a critical judgment to get at the right perception of it! And no matter how quickly the dissociation takes place, still the first fresh impression is lost.

108. Socratic irony is the only involuntary and yet completely deliberate dissimulation. It is equally impossible to feign it or divulge it. To a person who hasn't got it, it will remain a riddle even after it is openly confessed. It is meant to deceive no one except those who consider it a deception and who either take pleasure in the delightful roguery of making fools of the whole world or else become angry when they get an inkling they themselves might be included. In this sort of irony, everything should be playful and serious, guilelessly open and deeply hidden. It originates in the union of *savoir vivre* and scientific spirit, in the conjunction of a perfectly instinctive and a perfectly conscious philosophy. It contains and arouses a feeling of

indissoluble antagonism between the absolute and the relative, between the impossibility and the necessity of complete communication. It is the freest of all licenses, for by its means one transcends oneself; and yet it is also the most lawful, for it is absolutely necessary. It is a very good sign when the harmonious bores are at a loss about how they should react to this continuous self-parody, when they fluctuate endlessly between belief and disbelief until they get dizzy and take what is meant as a joke seriously and what is meant seriously as a joke. For Lessing irony is instinct; for Hemsterhuis it is classical study; for Hülsen it arises out of the philosophy of philosophy and surpasses these others by far.

112. The analytic writer observes the reader as he is; and accordingly he makes his calculations and sets up his machines in order to make the proper impression on him. The synthetic writer constructs and creates a reader as he should be; he doesn't imagine him calm and dead, but alive and critical. He allows whatever he has created to take shape gradually before the reader's eyes, or else he tempts him to discover it himself. He doesn't try to make any particular impression on him, but enters with him into the sacred relationship of deepest symphilosophy or sympoetry.

115. The whole history of modern poetry is a running commentary on the following brief philosophical text: all art should become science and all science art; poetry and philosophy should be made one.

117. Poetry can only be criticized by way of poetry. A critical judgment of an artistic production has no civil rights in the realm of art if it isn't itself a work of art, either in its substance, as a representation of a necessary impression in the state of becoming, or in the beauty of its form and open tone, like that of the old Roman satires.

123. It is thoughtless and immodest presumption to want to learn something about art from philosophy. There are many who start out that way as if they hope to find something new there, since philosophy, after all, can't and shouldn't be able to do more than order the given artistic experiences and the existing artistic principles into a science, and raise the appreciation of art, extend it with the help of a thoroughly learned history of art, and create here as well that logical mood which unites absolute tolerance with absolute rigor.

127. It's indelicate to be astonished when something is beautiful or great; as if it could really be any different.

2 Friedrich Schlegel (1772–1829) from 'Athenaeum Fragments'

Together with his brother, August Wilhelm, Friedrich Schlegel edited the journal *Athenäum* from 1798 to 1800. The journal embraced the work of the rich intellectual circle surrounding the two brothers in Jena. This included Dorothea Veit, Novalis (see VIA3 and VIB4),

Ludwig Tieck (see VIB2), Friedrich Schelling (see VIA8) and Friedrich Schleiermacher (see *Art in Theory 1815–1900*, IA11). The two brothers insisted on 'unity of spirit' rather than 'unity of content'. The journal covered a wide range of topics through an equally broad range of literary forms, including essays, dialogues, letters, discussions and, most characteristic of all, 'fragments'. The majority of the so-called 'Athenaeum Fragments' were written by Friedrich Schlegel, though some were by Novalis, Schleiermacher and August Wilhelm Schlegel. In fragment 116 Friedrich defines Romantic poetry as 'a progressive, universal poetry'. Whereas classicism strives for completion, romantic poetry is constantly in the process of becoming. Rather than aiming for stylistic purity it fuses together a variety of different genres. It offers a portrait of the age rather than an expression of timeless values and the only binding rules are those which are provided by the creative imagination of the author. Schiller took a strong dislike to the fragments, writing in a letter to Goethe (23 July 1798) that 'This pert, opinionated, sarcastic, one-sided manner makes me feel physically ill.' Goethe welcomed their polemical character, however, describing the Schlegels as a 'wasps' nest'. The fragments were first published in *Athenäum. Eine Zeitschrift von August Wilhelm Schlegel und Friedrich Schlegel*, volume 1, part 2, Berlin: Friedrich Vieweg, 1798. The following selection is taken from the translation by Peter Firchow, *Philosophical Fragments*, Minneapolis and Oxford: University of Minnesota Press, 1991, pp. 18–24, 26–7, 30–5, 39, 41–2, 45–6, 51–4, 60, 75, 93. The fragments written by August Wilhelm Schlegel are marked with the initials AW in square brackets.

1. Nothing is more rarely the subject of philosophy than philosophy itself.

13. When young people of both sexes know how to dance to a lively tune, it doesn't in the least occur to them to try to make a critical judgment about music just for that reason. Why do people have less respect for poetry?

22. A project is the subjective embryo of a developing object. A perfect project should be at once completely subjective and completely objective, should be an indivisible and living individual. In its origin: completely subjective and original, only possible in precisely this sense; in its character: completely objective, physically and morally necessary. The feeling for projects – which one might call fragments of the future – is distinguishable from the feeling for fragments of the past only by its direction: progressive in the former, regressive in the latter. What is essential is to be able to idealize and realize objects immediately and simultaneously: to complete them and in part carry them out within oneself. Since transcendental is precisely whatever relates to the joining or separating of the ideal and the real, one might very well say that the feeling for fragments and projects is the transcendental element of the historical spirit.

24. Many of the works of the ancients have become fragments. Many modern works are fragments as soon as they are written.

32. One should have wit, but not want to have it. Otherwise, you get persiflage, the Alexandrian style of wit.

40. Notes to a poem are like anatomical lectures on a piece of roast beef. [AW]

51. Naive is what is or seems to be natural, individual, or classical to the point of irony, or else to the point of continuously fluctuating between self-creation and self-destruction. If it's simply instinctive, then it's childlike, childish, or silly; if it's merely intentional, then it gives rise to affectation. The beautiful, poetical, ideal naive must combine intention and instinct. The essence of intention in this sense is freedom, though intention isn't consciousness by a long shot. There is a certain kind of self-infatuated intuition of one's own naturalness or silliness that is itself unspeakably silly. Intention doesn't exactly require any deep calculation or plan. Even Homeric naiveté isn't simply instinctive; there is at least as much intention in it as there is in the grace of lovely children or innocent girls. And even if Homer himself had no intentions, his poetry and the real author of that poetry, Nature, certainly did.

68. The only true lover of art is the man who can renounce some of his wishes entirely whenever he finds others completely fulfilled, who can rigorously evaluate even what he loves most, who will, if necessary, submit to explanations, and has a sense for the history of art.

71. People always talk about how an analysis of the beauty of a work of art supposedly disturbs the pleasure of the art lover. Well, the real lover just won't let himself be disturbed!

73. Might it not be the same with the people as with the truth: where, as they say, the attempt is worth more than the result?

77. A dialogue is a chain or garland of fragments. An exchange of letters is a dialogue on a larger scale, and memoirs constitute a system of fragments. But as yet no genre exists that is fragmentary both in form and content, simultaneously completely subjective and individual, and completely objective and like a necessary part in a system of all the sciences.

109. A certain kind of micrology and belief in authority are characteristics of greatness – namely, the perfecting micrology of the artist, and the historical belief in the authority of nature.

110. It is a sublime taste always to like things better when they've been raised to the second power. For example, copies of imitations, critiques of reviews, addenda to additions, commentaries on notes. This taste is very characteristic of us Germans whenever it's a matter of making something longer; and of the French when it promotes brevity and vacuity. Their scientific education very likely tends to be an abbreviation of an extract, and the highest production of their poetical art, their tragedy, is merely the formula of a form. [AW]

111. The teachings that a novel hopes to instill must be of the sort that can be communicated only as wholes, not demonstrated singly, and not subject to exhaustive analysis. Otherwise the rhetorical form would be infinitely preferable.

114. A definition of poetry can only determine what poetry should be, not what it really was and is; otherwise the shortest definition would be that poetry is whatever has at any time and at any place been called poetry.

116. Romantic poetry is a progressive, universal poetry. Its aim isn't merely to reunite all the separate species of poetry and put poetry in touch with philosophy and rhetoric. It tries to and should mix and fuse poetry and prose, inspiration and criticism, the poetry of art and the poetry of nature; and make poetry lively and sociable, and life and society poetical; poeticize wit and fill and saturate the forms of art with every kind of good, solid matter for instruction, and animate them with the pulsations of humor. It embraces everything that is purely poetic, from the greatest systems of art, containing within themselves still further systems, to the sigh, the kiss that the poetizing child breathes forth in artless song. It can so lose itself in what it describes that one might believe it exists only to characterize poetical individuals of all sorts; and yet there still is no form so fit for expressing the entire spirit of an author: so that many artists who started out to write only a novel ended up by providing us with a portrait of themselves. It alone can become, like the epic, a mirror of the whole circumambient world, an image of the age. And it can also – more than any other form – hover at the midpoint between the portrayed and the portrayer, free of all real and ideal self-interest, on the wings of poetic reflection, and can raise that reflection again and again to a higher power, can multiply it in an endless succession of mirrors. It is capable of the highest and most variegated refinement, not only from within outwards, but also from without inwards; capable in that it organizes – for everything that seeks a wholeness in its effects – the parts along similar lines, so that it opens up a perspective upon an infinitely increasing classicism. Romantic poetry is in the arts what wit is in philosophy, and what society and sociability, friendship and love are in life. Other kinds of poetry are finished and are now capable of being fully analyzed. The romantic kind of poetry is still in the state of becoming; that, in fact, is its real essence: that it should forever be becoming and never be perfected. It can be exhausted by no theory and only a divinatory criticism would dare try to characterize its ideal. It alone is infinite, just as it alone is free; and it recognizes as its first commandment that the will of the poet can tolerate no law above itself. The romantic kind of poetry is the only one that is more than a kind, that is, as it were, poetry itself: for in a certain sense all poetry is or should be romantic.

119. Even those metaphors that seem simply arbitrary often have deep significance. What kind of analogy, one might wonder, exists between heaps of gold or silver and the accomplishments of the spirit that are so sure and so perfect they become arbitrary, and which sprang to life so casually they seem inborn? And yet it's obvious that one only has talents, owns them as if they were things, though they still retain their solid value even though they can't ennoble the possessor. But one can never really have genius, only be one. And there is no plural for genius, which in this case is already contained in the singular. For genius is actually a system of talents.

121. An idea is a concept perfected to the point of irony, an absolute synthesis of absolute antitheses, the continual self-creating interchange of two conflicting

thoughts. An ideal is at once idea and fact. If ideals don't have as much individuality for the thinker as the gods of antiquity do for the artist, then any concern with ideas is no more than a boring and laborious game of dice with hollow phrases, or, in the manner of the Chinese bronzes, a brooding intuition of one's own nose. Nothing is more wretched and contemptible than this sentimental speculation without any object. But one shouldn't call this mysticism, since this beautiful old word is so very useful and indispensable for absolute philosophy, from whose perspective the spirit regards everything as a mystery and a wonder, while from other points of view it would appear theoretically and practically normal. Speculation *en detail* is as rare as abstraction *en gros*, and yet it is these that beget the whole substance of scientific wit, these that are the principles of higher criticism, the highest rungs of spiritual cultivation. The great practical abstraction is what makes the ancients – among whom this was an instinct – actually ancients. In vain did individuals express the ideal of their species completely, if the species themselves, strictly and sharply isolated, weren't freely surrendered, as it were, to their originality. But to transport oneself arbitrarily now into this, now into that sphere, as if into another world, not merely with one's reason and imagination, but with one's whole soul; to freely relinquish first one and then another part of one's being, and confine oneself entirely to a third; to seek and find now in this, now in that individual the be-all and end-all of existence, and intentionally forget everyone else: of this only a mind is capable that contains within itself simultaneously a plurality of minds and a whole system of persons, and in whose inner being the universe which, as they say, should germinate in every monad, has grown to fullness and maturity.

125. Perhaps there would be a birth of a whole new era of the sciences and arts if symphilosophy and sympoetry became so universal and heartfelt that it would no longer be anything extraordinary for several complementary minds to create communal works of art. One is often struck by the idea that two minds really belong together, like divided halves that can realize their full potential only when joined. If there were an art of amalgamating individuals, or if a wishful criticism could do more than merely wish – and for that there are reasons enough – then I would like to see Jean Paul and Peter Leberecht combined. The latter has precisely what the former lacks. Jean Paul's grotesque talent and Peter Leberecht's fantastic turn of mind would, once united, yield a first-rate romantic poet.

167. Almost all criticisms of art are too general or too specific. The critics should look for the golden mean here, in their own productions, and not in the works of the poets.

178. If any work of German painting is worthy of being displayed in the forecourt of Raphael's temple, then certainly Albrecht Dürer and Holbein would be much closer to the inner sanctum than the scholarly Mengs. [AW]

182. To have a Diderot describe an art exhibition for you is a truly imperial luxury. [AW]

183. Hogarth painted ugliness and wrote about beauty. [AW]

190. Nature at its flattest and most monotonous is the best teacher of a landscape painter. Consider the wealth of Dutch art that comes under this heading. Poverty makes one thrifty: there comes from it a sense of frugality that is gladdened by even the slightest hint of higher life in nature. When later during his travels the artist gets to know romantic scenes, they make an even greater impression on him. The imagination too has its antitheses: the greatest painter of horrific wastelands, Salvator Rosa, was born in Naples. [AW]

206. A fragment, like a miniature work of art, has to be entirely isolated from the surrounding world and be complete in itself like a porcupine.

216. The French Revolution, Fichte's philosophy, and Goethe's *Meister* are the greatest tendencies of the age. Whoever is offended by this juxtaposition, whoever cannot take any revolution seriously that isn't noisy and materialistic, hasn't yet achieved a lofty, broad perspective on the history of mankind. Even in our shabby histories of civilization, which usually resemble a collection of variants accompanied by a running commentary for which the original classical text has been lost; even there many a little book, almost unnoticed by the noisy rabble at the time, plays a greater role than anything they did.

243. The mirage of a former golden age is one of the greatest obstacles to approximating the golden age that still lies in the future. If there once was a golden age, then it wasn't really golden. Gold can't rust or decompose: it emerges victoriously genuine from all attempts to alloy or decompose it. If the golden age won't last always and forever, then it might as well never begin, since it will only be good for composing elegies about its loss. [AW]

252. A real aesthetic theory of poetry would begin with the absolute antithesis of the eternally unbridgeable gulf between art and raw beauty. It would describe their struggle and conclude with the perfect harmony of artistic and natural poetry. This is to be found only among the ancients and would in itself constitute nothing but a more elevated history of the spirit of classical poetry. But a philosophy of poetry as such would begin with the independence of beauty, with the proposition that beauty is and should be distinct from truth and morality, and that it has the same rights as these: something that – for those who are able to understand it at all – follows from the proposition $I = I$. It would waver between the union and the division of philosophy and poetry, between poetry and practice, poetry as such and the genres and kinds of poetry; and it would conclude with their complete union. Its beginning would provide the principles of pure poetics; its middle the theory of the particular, characteristically modern types of poetry: the didactic, the musical, the rhetorical in a higher sense, etc. The keystone would be a philosophy of the novel, the rough outlines of which are contained in Plato's political theory. Of course, to the ephemeral, unenthusiastic dilettantes, who are ignorant of the best poets of all types, this kind of poetics would seem very much like a book of trigonometry to a child who just

wants to draw pictures. Only a man who knows or possesses a subject can make use of the philosophy of that subject; only he will be able to understand what that philosophy means and what it's attempting to do. But philosophy can't inoculate someone with experience and sense, or pull them out of a hat – and it shouldn't want to do so. To those who knew it already, philosophy of course brings nothing new; but only through it does it become knowledge and thereby assume a new form.

255. The more poetry becomes science, the more it also becomes art. If poetry is to become art, if the artist is to have a thorough understanding and knowledge of his ends and means, his difficulties and his subjects, then the poet will have to philosophize about his art. If he is to be more than a mere contriver and artisan, if he is to be an expert in his field and understand his fellow citizens in the kingdom of art, then he will have to become a philologist as well.

302. Jumbled ideas should be the rough drafts of philosophy. It's no secret how highly these are valued by connoisseurs of painting. For a man who can't draw philosophical worlds with a crayon and characterize every thought that has a physiognomy with a few strokes of the pen, philosophy will never be an art and consequently never a science. For in philosophy the way to science lies only through art, just as the poet, on the other hand, finds his art only through science.

366. Understanding is mechanical, wit is chemical, genius is organic spirit.

451. Universality is the successive satiation of all forms and substances. Universality can attain harmony only through the conjunction of poetry and philosophy; and even the greatest, most universal works of isolated poetry and philosophy seem to lack this final synthesis. They come to a stop, still imperfect but close to the goal of harmony. The life of the Universal Spirit is an unbroken chain of inner revolutions; all individuals – that is, all original and eternal ones – live in him. He is a genuine polytheist and bears within himself all Olympus.

3 Novalis (Friedrich von Hardenberg) (1772–1801) 'Fugitive Thoughts'

The German poet and novelist Friedrich von Hardenberg was born in Oberwiederstedt in Saxony. He was brought up in a strict pietistic household and was educated at home by private tutors. In 1790 he entered the University of Jena to study law, also attending the universities of Göttingen and Leipzig, where he made the acquaintance of Friedrich Schlegel (see VIA1 and 2). He first employed the pseudonym 'Novalis' for a collection of fragments entitled *Blütenstaub* (Pollen), published in the journal *Athenäum* in 1798. The early death of his fiancée, the 15-year-old Sophie von Kühn, initiated a profound spiritual and religious crisis, to which he gave literary expression in his *Hymnen an die Nacht* (Hymns to the Night), also published in the *Athenäum* in 1800. These were amongst the

few works which Novalis succeeded in completing before his own early death in 1801. He left behind a large body of writings and fragments which were edited and published shortly after his death by Friedrich Schlegel and Ludwig Tieck (*Schriften*, 2 volumes, 1802). Strongly influenced by the philosophy of German idealism, his writings encompass philosophical, scientific, mathematical and technical matters as well as issues connected with the transformative power of 'poesie'. His declared ambition was to 'poeticize the world' – to discover the original power behind the appearances of things and to invest them with a higher meaning. The following selection of fragments was made and translated by Mary Jane Hope, who gave them the title 'Fugitive Thoughts'. They most probably date from the period 1798–1801. Our excerpts are taken from Hope's *Novalis (Friedrich von Hardenberg). His Life, Thoughts and Work*, London: David Stott, 1891, pp. 175–8, 180–5, 188–9, 193–4, 198.

THE art of writing books has not yet been found out. It is, however, near at hand. The fragments which exist are literary seed-beds. Many of the seeds fail; but here and there one will spring up and bear fruit.

Perhaps I owe my happiest thoughts to the fact, that impressions do not strike me at once in their full completion, but first enter my brain in an uncertain and tentative form.

Every work of art is formed of spirit element.

The poet understands Nature better than the man of science.

The representation of feeling must be like the representation of nature, independent, complete, and original. Not as we find it, but as it ought to be.

Poetry heals the wounds given by reason. Its elements are of a totally opposite character, and may be described as elevated truth and agreeable illusion.

It is easy to be understood how all things tend to poetry. Is not the whole universe full of soul?

One must strive to maintain a ceaseless current of thought. If one has no time for a wide view of general literature, free thought, and calm reflection, even the most active imagination will grow dull, and the inward alertness cease. The poet must be alive to all the varying conditions of life with their special peculiarities, and have also a keen interest in all science and knowledge.

There are moments when even alphabets and books of reference may appear poetical.

All poetry forms a contrast to actual humdrum life; and real poetry revives the mind, even as sleep does the body. Illness, strange events, journeys, fresh acquaintances, influence us in the same way.

The past history of mankind is like an incomplete poem. Our belief in an ultimate reconciliation is in reality a confidence in the final poetic harmony of life. It is in our own power to tune our highest faculties, and infuse poetry into existence.

The artist rises above other men, as the statue does above its pedestal.

Poetry is creation. All poems must have a living individuality.

The power by which one throws oneself entirely into an extraneous individuality – not merely imitating it – is still quite unknown; it arises from keen perception and intellectual mimicry. The true artist can make himself anything that he likes.

Poetry is absolute truth. That is the gist of my philosophy. The more poetic, the more truthful.

This abundance of art essentials makes the few artists who arise among us so original, that we may be certain that the most splendid of all works of art will in time be produced by us, as no nation can compare with us in energy. If I understand our latest authors aright, they uphold the study of the ancients as a means of cultivation, not to make us slavish imitators, but to develop true artistic feeling.

No modern nation has such comprehension of art as the ancients.

By diligent and thoughtful study of the classics, we shall produce such a literature as never existed in classic ages. Goethe resembles classical writers in strength, but has a higher standard, which, however, is no merit of his. Goethe, however, will, and must, be surpassed; but only as the ancients have been, in power, in breadth of view, and reflection; not in the point of view of pure art, for his justness of observation and strength are even more perfect than they appear to be.

Arabesques and ornaments are embodied music.

All talents spring from intellect. Intellect sets the task, imagination chalks out the design, but intellect carries it out.

A romance must be like an English garden, every point must tell.

By invention and dexterity everything may be delineated gracefully on paper, either in writing or painting.

Poetry is only an active, productive use of our powers; thought is the same. Hence poetry and thought may be identical, for in thought the senses reproduce their accumulated impressions, transmuted into a fresh form, from which fresh ideas take their rise.

All purely comic characters must, as in the old plays, be roughly, broadly, sketched in; fine distinctions are prosaic. In the region of poetry, every touch must be incisive, every action full of animation and colour.

When we attentively consider the Laocoon, it may occur to us that there was a higher ideal than the ancients could grasp. Not that of wild defiance, but of resistance passing into resignation. Should not the sculptor always seize the moment of repose, and only that, for his art?

The poet's realm is the world compressed into the focus of his own times. He can make use of any topic, only he must do so with spirit. He must set forth both commonplace and extraordinary events; all effects are produced by contrast, and he is absolutely free to use whatever material he likes. Lifeless descriptions offer no interest; they do not touch either heart or soul; they must at least be symbolical, like nature herself, if they do not excite the deepest emotions. Above all, the poet must be no egotist. He is the representative prophet of nature, as the philosopher is the natural prophet of imagination. To the one all is objective, to the other all is subjective. The one is the voice of creation, the other the voice of the simple unit; one is song, the other talk.

The poet is ever true. He remains faithful to nature, and her recurrent cycles. All the poet's delineations must be symbolical or emotional. The symbolical does not touch the feelings at once, but it gives rise to spontaneous action. The one excites and rouses, the other touches and moves; the one affects the intellect, the other appeals to natural feeling; the one leads from appearances to actuality, the other from actuality to appearance.

Formerly the poet could be all things to all men; life's circle was so narrow, and men's experience, knowledge, customs, and character so much alike, their requirements so much simpler.

The most wonderful and eternal phenomenon is oneself. Man is the greatest of mysteries. The history of the world is the answer to this problem. Philosophy, science, and literature all seek to solve the riddle. Its attraction will never cease as long as men exist.

Dreams have a high degree of interest to the psychologist, also to the historian of humanity. Dreams have largely contributed to the culture and education of men – hence the great importance formerly attached to them.

We are united by closer bonds with the unseen, than with the seen.

The synthesis of body and soul is called person; the person is to the spirit what the body is to the soul. It fades away, but arises in a nobler form.

Commerce is the moving spirit of the world. It sets everything in motion, and unites everything, arouses countries and towns, nations and the arts, and is the spirit of culture, the perfection of human society.

The simplification and combination of science, and the transformation of all sciences into one, is an exercise for philosophy, which the love of science demands.

The individual soul must be brought into harmony with the soul of the universe.

Light in action; light is like life – a force; light makes fire – it is the genius of the fire.

With the ancients, religion certainly was what it ought to be with us – poetry.

There is no higher enjoyment than in learning; and the feeling of power is the source of all pleasure.

What attracts most is the unknown. The well known has no further attraction. The power of perception is in itself the greatest of charms.

Nothing is so great a perservative against folly as activity and technical work.

Real enjoyment is a *perpetuum mobile*; it is ever reproducing itself. The cessation of this activity is the cause of all the discontent and dissatisfaction in the world.

The life of a cultivated man should alternate between music and silence, as between day and night.

Christianity is an historical religion permeated by morality and poetry.

Intellect, soul, earnestness, and knowledge are inextricably associated with Divine things.

Science is only one half; faith is the completion.

Poetry permeates us with the individuality of another.

Nature has allegories of her own. The mists rising from the waters are like prayer.

4 Joseph Görres (1776–1848) from *Aphorisms on Art*

Born in Koblenz, Joseph Görres was an enthusiast for the French Revolution, an ardent supporter of republicanism and an advocate for the secession of the Rhineland. However, he was bitterly disappointed by what he saw when he visited France in 1799 and in 1800 he became a fervent nationalist. In 1806 he lectured on philosophy in Heidelberg where he came into contact with Georg Friedrich Creuzer (see VIB10), Ludwig Achim von Arnim and Clemens Brentano (see VIB14). Inspired by Arnim's and Brentano's collection of folk-songs, *Des Knaben Wunderhorn* (1805–8), he published *Die deutschen Volksbücher* (1807) and the Middle High German poem *Lohengrin* (1813), confirming the increasingly nationalistic and philological orientation of German Romanticism. From 1814 to 1816 he edited the influential *Rheinischer Merkur*. He later became an ardent Catholic, leading a movement of religious awakening in Munich and publishing *Die christliche Mystik* (1836–42). His 'Aphorisms on Art' precede his Heidelberg years and form part of a larger work dedicated

to 'organonomy', physics, psychology and anthropology, as well as art. Although dense and confusing in places, they can be seen as sketching out a new set of categories through which to describe the visual language of Romanticism. Görres shares with Philipp Otto Runge (see VIB5 and VIIA8) an interest in the expressive potential of colour and in the coded meanings of hieroglyphs and arabesques. The following excerpt has been translated for the present volume by Nicholas Walker from *Aphorismen über die Kunst. Als Einleitung zu Aphorismen über Organonomie, Physik, Psychologie und Anthropologie*, Koblenz: Lassauln, 1802, pp. 47–61. The book is dated 'Year X', following the calendar of the French Revolution.

The language of images [*Bildersprache*] is the other branch of that river into which the inner capacity of the heart for art pours itself forth. The language of images, drawn from the realm of the cold, mute and mortified hieroglyph, of the symbol, and raised to the realm of warm, living, speaking presentation [*Darstellung*] – this is the object of all *formative art* [*der bildenden Kunst*].

Nature without paints shapes and forms images before our senses. Imagination clothes for us in shapes and forms and images the feeling which it would present in space for sensuous perception.

Images presented in external space initially distinguish themselves *mechanically* through the matter in which we fix them, and which we perceive as already formed by the images.

The matter which forms itself into an image is now either a *stuff*, namely *light*, and the art which speaks to our senses through the formation of light is *painting*.

Or the matter which forms itself into an image is all other *solid bodies*, and the art which speaks to our senses through the formation of the body is *plastic art*.

The artist who produces from himself presents effects, the artist who produces from out of matter presents sensations; every effect is a bundle of infinite effects, every sensation encompasses an infinity of simple sensations. The medium in which the artist reveals them both to us in an embodied form must therefore possess a similar infinity which can easily be evolved indefinitely.

Light is a bundle involving an infinity of colours; the prism and the structure of corporeal surfaces already effect the evolution of light. Light, therefore, is amongst all matters the most appropriate kind to meet this demand, and painting, by clothing its shapes in the stuff of light, opens up an unlimited field for its own creations.

For every tonal accordance a geometrical accordance in the length of a vibrating string, for every colour consonance and dissonance a spatial relationship within the spectrum, for each in turn a consonant and pleasing sensation, or a displeasing sensation, in the mind.

The light which art forms for us lies fettered in the *pigment*; pigments, therefore, are the *alphabet* of painting.

Grammar groups letters into words, and words into phrases; *composition* directs the grouping of pigments into a simple or variously organized picture according to rules of the understanding and perspective. *Composition*, therefore, is the *syntax* of painting.

The images expressed in pigments distinguish themselves *mathematically* through the closed determinate space which they delimit. *Drawing* constructs space that is delimited to form an image.

Images distinguish themselves *dynamically* through the strength or weakness of light, which thus gives rise to *illumination*.

Tones arrange themselves one after another in a regular and beautiful succession, which thus gives rise to melody; tones arrange themselves alongside one another in simultaneously sounding chords, and this gives rise to harmony.

Pigments likewise arrange themselves one after another spatially in a sequence of colour consonances in two dimensions; the rainbow is a colour scale, of which nature presents us with innumerable examples.

Insofar as painting arranges colours harmoniously with one another, works to produce consonance through distribution and mutual disposition of the latter and effects gradual transitions through the use of half-tones, thereby bringing truth, fidelity and nature into the painting, it is the art of *colourism*.

But the painting is not supposed to possess *surface* alone but also *depth*, and the magic of art brings this third dimension into play. Through the gradation of light and shade, through the distribution of light and its various reflections, through the use of half-shade and the feeling for colour, painting can highlight or withdraw the various parts of the picture and endow it thus with life and meaning. It is thus the art of *chiaroscuro*. *Chiaroscuro* here corresponds, therefore, to *melody* in the art of music, and *coloration* here corresponds to harmony there.

But in the art of music *melody* is a separate product elicited from nature, while *harmony* is only the later product of sentimental experimentation. In painting, on the other hand, *coloration* is the first thing that presents itself to perception, while *chiaroscuro* can only be a later product of reflection. In the painting of the battle of Marathon the figures of the generals stood in a row one after another.

Painting *drawn out from nature* is therefore coloration, and painting *produced from out of the artist* is *chiaroscuro*, though both flow together as *drawing*.

The colourist is the portrait painter of nature which stands warm, fresh and youthful before his eyes. The painter's task is to reproduce this warmth, freshness and youthfulness on canvas through glowing colour.

In the whole domain of nature *colour* is susceptible to the most delicate process of individualization, every unity can find a clear significance and designation in its manifold wealth of nuances, and colour as universal can present itself again in varied combinations. Passion reveals its different stages in changing colours, and the chemist interprets the latter as a reactive agent that registers even the slightest of changes within the body in question.

Colour speaks perceptibly even to the crudest of the senses. The latter understands what colour signifies: and sensation answers its call from the innermost depths of its being. Gladness gleams already in the eyes of a child in response to colour; after the mother's breast it is itself the first thing which entrances the child.

The first outpouring of artistic activity the very moment it awakes can only have been the *perception of colour*. What is received from the senses streams forth unchanged in the experience of colour; hence there can be no rules, no theory, for it, but only praxis.

Amongst all painters *Titian* stands unsurpassed for the use of colour. He may therefore serve to stand as representative of the educative painter who draws from nature.

The productive painter brings something out of himself to the *surface* over which his brush hovers, namely *depth*.

An infinite depth, in each case limited only by the particular will of the artist, presents itself to the imagination, and employing all the arts of perspective, of drawing, of chiaroscuro, he represents within the painting just what he has himself produced.

His task is to reflect distance within proximity, to present the unlimited within the limited, to lend body to what is flat. The painting should deceptively present as existing to the senses what imagination alone has fashioned; the eye should believe it penetrates the furthest distance when in fact the impenetrable surrounds it.

If coloration astonishes us through the appearance of solid nature, through simplicity and innocence, and pleasing grace, then chiaroscuro moves the soul through the limitless and the immeasurable, through sublimity and an art drawn from the utmost depths. If coloration is already quite intelligible to the beginner here, chiaroscuro calls for culture and understanding in order to be grasped at all. One born blind with vision subsequently restored has long continued to perceive the objects in a painting as merely juxtaposed externally to one another in a single plane.

What coloration brings mutely and silently together side by side, first finds language, life and meaning when it is illuminated through and through by the idea which gives it sense, standing and soul.

As exemplary masters of productive painting we may name *Correggio* by virtue of his lively chiaroscuro and *Michelangelo* by virtue of his towering sublimity.

Landscape painting tends rather towards productive art; for infinite space, perspective and chiaroscuro are really properly at home here. The sphere of the painter is here extended up to the furthest mists of the horizon, and imagination bathes gladly in the distant airy blue.

Landscape painting stands initially at a point of transition between the language of images and formative art proper, like didactic poetry in the sphere of verbal language. The hieroglyph still reveals itself in purest form in the representation of foliage through shading. That is why the sentimental Gessner was also a sentimental landscape painter.

The portrait tends more towards educative painting, where the sole and proper task is to represent to us an individual grasped at a single moment of life. Hence it was pre-eminently the *Venetian School* that excelled so much in portrait painting.

Productive painting without educative painting is the form without the object, or *arabesque*, while educative painting without productive painting is content without form, the slavish imitation of prosaic everyday life, or *still life*.

Productive and educative painting without the preponderance of either, in harmonious balance with one another, give rise to the *ideal*.

Unity and outline is only characteristic of the mortified hieroglyph. The art which brings the latter to life necessarily divides this unity into coloration on the one hand and chiaroscuro on the other; the ideal brings unity back into division and restores

the outline of drawing through the inner connection between *colour* and the *clair-obscur*.

In coloration the artist breathes the gentle delicate play of shimmering colour from nature onto his canvas, pours the shapes of his imagination in their coloured haze into the effects of chiaroscuro, and from this form the ideal arises as his master-work.

For the ideal nature possesses an imagination of her own; the finest thing to be found in reality was first called forth through this imagination, and the painter merely carries this perfect product over into his own homogeneous imagination.

Raphael flew closest to the illuminated centre of the ideal, and his painting of the *Transfiguration* has solved the problem of the total and harmonious balance of opposed forces in the purest possible manner.

Painting illuminates our senses by virtue of its shimmering light, while *plastic art* expresses itself through solid bodies.

In plastic art the effects are embodied in the domain of outer nature. What floats before the artist's soul in great ethereal masses here leaps over, like a spark, into the external world; thus it is that matter comes to clothe the little flame that has sprung forth from the burning ocean of the artist's imagination, and what is thereby clothed speaks lovingly to us in terms of form.

The rich abundance of our inner powers arranges itself into a state of equilibrium and the struggle of the battling elements of our nature has thus transformed itself into quiescence; the inner world now lies out there before us in the gentle happy light of a spring morning like a pure and distant cloudless sky. Just such a pure and distant cloudless sky shines back upon us from the marble statue of *Apollo Belvedere*.

Painful feelings rise within the breast, and gradually their coils embrace the soul, fetter and cripple our every power and capacity; trembling and suffocating with inexpressible anguish, the soul struggles with its final impulse against oppression but finally must submit; art receives the falling victim in her arms, and the catastrophic fate is captured for us in the *Laocoön*.

If you would feel how in such extremity the woman patiently endures while the husband struggles to his last breath with all-destroying fate and struggling falls; how, weeping, she beseeches nature for deliverance as her wounded husband, proud and unlamenting, is inwardly destroyed, then stand before the depiction of *Niobe*.

The Greek genius clothed every affect in the garments of myth, and form then crystallized around the latter in accordance with the corresponding laws of the plastic impulse.

Plastic art is thus the *petrification* of the soul.

Light decomposes into colour, and sound into tone; solid bodies are elements for our sensibility, and there can be no possible internal division within them that would effect the latter.

In the plastic product of art, therefore, there is no division, no sequential harmony of parts one after another, nothing that corresponds to coloration; it is impossible for it to represent melodic succession or anything resembling chiaroscuro. The single, homogeneous and undivided substance acquires differentiation only in relation to the external medium of space.

The depth which the painter transfers to the painting out of his own imagination, the breadth which the composer lends to song through his own inner and creative

capacity, both of these are also to be found in the plastic art of sculpture, and each is simultaneously given along with the other here.

If in painting the element of drawing decomposes into coloration and chiaroscuro, the solid form of plastic art, which characterizes the work of sculpture on every side, resists all such decomposition, but also renders it superfluous here for art.

In his domain the plastic artist already and immediately provides what the painter's highest striving only ever attains in infinity – namely to connect the uttermost extremes of art together in the ideal. But while unlimited paths stand open to the painter, the plastic artist must tread a narrow road, and any deviation in one direction or the other spells his downfall.

What the educative artist wrests from nature for his art is merely the form; what the productive artist puts into nature out of himself is the selfsame form, the only possible garment in which the idea is clothed for him. The divided capacities for art are thus united in the image; in the image the points of contact between inner and outer nature, in which the soul and the organism are formed, are once again presented in external space.

The productive and the educative capacities for art must assume, therefore, a perfect equilibrium in the artist if a single beautiful form is properly to arise. If the former is too prominent the contours are distorted into *caricature*, and if the latter is predominant the work of art *models* only what is *ordinary*.

The composer reproduces the same *theme* in a thousand different *variations*; the painter presents us with the same *image* from a hundred different views: the work of plastic art must express itself entirely from all sides and in every part, it stands before us ever finished and complete.

What the *harmonic scale* represents for music, *Antiquity* represents for the formative arts; as in the former the ideal seems to float towards us from the heavens, so here it rises forth to meet us from the clefts of earth as blocks of marble.

Monochromatic paintings in chiaroscuro without colour correspond to the *percussion* instruments in music; *coloured* paintings in the varied hues of light and shade correspond to the *wind* instruments in music; as the *string* instruments assume an intermediate position between both, so *plastic art* stands half-way between water-colour and painted picture, *bas-relief* marking the transition to the one and *mosaic* the transition to the other.

Landscape painting in the visual arts corresponds to the *art of garden design*, and the related art of *architecture*, in the plastic arts; both of the latter offer great scope for sentimental expression, whereas with the *bust* we must concentrate entirely upon the expression of individuality.

This is therefore how the scale of the formative arts is articulated: the manifestation of external nature presents itself to us in the *language of images* or symbols: it is only the heart that is capable of apprehending mere appearance; the inanimate *appearance of nature*, shining in upon the heart and represented in terms of solid bodies, is the art of *garden design*, while reflected in light and colour it is *landscape painting*; *living reality* expressed in solid form gives rise to *plastic art*, expressed in light itself to *figure painting*.

A duplex structure is therefore in the scale; a twofold character here as everywhere.

Mathematics, as the ideal in the realm of spirit, decomposes initially into a positive and a negative, into something produced and into something educed, into theoretical speculation and empirical experience, into science and manifestation.

The ideal in the realm of the heart, the summit of art, to which we here find ourselves driven, and which we have yet to demonstrate, decomposes in the same way into a positive and a negative, into something produced and something educed, into the arts of language and the formative arts.

The arts of language, in contrast to the formative arts, tend more towards the productive side; the tone, the word is a liquefied image which, unlike space, is not capable of the most precise external delimitation, but is shrouded, even more than light, in a kind of misty half-shade.

The formative arts, in contrast to the arts of language, tend more towards the educative side; the images here represented in space acquire a sharply defined individuality; the eye grasps what is represented more sharply and clearly than the ear, and the imagination here finds itself confined within much narrower limits.

The highest and most primordial division in art thus reveals itself to us in the *sound* and in the *image*; at the next level the division itself will be divided in turn, and every opposition will disintegrate into new and further oppositions.

Thus the art of language divides into poetry and the musical art of tones; poetry, in contrast to music, will be the positive factor, while the latter provides the negative factor. Didactic poetry leads us into the brighter regions of the spirit, while music carries below in the misty realm of feelings.

Formative art separates into *painting* and *sculpture*, the former being the productive moment, and the latter the educative moment. We behold the imagination glimmering darkly towards us in the chiaroscuro of painting, whereas the sharply defined form of the sculpted work produces only sharply defined sensations in the senses.

The *single* great ideal of art will also divide into *two* further ideals; the oppositions of poetry and music are united in the ideal associated with the art of language, while the productive moment of painting and the educative moment of plastic art are united in the ideal associated with formative art.

In the earliest childhood of their growth poetry and music played together trustingly like inseparable sisters; only later were the companions divided in order to meet again, when both had reached maturity, in the ideal.

Plastic art and painting would thus reveal themselves in the individual sculpture as the *colossal*, existing in every individual sculpture and uniting all of them together as a single, mighty, ideal *embodiment of art*.

5 William Wordsworth (1770–1850) ‘Advertisement’ from *Lyrical Ballads*

Wordsworth and Samuel Taylor Coleridge published their *Lyrical Ballads* in 1798. The book, which is regarded as marking the emergence of Romanticism in England, contained twenty-three poems, the great majority by Wordsworth. It also contained a short ‘Advertisement’, written between April and September 1798, after completion of the poems.

Poetry represents the principal focus of this 'Advertisement', as of the longer preface Wordsworth contributed to the second edition of 1800 (see VIA6). But it also encapsulates in concise form the wider Romantic move away from neo-classical decorum. Greater immediacy is to be achieved through a closer attention to nature and to daily life (in the case of poetry, to the patterns of ordinary speech). As if in anticipation of a persistent disposition in subsequent modern art, literary and visual alike, Wordsworth explicitly opposes the 'natural delineation' of feelings and incidents to the 'pre-established codes' of conventional taste. We have used the text of the Advertisement as published in *The Prose Works of William Wordsworth*, volume 1, edited by W. J. B. Owen and Jane Worthington Smyser, Oxford: Clarendon Press, 1974, pp. 116–17.

It is the honourable characteristic of Poetry that its materials are to be found in every subject which can interest the human mind. The evidence of this fact is to be sought, not in the writings of Critics, but in those of Poets themselves.

The majority of the following poems are to be considered as experiments. They were written chiefly with a view to ascertain how far the language of conversation in the middle and lower classes of society is adapted to the purposes of poetic pleasure. Readers accustomed to the gaudiness and inane phraseology of many modern writers, if they persist in reading this book to its conclusion, will perhaps frequently have to struggle with feelings of strangeness and awkwardness: they will look round for poetry, and will be induced to enquire by what species of courtesy these attempts can be permitted to assume that title. It is desirable that such readers, for their own sakes, should not suffer the solitary word Poetry, a word of very disputed meaning, to stand in the way of their gratification; but that, while they are perusing this book, they should ask themselves if it contains a natural delineation of human passions, human characters, and human incidents; and if the answer be favorable to the author's wishes, that they should consent to be pleased in spite of that most dreadful enemy to our pleasures, our own pre-established codes of decision.

Readers of superior judgment may disapprove of the style in which many of these pieces are executed: it must be expected that many lines and phrases will not exactly suit their taste. It will perhaps appear to them, that wishing to avoid the prevalent fault of the day, the author has sometimes descended too low, and that many of his expressions are too familiar, and not of sufficient dignity. It is apprehended, that the more conversant the reader is with our elder writers, and with those in modern times who have been the most successful in painting manners and passions, the fewer complaints of this kind will he have to make.

An accurate taste in poetry, and in all the other arts, Sir Joshua Reynolds has observed, is an acquired talent, which can only be produced by severe thought, and a long continued intercourse with the best models of composition. This is mentioned not with so ridiculous a purpose as to prevent the most inexperienced reader from judging for himself; but merely to temper the rashness of decision, and to suggest that if poetry be a subject on which much time has not been bestowed, the judgment may be erroneous, and that in many cases it necessarily will be so. [. . .]

6 William Wordsworth (1770–1850) from Preface to *Lyrical Ballads*

A second edition of *Lyrical Ballads* appeared two years after first publication, in 1800. It was now accompanied by a longer preface than the original short 'Advertisement' (see VIA5). In the new preface, Wordsworth further spelled out his aim to give more direct expression to the emotions. He calls these our 'elementary feelings', and regards them as capable of articulation only by an artist of 'organic sensibility'. For Wordsworth such an art is more likely to prosper in the face of nature, but in his conception, nature is not just a timeless idyll. It is, rather, historically situated. The experience of nature is a defence against forces which are at work to blunt what he calls the 'discriminating powers of the mind': the forces, that is, of an emergent modernity. These he specifies in particular as the turbulent political events of the period, the increasing pace of urban life, *and*, not least, the debased forms of mass culture to which the circumstances of urban life were already giving rise. Wordsworth writes in some detail of specifically literary matters, but we consider the inclusion of selections from his text to be justified because of the importance which technique as such came to assume across all the arts during the nineteenth century and later. Our extracts are taken from the 1800 preface to *Lyrical Ballads* as printed in *The Prose Works of William Wordsworth*, edited by W. J. B. Owen and Jane Worthington Smyser, volume 1, Oxford: Clarendon Press, 1974, pp. 122–30, 148–50.

[...] The principal object . . . which I proposed to myself in these Poems was to make the incidents of common life interesting by tracing in them, truly though not ostentatiously, the primary laws of our nature: chiefly as far as regards the manner in which we associate ideas in a state of excitement. Low and rustic life was generally chosen because in that situation the essential passions of the heart find a better soil in which they can attain their maturity, are less under restraint, and speak a plainer and more emphatic language; because in that situation our elementary feelings exist in a state of greater simplicity and consequently may be more accurately contemplated and more forcibly communicated; because the manners of rural life germinate from those elementary feelings; and from the necessary character of rural occupations are more easily comprehended; and are more durable; and lastly, because in that situation the passions of men are incorporated with the beautiful and permanent forms of nature. The language too of these men is adopted (purified indeed from what appear to be its real defects, from all lasting and rational causes of dislike or disgust) because such men hourly communicate with the best objects from which the best part of language is originally derived; and because, from their rank in society and the sameness and narrow circle of their intercourse, being less under the action of social vanity they convey their feelings and notions in simple and unelaborated expressions. Accordingly such a language arising out of repeated experience and regular feelings is a more permanent and a far more philosophical language than that which is frequently substituted for it by Poets, who think that they are conferring honour upon themselves and their art in proportion as they separate themselves from the sympathies of men, and indulge in arbitrary and capricious habits of expression in order to furnish food for fickle tastes and fickle appetites of their own creation.

I cannot be insensible of the present outcry against the triviality and meanness both of thought and language, which some of my contemporaries have occasionally introduced into their metrical compositions; and I acknowledge that this defect where it exists, is more dishonorable to the Writer's own character than false refinement or arbitrary innovation, though I should contend at the same time that it is far less pernicious in the sum of its consequences. From such verses the Poems in these volumes will be found distinguished at least by one mark of difference, that each of them has a worthy *purpose*. Not that I mean to say, that I always began to write with a distinct purpose formally conceived; but I believe that my habits of meditation have so formed my feelings, as that my descriptions of such objects as strongly excite those feelings, will be found to carry along with them a *purpose*. If in this opinion I am mistaken I can have little right to the name of a Poet. For all good poetry is the spontaneous overflow of powerful feelings; but though this be true, Poems to which any value can be attached, were never produced on any variety of subjects but by a man who being possessed of more than usual organic sensibility had also thought long and deeply. For our continued influxes of feeling are modified and directed by our thoughts, which are indeed the representatives of all our past feelings; and as by contemplating the relation of these general representatives to each other, we discover what is really important to men, so by the repetition and continuance of this act feelings connected with important subjects will be nourished, till at length, if we be originally possessed of much organic sensibility, such habits of mind will be produced that by obeying blindly and mechanically the impulses of those habits we shall describe objects and utter sentiments of such a nature and in such connection with each other, that the understanding of the being to whom we address ourselves, if he be in a healthful state of association, must necessarily be in some degree enlightened, his taste exalted, and his affections ameliorated.

I have said that each of these poems has a purpose. I have also informed my Reader what this purpose will be found principally to be: namely to illustrate the manner in which our feelings and ideas are associated in a state of excitement. But speaking in less general language, it is to follow the fluxes and refluxes of the mind when agitated by the great and simple affections of our nature. [. . .]

[T]he human mind is capable of excitement without the application of gross and violent stimulants; and he must have a very faint perception of its beauty and dignity who does not know this, and who does not further know that one being is elevated above another in proportion as he possesses this capability. It has therefore appeared to me that to endeavour to produce or enlarge this capability is one of the best services in which, at any period, a Writer can be engaged; but this service, excellent at all times, is especially so at the present day. For a multitude of causes unknown to former times are now acting with a combined force to blunt the discriminating powers of the mind, and unfitting it for all voluntary exertion to reduce it to a state of almost savage torpor. The most effective of these causes are the great national events which are daily taking place, and the encreasing accumulation of men in cities, where the uniformity of their occupations produces a craving for extraordinary incident which the rapid communication of intelligence hourly gratifies. To this tendency of life and manners the literature and theatrical exhibitions of the country have conformed themselves. The invaluable works of our elder writers, I had almost

said the works of Shakespear and Milton, are driven into neglect by frantic novels, sickly and stupid German Tragedies, and deluges of idle and extravagant stories in verse. – When I think upon this degrading thirst after outrageous stimulation I am almost ashamed to have spoken of the feeble effort with which I have endeavoured to counteract it; and reflecting upon the magnitude of the general evil, I should be oppressed with no dishonorable melancholy, had I not a deep impression of certain inherent and indestructible qualities of the human mind, and likewise of certain powers in the great and permanent objects that act upon it which are equally inherent and indestructible; and did I not further add to this impression a belief that the time is approaching when the evil will be systematically opposed by men of greater powers and with far more distinguished success.

Having dwelt thus long on the subjects and aim of these Poems, I shall request the Reader's permission to apprise him of a few circumstances relating to their *style*, in order, among other reasons, that I may not be censured for not having performed what I never attempted. Except in a very few instances the Reader will find no personifications of abstract ideas in these volumes, not that I mean to censure such personifications: they may be well fitted for certain sorts of composition, but in these Poems I propose to myself to imitate, and, as far as is possible, to adopt the very language of men, and I do not find that such personifications make any regular or natural part of that language. I wish to keep my Reader in the company of flesh and blood, persuaded that by so doing I shall interest him. Not but that I believe that others who pursue a different track may interest him likewise: I do not interfere with their claim, I only wish to prefer a different claim of my own. There will also be found in these volumes little of what is usually called poetic diction; I have taken as much pains to avoid it as others ordinarily take to produce it; this I have done for the reason already alleged, to bring my language near to the language of men, and further, because the pleasure which I have proposed to myself to impart is of a kind very different from that which is supposed by many persons to be the proper object of poetry. [. . .]

If I had undertaken a systematic defence of the theory upon which these poems are written, it would have been my duty to develop the various causes upon which the pleasure received from metrical language depends. Among the chief of these causes is to be reckoned a principle which must be well known to those who have made any of the Arts the object of accurate reflection; I mean the pleasure which the mind derives from the perception of similitude in dissimilitude. This principle is the great spring of the activity of our minds and their chief feeder. From this principle the direction of the sexual appetite, and all the passions connected with it take their origin: It is the life of our ordinary conversation; and upon the accuracy with which similitude in dissimilitude, and dissimilitude in similitude are perceived, depend our taste and our moral feelings. It would not have been a useless employment to have applied this principle to the consideration of metre, and to have shewn that metre is hence enabled to afford much pleasure, and to have pointed out in what manner that pleasure is produced. But my limits will not permit me to enter upon this subject, and I must content myself with a general summary.

I have said that Poetry is the spontaneous overflow of powerful feelings: it takes its origin from emotion recollected in tranquillity: the emotion is contemplated till by a

species of reaction the tranquillity gradually disappears, and an emotion, similar to that which was before the subject of contemplation, is gradually produced, and does itself actually exist in the mind. In this mood successful composition generally begins, and in a mood similar to this it is carried on; but the emotion, of whatever kind and in whatever degree, from various causes is qualified by various pleasures, so that in describing any passions whatsoever, which are voluntarily described, the mind will upon the whole be in a state of enjoyment. Now if Nature be thus cautious in preserving in a state of enjoyment a being thus employed, the Poet ought to profit by the lesson thus held forth to him, and ought especially to take care, that whatever passions he communicates to his Reader, those passions, if his Reader's mind be sound and vigorous, should always be accompanied with an overbalance of pleasure. Now the music of harmonious metrical language, the sense of difficulty overcome, and the blind association of pleasure which has been previously received from works of rhyme or metre of the same or similar construction, all these imperceptibly make up a complex feeling of delight, which is of the most important use in tempering the painful feeling which will always be found intermingled with powerful descriptions of the deeper passions. This effect is always produced in pathetic and impassioned poetry; while in lighter compositions the ease and gracefulness with which the Poet manages his numbers are themselves confessedly a principal source of the gratification of the Reader. I might perhaps include all which it is *necessary* to say upon this subject by affirming what few persons will deny, that of two descriptions either of passions, manners, or characters, each of them equally well executed, the one in prose and the other in verse, the verse will be read a hundred times where the prose is read once.

7 Friedrich Schlegel (1772–1829 from *Description of Paintings in Paris and the Netherlands in the Years 1802–04*)

After the dissolution of the Jena circle in 1800, Friedrich Schlegel (see VIA1 and 2) gave a series of lectures in Berlin, before travelling to Dresden and then to France. From January to May 1802 he was in Dresden, where he met Philipp Otto Runge (see VIB5 and VIIA8) and enjoyed extensive conversations on painting with Ludwig Tieck (see VIB2). On an earlier visit to Dresden in 1789 he had responded primarily to classical works of art, and had been particularly impressed by Mengs' collection of casts from the antique. However, his growing interest in the poetry of the Middle Ages helped to make him unusually receptive to early Renaissance painting, which he was one of the first to champion. From June 1802 to 1804 he lived in Paris, studying Sanskrit in the Bibliothèque Nationale and exploring the collections of the Musée Napoléon, recently expanded with works appropriated from abroad. From 1803 to 1805 he edited the journal *Europa* and it was here that he published his important series of 'Descriptions of Paintings'. Combining both critical and descriptive writing, these essays explore the historical and national roots of early German, Flemish and Italian painting. Schlegel conceives the true source of art as 'feeling' and passionately advocates a return to genuinely religious art. In 1808 he converted to Catholicism and entered into the employment of the Austrian government. Between 1822 and 1825 he oversaw a collected edition of his works, revising many of the essays in the process. The following excerpts were originally published in *Europa*, volume II, part 2, nos 1 and 6,

1805. We have used the English translation by E. J. Millington in *The Aesthetic and Miscellaneous Works of Friedrich von Schlegel*, London: Henry G. Bohn, 1849, pp. 72-4, 88-91, 113-19, 143-8. This was made from the version published by Schlegel in his *Sämmtliche Werke*, volume VI, Vienna, 1823. It has been conjectured that the engraving by Albrecht Dürer (1471-1528) of Sikkingen riding through the wood is *Knight, Death and the Devil*. The painting by Albrecht Altdorfer (c.1480-1529) is *The Battle of Issus (Alexander's Battle)* in the Alte Pinakothek in Munich.

The art of painting having gradually abandoned its early office of adorning the sacred edifices of the Christian faith, and placing the mysteries of our holy religion more clearly and beautifully before the eyes of men than could be effected by words alone, became ere long frivolous and unmeaning, till, vacillating between misconceptions of the ideal and a faulty struggle after mere effect, it wandered still farther from the high object to which it had been originally devoted, and eventually degenerated into uninteresting and commonplace generalities. Every attempt to separate the theory of the art from its practice will in the same manner lead invariably either to empty generalities or fantastic dreams of the imagination. In pursuing, therefore, my present attempt to develop the true and correct principles of the art, I shall, instead of confining myself to a theoretical outline alone, accompany my observations by such an uninterrupted description of various old paintings as may amply suffice to illustrate the ideas suggested. This description will form an appropriate introduction to my subsequent remarks, the results of which will thus rise naturally, and arrange themselves according to certain general principles whose innate affinity and connection will be easily perceived by every reflecting mind.

It is true that no contemplation of works of art can be throughout entirely systematic, more especially at the present time; still the unconnected character of these observations need not by any means interfere with the general unity of the views set forth in the minds of those who have already imbibed correct ideas of the art; and it may be in a certain degree advantageous, as serving continually to remind us of a fact in the history of art, which ought never to be forgotten. A fragmentary form is indeed the most appropriate for observations on an art which is in itself no more than a fragment, the ruined remains of by-gone times. The great body of Italian paintings is torn in pieces and dispersed, and rarely, very rarely, indeed, do we see any attention given to the older masters of the Italian school, or to the study of their works, although the original idea and object of the art is far more simply and naturally expressed in their compositions than in those of a later period. The old German school is in even a more deplorable state, although its preservation is of equal, perhaps even of greater importance than the other, on account of the decided superiority it evinces in principles and technicalities, because also it was more true to the object of religion, and besides remained always pure painting, not infringing the limits which properly divide that art from others. Yet, both German and Italian schools are now almost entirely unknown. The art, as a whole, no longer exists, and a few vanishing traces alone remain which may again furnish ideas for future development to those who, alive to the spirit of the past, are prepared to imbibe them. As we proceed in our survey of modern art, this dismemberment appears to us under a new light. The paintings at present existing are not only dispersed throughout all

lands, and formed into the most heterogeneous collections, not one of which is altogether satisfactory and complete, but pictures requiring to be viewed and studied together are, on the contrary, widely distant from each other. Christian art is in itself but a fragment, and probably will never be completed; and although this is less palpably evident in painting than in the ruined towers and churches of Gothic architecture, many of which have remained unfinished during the last thousand years, and have been suffered in that state to fall into decay and ruin, the observation is equally true of painting, and applicable to the Italian no less than to the German schools.

* * *

How strangely do artists of the present day appear to vacillate in their choice of subjects! Sometimes having recourse to classical fables, to modern French, or Celti-Ossianic figures and subjects: or possibly to such as have no existence at all, except in the brain of the bewildered artist, lost amid the mazes of false and erroneous theories. Were it not better to return at once to the beaten track of the old Italian and German masters? We should find in it no lack of materials, and those persons who imagine the circle of designs from Christian subjects would soon be exhausted, are most completely mistaken. Let them but examine attentively the series of Albert Dürer's engravings, – how rich a fund of new and profound ideas do these supply! I do not refer exactly to the apocalyptic wood-cuts, because, however profound the meaning they convey, these would, especially to the youthful artist, prove most dangerous guides. Yet, what originality is there in Dürer's treatment of ordinary subjects! His varied designs of the Crucifixion are familiar, and require no further notice here; so also his conceptions of the Virgin. Where, even among the greatest masters, can we find a Madonna superior to that of Dürer at Dresden, known by the name of the 'Immaculate Conception,' in which the Blessed Virgin is represented with the moon beneath her feet, the crown of heaven hovering as it were above her head, and her long hair flowing round her, like a veil, even to the hem of her garment? Where can you find a picture so truly and vividly representing the Queen of Heaven in all her divine majesty and loveliness, and at the same time so perfect as a work of art, and so entirely consonant with the symbolism of ancient Christianity? How rich, too, how finely imagined is his 'Madonna in the Garden,' the silent solitude of which, adorned with varied and beautiful plants, with here and there some curious animals, seems amplified into an abstract symbol of external nature! How vigorous, and at the same time incomparably true to nature, are his attempts to portray the Mother of God in her mortal condition, surrounded by domestic cares, – the infant Saviour, playing with angels in the workshop of his nominal earthly father! Where else can such pictures be found – and yet are they not almost necessary accompaniments of our belief? If the image of the star-crowned Madonna, with the planets at her feet, belongs intrinsically to the sphere of Christian ideas, her picture as the personification of spiritual love in the very heart and centre of the blooming garden of nature, lies surely very near to the same circle. Such paintings must undoubtedly be of great rarity, for we cannot point out one resembling either of these, in the collections of Dresden or Düsseldorf, Paris or Brussels, rich as those collections are in oil-paintings, and antique treasures. In the Salon of Ancient Paintings at Brussels, there is one very early picture of the Madonna, with the crown on her head and

the moon beneath her feet, but it is far from giving all the signification of which so lofty an idea is susceptible. Were there any painters of merit now to be found, who, emancipating themselves from the trammels of modern errors and innovations, had entered upon their course in the true spirit of ancient art, what could be a more worthy office for any noble and wealthy patron, than by a suitable and most invaluable gift to encourage the young artist to employ his genius on appropriate subjects, and with this object, to select for him some of the grandest and most beautiful of Dürer's unexecuted designs? Still, it must be remembered, leaving him at liberty to alter whatever is displeasing to modern taste, or appears imperfect in form, or not essential to the general effect. It was probably in this hope, and with this intention, that our great master bequeathed to posterity the unbroken series of his designs: the outpouring of that inexhaustible activity, which yet could not suffice for the systematic development of all his profound ideas. These plates ought, therefore, to be considered as a collection of fragments of artistic thoughts, a store of creative art-ideas, and not merely as studies, nor as copies from paintings, uncoloured, and in every respect most imperfect. Engravings on copper merit the highest approbation and esteem as previous studies or sketches, preparatory to the execution of a perfect work; and Dürer's should undoubtedly be viewed in that light; hatched hard upon the copper, they will never please the eye at the first glance, yet the outline alone is amply sufficient to realise all that Dürer wished to effect. The engraving of the Sikkingen riding through the wood, shows sufficiently the perfection of Dürer's finished plates of this description. In this we are scarcely sensible of the absence of colour, but on the contrary return again and again to the study of a good impression, as we should do of a good picture; and although it seems impossible for colourless outlines to attain that inexhaustible individuality of character and expression, which is the privilege and property of the all-pervading elements of colour alone, yet the impossible is here attempted and almost attained; as many other great masters have been seen to carry their art to the utmost limit of its peculiar province, and even (feeling the path of return secure) venture for a moment daringly to overstep the boundary. It is this which makes the example of the great luminaries of the art so dangerous to feeble imitators, who venture thoughtlessly to tread a path in which they must find themselves unprepared. Thus Dürer, and many great Italian masters, innocently contributed to the diffusion of erroneous principles in the new school, and to that all-destroying separation between design and colouring, which is no less fatal to the theory of the art than to its mechanical execution. Thus the teaching of Socrates, who first distinguished between the beautiful and the necessary, laid the earliest foundation of inconsistency; thus the erroneous principles supported by Descartes, asserting the absolute distinction of soul and body, and setting an awful gulf between the two, necessarily gave birth to all the succeeding errors of philosophy; and thus also the prevailing error of dividing painting as an art into the distinct branches of design and colouring, has become the fruitful source of all subsequent errors and aberrations. Dürer especially, like so many of those old philosophers, set a far higher value on truth than on personal fame; and feeling it impossible to bring to perfection the entire abundance of his ideas, confidently bequeathed the designs alone to the world at large. During a short period, some, among his contemporaries and followers employed them sometimes even without acknowledgment, till there

arose at last a feeble generation, incapable of completing or even of comprehending his ideas: ere long, they ceased to be esteemed, and in process of time were entirely forgotten. When after contemplating this splendid collection of Dürer's, I turn to all the throng of sketches and copper-plate designs among which we now live, he appears to me like the originator of a new and splendid system of thought, burning with the zeal of a first pure inspiration, eager to diffuse his deeply conceived, and probably true and noble views; and all the heap of frivolous sophists and sweet explainers succeeding him seem like those would-be connoisseurs, whose prattle is now to be heard in all markets both among the amateurs of art, and in every-day life.

* * *

[There is] a little composition of Altdorfer's with figures of one or two inches in height. I scarcely know whether to call it a landscape, an historical painting, or a battle-piece, – it is indeed all these combined, and much more. I cannot describe the astonishment I felt on first beholding this wonderful work. It was as if to one familiar only with the light, graceful verse of the Italians, and aware of no higher order of poetry, the magic world of Shakespeare's genius were suddenly unfolded in all its glorious creations. This simile, however, applies only to the depth and richness of the *poetry* in Altdorfer's painting, not to the romantic spirit which reigns supreme throughout it; so remarkably, indeed, that we might justly style it chivalric. It represents the victory of Alexander the Great over Darius. But there is no servile imitation of the Greek manner; it rather resembles the stories of old knight-errantry, as related in the romantic poetry of the middle ages. The costume is German and knightly; both men and horses clad in steel, with surcoats of gold and embroidery. The chamfrein on the heads of the horses, the glittering lances and stirrups, and the rich variety of the armour, form a scene of indescribable beauty and splendour. There is neither blood, nor any object likely to excite disgust and horror, – no severed or distorted limbs; only in the immediate foreground, if examined very closely, we discover under the feet of the charging hosts on either side, in their impetuous onset, many piles of corpses, lying thickly together, like a web, and forming, as it were, the groundwork to this world of war and arms, of glancing steel, and still more glittering fame and chivalry. It is, in truth, a little world comprised within a few square feet of canvas. The innumerable hosts of combatants advancing on all sides appear inexhaustible, and the distant landscape seems also to lose itself in immensity. The wide ocean stretches before us in the distance; an historical error, if you will, but which is made the vehicle of a lofty and speaking allegory. We see the sea, with lofty cliffs on either side, and a rugged island lying between them, ships of war and whole fleets of other vessels; on the left the sinking moon, and the sun rising on the right, form a striking and correct emblem of the event represented. The armies are arranged in rank and column, without any of the strange contrasts and distortions common in battle-pieces; indeed, with so vast a number of figures, this would have been impossible. It has the order, perhaps it may be termed formality, of the old school. The character and execution of the little figures is wonderful, and would not be unworthy even of Dürer. Let it be remarked, once for all, that the solidity of execution apparent in this picture, notwithstanding the injuries it has sustained, is superior to any we meet with even among *good* masters of the Italian school, and belongs only to the early German. What variety of expression is there, not in the

individual knights and warriors alone, but in the whole assembled armies! Here columns of black archers rush down the mountains, with the impetuosity of a sweeping torrent, while added numbers press on behind them. On the other side, high above, among the rocks, a scattered body of the flying is seen, turning into a narrow defile. Little can be distinguished except their helmets, glittering in the sun; and yet the whole scene, even in that remote distance, is most expressive. The point of highest interest stands out brilliantly in the centre, as the general focus of the composition, – Alexander and Darius, both glittering in armour of burnished gold. Alexander, mounted on Bucephalus, with lance in rest, and advancing far before his followers in eager pursuit of the flying Darius, whose charioteer has already fallen on his white horses, while Darius looks back upon his conqueror with all the rage and despair of a vanquished king. One may withdraw to so great a distance from this picture, that nothing else can be discerned, and yet this group is still clearly defined, and excites feelings of the deepest sympathy. It is a little Iliad on canvas, and by the mute language of its colouring, might instruct those who abandon the holy path of catholic symbolism in quest of new and grand subjects, and aim at producing really romantic compositions, how the stirring spirit of chivalry ought to be expressed.

[. . .] We can scarcely hope to see a revival of art in Germany until we possess some art-loving prince of German origin and temperament, or until some connoisseurs and investigators of the art arise, who being able to devote their lives to that sole object, seek to unite in one great body all the now-existing and widely-scattered compositions of the old German schools. The mingling rays of German art being thus concentrated in one focus, their effect would be inconceivably heightened, and they would prove at least as valuable and surprising as any exhibition of the assembled treasures of Greek or Italian art. The ancient Germans were peculiarly grand and original in their works, though modern ignorance is unacquainted with them; and a shallow rage for imitation, in bitter self-contempt, seeking the darkness, refuses to acknowledge it. But has this copying ever produced anything excellent in any art? Nothing, – nothing throughout! except what is either preposterous or completely shallow and useless. The poet who suffers his fancy to stray and luxuriate in distant regions, may perhaps be pardoned, yet even poetry must return from its quest of foreign treasures, and seek at home for what forms the closest point of union of feeling and of poetry among his own people and in his own times, or his poetry will be ever cold and feeble. The intellect, however, and the imitative art, become choked up, restricted in their length and breadth by such apparent improvement in variety. Certain circumscribed boundaries are necessary to the vigorous and successful development of the peculiar feeling of the art, and of what it ought to effect. Truths, dictated by reason, are universal. Imagination loves to wander in the unknown distance, but reason seeks rather to pierce to the lowest depth, and latent origin of what is near to us and around, and so to reproduce it in painting, that in this new-born and clear representation of the incomprehensible mystery of nature, an impulse from the heart may suddenly break through, uttering as it were unspeakable words; while imitation can find none more lofty or expressive than have been already heard. Springing from what is near and peculiar to us, the character of the art will infallibly be local and national. We may trace the general proportions of a beautiful figure according to a certain type or idealization, but to preserve a distinct individuality of

expression and of countenance is also of the highest importance. As long as the art devoted itself to the service of the church and of religion within the mysterious circle of symbolism, that spiritual beauty and holy signification which is the same in all Christian countries, of course supplied the first and highest distinction to which national characteristics must ever be held subordinate. Still this latter element is not to be blotted out, nor entirely lost; it must rather interweave itself with each higher attribute, and thus give to the arrangement of the whole that sensible grace and living charm which are so peculiarly its own. It has already been remarked, that in the works of the oldest masters of the Italian school the national features and physiognomy are so marked as often to appear harsh and glaring, while in the later period all these characteristics disappear in a general ideality, becoming by degrees completely frivolous and characterless. The reverse appears, generally speaking, to be the case with the Germans. In their earliest pictures, designed after the Greek style, a holy symbolism and severe dignity of devotional expression predominate, while the actual characteristics of the people in features and costume are first remarked in a much later period; then it is true, so glaringly brought forward, as often to appear harsh and almost caricatured. This is especially to be observed in Lucas van Leyden and his contemporaries of the Netherlands. The vivacity and varied expression with which Dürer seized and depicted the German national features, contributed to preserve a less variable character in the upper German schools, which in them ever remained predominant, and in time assumed a heavy, dull breadth of expression. It must not, however, be overlooked, that in the schools of the Netherlands, at their best period, all these elements were most happily blended, as in Van Eyck, and Hemling, who united the deep symbolism of devotion and holy beauty with a German abundance of feeling and expression. Nay, Meister Wilhelm, of Cologne, nearly as he assimilates to the Greek style, still in the calm godliness which forms the general characteristic of his pictures, and of his conceptions of the Madonna in particular, and of other glorified saints, clearly indicates a tendency to the rejoicing life of the German manner at that period. We trace this in the countenances, as well as in the surrounding groups of figures, and a certain fantastic richness and delicacy in the many-coloured robes and costume. The study of these lively characteristics and national peculiarities is of especial importance at the present time, as forming a necessary element of every vivid representation, and one in which modern art is most deficient, being more in danger of losing itself in the abstract generalisation of an ideal, equally feeble and frivolous, than of falling into errors of an opposite tendency. Until the amalgamating confusion of later times, every nation had its own distinct features, in manners, customs, feeling, and physiognomy, and equally national peculiarities in music, painting, and architecture. How, indeed, could it be otherwise? Much has been said concerning the universality of beauty, and the art, as unrestricted by the limits of any locality, yet never has a single spot been discovered in which it can successfully throw off the peculiar characteristics of the sphere in which it exists. Certainly the attempts hitherto made on this principle give us little reason to anticipate much advantage from the promulgation of this new faith. The Greeks and Egyptians, the Italians and Germans, all became great in art while it was confined within severe and well-defined limits, and in all alike we may date their decline from that high eminence at the period when indiscriminate imitations were first practised.

The excellence of painting, in particular, which can present an outline only of material forms, depends greatly on its power of seizing both the purely spiritual and the individual expression of those forms, and it should so employ the magic of colouring, as to embody and retain the exact proportions and appropriate ideality of each object, as existing in different nations and localities. The artist will do well to adopt and act upon the well-grounded principles of Dürer, who, when would-be critics blamed his manner of painting, and strove to turn him from his path, replied, 'I will paint nothing antique.' In him the many magnificent works of art displayed at Venice excited no false attempt to imitate the Italian style, for he held it much better to remain true to his own deeply-studied art. He had no higher ambition than to paint as a German, striving to attain the highest perfection in that style, and fully carrying out the vigorous and energetic principles of the upper German school. He united and blended with them the varied vivacity and rich imaginative faculty of the lower German masters; a manner which harmonises entirely with the inconceivable treasures of his own creative genius, and, indeed, is almost necessary to their full development.

* * *

And now, in conclusion, one question arises, standing in close connexion with the chief object of all our observations and reflections. Is it probable that in this present time we shall see either the rise or the permanent establishment of a grand original school of painting? Outward appearances would lead us to reply in the negative; but can we assert its utter impossibility? It is true, certainly, there are no modern artists capable of competing with the great masters of antiquity, and the points in which our attempts are most deficient appear also tolerably clear: partly, a neglect of technical proprieties in the colouring, and, still more, the absence of deep and genuine feeling. Modern artists even of the most judicious and well-directed talents are often found deficient in productive activity; in that certainty and facility of execution which was so peculiar a feature in the old schools. When we consider the infinite number of great compositions which Raphael produced, although snatched away in the bloom of age and the zenith of his fame, or the iron industry of the genuine Dürer, displayed in his innumerable creations of every kind, executed on the most various materials, although to him also a long term of years was denied, we shrink from comparing our own puny period with the vast proportions of that majestic epoch. Yet this is easily accounted for. The habit of universal painting, and the intellectual vanity which was a prevailing bias in the genius and art of our forefathers, naturally led to the breaking up of its spiritual strength, since these properties were most incompatible with the progressive development and final perfection of any one distinct branch. To this source we may refer the separation now existing, in a greater or less degree, between all the intellectual and imitative productions of our time; but in regard to the art of painting, the following observations deserve to be noted as of primary importance. Deep feeling is the only true source of lofty art, and as in our time everything is opposed to this feeling, struggling, as it were, either to destroy, repress, overwhelm, or lead it astray into the by-paths of error, the first portion of an artist's life is consumed in a preliminary struggle, ere the mind can enfranchise its powers from all the unspeakable difficulties imposed by the spirit of the time; a struggle unavoidably necessary, in order to unseal the spring of correct artistic feeling, and free it from the encumbering rubbish of the destroying outer world around.

A highly intellectual nature, spurning the trammels and conventionalities of the day, and rising in daring opposition to the ruling spirit, must ever concentrate its powers within itself, and can rarely attain great vivacity in the creative faculty of imagination. Thus we may account for the slow appreciation of ancient art in our day; but pressing onward with unshaken ardour in spite of all obstacles, it will at length attain a brighter future, and bloom out with new and glorious life in the realms of beauty and inspiration. There appears to be an unfathomable mystery in the fact that some periods, by their own will alone, and apparently without any outward stimulus, become so rich in art, so happy in their artistic productions, while others seem to expend their energy in vain, meeting with no corresponding nor even adequate success in their intellectual productions. It is impossible fully to unravel the mystery, and we must depend only on facts well known and understood, which will prove amply sufficient to guide us to the source of all lofty works of art, and the proper means and materials to be employed; this will lead to the working out of scientific principles, and the conservation of everything beautiful in Christian art, although without the especial gifts of nature, the summit of artistic excellence will ever remain unapproachable.

The one true fountain of beauty and the art is *feeling*. It is *feeling* which reveals to us true ideas and correct intentions, and gives that indefinable charm, never to be conveyed in words, but which the hand of the painter, guided by the poet's soul alone, can diffuse throughout all his works. From religious feeling, love, and devotion, arose the silent inborn inspiration of the old masters: few, indeed, now seek their hallowed inspiration or tread the paths by which alone they could attain it, or emulate that earnest endeavour to work out the principle of serious and noble philosophy which is discoverable in the works of Dürer and Leonardo. Vain will be every effort to recall the genius of the art, until we summon to our aid, if not religion, at least the idea of it, by means of a system of Christian philosophy founded on religion. Still, if young artists deem this road too distant or too difficult of attainment, let them at least study deeply the principles of poetry, in which the same spirit ever breathes and moves. Not so much the poetry of the Greeks, now familiar only to strangers and the learned, or read through the medium of translations from which every poetical association is banished by the wooden clapper-clang of the dactyls, but rather the romantic genre – Shakspeare, and the best Italian and Spanish dramatists, those also of the old German poems which are most accessible, and next such modern productions as are dictated by the spirit of romance. These should be the constant companions of the youthful artist, and will lead him back to the fairy-land of old romantic days, chasing from his eyes the prosaic mist engendered by imitation of the pagan antique, and the unsound babble of conventional art. Still every effort will be fruitless, unless the painter be endowed with earnest religious feeling, genuine devotion, and immortal faith. Fancy sporting with the symbols of catholicism, uninspired by that love which is stronger than death, will never attain exalted Christian beauty.

In what, then, does this exalted beauty consist? It is of the first importance to analyse the good and evil tendency of all theories of the art. Whoever has not himself discovered the fountain of life can never successfully guide others to the source, or unfold to them the glorious revelations of the painter's art; he will rather wander

perplexed amid the dreamy visions of mere external representations, and the creation of his imagination, being totally void of expression and character, will become in fact a mere nonentity. The true object of the art should be, instead of resting in externals, to lead the mind upwards into a more exalted region and a spiritual world. While false-mannered artists, content with the empty glitter of a pleasing imitation, soar no higher, nor ever seek to reach that lofty sphere, in which genuine beauty is portrayed according to certain defined ideas of natural characteristics. It finds on its path the most vivid development of all sensible forms; the fascination of grace, the highest natural bloom of youthful beauty, yet endowed rather with sensual fascination than the inspired loveliness of the soul. When heathen artists attempt to take a higher range, they wander into exaggerated forms of Titanic strength and severity, or melt into the solemn mournfulness of tragic beauty, and this last is the loftiest point of art that they can ever reach, and in which they do sometimes approach nearly to immortality. Here, however, their lofty flight is terminated: the path of spiritual beauty is barred on the one hand by a Titan-like exaggeration, striving to take heaven and the divinity by violence, yet failing in the power to accomplish its endeavour; on the other by an eternal grief, for ever plunged in mortal agony, in the hopeless bondage of its own unalterable doom. The light of hope dawned not on heathen intelligence; impassioned grief and tragic beauty bounded their purest aspirations. Yet this blessed light of hope, borne on the wings of trusting faith and sinless love, though on earth it breaks forth only in dim anticipations of a glorious hereafter, – this glorious hope, radiant with immortality, invests every picture of the Christian era with a bright harmony of expression, and fixes our attention by its clear comprehension of heavenly things, and an elevated spiritual beauty which we justly term Christian.

Many paths, old as well as new, must be tried and broken up before that certain road is laid open, in which renovated art may securely tread, and attaining the long-sought goal, bloom forth in high religious beauty. Here and there, perhaps, extremes may seem to produce the same effect, and it would not be astonishing if in the present universal tendency to imitation, some genius, conscious of its powers, should break forth into a longing desire for absolute originality. If such a genius were penetrated with a true idea of his art, justly esteeming that symbolic expression and revelation of divine mysteries which is its sole appropriate object, and regarding all besides merely as the means, the working members, or characters which, duly combined, produce a correct expression, his compositions would probably be the foundation of quite a new style: genuine hieroglyphic symbols, the simple offspring of nature and natural feelings, but drawn from individual conceptions, and arbitrarily thrown together rather than in accordance with the ancient methods of an earlier world. Every such picture might well deserve to be called a hieroglyphic, or divine symbol; and the question now to be considered is, whether a painter ought to trust thus implicitly to his own genius for the creation of his allegories, or confine himself to the adoption of those old symbols, which have been handed down to us, hallowed by tradition, and will always, if rightly understood, prove sufficiently expressive and effective. The first method is unquestionably the most dangerous, and its results would appear to be accidental if, of many who tried the same path, a few only reached the same point of excellence. Success would be uncertain, as has so long been the case with the sister art

of Poetry. There seems to be more safety in clinging to the old masters, especially to those of the very earliest date, assiduously emulating their unalterable truth and beauty, till it becomes a second nature to eye and soul. Next to the finest of the old Italians, for example, the style of the German masters well deserves our study, mindful that to that nation we also belong, and that the serious earnestness of its character, we, beyond all others, are bound to preserve. Thus we might hope to see combined the symbolically, spiritually beautiful, with the sure method of producing antique grace, whence, as from the very being of the art, even though all knowledge of it were lost, true poetry and science must proceed. The old German style is not only more accurate, and skilful in mechanism than the Italian in general, but it also adhered longer and more faithfully to that wonderful and profoundly true Catholic-Christian symbolism, whence they drew far more precious treasures than were granted to those who suffered their imagination to wander into the merely Jewish subjects of the old Testament, or digressed still farther into the province of ancient Greek mythology.

The Italian schools, indeed, though far superior to those of Upper Germany, can scarcely, even in ideal grace, claim precedence of those of Lower German art, if we judge of its excellence from the period of its maturity, when Wilhelm of Cologne, John Van Eyck, and Hemling [Memling] flourished, and not from later and more degenerate times. We should remember, especially, that an artist ought not to seek, nor expect to attain, the perfect antique by adopting the Egyptian style in the almost image-like position of the feet, the scanty draperies, and long narrow half-shut eyes, any more than by copying bad designs and actual errors or defects. These, in truth, are but the indications of a *false* taste, and have no more affinity with the real Christian antique than the little esteemed imitative manner of the old Germans. The beauty of early Christian art consists not so much in the external parts as in the tranquil, pious spirit universally pervading; and the cultivation of this spirit will give inspiration to the painter, guiding his steps to the pure neglected source of Christian beauty, till at length a new dawn shall break the darkness of the horizon, and shine forth in the clearest meridian splendour throughout the compositions of reviving art.

8 Friedrich Schelling (1775–1854) from ‘Concerning the Relation of the Plastic Arts to Nature’

The philosopher Friedrich Schelling was born in Leonberg, near Stuttgart. From 1790 to 1792 he studied at the Tübingen Stift alongside Hölderlin and Hegel (see VA15). He published his first important work, *Ideas for a Philosophy of Nature*, in 1797. The following year he was elected to a chair in philosophy at the University of Jena, where he soon made contact with Friedrich and August Wilhelm Schlegel (see VIA1, 2, 7 and 9), Novalis (see VIA3) and Ludwig Tieck (see VIB2). He lectured on the philosophy of art at Jena from 1802–3 and again in Würzburg from 1804–5. However, his most accessible work on the subject is contained in the address which he gave to the Munich Academy of Sciences in 1807, ‘Concerning the Relation of the Plastic Arts to Nature’. Although he accepts the traditional definition of art as imitation of nature, he contends that the concept of nature has consistently been left ambiguous. Rather than elevating the human mind over an inert

realm of nature, we need to recognize a profound interconnection between the two domains. For Schelling, 'spirit is invisible nature' and 'nature is visible spirit.' Not only does nature first come to consciousness in the human mind, but human mental activity is itself part of an already spiritualized nature. Describing nature as 'the world's holy, eternally creating primal energy, which engulfs and actively brings forth all things out of itself', he contends that the same creative principle which animates nature should animate the work of art, thereby overcoming the division between the two. The address was first published as a separate volume under the title *Über das Verhältnis der bildenden Künste zu der Natur*, Landshut: Philipp Krull, 1807. It was reprinted in Schelling's *Philosophische Schriften*, volume 1, Landshut, 1809. The following excerpts are taken from the translation by Michael Bullock in Herbert Read, *The True Voice of Feeling: Studies in English Romantic Poetry*, London: Faber and Faber, 1953, pp. 323–7, 329–32, 335–8. We have omitted the author's footnotes, which were added in the second edition of 1809. The 'profound philosopher' mentioned in the text is Johann Georg Hamann (see IIB12).

How much sensibility, thought and judgment has been expended upon art since long ago! How then could this lecture hope to give the subject a new attraction in such an eminent gathering of the most enlightened connoisseurs and the most penetrating critics, if that subject did not disdain alien embellishment and rather enable the lecture to reckon with some part of the universal favour and acclaim enjoyed by itself! For other subjects have to be exalted by eloquence, or, if there is something extravagant about them, rendered credible by exposition. Art, however, has the advantage of being visibly present, so that doubts which may otherwise be voiced as to the validity of the assertion that a perfection exceeding in sublimity the common level has been attained, meet a counter-argument in the fact that, in this domain, what was not apprehended in the idea appears incarnate before the eyes. Of additional assistance to the lecture is the consideration that the many theories formulated about this subject have still made far too little attempt to trace art back to its wellsprings. For most artists, though they are supposed to imitate the whole of nature, seldom achieve a conception of what nature's essence is. But experts and thinkers, on account of nature's greater inaccessibility, generally find it easier to derive their theories from the contemplation of the soul than from a science of nature. Such theories, however, are usually far too superficial; in general, they make a number of statements concerning art which are good and true, but which are ineffectual for the plastic artist and entirely fruitless for his practical work.

For plastic art, according to the most ancient definition, is wordless poetry. Without doubt, the author of this statement meant to imply that, like those spiritual thoughts, it should express ideas whose source is the soul, not, however, by means of speech, but, like silent nature, by configuration, by form, by sensuous works which are independent of it. Plastic art, therefore, manifestly occupies the position of an active link between the soul and nature, and can only be comprehended in the living centre between the two of them. Indeed, since it shares this relation to the soul with every other art, including poetry, that which binds it to nature and constitutes a productive force similar to the latter is the only element which remains its peculiar possession: upon this alone, therefore, can a theory be erected which will satisfy the intelligence and be helpful and profitable to art itself.

For this reason we hope, by looking at plastic art in relation to its true model and fountainhead, nature, to be able to contribute something as yet unknown to its theory, to provide some more precise definitions or elucidations of concepts; but above all, to make the inter-relationship of the whole structure of art manifest in the light of a higher necessity.

But has not science, then, recognized this relation from the beginning? Indeed, has not every recent theory started from the definite principle that art should imitate nature? This was true enough: but of what avail was this broad general principle to the artist, in view of the ambiguity of the concept nature and the fact that there are almost as many notions of it as there are different modes of living? To the one it is no more than the dead sum of an indefinite quantity of objects, or the space into which he thinks of things as placed, as into a receptacle; to the other it is merely the soil from which he extracts his food and his livelihood; only to the inspired investigator is it the world's holy, eternally creating primal energy, which engenders and actively brings forth all things out of itself. The foregoing principle would be of high significance if it admonished art to emulate this creating energy: but there can be little doubt as to the sense in which it was intended, if one knows the general condition of the sciences at the time of its genesis. It would be strange if just those who denied all life to nature had set it up as a pattern for art. The words of that profound thinker could have applied to them: Your lying philosophy has done away with nature, and why do you demand that we should imitate it? So that you may take fresh pleasure in exercising the same deed of violence upon nature's pupils?

To them, nature was not merely a dumb, but an absolutely dead image, to which even inwardly no living word was innate: an empty scaffolding of forms of which an equally empty image was to be transferred to the canvas or hewn in stone. This was the right theory for those ancient, crude peoples who, since they saw nothing divine in nature, brought forth idols out of it; while to the perceptive Hellenes, who everywhere felt traces of a vitally operative essence, true gods emerged from nature.

And is the pupil of nature supposed then to imitate all and everything in it indiscriminately? He is only supposed to reproduce beautiful objects, and of these only the most beautiful and perfect elements. The principle is thus more closely defined, but this very definition is an assertion that in nature the perfect is mingled with the imperfect, the beautiful with the unbeautiful. Now, how is the man whose relation to nature is solely that of servile imitation to distinguish the one from the other? It is in the nature of an imitator that he more readily assimilates the faults of his original than its merits, because the distinguishing features of the former are more easily grasped and manipulated; and so too we see that, by the imitators of nature in this sense, the ugly has been more frequently and even more lovingly imitated than the beautiful. If we do not look at things in terms of their inner essence, but only in terms of their empty, abstracted form, they in their turn say nothing to our inner being; we must set our own minds, our own spirits in operation before they will answer us. But what is each thing's perfection? Nothing else than the creative life within it, its power to exist. That deep process, similar to the chemical, by which the pure gold of beauty and truth emerges as though refined in the fire will never take place for him in whose eyes the whole of nature seems a dead thing.

There was no alteration in the main aspect of this relation when the inadequacy of the principle began to be more generally felt. Even Johann Winkelmann's splendid institution of a new theory and fresh knowledge made no difference to it. It is true that he re-established the whole operative function of the soul in art and raised it from ignoble dependence into the realm of spiritual liberty. Deeply moved by the forms of the plastic arts of antiquity, he taught that the production of an ideal figure, more noble than reality, together with the expression of spiritual ideas, was the highest purpose of art.

If, however, we examine the sense in which this surpassment of nature by art was for the most part understood, we find that even with this theory the view of nature as a mere product, of things as lifelessly existent, persisted and that it in no way served to arouse the notion of nature as living and creating. Thus it remained impossible to animate these ideal forms by any positive knowledge of their essence; and if the forms of reality were dead for the dead observers, those of art were no less so; if the former were incapable of self-active procreation, the latter were so too. The object to be imitated was changed, imitation itself remained. The place of nature was taken by the exalted works of antiquity, whose outward form the pupils were at pains to appropriate, but without the spirit which imbued it. However, these works are just as unapproachable, indeed even more unapproachable than those of nature, they leave you yet colder than the latter if you do not bring to bear upon them the spiritual eye that penetrates their husk and feels the force at work within them.

From the other side, artists since that time have admittedly received a certain ideal impetus and conceptions of a beauty more elevated than the material, but these conceptions were like fine words to which deeds do not conform. If earlier artistic practice produced a body with no soul, this view only taught the secret of the soul, but not that of the body. Theory, as is always the way, rapidly moved over to the opposite side, but it had not yet found the living centre.

* * *

Everywhere nature first confronts us in more or less hard form and closed in. It is like that serious and silent beauty which does not attract attention by clamorous signs, does not catch the common eye. How can we, so to speak, spiritually melt this apparently hard form, so that the unadulterated energy of things fuses with the energy of our spirits, forming a single cast? We must go beyond form, in order to regain it as comprehensible, living and truly felt. If you look at the most beautiful forms, what is there left once you have mentally eliminated the operative principle from them? Nothing but purely inessential qualities, such as extension and spatial relationship. Does the fact that one part of matter is beside and outside the other contribute anything to its inner essentiality, or does it rather contribute nothing whatever? Obviously the latter. It is not coexistence that makes form, but the kind of coexistence: this, however, can only be determined by a positive force, which rather runs counter to the existence of things outside one another and subordinates the manifoldness of the parts to the unity of an idea, from the force operating in a crystal to that which, like a gentle magnetic current, gives to the material parts in human constructions such an attitude and position in relation to one another as enables the idea, the essential unity and beauty, to become visible.

But it is not enough for essence in form to be manifest to us as the active principle in general, as spirit and practical science, for us to lay hold of it alive. All unity must be spiritual in kind and derivation, and what is the aim of all investigation of nature if not to find science itself therein? For that which contained no intelligence could not serve as an object for the intelligence either, what was without knowledge could not itself be known. The science by which nature operates is not, of course, one which, like the human, is linked to itself by reflection; in it the idea does not differ from the deed, nor the design from its execution. Hence raw matter tends, so to speak, blindly toward regular shape, and unwittingly assumes purely stereometric forms, which certainly appertain to the realm of ideas and are something spiritual within the material. The most sublime art of number and mensuration is inherent in the stellar system, which performs it in its movements without any notion of it. More distinctly, although beyond their own apprehension, is living knowledge manifest in animals, which we consequently observe achieving numberless effects that are much more splendid than they themselves: the bird which, intoxicated by music, surpasses itself in soulful notes, the little, artistically gifted creature which, without practice or instruction, accomplishes simple architectural works – all, however, conducted by a super-powerful spirit that gleams in single flashes of knowledge, but nowhere emerges as the full sun, as in man.

This practical science is, in nature and man, the link between idea and form, between body and soul. Every thing is ministered over by an eternal idea, designed in the infinite intelligence; but through what does this idea enter into reality and physical existence? Solely through creative science, which is just as necessarily linked to the infinite intelligence as, in the artist, that part of his being which apprehends the notion of non-sensuous beauty is linked to that which gives it sensuous representation. If that artist is to be called happy and pre-eminently deserving of praise upon whom the gods have bestowed this creative spirit, so will the work of art appear excellent in the degree to which it shows us this unfalsified natural force of creation and effectiveness contained, as it were, within a single outline.

It has long been perceived that not everything in art is the outcome of consciousness, that an unconscious force must be linked with conscious activity and that it is the perfect unanimity and mutual interpenetration of the two which produces the highest art. Works which lack this seal of unconscious science are recognizable by the palpable absence of a life which is autonomous and independent of their creator, while on the contrary, where it is in operation, art simultaneously imparts to its work, with the greatest lucidity of the intelligence, that unfathomable reality by virtue of which it resembles a work of nature.

The dictum that art, to be art, must first withdraw from nature and only return to it in its final consummation, has frequently been offered as an elucidation of the artist's position in relation to nature. It seems to us that the true meaning of this can be no other than the following. In all natural beings the living idea is manifested in blind operation only: if it were the same in the artist he would differ in no way from nature. If, however, he were consciously to subordinate himself entirely to nature and reproduce the existent with servile fidelity he would produce masks, but no works of art. Thus, he must withdraw from the product or creature, but only in order to raise himself to the level of creative energy and apprehend it spiritually. This bears him

aloft into the realm of pure ideas; he loses the creature, to regain it with thousandfold interest, and so return, in this sense at least, to nature. The artist ought indeed to emulate this spirit of nature, which is at work in the core of things and in whose speech form and shape are merely symbols, and only insofar as he has apprehended it in living imitation has he himself created something true. For works arising out of the combination of forms which are already beautiful in themselves would be devoid of all beauty, since that which now actually constitutes the beauty of the work or the whole can no longer be form. It is above form, it is essence, the universal, the vision and expression of the indwelling spirit of nature.

* * *

[. . .] Just as the whole of creation is a work of the greatest renunciation, so must the artist begin by denying himself and descending into the single-creature, not shunning separateness nor the pain, indeed the torment, of form. From its first works onward nature is entirely characteristic; the energy of fire, the flash of light it imprisons in hard stone and the lovely soul of sound in harsh metal; even at the threshold of life and with organic configuration already planned, it relapses into petrification, overcome by the power of form. The life of the plant consists in silent receptiveness; but within what a precise and strict outline is this patient life enclosed. Only with the animal kingdom does the struggle between life and form seem really to commence: its first works it conceals in hard shells, and where these are laid aside the animate world reunites with the realm of crystallization through the art impulse. Finally, it steps forth bolder and freer, and active living characters appear which are the same throughout whole genera. Admittedly, art cannot begin at such a deep level as nature. If beauty is equally distributed everywhere, there are nonetheless various degrees of the manifestation and evolution of the essence and, hence, of beauty: but art demands a certain fullness of beauty, and would like to strike up, not the single sound or note, nor even the separate chord, but the whole choral melody of beauty at once. It therefore prefers to seize directly upon that which is highest and most evolved, the human figure. For since it is not given it to encompass the immeasurable whole, and since there appear in all other creatures only single refulgences, in man alone existence full, entire and bereft of nothing, it is not only permissible but actually incumbent upon it to see the whole of nature in man alone. But just because the latter gathers together everything at one point, it also repeats its whole manifoldness and traverses the same path, along which it has already passed in its broad compass, for the second time in a narrower one. Here then arises the demand upon the artist first to be faithful and truthful in the limited, in order to emerge consummate and beautiful in the whole. Here it is a question of wrestling, not in flaccid and feeble, but in strong and courageous combat, with the creative spirit of nature which, in the human kingdom also, apportions character and stamp in unfathomable manifoldness. Restraining exercise in the recognition of that which renders the singularity of things positive must preserve him from emptiness, flabbiness and inner nothingness, before he dare aim at achieving the extreme of beauty in constructions of the greatest simplicity with infinite content, by means of the ever higher combination and ultimate fusion of manifold forms.

Only by the consummation of form can form be destroyed and this, of course, is the final goal of art in the characteristic. But just as apparent agreement comes more

easily to shallow souls than to others, but is inwardly valueless, so is it in art with swiftly achieved outer harmony devoid of the fullness of content, and if theory and teaching have to counteract the spiritless imitation of beautiful forms, they must also combat, above all, the inclination toward flabby, characterless art, whose bestowal of high-sounding titles upon itself merely serves to conceal its inability to fulfil art's basic conditions.

That sublime beauty in which fullness of form does away with form itself was assumed by the new theory of art after Winkelmann to be not only the highest, but the only standard. Because the deep foundation on which it rests was overlooked, however, a negative conception even came to be formed of the sum total of everything affirmative. Winkelmann likens beauty to water drawn from the depths of the well, which is esteemed the more wholesome the less flavour it has. It is true that the loftiest beauty is without character; but it is without it in the same manner as we say the universe has no definite dimensions, neither length, breadth nor depth, because it contains them all in the same infinitude, or that the art of creative nature is formless, because the latter is not itself subordinated to any form. In this and no other sense can we say that Greek art in its highest manifestation ascends to the level of the characterless. It does not strive after this directly, however. Only from within the bonds of nature did it first aspire to divine beauty. No carelessly scattered grain, but only a deeply embedded kernel could have been the seed of this heroic growth. Only mighty movements of the feelings, only profound convulsions of the imagination by the all-animating, all-governing forces of nature could have imbued art with the indomitable vigour with which, from the rigidly enclosed earnestness of the constructions of early times to the works of overflowing sensuous charm, it remained ever faithful to truth and begot in the spirit the loftiest reality it is granted mortals to look upon. Just as their tragedy begins with the greatest steadfastness in moral conduct, so the starting point of their sculpture was the earnestness of nature and the stern goddess Athene the one and only muse of plastic art. This period is distinguished by the style which Winkelmann portrays as still harsh and severe, from which the ensuing or high style was only able to develop by the intensification of the characteristic to the point of sublimity and simplicity. In depicting the most perfect or divine characters it was not merely necessary for the fullness of forms of which the human character as a whole is capable to be united; this union has also to be of the kind that we can visualize in the universe itself, namely one in which the lower forms, or those related to lesser qualities, were subsumed under higher ones and finally all under one highest form, in which, to be sure, they were all mutually extinguished as particular forms, but endured in their essence and energy. If, therefore, we cannot term this lofty and self-sufficient beauty characteristic, insofar as we understand thereby the restriction or relativity of the phenomenon, nevertheless the characteristic continues to operate indistinguishably, as, in the crystal, although it is transparent, its texture is nonetheless preserved; every characteristic element plays its part, however slight, and contributes to the achievement of the sublime indifference of beauty.

The outward face or basis of all beauty is beauty of form. But since form cannot exist without essence, the presence of character as well can be seen or felt wherever there is form. Hence, characteristic beauty is beauty in its roots, from which alone

beauty as fruit can subsequently come into being; essence certainly outgrows form, but even so the characteristic still remains the ever effective fundament of the beautiful.

* * *

9 August Wilhelm Schlegel (1767–1845) ‘The Spirit of True Criticism’ from *A Course of Lectures on Dramatic Art and Literature*

August Wilhelm Schlegel, elder brother of Friedrich (see VIA1, 2 and 7), was born in Hannover. From 1786 to 1791 he studied classical philology and theology at Göttingen University. In 1795 he settled in Jena, where he edited the journal *Athenäum* together with his brother (1798–1800). He was appointed Professor of Literature and Fine Art at Jena in 1798, and gave an important series of lectures on German literature in Berlin between 1801 and 1804. He travelled widely in the company of Madame de Stäel (see VIB6) before taking up a chair in Oriental Languages at Bonn which he held from 1818 until his death. He was an outstanding linguist. He translated works of Italian, Spanish and Portuguese poetry, while his verse renderings of seventeen plays by Shakespeare remain part of the standard German edition (subsequently completed by Ludwig Tieck). He also made a significant contribution to the study of Oriental cultures, editing the journal *Indische Bibliothek* (1820–30) and publishing critical editions of the *Bhagavad-Gita* (1823) and the *Ramayana* (1829–46). In his *Lectures on Dramatic Art and Literature*, given in Vienna in 1808, he draws on his already extensive knowledge of world literature and, for the first time, seeks to give comprehensive articulation to the principles of Romanticism which he had helped to forge in Jena. The lectures begin with a defence of ‘criticism’ as the mediating link between history and theory. Whilst acknowledging the importance of the classical revival, Schlegel criticizes the subordination of art to models derived from Antiquity. Genuine criticism requires universality of mind and an ability to transcend local conventions. The distinction between ancient and modern is reconfigured as a distinction between the classical and the Romantic. The relation between the two is complementary rather than oppositional, however, since the heterogeneity of Romanticism allows it to accommodate earlier forms. Schlegel’s *Vorlesungen über dramatische Kunst und Literatur* were first published in book form, Heidelberg: Mohr und Zimmer, 1809–11. They were warmly welcomed by English critics. William Hazlitt (VIB11), for example, claimed that Schlegel’s lectures offered ‘by far the best account of the plays of Shakespeare that has hitherto appeared’. They were translated into English by John Black in 1815. We have used the revised version of Black’s translation, *A Course of Lectures on Dramatic Art and Literature*, London: Henry G. Bohn, 1846. The following excerpt is taken from the start of the first lecture, pp. 17–27.

The object of the present series of Lectures will be to combine the theory of Dramatic Art with its history, and to bring before my auditors at once its principles and its models.

It belongs to the general philosophical theory of poetry, and the other fine arts, to establish the fundamental laws of the beautiful. Every art, on the other hand, has its own special theory, designed to teach the limits, the difficulties, and the means by which it must be regulated in its attempt to realize those laws. For this purpose, certain scientific investigations are indispensable to the artist, although they have hut

little attraction for those whose admiration of art is confined to the enjoyment of the actual productions of distinguished minds. The general theory, on the other hand, seeks to analyze that essential faculty of human nature – the sense of the beautiful, which at once calls the fine arts into existence, and accounts for the satisfaction which arises from the contemplation of them; and also points out the relation which subsists between this and all other sentient and cognizant faculties of man. To the man of thought and speculation, therefore, it is of the highest importance, but by itself alone it is quite inadequate to guide and direct the essays and practice of art.

Now, the history of the fine arts informs us what has been, and the theory teaches what ought to be accomplished by them. But without some intermediate and connecting link, both would remain independent and separate from one and other, and each by itself, inadequate and defective. This connecting link is furnished by criticism, which both elucidates the history of the arts, and makes the theory fruitful. The comparing together, and judging of the existing productions of the human mind, necessarily throws light upon the conditions which are indispensable to the creation of original and masterly works of art.

Ordinarily, indeed, men entertain a very erroneous notion of criticism, and understand by it nothing more than a certain shrewdness in detecting and exposing the faults of a work of art. As I have devoted the greater part of my life to this pursuit, I may be excused if, by way of preface, I seek to lay before my auditors my own ideas of the true genius of criticism.

We see numbers of men, and even whole nations, so fettered by the conventions of education and habits of life, that, even in the appreciation of the fine arts, they cannot shake them off. Nothing to them appears natural, appropriate, or beautiful, which is alien to their own language, manners, and social relations. With this exclusive mode of seeing and feeling, it is no doubt possible to attain, by means of cultivation, to great nicety of discrimination within the narrow circle to which it limits and circumscribes them. But no man can be a true critic or connoisseur without universality of mind, without that flexibility which enables him, by renouncing all personal predilections and blind habits, to adapt himself to the peculiarities of other ages and nations – to feel them, as it were, from their proper central point, and, what ennobles human nature, to recognise and duly appreciate whatever is beautiful and grand under the external accessories which were necessary to its embodying, even though occasionally they may seem to disguise and distort it. There is no monopoly of poetry for particular ages and nations; and consequently that despotism in taste, which would seek to invest with universal authority the rules which at first, perhaps, were but arbitrarily advanced, is but a vain and empty pretension. Poetry, taken in its widest acceptation, as the power of creating what is beautiful, and representing it to the eye or the ear, is a universal gift of Heaven, being shared to a certain extent even by those whom we call barbarians and savages. Internal excellence is alone decisive, and where this exists, we must not allow ourselves to be repelled by the external appearance. Everything must be traced up to the root of human nature: if it has sprung from thence, it has an undoubted worth of its own; but if, without possessing a living germ, it is merely externally attached thereto, it will never thrive nor acquire a proper growth. Many productions which appear at first sight dazzling phenomena in the province of the fine arts, and which as a whole have been honoured with the

appellation of works of a golden age, resemble the mimic gardens of children: impatient to witness the work of their hands, they break off here and there branches and flowers, and plant them in the earth; everything at first assumes a noble appearance: the childish gardener struts proudly up and down among his showy beds, till the rootless plants begin to droop, and hang their withered leaves and blossoms, and nothing soon remains but the bare twigs, while the dark forest, on which no art or care was ever bestowed, and which towered up towards heaven long before human remembrance, bears every blast unshaken, and fills the solitary beholder with religious awe.

Let us now apply the idea which we have been developing, of the universality of true criticism, to the history of poetry and the fine arts. This, like the so-called universal history, we generally limit (even though beyond this range there may be much that is both remarkable and worth knowing) to whatever has had a nearer or more remote influence on the present civilisation of Europe: consequently, to the works of the Greeks and Romans, and of those of the modern European nations, who first and chiefly distinguished themselves in art and literature. It is well known that, three centuries and a half ago, the study of ancient literature received a new life, by the diffusion of the Grecian language (for the Latin never became extinct); the classical authors were brought to light, and rendered universally accessible by means of the press; and the monuments of ancient art were diligently disinterred and preserved. All this powerfully excited the human mind, and formed a decided epoch in the history of human civilisation; its manifold effects have extended to our times, and will yet extend to an incalculable series of ages. But the study of the ancients was forthwith most fatally perverted. The learned, who were chiefly in the possession of this knowledge, and who were incapable of distinguishing themselves by works of their own, claimed for the ancients an unlimited authority, and with great appearance of reason, since they are models in their kind. Maintaining that nothing could be hoped for the human mind but from an imitation of antiquity, in the works of the moderns they only valued what resembled, or seemed to bear a resemblance to, those of the ancients. Everything else they rejected as barbarous and unnatural. With the great poets and artists it was quite otherwise. However strong their enthusiasm for the ancients, and however determined their purpose of entering into competition with them, they were compelled by their independence and originality of mind, to strike out a path of their own, and to impress upon their productions the stamp of their own genius. Such was the case with Dante among the Italians, the father of modern poetry; acknowledging Virgil for his master, he has produced a work which, of all others, most differs from the *Æneid*, and in our opinion far excels its pretended model in power, truth, compass, and profundity. It was the same afterwards with Ariosto, who has most unaccountably been compared to Homer, for nothing can be more unlike. So in art with Michael Angelo and Raphael, who had no doubt deeply studied the antique. When we ground our judgment of modern painters merely on their greater or less resemblance to the ancients, we must necessarily be unjust towards them, as Winkelmann undoubtedly has in the case of Raphael. As the poets for the most part had their share of scholarship, it gave rise to a curious struggle between their natural inclination and their imaginary duty. When they sacrificed to the latter, they were praised by the learned; but by yielding to the

former, they became the favourites of the people. What preserves the heroic poems of a Tasso and a Camoëns to this day alive in the hearts and on the lips of their countrymen, is by no means their imperfect resemblance to Virgil, or even to Homer, but in Tasso the tender feeling of chivalrous love and honour, and in Camoëns the glowing inspiration of heroic patriotism.

Those very ages, nations, and ranks, who felt least the want of a poetry of their own, were the most assiduous in their imitation of the ancients; accordingly, its results are hut dull school exercises, which at best excite a frigid admiration. But in the fine arts, mere imitation is always fruitless; even what we borrow from others, to assume a true poetical shape, must, as it were, be born again within us. Of what avail is all foreign imitation? Art cannot exist without nature, and man can give nothing to his fellow-men hut himself.

Genuine successors and true rivals of the ancients, who, by virtue of congenial talents and cultivation have walked in their path and worked in their spirit, have ever been as rare as their mechanical spiritless copyists are common. Seduced by the form, the great body of critics have been but too indulgent to these servile imitators. These were held up as correct modern classics, while the great truly living and popular poets, whose reputation was a part of their nations' glory, and to whose sublimity it was impossible to be altogether blind, were at best but tolerated as rude and wild natural geniuses. But the unqualified separation of genius and taste on which such a judgment proceeds, is altogether untenable. Genius is the almost unconscious choice of the highest degree of excellence, and, consequently, it is taste in its highest activity.

In this state, nearly, matters continued till a period not far back, when several inquiring minds, chiefly Germans, endeavoured to clear up the misconception, and to give the ancients their due, without being insensible to the merits of the moderns, although of a totally different kind. The apparent contradiction did not intimidate them. The groundwork of human nature is no doubt everywhere the same; but in all our investigations, we may observe that, throughout the whole range of nature, there is no elementary power so simple, but that it is capable of dividing and diverging into opposite directions. The whole play of vital motion hinges on harmony and contrast. Why, then, should not this phenomenon recur on a grander scale in the history of man? In this idea we have perhaps discovered the true key to the ancient and modern history of poetry and the fine arts. Those who adopted it, gave to the peculiar spirit of *modern art*, as contrasted with the *antique* or *classical*, the name of *romantic*. The term is certainly not inappropriate; the word is derived from *romance* – the name originally given to the languages which were formed from the mixture of the Latin and the old Teutonic dialects, in the same manner as modern civilisation is the fruit of the heterogeneous union of the peculiarities of the northern nations and the fragments of antiquity; whereas the civilisation of the ancients was much more of a piece.

The distinction which we have just stated can hardly fail to appear well founded, if it can be shown, so far as our knowledge of antiquity extends, that the same contrast in the labours of the ancients and moderns runs symmetrically, I might almost say systematically, throughout every branch of art – that it is as evident in music and the plastic arts as in poetry. This is a problem which, in its full extent, still remains to be

demonstrated, though, on particular portions of it, many excellent observations have been advanced already.

Among the foreign authors who wrote before this school can be said to have been formed in Germany, we may mention Rousseau, who acknowledged the contrast in music, and showed that rhythm and melody were the prevailing principles of ancient, as harmony is that of modern music. In his prejudices against harmony, however, we cannot at all concur. On the subject of the arts of design an ingenious observation was made by Hemsterhuys, that the ancient painters were perhaps too much of sculptors, and the modern sculptors too much of painters. This is the exact point of difference; for, as I shall distinctly show in the sequel, the spirit of ancient art and poetry is *plastic*, but that of the moderns *picturesque*.

By an example taken from another art, that of architecture, I shall endeavour to illustrate what I mean by this contrast. Throughout the Middle Ages there prevailed, and in the latter centuries of that æra was carried to perfection, a style of architecture, which has been called Gothic, but ought really to have been termed old German. When, on the general revival of classical antiquity, the imitation of Grecian architecture became prevalent, and but too frequently without a due regard to the difference of climate and manners or to the purpose of the building, the zealots of this new taste, passing a sweeping sentence of condemnation on the Gothic, reprobated it as tasteless, gloomy, and barbarous. This was in some degree pardonable in the Italians, among whom a love for ancient architecture, cherished by hereditary remains of classical edifices, and the similarity of their climate to that of the Greeks and Romans, might, in some sort, be said to be innate. But we Northerners are not so easily to be talked out of the powerful, solemn impressions which seize upon the mind at entering a Gothic cathedral. We feel, on the contrary, a strong desire to investigate and to justify the source of this impression. A very slight attention will convince us, that the Gothic architecture displays not only an extraordinary degree of mechanical skill, but also a marvellous power of invention; and, on a closer examination, we recognize its profound significance, and perceive that as well as the Grecian it constitutes in itself a complete and finished system.

To the application! – The Pantheon is not more different from Westminster Abbey or the church of St. Stephen at Vienna, than the structure of a tragedy of Sophocles from a drama of Shakespeare. The comparison between these wonderful productions of poetry and architecture might be carried still farther. But does our admiration of the one compel us to depreciate the other? May we not admit that each is great and admirable in its kind, although the one is, and is meant to be, different from the other? The experiment is worth attempting. We will quarrel with no man for his predilection either for the Grecian or the Gothic. The world is wide, and affords room for a great diversity of objects. Narrow and blindly adopted prepossessions will never constitute a genuine critic or connoisseur, who ought, on the contrary, to possess the power of dwelling with liberal impartiality on the most discrepant views, renouncing the while all personal inclinations.

For our present object, the justification, namely, of the grand division which we lay down in the history of art, and according to which we conceive ourselves equally warranted in establishing the same division in dramatic literature, it might be sufficient merely to have stated this contrast between the ancient, or classical, and

the romantic. But as there are exclusive admirers of the ancients, who never cease asserting that all deviation from them is merely the whim of a new school of critics, who, expressing themselves in language full of mystery, cautiously avoid conveying their sentiments in a tangible shape, I shall endeavour to explain the origin and spirit of the *romantic*, and then leave the world to judge if the use of the word, and of the idea which it is intended to convey, be thereby justified.

The mental culture of the Greeks was a finished education in the school of Nature. Of a beautiful and noble race, endowed with susceptible senses and a cheerful spirit under a mild sky, they lived and bloomed in the full health of existence; and, favoured by a rare combination of circumstances, accomplished all that the finite nature of man is capable of. The whole of their art and poetry is the expression of a consciousness of this harmony of all their faculties. They invented the poetry of joy.

Their religion was the deification of the powers of nature and of the earthly life: but this worship, which, among other nations, clouded the imagination with hideous shapes, and hardened the heart to cruelty, assumed, among the Greeks, a mild, a grand, and a dignified form. Superstition, too often the tyrant of the human faculties, seemed to have here contributed to their freest development. It cherished the arts by which it was adorned, and its idols became the models of ideal beauty.

But however highly the Greeks may have succeeded in the Beautiful, and even in the Moral, we cannot concede any higher character to their civilisation than that of a refined and ennobled sensuality. Of course this must be understood generally. The conjectures of a few philosophers, and the irradiations of poetical inspiration, constitute an occasional exception. Man can never altogether turn aside his thoughts from infinity, and some obscure recollections will always remind him of the home he has lost; but we are now speaking of the predominant tendency of his endeavours.

Religion is the root of human existence. Were it possible for man to renounce all religion, including that which is unconscious, independent of the will, he would become a mere surface without any internal substance. When this centre is disturbed, the whole system of the mental faculties and feelings takes a new shape.

And this is what has actually taken place in modern Europe through the introduction of Christianity. This sublime and beneficent religion has regenerated the ancient world from its state of exhaustion and debasement; it is the guiding principle in the history of modern nations, and even at this day, when many suppose they have shaken off its authority, they still find themselves much more influenced by it in their views of human affairs than they themselves are aware.

After Christianity, the character of Europe has, since the commencement of the Middle Ages, been chiefly influenced by the Germanic race of northern conquerors, who infused new life and vigour into a degenerated people. The stern nature of the North drives man back within himself; and what is lost in the free sportive development of the senses, must, in noble dispositions, be compensated by earnestness of mind. Hence the honest cordiality with which Christianity was welcomed by all the Teutonic tribes, so that among no other race of men has it penetrated more deeply into the inner man, displayed more powerful effects, or become more interwoven with all human feelings and sensibilities.

The rough, but honest heroism of the northern conquerors, by its admixture with the sentiments of Christianity, gave rise to chivalry, of which the object was, by vows

which should be looked upon as sacred, to guard the practice of arms from every rude and ungenerous abuse of force into which it was so likely to sink.

With the virtues of chivalry was associated a new and purer spirit of love, an inspired homage for genuine female worth, which was now revered as the acmè of human excellence, and, maintained by religion itself under the image of a virgin mother, infused into all hearts a mysterious sense of the purity of love.

As Christianity did not, like the heathen worship, rest satisfied with certain external acts, but claimed an authority over the whole inward man and the most hidden movements of the heart; the feeling of moral independence took refuge in the domain of honour, a worldly morality, as it were, which subsisting alongside of, was often at variance with that of religion, but yet in so far resembling it that it never calculated consequences, but consecrated unconditionally certain principles of action, which like the articles of faith, were elevated far beyond the investigation of a casuistical reasoning.

Chivalry, love, and honour, together with religion itself, are the subjects of that poetry of nature which poured itself out in the Middle Ages with incredible fulness, and preceded the more artistic cultivation of the romantic spirit. This age had also its mythology, consisting of chivalrous tales and legends; but its wonders and its heroism were the very reverse of those of the ancient mythology.

Several inquirers who, in other respects, entertain the same conception of the peculiarities of the moderns, and trace them to the same source that we do, have placed the essence of the northern poetry in melancholy; and to this, when properly understood, we have nothing to object.

Among the Greeks human nature was in itself all-sufficient; it was conscious of no defects, and aspired to no higher perfection than that which it could actually attain by the exercise of its own energies. We, however, are taught by superior wisdom that man, through a grievous transgression, forfeited the place for which he was originally destined; and that the sole destination of his earthly existence is to struggle to regain his lost position, which, if left to his own strength, he can never accomplish. The old religion of the senses sought no higher possession than outward and perishable blessings; and immortality, so far as it was believed, stood shadow-like in the obscure distance, a faint dream of this sunny waking life. The very reverse of all this is the case with the Christian view: every thing finite and mortal is lost in the contemplation of infinity; life has become shadow and darkness, and the first day of our real existence dawns in the world beyond the grave. Such a religion must waken the vague foreboding, which slumbers in every feeling heart, into a distinct consciousness that the happiness after which we are here striving is unattainable; that no external object can ever entirely fill our souls; and that all earthly enjoyment is but a fleeting and momentary illusion. When the soul, resting as it were under the willows of exile, breathes out its longing for its distant home, what else but melancholy can be the keynote of its songs? Hence the poetry of the ancients was the poetry of enjoyment, and ours is that of desire: the former has its foundation in the scene which is present, while the latter hovers betwixt recollection and hope. Let me not be understood as affirming that everything flows in one unvarying strain of wailing and complaint, and that the voice of melancholy is always loudly heard. As the austerity of tragedy was not incompatible with the joyous views of the Greeks, so that romantic poetry whose

origin I have been describing, can assume every tone, even that of the liveliest joy; but still it will always, in some indescribable way, bear traces of the source from which it originated. The feeling of the moderns is, upon the whole, more inward, their fancy more incorporeal, and their thoughts more contemplative. In nature, it is true, the boundaries of objects run more into one another, and things are not so distinctly separated as we must exhibit them in order to convey distinct notions of them.

The Grecian ideal of human nature was perfect unison and proportion between all the powers, – a natural harmony. The moderns, on the contrary, have arrived at the consciousness of an internal discord which renders such an ideal impossible; and hence the endeavour of their poetry is to reconcile these two worlds between which we find ourselves divided, and to blend them indissolubly together. The impressions of the senses are to be hallowed, as it were, by a mysterious connexion with higher feelings; and the soul, on the other hand, embodies its forebodings, or indescribable intuitions of infinity, in types and symbols borrowed from the visible world.

In Grecian art and poetry we find an original and unconscious unity of form and matter; in the modern, so far as it has remained true to its own spirit, we observe a keen struggle to unite the two, as being naturally in opposition to each other. The Grecian executed what it proposed in the utmost perfection; but the modern can only do justice to its endeavours after what is infinite by approximation; and, from a certain appearance of imperfection, is in greater danger of not being duly appreciated.

10 Henry Fuseli (1741–1825) from ‘Aphorisms on Art’

Fuseli was born Johann Heinrich Füssli in Zurich. Though he was in London from 1764 to 1770, it was not until 1779, after eight years spent in Rome, that he settled permanently in England and changed the form of his name. Salomon Gessner was his godfather (see VB3, 4), while in his initial training from his artist father he assimilated the neo-classical theories of Winckelmann (see IIIA5 and 8) and Mengs (see IIIB13 and IVA4). His earliest publication, in 1765, was a translation of Winckelmann's *Gedanken über die Nachahmung der griechischen Werke...* which did much to form William Blake's interest in the pictured nude. (Fuseli's title was *Reflections on the Paintings and Sculpture of the Greeks*; see IIIA5 for a later translation.) Lavater was to become a close friend (see VA6 and VB10). Fuseli's strongest early interest, however, was in literature, and particularly in the epic and tragic works of Homer, Virgil, Dante, Shakespeare and Milton. His understanding of art was to be coloured throughout his life by his sense of the power of poetic themes. While he was never to lose his enthusiasm for the classical tradition, he maintained an essentially poetic and romantic understanding of crucial concepts such as drama, inspiration, originality and genius. He was impatient of the association of taste with propriety and was to make his reputation through works with a marked phantasmagorical character. He was a principal contributor to John Boydell's Shakespeare Gallery (opened in 1789) and he painted forty-seven pictures for his own unsuccessful Milton Gallery (opened in 1799). His first success at the Royal Academy came with the exhibition of *The Nightmare* in 1781 (now in the Institute of Arts, Detroit). He was elected an Associate in 1788 and a full Academician two years later. He was made Professor of Painting in 1799 and Keeper in 1804. His series of

Academy lectures commenced in 1801. He began noting his aphorisms in 1788, the year in which he published a translation of Lavater's own *Aphorisms on Man*. The final collection, numbering 229, was first published as *Aphorisms, Chiefly Relative to the Fine Arts*, London, 1818. These were reprinted in J. Knowles, *The Life and Writing of Henry Fuseli, Esq*, 3 volumes, London, 1831, volume III, pp. 64–150. Our selection is made from the latter edition. (See also VIB10.)

4. Art is the attendant of nature, and genius and talent the ministers of art.
5. Genius either discovers new materials of nature, or combines the known with novelty.
6. Talent arranges, cultivates, polishes, the discoveries of genius.
7. Intuition is the attendant of genius; gradual improvement that of talent.
10. Some enter the gates of art with golden keys, and take their seats with dignity among the demi-gods of fame; some burst the doors and leap into a niche with savage power; thousands consume their time in chinking useless keys, and aiming feeble pushes against the inexorable doors.
14. Genius without bias, is a stream without direction: it inundates all, and ends in stagnation.
15. He who pretends to have sacrificed genius to the pursuits of interest or fashion; and he who wants to persuade you he has indisputable titles to a crown, but chooses to waive them for the emoluments of a partnership in trade, deserve equal belief.
16. Taste is the legitimate offspring of nature, educated by propriety: fashion is the bastard of vanity, dressed by art.
17. The immediate operation of taste is to ascertain the kind; the next, to appreciate the degrees of excellence.

Corollary – Taste, founded on sense and elegance of mind, is reared by culture, invigorated by practice and comparison: scantiness stops short of it; fashion adulterates it: it is shackled by pedantry, and overwhelmed by luxuriance.

Taste sheds a ray over the homeliest or the most uncouth subject. Fashion frequently flattens the elegant, the gentle, and the great, into one lumpy mass of disgust.

If 'foul and fair' be all that your gross-spun sense discerns, if you are blind to the intermediate degrees of excellence, you may perhaps be a great man – a senator – a conqueror; but if you respect yourself, never presume to utter a syllable on works of taste.

18. If mind and organs conspire to qualify you for a judge in works of taste, remember that you are to be possessed of three things – the subject of the work which you are to examine; the character of the artist as such; and, before all, of impartiality.

Corollary – All first impressions are involuntary and inevitable; but the knowledge of the subject will guide you to judge first of the whole; not to creep on from part to part, and nibble at execution before you know what it means to convey. The notion of a tree precedes that of counting leaves or disentangling branches.

Every artist has, or ought to have, a character or system of his own; if, instead of referring that to the test of nature, you judge him by your own packed notions, or arraign him at the tribunal of schools which he does not recognize – you degrade the dignity of art, and add another fool to the herd of Dilettanti.

But if, for reasons best known to yourself, you come determined to condemn what yet you have not seen, let me advise you to drop your pursuits of art for one of far greater importance – the inquiry into yourself; nor aim at taste till you are sure of justice.

30. Mediocrity is formed, and talent submits, to receive prescription; that, the liveried attendant, this, the docile client of a patron's views or whims: but genius, free and unbounded as its *origin*, scorns to receive commands, or in submission, neglects those it received.

Corollary – The gentle spirit of Rafaele embellished the conceits of Bembo and Divizio, to scatter incense round the triple mitre of his prince; and the Vatican became the flattering annals of the court of Julius and Leo: whilst Michael Angelo refused admittance to master and to times, and doomed his purple critic to hell.

36. Imitative art, is either epic or sublime, dramatic or impassioned, historic or circumscribed by truth. The first astonishes, the second moves, the third informs.

42. Beauty alone, fades to insipidity; and like possession cloy.

43. Grace is beauty in motion, or rather grace regulates the air, the attitudes and movements of beauty.

54. The painter, who makes an historical figure address the spectator from the canvass, and the actor who addresses a soliloquy to you from the stage, have equal claims to your contempt or pity.

58. All apparatus destroys terror, as all ornament grandeur: the minute catalogue of the cauldron's ingredients in Macbeth destroys the terror attendant on mysterious darkness; and the seraglio-trappings of Rubens annihilate his heroes.

62. All mediocrity pretends.

63. Invention, strictly speaking, being confined to *one* moment, he invents best who in that moment combines the traces of the past, the energy of the present, and a glimpse of the future.

100. Imitation seems to cease, where the ideal part begins.

101. The imitator rises above the copyist by generalizing the individual to a class; the idealist mounts above the imitator by uniting classes.

105. We are more impressed by Gothic than by Greek mythology, because the bands are not yet rent which tie us to its magic: he has a powerful hold of us, who holds us by our superstition or by a theory of honour.

110. The epoch of rules, of theories, poetics, criticisms in a nation, will add to their stock of authors in the same proportion as it diminishes their stock of genius: their productions will bear the stamp of study, not of nature; they will adopt, not generate; sentiment will supplant images, and narrative invention; words will be no longer the dress but the limbs of composition, and feeble elegance will supply the want of nerves.

125. Love for what is called deception in painting, marks either the infancy or decrepitude of a nation's taste.

133. The fewer the traces that appear of the means by which any work has been produced, the more it resembles the operations of Nature, and the nearer it is to sublimity.

162. He who aims at the sublime, consults the classes assigned to character by physiognomy, not its anatomy of individuals; the oak in its full majesty, and not the thwarted pollard.

163. None ever escaped from himself by crossing seas; none ever peopled a barren fancy and a heart of ice with images or sympathies by excursions into the deserts of mythology or allegory.

165. Pure history rejects allegory.

Corollary – The armed figure of Rome, with Fortune behind her frowning at Coriolanus, surrounded by the Roman matrons in the Volscian camp (by Poussin), is a vision seen by that warrior, and not an allegory; it is a sublime image, which, without diminishing the credibility of the fact, adds to its importance, and raises the hero, by making him submit, not to the impulse of private ties, but to the destiny of his country.

166. All ornament ought to be allegoric.

170. Judge not an artist from the exertions of accidental vigour or some unpremeditated flights of fancy, but from the uniform tenor, the never-varying principle of his works: the line and style of Titian sometimes expand themselves like those of Michael Angelo; the heads and groups of Raphael sometimes glow and palpitate with Titiano's tints; and there are masses of both united in Correggio: but if you aim at character, let Raphael be your guide; if at colour, Tiziano; if harmony allure, Correggio: they indulged in alternate excursions, but never lost sight of their own domain.

Corollary – No one, of whatever period of art, of whatever eminence or school, out-told Rembrandt in telling the story of a subject, in the choice of its real crisis, in simplicity, in perspicuity: still, as the vile crust that involves his ore, his local vulgarity of style, the ludicrous barbarity of his costume, prepossess eyes less penetrating than squeamish against him, it requires some confidence to place him with the classics of invention. Yet with all these defects, with every prejudice or superiority of taste and style against him, what school has produced a work (M. Angelo's Creation of Adam, and the Death of Ananias by Raffaele excepted,) which looks not pale in the superhuman splendour that irradiates his conception of Christ before Pilate, unless it be the raising of Lazarus by Lievens, a name comparatively obscure, whose awful sublimity reduces the same subject as treated by Rembrandt and Sebastian of Venice, to artificial parade or commonplace?

171. Tone is the moral part of colour.

172. If tone be the legitimate principle of colour, he who has not tone, though he should excel in individual imitation, colours in fragments and produces discord.

176. Colour affects or delights like sound. Scarlet or deep crimson rouses, determines, invigorates the eye, as the war-horn or the trumpet the ear; the flute soothes the ear, as pale celestial blue or rosy red the eye.

201. None but indelible materials can support the epic. Whatever is local, or the volatile creature of the time, beauties of fashion and sentiments of sects, tears shed over roses, epigrammatic sparkling, passions taught to rave, and graces trained to move, the antiquary's mouldering stores, the bubbles of allegorists – are all with equal contempt passed over or crushed by him who claims the lasting empire of the human heart.

225. Such is the fugitive essence, such the intangible texture of female genius, that few combinations of circumstances ever seemed to favour its transmission to posterity.

235. Resemblance, character, costume, are the three requisites of portrait: the first distinguishes, the second classifies, the third assigns place and time to an individual.

11 Samuel Taylor Coleridge (1772–1834), ‘On the Principles of Genial Criticism’

In his literary theory Coleridge is best known for the centrality he accorded to the imagination. He regarded it as a faculty capable of mediating between the two sides of human consciousness: non-rational intuition of feelings and emotions, and rational conceptualization of the material world. Coleridge wrote copiously on a wide range of subjects, but little on the visual arts. His most sustained discussion of them occurs in three essays contributed to *Felix Farley's Bristol Journal* in August and September 1814. The occasion was an exhibition in Bristol of work by the American painter Washington Allston (1779–1843, see *Art in Theory 1815–1900*, IA17), whom Coleridge had originally met in Rome in 1805. It appears from letters that Coleridge meant to support the artist, whose career at that point was at a low ebb, through ‘a bold avowal of my sentiments on the fine arts’ underlined ‘by continual reference to Allston's pictures’ (quoted in Shawcross, edition, 1907, p. 304). During the process of writing, however, his essays took a more general turn and mutated into a theoretical discussion of beauty. Although he makes much use of eighteenth-century association theory, Coleridge also draws on Kant to arrive at a notion of the aesthetic with a significantly modern inflection. For Coleridge, the contemplation of beauty in visual art is an end in itself, to be distinguished both from the pursuit of the good and from the appreciation of the merely agreeable-by-association. Our extracts are taken from ‘On the Principles of Genial Criticism Concerning the Fine Arts, more especially those of Statuary and Painting’, in Coleridge's *Biographia Literaria, with his Aesthetical Essays*, edited by J. Shawcross, Oxford: Oxford University Press, 1907. We have used the 1967 reprint, pp. 220–1, 226–7, 231–4, 236–9.

All the fine arts are different species of poetry. The same spirit speaks to the mind through different senses by manifestations of itself, appropriate to each. They admit therefore of a natural division into poetry of language (poetry in the emphatic sense, because less subject to the accidents and limitations of time and space); poetry of the ear, or music; and poetry of the eye, which is again subdivided into plastic poetry, or statuary, and graphic poetry, or painting. The common essence of all consists in the excitement of emotion for the immediate purpose of pleasure through the medium of beauty; herein contra-distinguishing poetry from science, the immediate object and primary purpose of which is truth and possible utility. (The sciences indeed may and will give a high and pure pleasure; and the Fine Arts may lead to important truth, and be in various ways useful in the ordinary meaning of the word; but these are not the direct and characteristic ends, and we define things by their peculiar, not their common properties.) [. . .]

There are few mental exertions more instructive, or which are capable of being rendered more entertaining, than the attempt to establish and exemplify the distinct meaning of terms, often confounded in common use, and considered as mere synonyms. Such are the words, Agreeable, Beautiful, Picturesque, Grand, Sublime: and to attach a distinct and separate sense to each of these, is a previous step of indispensable necessity to a writer, who would reason intelligibly, either to himself or to his readers, concerning the works of poetic genius, and the sources and the nature of the pleasure derived from them. But more especially on the essential difference of

the beautiful and the agreeable, rests fundamentally the whole question, which assuredly must possess no vulgar or feehle interest for all who regard the dignity of their own nature: whether the noblest productions of human genius (such as the Iliad, the works of Shakspeare and Milton, the Pantheon, Raphael's Gallery, and Michael Angelo's Sistine Chapel, the Venus de Medici and the Apollo Belvedere, involving, of course, the human forms that approximate to them in actual life) delight us merely by chance, from accidents of local associations – in short, please us because they please us (in which case it would be impossible either to praise or to condemn any man's taste, however opposite to our own, and we could be no more justified in assigning a corruption or absence of just taste to a man, who should prefer Blackmore to Homer or Milton, or the Castle Spectre to Othello, than to the same man for preferring a black-pudding to a sirloin of beef); or whether there exists in the constitution of the human soul a sense, and a regulative principle, which may indeed be stifled and latent in some, and be perverted and denaturalized in others, yet is nevertheless universal in a given state of intellectual and moral culture; which is independent of local and temporary circumstances, and dependent only on the degree in which the faculties of the mind are developed; and which, consequently, it is our duty to cultivate and improve, as soon as the sense of its actual existence dawns upon us. [...]

AGREEABLE. – We use this word in two senses; in the first for whatever agrees with our nature, for that which is congruous with the primary constitution of our senses. Thus green is naturally agreeable to the eye. In this sense the word expresses, at least involves, a pre-established harmony between the organs and their appointed objects. In the second sense, we convey by the word *agreeable*, that the thing has by force of habit (thence called a second nature) been made to agree with us; or that it has become agreeable to us by its recalling to our minds some one or more things that were dear and pleasing to us; or lastly, on account of some after pleasure or advantage, of which it has been the constant cause or occasion. Thus by force of custom men *make* the taste of tobacco, which was at first hateful to the palate, agreeable to them [...].

The BEAUTIFUL, contemplated in its essentials, that is, in *kind* and not in *degree*, is that in which the *many*, still seen as many, becomes one. Take a familiar instance, one of a thousand. The frost on a window-pane has by accident crystallized into a striking resemblance of a tree or a seaweed. With what pleasure we trace the parts, and their relations to each other, and to the whole! Here is the stalk or trunk, and here the branches or sprays – sometimes even the buds or flowers. Nor will our pleasure be less, should the caprice of the crystallization represent some object disagreeable to us, provided only we can see or fancy the component parts each in relation to each, and all forming a whole. A lady would see an admirably painted tiger with pleasure, and at once pronounce it beautiful, – nay, an owl, a frog, or a toad, who would have shrieked or shuddered at the sight of the things themselves. So far is the Beautiful from depending wholly on association, that it is frequently produced by the mere removal of associations. Many a sincere convert to the beauty of various insects, as of the dragon-fly, the fangless snake, &c., has Natural History made, by exploding the terror or aversion that had been connected with them.

The most general definition of beauty, therefore, is – that I may fulfil my threat of plaguing my readers with hard words – Multēity in Unity. Now it will be always found, that whatever is the definition of the *kind*, independent of degree, becomes likewise the definition of the highest degree of that kind. An old coach-wheel lies in the coachmaker's yard, disfigured with tar and dirt (I purposely take the most trivial instances) – if I turn away my attention from these, and regard the *figure* abstractly, 'still,' I might say to my companion, 'there is beauty in that wheel, and you yourself would not only admit, but would feel it, had you never seen a wheel before. See how the rays proceed from the centre to the circumferences, and how many different images are distinctly comprehended at one glance, as forming one whole, and each part in some harmonious relation to each and to all.' But imagine the polished golden wheel of the chariot of the Sun, as the poets have described it; then the figure, and the real thing so figured, exactly coincide. There is nothing heterogeneous, nothing to abstract from: by its perfect smoothness and circularity in width, each part is (if I may borrow a metaphor from a sister sense) as perfect a melody, as the whole is a complete harmony. This, we should say, is beautiful throughout. Of all 'the many,' which I actually see, each and all are really reconciled into unity: while the effulgence from the whole coincides with, and seems to represent, the effluence of delight from my own mind in the intuition of it.

It seems evident then, first, that beauty is harmony, and subsists only in composition, and secondly, that the first species of the Agreeable can alone be a component part of the beautiful, that namely which is naturally consonant with our senses by the pre-established harmony between nature and the human mind; and thirdly, that even of this species, those objects only can be admitted (according to rule the first) which belong to the eye and ear, because they alone are susceptible of distinction of parts. [...]

But we are conscious of faculties far superior to the highest impressions of sense; we have life and free-will – What then will be the result, when the Beautiful, arising from regular form, is so modified by the perception of life and spontaneous action, as that the latter only shall be the object of our conscious *perception*, while the former merely acts, and yet does effectively act, on our feelings? With pride and pleasure I reply by referring my reader to the group in Mr. Allston's grand picture of the 'Dead Man reviving from the touch of the bones of the Prophet Elisha,' beginning with the slave at the head of the reviving body, then proceeding to the daughter clasping her swooning mother; to the mother, the wife of the reviving man; then to the soldier behind who supports her; to the two figures eagerly conversing: and lastly, to the exquisitely graceful girl who is bending downward, and whose hand nearly touches the thumb of the slave! You will find, what you had not suspected, that you have here before you a circular group. But by what variety of life, motion, and passion is all the stiffness, that would result from an obvious regular figure, swallowed up, and the figure of the group as much concealed by the action and passion, as the skeleton, which gives the form of the human body, is hidden by the flesh and its endless outlines! [...]

RECAPITULATION. *Principle the First.* – That which has become, or which has been *made* agreeable to us, from causes not contained in its own nature, or in its original conformity to the human organs and faculties; that which is not pleasing for its own

sake, but by connection or association with some other thing, separate or separable from it, is neither beautiful, nor capable of being a component part of Beauty: though it may greatly increase the sum of our pleasure, when it does not interfere with the beauty of the object, nay, even when it detracts from it. A moss-rose, with a sprig of myrtle and jasmine, is not more *beautiful* from having been plucked from the garden, or presented to us by the hand of the woman we love, but is abundantly more delightful. The total pleasure received from one of Mr. Bird's finest pictures may, without any impeachment of our taste, be the greater from his having introduced into it the portrait of one of our friends, or from our pride in him as our townsman, or from our knowledge of his personal qualities; but the amiable artist would rightly consider it a coarse compliment, were it affirmed, that the *beauty* of the piece, or its merit as a work of genius, was the more perfect on this account. [. . .]

Principle the Second. – That which is naturally agreeable and consonant to human nature, so that the exceptions may be attributed to disease or defect; that, the pleasure from which is contained in the immediate impression; cannot, indeed, with strict propriety, be called beautiful, exclusive of its relations, but one among the component parts of beauty, in whatever instance it is susceptible of existing as a part of a whole. This, of course, excludes the mere objects of the taste, smell, and feeling, though the sensation from these, especially from the latter when organized into touch, may secretly, and without our consciousness, enrich and vivify the perceptions and images of the eye and ear; which alone are true organs of sense, their sensations in a healthy or uninjured state being too faint to be noticed by the mind. We may, indeed, in common conversation, call purple a beautiful color, or the tone of a single note on an excellent piano-forte a beautiful tone; but if we were questioned, we should agree that a rich or delightful color; a rich, or sweet, or clear tone; would have been more appropriate – and this with less hesitation in the latter instance than in the former, because the single tone is more manifestly of the nature of a *sensation*, while color is the medium which seems to blend sensation and perception, so as to hide, as it were, the former in the latter; the direct opposite of which takes place in the lower senses of feeling, smell, and taste. (In strictness, there is even in these an ascending scale. The smell is less sensual and more sentient than mere feeling, the taste than the smell, and the eye than the ear; but between the ear and the taste exists the chasm or break, which divides the beautiful and the elements of beauty from the merely agreeable.) When I reflect on the manner in which smoothness, richness of sound, &c., enter into the formation of the beautiful, I am induced to suspect that they act negatively rather than positively. Something there must be to realize the form, something in and by which the *forma informans* reveals itself: and these, less than any that could be substituted, and in the least possible degree, distract the attention, in the least possible degree obscure the idea, of which they (composed into outline and surface) are the symbol. An illustrative hint may be taken from a pure crystal, as compared with an opaque, semi-opaque or clouded mass, on the one hand, and with a perfectly transparent body, such as the air, on the other. The crystal is lost in the light, which yet it contains, embodies, and gives a shape to; but which passes shapeless through the air, and, in the ruder body, is either quenched or dissipated.

Principle the Third. – The safest definition, then, of Beauty, as well as the oldest, is that of Pythagoras: THE REDUCTION OF MANY TO ONE . . . of which the following may be

offered as both paraphrase and corollary. *The sense of beauty subsists in simultaneous intuition of the relation of parts, each to each, and of all to a whole: exciting an immediate and absolute complacency, without intervenence, therefore, of any interest, sensual or intellectual.* The BEAUTIFUL is thus at once distinguished both from the AGREEABLE, which is beneath it, and from the GOOD, which is above it: for both these have an interest necessarily attached to them: both act on the WILL, and excite a desire for the actual existence of the image or idea contemplated: while the sense of beauty rests gratified in the mere contemplation or intuition, regardless whether it be a fictitious Apollo, or a real Antinous.

12 Percy Bysshe Shelley (1792–1822) from *A Philosophical View of Reform*

Shelley's standing as a lyric poet has often obscured his devotion to radical politics. Throughout his life he was committed to the cause of social reform, and gave voice to this commitment not only in poems such as *Ode to Liberty* but also in prose writings. Shelley moved to Italy in 1818 and it was there, in September 1819, that he received news of the Peterloo Massacre in Manchester. What followed has been referred to as 'Shelley's revolutionary year' (Foot, 1990). He rapidly wrote a number of political poems including *The Mask of Anarchy* ('I met murder on the way / He had a mask like Castlereagh'), and *Song to the Men of England* ('Wherefore feed and clothe and save / From the cradle to the grave / Those ungrateful drones who would / Drain your sweat – nay, drink your blood?'). These he intended to include in a volume of *Popular Songs*, along with a 15,000-word essay setting out his political ideas. This essay, *A Philosophical View of Reform*, was written between September 1819 and May 1820. At this point it was abandoned unfinished, Shelley's enquiries about publishing the collection in England having come to nothing. It contains one of the great credos of the radical artist: the claim that poets, and, it has been assumed, artists in general, are 'the unacknowledged legislators of the world'. Our extract is taken from the essay's introductory chapter, as published in *Shelley's Revolutionary Year*, edited with an introduction by Paul Foot, London: Redwords, 1990, pp. 39–40 and 46–7.

The just and successful revolt of America corresponded with a state of public opinion in Europe of which it was the first result. The French Revolution was the second. The oppressors of mankind had enjoyed (O that we could say suffered) a long and undisturbed reign in France, and to the pining famine, the shelterless destitution of the inhabitants of that country had been added and heaped-up insult harder to endure than misery. For the feudal system (the immediate causes and conditions of its institution having become obliterated) had degenerated into an instrument not only of oppression but of contumely, and both were unsparingly inflicted. Blind in the possession of strength, drunken as with the intoxication of ancestral greatness, the rulers perceived not that increase of knowledge in their subjects which made its exercise insecure. They called soldiers to hew down the people when their power was already past. The tyrants were, as usual, the aggressors. Then the oppressed, having being rendered brutal, ignorant, servile, and bloody by long slavery, having had the intellectual thirst excited in them by the progress of civilisation, satiated from

fountains of literature poisoned by the spirit and the form of monarchy, arose and took a dreadful revenge upon their oppressors. Their desire to wreak revenge to this extent, in itself a mistake, a crime, a calamity, arose from the same source as their other miseries and errors and affords an additional proof of the necessity of that long-delayed change which it accompanied and disgraced. If a just and necessary revolution could have been accomplished with as little expense of happiness and order in a country governed by despotic as [in] one governed by free laws, equal liberty and justice would lose their chief recommendations and tyranny be divested of its most revolting attributes. Tyranny entrenches itself within the existing interests of the most refined citizens of a nation and says, 'If you dare trample upon these, be free.' Though this terrible condition shall not be evaded, the world is no longer in a temper to decline the challenge. [...]

Meanwhile England . . . has arrived like the nations which surround it at a crisis in its destiny. The literature of England, an energetic development of which has ever followed or preceded a great and free development of the national will, has arisen, as it were, from a new birth. In spite of that low-thoughted envy which would undervalue, through a fear of comparison with its own insignificance, the eminence of contemporary merit, it is *felt by the British* [that] ours is in intellectual achievements a memorable age, and we live among such philosophers and poets as surpass beyond comparison any who have appeared in our nation since its last struggle for liberty. For the most unfailing herald, or companion, or follower, of an universal employment of the sentiments of a nation to the production of beneficial change is poetry, meaning by poetry an intense and impassioned power of communicating intense and impassioned impressions respecting man and nature. The persons in whom this power takes its abode may often, as far as regards many portions of their nature, have little tendency [to] the spirit of good of which it is the minister. But although they may deny and abjure, they are yet compelled to serve that which is seated on the throne of own soul. And whatever systems they may [have] professed by support, they actually advance the interests of liberty. It is impossible to read the productions of our most celebrated writers, whatever may be their system relating to thought or expression, without being startled by the electric life which there is in their words. They measure the circumference or sound the depths of human nature with a comprehensive and all-penetrating spirit at which they are themselves perhaps most sincerely astonished, for it [is] less their own spirit than the spirit of their age. They are the priests of an unapprehended inspiration, the mirrors of gigantic shadows which futurity casts upon the present; the words which express what they conceive not; the trumpet which sings to battle and feels not what it inspires; the influence which is moved not, but moves. Poets and philosophers are the unacknowledged legislators of the world.

VIB

Painting and Fiction

1 Wilhelm Wackenroder (1773–1798) from *Confessions from the Heart of an Art-Loving Friar*

The son of a Prussian civil servant who later became a minister of justice, Wackenroder was constrained to pursue a career in law despite evidence of a gift for music and a passionate enthusiasm for art. His death at the age of 25 helped to establish the romantic image of a young man whose passionate and sensitive nature was broken by the rigidity of the demands placed upon him. He was a boyhood friend of Ludwig Tieck (see VIB2). Whilst studying at the University of Erlangen in 1793 the two made a number of trips to explore the art and architecture of the region, including nearby Nuremberg and Bamberg. The first fruit of these journeys was the essay 'A Memorial to our Venerable Ancestor Albrecht Dürer from an Art-Loving Friar' which Wackenroder published in the journal *Deutschland* in 1796. This essay was then included in the small volume of essays entitled *Confessions from the Heart of an Art-Loving Friar* which was published anonymously later in the same year. A second collection of essays, *Phantasien über die Kunst* (Fantasies on Art), was published by Tieck in 1799, a year after Wackenroder's death. Whilst the latter collection contains essays by both writers, the *Confessions* is now thought to be almost entirely Wackenroder's work. The book is written in the authorial guise of a friar who has retired to the 'solitude of monastic life' and who shares his emotional and pious responses to art with his readers. The author contrasts his own highly personal and empathetic approach to the rational and classicist aesthetics of Friedrich Ramdohr (see VB12 and VIB12). The essays were enormously influential and helped to stimulate the interest in the art of the medieval period which was so central to the art of the Nazarenes (see VIB5–7). It is noteworthy, however, that this influence was conveyed by the spirit of tolerance and pluralism advocated in the work, and by the tone of rapt awe in which it is written, rather than by any detailed study of earlier artists. Wackenroder's own preference is for the art of the sixteenth century and the majority of the essays are devoted to Renaissance artists, including Raphael, Leonardo and Piero di Cosimo. *Herzensergießungen eines kunstliebenden Klosterbruders* was first published in Berlin by Johann Friedrich Unger in 1796. Here we include the address to the reader and the three essays which form the heart of the book (the centre of which is the essay on Dürer). We have used the translation by Mary Hurst Schubert, *Wilhelm Heinrich Wackenroder's Confessions and Fantasies*, University Park and London: Pennsylvania State University Press, 1971, pp. 81–2, 108–20.

To the Reader of these Pages

The following essays have come into existence little by little in the solitude of a monastic life, from which I only occasionally think back dimly to the distant world. In my youth I loved art inordinately and this love, like a faithful friend, has accompanied me up to my present age: without realizing it, but acting out of an inner compulsion, I wrote down my reminiscences, which you, beloved reader, must view with an indulgent eye. They are not composed in the tone of the present-day world because this tone is not within my power and because, if I am to speak entirely honestly, I also am unable to like it.

In my youth I was involved in the world and in many worldly affairs. My strongest inclination was toward art and I wished to dedicate to it my life and all my limited talents. According to the judgment of several friends I was not without skill in sketching and my copies, as well as my own creations, were not totally unpleasing. But I continuously thought about the great, blessed saints of art with quiet, holy awe; it seemed strange, indeed, almost absurd to me that I should be guiding the charcoal or the paintbrush in my hand whenever the name of Raphael or Michelangelo came into my mind. I may, indeed, admit that I occasionally had to weep out of an indescribable melancholy fervor, when I pictured to myself most vividly their products and their lives: I could never manage – indeed, such a thought would have seemed impious to me, – to separate the Good from the so-called Bad in my chosen favorites and, in the end, to place them all in a row in order to observe them with a cold, criticizing eye, as young artists and so-called friends of art tend to do nowadays. Therefore, I am willing to admit openly that I have read only very little in the works of H. von *Ramdohr* with pleasure; and whoever likes these may immediately put out of his hand that which I have written, for it will not please him. I dedicate these pages, which I initially did not intend for the press at all, only to young, beginning artists or to boys who intend to dedicate themselves to art and who still carry in a quiet, uninflated heart holy respect for the time which has passed by. Perhaps they will be even more touched by my otherwise insignificant words, inspired to a still deeper respect; for they read with the same love with which I have written.

Heaven has ordained that I close my life in a monastery: these endeavors are, therefore, all that I am now in a position to do for art. If they are not entirely displeasing, then perhaps a second part will follow, in which I should like to refute the evaluations of several individual works of art, if Heaven grants me health and time to arrange the thoughts which I have jotted down regarding this and bring them into a clear exposition. –

A Few Words concerning Universality, Tolerance and Human Love in Art

The Creator, who made our earth and everything upon it, encompassed the entire globe with His glance and poured out the river of His blessing upon the whole earthly realm. However, from His mysterious workshop He scattered over our globe thousands of infinitely diverse seeds of things which bear infinitely varied fruits and, in

honor of Him, shoot up into the largest, most colorful gardens. In a wondrous way He guides His sun around the earth in precise circles, so that its beams fall upon the earth in thousands of directions and extract and stimulate the essence of the soil for a variety of creations in every region under heaven.

At *one* great moment He gazes with impartial eye upon the work of His hands and receives with satisfaction the offerings of all animate and inanimate Nature. The roaring of the lion is as pleasant to Him as the crying of the reindeer; and the aloe smells just as lovely to Him as rose and hyacinth. Man also emanated from His creating hand in thousandfold forms: – the brothers of *one* house do not know and understand each other; they speak different languages and are amazed at each other; – but He knows them all and takes pleasure in all; with impartial eye He gazes upon the work of His hands and receives the offering of all Nature.

In many a way He hears the voices of human beings speaking in confusion about heavenly things and knows that all, – all, even if it were against their knowledge and intention, – nevertheless mean *Him*, the Ineffable One.

In this manner He also hears the inner feelings of people speak different languages in different zones and in different eras and hears how they argue with each other and do not understand one another: but, for the Eternal Spirit, everything dissolves into harmony; He knows that each individual speaks the language which He has created in him, that each expresses his inner feelings as he can and should; – if in their blindness they argue with each other, then He knows and recognizes that each is, for himself, in the right; He looks with pleasure upon each and all and delights in the variegated mixture.

Art is to be called the flower of human emotion. In continuously changing form amidst the manifold zones of the earth it rises up towards heaven, and only *one* united perfume comes forth from this seed for the Universal Father, who holds in His hand the earth with all that is upon it.

In each work of art in all the zones of the earth, He sees the trace of the heavenly spark which, having emanated from Him, passed over through the breast of the individual into his little creation, from which it then glows back again to the great Creator. The Gothic temple pleases Him as well as the temple of the Greek and the crude war-music of the uncivilized is for Him just as lovely a sound as artistic choirs and hymns.

And when, through the immeasurable spaces of heaven, I now return to earth from Him, the Infinite One, and look around among my fellow-brothers, – alas! then I must utter loud laments that they strive so little to resemble their great eternal model in heaven. They quarrel with each other and do not understand each other and fail to see that they are all hastening toward the same goal, because each remains standing firmly upon his own location and does not know how to lift his eyes over all the world.

Stupid people cannot comprehend that there are antipodes on our globe and that they are themselves antipodes. They always conceive of the place where they are standing as the gravitational center of the universe, – and their minds lack the wings to fly around the entire earth and survey with *one* glance the integrated totality.

And, similarly, they regard their own emotion as the center of everything beautiful in art and they deliver the final judgment concerning everything as if from

the tribunal, without considering that no one has appointed them judges and that those who are condemned by them could just as well set themselves up to the same end.

Why do you not condemn the American Indian, that he speaks Indian and not our language? –

And yet you want to condemn the Middle Ages, that it did not build such temples as did Greece? –

O, at least feel your way into these unknown souls and observe that you have received the gifts of the spirit from *the same* hand as your misunderstood brothers! Comprehend, moreover, that each creature can only be creative from within himself with the capacities which he has received from heaven and that each person's creative works must be in conformity with his talents. And if you are not capable of *feeling* your way into all unfamiliar beings and *experiencing* their works through their mentalities; then try, at least, to reach up to this conviction indirectly through the intellect's chains of reasoning. –

If the disseminating hand of heaven had let the embryo of your soul fall upon the African sand deserts, then you would have preached to all the world the shining blackness of skin, the large, flat face and the short, curly hair as essential components of the highest beauty and would have laughed at or hated the first white man. If your soul had arisen several hundred miles further to the East, on the soil of India, then you would feel the secret spirit which exists, concealed from our senses, in the little, strangely shaped idols with many arms and, if you were to see the statue of the Venus of Medici, you would not know what you should think of it. And had it pleased that One, under whose power you stood and are standing, to cast you into the multitudes of southern island dwellers, then you would find in every wild drum-beat and in the crude, shrill shocks of the melody a deep significance, of which you now comprehend not a syllable. In any one of these cases, however, would you have received the gift of creativity or the gift of appreciation of art from another source than the eternal and universal One, to whom you are now indebted for all of your treasures? –

Amidst all the nations of the earth, the multiplication table of reason follows the same laws and is only applied to an infinitely larger field of objects here, to a very small field there. – In a similar way *artistic feeling* is only one and the same divine ray of light which, however, is refracted into thousands of different colors by the diversely polished glass of sensuality in various regions.

Beauty: a wondrously strange word! First invent new words for each separate artistic feeling, for each individual work of art! A different color plays in each and, for each, separate nerves are provided in the structure of the human being.

But, with talents of the intellect you spin a rigorous *system* from this one word and want to compel all men to feel according to your prescriptions and rules, – yet you yourselves do not feel.

He who *believes a system* has expelled universal love from his heart! Intolerance of emotion is still more endurable than intolerance of the intellect; – *superstition* better than *belief in a system*. –

Can you force one who is melancholy to find playful songs and lively dancing pleasant? Or one who is sanguine to offer his heart joyfully to tragic horrors?

O, rather let every mortal being and every race under the sun keep its belief and its happiness! and rejoice when others are happy, – even if you yourself do not know how to be happy about that which is dearest and most precious to them.

We, sons of this century, have had fall to our lot the advantage that we stand on the peak of a high mountain and that many countries and many ages lie spread out around us and at our feet, open to our eyes. Therefore, let us make use of this good fortune and wander about through all the ages and peoples with clear vision and always strive to discover *the human element* in all their manifold sensations and products of sensation. – –

Every creature strives toward that which is the most beautiful: but it cannot transcend itself and sees what is most beautiful only within itself. Just as a different image of the rainbow enters into every mortal eye, so too does the surrounding world reflect for each individual a different imprint of beauty. However, universal, original beauty, which we can *name* only in moments of ecstatic intuition and are unable to reduce to words, reveals itself unto the One who created the rainbow and the eye that beholds it.

I began my discourse with Him and I return to Him again: – in the same way as the spirit of art, – as all spirit goes forth from Him and, as an offering, penetrates through the atmosphere of the earth up to Him again.

A Memorial to our venerable ancestor Albrecht Dürer
By an art-loving friar

Nuremberg! you formerly world-renowned city! How I liked to wander through your quaint streets; with what childlike love I gazed at your antiquated houses and churches, upon which the permanent trace of our early native art is imprinted! How deeply I love the structures of that age, which have such a robust, powerful and true language. How they transport me back into that venerable century when you, Nuremberg, were the vibrantly teeming school of native art and a truly fruitful, overflowing spirit of art lived and thrived within your walls: – when Master Hans Sachs and Adam Kraft, the sculptor, and, above all, *Albrecht Dürer* with his friend, Wilibaldus Pirkheimer, and so many other highly praised men of honor were still living! How often I have wished that I were back in that age! How often it has appeared before me anew in my thoughts, while I was sitting in a narrow corner in your venerable libraries, Nuremberg, in the twilight of the little, round-paned windows and brooding over the folio volumes of valiant Hans Sachs or over some other old, yellow, worm-eaten paper; – or while I was walking under the bold arches of your dark churches, where, through colorfully painted windows, the sunlight splendidly illuminates all the objects of art and paintings of the past age! – –

You are surprised again and gaze at me, you narrow-minded and faint-hearted ones! O, I know them, indeed, the myrtle-forests of Italy, – I know it, indeed, the divine ardor in the inspired men of the blessed South: – how you call me hence, where my soul's thoughts are dwelling constantly, where is the native land of the most beautiful hours of my life! – You, who see boundaries everywhere where there are none! Are not Rome and Germany situated on *one earth*? Has the heavenly Father

not made *pathways* from North to South as from West to East across the globe? Is a human life too brief? Are the Alps insurmountable? – Then, more than *one* love must also be able to live in the breast of man. – –

But now my grieving spirit is wandering about on the consecrated ground before your walls, Nuremberg; on the cemetery where the bones of Albrecht Dürer are resting, who was formerly the embellishment of Germany, indeed, of Europe. Visited by few, his remains rest amidst innumerable tombstones, each of which is marked with a bronze plaque, as the stamp of the early art. Between the graves tall sunflowers spring up in multitudes, which make the cemetery into a lovely garden. In this setting rest the forgotten bones of our old Albrecht Dürer, on account of whom I am glad that I am a German.

Few must have been given the ability to understand the soul in your pictures as well and to enjoy their unique and particular qualities with such fervor as heaven seems to have granted unto me over many others; for, I look around and find few who lingered before you with such an affectionate love, with such emotion as I.

Is it not as if the figures in your pictures were real people who were talking together? Each is etched so distinctly that one would recognize him in a large crowd; each so true to life that he totally fulfills his purpose. Not one is there with half a soul, as people frequently would like to say regarding very ornamental pictures by more modern masters; each is captured in the fullness of life and set down on the panel in this way. Whoever is supposed to lament, laments; whoever is supposed to be angry, is angry; and whoever is supposed to pray, prays. All of the figures speak; they speak openly and with refinement. No arm moves superfluously or merely to please the eyes and fill up space; all of the limbs, everything speaks to us as if with force, so that we comprehend with genuine firmness the meaning and the soul of the entire picture. We believe everything which the artistic man presents to us; and it is never blotted out of our memory.

Why is it that the contemporary artists of our native land seem to me so different from those praiseworthy men of the past and from you, above all, my beloved Dürer? Why is it that I feel as if you all had handled the art of painting far more seriously, more importantly and more worthily than these ornamental artists of our days? I imagine that I see you, how you stand meditating before the picture you have begun, – how the conception that you want to make visible hovers very animatedly before your soul, – how you prudently consider what expressions and positions might affect the viewer the most powerfully and most surely and stir his soul the most forcefully while he is looking at them, – and you then accurately and painstakingly convey to the panel the beings allied with your lively imagination. – But the more recent artists do not seem to want one to participate seriously in that which they portray for us; they work for aristocratic gentlemen, who do not want to be moved and ennobled by art but dazzled and titillated to the highest degree; they strive to make their paintings specimens of many lovely and deceiving colors; they test their cleverness in the scattering of light and shadow; – however, the human figures frequently seem to be in the picture merely for the sake of the colors and the light, I would indeed like to say, as a necessary evil.

I must cry out woe upon our age, that it practices art merely as a frivolous plaything of the senses, while it is actually something very serious and exalted. Do

people no longer pay heed to the human being, that they neglect him in art and find pretty colors and all sorts of tricks with highlights more worthy of contemplation? –

In the writings of *Martin Luther*, who was very highly esteemed and defended by our Albrecht, in which, as I willingly admit, I have done some reading out of intellectual curiosity and in which much good material may be hidden, I found a remarkable passage concerning the importance of art, which now comes vividly to mind. For this man maintains somewhere very daringly and explicitly that, after theology, music occupies the first place among all the sciences and arts of the human spirit. And I must open-heartedly confess that this bold claim attracted my attention very much to this excellent man. For the soul from which such a claim could come had to feel precisely that deep veneration for art which, from whence I know not, dwells in so few minds and which is, nevertheless, seemingly so very natural and so significant.

Now, if art (I mean its principal and essential part) is really of such importance, then it is very unworthy and foolish to turn away from the expressive and instructive human figures of our old Albrecht Dürer because they are not endowed with the glistening external beauty which the world of today considers to be the sole and highest aspect of art. It does not give evidence of an entirely healthy and untroubled disposition, if someone closes his ears to an intellectual reflection which is, in itself, convincing and penetrating, only because the speaker does not arrange his words in fine order or because he has an incorrect, foreign accent or an unattractive motion of his hands. But do not similar thoughts prevent me from appreciating and admiring for its merits this external and, so to speak, merely physical beauty of art where I come upon it?

This is also charged against you as a crude fault, my beloved Albrecht Dürer, that you merely place your human figures so conveniently next to each other, without intermingling them so that they form a methodical group. I love you in your unaffected simplicity and I spontaneously fix my eye first of all upon the *soul* and deep *significance* of your human beings, without such censoriousness even entering my mind. However, many people seem so disturbed by this, as by an evil, tormenting spirit, that they become aroused to despise and to mock before they are able to observe serenely, – and they are least of all capable of transporting themselves beyond the boundaries of the present into past ages. I am quite willing to admit to you, you eager neophytes, that a young pupil might nowadays speak more cleverly and learnedly about colors, light, and arrangement of figures than old Dürer knew how to; but is it the youth's own intellect which is speaking, or is it not, instead, the artistic wisdom and experience of the past ages? Only individual, chosen mentalities comprehend the actual inner soul of art *suddenly*, even if their handling of the paintbrush may still be very imperfect; all the external aspects of art, on the other hand, are brought to perfection little by little through invention, practice, and reflection. It is, however, a base and deplorable vanity which sets the gain of the *ages* upon its own weak head as a crown and wants to conceal its nothingness under borrowed splendor. Away, you wise youths, from the old artist of Nuremberg! – and may no one venture to judge him with mockery who can still childishly turn up his nose over the fact that he did not have Titian or Correggio as teachers or that, in his day, people wore such odd Old-Franconian clothing.

For, on this account as well, today's teachers do not want to call him, as well as many another good painter of his century, beautiful and noble, because they clothe the history of all peoples and even the sacred stories of our religion in the dress of their own times. But, I consider thereby how *every* artist who lets the spirit of past centuries enter into his heart must enliven this with the spirit and breath of *his own* age; and how it is, indeed, appropriate and natural that the creative power of the human being lovingly attract to itself everything strange and distant, even the heavenly beings as well, and envelop all in the well-known and beloved forms of *its* world and *its* mental horizon.

When Albrecht was wielding the paintbrush, the German was at that time still a unique and an excellent character of firm constancy in the arena of our continent; and this serious, upright and powerful nature of the German is imprinted in *his* pictures accurately and clearly, not only in the facial structure and the whole external appearance but also in the inner spirit. This firmly determined German character and German art as well have disappeared in our times. The young German learns the languages of all the peoples of Europe and, examining and evaluating, is expected to draw sustenance from the spirit of all nations; – and the student of art is taught how he should imitate the expressiveness of Raphael and the colors of the Venetian School and the realism of the Dutch and the enchanting highlights of Correggio, all simultaneously, and should in this way arrive at the perfection which surpasses all. – O, wretched sophistry! O, blind belief of this age that one could combine every type of beauty and every excellence of all the great painters of the earth and, through the scrutinizing of all and the begging of their numerous great gifts, could unite the spirit of all in oneself and transcend them all! – The period of individual vigor is over; people wish to simulate the talent which has faded away by means of impoverished imitation and shrewd compilation, and cold, immaculate, insipid works are the fruit. – German art was a pious youth, raised in simplicity within the walls of a small city amidst intimate friends; – now that it is older, it has become a universal man of the world who, along with his provincial manners, simultaneously wiped away the emotion and the unique character from his soul.

I would not wish for all the world that the enchanting Correggio or the magnificent Paolo Veronese or the mighty Buonarroti had painted in the very same way as *Raphael*. And I also do not agree in the least with the utterances of those who say: 'If Albrecht Dürer had only lived in Rome for a while and learned true beauty and the ideal from Raphael, then he would have become a great painter; one has to pity him and marvel that he, nevertheless, achieved so much in his position.' I find nothing to pity here; rather, I rejoice that in this man Fate has granted to German soil a truly native painter. He would not have remained himself; his blood was not Italian blood. He was not born for the perfection and the lofty grandeur of a Raphael; he took his pleasure *in this*, depicting for us human beings as they actually were in his surroundings, and he succeeded most admirably.

But, nevertheless, when I for the first time saw paintings by Raphael as well as by you, my beloved Dürer, in a magnificent art gallery during my younger years, it occurred to me most amazingly that, of all the other painters whom I knew, these two had a particularly close affinity to my heart. It pleased me very much that they both present to our eyes so clearly and distinctly mankind in the fullness of soul, so simply

and straightforwardly, without the ornamental digressions of other painters. At that time, however, I did not dare to reveal my opinion to anyone, for I believed that everyone would laugh at me and I well knew that the majority perceive nothing other than something very stiff and dull in this early German painter. On the day when I had seen that art gallery I was, however, so filled with this new thought that I fell asleep therewith and, in the night, a delightful vision appeared before me which confirmed me even more firmly in my belief. It seemed to me, namely, that after midnight I had gone with a torch out of the room of the castle in which I was sleeping. Totally alone I walked through the dark halls of the building toward the art gallery. When I arrived at the door, I heard a soft murmuring within; – I opened it, – and suddenly I started back in surprise, for the entire large hall was illuminated by a strange light and in front of numerous pictures were standing their venerable masters in living form and in their old-fashioned dress, just as I had seen them in portraits. One of them, whom I did not know, told me that they descended from heaven on many a night and, in the nocturnal stillness, wandered about in picture galleries here and there on earth and viewed the still beloved works of their hands. I recognized many Italian painters; from the Netherlands I saw very few. Full of reverence I passed between them; – and behold! there, apart from all the others, *Raphael* and *Albrecht Dürer* were standing hand in hand in the flesh before my eyes and were silently gazing in friendly tranquillity at their paintings, hanging side by side. I did not have the courage to address the divine Raphael; a mysterious, reverential fear sealed my lips. However, I was just about to greet my Albrecht and pour out my love to him; – but, at that moment, everything became disarranged before my eyes with a great din and I awoke with a violent start.

This vision had given my heart deep joy and the joy became even more complete when, shortly thereafter, I read in old Vasari how, without knowing each other, these two magnificent artists had also really been friends during their lifetimes through their works and how the sincere and life-like products of the early German had been regarded with satisfaction by Raphael and he had considered them not unworthy of his love.

But, to be sure, I cannot conceal the fact that afterwards I always felt just as in that dream regarding the works of the two painters; in the case of those by Albrecht Dürer, namely, I sometimes attempted to explain their true merit to someone and dared to speak expansively concerning their excellencies; but, with the works of Raphael, I always became so surfeited and afflicted in the presence of this heavenly beauty that I was not able to speak about it nor to analyze clearly for someone the source of the divine essence which shone forth for me everywhere.

However, I do not want to turn my attention from you now, my Albrecht. Comparison is a dangerous enemy of enjoyment; even the highest beauty of art exerts its full force upon us only then, as it should, when our eye is not simultaneously looking aside at other beauty. Heaven has distributed its gifts among the great artists of the earth in such a way that we are absolutely compelled to stop before each one and offer up to each his share of our adoration.

True art sprouts forth not only under Italian sky, under majestic domes and Corinthian columns, – but also under pointed arches, intricately ornamented buildings, and Gothic towers.

Peace be with your remains, my Albrecht Dürer! and may you know how I love you and hear how I am the herald of your name in the world of today, unfamiliar to you. – Blessed be to me your golden age, Nuremberg! the only age when Germany could boast of having its own native art. – But the beautiful eras pass away across the earth and disappear, just as shining clouds drift away across the arch of the sky. They are over and are no longer thought of; only a few, out of deep love, call them back to mind from dust-covered books and enduring works of art.

Concerning Two Wonderful Languages and their mysterious power

The language of words is a great gift of heaven and it was a perpetual blessing of the Creator that He enabled the first human being to speak, so that he could name all the things which the Highest One had placed around him in the world and all the spiritual images which He had implanted in his soul and could exercise his mind in the diverse play with this abundance of names. We rule over the entire globe by means of words; with easy effort we acquire for ourselves through trade all the treasures of the earth by means of words. Only *the invisible force which hovers over us* is not drawn down into our hearts by words.

We have the earthly things in our hand when we speak their names; – but when we hear the infinite goodness of God mentioned, or the virtue of the saints, which are indeed subjects that ought to grip our whole being, then our ears alone become filled with empty sounds and our spirit is not elevated as it should be.

However, I know of *two wonderful languages* through which the Creator has permitted human beings to perceive and to comprehend heavenly things in their full force, as far as this (in order not to speak presumptuously) is possible, namely, for mortal creatures. They enter into our souls through entirely different ways than through the aid of words; they move our entire being *suddenly*, in a wondrous manner, and they press their way into every nerve and every drop of blood which belongs to us. God alone speaks the first of these wonderful languages; the second is spoken only by a few Chosen Ones among men, whom He has anointed as His favorites. I mean: *Nature and Art*. –

Since my early youth, when I first became acquainted with the God of mankind from the ancient holy books of our religion, *Nature* always seemed to me the most fundamental and the clearest book of explanation concerning His being and His attributes. The rustling in the treetops of the forest and the rolling of the thunder told me mysterious things about Him which I cannot set down in words. A beautiful valley surrounded by fantastic cliff formations or a calm river in which leaning trees are reflected or a pleasant green meadow, shone upon by the blue sky, – ah! these things have inspired more marvelous emotions deep within me, have filled my spirit more fervently with the omnipotence and infinite goodness of God, and have purified and elevated my entire soul far more than the language of words was ever capable of doing. It is, in my opinion, an all too earthly and clumsy instrument to handle the spiritual as well as the physical realm with it.

I find here a great inducement to praise the power and goodness of the Creator. Around us human beings He placed an infinite number of things, each of which has a different nature and none of which we can understand and comprehend. We do not

know what a tree is; nor what a meadow nor what a cliff is; we cannot communicate with them in our language; we only understand *each other*. And, nevertheless, the Creator has placed in the human heart such a marvelous sympathy for these things that they bring to it by unknown pathways emotions or sentiments, or whatever one may call them, which we never acquire through the most measured words.

Out of a zeal for the truth which is in itself laudable, the philosophers have gone astray; they have wanted to uncover the mysteries of heaven and place them amidst the things of earth in earthly illumination and have expelled the *dim intuitions* of the same from their breasts with bold advocacy of their right. – Is the weak human being capable of clarifying the mysteries of heaven? Does he rashly think that he can bring to light what God has hidden with His own hand? May he, indeed, arrogantly dismiss the *dim intuitions* which descend to us like veiled angels? – I honor them in deep humility; for it is a great benevolence of God that He send down to us these genuine witnesses of the truth. I fold my hands and worship. –

Art is a language of a totally different type than Nature; but, through similar dark and mysterious ways, it also has a marvelous power over the heart of man. It speaks through pictures of human beings and, therefore, makes use of a hieroglyphic script, whose symbols we know and understand in their external aspect. But it fuses spiritual and supersensual qualities into the visible shapes in such a touching and admirable manner that, in response, our entire being and everything about us is stirred and affected deeply. Many a painting of the Passion of Christ or of our Holy Virgin or from the history of the saints has, I may indeed say it, cleansed my mind more and inspired my inner consciousness with more blessedly virtuous convictions than systems of morality and spiritual meditations. Among others, I still think with fervor about a most magnificently painted picture of our Saint Sebastian, how he stands naked and bound to a tree, how an angel draws the arrow out of his breast and a second angel brings a floral wreath from heaven for his head. I am indebted to this painting for very penetrating and tenacious Christian convictions and I now can scarcely bring the same vividly back to mind without having tears well up in my eyes.

The teachings of the philosophers set only our brains in motion, only the one half of our beings; but the two wonderful languages whose power I am proclaiming here affect our senses as well as our minds; or, rather (I cannot express it differently), they seem thereby to fuse all the parts of our nature (incomprehensible to us) into one single new organ, which perceives and comprehends the heavenly miracles in this twofold way.

One of the languages, which the Highest One Himself continues to speak from eternity to eternity, continuously active, infinite *Nature*, leads us through the vast expanses of the atmosphere directly to the godhead. *Art*, however, which, by means of clever mixtures of colored earth and some moisture, copies the human form in narrow, restricted space, striving for inner perfection (a type of creation as was granted to mortal beings to produce), – it discloses for us the treasures in the human breast, turns our eyes towards our inner selves, and shows us the invisible part, I mean everything that is noble, grand, and divine, in human form. –

Whenever I walk out of the consecrated temple of our monastery into the open air after the contemplation of Christ on the Cross and the sunshine from the blue sky embraces me warmly and vibrantly and the beautiful landscape with mountains,

waters, and trees strikes my eye, then I see a special world of God arise before me and feel great things surge up in my soul in a special way. – And when I go from the open air into the temple again and reflect upon the painting of Christ on the Cross with seriousness and fervor, then I once again see another entirely different world of God before me and feel great things rise up in my soul in another special way.

Art represents for us the highest human perfection. Nature, to the extent that a mortal eye sees it, resembles fragmentary oracular decrees from the mouth of the deity. However, if it is permissible to speak thusly of such things, then one would perhaps like to say that God may, indeed, look upon all of Nature or the entire world in a manner similar to the manner in which we look upon a work of art.

2 Ludwig Tieck (1773–1853) from *Franz Sternbald's Wanderings*

Ludwig Tieck was born and educated in Berlin where he formed a close friendship with Wilhelm Wackenroder (see VIB1). The son of a rope-maker, he revealed an early gift for imaginative writing, publishing a large quantity of fantastical and humorous fiction in journals such as *Die Straußfedern*, edited by Friedrich Nicolai. In 1797 he published three volumes of fairy-tales under the pseudonym Peter Leberecht, including dramatized versions of *Puss in Boots* and *Duke Bluebeard*. His greatest early success was achieved with the novel *Franz Sternbald's Wanderings*, which he published unfinished. The novel tells the story of a pupil of Dürer who journeys from Nuremberg to Holland and then on to Italy. As Tieck himself observed in a postscript to the novel, its structure and composition owe a great deal to conversations with Wackenroder. Indeed, the book is characterized by the same reverent worship of art and delight in nature which is to be found in the *Confessions from the Heart of an Art-Loving Friar*. It exercised a strong influence on Philipp Otto Runge (see VIB5 and VIIA8), who declared 'I have never been so stirred in my innermost soul as I have been by this book.' In the section reproduced here, Sternbald visits an eccentric painter who lives as a hermit high up in the mountains. Sternbald's rapturous responses to the natural world and the high significance he places on art appear to be confirmed by his conversation with the hermit. The recluse's words echo Wackenroder's claim that art and nature represent 'two wondrous languages' through which divine wisdom is revealed. The description of one of his landscape paintings offers a remarkable parallel with the type of subject that was to be painted by Caspar David Friedrich (see VIB13 and *Art in Theory: 1815–1900*, IA8). *Franz Sternbald's Wanderungen* was first published in Berlin by Johann Friedrich Unger in 1798. The following excerpt has been translated for the present volume by Jason Gaiger from the edition edited by Alfred Anger, Stuttgart: Philipp Reclam, 1979, Part II, Book I, chapter 5, pp. 248–57.

The narrow path wound through the rocks, a scrub of fir trees grew up from the barren ground, and after a few hours Franz stood upon the highest point of the mountain.

Once again it was as if a curtain had fallen to the ground, the plain opened itself up to his view and the barren rocks beneath him merged delightfully into the jumble of green woods and fields. Hostile nature had disappeared, unified with the charming prospect of the whole; made beautiful, she in turn made everything else more

beautiful. The splendour of the river lay stretched out before him and in this sudden unveiling of infinite, all-encompassing nature he felt as if he would lose himself; it was as if nature spoke to him in a voice which entered into his heart; she stared down at him from the heavens with burning eyes and looked up at him from the shimmering river, gesturing towards him with her giant limbs. Franz reached out his arms as if he wished to press something invisible to his breast, as if he wanted to seize and hold tight that for which he had yearned for so long. The clouds moved across the horizon against the blue sky, and shadows and reflected light stretched over the meadows, changing their colours and sending wondrous tones down the mountain-side. Franz felt as if he were rooted to the spot, like someone under a spell who is kept still by a magic power and who, no matter how hard he tries, cannot tear himself free from the invisible circle which surrounds him.

‘O powerless art,’ he cried out, sinking down upon a green bank of rock, ‘how childish and inarticulate are the sounds you make compared to the full, harmonious organ’s song which pours forth from the innermost depths of nature, from the mountains, woods, valleys and rivers, in ever fuller and richer chords. I hear, I perceive, how the eternal world spirit with masterly fingers sends forth sounds from its fearsome harp, conjuring forth the most varied images which take wing above the realm of nature. Inspiration impels my small human heart to participate, wrestling with these higher powers until it is exhausted; nature governs gently and will perhaps refuse to acknowledge my striving and my appeals for help with this omnipotent beauty. The immortal melody rejoices and exults and tears away from me; my gaze falls to the ground and my senses are dulled. How ignorant you are, you who believe that all-powerful nature can be made more beautiful by calling upon art and deception to aid you in your powerlessness! What more can you hope for than to give an intimation of nature, if nature herself gives us an intimation of the divine? It is not a presentiment or an intimation which reigns here on the peaks and in the valleys but the power of an originary responsiveness, a religion which receives my prayer with benevolent compassion. The hieroglyph which represents God, the highest, lies there before me, an active power, fulfilling its task of resolution and of bringing itself to speech; I feel the need to resolve the puzzle into concepts – and feel my own humanity. – The highest art can only explain itself, it is a song whose content can only be art itself.’

Reluctantly, Sternbald let go his inspiration and left the place which had so enraptured him. He sorrowed that he could not preserve for ever the freshness and vigour of the words and thoughts which he had spoken and that new impressions and new ideas would erase or cover them over.

At the top, he was met by a thick wood and he often looked behind him, going forwards reluctantly as if he were leaving life behind. The solitary darkness awoke in him a strange feeling towards the open countryside; his breast was oppressed and contracted with anxiety. After half an hour of walking he encountered a small hut which stood open without anyone inside. Exhausted, he threw himself beneath a tree and gazed at the narrow dwelling with its sparse furnishing; he was moved by an old lute lacking one of its strings which hung upon the wall. Palettes and paints were scattered everywhere, together with items of clothing. It was as if Sternbald found himself transported back into the most ancient times, of which we hear tell in stories

with so much pleasure – where there is no lock upon the door and where no miscreant interferes with the belongings of another.

After a while, the old painter returned; he was not at all surprised to encounter a stranger before his door, but instead went into his hut, cleared his things and played upon his zither as if no one were there. Franz watched in astonishment as the old man sat in his house like a child, showing his contentment in his small home, surrounded by the friendly, familiar sounds of his instrument. Once he had finished playing, he unpacked herbs, moss and stones from a bag and carefully laid them out in small boxes, examining each one attentively. Some caused him to smile, whilst others aroused his astonishment, causing him to strike his hands together or gravely to shake his head. Still he did not look at Sternhald, until finally he came into the old man's hut and offered his greetings. The old man gave him his hand and silently gestured him to sit, examining him in wonder as a stranger.

The hut was decorated with a large variety of stones and mussel shells, together with unusual plants and stuffed animals and fish, so that everything took on a fantastical appearance. Silently, the old man reached our friend some fruit which he set before him with a wordless gesture. After Franz had eaten, observing all the while this curious man, he began to speak with the following words, 'For some time now I have taken great pleasure in watching you, and I very much hope that you will show me some of your paintings; this is what I desire most of all, for I too have given myself up to this noble art.'

'Your are a painter?' cried the old man. 'Now, indeed, I am delighted to see you, for it is a long time since I last met one. But you are still very young, and I doubt whether you have yet developed a proper feeling for this great art.'

'I do the best I can,' Franz answered, 'and will always do my best; but I am aware that this is not always sufficient.'

'It is always enough,' cried the old man; 'only the rare few are able to express what is highest and truest; we others can only ever come near, but we will have reached our goal when we are able to recognize and acknowledge that which the Almighty has placed within us. In this world we can only *wish*; we must live with our intentions, for genuine action lies beyond us; it consists no doubt in the most individual and effective thoughts, for in this many-coloured world everything is mixed up with everything else. Thus it is that the omnipotent Creator, in a mysterious way which is proper for us his children, has revealed himself through the realm of nature which belongs to him. He does not speak to us directly, for sometimes we are too weak to understand him. Instead, he gives us signs and in every piece of moss, in every stone, there is hidden a secret number which can never be written out or fully guessed, but which we believe we can always see. The artist works in just the same way: strange, wondrous, unknown rays of light shine forth from him which he reflects towards others through the crystal of art; in this way he does not frighten them, but allows them in their own way to grasp and to understand. Thus the work is completed, a vast land is revealed, a boundless prospect in which all of human life is illuminated by the brilliance of the heavens; flowers grow up mysteriously and even the artist does not know that the finger of God has produced them; we smell their ethereal scent and they silently proclaim the artist a favourite of God. Behold, these are my thoughts about nature and about art.'

Franz was gripped by astonishment, for no one before had ever spoken to him in this way; he shrank back from himself, for he heard his own most personal thoughts spoken in the mouth of someone whom other people called mad; as if under a magic spell, his soul was spirited forth from its distant dwelling-place and he saw his own indeterminate intuitions presented before him in the form of perspicuous images.

'How I welcome this way of speaking,' he cried out, 'I had not gone astray after all when I arrived here in the quiet hope that you might be able to help me and lead me from confusion.'

'We all lose our way,' said the old man, 'it is necessary that we err; but beyond error does not lie truth; these are not opposed to each other – they are only words which man invents in his helplessness in order to describe what he does not mean at all. Do you understand me?'

'Not so well,' answered Sternbald.

The old man continued, 'If I could only paint, or say, or sing what animates my innermost self, then I could aid myself and everyone else; but my soul scorns the words and signs which press in upon it; and since it cannot employ these, it uses them only to play with. This is how art comes into being, this is how true thought is born.'

Franz recalled that Dürer had once expressed this idea in almost exactly the same words. He asked, 'What, then, do you hold to be the highest that man can attain?'

'To be at peace with himself,' cried the old man, 'to be at peace with everything, for then he himself and everything around him vanishes in a heavenly art work, he purifies himself with the fire of the divinity.'

'Is this something we can achieve?' Franz asked.

'We should want to achieve it,' the old man continued, 'and, indeed, this is something everyone does want; it is just that many, indeed the majority, have allowed their minds to become stunted in this strange world we inhabit. For this reason, it is rare for us to become aware of others and even more rare that we become aware of ourselves.'

'I look around for your paintings,' said Sternbald, 'but I cannot see them; after what you have said about art, I anticipate something great.'

'You would be wrong to do so,' answered the old man with some frustration, 'for I was not born to be an artist; I am an unsuccessful painter who has not found his proper vocation. The desire seizes many and makes their life a misery. From my childhood on I sought only to live for art, but, unwilling, she turned away from me and refused to recognize me as her son. Although I continue to work, she has turned her back on me.'

He opened a door and led the painter into a small room full of paintings. The majority were portraits, a few landscapes and yet fewer history paintings. Franz examined them with great attention, whilst the old man silently occupied himself with repairing a broken bird-cage. A severe and earnest character was reflected in each of the paintings; the features were clear, the drawing hard and definite; little attention was paid to ancillary features, but there was something in the faces which both attracted and repelled the gaze; in many of the portraits a happiness was expressed in the eyes which could be termed cruel, whilst others were curiously withdrawn and excited horror through their fearful countenance. Franz felt indescribably lonely, particularly when he looked out of the small window to the

mountain and the woods outside and could not make out a single house or human being in the distant plane.

When Franz had finished looking, the old man said, 'I wonder whether you do not notice something peculiar about my paintings, for I finished them all in a strange state of mind. I do not like to paint unless I see clearly and definitely in front of me what I want to represent. Sometimes when I sit in front of my hut in the evening sun, or in the freshness of the morning as it travels down from the mountain to the meadows below, images of the apostle or of holy martyrs appear in the trees; their faces stare down at me when I pray to them, demanding of me that I draw them. Then I reach for my brush and palette and my agitated soul, filled with ardour for these great men and with love for the ages that are past, seeks to shadow forth their excellency with earthly colours which shine with splendour in my mind and before my eyes.'

'You are happy then,' said Franz, who was astonished at these words.

'As you wish it,' said the old man. 'In my opinion, the artist should not work in any other way. What else is inspiration? For the painter, everything must possess reality, for what else does he wish to represent? His soul must move like a stream, so that his innermost world is shattered to its very ground; then, from the multi-coloured confusion the great forms will emerge which he reveals to his fellow man. Believe me, no artist has ever been inspired in any other way. We speak of inspiration as if it were something natural; but it is wholly incomprehensible – it comes and goes like the first light of Spring which descends unexpectedly from the clouds and then, before you have enjoyed it, disappears.'

Franz was unsure what to answer. He was uncertain whether the artist really had succumbed to madness or whether he simply spoke the language of artists.

'Occasionally,' the old man continued, 'surrounding nature speaks to me and arouses me to practise at my art. But I have never sought to capture nature, only to attune myself to character or physiognomy, inserting a pious thought which transforms the landscape into a beautiful story.'

He then drew the young painter's attention to a landscape which hung somewhat to one side. It was a night scene; a wood, a mountain and a valley lay in unclear masses alongside one another; dark clouds lowered from the sky. A pilgrim wandered through the night, recognizable by his staff and by the mussel shells on his hat. He was surrounded by deepest darkness, illuminated only by the shimmer of a stolen ray of light from the moon. In front of him could be made out a dark path into the woods and high up on the hill a gleaming crucifix separated the clouds. From the moon fell a ray of light which played upon the holy sign.

'Look,' cried the old man, 'here I have sought to paint temporal existence and celestial hope: look at the sign which calls us from the dark valley to the moonlit heights. Are we any further forward than lost and wandering pilgrims? Can anything illuminate our path other than a light from above? It is from the crucifix that light penetrates this world with its gentle force, giving us life and sustaining our strength. Here I have sought to transform nature once again and to say in my own human fashion what nature herself says to us. I have painted a puzzle which not everyone will be able to unlock, but which is easier to solve than the sublime mystery with which nature covers herself.'

'One could,' Franz replied, 'call this painting allegorical.'

'All art is allegorical as you call it,' said the old man. 'Art cannot represent things as isolated objects existing for themselves, eternally separated from the world before us. Nor should art seek to do so: we combine things together and we strive to identify a universal meaning in the particular. This is how allegory comes into being. It means nothing else than true poetry which seeks what is great and noble and which can only be discovered in this way.'

3 Francisco de Goya (1746–1828) on the *Caprichos*

The eighty prints composing Goya's *Caprichos* (Caprices) were published in February 1799. The designs were based on work in two sketchbooks from the years 1796–7. These contained intimate observations made in ink and wash which he made while staying with the Duchess of Alba, together with satirical sketches, anecdotal fragments and caricatures. Underneath one drawing from 1797 he wrote, 'The artist dreaming. His only purpose is to banish harmful, vulgar beliefs, and to perpetuate in this work of caprices the solid testimony of truth.' In the resulting aquatints several of the various vignettes appear with suggestive captions and gnomic comments. The collection as a whole offers vivid and ironic comment both on the patterns of private life and on the Spanish social world of the time, augmented by more enigmatic references to witchcraft and the threat of madness. The final plate of the series was titled *The Sleep of Reason produces Monsters*, to which Goya added the note, 'Imagination, deserted by reason, begets impossible monsters. United with reason, she is the mother of all arts, and the source of their wonders.' Only twenty-seven sets of the *Caprichos* were sold before they were withdrawn from sale, perhaps as a result of protests at their satirical content. They nevertheless played a considerable part in establishing Goya's reputation outside Spain. Though he was denounced to the Inquisition, he was safeguarded by his reputation and by the support of powerful patrons. He presented the plates of the *Caprichos* to the king, who granted a pension to his son in return. The following announcement was published in the paper *Diario de Madrid* for 6 February 1799. Our text is taken from the English version published in José López-Rey, *Goya's Caprichos: Beauty, Reason & Caricature* (1953), Westport, Connecticut: Greenwood Press, 1970, volume I, pp. 78–9. (For a previous text by Goya see IVA14.)

A Collection of Prints of Capricious Subjects, Invented and Etched by Don Francisco Goya. Since the artist is convinced that the censure of human errors and vices (though they may seem to be the province of Eloquence and Poetry) may also be the object of Painting, he has chosen as subjects adequate for his work, from the multitude of follies and blunders common in every civil society, as well as from the vulgar prejudices and lies authorized by custom, ignorance or interest, those that he has thought most suitable matter for ridicule as well as for exercising the artificer's fancy.

Since the majority of the objects represented in this work are ideal, it may not be too daring to expect that their defects will perhaps meet with forgiveness on the part of the connoisseurs as they will realize that the artist has neither followed the examples of others, nor been able to copy from nature. And if imitating Nature is as difficult as it is admirable when one succeeds in doing so, some esteem must be

shown toward him who, holding aloof from her, has had to put before the eyes forms and attitudes that so far have existed only in the human mind, obscured and confused by lack of illustration, or excited by the unruliness of passions.

One would be assuming too much ignorance of the fine arts, if one were to warn the public that in none of the compositions which form this series has the artist had in mind any one individual, in order to ridicule particular defects. For truly, to say so would mean narrowing overmuch the boundaries of talent, and mistaking the methods used by the arts of imitation in producing perfect works.

Painting (like Poetry) chooses from the universal what it considers suitable to its own ends: it reunites in a single fantastic personage circumstances and characteristics that nature has divided among many. From such a combination, ingeniously arranged, results the kind of successful imitation for which a good artificer deserves the title of inventor and not that of servile copyist.

4 Novalis (Friedrich von Hardenberg) (1772–1801) The Blue Flower from *Henry of Ofterdingen*

Towards the end of his short life, Novalis (see VIA3) turned towards the novel, which the early German Romantics conceived as the poetic genre that could encompass all the other genres. He wrote two 'prose romances', *Die Lehrlinge zu Sais* (The Disciples at Sais) and *Heinrich von Ofterdingen*, both of which remained unfinished at his death. Like Ludwig Tieck's *Franz Sternbald's Wanderings* (see VIB2), *Heinrich von Ofterdingen* is the story of an artist, in this case the historical 'minnesinger' or courtly poet who was active in the twelfth or thirteenth century. Novalis imagines the Middle Ages as a period of unity prior to the divisions inaugurated by the 'age of reason'. The story of Heinrich's quest for artistic and personal fulfilment is also an allegory of Novalis' own spiritual life. *Heinrich von Ofterdingen* has been described as the representative novel of early German Romanticism, and in the image of the 'blue flower' it provided this movement with one of its enduring motifs. Heinrich's quest to locate the blue flower which he sees in a dream typifies the Romantic condition of yearning (*Sehnsucht*) for an unobtainable ideal. The idea of a secret symbolism of flowers is also to be found in the work of Philipp Otto Runge (see VIB5). The unfinished novel, which was largely composed in 1799, was first published by Friedrich Schlegel and Ludwig Tieck in the first volume of their edition of Novalis' *Schriften* (Berlin, 1802). The following excerpt, which forms the opening section of the book, is taken from the anonymous translation, *Henry of Ofterdingen: A Romance*, Cambridge: John Owen, 1842, pp. 23–6.

THE parents had already retired to rest; the old clock ticked monotonously from the wall; the windows rattled with the whistling wind, and the chamber was dimly lighted by the flickering glimmer of the moon. The young man lay restless on his bed, thinking of the stranger and his tales. 'It is not the treasures,' said he to himself, 'that have awakened in me such unutterable longings. Far from me is all avarice; but I long to behold the blue flower. It is constantly in my mind, and I can think and compose of nothing else. I have never been in such a mood. It seems as if I had hitherto been dreaming, or slumbering into another world; for in the world, in which hitherto I have lived, who would trouble himself about a flower? I never have heard

of such a strange passion for a flower here. I wonder, too, whence the stranger comes? None of our people have ever seen his like; still I know not why I should be so fascinated by his conversation. Others have listened to it, but none are moved by it as I am. Would that I could explain my feelings in words! I am often full of rapture, and it is only when the blue flower is out of my mind, that this deep, heart-felt longing overwhelms me. But no one can comprehend this but myself. I might think myself mad, were not my perception and reasonings so clear; and this state of mind appears to have brought with it superior knowledge on all subjects. I have heard, that in ancient times beasts, and trees, and rocks conversed with men. As I gaze upon them, they appear every moment about to speak to me; and I can almost tell by their looks what they would say. There must yet be many words unknown to me. If I knew more, I could comprehend better. Formerly I loved to dance, now I think rather to the music.'

The young man gradually lost himself in his sweet fancies, and fell asleep. Then he dreamed of regions far distant, and unknown to him. He crossed the sea with wonderful ease; saw many strange monsters; lived with all sorts of men, now in war, now in wild tumult, and now in peaceful cottages. Then he fell into captivity and degrading want. His feelings had never been so excited. His life was an unending tissue of the brightest colors. Then came death, a return again to life; he loved, loved intensely, and was separated from the object of his passion. At length towards the break of day his soul became calmer, and the images his fancy formed grew clearer, and more lasting. He dreamed that he was walking alone in a dark forest, where the light broke only at intervals through the green net-work of the trees. He soon came to a passage through some rocks, which led to the top of a neighboring hill, and to ascend which he was obliged to scramble over the mossy stones, which some stream in former times had torn down. The higher he climbed, the more was the forest lit up, until at last he came to a small meadow situated on the declivity of the mountain. Behind the meadow rose a lofty cliff, at whose foot an opening was visible, which seemed to be the beginning of a path hewn in the rock. The path guided him gently along, and ended in a wide expanse, from which at a distance a clear light shone towards him. On entering this expanse, he beheld a mighty beam of light, which, like the stream from a fountain, rose to the overhanging clouds, and spread out into innumerable sparks, which gathered themselves below into a great basin. The beam shone like burnished gold; not the least noise was audible; a holy silence reigned around the splendid spectacle. He approached the basin, which trembled and undulated with ever-varying colors. The sides of the cave were coated with the golden liquid, which was cool to the touch, and which cast from the walls a weak, blue light. He dipped his hand in the basin and bedewed his lips. He felt as if a spiritual breath had pierced through him, and he was sensibly strengthened and refreshed. A resistless desire to bathe himself made him undress and step into the basin. Then a cloud tinged with the glow of evening appeared to surround him; feelings as from Heaven flowed into his soul; thoughts innumerable and full of rapture strove to mingle together within him; new imaginings, such as never before had struck his fancy, arose before him, which, flowing into each other, became visible beings about him. Each wave of the lovely element pressed to him like a soft bosom. The flood seemed like a solution of the elements of beauty, which constantly became embodied in the

forms of charming maidens around him. Intoxicated with rapture, yet conscious of every impression, he swam gently down the glittering stream. A sweeter slumber now overcame him. He dreamed of many strange events, and a new vision appeared to him. He dreamed that he was sitting on the soft turf by the margin of a fountain, whose waters flowed into the air, and seemed to vanish in it. Dark blue rocks with various colored veins rose in the distance. The daylight around him was milder and clearer than usual; the sky was of a sombre blue, and free from clouds. But what most attracted his notice, was a tall, light-blue flower, which stood nearest the fountain, and touched it with its broad, glossy leaves. Around it grew numberless flowers of varied hue, filling the air with the richest perfume. But he saw the blue flower alone, and gazed long upon it with inexpressible tenderness. He at length was about to approach it, when it began to move, and change its form. The leaves increased their beauty, adorning the growing stem. The flower bended towards him, and revealed among its leaves a blue, outspread collar, within which hovered a tender face. His delightful astonishment was increasing with this singular change, when suddenly his mother's voice awoke him, and he found himself in his parents' room, already gilded by the morning sun. He was too happy to be angry at the sudden disturbance of his sleep. He bade his mother a kind good morning, and returned her hearty embrace.

5 Philipp Otto Runge (1777–1810) Letters, 1802

Despite his death at the age of 33 and the incomplete state of many of his larger projects, the German painter Philipp Otto Runge made a definitive contribution to Romantic art. He was born in the small harbour town of Wolgast in what was then Swedish Pomerania and was brought up in a strict Protestant household. Runge's artistic theory is closely linked to his religious faith, and biblical references abound in his extensive correspondence, which was largely conducted with members of his own family. From 1799 to 1801 he studied at the art academy in Copenhagen, before moving in 1802 to Dresden, where he met some of the central figures of German Romanticism, including the brothers Schlegel (see VIA1, 2, 7 and 9), Gotthilf Heinrich Schubert (see VIB11), Ludwig Tieck (see VIB2) and Caspar David Friedrich (see VIB13). He also drew upon the nature mysticism of Jakob Böhme (1575–1624) and the ideas of Novalis (see VIA3). The letters in the following selection all date from Runge's Dresden period. The first, written to his father, concerns the annual competition organized by Goethe and Heinrich Meyer in Weimar. The lack of success met by his drawing, *Achilles and Scamander*, leads Runge to reflect on the historical conditions under which art is made. He powerfully rejects the values of Weimar classicism, insisting that art needs a new content and a new form if it is to meet the demands of the modern age. The second letter, to his brother Daniel, has been seen as a form of artist's manifesto, offering a sustained account of Runge's ideas at the time and culminating in a ten-point programme of the creative process. The third and fourth letters, to his brother Daniel and to Ludwig Tieck, elaborate the idea of a symbolic language of flowers which found its fullest expression in the series *Times of Day* (Hamburg, Kunsthalle). Although Runge's own art remained primarily figurative, he envisions a new art of landscape which will transcend the traditional genres of painting and allow truth to nature to be combined with a heightened expression of feeling. The letters of February 1802 to his father, of November 1802 to his brother Daniel and of December 1802 to Tieck have been translated for the present

volume by Nicholas Walker from Philipp Otto Runge, *Die Begier nach der Möglichkeit neuer Bilder: Briefwechsel und Schriften zur bildenden Kunst*, ed. Hannelore Gärtner, Leipzig: Philipp Reclam, 1982, pp. 86–8, 110–11, 118–23. The letter to Daniel of March 1802 is taken from the translation by Michel Sniderman in Joshua C. Taylor, *Nineteenth-Century Theories of Art*, Berkeley and Los Angeles: University of California Press, 1987, pp. 260–9.

Letter to his father, February 1802

The exhibition in Weimar, and the whole approach that is being pursued there, has already begun to take a wholly false path upon which it will be quite impossible to achieve anything valuable. The test subject which they have set, namely 'Achilles on Skyros', is incapable of being fulfilled properly, and while the Roman School has occasionally succeeded in rendering such complicated motifs vividly in a single moment of time, the subject was then never simply given in advance to the artist. Hoffmann's piece is just a swirling turmoil of figures and gets completely lost in subsidiary details, which only serve to confuse the work as a whole even more. Perhaps the gentlemen were mightily impressed by the execution of the thing. Breaking the necklace of pearls like that is not especially characteristic of Achilles and nothing but a curiosity as far as pictorial composition is concerned. – Achilles and the river Scamander, together with all the other things which have still to be properly executed, is, in the last analysis, but a vain and fruitless fantasy; we are no longer Greeks after all, we can no longer respond to the theme as a totality even when we contemplate their perfect works of art, and even less can we actually produce such works ourselves. Why then should we struggle to bring forth something mediocre in comparison? – The new test subject ['Perseus and Andromeda' for 1802] is said to offer an opportunity 'for much feeling and symbolic treatment'; so now we are supposed to go and sit down and feel accordingly, and for us that simply means, to start at entirely the wrong end. The figure of Tiresias represents a 'new discovery in the domain of composition' – and indeed people are all busy hunting down possible subjects, as if art consisted in the latter, or as if they had nothing living to find within themselves. But must something like this really be introduced from the outside? Did not all artists who have ever produced a fine work of art possess some feeling in advance? and did they not always choose a subject appropriate to that feeling?

The art of all times has clearly taught us how humanity has changed, how the same age has never returned again. Whatever has given us the disastrous idea of attempting to revive the art of the past? In Egyptian art we behold the harsh, crude and iron character of the human race. The Greeks deeply felt their religion, which was then sublimated into works of art. Michelangelo marked the highest stage in the development of composition, and historical composition reached its final culmination in his *Last Judgement*. Raphael already painted many works that can no longer be described as purely historical. The *Sistine Madonna* in Dresden is obviously the expression of a certain state of feeling which assumes the form of a familiar figure. And since the time of Raphael there has indeed been no history painting proper. All beautiful compositions now tend towards the subject of landscape, like the *Aurora* of Guido Reni for example. But until the present time no landscape artist has succeeded

in bestowing true significance upon landscape, in endowing the latter with allegorical meaning and beautiful ideas comprehensible to the understanding. But are not all of us capable of perceiving spirits in the clouds at sunset? Does not such an idea suffice to inspire specific thoughts within the soul? Is it not true that the work of art comes into existence only in the moment that we feel ourselves one with the universe? Am I not able to capture the disappearing moon just as I might capture the disappearing figure which has evoked a thought within my mind, and is it not possible for both, moon and human figure alike, to be turned into art? And what artist who had ever really sensed such a thing, who had ever been roused by nature (something which we perceive so clearly only in ourselves, in love, in the sky) could fail to seize upon the appropriate subject for the expression of his feeling? How could such a one possibly lack for a subject? And it is just such a feeling which must precede the choice of subject; how foolish then to rely upon some subject set out in advance! – How can we even think of reviving the art of the ancients? The Greeks carried formal and corporeal beauty to its highest level at the very moment when their gods were dying; the modern artists of Rome brought historical painting to its uttermost point at the very moment when the Catholic faith was dying; and amongst ourselves something is also dying, for we now stand at the brink of all religions which have sprung from the Catholic religion, the abstractions are dying, everything is airier and lighter than it was before, everything is moving ineluctably in the direction of landscape, is seeking something determinate precisely within this indeterminacy, and yet no one really knows how to proceed? Everyone is reaching falsely after historical subjects once again, and getting lost in confusion as a result. But is it not possible to reach a highest point of perfection precisely in this new kind of art – in the art of landscape painting if one wishes to describe it thus – and one which will perhaps prove even more beautiful than what has gone before? I should like to express my life in a series of works; for when the sun is setting and the moon is gilding the clouds I wish to capture the fugitive spirits of this moment. Perhaps indeed we shall not live to experience the blossoming of this art, but we would gladly devote our life to creating such an art in reality and truth; no mean or vulgar thought shall penetrate our souls; those who cherish within themselves the beautiful and the good with fervent love will certainly be able to attain something beautiful in turn. We must become once again as children if we would truly accomplish the highest.

Letter to his brother Daniel, 9 March 1802

It has always rather embarrassed me when Hartmann or someone else assumed about me – or at least said of others: So-and-so actually does not quite know what art is. Because I had to admit to myself that I just could not say what it is either. That weighed on my mind terribly and vexed me. Then I attempted to find some light in such general maxims as, for example, ‘a work of art is eternal’ or ‘a work of art requires the whole being as art requires all mankind’ or ‘one ought to look upon one’s life as a work of art,’ and other such things, all of which seemed to raise a point that still had to be probed before I could entirely understand these sayings we hear bandied about. Well, some time ago a kind of light dawned in my soul, and I intend to see if I can communicate my roving perceptions to you briefly and clearly.

Once I thought of a war that could overthrow the entire world, or how such a war would have to arise, and saw simply no means – since war has now become a science throughout the world and thus does not properly exist any longer, and there is no longer any people extant that might massacre all Europe and the entire civilized world as the Germans once did the Romans when the spirit of that people had departed – I saw, as I said, no means other than the Last Judgement, when the earth would open and swallow us all, the entire human race, so that absolutely no trace would remain of all present-day accomplishments.

These thoughts came to me from a few dejected remarks on the spread of civilization that Tieck made when he was ill recently, remarks that also led to the Judgement Day. The question occurred to me: What sort of relation, insofar as our traditions go, does this most advanced civilization – which, it seems, might be brought to consciousness only by such drastic means – bear to humankind as it formerly was constituted? Also, I wondered how the earth itself once looked; how granite and water, raw masses opposing each other, had more and more united. I found both these formations everywhere, in people, in our life, in nature, and in every era of art. I thought of the various religions, how they had originated and gone to ruin, and again an observation by Tieck struck me, that it has always been just after an age has gone down that master-works of art have come into being – for example, Homer, Sophocles, Dante: the great Greek works of art and the more recent Roman ones; also in architecture – and that these works of art have each time borne within them the very loftiest spirit of the uprooted religion. From what has been, it flashed before my eyes that after the zenith in every era of art (for example, after the formation of the Olympian Jupiter and after the creation of the *Last Judgement*), art has declined, disintegrated, and again reached a quite different and almost more beautiful high point. I asked myself, is it not likely that we are again about to carry an age to its grave?

I lost myself in wonderment. I could not think further. I sat before my picture [*Triumph of Love*], and all that I had at first thought about it – how it had originated in me, the feelings that always mount in me upon beholding the moon or the setting of the sun, this foreboding of spirits, the destruction of the world, the distinct awareness of everything that I had ever perceived – passed before my soul. For me this firm awareness became eternity: God you can only sense as being behind these golden mountains, but of your own self you are certain, and what you perceive in your eternal soul, that too is eternal. What you drew from it is everlasting; art must originate there if it is to be eternal. What then happened within me, to what extent I have worked my way out of these confused feelings and sought to regulate them, you will now bear. What transpired subsequently and whatever else requires explanation – I shall tell you later.

When the heavens above me swarm with countless stars, the wind whistles through immense space, the wave breaks roaring in the vast night; when the atmosphere reddens over the forest and the sun lights up the world, the valley steams and I throw myself into the grass amidst sparkling dewdrops; when every leaf and every blade of grass abounds with life, the earth lives and stirs beneath me; when all things resound in a single, harmonious chord – then my soul shouts for joy and flies about in the

immeasurable space around me. There is no more below and above, no time, no beginning and no end; I hear and feel the living breath of God, who contains and carries the world, in whom everything lives and acts. Here is our highest perception – God!

This most profound intimation of our soul, that God is over us; that we see how all has come into existence, has been, and passed away; how everything is coming into existence, being, and passing away around us; and how everything will come into existence, will be, and will again pass away; how there is in us no rest and standing still – this vital soul in us, which issued from Him and will return to Him, which will endure when heaven and earth pass away – this is the most certain, clearest consciousness of ourselves and our own eternity.

We feel that an inexorable severity and appalling everlastingness are opposed to a sweet, eternal, and boundless love in a harsh and violent struggle, like hardness and softness, like rocks and water. We see these opponents everywhere, in the smallest as well as the largest things, in the whole as in the parts. These opponents are the quintessence of the world, are basic in the world, and come from God, and over them is God alone. In violent opposition to each other, they reveal themselves in the origin of every single thing that comes from God, that is basic in man and nature. The more harshly they are opposed to each other, the farther each thing is from its consummation. And the more they come together, the closer each is to its consummation. After the acme of this consummation, the spirit returns to God, whereas the lifeless material elements disintegrate, merge with each other at the innermost core of their existence. Then heaven and earth cease to be, and from its ashes the world develops anew and both forces revive in a pure state, unite, and destroy themselves once more. This unceasing flux we perceive in us, in the entire world, in every lifeless thing, and in art. The human being is born helpless, without consciousness, put into the world so that fate may exercise on him what it can and chooses. Along with what is frightful, that which is most beautiful, maternal love, enters the struggle and unites savage passions with the sweetest love and innocence. At the point of completion, man sees his relationship with the whole world. Earnest desire drives him hence. His soul flies forth without rest through all things and finds no peace, but then love binds him to sweet life and he engages in the circle of life around him. He unifies and completes himself through the opposing forces. Then his spirit returns to God. When our feelings sweep us away so that all our senses tremble through and through, then we search for the firm, meaningful signs outside ourselves that have been found by others, and we unite them with our feelings. In our best moments, we can communicate this to others. If, however, we want to protract these moments, an overstraining occurs, that is, the spirit flees the signs that have been found and we cannot regain the unity in us until we have returned to our original fervor or until we have been transformed to children again. This circle, in which one is invariably rendered dead, everyone experiences; and the more often one experiences it, the deeper and more fervent one's feelings are certain to become. And so art comes into existence and goes to ruin, and nothing remains but lifeless signs when the spirit has returned to God.

This perception of how the entire universe relates to us, this jubilating rapture of the most fervent, most vital spirit of our soul, this harmonious chord which, in

soaring, strikes our every heartstring: the love that holds and carries us through life, this sweet being who is near to us, who lives in us and in whose love our soul glows – it is this urging in our breast that drives us to communicate. We hold fast to the acmes of these perceptions and thus certain ideas arise in us.

We express these ideas in words, tones, or images and thus provoke the same feeling in the bosoms of people near us. The truth of the perception seizes everyone; all feel themselves together in this relationship. All who feel for Him praise the one God, and thus *religion* arises. We unite these words, tones, or images with our most fervent feeling, our intimation of God, and, through perceiving the unity of the whole, with the certainty of our own eternity. That is, we align these feelings with the most significant and vital beings around us, and – in holding fast to characteristic features of these beings, that is, those features that correspond to our feelings – we present the symbols of our thoughts about great forces in the world. These are the images of God or of the gods. The more people keep themselves and their feelings pure and elevated, the more definite do these symbols of God's powers become, the more acutely is the great almighty power perceived. The symbols compress all the infinitely varied natural powers together into one entity; they attempt to concentrate everything simultaneously in one image and thus to present an image of the infinite. (When the human spirit has reached its highest intimation, then an overstraining occurs and, as soon as the spirit has fled, the signs collapse from within and man must begin again from the first childish feeling.)

These symbols we employ when we want to make clearly intelligible to others great events, beautiful thoughts about nature, delightful or terrifying perceptions of our soul, thoughts about occurrences, or the inner unity of our feelings. We search for an occurrence that corresponds in character to the feeling we want to express, and when we have found it, we have selected a *subject* for art.

When we link this subject to our feeling, we juxtapose those symbols of the powers of nature or of the feelings in us so that they express the peculiar characteristics of both the *subject* and *our perception*. This is *composition*. (Here again, as in presenting the single, highest symbol of God, the human being seeks to express an image of God through the loftiest symbolic composition. He unites his loftiest feelings with the world's greatest event and lets all the symbols of his feelings and of nature take effect in that context until he has expressed his thought about the most profound perception of the soul: the omnipotence of God in the world's greatest and last event. In this manner the spirit is again exhausted; the lifeless materials collapse of themselves, and this marks the limit of historical composition.)

Just as we perceive more clearly and coherently the forms of those entities from which we take our symbols, so, too, do we derive more characteristic outlines and representations of them from their basic existence, from our feelings, and from the consistency of the natural subject. We observe the subject in all positions, tendencies, and expressions. We arrange every object within the whole exactly according to nature and in consonance with the composition, the effect, the particular action in its own right, and the action of the entire work. We allow objects to become smaller or larger according to perspective and observe all the subordinate objects that belong to the background, in which everything functions in accordance with nature and the subject. This is *design*.

Just as we behold the colours of the sky and earth, the changes in colour caused in people by affects and feelings, the effect of colours as they occur in grand natural phenomena, and their harmony, to the extent that certain colours have become symbolic, so do we give to every compositional subject and to each symbol and object individually its colour in harmony with our first, deep feeling. And this is the *colour scheme*.

We diminish or augment the purity of these colours according to how near or far each object should appear to be or how great or small the extent of atmosphere between the object and the eye. This is the *ordering of colour*.

We observe the consistency of each object in its local colour as well as the effect of brighter or weaker light on it, just as we examine the shadow and the effect on it of nearby, illuminated objects. This is *colouring*.

We attempt to find gradations among the reflections and effects of one object on another and among their colours. We examine all colours in accord with the effect of the atmosphere and time of day, attempting with utter thoroughness to discern this tone as the last resonance of our feeling. And this is the *tone* – and the end.

Thus art is the most beautiful endeavour when it proceeds from and is one with what belongs to all. I wish, then, to set down once more the requisites of a work of art with regard not only to the order of their significance but to their proper order in the creative process:

1. Our intimation of God,
2. the perception of ourselves in relation to the whole; and out of these two:
3. religion and art, that is, expression of our loftiest feelings through words, tones, or images; and there pictorial art seeks first:
4. the subject, then
5. the composition,
6. the design,
7. the colour scheme,
8. the ordering of colour,
9. the colouring,
10. the tone.

In my opinion, a work of art simply cannot come into being when the artist does not proceed from these primary instances. Moreover, in no other way is a work of art eternal, for the eternity of a work lies really only in its association with the artist's soul, and through this it is an image of the eternal source of his soul. A work of art that originates in these primary impulses and develops only to the stage of composition is worth more than any fancy piece that is begun as mere composition, without the initial stages, even if it is fully executed to the point of tone. Clearly, without that which is primary the remaining parts cannot attain relatedness and purity. Only in this order, then, can art rise again. Here, in the innermost core of the person, it must originate; otherwise it remains mere trifling. Here it arose in the case of Raphael, Michelangelo Buonarroti, Guido, and others. Afterward, it is said, art declined. What does that mean but that the spirit has fled? – Annibale Carracci and the like began

only at the level of composition, and Mengs at design; our people currently making noise are concerned only with tone.

When I look at this progression and apply it to life and see a perfectly stylish gentleman who can do nothing more than *parler* French and yet knows how to keep himself in full swing, then it instinctively occurs to me: he is at the stage of tone. Yes, the entire progression holds true also in human life, and 'blessed are the pure in heart, for they shall see God.'

And what is to come out of all the chitchat in Weimar, where they foolishly want to evoke what has already been, through mere signs? Has such ever been reborn? I hardly believe that so beautiful a thing as the zenith of historical art will occur again until all the corruptible newer works of art have perished. Then it would have to happen in a completely new way, which is already rather evident. Perhaps the time might come when a quite beautiful art could again arise, and it would be landscape painting. Probably we can say that there have actually never been any real artists in this area, only a few now and again, and particularly in more recent times, who have sensed the spirit of art there.

Is it not singular that we become clearly and distinctly aware of the entirety of our life when we see thick, heavy clouds now hastening past the moon, now having their edges gilded by the moon, now altogether swallowing the moon? Existence becomes intelligible to us, as if we could write our whole life history solely in such pictures. And is it not true that there have been no more genuine historical painters since Raphael and Buonarroti? Even Raphael's painting in the gallery here [*Sistine Madonna*] shows a downright tendency toward landscape painting – of course by *landscape* we must here understand something quite apart.

Behold, just as a work of art develops from the first basic feeling, where the two raw forces stand opposed, so, too, has the whole human race developed. Every era of art has shown us how these two forces have increasingly united in the purest beings of the age. In the Egyptians' pictorial art, as in their architecture and in all symbols at that time, there was something far harder and more resistant than in Greek art; so too, the first human beings worshiped every last spring, every tree, rock, fire, and so on. The Christian religion, I mean the Catholic one, still needed four persons in its godhead. Through the Mother of God, there was still the good life in heaven; all the saints went there; and thus historical composition thrived until this religion waned. The Reformation limited itself to three persons in the godhead, which now seems to have collapsed. The spirit of this religion has been more abstract but by no means less fervent; a more abstract art must also arise from it. Now people want to stay with one God. If, however, He is lost to them, then there is probably no other remedy but the coming of the Judgement Day.

Just as a work of art that is not rooted in our own eternal existence will not endure, so too it surely is with the person who is not rooted in God. The blossoms we sprout from a consciousness of this, our primal origin, wherein the sap is drawn from this trunk of the world, will grow into fruit. Every man is a twig on this great tree, and only through the trunk can we obtain the sap for eternal, immortal fruit. He who, within himself, no longer feels union with the trunk has already withered away.

Letter to his brother Daniel, 7 November 1802

I am very pleased that it looks as though some real art will be reaching Hamburg. As far as my own abandonment of the respectable path is concerned, I must indeed confess, to the great discomfort of all respectable folk, that things will have to get a lot worse yet. I now feel quite convinced that the elements of art can only be discovered in the elements themselves, and that it is there they must once again be sought; but the 'elements themselves' are within us, and everything therefore should and must emerge once again from our own innermost being.

In the beginning men embodied the various elements and forces of nature within the human form, it was only ever in man himself that they beheld nature stirring; the authentic historical perspective lay precisely in perceiving these mighty forces moving within history itself: this was history as such; the greatest image that emerged from this perspective was that of the Last Judgement; the very rocks themselves had come to resemble the human figure, and the trees, the flowers and the waters were all confounded with one another.

But now our attention has fallen rather upon the other extreme. And just as the philosophers have come to the conclusion that we actually only imagine everything from within ourselves, so that now we see or at least should perceive in every flower the living spirit which man himself has put there; and that is how landscape first emerges for all the animals and flowers themselves are only half-present until man supplies the better part in his own right; thus it is that man impresses his own feelings upon the objects that surround him, which is precisely how everything acquires significance and language. I shall attempt to explain that these forms and shapes are nothing apart from ourselves: 'And the lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul. And the Lord God planted a garden eastward in Eden; and there he put the man whom he had formed.' And furthermore: 'And out of the ground the Lord God formed every beast of the field, and every fowl of the air; and brought them unto Adam to see what he would call them: and whatsoever Adam called every living creature, that was the name thereof.'

The delight we take in flowers is properly something that comes to us from Paradise. Thus it is that we always associate some inner meaning with the flower, that is to say some kind of human shape, and it is only then that we perceive such a thing with delight. When we see how it is only our own life that is thus reflected in the whole of nature, it is clear that it is only in this way that landscape proper can arise, as something quite distinct from the kind of composition that takes human action or historical events as its subject.

Flowers, trees and figures will then emerge as significant in our eyes, and we shall have taken another step closer to meaning of colour! For colour is the ultimate in art, and colour is and must always remain something mystical for us insofar as we can only really comprehend it in a mysteriously intuitive fashion through our perception of flowers. The whole symbolism of the Trinity itself is concealed in flowers: light or whiteness, black or darkness, are not themselves colours; light represents the good, dark the evil (again I am thinking of the Creation narrative); we cannot possibly grasp

light and we ought not to try and grasp darkness. And then when man was granted Revelation, colour first came into the world: blue and red and yellow. Light is the sun at which we are not permitted to gaze directly. But as soon as the sun turns its face towards the earth, and towards man, the sky is turned to red. Blue inspires a certain sense of reverence within us, and represents the Father, while red properly represents the Mediator between earth and heaven. When both disappear, then fiery flames illuminate the night for us, and this yellow represents the Comforter who has been sent down to sustain us; – for the moon too is entirely yellow.

But one might well ask: what then is the point of all this art and foolery? For this is not itself the ultimate reality, it is merely something which the latter has produced within us, and on this path one could very easily end up with a kind of idolatry. – This is true enough, but we can only grasp the primary (and highest) reality by recourse to the secondary one, and if there is anything that can lead us back towards the former, it can only be this latter; for idolatry is nothing but the passion of man himself.

* * *

Letter to Ludwig Tieck, 1 December 1802

My dear T, it really seems to me that I shall soon see my way to becoming a thoroughly respectable person. Everything now suggests that at last I shall be able to find a firmer sense of purpose within me and that I can rely on.

A number of different thoughts have occurred to me which seem to be so well-founded that they cannot be brought to totter, and I almost dare to believe that they are indeed firmly based. I think I am now beginning to understand a little what you actually mean by ‘landscape’. In all ancient history – or so it appears to me – artists have always striven to see and to express in terms of man himself the stirrings and motions of the elements and forces of nature. In Homer, and in actual history, people are never treated merely individually but rather in such a way as to present the mighty times that stirred within them; this is also the case with Shakespeare, and pre-eminently in all the pictorial images of the ancients. And this, according to my way of thinking, would also represent the distinguishing mark and essential difference between art on historical subjects and art concerned with ‘landscape’; and in the area of the former it is impossible to imagine that anything greater can now be achieved after Michelangelo’s *Last Judgement*.

‘Landscape’ on the other hand would naturally be based upon the opposite premise, namely that people would perceive themselves, along with their various characteristics and passions, in all the flowers and other growing things, indeed in all natural phenomena, that surround us. Especially with regard to all kinds of flowers and trees, it has become ever clearer and more certain in my mind how each one harbours a certain human spirit, idea or feeling, and it is obvious to me that all of this can only hail from Paradise itself. This is precisely the purest thing still left in the world in which we can recognize God or his image – as man was called when God came to create him. It is then further said, of course, that man should make unto himself no image of God, and indeed he is incapable of doing so. It is written in the Bible: ‘And out of the ground the Lord God formed every beast of the field, and

every fowl of the air, and brought them unto Adam to see what he would call them: and whatsoever Adam called every living creature, that was the name thereof.' – Now I think that this can be interpreted in the following way: whatsoever spirit man bestows upon them, that will be the spirit thereof. And that would indeed be the first proper flower, for I am also assuming that flowers were then at hand; and now, so it occurred to me, we should have to explore precisely what kind of name was implied in such a spirit.

* * *

It is quite clear that flowers – at least in my eyes – are things that are quite capable of being understood. And I can easily imagine that, in the course of my life, I shall succeed in rendering them quite understandable, if only the right approach is intelligently pursued. I would like to tell you precisely how I intend to present to myself, and to the worthy public – if they care to know about it – a theme which I could treat repeatedly and execute in detail.

You are well aware of my ideas concerning 'The Water Spring'. I have often enough discussed it with you before and the following thoughts have come to me as a result. In this picture I desired to portray all the flowers with which I am myself familiar and which possess a certain significance, as indeed all flowers do if we only take pains to observe them in that light. I would try and express this whole idea through the very composition of the flowers, beginning with the first formation of the latter, the lily standing in the highest light where the red, yellow and blue flowers are clustered, where the oak tree, like some hero, spreads his branches over them all. The flowers will receive their true significance through the joyous sounds of spring which disperse amongst the flowers. The composition of the flowers must be designed in such a way that a sense of gradual transition is achieved. Just as the spirit inhabits the flowers, so too it must inhabit the trees as well. Of course it is essential to find the right spot for the figure in the flower, but I am sure I shall be able to manage that. Everything depends here upon the courage and practice of the artist. A good butcher, after all, is quite capable of bringing down the meat cleaver between his own toes without even hurting himself! Now I believe that if the appropriate and corresponding human feelings were thus invariably painted in every picture of flowers, people would gradually and inevitably become accustomed to the idea of thinking in this way on each particular occasion. Of course, this is certainly not something that could be accomplished overnight, and that is why I shall never in my life attempt a flower picture without the accompaniment of corresponding figures.

I cannot properly say, and much less express in writing, the way in which I actually understand these things. I had originally intended to depict in my paintings how it was that I came to such ideas concerning flowers and nature in general. I did not merely want to show what I believe, what I cannot avoid feeling, what genuine and interconnected ideas are expressed in such pictures, but also how I arrived at this approach, how I continue to see, think and feel, together with the path that I have travelled up to this point. It would be strange indeed if no one else were utterly unable to understand any of this. Now what I originally hoped to do has proved much more difficult and requires an enormous exercise of self-discipline, but there is no other approach which could be of very much use to me. Most days, indeed, it is not possible to pursue this path without exposing oneself to madness. Everything will

turn out well in the end through constant practice. The subject-matter can all the more easily lead us in the direction of arabesques and hieroglyphics. However, 'landscapes' themselves should emerge from the latter, just as the art of historical composition also once emerged from them. The art of landscape can only be properly understood through recourse to the deepest mysticism of religion. For art must originate in and be firmly based upon the latter if it is not eventually to collapse like a house that is built on sand. I am also now almost convinced that everything is ruined once we attempt to discuss such matters with someone incapable of understanding or grasping them. And it would be even worse to try and do so in public. That cannot possibly lead anywhere. Those who do not comprehend and cannot grasp this art – even if I have to say this a thousand times – must be led to understanding in a practical fashion before their very eyes. This is certainly the better way.

6 Madame de Staël (Anne Louise Germaine Necker, Baroness of Staël-Holstein, 1766–1817) from *Corinne*

Madame de Staël was born in Paris, daughter of the financier Jacques Necker, whose dismissal by the French Crown was a contributory cause of the Fall of the Bastille. In the years immediately before and after the Revolution her salon provided a forum for political discussion. In 1792, however, she left France, travelling to England and then to Geneva, where she entertained Rousseau and A. W. Schlegel, among others. After a return to France in 1795 she was exiled by Napoleon and travelled to Weimar, Berlin, Rome, Vienna and Dresden. She had a considerable and varied literary output, including a volume of *Lettres sur les écrits et le caractère de Jean-Jacques Rousseau* (Letters on the Writings and Character of Rousseau), published in 1788, and her major work, *De l'Allemagne* (On Germany), published in Paris in 1810 and in London in 1813, which served to inform French and English readers about the Romantic movement in Germany. European fame came with the publication in 1807 of her romantic novel *Corinne, ou l'Italie*. (A *Portrait of Madame de Staël as Corinne*, painted by Elisabeth Vigée-Lebrun in 1807–8, is now in the Musée des Beaux-Arts, Geneva.) The *Corinne* of the title is equipped with talent, wealth, beauty and a villa in Tivoli, near Rome. She is also possessed of a gallery of paintings. In Book I, chapter IV of the novel she displays these to the male interest, an English lord called Oswald. Among the recognizable works in her carefully composed collection are David's *Brutus* (see IVB2, 3) and paintings by two of David's pupils, Jean-Germain Drouais' *Marius at Minturnae* (Louvre, Paris) and François Gérard's *Belisarius* (formerly Leuchtenberg Collection, St Petersburg, now lost). She has religious paintings by Francesco Albani (an allegory of the Passion) and by Titian, and four 'poetic' works on themes from Virgil, Tasso, Shakespeare and Racine. Finally there is a group of landscapes. The first of these is an unpopulated scene by Salvator Rosa, while the second and third have Roman and Gothic settings respectively. Madame de Staël uses the imaginary episode to speculate about the means by which pictures communicate their subjects and about the relative expressive powers of paintings and poetry. Our text is taken from the translation published as *Corinne; or, Italy*, Philadelphia: E. L. Carey & A. Hart, ('third American edition') 1836, pp. 152–5.

Her gallery was composed of historical, poetic, religious subjects, and landscapes. None of them contained any great number of figures. Crowded pictures are,

doubtless, arduous tasks; but their beauties are mostly either too confused or too detailed. Unity of interest, that vital principle of art, as of all things, is necessarily frittered away. The first picture represented Brutus, sitting lost in thought, at the foot of the statue of Rome, while slaves bore by the dead bodies of the sons he had condemned; on the other side, their mothers and sisters stood in frantic despair, fortunately excused, by their sex, from that courage which sacrifices the affections. The situation of Brutus, beneath the statue of Rome, tells all. But how, without explanation, can we know that this *is* Brutus or that those are his children, whom he himself has sentenced? and yet the event cannot be better set forth by any painting. Rome fills its back-ground, as yet unornamented as a city, grand only as the country that could inspire such heroism. 'Once hear the name,' said Corinne, 'and doubtless your whole soul is given up to it; otherwise might not uncertainty have converted a pleasure which ought to be so plain and so easy into an abstruse enigma? I chose the subject, as recalling the most terrible deed a patriot ever dared. The next is Marius, taken by one of the Cimbri, who cannot resolve to kill so great a man. Marius, indeed, is an imposing figure; the costume and physiognomy of the Cimbrian leader extremely picturesque: it marks the second era of Rome, when laws were no more, but when genius still exerted a vast control. Next come the days in which glory led but to misfortune and insult. The third picture is Belisarius, bearing his young guide, who had expired while asking alms for him; thus is the blind hero recompensed by his master; and in the world he vanquished hath no better office than that of carrying to the grave the sad remains of yon poor boy, his only faithful friend. Since the old school, I have seen no truer figure than that: the painter, like the poet, has loaded him with all kinds of miseries – too many, it may be, for compassion. But what tells us that it is Belisarius? what fidelity to history is exacted both of artist and spectator! a fidelity, by the way, often ruinous to the beautiful. In Brutus we look on virtues that resemble crime; in Marius, on fame causing but distress; in Belisarius, on services requited by the blackest persecution. Near these I have hung two pictures that console the opposed spirit by reminding it of the piety that can cheer the broken heart, when all around is bondage. The first is Albano's infant Christ asleep on a cross. Does not that stainless, smiling face convince us that heavenly faith hath nought to fear from grief or death? The following one is Titian's Jesus bending under the weight of the cross. His mother on her knees before him: what a proof of reverence for the undeserved oppressions suffered by her Divine Son! What a look of resignation is his! yet what an air of pain, and therefore sympathy, with us! That is the best of all my pictures; to that I turn my eyes with rapture inexhaustible: and now come my dramatic *chefs-d'œuvre* drawn from the works of four great poets. There is the meeting of Dido and Æneas in the Elysian fields: her indignant shades avoid him; rejoicing to be freed from the fond heart which yet would throb at his approach. The vaporous colour of the phantoms, and the pale scenes around them, contrast the air of life in Æneas, and the Sibyl who conducts him; but in these attempts the bard's description must far transcend all that the pencil reaches; in this of the dying Clorinda our tears are claimed by the remembered lines of Tasso, where she pardons the beloved Tancred, who had just dealt her the mortal wound. Painting inevitably sinks beneath poetry, when devoted to themes that great authors have already treated. One glance back at their words effaces all before us. Their favourite situations gain

force from impassioned eloquence; while picturesque effect is most favoured by moments of repose, worthy to be indefinitely prolonged, and too perfect for the eye ever to weary of their grace. Your terrific Shakspeare, my Lord, afforded me the ensuing subject. The invincible Macbeth, about to fight Macduff, learns that the witches have equivocated with him; that Birnam wood is coming to Dunsinnane, and that his adversary was *not* of woman born, but torn from his dying mother. Macbeth is subdued by his fate, not by his foe; his desperate hand still grasps its glaive, certain that he must fall, yet to the last opposing human strength against the might of demons. There is a world of fury and of troubled energy in that countenance: but how many of the poet's beauties do we lose? Can we paint Macbeth hurried into crime by the dreams of ambition, conjured up by the powers of sorcery? How express a terror compatible with intrepidity; how characterise the superstition that oppresses him? the ignoble credulity which, even while he feels such scorn of life, forces on him such horror of death! Doubtless the human face is the greatest of all mysteries; yet fixed on canvass it can hardly tell of more than one sensation; no struggle, no successive contrasts accessible to dramatic art, can painting give, as neither time nor motion exists for her.

'Racine's Phedra forms the fourth picture. Hippolitus, in all the beauty of youth and innocence, repulses the perfidious accusations of his stepmother. The heroic Thesus still protects his guilty wife, whom his conquering arms surround. Phedra's visage is agitated by impulses that we freeze to look on; and her remorseless nurse encourages her in guilt. Hippolitus is here even more lovely than in Racine; more like to Meleager, as no love for Aricia here seems to mingle with his tameless virtue. But could Phedra have supported her falsehood in such a presence? No, she must have fallen at his feet: a vindictive woman may injure him she loves in absence, but, while she looks on him, that love must triumph. The poet never brings them together after she has slandered him. The painter was obliged to oppose them to each other; but is not the distinction between the picturesque and the poetical proved by the fact, that verse copied from paintings are worth all the paintings that have imitated poetry? Fancy must ever precede contemplation, as it does in the growth of the human mind. [...]

'My Lord, there remain but three landscapes for me to show you; two possess some interest. I do not like rural scenes that bear no allusion to fable or history: they are insipid as the idols of our poets. I prefer Salvator Rosa's style here, which gives you rocks, torrents, and trees, with not even the wing of a bird visible to remind you of life! The absence of man, in the midst of nature, excites profound reflections. What is this deserted scene, so vainly beautiful, whose mysterious charms address but the eye of their Creator? Here, on the contrary, history and poesy are happily united in a landscape. This represents the moment when Cincinnatus is invited by the consuls to quit his plough, and take command of the Roman armies. All the luxury of the South is seen, in this picture, – abundant vegetation, burning sky, and an universal air of joy, that pervades even the aspect of the plants. See what a contrast is beside it. The son of Cairbar sleeps upon his father's tomb. Three nights he awaited the bard who comes to honour the dead. His form is beheld afar, he descends the mountain's side. On the clouds floats the shade of the chief. . . .'

7 William Blake (1757–1827) Letters

From the age of 10, Blake was at drawing school, where he copied casts of antique sculpture. Then at 15 he was apprenticed to an engraver, James Basire. After the completion of his apprenticeship in 1779 he briefly entered the Royal Academy, but he found the experience unprofitable. Later he was to be deeply critical of Reynolds (see VIB8). He exhibited with the Academy throughout his career, however, and was supported by many of its members, not least Fuseli and Flaxman. Nonetheless, Blake was guaranteed a distinctive sense of the place of art, both by his London artisanal milieu and by family connections into the radical religious tradition which descended from the English revolution of the seventeenth century (Thompson 1993). The visionary nature of his calling was encouraged at the end of the 1780s by a religious crisis and by the death of his younger brother Robert. A further factor was the impact of the French Revolution. Blake was in a circle including William Godwin and Mary Wollstonecraft, and in 1791 he illustrated the latter's book *Original Stories from Real Life*, on the education of children. (It is worth noting in this connection that in his marginalia to Lavater's *Aphorisms*, Blake pronounces 'Keep him at least three paces distant who hates bread, music and the laugh of a child' as 'The best in the book'.) The present letters forcefully demonstrate both Blake's essentially mystical understanding of art, and his unshakeable confidence in his own standing relative to the most exalted practitioners of previous ages. The recipient of the first two letters was Dr John Trusler, author of a study *Hogarth Memorialized* and a neighbour of Blake's friend, the artist George Cumberland. Cumberland had recommended Trusler as a client, but his unsympathetic response to the picture *Malevolence* spurred Blake to articulate his credo that the real business of the artist was to evoke 'a world of imagination and vision' rather than to imitate nature. Our third letter was addressed to Thomas Butts, a minor civil servant and one of Blake's most loyal patrons, for whom he made many drawings and watercolours, mostly on religious subjects. The letter was written from Felpham in Sussex, where Blake lived for three years from September 1800. After moderate success in the 1780s and early 1790s his engraving business had declined and he accepted a post which Flaxman found for him as assistant to the poet William Hayley. Blake suffered deep melancholia during this period, but it was at Felpham that he began to conceive *Jerusalem*, which appeared in 1804. Our final letter was written to Hayley two years after Blake's return to London. It begins as an expression of gratitude for Hayley's support in subscribing to Robert Blair's *The Grave*, which Blake was illustrating (see VIB10). Blake speaks of the spiritual crisis through which he has passed and of his exalted sense of the artistic calling: 'the mocker of art is the mocker of Jesus.' The letters are taken from *William Blake's Writings*, volume II, edited by G. E. Bentley, Oxford: Clarendon Press, 1978, pp. 1524–5, 1525–8, 1559–62, 1629–31. We have retained punctuation added to the letters in this edition.

16 August 1799

To The Rev^d D^r Trusler

Rev^d Sir

I find more & more that my Style of Designing is a Species by itself & in this which I send you have been compell'd by my Genius or Angel to follow where he led;

if I were to act otherwise it would not fulfill the purpose for which alone I live, which is in conjunction with such men as my friend Cumberland to renew the lost Art of the Greeks.

I attempted every morning for a fortnight together to follow your Dictate, but when I found my attempts were in vain, resolved to shew an independence which I know will please an Author better than slavishly following the track of another however admirable that track may be. At any rate my Excuse must be: I could not do otherwise, it was out of my power!

I know I begged of you to give me your Ideas & promised to build on them; here I counted without my host. I now find my mistake.

The Design I have Sent, Is

A Father taking leave of his Wife & Child, Is watched by Two Fiends incarnate, with intention that when his back is turned they will murder the mother & her infant. If this is not Malevolence with a vengeance I have never seen it on Earth, & If you approve of this I have no doubt of giving you Benevolence with Equal Vigor, as also Pride & Humility, but cannot previously describe in words what I mean to Design for fear I should Evaporate the Spirit of my Invention. But I hope that none of my Designs will be destitute of Infinite Particulars which will present themselves to the Contemplator. And tho I call them Mine I know that they are not Mine being of the same opinion with Milton when he says That the Muse visits his Slumbers & awakes & governs his Song when Morn purples the East, & being also in the predicament of that prophet who says I cannot go beyond the command of the Lord to speak good or bad.

If you approve of my Manner & it is agreeable to you, I would rather Paint Pictures in oil of the same dimensions than make Drawings, & on the same terms. By this means you will have a number of Cabinet pictures, which I flatter myself will not be unworthy of a Scholar of Rembrandt & Teniers, whom I have Studied no less than Rafael & Michael angelo. Please to send me your orders respecting this & In my next Effort I promise more Expedition.

I am Rev^d Sir
Your very humble Serv^t
Will^m Blake

23 August 1799

To 'Rev^d D^r Trusler / Englefield Green / Egham / Surrey'

Rev^d Sir

I really am sorry that you are falln out with the Spiritual World Especially if I should have to answer for it. I feel very sorry that your Ideas & Mine on Moral Painting differ so much as to have made you angry with my method of Study. If I am wrong I am wrong in good company. I had hoped your plan comprehended All Species of this Art & Especially that you would not reject that Species which gives Existence to Every other, namely Visions of Eternity. You say that I want somebody to Elucidate my Ideas, But you ought to know that What is Grand is necessarily obscure to Weak men. That which can be made Explicit to the Idiot is not worth my

care. The wisest of the Ancients considered what is not too Explicit as the fittest for Instruction because it rouses the faculties to act. I name Moses Solomon Esop Homer Plato.

But as you have favord me with your remarks on my Design permit me in return to defend it against a mistaken one, which is, That I have supposed Malevolence without a Cause. Is not Merit in one a Cause of Envy in another & Serenity & Happiness & Beauty a Cause of Malevolence? But Want of Money & the Distross of A Thief can never be alledged as the Cause of his Thieving, for many honest people endure greater hard ships with Fortitude. We must therefore seek the Cause else where than in want of Money for that is the Misers passion, not the Thiefs.

I have therefore proved your Reasonings Ill proportioned which you can never prove my figures to be; they are those of Michael Angelo, Rafael & the Antique & of the best living Models. I percieve that your Eye is perverted by Caricature Prints, which ought not to abound so much as they do. Fun I love but too much Fun is of all things the most loathsom. Mirth is better than Fun & Happiness is better than Mirth. I feel that a Man may be happy in This World. And I know that This World Is a World of Imagination & Vision. I see Every thing I paint In This World, but Every body does not see alike. To the Eyes of a Miser a Guinea is more beautiful than the Sun & a bag worn with the use of Money has more beautiful proportions than a Vine filled with Grapes. The tree which moves some to tears of joy is in the Eyes of others only a Green thing that stands in the way. Some See Nature all Ridicule & Deformity & by these I shall not regulate my proportions, & Some Scarce see Nature at all. But to the Eyes of the Man of Imagination Nature is Imagination itself. As a man is So he Sees. As the Eye is formed such are its Powers. You certainly Mistake when you say that the Visions of Fancy are not to be found in This World. To Me This World is all One continued Vision of Fancy or Imagination & I feel Flatterd when I am told So. What is it Sets Homer, Virgil & Milton in so high a rank of Art? Why is the Bible more Entertaining & Instructive than any other book? Is it not because they are addressed to the Imagination which is Spiritual Sensation & but mediately to the Understanding or Reason? Such is True Painting and such was alone valued by the Greeks & the best modern Artists. Consider what Lord Bacon says: 'Sense sends over to Imagination before Reason have judged & Reason sends over to Imagination before the Decree can be acted'. See *Advancem^t of Learning* Part 2 P 47 of first Edition.

But I am happy to find a Great Majority of Fellow Mortals who can Elucidate My Visions & Particularly they have been Elucidated by Children who have taken a greater delight in contemplating my Pictures than I even hoped. Neither Youth nor Childhood is Folly or Incapacity. Some Children are Fools & so are Some Old Men. But There is a vast Majority on the Side of Imagination or Spiritual Sensation.

To Engrave after another Painter is infinitely more laborious than to Engrave ones own Inventions. And of the Size you require my price has been Thirty Guineas & I cannot afford to do it for less. I had Twelve for the Head I sent you as a Specimen, but after my own designs I could do at least Six times the quantity of labour in the same time which will account for the difference of price as also that Chalk Engraving is at least Six times as laborious as Aqua tinta. I have no objection to Engraving after another Artist. Engraving is the profession I was apprenticed to, & Should never have attempted to live by any thing else If orders had not come in for my Designs &

Paintings which I have the pleasure to tell you are Increasing Every Day. Thus If I am a Painter it is not to be attributed to Seeking after. But I am contented whether I live by Painting or Engraving.

I am Rev^d Sir Your very obedient Servant

William Blake

22 November 1802

To 'M^r Butts / Gt Marlborough Street'

Felpham Nov^r 22: 1802

Dear Sir

My Brother tells me that he fears you are offended with me. I fear so too because there appears some reason why you might be so. But when you have heard me out you will not be so.

I have now given two years to the intense study of those parts of the art which relate to light & shade & colour & am Convinced that either my understanding is incapable of comprehending the beauties of Colouring or the Pictures which I painted for You Are Equal in Every part of the Art & superior in One to anything that has been done since the age of Rafael. – All S^r J Reynolds's discourses to the Royal Academy will shew, that the Venetian finesse in Art can never be united with the Majesty of Colouring necessary to Historical beauty, & in a letter to the Rev^d M^r Gilpin author of a work on Picturesque Scenery he says Thus: 'It may be worth consideration whether the epithet Picturesque is not applicable to the excellencies of the inferior Schools rather than to the higher. The works of Michael Angelo Rafael &^c appears to me to have nothing of it: whereas Rubens & the Venetian Painters may almost be said to have Nothing Else. – Perhaps Picturesque is somewhat synonymous to the word Taste which we should think improperly applied to Homer or Milton but very well to Prior or Pope. I suspect that the application of these words are to Excellencies of an inferior order & which are incompatible with the Grand Style. You are certainly right in saying that variety of Tints & Forms is Picturesque: but it must be rememberd on the other hand that the reverse of this – (*'uniformity of Colour & a long continuation of lines'*) produces Grandeur.' – S[o] Says S^{ir} Joshua and So say I for I have now proved that the parts of th[e] art which I neglected to display in those little pictures & drawings which I had the pleasure & profit to do for you are incompatible with the designs – There is nothing in the Art which our Painters do, that I can confess myself ignorant of. I also Know & Understand & can assuredly affirm that the works I have done for You are Equal to Carrache or Rafael (and I am now Seven years older than Rafael was when he died) I say they are Equal to Carache or Rafael or Else I am Blind Stupid Ignorant and Incapable in two years Study to understand those things which a Boarding School Miss can comprehend in a fortnight. Be assured My dear Friend that there is not one touch in those Drawings & Pictures but what came from my Head & my Heart in Unison, That I am Proud of being their Author and Grateful to you my Employer, & that I look upon you as the Chief of my Friends whom I would endeavour to please because you among all men have enabled me to produce these things. I would not send you a Drawing or a

Picture till I had again reconsidered my notions of Art & had put myself back as if I was a Learner. I have proved that I am Right & shall now Go on with the Vigor I was in my Childhood famous for.

But I do not pretend to be Perfect, but if my Works have faults Carrache Corregio & Rafaels have faults also. Let me observe that the yellow leather flesh of old men, the ill drawn & ugly young women & above all the dawbed black & yellow shadows that are found in most fine, ay & the finest pictures, I altogether reject as ruinous to Effect tho Connoisseurs may think otherwise.

Let me also notice that Carraches Pictures are not like Correggios nor Correggios like Rafacels & if neither of them was to be encouraged till he did like any of the others he must die without Encouragement. My Pictures are unlike any of these Painters & I would have them to be so. I think the manner I adopt More Perfect than any other; no doubt They thought the same of theirs.

You will be tempted to think that as I improve The Pictures &^c that I did for you are not what I would now wish them to be. On this I beg to say That they are what I intended them & that I know I never shall do hetter for if I was to do them over again they would lose as much as they gained because they were done in the heat of My Spirits.

But You will justly enquire why I have not written all this time to you? I answer I have been very Unhappy & could not think of troubling you about it or any of my real Friends (I have written many letters to you which I burnd & did not send) & why I have not before now finished the Miniature I promised to M^{rs} Butts? I answer I have not till now in any degree pleased myself & now I must intreat you to Excuse faults for Portrait Painting is the direct contrary to Designing & Historical Painting in every respect – If you have not Nature before you for Every Touch you cannot Paint Portrait, & if you have Nature before you at all you cannot Paint History; it was Michael Angelos opinion & is Mine. Pray Give My Wifes love with mine to M^{rs} Butts, assure her that it cannot be long before I have the pleasure of Painting from you in Person & then that She may Expect a likeness but now I have done All I could & know she will forgive any failure in consideration of the Endeavour.

And now let me finish with assuring you that Tho I have been very unhappy I am so no longer. I am again Emerged into the light of day. I still & shall to Eternity Embrace Christianity and Adore him who is the Express image of God hut I have traveld thro Perils & Darkness not unlike a Champion. I have Conquerd and shall still Go on Conquering. Nothing can withstand the fury of my Course among the Stars of God & in the Abyesses of the Accuser. My Enthusiasm is still what it was only Enlarged and confirmd.

I now Send Two Pictures & hope you will approve of them. I have inclosed the Account of Money recievd & work done which I ought long ago to have sent you; pray forgive Errors in [*for* and] omissions of this kind. I am incapahle of many attentions which it is my Duty to observe towards you thro multitude of employment & thro hope of soon seeing you again. I often omit to Enquire of you But pray let me now hear how you do & of the welfare of your family.

Accept my Sincere love & respect.

I remain Yours Sincerely
Will^m Blake

11 December 1805

'To / William Hayley Esq^{re} / Felpham near Chichester / Sussex'

Dear Sir

I cannot omit to Return you my Sincere & Grateful Acknowledgments, for the kind Reception you have given my New Projected Work. It bids fair to Set me above the difficulties, I have hitherto encounterd. But my Fate has been so uncommon that I expect Nothing – I was alive & in health & with the same Talents I now have all the time of Boydells Macklins Bowyers & other Great Works. I was known by them & was looked upon by them as Incapable of Employment in those Works; it may turn out so again notwithstanding appearances. I am prepared for it, but at the same time Sincerely Grateful to Those whose Kindness & Good opinion has Supported me thro all hitherto. You Dear Sir are one who has my Particular Gratitude, having conducted me thro Three that would have been the Darkest Years that ever Mortal Sufferd, which were rendered thro your means a Mild & Pleasant Slumber. I speak of Spiritual Things, Not of Natural, Of Things known only to Myself & to Spirits Good & Evil, but Not Known to Men on Earth. It is the passage thro these Three Years that has brought me into my Present State, & *I know* that if I had not been with You I must have Perish'd. Those Dangers are now Passed & I can see them beneath my feet. It will not be long before I shall be able to present the full history of my Spiritual Sufferings to the Dwellers upon Earth, & of the Spiritual Victories obtaind for me by my Friends – Excuse this Effusion of the Spirit from One who cares little for this World which passes away, whose Happiness is Secure in Jesus our Lord, & who looks for Sufferings till the time of complete deliverance. In the mean While, I am kept Happy as I used to be, because I throw Myself & all that I have on our Saviours Divine Providence. O What Wonders are the Children of Men! Would to God that they would Consider it, That they would Consider their Spiritual Life Regardless of that faint Shadow Calld Natural Life, & that they would Promote Each others Spiritual Labours, Each according to its Rank & that they would Know that Recieving a Prophet As a Prophet is a Duty which If omitted is more Severely Avenged than Every Sin & Wickedness beside. It is the Greatest of Crimes to Depress True Art & Science. I know that those who are dead from the Earth & who mockd & despised the Meekness of True Art (and such I find have been the situations of our Beautiful Affectionate Ballads), I Know that such Mockers are Most Severely Punished in Eternity. I know it for I see it & dare not help. – The Mocker of Art is the Mocker of Jesus. Let us go on Dear Sir following his Cross; let us take it up daily Persisting in Spiritual Labours & the Use of that Talent which it is Death to Bury, & of that Spirit to Which we are Called [...]

Wishing You & All Friends in Sussex a Merry & a Happy Christmas

I remain Ever Your
Affectionate
Will. Blake & his Wife Catherine Blake

8 William Blake (1757–1827) Marginal Notes to Reynolds’

Discourses

It was Blake’s habit to annotate the books he read with extensive marginalia, something he did irrespective of whether he was reading poetry or prose. He maintained this form of running dialogue with several works of the religious mystic Emanuel Swedenborg, with Lavater’s *Aphorisms*, with Dante’s *Inferno* and with the poems of Wordsworth. Most acerbically, though, he commented on Joshua Reynolds’ *Discourses*. Reynolds had been the figurehead of art in England across all its aspects, practice, theory and organization. Yet the first line of Blake’s judgement, written on Reynolds’ title-page no less, is ‘This man was hired to depress art.’ What is at stake in Blake’s marginalia is not mere opinion, let alone personal pettiness, but a fundamental clash of values as to what the serious practice of art should amount to. Not all of Reynolds’ *Discourses* were subjected to Blake’s attentions. He worked from the first volume of the collected *Works*, published by Edmund Malone in 1798, which contained only the first eight *Discourses*. He seems to have looked at the book first in 1801–2, and then to have returned to it during 1808–9. Blake’s comments are extensive and fill fifty pages of his collected *Writings*. We have therefore restricted our selection to those *Discourses* excerpted earlier in the present anthology, apart from the notes to the introductory matter and to the first *Discourse*, which we have retained because of the relatively general nature of the commentary. We have followed the convention established by Bentley, who gives the relevant extract from Reynolds’ text with its Malone page number in a small typeface, before Blake’s marginal comment. The extracts are taken from *William Blake’s Writings*, volume II, edited by G. E. Bentley, Oxford: Clarendon Press, 1978, pp. 1450–2, 1460–1, 1469–74, 1487–9.

[*Title-page top*]

This Man was Hired to Depress Art.

This is the opinion of Will Blake; my Proofs of this Opinion are given in the following Notes.

[*Title-page bottom*]

Advice of the Popes who succeeded the Age of Rafael

Degrade first the Arts if you’d Mankind Degrade.
 Hire Idiots to Paint with cold light & hot shade:
 Give high Price for the worst, leave the best in disgrace,
 And with Labours of Ignorance fill every place.

[*Title-page verso*]

Having spent the Vigour of my Youth & Genius under the Oppression of S^r Joshua & his Gang of Cunning Hired Knaves Without Employment & as much as could possibly be Without Bread, The Reader must Expect to Read in all my Remarks on these Books Nothing but Indignation & Resentment. While S^r Joshua was rolling in Riches Barry was Poor & Unemployd except by his own Energy, Mortimer was called a Madman & only Portrait Painting applauded & rewarded by the Rich & Great. Reynolds & Gainsborough Blotted & Blurred Onc against the other & Divided all the English World between them. Fuseli Indignant almost hid himself – I am hid.

[*First Contents leaf*]

The Arts & Sciences are the Destruction of Tyrannies or Bad Governments. Why should A Good Government Endeavour to Depress what is its Chief & only Support?

The Foundation of Empire is Art & Science. Remove them or Degrade them & the Empire is No More – Empire follows Art & Not Vice Versa as Englishmen suppose.

[*Third Contents leaf verso*]

Who will Dare to Say that [*fine del*] Polite Art is Encouraged or Either Wished or Tolerated in a Nation where The Society for the Encouragement of Art Suffered Barry to Give them his Labour for Nothing, A Society Composed of the flower of the English Nobility & Gentry – A Society Suffering an Artist to Starve while he Supported Really what They under Pretence of Encouraging were Endeavouring to Depress. – Barry told me that while he Did that Work, he Lived on Bread & Apples.

TO THE KING.

The regular progress of cultivated life is from necessities to accommodations, from accommodations to ornaments.

The Bible says That Cultivated Life Existed First – Uncultivated Life comes afterwards from Satans Hirelings. Necessaries, Accomodations & Ornaments are the whole of Life. Satan took away Ornament First. Next he took away Accomodations & Then he became Lord & Master of Necessaries.

[*Page ii, Dedication continued*]

To give advice to those who are contending for royal liberality, has been for some years the duty of my station in the Academy

Liberality! we want not Liberality. We want a Fair Price & Proportionate Value & a General Demand for Art.

Let not that Nation where Less than Nobility is the Reward Pretend that Art is Encouraged by that Nation. Art is First in Intellectuals & Ought to be First in Nations.

[*Page 2 DISCOURSE I*]

I consider Reynolds's Discourses to the Royal Academy as the Simulations of the Hypocrite who Smiles particularly where he means to Betray. His Praise of Rafael is like the Hysteric Smile of Revenge, His Softness & Candour, the hidden trap, & the poisoned feast. He praises Michael Angelo for Qualities which Michael Angelo abhorred; & He blames Rafael for the only Qualities which Rafael Valued, Whether Reynolds knew what he was doing, is nothing to me; the Mischief is just the Same, Whether a Man does it Ignorantly or Knowingly: I always considered True Art & True Artists to be particularly Insulted & Degraded by the Reputation of these Discourses, As much as they were Degraded by the Reputation of Reynolds's Paintings, & that Such Artists as Reynolds, are at all times Hired by the Satans, for the Depression of Art. A Pretence of Art: To Destroy Art.

[Page 5]

Reynolds Opinion was that Genius May be Taught & that all Pretence to Inspiration is a Lie & a Deceit to say the least of it. [If the Inspiration is Great why Call it Madness *del*] For if it is a Deceit the whole Bible is Madness. This Opinion originates in the Greeks' Calling the Muses Daughters of Memory.

The Enquiry in England is not whether a Man has Talents & Genius, But whether he is Passive & Polite & a Virtuous Ass: & obedient to Noblemens Opinions in Art & Science. If he is; he is a Good Man: If Not he must be Starved.

[Page 50] DISCOURSE III]

The following [Lecture *del*] Discourse is particularly Interesting to Blockheads, as it Endeavours to prove That there is No such thing as Inspiration & that any Man of a plain Understanding may by Thieving from Others, become a Mich Angelo.

[Page 52]

The wish of the genuine painter must be more extensive: instead of endeavouring to amuse mankind with the minute neatness of his imitations, he must endeavour to improve them by the grandeur of his ideas. . . .

Without Minute Neatness of Execution The Sublime cannot Exist! Grandeur of Ideas is founded on Precision of Ideas.

[Page 54]

The Moderns are not less convinced than the Aneients of this superior power existing in the art; nor less sensible of its effects.

I wish that this was True.

[Page 55]

Such is the warmth with which both the Ancients and Moderns speak of this divine principle of the art;

And Such is the Coldness with which Reynolds speaks! And such is his Enmity . but, as I have formerly observed, enthusiastick admiration seldom promotes knowledge.

Enthusiastic Admiration is the first Principle of Knowledge & its last.

Now he begins to Degrade, to Deny & to Mock.

. . . a student by such praise may have his attention roused . . . HE EXAMINES his own mind, and perceives there nothing of that divine inspiration, with which, he is told, so many others have been favoured.

The Man who on Examining his own Mind finds nothing of Inspiration ought not to dare to be an Artist; he is a Fool & a Cunning Knave suited to the Purposes of Evil Demons.

[Page 56]

He never travelled to heaven to gather new ideas; and he finds himself possessed of no other qualifications than what mere common observation and a plain understanding can confer.

The Man who never in his Mind & Thoughts traveld to Heaven Is No Artist.

Artists who are above a plain Understanding are Mocked & Destroyed by this President of Fools.

But on this, as upon many other occasions, we ought to distinguish how much is to be given to enthusiasm, and how much to reason . . . taking care . . . not to lose in terms of vague admiration, that solidity and truth of principle, upon which alone we can reason, and may be enabled to practise.

It is Evident that Reynolds Wishd none but Fools to be in the Arts & in order to this, he calls all others Vague Enthusiasts or Madmen.

What has Reasoning to do with the Art of Painting?

[Page 58]

and the whole beauty and grandeur of the art consists, in my opinion, in being able to get above all singular forms, local customs, particularities, and details of every kind.

A Folly! Singular & Particular Detail is the Foundation of the Sublime.

All the objects which are exhibited to our view by nature, upon close examination will be found to have their blemishes and defects. The most beautiful forms have something about them like weakness, minuteness, or imperfection.

Minuteness is their whole Beauty.

. . . This long laborious comparison should be the first study of the painter, who aims at the greatest style. . . he corrects nature by herself. . . . This idea of the perfect state of nature, which the Artist calls the Ideal Beauty, is the great leading principle by which works of genius are conducted.

Knowledge of Ideal Beauty is Not to be Acquired. It is Born with us. Innate Ideas are in every Man, Born with him; they are truly Himself. The Man who says that we have No Innate Ideas must be a Fool & Knave, Having No Con-Science or Innate Science.

[Page 60]

Thus it is from a reiterated experience, and a close comparison of the objects in nature, that an artist becomes possessed of the idea of that central form . . . from which every deviation is deformity.

One Central Form Composed of all other Forms being Granted, it does not therefore follow that all other Forms are Deformity.

All Forms are Perfect in the Poets Mind, but these are not Abstracted nor Compounded from Nature but are from Imagination.

[Page 65]

When the Artist has by diligent attention acquired a clear and distinct idea of beauty and symmetry; when he has reduced the variety of nature to the abstract idea . . .

What Folly!

[Page 67]

. . . the painter . . . must divest himself of all prejudices in favour of his age or country; he must disregard all local and temporary ornaments, and look only on those general habits which are every where and always the same . . .

Generaliz[ing] in Every th[ing,] the Man w[ould] soon be a Fool bu[t] a Cunning Fool.

[Page 71]

Albert Durer, as Vasari has justly remarked, would, probably, have been one of the first painters of his age... had he been initiated into those great principles of the art, which were so well understood and practised by his contemporaries in Italy.

What does this mean, '*Would have been*' one of the first Painters of his Age'? Albert Durer *Is!* Not would have been! Besides, let them look at Gothic Figures & Gothic Buildings & not talk of Dark Ages or of any Age: Ages are all Equal. But Genius is Always Above the Age.

[Page 144]

DISCOURSE VI.

When a Man talks of Acquiring Invention & of learning how to produce Original Conception he must expect to be called a Fool by Men of Understanding but such a Hired Knave cares not for the Few. His Eye is on the Many, or rather the Money.

[Page 147]

Those who have undertaken to write on our art, and have represented it as a kind of *inspiration*... seem to insure a much more favourable disposition from their readers... than he who attempts to examine, coldly, whether there are any means by which this art may be acquired....

Bacons Philosop[hy] has Destroyd Art & Science. The Man who says that the Genius is not Born b[ut] Taught – Is a Knave[c.]

[Page 152]

... the *degree* of excellence which proclaims *Genius* is different, in different times and different places....

Never!

and what shews it to be so is, that mankind have often changed their opinion upon this matter.

Never!

[Page 153]

These excellencies were, heretofore, considered merely as the effects of genius; and justly, if genius is not taken for inspiration, but as the effect of close observation and experience.

Damnd Fool!

[Page 154]

He who first made any of these observations... had that merit, but probably no one went very far at once... others worked more, and improved further....

If Art was Progressive We should have had Mich Angelo's & Rafacels to Succeed & to Improve upon each other But it is not so. Genius dies with its Possessor & comes not again till Another is Born with It.

[Page 155]

... even works of Genius, like every other effect, as they must have their cause, must likewise have their rules....

Identities or Things are Neither Cause nor Effect. They are Eternal.

[Page 157]

... our minds should be habituated to the contemplation of excellence . . . we should, to the last moment of our lives, continue a settled intercourse with all the true examples of grandeur. Their inventions are not only the food of our infancy, but the substance which supplies the fullest maturity of our vigour.

Reynolds Thinks that Man Learns all that he Knows. I say on the Contrary That Man Brings All that he has or Can have Into the World with him. Man is Born Like a Garden ready Planted & Sown. This World is too poor to produce one Seed.

The mind is but a barren soil; a soil which is soon exhausted, and will produce no crop . . .

The mind that could have produced this Sentence must have been a Pitiful, a Pitiable Imbecillity. I always thought that the Human Mind was the most Prolific of All Things & Inexhaustible. I certainly do Thank God that I am not like Reynolds.

9 William Blake (1757–1827) from *Descriptive Catalogue*

The years around 1808–9 were not good for Blake. His finances had been strained for some time, and he then faced public attack in a review of *The Grave*, published in *The Examiner* in August 1808, which asserted 'the utter impossibility of representing the *Spirit to the eye*' (cited by Bentley, p. 847). The need both to sell and to publicly defend his ideas led Blake to conceive an exhibition of his work. This duly opened in May 1809, and although it was planned to last only until the end of September, Blake kept the exhibition open until the summer of the next year. For the occasion he produced a 72-page *Descriptive Catalogue* which contained his account of the most important paintings. The exhibition was a failure, and Blake worked in poverty and obscurity for most of the next decade, until 1818 when he was introduced to John Linnell and the circle that included Samuel Palmer. The *Descriptive Catalogue* consists of explanations of sixteen watercolour paintings and drawings. (Blake insisted on calling the paintings 'frescos', to distinguish them from oil paintings, which he disliked.) The works described ranged from pictures of contemporaries such as Nelson and William Pitt, to Chaucer and his Pilgrims en route to Canterbury, and the three surviving Ancient Britons left alive after King Arthur's final defeat by the Romans. In our extracts Blake asserts the importance of a strong linear element derived from Raphael and Michelangelo, deprecating the emphasis on chiaroscuro and 'hellish brownness' which he associates with the Venetian tradition and seventeenth-century Flemish and Dutch art, as well as the contemporary English academic style of 'blotting and blurring'. He is also at pains to defend his view of art as 'visionary conception' against the 'sordid drudgery of facsimile'. The selections are taken from *William Blake's Writings*, volume II, edited by G. E. Bentley, Oxford: Clarendon Press, 1978, pp. 825, 827–8, 828–9, 847–8, 855–8, 860–1.

A DESCRIPTIVE CATALOGUE
OF
BLAKE'S EXHIBITION,
At No. 28, Corner of
BROAD-STREET,
GOLDEN-SQUARE.

THE grand Style of Art restored; in FRESKO, or Water-colour Painting, and England protected from the too just imputation of being the Seat and Protectress of bad (that is blotting and blurring) Art.

In this Exhibition will be seen real Art, as it was left us by *Raphael* and *Albert Durer*, *Michael Angelo*, and *Julio Romano*; stripped from the Ignorances of *Rubens* and *Rembrandt*, *Titian* and *Correggio* [...]

Preface

The eye that can prefer the Colouring of Titian and Rubens to that of Michael Angelo and Rafael, ought to be modest and to doubt its own powers. Connoisseurs talk as if Rafael and Michael Angelo had never seen the Colouring of Titian or Correggio: They ought to know that Correggio was born two years before Michael Angelo, and Titian but four years after. Both Rafael and Michael Angelo knew the Venetian, and contemned and rejected all he did with the utmost disdain, as that which is fabricated for the purpose to destroy art.

Mr. B. appeals to the Public, from the judgment of those narrow blinking eyes, that have too long governed art in a dark corner. The eyes of stupid cunning never will be pleased with the work any more than with the look of self-devoting genius. The quarrel of the Florentine with the Venetian is not because he does not understand Drawing, but because he does not understand Colouring. How should he who does not know how to draw a hand or a foot, know how to colour it?

Colouring does not depend on where the Colours are put, but on where the lights and darks are put, and all depends on Form or Outline, on where that is put; where that is wrong, the Colouring never can be right; and it is always wrong in Titian and Correggio, Rubens and Rembrandt. Till we get rid of Titian and Correggio, Rubens and Rembrandt, we never shall equal Rafael and Albert Durer, Michael Angelo, and Julio Romano.

Number I.

The spiritual form of Nelson guiding Leviathan, in whose wreathings are infolded the Nations of the Earth.

Clearness and precision have been the chief objects in painting these Pictures: Clear colours unmuddled by oil, and firm and determinate lineaments unbroken by shadows, which ought to display and not to hide form, as is the practice of the latter Schools of Italy and Flanders.

Number II, Its Companion

The spiritual form of Pitt, guiding Behemoth; he is that Angel who, pleased to perform the Almighty's orders, rides on the whirlwind, directing the storms of war: He is ordering the Reaper to reap the Vine of the Earth, and the Plowman to plow up the Cities and Towers.

This Picture also is a proof of the power of colours unsullied with oil or with any cloggy vehicle. Oil has falsely been supposed to give strength to colours: but a

little consideration must shew the fallacy of this opinion. Oil will not drink or absorb colour enough to stand the test of very little time and of the air. It deadens every colour it is mixed with, at its first mixture, and in a little time becomes a yellow mask over all that it touches. Let the works of modern Artists since Rubens' time witness the villainy of some one at that time, who first brought oil Painting into general opinion and practice: since which we have never had a Picture painted, that could shew itself by the side of an earlier production. Whether Rubens or Vandyke, or both, were guilty of this villainy, is to be enquired in another work on Painting, and who first forged the silly story and known falsehood, about John of Bruges inventing oil colours: in the mean time let it be observed, that before Vandyke's time, and in his time all the genuine Pictures are on Plaster or Whiting grounds and none since.

Number IV.

The Bard, from Gray

Weaving the winding sheet of Edward's race by means of sounds of spiritual music and its accompanying expressions of articulate speech is a bold, and daring, and most masterly conception, that the public have embraced and approved with avidity. Poetry consists in these conceptions; and shall Painting be confined to the sordid drudgery of fac-simile representations of merely mortal and perishing substances, and not be as poetry and music are, elevated into its own proper sphere of invention and visionary conception? No, it shall not be so! Painting, as well as poetry and music, exists and exults in immortal thoughts. If Mr. B.'s Canterbury Pilgrims had been done by any other power than that of the poetic visionary, it would have been as dull as his adversary's.

The Spirits of the murdered bards assist in weaving the deadly woof.

With me in dreadful harmony they join,
And weave, with bloody hands, the tissue of thy line.

The connoisseurs and artists who have made objections to Mr. B.'s mode of representing spirits with real bodies, would do well to consider that the Venus, the Minerva, the Jupiter, the Apollo, which they admire in Greek statues, are all of them representations of spiritual existences of gods immortal, to the mortal perishing organ of sight; and yet they are embodied and organized in solid marble. Mr. B. requires the same latitude and all is well. The Prophets describe what they saw in Vision as real and existing men whom they saw with their imaginative and immortal organs; the Apostles the same; the clearer the organ the more distinct the object. A Spirit and a Vision are not, as the modern philosophy supposes, a cloudy vapour or a nothing: they are organized and minutely articulated beyond all that the mortal and perishing nature can produce. He who does not imagine in stronger and better lineaments, and in stronger and better light than his perishing mortal eye can see does not imagine at all. The painter of this work asserts that all his imaginations appear to him infinitely more perfect and more minutely organized than any thing seen by his mortal eye. Spirits are organized men: Moderns wish to draw figures without lines, and with

great and heavy shadows; are not shadows more unmeaning than lines, and more heavy? O who can doubt this?

Number VIII.

The spiritual Preceptor, an experiment Picture.

THIS subject is taken from the visions of Emanuel Swedenborg. Universal Theology, No. 623. The Learned, who strive to ascend into Heaven by means of learning, appear to Children like dead horses, when repelled by the celestial spheres. The works of this visionary are well worthy the attention of Painters and Poets; they are foundations for grand things; the reason they have not been more attended to, is, because corporeal demons have gained a predominance; who the leaders of these are, will be shewn below. Unworthy Men who gain fame among Men, continue to govern mankind after death, and in their spiritual bodies, oppose the spirits of those, who worthily are famous; and as Swedenborg observes, by entering into disease and excrement, drunkenness and concupiscence, they possess themselves of the bodies of mortal men, and shut the doors of mind and of thought, by placing Learning above Inspiration. O Artist! you may disbelieve all this, but it shall be at your own peril.

Number IX.

Satan calling up his Legions, from Milton's Paradise Lost; a composition for a more perfect Picture, afterward executed for a Lady of high rank. An experiment Picture.

This Picture was likewise painted at intervals, for experiment on colours, without any oily vehicle; it may be worthy of attention, not only on account of its composition, but of the great labour which has been bestowed on it, that is, three or four times as much as would have finished a more perfect Picture; the labour has destroyed the lineaments, it was with difficulty brought back again to a certain effect, which it had at first, when all the lineaments were perfect.

These Pictures, among numerous others painted for experiment, were the result of temptations and perturbations, labouring to destroy Imaginative power, by means of that infernal machine, called Chiaro Oscuro, in the hands of Venetian and Flemish Demons; whose enmity to the Painter himself, and to all Artists who study in the Florentine and Roman Schools, may be removed by an exhibition and exposure of their vile tricks. They cause that every thing in art shall become a Machine. They cause that the execution shall be all blocked up with brown shadows. They put the original Artist in fear and doubt of his own original conception. The spirit of Titian was particularly active, in raising doubts concerning the possibility of executing without a model, and when once he had raised the doubt, it became easy for him to snatch away the vision time after time, for when the Artist took his pencil, to execute his ideas, his power of imagination weakened so much, and darkened, that memory of nature and of Pictures of the various Schools possessed his mind, instead of appropriate execution, resulting from the inventions; like walking in another man's style, or speaking or looking in another man's style and manner, inappropriate and

repugnant to your own individual character; tormenting the true Artist, till he leaves the Florentine, and adopts the Venetian practice, or does as Mr. B. has done, has the courage to suffer poverty and disgrace, till he ultimately conquers.

Rubens is a most outrageous demon, and by infusing the remembrances of his Pictures, and style of execution, hinders all power of individual thought: so that the man who is possessed by this demon, loses all admiration of any other Artist, but Rubens, and those who were his imitators and journeymen, he causes to the Florentine and Roman Artist fear to execute; and though the original conception was all fire and animation, he loads it with hellish brownness, and blocks up all its gates of light, except one, and that one he closes with iron bars, till the victim is obliged to give up the Florentine and Roman practice, and adopt the Venetian and Flemish.

Correggio is a soft and effeminate and consequently a most cruel demon, whose whole delight is to cause endless labour to whoever suffers him to enter his mind. The story that is told in all Lives of the Painters about Correggio being poor and but badly paid for his Pictures, is altogether false; he was a petty Prince, in Italy, and employed numerous Journeymen in manufacturing (as Rubens and Titian did) the Pictures that go under his name. The manual labour in these Pictures of Correggio is immense, and was paid for originally at the immense prices that those who keep manufactories of art always charge to their employers, while they themselves pay their journeymen little enough. But though Correggio was not poor, he will make any true artist so, who permits him to enter his mind, and take possession of his affections; he infuses a love of soft and even tints without boundaries, and of endless reflected lights, that confuse one another, and hinder all correct drawing from appearing to be correct; for if one of Rafael or Michael Angelo's figures was to be traced, and Correggio's reflections and refractions to be added to it, there would soon be an end of proportion and strength, and it would be weak, and pappy, and lumbering, and thick headed, like his own works; but then it would have softness and evenness, by a twelvemonth's labour, where a month would with judgment have finished it better and higher; and the poor wretch who executed it, would be the Correggio that the life writers have written of: a drudge and a miserable man, compelled to softness by poverty. I say again, O Artist, you may disbelieve all this, but it shall be at your own peril.

Number XV.

Ruth. – A Drawing.

This Design is taken from that most pathetic passage in the Book of Ruth, where Naomi having taken leave of her daughters in law, with intent to return to her own country; Ruth cannot leave her, but says, 'Whither thou goest I will go; and where thou lodgest I will lodge, thy people shall be my people, and thy God my God: where thou diest I will die, and there will I be buried; God do so to me and more also, if ought but death part thee and me.'

The distinction that is made in modern times between a Painting and a Drawing proceeds from ignorance of art. The merit of a Picture is the same as the merit of a Drawing. The dawber dawbs his Drawings; he who draws his Drawings draws his

Pictures. There is no difference between Rafael's Cartoons and his Frescos, or Pictures, except that the Frescos, or Pictures, are more finished. When Mr. B. formerly painted in oil colours his Pictures were shown to certain painters and connoisseurs, who said that they were very admirable Drawings on canvass; but not Pictures: but they said the same of Rafael's Pictures.

Mr. B. thought this the greatest of compliments, though it was meant otherwise. If losing and obliterating the outline constitutes a Picture, Mr. B. will never be so foolish as to do one. Such art of losing the outlines is the art of Venice and Flanders; it loses all character, and leaves what some people call, expression: but this is a false notion of expression; expression cannot exist without character as its stamina; and neither character nor expression can exist without firm and determinate outline. Fresco Painting is susceptible of higher finishing than Drawing on Paper, or than any other method of Painting. But he must have a strange organization of sight who does not prefer a Drawing on Paper to a Dawbing in Oil by the same master, supposing both to be done with equal care.

The great and golden rule of art, as well as of life, is this: That the more distinct, sharp, and wirey the bounding line, the more perfect the work of art; and the less keen and sharp, the greater is the evidence of weak imitation, plagiarism, and bungling. Great inventors, in all ages, knew this: Protogenes and Apelles knew each other by this line. Rafael and Michael Angelo, and Albert Durer, are known by this and this alone. The want of this determinate and bounding form evidences the idea of want in the artist's mind, and the pretence of the plagiary in all its branches. How do we distinguish the oak from the beech, the horse from the ox, but by the bounding outline? How do we distinguish one face or countenance from another, but by the bounding line and its infinite inflexions and movements? What is it that builds a house and plants a garden, but the definite and determinate? What is it that distinguishes honesty from knavery, but the hard and wirey line of rectitude and certainty in the actions and intentions? Leave out this line and you leave out life itself; all is chaos again, and the line of the almighty must be drawn out upon it before man or beast can exist. Talk no more then of Correggio, or Rembrandt, or any any other of those plagiaries of Venice or Flanders. They were but the lame imitators of lines drawn by their predecessors, and their works prove themselves contemptible disarranged imitations and blundering misapplied copies.

10 Henry Fuseli (1741–1825) Introduction to *The Grave*

Originally published in 1743, *The Grave* was the work of Robert Blair (1699–1746), a Scottish poet and clergyman. In moralizing upon the subject of death, it followed a precedent set by Edward Young's *Night Thoughts*, the first part of which had appeared the previous year. Like Young's work, it attracted the attention of religious dissenters of a literary inclination. In 1797 Fuseli had contributed an unsigned introduction to a new edition of *Night Thoughts*, illustrated by William Blake. In 1808 Blake provided twelve illustrations to be engraved for a new edition of *The Grave*, and Fuseli again contributed an introduction, this time in his own name. Following the spirit of the enterprise, he sermonized on the bankruptcy of such conventional imagery as had previously served to emphasize the fact

of mortality, praising the combination of unaffectedness with originality that he observed in Blake's figures. In fact the publication was not a success. Criticism in *The Examiner* led Blake to mount a defence of his own work through a public exhibition in 1809–10. It was for this occasion that he compiled *The Descriptive Catalogue* (VIB9). Fuseli's untitled introduction was originally printed in *The Grave, a poem. By Robert Blair. Illustrated by Twelve Etchings executed from original designs*, London: R. H. Cromek, 1808, pp. xiii–xiv. Our complete text is taken from this edition. (See also VIA10.)

The moral series here submitted to the Public, from its object and method of execution, has a double claim on general attention.

In an age of equal refinement and corruption of manners, when systems of education and seduction go hand in hand; when religion itself compounds with fashion; when in the pursuit of present enjoyment, all consideration of futurity vanishes, and the real object of life is lost – in such an age, every exertion confers a benefit on society which tends to impress man with his destiny, to hold the mirror up to life, less indeed to discriminate its characters, than those situations which shew what all are born for, what all ought to act for, and what all must inevitably come to.

The importance of this object has been so well understood at every period of time, from the earliest and most innocent, to the latest and most depraved, that reason and fancy have exhausted their stores of argument and imagery, to impress it on the mind: animate and inanimate nature, the seasons, the forest and the field, the bee and ant, the larva, chrysalis and moth, have lent their real or supposed analogies with the origin, pursuits, and end, of the human race, so often to emblematic purposes, that instruction is become stale, and attention callous. The serpent with its tail in its mouth, from a type of eternity, is become an infant's bauble; even the nobler idea of Hercules pausing between virtue and vice, or the varied imagery of Death leading his patients to the grave, owe their effect upon us more to technic excellence than allegoric utility.

Aware of this, but conscious that affectation of originality and trite repetition would equally impede his success, the author of the moral series before us, has endeavoured to wake sensibility by touching our sympathies with nearer, less ambiguous, and less ludicrous imagery, than what mythology, Gothic superstition, or symbols as far-fetched as inadequate, could supply. His invention has been chiefly employed to spread a familiar and domestic atmosphere round the most important of all subjects, to connect the visible and the invisible world, without provoking probability, and to lead the eye from the milder light of time to the radiations of eternity.

Such is the plan and the moral part of the author's invention; the technic part, and the execution of the artist, though to be examined by other principles, and addressed to a narrower circle, equally claim approbation, sometimes excite our wonder, and not seldom our fears, when we see him play on the very verge of legitimate invention; but wildness so picturesque in itself, so often redeemed by taste, simplicity, and elegance, what child of fancy, what artist would wish to discharge? The groups and single figures on their own basis, abstracted from the general composition, and considered without attention to the plan, frequently exhibit those genuine and unaffected attitudes, those simple graces which nature and the heart alone can dictate, and only an eye inspired by both, discover. Every class of artists, in every

stage of their progress or attainments, from the student to the finished master, and from the contriver of ornament, to the painter of history, will find here materials of art and hints of improvement!

11 Gotthilf Heinrich Schubert (1780–1860) from *Views on the Dark Side of Natural Science*

Gotthilf Heinrich Schubert was born in Hohenstein in Saxony. He initially studied theology in Munich before transferring to Jena to study medicine. There he was strongly influenced by Friedrich Shelling's lectures on the philosophy of nature (see VIA8). From 1805 to 1809 he lived in Dresden, where he was a practising doctor. He formed a friendship with Caspar David Friedrich and in the second volume of his autobiography (*Der Erwerb aus einem Vergangenen und die Erwartung von einem zukünftigen Leben*, Erlangen, 1855) offers valuable reminiscences of Friedrich and of his studio. During his Dresden period Schubert gave a series of lectures on the philosophy of nature. These covered a wide range of topics, including the original relationship of mankind to nature, the laws governing the planetary system, and 'animal magnetism'. The lectures were subsequently published as *Views on the Dark Side of Natural Science* and enjoyed considerable popularity. In the twelfth lecture, Schubert inserted a description of an early version of Friedrich's allegorical cycle, *The Times of Year*, a subject to which the artist frequently returned. Schubert's text offers a sympathetic attempt at interpreting the complex symbolism of the artist's work. The lectures were first published as *Ansichten von der Nachtseite der Naturwissenschaft* by the Arnoldische Buchhandlung in Dresden in 1808. The following excerpt is taken from the translation in William Vaughan, Helmut Börsch-Supan and Hans Joachim Neidhardt (eds), *Caspar David Friedrich, 1774–1840, Romantic Landscape Painting in Dresden*, London: The Tate Gallery, 1972, pp. 105–6. The translator notes that 'the autumn crocus, which blossoms in autumn while its leaves and seed pods do not appear until the following spring, is called in German "Die Zeitlose" (the timeless one).'

Here I could not do better than follow closely the work of my friend, the landscape painter Friedrich, and tell faithfully the story of the development of our own nature as it is depicted by him in the four seasons of the year and the four stages of human life. I shall do so even at the risk that my words may lag far behind his brush.

We do not know what profound charm lies over the beginning of childhood. It may be that it is glorified by an echo of the unknown dream whence we came or by that reflection of the divine which hovers in its purest form above the quiet and the childlike. When we wake from that dream we find ourselves in the morning glow of an everlasting spring day and no trace of a bygone autumn tinges its bright green. We awake among flowers by the clear source of life, where the eternal sky is mirrored in its virgin purity. The wind does not strive yet beyond the brink of the nearby hills. We seek and understand in Nature the flowers only and we still perceive life as an image of playful, innocent lambs. There the first ray of that longing which guides us from the cradle to the grave touches an early unfolding mind and unaware of the endless distance, which separates us from the eternal source of light, the child's arms open wide to grasp what he believes to be within his reach. But his first steps already

are an error and from the lovely hill of childish dreams where we perceived the first rising rays, we hurry downward into the deep bustle of life, where another twilight surrounds us.

The clear source soon swelled into a river, the inner striving, grown stronger and more powerful, carried us out further and further. Indeed, the hours of dawn were soon over; far behind us are left the green hills of childhood with their spring flowers and the dream of playing lambs. Brighter and grander shines the sun rising towards its zenith and the fresh trail is not yet threatened by any obstacles. When in the glittering hours of noon the blossoming world opens itself so freely to the inner eye, when to the keen mind – yet unaware of the limits of its aspirations – the distant high clouds appear like distant mountains, still to be reached easily in the end, then in the sweet time of roses all deep longing seems to have found its fulfilment. There, where the lily weds the rose, where slim trees with dark green branches entwine, youthful love clasps its arm round us. There the blissful heart no longer needs the outside world, we only dream of the still, lonely hut on a green mount, of the pastoral song of the turtle-dove and the lonely valley. For moments all further striving is forgotten and for the first time – maybe also for the last – we rest in perfect, blissful contentment. For look! among the roses and lilies there also stood the tall sunflower which with its faithful head follows the path of the eternal light. A deeper longing in us has as yet not been stilled and reawakens the eternal ideal with a stern voice.

There in the interplay of many aspirations mid-day is reached and passed; past is the time of roses and lilies. Evening reveals the land in its last and strongest aspect, at the time of its maturity. The flowers which before have delighted the heart, are over, only a few have born fruit, more remained barren and upon the autumnal soil there blossoms with the shade of the evening light the late, lonely autumn crocus whose fruit will only ripen in another spring. The dreams of quiet huts on blossom-covered hills, the song of the turtle-doves have been supplanted by the crude noise of the city.¹ But at last, past mid-day it has become clear to the mind what that profound striving, that longing within us, desires. See these immortal heights with their three-peaked summit, lofty above the flying clouds, shrouded by everlasting snow, but still in untroubled serenity, gleaming in the rays of the sun, a high symbol of the eternal light. There the soul strives with its highest powers towards the immortal heights. But the impulse of passions within us has turned into a river carrying ships down its way. In vain we often struggle with its waves in order to reach the other bank and the high mountains; only in the hours of exultation the spirit rises towards the immortal heights like that eagle who has left the clouds and the river far behind. Now that the inner striving has grown weary on the last part of the path which was full of rocks and crags here, on this side of the river a place of rest is found beneath the cross which rises peacefully above the cliffs. At last the mind understands that the abode of that longing which has guided us so far, is not here on earth. Speed on then, river, down your way! Where your waves flow into the infinite sea on a far distant shore we have heard of a last place of rest. There indeed the inner fire shall cool, the deep wound shall heal. Cease blooming then, poor autumn crocus, when winter approaches – you one, late blossom which does not bear fruit. A new, distant spring beyond winter, will ripen your fruit, you wonderful flower.

At last, see, the sun of man's power and glory has sunk. The last part of the way was barren and lonely. All blossoms have gone, so has even the fruit which they had brought us. For fate has taken back its gift which we had thought to be ours for ever. Before our very eyes part of our work which seemed built for eternity has fallen into ruins and is forgotten by the young world. Only the will, the striving within us which has persevered to the very grave, becoming all the while purer and better, has remained ours; and in it we put our inner trust. The quiet coast where the once so powerful stream has become lost in the ocean has been reached and the grey wanderer finds himself lonely among the graves. The deep-rooted longing which has guided us so far, is still not satisfied but, alas, the promise of the summer which should have brought it to fruition, has been a vain hope and the season of snow covers the crop of a future spring. And there the moon shines in full brightness through the ruins of an ancient, noble past. The sky reveals itself above the sea once more in its clear blueness as it did in our early childhood. There in a prophetic glimmer we get the vision of the coast of a far-away land across the sea. We have heard of its everlasting spring and how in it our innermost being, which we bring there as a bud, will ripen. Then take away, time, even the last debris of our life on earth, take away for a while even the memory of the path we have followed and let us, if it be the command of your eternal law, arrive slumbering in the fatherland which we have desired for so long.

So, when we contemplate the formation of the human mind and its development from the cradle to the grave, amidst earthly striving another higher one may be perceived which even seems to contradict the first and which, at least in the bustle of life, can only rarely or never blossom. The lofty world of poetry and the artist's ideals, even more the world of religion, can never fit completely into our life on earth and tends to resist a fusion with its elements.

¹ In childhood we still see by the green bank of the brook nothing but flowering shrubs; in youth, beyond the stream, a few scattered huts, in manhood, beyond the bank of the river, a large city. In old age we see a churchyard.

12 Friedrich Ramdohr (1752–1822) 'Remarks upon a Landscape Painting intended as an Altarpiece by Herr Friedrich in Dresden, and upon Landscape Painting, Allegory and Mysticism in General'

Shortly before Christmas 1808, Caspar David Friedrich exhibited in his studio in Dresden a small landscape painting entitled *The Cross in the Mountains*, which had been commissioned for the private chapel of Count Thun und Hohenstein's castle in Tetschen. The painting, now in the Gemäldegalerie Neue Meister in Dresden, shows a fir-clad mountain before the rays of the setting sun with the silhouette of a cross bearing a figure of Christ at its summit turned so as to face into the depth of the pictorial space. It is set in an ornate frame in the shape of a Gothic arch, with palm leaves and Christian symbols, specially made for Friedrich by the sculptor Gottlob Christian Kühn. The various innovations which the artist brought to bear in this work came under severe criticism from the art critic and theorist, Friedrich Ramdohr (see also VB12). Not least of these was the novelty of making a

landscape painting into an altarpiece, Although the tone of Ramdohr's piece is critical throughout, his commitment to the principles of classicist aesthetics renders him unusually sensitive to what was genuinely new in Friedrich's work. He is also prepared to pay detailed attention to the way in which the image has been constructed and to the possible meanings it was intended to convey. He objects, however, to the artist's neglect of the technique of aerial perspective and of the gradation of colour which enables space and distance to be effectively articulated. He further contends that the abrupt cutting away of the foreground by the picture frame deprives spectators of any indication of their own position in relation to the scene depicted. Most important of all, however, he questions whether a landscape can be used to convey the definite meaning which an altarpiece requires. Although a landscape can be evocative or suggestive of a mood or feeling, he rejects the idea that it can take on an explicit religious content. To compensate for this, he suggests, the artist has had to make recourse to an elaborate frame which imposes a determinate meaning on the painting from without. Ramdohr uses his analysis of Friedrich's painting to mount an attack on Romanticism in general, returning with good measure the criticism he had suffered at the hands of Wackenroder (see VIA1). For Friedrich's response to Ramdohr's criticisms, see VIB13. The article was first published as 'Über ein zum Altarblatte bestimmtes Landschaftsgemälde von Herrn Friedrich in Dresden, und über Landschaftsmalerei, Allegorie und Mystizismus überhaupt' in the *Zeitung für die elegante Welt*, nos 12–15, January 19–21, 1809. This translation has been made for the present volume by Nicholas Walker from Sigrid Hinz ed., *Caspar David Friedrich in Briefen und Bekenntnissen*, Berlin: Henschelverlag, 1968, pp. 112–24, 129–31.

I take no pleasure in coming out publicly in criticism of a work from the hand of a contemporary artist. If the altarpiece which the landscape painter Herr Friedrich has exhibited here in Dresden during the Christmas holidays just past were a work executed in accordance with those principles that long experience has tested and the example of great masters sanctioned – and whether it were excellent or poor – I should gladly remain silent. For a work that is simply ordinary or poor soon brings itself to judgement. It is a sagacious maxim not to disturb the peace in literary and cultural matters unless it is absolutely necessary. But Herr Friedrich's painting is very far from ordinary: it opens up a new and, to me at least, hitherto unrecognized perspective upon landscape painting; it gives evidence of a highly imaginative and extremely sensitive artist; it expresses the attitudes of the public; and it has made a considerable impression upon the general multitude. But when I see that the approach here taken by this talent is detrimental to all good taste, that it robs the essence of painting, and particularly of landscape painting, of its most distinctive and appealing features, that it is related to a broader spirit that is the wretched spawn of the present age and a fearful premonition of a rapidly approaching barbarism, then it would be pusillanimous to remain silent – pusillanimous for anyone who believes that he might be able, through rational argument, to prevent art and science from embarking upon a false course, and particularly pusillanimous for myself who have cast off the fetters which formerly bound me to painting of a purely local significance and have now dedicated the remainder of my days to the propagation of everything that is good and beautiful in all its limitless range.

I repeat, and I say it even more clearly and definitely: my criticisms are not directed simply against Herr Friedrich's picture hut against the entire system to

which it gives expression, against a large number of ideas which are beginning to creep into art and science, against certain errors which in part the picture itself does not reveal, although those it does are closely connected with them. The public will forgive me, therefore, if I here present them with such a lengthy disquisition upon a single picture.

The true standpoint of the critic, of the writer on art, is often misunderstood. The critic cannot presume to tell the artist how he should proceed in order to produce a good work of art. No such work has ever been successfully composed or painted by following a theory of art. But the critic can prove useful through his warnings: useful to the creative genius who would break out on new paths, and useful to the age when it is either dulled by a blind faith in the prevailing styles or mesmerized by daring virtuosity or surprise effects. In this respect, men like Mengs, Winckelmann and Reynolds have incontestably performed a great service. They were successful in defeating the ecclesiastical style and the boudoir manner, the whole insipid and deleterious expression of taste which dominated the first half of the eighteenth century.

Of course it is true that they have helped to encourage the repellent tendency to fabricate frigid compositions by anxiously copying and collecting fragments from the life of nature, the works of the great masters and the products of Antiquity, or even to colour marble statues. And they have also encouraged the no less mistaken tendency to attempt the mere effects of great masses disposed in various forms and styles of lighting and offer us brightly illuminated sketches neglecting all true detail in place of finished works of art. But these errors of our time cannot properly be justified by appeal to the express intentions of those worthy writers. But why would any painter attempt to learn from the latter how he should set about his own work? All they can possibly teach him is how he should not set about it. [...]

But to the painting itself! As far as its dimensions are concerned, it is approximately three feet wide and four feet tall. The lower part of the painting is occupied by a craggy mountain peak. The latter is covered in fir trees, and the tops of some of them tower up from behind the peak, while half of one tree rises up in the foreground. For the greater part of the trunk, down to the roots, is cut off by the picture frame. The fir trees rising up at the back are arranged more or less symmetrically on both slopes of the mountain, and thus form no groups of their own. They rise rather in a stepwise fashion towards two unequal rocky boulders disposed in such a way as to suggest a pair of mountain horns, between which there is just enough space for a crucifix in the middle. The Christ figure is bronze, the front of which is turned in three-quarter profile towards the back of the mountain, so that the viewer in the foreground can barely see a quarter of the figure properly. At the foot of the mountain there are a couple of blocks of granite lying on the stony ground, which is covered here and there in moss and from which a couple of young spruce and pine trees struggle laboriously upwards.

The pyramid-shaped earthy mass of the mountain is sharply profiled against the surrounding sky. The sky is a dirty violet towards the top but becomes redder as it descends and ends in a cold yellowish hue. The upper part of the picture swarms with vermilion streaks. But the whole scene is also bisected by rays of light which

indicate how low the sun has already set and illuminate nothing else on the mountain but a few aspects of the Christ figure on the cross, namely the head, the lower part of the body and one knee. Everything else on the mountain, including the cross itself, suggests a kind of twilight caught in such an unequal contest with the night sky that one can hardly distinguish it, especially standing some little distance away, from the darkness itself.

The unprejudiced viewer cannot possibly doubt that an allegorical significance underlies the composition. This is also strongly suggested by the frame which encloses the picture, filled as it with various symbols which I shall discuss further below. The frame must have met the approval of the artist since the picture has been expressly exhibited in this way. And the fact that the painting is intended to function as an altarpiece also suggests as much. The crucifix in the picture, two or three inches high, turned away from the viewer as it is, is itself hardly enough to justify this function. There is no doubt that the natural scene depicted here conceals an allegorical meaning that is designed to evoke in the viewer a pious mood akin to participating of the Lord's Supper.

What then is this allegorical meaning? I shall attempt to unravel it. If I have seen less here than I was meant to see, so much the worse for Herr Friedrich. For why then did he not express himself with greater clarity? Why, in a painting intended to edify so many, did he rely upon the special perspicacity of a select few?

I imagine that Herr Friedrich beheld this natural scene himself and then attempted to express the feelings which it provoked in him. I shall allow him to interpret his own painting in the following way:

'Everything about me was still dark when I came upon the place which supplied me with the material for the picture that is exhibited here. The sky was already brightening behind the mountain that lay before me. Streaming flecks of red across the sky announced the imminent arrival of day, and the reflection of other rays in the skies above already suggested the sunrise which was still concealed by the intervening mountain. The sun was hidden away deep behind the mountain. The various aspects of the earthy mass were more surmised in this ambivalent light than directly perceived, but the outline of the mountain itself stood out sharply against the sky. At the summit there stood a crucifix, its face turned towards the hidden side of the mountain, as I could just make out from the few patches already illuminated by the sun's rays. – What a wealth of meaning lay within this sight! Christ the crucified one standing in such solitary bleakness! At the turning-point between darkness and light! But still enthroned high above the highest in nature itself, visible to all who seek him! But He, He beholds the light face to face, while to us, surrounded by twilight in this vale of tears as we are, whose dull eyes could not yet bear the clear and undiminished light of splendour, he imparts merely its reflected gleam! Thus, as a proclaimer of the salvation that awaits us, he also immediately becomes the mediator between earth and heaven. And we ourselves, we take heart, we rejoice in his tidings and his service, just as we rejoice at the approach of the sun when, after the nocturnal darkness, we first perceive its faint illumination and the effects thereof even before its actual appearance. And here I felt a need to celebrate that commemorative feast which, itself a mystery, becomes the symbol of another: the Incarnation and the Passion of God!'

If I might flatter myself in the hope of having understood Herr Friedrich entirely here, I should cry out: What an abundance of sentiment, of imagination! But when and where? If I had read this description in the confessions of a pious soul, in a novel written in the style of [Chateaubriand's] *Atala*, such would indeed be my response. If the owner of a chapel in the vicinity of this mountain and its crucifix were to have an opening made in the altar, and the gazes of the faithful on approaching the altar were led in accordance with perspective towards this natural scene, the idea would be fanciful enough, but I could easily imagine that, from certain positions at certain hours of the day, the sight could inspire many a pious soul to a solemn mood like that Herr Friedrich himself had experienced.

But here we have a painted picture, a work of art before us, and quite different questions come into consideration as a result.

Can this particular natural scene be painted without sacrificing the most essential and positive features of painting, and particularly of landscape painting? Is it a happy thought to employ a landscape as an allegory of a specific religious idea, or even with the purpose of evoking pious sentiments? And finally, is it compatible with the dignity of art and the truly pious individual to encourage religious worship by such means as Herr Friedrich has employed here?

I intend to examine these questions in turn, but in answering the first I shall also attempt to assess the quality of the execution as well.

My intention here cannot possibly be to present a general theory of landscape, least of all my own. I must nevertheless lay down a few basic principles which must prove convincing to anyone, including laymen, and have a direct bearing on Herr Friedrich's painting. The figure painter who presents me with an individual body, or a number of bodies grouped together, especially if the human figure is at issue, will naturally expect me to direct my attention to the same aspects as I would if I were actually confronted by a body directly before me and a short distance away. In attempting simply to perceive the figure as an independent whole and to distinguish it as a single individual from other bodies, I will naturally interpret it in terms of line and specific form, in terms of a quickly comprehensible division of planes and masses *within the body itself*, in terms of the effortless transition of the eye from one part to another, in terms of the uninterrupted and continuous outline which circumscribes the entire body and differentiates it from the others. With respect to colour I will pay particular attention to the fidelity of the local colour or the colour peculiar to the represented body, to its general coherence and particular variations. With respect to chiaroscuro effects I will inspect the modelling and the authentic disposition of the light through which the principal aspects of form and colour are pre-eminently emphasized. All of this properly belongs to the view, and the appearance of judicious disposition, which figure painting offers us: conspicuously well-proportioned with regard to the mutual differentiation of the parts, the equally conspicuous unification of the parts to form an independent whole through the fluent delineation, I might even say through the casting, of outlines; truth, variety and harmony in the local hues; harmonious modelling in terms of shape and colour, and the favourable arrangement of light and its effects, these are particular advantages that belong to figure painting. Everything it may offer over and beyond this is a valuable addition perhaps, but is not essential to my enjoyment of the work.

Landscape painting, on the other hand, lays down before me a surface upon which a group of objects has been arranged – one should not describe them all as bodily figures in the painter's sense – layer by layer, like stage scenery, one behind the other, and always presented to the eye from some distance away. This ensures that my attention will concentrate itself precisely upon what is to be recognized and evaluated when I adopt *a view upon external nature*. A certain variety is what I look for first, and if I also seek satisfaction in the differentiation and the interconnection of the material, I still prefer this aspect to be implicitly concealed rather than explicitly striking. Thus the various masses will be roughly balanced in relation to one another, the outlines of the individual planes will be modulated, that is, will incline towards and gently succeed one another, rather than all flowing in together at a single stroke. There must be a harmony here, if I might so express myself, but not the melody that is characteristic of figure painting. The definite and graduated differentiations, the undivided confluence of the outlines would merely destroy the character of free inanimate nature. Landscape painting must, therefore, renounce the pleasing forms of organic nature. But free inanimate nature, on the other hand, possesses its own kind of pleasing form which arises from the layered disposition of objects protruding from behind one another at different distances: the pleasing form which is intelligibly presented to us in natural grottoes, in the perspective of the stage, in the excellently composed landscapes of a Nicolas Poussin. As for the latter, just think how delightfully the eye passes on from one plane to the other, how it is challenged by this straight line, drawn along by that turning and winding one, encouraged to leap up by a third combining the features of the other two! And how do these various planes and lines succeed one another? Not in a gradual process of uninterrupted continuation, of undivided interconnection. No! They present themselves rather to the eye as a gentle means of transition from one differently configured aspect of nature to another! This is the pleasing harmony offered by the various depths and hollows suggested by the painted surface, or if one prefers to express it thus, this is itself the pleasing harmony of compositional and linear perspective!

With regard to colour, landscape painting cannot expect to represent local hues as faithfully, that is, expose them to so close an examination, as can figure painting. Between my eye and the objects which the landscape painter represents to me as coloured through the distance, there invariably intervenes so much air as to project a kind of mist or haze which not only modifies the local colour but actually transforms it. The more distant the objects are in relation to me, the more conspicuous such changes become. The brown or green colouring of the mountain becomes violet, blue, and so forth. But between myself and the objects initially presented in the foreground there already prevails this haze which also immediately imparts its own hue to the objects I perceive further back. In spite of this, landscape painting possesses its own truthfulness in the matter of colour, knows how to take advantage for its own particular purposes of the effects of aerial perspective, of the total transformation of local colour produced by distance, of the haze or mist which suffuses all its objects. For in the strongest sense the images of landscape painting are characterized by a certain general tone or feeling, something which is indeed not entirely foreign or unfavourable to figure painting but is certainly not essential to it, and cannot be expressed so strikingly in that context either. Landscape painting

reproduces in its entirety the harmonious effect which a dark mirror or natural reflections in water can produce, the harmonious effect which infuses every local colour with the prevailing hue of the picture surface upon which a number of differently coloured objects are also presented. And how wonderfully the Dutch painters have exploited this particular advantage of painting, even if they sometimes rather misused it as well! And think what immeasurable advantage Lorrain has drawn from this transformation of colours through aerial perspective! Let us then define the peculiar characteristics of colouring in landscape painting in accordance with such aerial perspective.

Finally, landscape painting does not regard light simply as a means of modelling figures, or of setting off pleasing form or the charms of colour. No! It paints light itself, and combines this representation with the most piquant effects. One need only consider a sunrise by Claude Lorrain, a forest suffused by shafts of light as in a work by Ruisdael, or many similar pieces by Cuyp and other Dutch artists, where the rays of the sun appear to gild the objects upon which they fall. No figure painter, not even Correggio, has ever achieved this, and nor should or could he attempt to do so since his purposes are quite different and he cannot fully master the great variety of reflections, the manifold sources of light or the aerial perspective which also claims its rights in landscape painting. I shall now briefly summarize the foregoing considerations and draw certain conclusions from them.

The harmonious form of linear perspective is especially characteristic of landscape; equally characteristic is the charm attaching to the picture's general tone and the aerial perspective in relation to light and colour; only linear perspective is able wholly to command the most piquant effects of light produced in open air.

If we grant the validity of the principle that every art ought properly to pursue the particular advantage it enjoys over others, it follows that a beautiful landscape must present us with several planes in order to exemplify the harmonious effect of linear perspective, and that the representation of no individual object in a landscape, whether it be a tree, a mountain summit, a house or a motionless pool, can take priority over the former. It follows from this that the landscape must not express any detail as if it were being contemplated from close by and without the intervening haze of light. And further that no landscape should present the impression of twilight or darkness which would utterly disturb the effects of aerial perspective and the expression of light. The opposite approach may well produce a great effect in a sepia drawing, at least for lovers of novelty and highly sophisticated technique. But it contradicts the serious intention of a perfectly finished work of art.

Now with his altarpiece Herr Friedrich has directly and quite intentionally violated all these fundamental principles. He has, without any perceptible indication of different levels, filled the lower part of his picture entirely with a single craggy summit resembling a cone in shape. He has banished any trace of aerial perspective and, what is even worse, has covered the earth in darkness and thereby deprived himself of all the favourable effects which the presence of light can afford.

At the beginning of the eighteenth century and in the second half of the seventeenth, several Neapolitan and Venetian masters hit upon the idea of introducing the specific features of landscape painting into the domain of history painting. They arranged their figures exclusively in levels or as in a stage scene, concealed the

balancing of different masses as much as possible, and did their utmost to emphasize instead the general tone, the *sfumato* effect in the colour, and the gleaming effects of light. Such a false expression of taste is now widely proscribed. But has not Herr Friedrich simply fallen into the opposite error? Is he not attempting to treat the landscape as if it were a figure placed directly in front of me, one that I can make out individually in the half-shadow because the surrounding light still at least reveals its harmonious shape, its local colour and its general outline?

Quite apart from any allegorical intent, it is also possible that Herr Friedrich has been seduced by a certain striving for noble simplicity into his false choice of subject. But in art and the moral world alike, there is a kind of presumptuous simplicity which can prove quite wretched. An artist of noble simplicity is one who is no more extravagant in the execution and the work than is required by the true nature of both. Without this the artist will become crude, clumsy and barren. I hope Herr Friedrich will forgive this remark, which is directed not against his talent but his underlying system. His problem is not so much barrenness as a falsely affected economy.

The execution of the picture exhibits all the consequences that follow inevitably from the neglect of the principles I have set out above. The painter has taken up no point of view at all, and nor is there any he could take up in order to express what he wanted to express. In order to perceive the mountain and the sky together in this expanse, Herr Friedrich would have had to stand several thousand paces away, on the same level as the mountain itself, with the line of the horizon in parallel with the latter. From such a distance he would not have been able to perceive any details within the outline of the mountain: no granite boulders, no moss, no trees surrounding the front. All of this would necessarily have vanished, and the entire earthy mass would simply project itself sharply against the sky like a black silhouette. And not merely that! For assuming, what cannot be denied, that the line of the horizon runs parallel with the summit of the mountain, then the illumination of the crucifix completely contradicts the first principles of optics. For if we trace the prismatic reflection of the sun-rays that bisect the sky back to their point of origin, the resulting position is so low that Herr Friedrich, from his position behind the mountain, could not possibly perceive any reflected light shining on the Christ figure, least of all from below. In support of this claim, I would simply refer to the best treatise on perspective, namely the *Traité de perspective* by Valenciennes, chapter 7, §4. [...]

What has led Herr Friedrich into this error, which violates all the rules of optics, is either that he cast an artificial light upon a clay or wax model of the mountain or imagined himself standing at the side of the mountain instead of behind it. In the latter case the sunlight would indeed have poured across the mountain, which lies much lower than the sun. But then not merely would the crucifix have been illuminated, though certainly not from below, but equally everything else that lies upon the mountain. Standing behind the mountain, Herr F would have been quite unable to see anything of the sun's rays, just as little as if he had held his hand horizontally in front of his eyes.

Another error in the picture is that the time of day remains uncertain owing to the absence of all illuminated surfaces. The coldness of the air suggests morning, but the lack of mist does not. The silver star on the head of the highest angel in the frame is

presumably intended to make good this absence. But Herr F might just as well have written over it: This is Morning!

The mountain mass has a bluish-brown and entirely monotonous colouring. Entirely deprived of light, it is quite flat and lacks all rounding out. It therefore stands in the most strident contrast to the bright sky around it, without transition or a trace of harmony. This can only make a great effect on those who are prepared to accept such a division into a great light mass and a great dark mass as a kind of chiaroscuro.

* * *

Let us now see how far it is possible to allegorize with landscape. Allegorical paintings are those which present perceptible objects in the picture under such conditions as we are not accustomed to see such objects in everyday life or in the story or fable presented in the picture itself. This strange relationship between perceptible objects and their presentation in the picture under circumstances different from more usual ones is precisely what alerts us to the hidden meaning that is the basis of allegory and the key to its interpretation.

How then is it possible in a landscape to transform the visible and familiar conditions of objects into one so strange that we tell ourselves: this is allegory? One could of course locate the earth at the top and the sky below, one could paint pastry on the trees in place of foliage, etc. But this would simply destroy nature itself. Figure painting can retain its own nature when it allegorizes. It simply extends this nature through the fable it presents. It differs principally from our customary view of things only through the way in which it depicts specific customs and characteristics. Nevertheless, where it cannot lend at least some moral probability to the allegory or offer in addition to the allegorical meaning a purely human or historical one, then it should not dare to attempt allegory at all.

Let us not confuse an expressive landscape with allegory! In the gallery in Dresden we can behold a landscape with a cemetery by Ruisdael [*The Jewish Graveyard*, c.1655]. A replica of larger proportions, considered to be an original, is in the possession of M. Tourton in Paris. The work is a masterpiece of expression. It depicts a scene presenting a universal predicament of human life, and awakens not merely a solemn mood in general, but the specifically felt, solemnly religious emotions aroused by reflection upon the nothingness and transitoriness of all that is human. But where is the allegory in this? Nowhere, except in the common prosaic minds of presumptuous declaimers who dare to wax poetical when they are coldly playing with symbols, to awaken emotion when they are merely reasoning about emotion.

It is undeniable: he who would deviate from nature, as we generally see her every day, in the domain of landscape either creates the impression of an erroneous imitation or that of some alien scene in a distant and remote part of the world, and the latter in turn also involves expression. One will therefore never be able to allegorize with any properly composed landscape. It is quite true that the figures in such a landscape could express an allegorical event. But if they are subordinated to the landscape itself, they remain a secondary feature, a symbol or attribute of the latter. If they are the principal subject on the other hand, the landscape merely presents the scene for the event and belongs in the expressive domain of history

painting. The allegorical meaning of a landscape must therefore always be sought outside the painting itself, in the site for which it is destined, or in the frame. And this is precisely what Herr Friedrich has done, and could not indeed help doing, since if it were exhibited in a public gallery without this frame, his landscape would appear as nothing more than a poorly chosen nature scene and the crucifix merely as an accessory figure or fabrication. But he never stopped to consider that he has thereby degraded an independent work of art into a bare symbol which, like the scales which Justice holds in her hands, can only be explained by asking: how have you come to stand in this frame, within this chapel, upon this altar?

'But surely,' so it will be protested, 'if a landscape can supply the expressive scene for a universal and yet specific predicament of human life, why can it not depict the realm where every cultivated mind will gladly abandon itself to reverence? The holy nature made by God is also his fairest temple!'

It is here that the important difference between powerful external [*pathologischer*] and properly aesthetic feeling comes into question.

Go out into nature as she really is! The fresh air you inhale, the authentic splendour of the sun, the mountain heights and the broad expanses that surround you, etc. – immediately they affect every organ, rouse and strengthen through exertion and repose, through piquant influence upon the nerves, those ideas of grandeur, of benevolence and of life in general which move every healthy soul to love, gratitude and admiration for the Creator. It is truly absurd to expect powerful external feelings such as these from a painting that necessarily lacks the appropriate means for it. What a painting offers is an aesthetic sentiment which allows us, constantly aware of the distance from real life, to enjoy the playful way in which art moves our sentiments. If it were possible for art to transport us into truly powerful external sentiments, then the aesthetic sentiment would disappear: the work of art would simply pass over into nature, our experience of the beautiful into that of sympathy. Would that prove an advantage to the work? By no means! Any relic of a widely venerated saint set out upon the altar can rouse our powerful feelings more strongly than the most beautiful work of art, and the coarsest caricature enjoys a less disputed claim to this advantage than the most beautiful of paintings.

If the painting is not to be the real basis of our powerful external feelings, of our true devotion, should this properly be found in the pious acts that we perform before the altar? Should the work of art merely *support* [*unterstützen*] this mood by means of aesthetic sentiment? – but in how much closer relation, then, to such a purpose historical painting stands! – the kind of art which paints devotion itself, which depicts events long since familiar to us, the gentlest intimation of which suffices to inspire a host of touching episodes, of characteristic deeds, of sayings! The kind of painting, finally, which represents the very love-feast which we all wish to share, which invites us to worthy participation in this solemn occasion through its depiction of the figures involved, through the expressive presentation of the Saviour and his faithful companions, just as it can warn us from unworthy participation in this touching feast of commemoration through its expressive presentation of the traitor amongst them.

O you protagonists of the new! You might still recall to us a thousand times those touching words: '*Do this in remembrance of me*', without ever fully exhausting the character, the intrinsic expression revealed by Him who spoke these words, and

ineluctably revealed by those who heard them. Indeed it is a true presumption when landscape painting would slink into the churches and creep onto the altars. But let us leave all this aside and ask after what is ultimately the most important thing of all.

Is it compatible with the dignity of the truly pious man to try and encourage devotion by such means as Herr Friedrich has here employed?

And here I must discuss the frame which surrounds the picture. It stands in an immediate relationship with the picture and constitutes an integral factor of the same, for without the frame the allegory would not be even remotely intelligible and the frame itself effectively forms the upper section of the altar. In addition to this, the carved and silver-coated evening star at the top above the painting obviously alludes to the time of day represented.

When I stepped into the room where the painting was displayed here in Dresden, I found it in its frame standing on a brown table which itself was covered with a black cloth.

Yet the frame lacks any proper relation to the picture. At the bottom there is a large pedestal with steps attached. In the middle of the lower frame one sees an eye in a triangle surrounded by rays of light, and a winding grapevine and ear of wheat on either side. Two variously fluted Gothic columns stand upon the pedestal with palm branches emerging from the capitals to form a kind of arch at the top. Children's heads with wings peer out from the branches. Above the uppermost child's head there stands a silver-coated star. Everything else is gilded all over.

If one now unites these emblematic forms with the allegory of the painting itself and evaluates the general tendency of the whole, while sacrificing all truth and taste, what results is indeed a worthily revered and consoling, though hardly aesthetic, religious idea: one symbolizing our belief in the mysterious effects of the Lord's Supper. It is surely impossible to mistake the influence which a currently prevailing system of thought has here exercised upon Herr Friedrich's composition: that mysticism which is now creeping into everything and enveloping art as well as science, philosophy as well as religion, with a haze of narcotic intoxication! that mysticism which would treat symbols and fantasies as the equivalent of painterly and poetic images and exchange the works of classical antiquity for Gothic woodwork, hide-bound craftsmanship and ancient legends! that mysticism which plies its verbal games instead of concepts and bases its principles upon the most remote of allegories, which searches on all sides for mere presentiment where we should know and recognize the truth or modestly hold our peace! that mysticism for whose adherents the ignorance of facts and literature is such a shibboleth! that mysticism which exalts the Middle Ages and its precepts far above the age of the Medici, of Ludwig and of Frederick! that mysticism which would gladly conflate the bold and vigorous fervour that properly accompanies the authentic religion of Christ with a languishing and exaggerated devotion to the cross! that mysticism, finally, which makes me tremble for the consequences of the present age and calls to mind all those who with the end of the Roman Empire hastened the decline of taste and all true learning! For then as now, the Neoplatonic sophists, the Gnostic and Orphic shamans, appeared upon the scene, then as now, they played with legends and pronouncements, with amulets and symbols, and then as now, they crippled art with the presumption that they would bring it back to its original simplicity.

Courageous Frederich, and all you men of genius and talent whom current fashion once distracted from the true path, return again to that which experience alone has shown to be the tried and proper one. Such a passing fashion will never spread so readily where history is taught with thoroughness, where classical Antiquity is preached with taste, where ability and knowledge still represent the goal of the artist and the scholar. But in the principal cities, in the vicinity of the courts, anywhere indeed where diversion prevents men from studying thoroughly whatever lies beyond the sphere of commercial life, where art and learning are principally employed for light social entertainment, where the gluttoned senses seek ever new enticements and heightened pleasures of imagination, there alone, I say, will doctrines which vaunt their images and wordplay, their eccentric half-grasped observations garbed in high-flown phrases, as knowledge and wisdom find a ready welcome, and especially those, as far as art is concerned, who chatter on about divinity and the heart without endeavouring to acquire the first condition of both: namely truth and a skilled hand!

13 Caspar David Friedrich (1774–1840) *On The Cross in the Mountains*, letter to Professor Schulze, 8 February 1809

Friedrich responded to Ramdohr's criticism of his painting, *The Cross in the Mountains*, in a letter to Johann Schulze (1786–1869). Schulze was at this time in Dresden working on the Weimar edition of Winckelmann's writings, which he edited with Heinrich Meyer and Karl Ludwig Fernow (see VIIA6). Through Schulze the letter reached the editor of the *Journal des Luxus und der Modens*, who published a shortened version of Friedrich's account of the painting in April 1809. Clearly stung by Ramdohr's remarks, Friedrich offers a detailed account of the symbolic meaning which the painting was intended to convey. He freely admits that he has broken with long-standing rules of pictorial composition, but insists that he has used different means in pursuit of legitimate goals. The absence of traditional effects of light and aerial perspective, for example, should not be read naturalistically but as a representation of the departure of God as a direct presence in the world. His presence is henceforth known only through the reflected light which reaches us from the figure of the Redeemer on the cross. The letter has been translated complete for this volume by Nicholas Walker from Hermann Uhde-Bernays ed., *Künstlerbriefe über Kunst*, Frankfurt am Main, Zurich, Vienna: Jess Verlag, 1962, pp. 246–52. Friedrich frequently refers to Ramdohr as Herr Kammerherr (chamberlain) von R or simply as K von R. The Herr von Kugelgen mentioned at the end of the letter was a friend of Friedrich's who later published an essay in defence of *The Cross in the Mountains* in the *Zeitung für die Elegante Welt*, no. 49, 1809.

My dear Professor,

In your last letter you asked if I would communicate to you my thoughts concerning my altar painting. At that moment I did not really feel in a position to do so and shared my thoughts about a different picture with you instead. But I have recently been impelled by the appearance of an essay directed expressly against myself by Herr Ramdohr to present my thoughts on the altar painting after all. I have now woven them into a short piece intended as a riposte to the essay in question. I have written the piece even though I have expressed myself in the third person, although I do not

rightly know why I proceeded in this way. Several individuals have advised me to publish the piece and indeed I am not wholly disinclined to do so. I would also be very grateful to learn your own opinion with regard to this possibility. I am assuming that you have already read the essay by Ramdohr; if not, I would ask if you could read it beforehand since otherwise my own piece might very well strike you as rather strange.

If the picture by the said painter Friedrich had indeed observed the rules of art which have been acknowledged and sanctified through the centuries, if, in other words, F had availed himself of the crutches proffered by art instead of presuming to follow his own way, then Herr Kammerherr von R would never have roused himself from slumber. If Herr F had simply followed the already established road where every donkey bears its burden, where cat and dog take care to stay for safety's sake, where after all the celebrated artists of earlier times have been set up along the way as models and examples for all future ages, then K von R would surely have held his peace. But it was not actually these artists who expressly presented themselves as the one and only signpost for us to follow. For these worthy masters were all too aware that the roads that lead to art are in fact infinitely various, that art is properly speaking the focal point of all the world, the focal point of the highest of our spiritual aspirations, and that artists stand together in a circle around this focal point. That is why it so easily transpires that two different artists can actually move towards one another insofar as both are striving to reach a single point. For the variety of possible standpoints here is also the variety of individual hearts and minds, and both artists could achieve the same goal in travelling their opposite roads. It is merely those narrow and heartless art critics, whose writings have often enough chilled or blasted many a fragile soul, that could even entertain the idea that there is only one road to art, namely the one they themselves have proposed. Of course, if the picture of Herr F were wholly without value, then Counsellor R would certainly have extended his hand in friendship instead of mounting the stage as his opponent. The ordinary and the had in art will surely perish of itself, but the half-way decent must be expressly toppled.

But why on earth did Herr F fail to share his views on landscape painting with Herr von K beforehand? Why did he fail to ask such an outstanding connoisseur of art whether the latter was already acquainted with these views? For that would also have sufficed to answer the question whether or not he lent any credence to the latter. Let F therefore accept Herr von R's sermon of denunciation as a natural consequence of his own stubbornness. For what matter if the picture is pleasing to the multitude, if it is not pleasing to Herr von R!

It must be a painful experience for a man like K von R when he looks around and beholds the horrors of the present age, the omens of advancing barbarism, black as night, pressing on defiantly and contemptuously trampling underfoot all the rules, the chains, the bonds with which the human spirit was once kept in line along the well-established straight and narrow. Is it not obvious that the artistic spirit of our age has put its foolish, pitiable and unlimited faith in a purely imaginary spiritual reality? Has it not clearly abandoned itself with a child-like, indeed childish, enthusiasm to every sacred stirring of the inner life? Is it not ready to revere, with a kind of blind devotion, every pious presentment, as if all this were without question the

purest, most transparent source and origin of art? Without even asking or discovering whether a Claude Lorrain, a Nicolas or Caspar Poussin, a Ruisdael, or what is far more important, a K von R would give his approval first?

The 'effect' [*Effekt*] or rather, to speak in plainer German terms, the way my picture 'works' [*die Wirkung*] upon the beholder is enough to justify its worth as long as it works truthfully, as long as its truth is directed towards what is noble. If a picture works feelingly and spiritually upon the beholder, if it inspires a fairer mood within the heart, then it has already fulfilled the first demand placed upon a work of art, however poor it might otherwise be in respect of draughtsmanship, the use of colour, the painting technique, etc. If a picture leaves the feeling and responsive beholder cold and the heart untouched, however exemplary it might otherwise be in respect of form and colour, then it can lay no claim to the name of an authentic work of art [*eines wahrhaften Kunstwerks*], although it may well deserve the name of a most beautiful piece of artifice [*einer schönen Künstelei*]. But a perfect work of art will combine both of these aspects within itself.

A description of the picture

An upright cross, green ivy clinging around its stem, and surrounded by evergreen fir trees, stands on the summit of a rocky outcrop. With the sinking of the glowing sun the Saviour is gleaming in the reddish-purple of evening.

A description of the frame

The frame, as we know, is not merely fashioned in general agreement with the painter, but entirely in accordance with his express design. If there is anything wrong with the disposition of the frame, this is not to be ascribed to the sculptor Kühn but solely to the painter himself. Along the sides the frame effectively forms a pair of rather Gothic columns. Palm branches spring forth from the columns and arch over the picture. There are five angelic heads set within the palm branches, all looking down in prayer upon the cross below. The evening star, in pure gleaming silver, stands directly above the central angel. At the bottom of the frame, in extended relief, we behold the all-seeing eye of God in a sacred triangle surrounded by rays of light. Sheaves of corn on one side and vine leaves on the other turn inwards towards the all-seeing eye. These are intended to signify the body and blood of Him who is nailed to the cross. There are three donors at the bottom beneath the frame itself.

Secretary R does not properly know how to imitate the tongue of the painter F, and I am convinced that F would certainly never have expressed himself as he is here represented as speaking. It is quite true that the picture possesses an allegorical meaning, even if that meaning is not immediately clear to the Secretary! It is quite deliberate that Jesus Christ, nailed to the rood, is turned away towards the sinking sun, itself an image of the all-seeing and all-life-giving Father. An ancient world came to perish with the teachings of Jesus, a time when God the Father still walked visibly upon the earth, when He spoke unto Cain, saying: Why dost thou wax wrothful, and why dost thou dissemble?, when He delivered amidst thunder and

lightning the tables of the Law, when he spoke unto Abraham, saying: Take off thy shoes for thou standest on holy land! The sun sank down, and the earth could no longer grasp the departing light. The Saviour on the cross shines here, like the purest and noblest of metals, in the reddish-golden glow of evening, and is himself reflected, though with milder light, upon the earth. The cross stands forth, unshakeably firm, upon the rock, like our own faith in Jesus Christ. The fir trees, evergreen through the ages, stand about the cross, like our own hope in Him, the Crucified One. When the Herr Secretary says that F has banished every trace of aerial perspective from his picture he is quite wrong; but if he had said that it was expressed but weakly there, he would have been right. If the secretary finds only darkness where other honest men can still clearly perceive objects, then the fault lies not with the picture, but in the weakness of his own eyes.

The Secretary's unconditional demand that a landscape must always present several different planes is not one that is accepted by Herr F. Nor indeed does Herr F accept that the greatest possible variation of form and colour alone represents the essence of painting, that straight lines must invariably be complemented by curvilinear ones, that while one line encourages a kind of dynamic delight, another meanders slowly and mournfully instead, that while one line gradually disappears into the undergrowth, another is friendly enough to suggest Ramdohr's *Urania*, and a third generously serves up the rules of art. In short F is a disillusioned friend of what is generally described as 'contrast'. He believes that the attempt to express oneself through contradictions (for this is how the coarse and slick interpret contrast) is utterly deluded. On his view of things every truthful work of art must express a specific meaning, must move the soul of the beholder to the experience of joy or grief, of melancholy or happiness, but that does not mean simply throwing every possible feeling together and churning them up indiscriminately. The work of art must simply strive for unity, and a single intention must thoroughly permeate the whole. Every individual part of the work must be stamped by the sense of the whole rather than resembling a crowd of human beings who hide behind flattering words and evil cunning.

Contrast, so you all say, is the rule of all rules, the fundamental law of art. But only for you who are a contrast with the spirit, you who are nothing but body! This is indeed the right rule for you!

Art can never be at home with those whose hearts and souls are cold. Landscape nature appears inanimate to Herr von R precisely because he has no living feeling for nature.

F forgives Herr von R his coarseness. F forgives the heathen who finds the Christian theme unseemly. First the Secretary complains about the all-pervading darkness, while later on he claims we see too much. The Secretary's malicious lie that the cross is illuminated from below most certainly should merit censure, but only serves clearly to reveal his feral malice. The cross is not illuminated at all, but simply gleams in the reddish glow of evening. The Secretary refers F to the writings of Lairesse, but I would refer him to the first commandment in which it is written: Thou shalt not bear false witness against thy neighbour.

But if one can perceive the air behind the rocks, why should one be unable to perceive the sun's rays too? F concedes that the redness of the air is misleading, and

therefore leaves us doubtful whether it is morning or evening, and that the mountain lacks a rounded profile. But the crudity of K von R's remarks on the subject merits only contempt. He even writes as if he had witnessed F sitting and drawing before a mountain modelled out of wax or clay!

Herr von R claims to have demonstrated that F has failed to provide a good painting. He may be right, for F himself is convinced that there are many faults and defects in his picture, but, unlike the Secretary, he is not convinced of the utter worthlessness of his work. But even more than the faults and defects of his picture, F is rightly convinced of the baseness of Herr von K.

This short essay was not intended for F to defend his picture, but rather as an occasion for informing the lovers of art in brief about his own views concerning art and the sacred in art. But Herr K von R has demeaned himself rather than F, and pilloried himself as a heartless man!

I have chosen to ignore the final page of Herr von R's essay since I am too disgusted to respond to it. It is indeed no small task simply to try and read the essay from beginning to end.

Herr von Kügelgen has arrived here safely, and his wife's condition has improved from the very hour he entered the house. Kügelgen reported on Weimar with much warmth and affection, and spoke a good deal about the welcome reception he received there.

May God preserve you in good health, my dear Schulz, and so write soon to your friend, C. Friedrich.

14 Clemens Brentano (1778–1842) 'Various Emotions before a Seascape by Friedrich'

Clemens Brentano belonged to the Heidelberg school of Romanticism whose members included Ludwig Achim von Arnim and Joseph Görres (see VIA4). He was born in Ehrenbreitstein to a wealthy merchant father. From 1797 he studied in Jena where he came into contact with some of the leading members of early German Romanticism. His most important work is the collection of folk-songs, *Des Knaben Wunderhorn*, which he edited with Arnim between 1805 and 1808. He also wrote numerous novels, fairy-tales and plays. He later converted to Catholicism and in 1818 he withdrew to the monastery of Dümen near Münster, recording the revelations of the visionary nun, Anna Katharina Emmerich (*Das bittere Leiden unsers Herrn Jesu Christi*, 1833). The following text dates from 1810 and was originally intended for publication in Heinrich Kleist's journal, *Berliner Abendblätter*. However, Kleist severely shortened and adapted the piece, later accepting that the published version (see VIB15) represented his own work. Caspar David Friedrich's *The Monk by the Sea* (Berlin, Charlottenburg) was included in the annual exhibition at the Berlin Royal Academy of Art which opened on 23 September 1810. Brentano's inventive and humorous account of the various responses to Friedrich's painting is full of wordplay difficult to render in English. It is likely that Arnim contributed to its composition. He is the 'tall and reserved young man' who appears at the end, and the final description of the painting is thought to have been written by him. The full text was first published in *Iris. Unterhaltungsblatt für Freunde des Schönen und Nützlichen*, no. 20, 28 January 1826. The following translation has been made for the present volume by Jason Gaiger from Clemens

Bretano, *Werke*, ed. Friedhelm Kemp, volume 2, Munich: Carl Hanser Verlag, 1963, pp. 1034–8. Notes have been added.

It is splendid, in infinite loneliness by the shore of the sea under a cheerless sky, to stare at a limitless expanse of water; in part, this is due to the fact that one has gone there, that one must return, that one would like to cross over, that one cannot do so; that everything belonging to life is missing and that one hears one's own voice in the roar of the tide, in the billowing of the wind, in the passing of the clouds and in the lonely cry of the birds; in part it is due to a demand which is made by the heart and by the withdrawal of nature. This is impossible before this painting, however, and that which I should have found in the painting I could find only between myself and the painting, that is to say, a demand which the painting makes on me but which it does not fulfil; and so I became the monk and the painting became the dune, but that upon which I gazed with yearning, the sea, was not there at all. In order to discover this wonderful feeling, I listened to the comments of the various different visitors and considered them as something belonging to the painting; it is a form of decoration before which some sort of action must take place, for it does not allow anyone to rest.

A lady and a gentleman, who is perhaps very clever, came forward; the lady looked in her catalogue and said:

'Number two: Landscape in Oil. Do you like it?'

GENTLEMAN: Infinitely deep and sublime.

LADY: You mean the sea, it must be astonishingly deep, and the monk is also very sublime.

GENTLEMAN: No, Frau Kriegrat, I mean the feeling of Friedrich himself before this picture.

LADY: Is it so old, then, that he has seen it?¹

GENTLEMAN: Oh, you misunderstand me. I am talking of the painter Friedrich; Ossian plays his harp before this painting.² (*Exeunt*)

Two young ladies

FIRST LADY: Did you hear, Louise? That is Ossian.

SECOND LADY: No, you misunderstood him. That is the ocean.

FIRST LADY: But he said that he plucks his harp.

SECOND LADY: I do not see any harp. It is very greyish to look upon. (*Exeunt*)

Two connoisseurs of art

FIRST: Yes, greyish indeed, it is all quite grey; why does he wish to paint such dry things?

SECOND: You should rather ask, why does he wish to paint such wet things so dry?

FIRST: He will have painted it as well as he can. (*Exeunt*)

A governess with two demoiselles

FIRST DEMOISELLE: That is the sea at Rügen.

SECOND DEMOISELLE: Where Kosegarten³ lives.

FIRST DEMOISELLE: Where colonial goods come from.

GOVERNESS: Why does he paint such a cheerless sky? How nice if he had painted some men fishing for amber in the foreground.

FIRST DEMOISELLE: Oh yes, I too would like one day to fish together a beautiful necklace of amber. (*Exeunt*)

A young lady with two blond children and a pair of gentlemen

GENTLEMAN: Splendid, splendid, this man is the only one who expresses character in his landscapes; there is great individuality in this painting, elevated truth, loneliness, a cheerless, melancholy sky – he knows what he wants to paint.

SECOND GENTLEMAN: And he paints what he knows, he feels it and he thinks it and he paints it.

FIRST CHILD: What is that there?

FIRST GENTLEMAN: That is the sea, my child, and a monk who goes for a walk and is sad that he does not have a well-behaved boy like you.

SECOND CHILD: Why doesn't the monk dance around at the front and why doesn't he shake his head like he does in the shadow play? That would be nicer.

FIRST CHILD: Is it one of those monks who tell the weather such as we have outside our window?

SECOND GENTLEMAN: No, it is not one of those, my child, but he too shows the weather, he is the unity in the totality, the lonely centre of a lonely circle.

FIRST GENTLEMAN: Yes, he is the character, the heart, the reflection of the entire painting in itself and beyond itself.

SECOND GENTLEMAN: How divinely chosen is the staffage: it is not, as with ordinary painters, a mere device for gauging the height of the objects; it is the subject itself, the painting; as in a melancholy mirror, the monk seems to dream his own isolation into this place, and the shipless, all-encompassing sea, which constrains him like his vows, and the desolate sand dune, which is as devoid of joy as his life, push him symbolically onwards like a shore plant which offers its own prophecy.

FIRST GENTLEMAN: Marvellous, you are undoubtedly right; (*to the lady*) but my dearest, you do not say anything.

LADY: Before this painting, it was as if I were at home; it touched me deeply and it is only natural that it would do so; when you spoke it was as incomprehensible to me as when I walk with our philosophical friends along the shore; only I wished that a fresh sea breeze was blowing, driving a sail towards us, and that a ray of sunlight shimmered below and the water murmured; to me it is like a nightmare and yearning in a dream for the fatherland; come, let's go on, it makes me sad. (*Exeunt*)

A lady and a guide

LADY (stands for a long time without speaking): Grand, incomprehensibly grand! It is as if the sea had Young's *Night Thoughts*.⁴

GENTLEMAN: You mean, it is as if they had occurred to the monk?

LADY: If only you did not always jest and disturb my state of mind. Secretly you have the same feelings as me, but you prefer to laugh at in others what you revere in yourself. I say, it is as if the sea had Young's *Night Thoughts*.

GENTLEMAN: And I agree, and also the Karlsruhe reprint and the *Bonnet de nuit* by Mercier⁵ and Schubert's *View of Nature from the Night Side*⁶ too.

LADY: I cannot answer you better than with a parallel anecdote. When the immortal Klopstock⁷ wrote for the first time in one of his poems, 'The dawn smiles,' Madame Gottsched⁸ responded when she read it. 'What sort of mouth does she pull?'

GENTLEMAN: Certainly not a mouth as beautiful as yours when you tell me that.

LADY: And now you are going too far.

GENTLEMAN: And Gottsched gave his wife a kiss for her *bon mot*.

LADY: I would give you a nightcap for yours, if you were not one already.

GENTLEMAN: I would rather have a view of your nature from the night side.

LADY: You misbehave.

GENTLEMAN: If only we stood there together where the monk stands.

LADY: I would leave you and go over to the monk.

GENTLEMAN: And ask him to couple us together.

LADY: No, to throw you in the water.

GENTLEMAN: And then you would remain alone with the father and seduce him and spoil the whole picture with its night thoughts; that is how you women are; in the end you destroy what you feel and out of pure lies you tell the truth. Oh I wish I were the monk, eternally alone, gazing out over the dark, promising sea which lies before him like the apocalypse; I wish I could yearn for all eternity after you, dear Julie, and miss you forever, for this yearning is the only magnificent feeling in love.

LADY: No, no, my dear, in this picture of yours, if you speak in this way, I would leap after you into the water and leave the monk standing on his own. (*Exeunt*)

The whole time, a tall and reserved young man had listened on with some signs of impatience. I stepped lightly on his foot and he answered me as if I had meant to ask him his opinion. 'It is a good thing that paintings cannot hear, otherwise they would long since have veiled themselves over; people treat them with so little respect and they are quite convinced that they have been put in the stocks because of some secret crime which they as spectators must discover.' – 'What, then, is your opinion of this picture?' I asked. – 'I am pleased,' he answered, 'that there is still a landscape painter who pays attention to the wondrous conjunction of the seasons with the sky, which even in the most desolate regions produces the most arresting effects; but I would have preferred it if this artist possessed not only the right feeling but also the appropriate gifts and study to be able to reproduce this in his picture; in this respect, he stands as far behind certain Dutch artists who have painted similar things as he excels them in the state of mind with which he has grasped them; it would not be difficult to list a dozen paintings in which the sea, the shore and a monk are better painted. From a certain distance, the monk looks like a brown mark; if there has to be a monk there, I would rather he was stretched asleep upon the ground, or praying, or cast down and gazing up with humility so as not to spoil the view of the sea which clearly makes a greater effect upon the spectator than the tiny monk. Whoever might afterwards seek to discover the inhabitants of the coast would still find in the monk an opportunity to express what several of the spectators have loudly communicated with expansive familiarity to everyone else.'

This speech pleased me so much that I immediately went home with this man where I still find myself and where I shall be found in the future.

¹ The lady assumes that the reference is to Friedrich II, the Great (1712–86).

- ² A reference to the legendary Gaelic bard and warrior whose verse was popularized in the eighteenth century in 'translations' by the Scottish poet, James Macpherson (1736–93). *Finegal* appeared in 1762 and *Temora* in 1763.
- ³ The German poet, Christian Ludwig Kosegarten (1758–1818), who was an influence upon the young Friedrich.
- ⁴ A reference to Edward Young (1683–1765) whose long poem *The Complaints or Night Thoughts on Life, Death and Immortality* (1742–5) which was widely read in Germany.
- ⁵ Louis Sébastien Mercier (1740–1815) was a historian and playwright, who, together with Diderot, founded the school of bourgeois drama. His *Mon bonnet de nuit* appeared in 1784.
- ⁶ Gotthilf Heinrich Schubert (1780–1860) published his *Ansichten von der Nachtseite der Naturwissenschaft* (Views from the Night Side of Natural Science) in Dresden in 1808. See VIB11.
- ⁷ Friedrich Gottlieb Klopstock (1724–1803), author of highly emotional and sentimental religious poetry.
- ⁸ Louise Adelgunde Viktorine Gottsched (1713–62), wife and co-worker of Johann Christoph Gottsched (1700–66), who sought to apply the rules of rationalism to literature.

15 Heinrich Kleist (1777–1811) 'Emotions before Friedrich's Seascape'

The German poet and dramatist Heinrich Kleist was born into a military environment in Frankfurt-am-Oder. In 1799 he resigned his commission as an army officer in order to study philosophy and mathematics at his home university. His studies led to disillusionment with science's apparent claims to objectivity and he came to trust instead only inner emotional truth. He has been described as the first great dramatist of the nineteenth century. In the years prior to his early death in 1811 he produced a remarkable series of plays and novellas, including *Der zerbrochene Zug* (1808) and *Michael Kohlhaas* (1810). However, in November 1811 he ended his own life by shooting himself on the shores of the Wannsee, near Potsdam. As editor of the *Berliner Abendblätter* he adapted and rewrote Clemens Brentano's 'Various Emotions Before a Seascape by Friedrich' (see VIB14) in a shortened version which, after the first few lines, constitutes his own work. The playful irony of Brentano's writing is replaced by Kleist's characteristically earnest and painful response to the painting. The references to Young's *Night Thoughts* and to Ossian are explained in the footnotes to Brentano's text. Kleist's version was first published in the *Berliner Abendblätter*, volume 12, part 13, 13 October 1810. It has been translated complete for the present volume by Jason Gaiger from Heinrich von Kleist, *Werke und Briefe*, ed. Siegfried Streller, volume 3, Berlin und Weimar: Aufbau Verlag, 1978, pp. 502–3.

It is splendid, in infinite loneliness by the shore of the sea under a cheerless sky, to stare at a limitless expanse of water; in part, this is due to the fact that one has gone there, that one must return, that one would like to cross over, that one cannot do so; that everything belonging to life is missing and that one hears one's own voice in the roar of the tide, in the billowing of the wind, in the passing of the clouds and in the lonely cry of the birds; in part it is due to a demand which is made by the heart and by the withdrawal of nature, if I may so express it. This is impossible before this painting, however, and what I should have found in the painting I could find only between myself and the painting, that is to say, a demand the painting makes on me but does not fulfil; and so I became the monk and the painting became the dune, but that on which I gazed with yearning, the sea, was not there at all. Nothing can be more melancholy and unpleasant than this position in the world: to be the only spark

of life in the wide realm of death, the lonely centre of a lonely circle. The painting stands there with its two or three mysterious objects like the apocalypse, as if it possessed Young's *Night Thoughts*, and since in its monotony and boundlessness it has nothing but the frame for a foreground, when one looks at it, it is as if one's eyelids had been cut away. Without a doubt, the artist has opened up a completely new path in this field of art; I am convinced that with his spirit this artist could depict a square mile of sand in the Brandenburg Marches, with a crane preening itself on top of a barberry bush, and that this painting would affect us in the same way as Ossian or Kosegarten. If one were to paint this landscape with its own chalk and its own water, one could make the foxes and wolves howl: and this is the greatest praise which can be bestowed on this sort of landscape painting. – But my own emotions before this painting are too confused, and before I venture to express them fully I have decided to let myself be instructed by the comments of those who pass before this painting in pairs from morning to evening.

16 Heinrich Kleist (1777–1811) 'Letter from a Young Poet to a Young Painter'

Heinrich Kleist's short 'Letter from a Young Poet to a Young Painter' appeared in the same journal as his 'Emotions before Friedrich's Seascape', the *Berliner Abendblätter*, of which Kleist himself was the editor. Employing the conceit of a letter from one novice to another, Kleist challenges the dependence of painting upon rules and examples drawn from the work of previous artists. His insistence upon the artist's freedom to pursue his own ideas in an open and exploratory fashion echoes Caspar David Friedrich's comment in his reply to Ramdohr that he had sought to go upon his own two feet rather than use the 'crutches' of past art (see VIB12 and 13). Indeed, it is likely that the debate surrounding Friedrich's *Cross in the Mountains* provided the starting-point for Kleist's reflections. The letter, which ends on a characteristic note of cynicism, was first published as 'Brief eines jungen Dichters an einen jungen Maler', *Berliner Abendblätter*, no. 32, part 6, November 1810. The following translation of the complete text has been made for the present volume by Jason Gaiger from Heinrich von Kleist, *Werke und Briefe*, ed. Siegfried Streller, volume 3, Berlin and Weimar: Aufbau Verlag, 1978, pp. 569–71.

To us poets it is incomprehensible how you painters can resolve to spend years copying the works of your great masters when your art possesses such infinite resources. The teachers under whom you are schooled tell you not to present your own ideas on the canvas until the time is right. Placed in your position, we poets would have exposed ourselves to ceaseless beatings rather than accept this cruel ban. The power of imagination would have stirred indomitably within us; as soon as we knew that we had to paint with the head of the brush rather than with its handle, and in defiance of our inhuman teachers, we would secretly have locked our doors at night in order to try out our capacity for invention, the play of the blessed. Where imagination stirs in your youthful spirit, it is pitilessly and irretrievably destroyed by the copying in museums and galleries to which you are condemned. If a painting touches you, and you wish to make its excellence your own, what more is required

than with piety and love to gaze at the painting for hours, days, weeks, months, for half a year if need be. At the very least, it seems to us, two different uses can be made of a painting. First there is the use you make of it, that is, to copy out its individual features in order to learn its handwriting; another use is to seek from the very outset to invent something new in the same spirit. But even this should be put to one side as soon as possible in favour of pursuing art itself, whose essential character resides in free invention in accordance with one's own laws. For heaven's sake! The real task is not to be someone else but to be oneself, to use lines and colours to make visible one's deepest and truest ideas and feelings. How can you hold yourselves in so little esteem that you are prepared to prevent yourselves from appearing in any form whatsoever? The existence of the great masters whom you so admire should not reduce you to nothing, but should awaken in you the right eagerness and equip you with the strength and serene courage to pursue your own proper path. But you believe that you must first make your way through these masters, through Raphael or Correggio, or whoever it is that you have identified as your model. But why do you not turn around, set your back against him and set off in the diametrically opposite direction in order to find and scale the pinnacle of art you have in mind? – You will look at me and say, 'What else is new that this young man has to tell us?' and you will laugh and shrug your shoulders. Let God decide what happens next! It is 300 years since Copernicus said that the world was round and I do not see what good it can do for me to repeat it here once again. Farewell!

17 E. T. A. Hoffmann (1776–1822) 'Beethoven's Instrumental Music'

Hoffmann was born in Königsberg in Prussia, where he went on to study law at the university. From his early twenties he worked in the Prussian legal and governmental apparatus, while also writing, painting and composing. When the Prussian bureaucracy was dissolved following defeat by Napoleon in 1806, Hoffmann was freed to pursue a career in his first interest, music. He went on to become a leading figure in the German Romantic movement as composer, conductor and theatre director. Towards the end of the French revolutionary wars, he was able to resume his career in the law, combining it from then on with his writing. He remains best known today for his macabre fiction, which employs sinister and uncanny elements to explore themes of madness and conflicts of personal identity, and for Offenbach's later operatic setting of *Tales of Hoffmann*. Hoffmann was also a pioneer of musical criticism, keen to emphasize the specificity of the expressive language of music. In the visual arts, as imitation and narrative were subjected to question by the nineteenth-century avant-garde, modernist critics increasingly looked to music for their models of an independent art. To that extent, Hoffmann's Romantic appreciation of Beethoven's instrumental music prefigures the tenor of much subsequent writing on the visual arts. The essay was first published anonymously in the *Zeitung für die elegante Welt* in Leipzig in December 1813. It was based on an earlier review of Beethoven's Fifth Symphony, also published anonymously in July 1810 in the *Allgemeine musikalische Zeitung* (Leipzig). The opening sections, reprinted here, represent Hoffmann's most enduring contribution to criticism, frequently quoted and republished. Our extract is taken

from the translation in *Source Readings in Music History*, selected and annotated by Oliver Strunk, New York: W. W. Norton, 1950, pp. 775–7.

When we speak of music as an independent art, should we not always restrict our meaning to instrumental music, which, scorning every aid, every admixture of another art (the art of poetry), gives pure expression to music's specific nature, recognizable in this form alone? It is the most romantic of all the arts – one might almost say, the only genuinely romantic one – for its sole subject is the infinite. The lyre of Orpheus opened the portals of Orcus – music discloses to man an unknown realm, a world that has nothing in common with the external sensual world that surrounds him, a world in which he leaves behind him all definite feelings to surrender himself to an inexpressible longing.

Have you even so much as suspected this specific nature, you miserable composers of instrumental music, you who have laboriously strained yourselves to represent definite emotions, even definite events? How can it ever have occurred to you to treat after the fashion of the plastic arts the art diametrically opposed to plastic? Your sunrises, your tempests, your *Batailles des trois Empereurs*,¹ and the rest, these, after all, were surely quite laughable aberrations, and they have been punished as they well deserved by being wholly forgotten.

In song, where poetry, by means of words, suggests definite emotions, the magic power of music acts as does the wondrous elixir of the wise, a few drops of which make any drink more palatable and more lordly. Every passion – love, hatred, anger, despair, and so forth, just as the opera gives them to us – is clothed by music with the purple luster of romanticism, and even what we have undergone in life guides us out of life into the realm of the infinite.

As strong as this is music's magic, and, growing stronger and stronger, it had to break each chain that bound it to another art.

That gifted composers have raised instrumental music to its present high estate is due, we may be sure, less to the more readily handled means of expression (the greater perfection of the instruments, the greater virtuosity of the players) than to the more profound, more intimate recognition of music's specific nature.

Mozart and Haydn, the creators of our present instrumental music, were the first to show us the art in its full glory; the man who then looked on it with all his love and penetrated its innermost being is – Beethoven! The instrumental compositions of these three masters breathe a similar romantic spirit – this is due to their similar intimate understanding of the specific nature of the art; in the character of their compositions there is none the less a marked difference.

In Haydn's writing there prevails the expression of a serene and child-like personality. His symphonies lead us into vast green woodlands, into a merry, gaily colored throng of happy mortals. Youths and maidens float past in a circling dance; laughing children, peering out from behind the trees, from behind the rose bushes, pelt one another playfully with flowers. A life of love, of bliss like that before the Fall, of eternal youth; no sorrow, no suffering, only a sweet melancholy yearning for the beloved object that floats along, far away, in the glow of the sunset and comes no nearer and does not disappear – nor does night fall while it is there, for it is itself the sunset in which hill and valley are aglow.

Mozart leads us into the heart of the spirit realm. Fear takes us in its grasp, but without torturing us, so that it is more an intimation of the infinite. Love and melancholy call to us with lovely spirit voices; night comes on with a bright purple luster, and with inexpressible longing we follow those figures which, waving us familiarly into their train, soar through the clouds in eternal dances of the spheres.

Thus Beethoven's instrumental music opens up to us also the realm of the monstrous and the immeasurable. Burning flashes of light shoot through the deep night of this realm, and we become aware of giant shadows that surge back and forth, driving us into narrower and narrower confines until they destroy *us* – but not the pain of that endless longing in which each joy that has climbed aloft in jubilant song sinks back and is swallowed up, and it is only in this pain, which consumes love, hope, and happiness but does not destroy them, which seeks to burst our breasts with a many-voiced consonance of all the passions, that we live on, enchanted beholders of the supernatural!

Romantic taste is rare, romantic talent still rarer, and this is doubtless why there are so few to strike that lyre whose sound discloses the wondrous realm of the romantic.

Haydn grasps romantically what is human in human life; he is more commensurable, more comprehensible for the majority.

Mozart calls rather for the superhuman, the wondrous element that abides in inner being.

Beethoven's music sets in motion the lever of fear, of awe, of horror, of suffering, and wakens just that infinite longing which is the essence of romanticism.

¹ A reference to *La Grande Bataille d'Austerlitz* (1806), a symphony by Louis Jadin.

18 Caspar David Friedrich (1774–1840) Letter to Arndt, March 1814

Throughout the Wars of Liberation from Napoleonic troops, Friedrich supported the cause of German patriotism. He produced numerous drawings and paintings on patriotic themes, including *The Grave of Arminius* (Kunsthalle, Bremen) and *The Chasseur in the Forest* (Private Collection, Bielefeld). He also contributed works to the exhibition of patriotic art organized in Dresden in 1814 by Fürst Replin to celebrate the freeing of the city. From the following letter to Ernst Moritz Arndt, a childhood friend from Greifswald, we learn that Friedrich had asked his compatriot to write an inscription for a memorial to the German military commander, Gerhard Johann David Scharnhorst (1755–1813). Friedrich had met Arndt once again when the latter visited Dresden in April 1813 and both were greatly moved by Scharnhorst's death that same year. Arndt had paid tribute to the soldier in a poem, whilst Friedrich sketched a memorial to him and planned a painting on the same theme. On the back of the letter Arndt had written 'To the calm, pious and bold Scharnhorst, who inspired and prepared the way for German honour and freedom.' It is known that the letter passed through the hands of the censors, for certain passages have been underlined. William Vaughan has suggested that Friedrich's sympathies extended to a form of pan-German patriotism, whose goals included not merely the expulsion of the

French but the creation of a liberal German state (Vaughan, 1980). This claim is supported by Friedrich's insistence that no great patriotic monuments could be erected 'as long as we remain servants of princes (*Fürstenknechte*)'. The letter was first published in Ernst Moritz Arndt's *Notgedrungener Bericht aus seinem Leben*, volume 2, Leipzig, 1847. It has been translated complete for the present volume by Jason Gaiger from Sigrid Hinz (ed.), *Caspar David Friedrich in Briefen und Bekenntnissen*, Berlin: Henschelverlag, 1968, p. 25.

Dresden, 12 March 1814

Highly esteemed compatriot!

I have received your kind letter and the accompanying drawings. I am not at all surprised that no memorials are to be erected, either to the great achievements of the people or to the courageous deeds of specific German individuals.

As long as we remain the servants of princes no such great things will take place. Where the people do not have a voice, they will not be able to recognize and honour themselves.

At the moment I am working on a painting which depicts the market-place of an imaginary town in which a memorial has been erected. I wanted to dedicate this memorial to the noble Scharnhorst and to ask you to compose an inscription for it. The inscription cannot be more than twenty words, however, for I lack space for anything longer. I trust in your kindness to fulfil my request.

Your compatriot Friedrich

Part VII

Observation and Tradition

VII

Introduction

At the close of the year 1799 Napoleon Bonaparte was installed as First Consul in France. Over the next few years, political opposition was silenced and censorship reimposed. Political clubs were banned, and old Jacobins and sans-culottes were deported on trumped-up charges. At the time of Napoleon's coup, Paris had seventy newspapers. After a decade or so, four survived, which was just the same number as there had been before 1789. The fear that revolution might spread among the other European countries turned into the very real threat of an organized and expansionist military power. Russia having withdrawn from the alliance against France, Austria was defeated at Marengo and forced to sign the Treaty of Lunéville in 1801. Standing alone in opposition, Britain agreed to an uneasy peace at Amiens the following year, though the prospect of a continental Europe united under French domination was not one that British interests would accept as a status quo. In his turn Napoleon continued with plans for an invasion of England until 1805, when the scheme was finally ruled out by the defeat of his naval forces at the battle of Trafalgar. A year later, however, the French effectively defeated a renewed European alliance involving Britain, Austria, Russia, Sweden, Naples and some of the German states, in the process achieving the final overthrow of the Holy Roman Empire. Napoleon's imperial ambition was confirmed in 1806, when he proclaimed himself Emperor. The ever-loyal Jacques-Louis David recorded the event in a colossal painting, capturing for eternity the moment when Napoleon, who bowed to no one, took the crown from the attendant Pope, and placed it on his own head. Now at its height, the French Empire extended from the Dalmatian coast to the Pyrenees and from the Elbe in the north to the toe of Italy in the south. By 1808 Napoleon's brothers were installed as kings in Westphalia, Holland and Madrid, and his brother-in-law in Naples, while he assumed the crown of Italy himself.

At that point Spanish resistance opened a further front of European opposition, leading to the invasion of British forces in Portugal and the ensuing Peninsular War. While this war was still proceeding, Napoleon moved against Russia and was drawn gradually further into a disastrous invasion. Following the retreat from Moscow in 1812, he was unable fully to recover his forces or his military initiative. Heavy defeats followed against the combined armies of Austria and Prussia on his eastern front and against the British in the Peninsula. Following the surrender of Paris in March 1814,

Napoleon was finally deposed by the French senate, to be replaced by Louis XVIII, the eldest surviving brother of the king the revolutionary regime had sent to the guillotine twenty-two years earlier. France was confined within the limits of its 1792 boundaries, while the former Emperor was exiled to Elba.

However, the great majority of the French population remained hostile both to the restored Bourbon monarchy and to the return of royalist émigrés. (Elisabeth Vigée-Lebrun, originally listed as a proscribed émigré, had been allowed to return earlier, following the success of an artists' petition in 1800.) When Napoleon escaped from exile and landed in the south of France, he was able to attract a considerable army of followers, and in the spring of 1815 he re-entered Paris in triumph. The triumph was short-lived. In June the hastily remobilized allies finally imposed a decisive defeat at the battle of Waterloo. The former Emperor was exiled to the more distant and more secure island of St Helena. France was contained again, this time within her boundaries of 1790, and a second reinstatement of Louis XVIII initiated a short period of 'White Terror'. Within fifteen years, the Bourbons were to be ejected for the last time, but by then Napoleon was dead. His fall had in the end been as absolute as his reign. For all that, no restoration could overturn the changes he left in the administrative structure of France, in the class composition of its population, and in the relationship between the two. His legacy persists in the bureaucratic character of modern Europe.

Napoleon also left a disturbing legacy in the European imagination. In justification of his authority, he had luxuriated in an imagery of republican virtue that the revolutionaries had originally taken from the legacy of ancient Rome. His adopted title of First Consul was a clear reference to that legacy. It is to this basically political tension between republican enthusiasm and nostalgic idealism that we should perhaps look in accounting for the uneasy combination of disciplined vitality with sensuous lassitude that imbues the neo-classical art of the early nineteenth century (see VIIB2, VIIB9). Testament to the fascination Napoleon exerted during his rule survives in the painting of David and of Jean-Dominique Ingres, in the sculpture of Antonio Canova and in the music of Beethoven. In the icons the artists provided for the Emperor, the classical references are certainly carefully established, as they were in much of the rhetoric that accompanied artistic practice at the time (VIIB3). And yet the very depth of its implication in the legacy of revolution and the rise of Napoleon invests early nineteenth-century neo-classicism with a paradoxical and uncomfortable modernity. As one whose power was achieved rather than inherited, the former First Consul had also become the type at once of the modern hero and of the modern despot. Long after his fall, he remained an abiding example to those for whom the meaning of ambition was the pursuit of agency by the individual; the more so, ironically, the more pervasively success for the individual came to be measured in terms of commercial and social self-establishment.

If neo-classicism was implicated in the shifting political values of the period, classical art itself remained a source of abiding interest to European intellectuals, largely irrespective of the course of European wars and revolutions. Increasingly, however, that interest came to be inflected by others, which served to modify the very meaning of the classical. Greek art in particular was re-examined in the light of a growing tendency to naturalism (VIA), itself fuelled by considerable developments

in scientific knowledge and by the spread of scientific method (VIIA5, 7, 9, 13). In England, one of the most celebrated surviving ensembles of classical sculpture was to become the focus for intense debates about the character of Greek art and its status as example. In 1807, The Earl of Elgin put on display the marble carvings he had appropriated – or saved – from the Parthenon in Athens, with a proposal that they be bought from him by the British Government. In the resulting controversy it was not clear which view offered the better justification for their acquisition: that they represented the supreme realization of that abstract ideal by which all high art should be guided; or that they furnished examples of the most exquisite naturalism, thereby countering the assumption that a tendency to idealization lay at the heart of all true classical art. (See VIIB11 (i–vi).)

It was in the developing genre of landscape painting that the importance of naturalistic observation was most vividly demonstrated. Behind Pierre-Henri de Valenciennes' 'Advice to a Student...' (VIIA3) lay a quantity of small informal sketches, painted at the end of the eighteenth century and devoted to the capture of specific atmospheric effects (see VIIA3). In England, John Constable gave increasing priority to the preservation of detail and character from particular rural motifs (see VIIA4). We do not mean to suggest that these or any other significant artists at the time believed that a satisfactory painting could be made without reference to the example of previous art. (Valenciennes' true ambitions lay in the field of 'historical' rather than naturalistic landscape, while Constable's interest in earlier painters is clearly revealed both in his work and in his correspondence.) Nor had the painters of the eighteenth century generally composed their works without making careful studies from life. What was new in the advanced landscape painting of the early nineteenth century was the idea that the phenomenal experience of the natural world should be taken as a measure, and that it was against this measure that the achieved effects of the painted composition should in the end be judged. At the same time, the study of phenomenal effects through the practice and connoisseurship of landscape painting in watercolours was encouraged, in England particularly, by the possibility of high-quality colour illustration (VIIA11), while interest in the scenic and the topographical was in general fuelled by rapid developments in the technology of reproductive printing (VIIB12).

Two further factors were at work to complicate and to enlarge the understanding of tradition as it bore upon the practice of art in Europe. In Germany, Romantic nationalism had led to celebration of the indigenous art of the Middle Ages, in a tendency exacerbated by the effects of French imperial expansion. In France itself, the Musée des Monuments had grown out of Lenoir's efforts to salvage medieval and other monuments displaced by the Revolution. In the early years of the century, an idealized understanding of the Middle Ages – of the supposed unity of its social orders and of the supposed simplicity and purity of its faith – served as an imaginary counter to the disastrous conflicts and secular loyalties of the present. In the work of the German Nazarenes, reaction against academic classicism issued in the combination of a self-consciously 'medieval' or neo-Renaissance style with an aestheticized Christian iconography (see VIIB5, 6, 7). In the French writings of the royalist Comte de Chateaubriand we find the 'beauties' of Christianity similarly associated with an idealized Middle Ages in reaction against the secular classicism of the revolutionary

period (VIIB4). Despite the appeals to community that we find alike in the programmes of the Nazarenes and in the work of Chateaubriand, implicit in their responses is a rejection of the egalitarian aspects of that nascent socialism which Enlightenment and Revolution had in their different ways encouraged.

The second factor leading to a revised European understanding of artistic traditions was the rapid expansion that took place in the late eighteenth and early nineteenth centuries in the range of artefacts that came up for consideration as artistic. This expansion was primarily geographical, as information spread about increasingly remote civilizations and as the fruits of anthropological study were published in illustrated form. But it was also chronological, as knowledge of pre-classical civilizations was disseminated through archaeological appropriation and publication. Two examples will testify to the processes in question and to their consequences. The first is Benjamin West's 'Discourse to the Students of the Royal Academy', delivered following his election to the Presidency in 1792 (VIIB1). In his better-known Discourses, West's predecessor Sir Joshua Reynolds had had in view a single continuous tradition connecting the academic artist of the recent past and the present back through the Italian Renaissance masters to the painters and sculptors of Greece and Rome. For West, however, the field of possible reference includes material from North and South America, from India and from the Middle East. The second example is the massive 'Description of Egypt', published between 1809 and 1820 by artists and 'savants' who had accompanied Napoleon on his Egyptian campaign of 1798-9 (VIIB8). Acquaintance with the extent and antiquity of Egyptian civilization greatly encouraged a broader understanding of the antecedents of the European tradition, while stimulating further interest in the cultures of the ancient Middle East and of Africa.

Expansion in the range of cultures and artefacts admitted into the history of art led not simply to a revision in the understanding of artistic traditions. It also encouraged changes in the methods by which individual works of art were classified and interpreted. Inquiries of the kind represented by Georg Friedrich Creuzer (VIIB10) and Richard Payne Knight (VIIB13) were driven by an anthropological curiosity concerning the wide range of human artefacts and the common tendencies they might reveal. So long as the interpretation of art was submissive to a fixed canon of values, curiosity of this order was likely to be inhibited, whether the authority in question was vested in religious doctrine or in academic protocol, or in some combination of the two. By the end of our period, however, the factors principally determining both the production and the interpretation of art were such as neither Churches nor Academies could control.

VIIA

Objects of Study

1 Johann Wolfgang Goethe (1749–1832) Introduction to the *Propyläen*

Together with Herder and Schiller (see VA7, 12 and 13), Goethe was one of the leading exponents of the *Sturm und Drang* (Storm and Stress). This was a primarily literary movement which emphasized individual and national genius at the expense of a reliance on tradition. Goethe's writings of the early 1770s (see VA4 and VB7), in particular his novel *The Sufferings of Young Werther*, were later to be taken up by the Romantics as paradigmatic of the new spirit of freedom from conventional modes of expression. However, his appointment to the court of the Duke of Weimar in 1775, and above all, the effect of his journey to Italy between 1786 and 1788, led him to a new appreciation of the classical heritage. In the late 1790s he collaborated with Schiller to produce two short-lived journals dedicated to raising the level of art in Germany and exploring the Greek ideal. The best known of these was the *Propyläen* (1798–1800), which took its title from the name of the gateway to the Acropolis in Athens. It was also at this time that Goethe organized an annual competition under the auspices of the 'Weimar Friends of Art' to encourage painting of a neo-classical style and subject-matter. The competition attracted hostile comment from the younger, Romantic generation (see VIB5) and was conspicuously unsuccessful in fostering a classical revival. In his introduction to the *Propyläen*, Goethe sets out his ideas for the way forward in art, advocating the close observation of nature, informed and guided by an understanding of the classical ideal. Goethe seems to sense the paradox of wanting something 'both natural and beyond nature'. But in his search for classical harmony, he emphasizes a point which, since Lessing (IIIA10), was becoming increasingly significant in the theory of art. The desired overall harmony of form must be rooted in an acknowledgement of the constraints of the particular medium. If two and three dimensions are mixed, 'true art is in decline.' Our extracts are taken from *Goethe on Art*, selected, edited and translated by John Gage, London: Scolar Press, 1980, pp. 3–4, 6–7, 10–11. (For an example of Goethe's later thinking on art, as distilled into his 'Maxims and Reflections', see *Art in Theory 1815–1900*, IA12).

The youth who begins to feel the attraction of nature and art believes that a serious effort alone will enable him to penetrate to their inner sanctuary; but the man discovers that even after lengthy wanderings up and down, he is still in the forecourt.

This is what has given rise to our title; the step, the door, the entrance, the antechamber, the space between the inner and the outer, the sacred and the profane, this is the place we choose as the meeting-ground for exchanges with our friends.

It will not be inappropriate if by this word *Propylæum* the reader is reminded of that edifice that led to the citadel of Athens and the Temple of Minerva; but let no one suggest that we are presuming to attempt such artifice and splendour here. The name of the place will suggest what might have been done there, and discussions and conversations not unworthy of it will be expected.

Will not thinkers, scholars, artists be drawn to such a place to spend their best hours, and to dwell, at least in imagination, among a people endowed by nature with that perfection we desire but never attain, who achieved the continuous development of a culture that is only piecemeal and fleeting with us?

What modern nation does not owe its artistic culture to the Greeks; and, in some respects, who more so than the Germans?

So much in extenuation of our symbolic title, if that be necessary. Let it remind us that we shall depart as little as possible from Classic ground; let its brevity and its rich significance inform those friends of art whom we hope to interest in this work, that it is to present the observations and reflections on nature and art of a like-minded group of friends.

He whose vocation is to be an artist should pay vital and constant attention to everything around him, observe closely all objects and their parts, and by making practical use of what he has experienced, come to observe ever more sharply, first on his own behalf, but later for such information as he will gladly give to others. To this end we shall relate and present our readers with much that we have noted in various circumstances over the years, which we trust will be both useful and agreeable.

But who will not admit that unprejudiced observations are rarer than is generally believed? We are so ready to interject our own fancies, opinions, judgements into what comes to our notice, that we do not long remain quiet observers, but begin to reflect. [. . .]

The highest demand made on an artist is this: that he be true to nature, that he study her, imitate her, and produce something that resembles her phenomena. How great, how vast this demand is, is not always borne in mind, and even the true artist only learns it by experience in the course of his progressive development. Nature is separated from art by an enormous chasm which genius itself cannot bridge without outside assistance.

All that we see around us is but raw material. If it is rare enough for an artist, through instinct and taste, by practice and experiment, to reach the point of achieving the beautiful exterior of things, selecting the best from the good in front of him and producing at least a pleasing appearance, it is rarer still, especially in modern times, for an artist to penetrate into the depths of things as well as into the depths of his own soul, so as to produce in his works not only something light and superficially effective, but, as the rival of nature, something spiritually organic, and to give it a content and a form by which it appears both natural and beyond nature.

Man is the highest and the proper subject of art; to understand him, to extricate oneself from the labyrinth of his anatomy, a general knowledge of organic nature is imperative. The artist should also familiarize himself with inorganic matter, and with

the general operations of nature, especially where, as in the cases of sound and colour, they are adaptable to the purposes of art. But what a circuitous route he would be obliged to follow, if he were to take the trouble to seek out in the schools of the anatomist, the naturalist, or the professor of science what serves his purposes. It is indeed questionable whether he would find what is necessarily most important to him there. Those gentlemen have to satisfy the quite different needs of their own students, without thinking about the specialized and particular needs of the artist. Hence we propose to take a middle course, and although we do not imagine we can be exhaustive we may nevertheless give a survey of the whole field, and at least introduce the detailed studies.

The human figure cannot be understood merely through the observation of its surface: the interior must be laid bare, the parts must be separated, the connexions perceived, the differences noted, action and reaction observed, the hidden, constant, fundamental elements of the phenomena impressed on the mind, if we really wish to contemplate and imitate what moves in living waves before our eyes as a beautiful, unified whole. [. . .]

For the German artist, and for the modern or northern artist in general, the transition from formlessness to form, and the maintenance of form once attained, is difficult, nay, almost impossible. Let any artist who has spent some time in Italy ask himself whether contact with the best examples of ancient and modern art has not inspired him with the desire to study and imitate the human figure, its proportions, forms and character, and to spare no pains in this pursuit, to come close to the autonomy of those works and to produce something that both satisfies the senses, and, at the same time, lifts the soul into its highest regions. But he must also confess that, after his return, his efforts relaxed little by little, for he found few who saw truly what he represented, but only such as regard a work superficially for its agreeable suggestion, and who feel and enjoy something after their own fashion.

The worst picture can speak to our perception and imagination, for it sets them in motion, makes them free, and leaves them to themselves. The best also speaks to our perceptions, but in a higher language, one, certainly, which has to be understood, but which chains our feelings and our imagination and robs us of our will-power, for we cannot do what we please with the perfect, we are compelled to surrender to it in order to receive ourselves again, raised and ennobled.

That these are no idle dreams we shall endeavour to prove by our treatment of details, and we shall draw particular attention to one contradiction in which the Moderns so often get entangled. They call the Ancients their teachers, they attribute to their works an unapproachable perfection, and yet they distance themselves in theory and practice from the precepts which the Ancients constantly observed.

Leaving this important point, to which we shall often have occasion to return, we find others of which some notice should be taken.

One of the most striking signs of the decay of art is when we see its separate forms jumbled together. The arts themselves, in all their varieties, are closely related to each other, and have a great tendency to unite, and even lose themselves in each other. But herein lies the duty, the merit and the dignity of the artist: that he knows how to separate his own branch from the others, and to isolate it as far as may be.

It has been noticed that all visual art tends towards painting, all poetry towards the drama; and this may in future be the occasion of important observations.

The true, prescriptive artist strives after artistic truth; the lawless artist, following blind instinct, after an appearance of naturalness. The one leads to the highest peak of art, the other to its lowest depths.

This is no less true of the individual arts than of art in general: the sculptor must think and feel differently from the painter, and must set about a work in relief in a different way from the way he would deal with a free-standing statue. When the low relief is raised little by little, and then parts and figures are cut free from the ground and finally buildings and landscapes admitted, producing a work which is half picture, half puppet-show, true art is in decline, and it is to be deplored that excellent artists have taken this course in modern times.

2 Priscilla Wakefield (1751–1832) from *Reflections on the Present Condition of the Female Sex*

Wakefield was a well-to-do Quaker philanthropist. Her main work was in the field of education, and she wrote many essays of moral instruction for parents and their children. The principal purpose of the present text is to discuss ways in which women can become more useful members of society. The passages we have selected concern women of what she calls the 'first and second ranks' of society who, through some kind of misfortune, are in the position of needing to fend for themselves. Faced by the relative triviality of the pursuits with which gentlewomen were associated, Wakefield lays the blame not on innate incapacity but on women's inadequate education and understanding of their own potential. Accordingly she surveys occupations which appear suitable for women of a certain social standing, through the practice of which they might expect to maintain their independence and livelihood. Among these are the arts. Wakefield first discusses the fine arts, from history painting to portraiture, maintaining that women have the capacity to succeed in them. At the same time, she acknowledges the actual social obstacles which stand in the way of women making a career in the arts: that art tends to be treated merely as a form of amusement for fashionable young ladies; that theoretical ('scientific') treatments of the subject tend to be unavailable to women; that they are denied access to an intellectual community in which art is taken seriously; and that they have little opportunity to engage with the fount of artistic achievement, namely 'the precious models of antiquity'. She further acknowledges, beyond enumerating these practical obstacles, that the 'genius' necessary for a successful career in art is likely to be no more evenly distributed among women than it is among men. Accordingly she also considers the possibility of women developing careers in the applied arts and design. She suggests the colouring of prints, designing frontispieces for books, needlework, miniatures, book illustration and engraving. Even sculpture is not precluded, despite its more physical demands. Apart from the obvious question of gender imbalance in eighteenth-century society, and its consequences for the arts as for any other walk of life, the interest of the text for the present anthology lies also as much in what it does not say as in what it does. Wakefield eschews all high-flown estimates of the arts, of their stimulus to spiritual improvement or their civilizing potential. From her point of view, the key issue is that 'the fine arts offer a mode of subsistence' and that, since they require 'the exercise of intellectual rather than bodily powers', they represent an option for women seeking – or needing – economic

independence from men. Our extracts are taken from chapters I and VI of *Reflections on the Present Condition of the Female Sex; with Suggestions for its Improvement*, London: J. Johnson, 1798, pp. 1-3, 6-7, 124-34.

It is asserted by Doctor Adam Smith, that every individual is a burthen upon the society to which he belongs, who does not contribute his share of productive labour for the good of the whole. The Doctor, when he lays down this principle, speaks in general terms of man, as a being capable of forming a social compact for mutual defence, and the advantage of the community at large. He does not absolutely specify, that both sexes, in order to render themselves beneficial members of society, are equally required to comply with these terms; but since the female sex is included in the idea of the species, and as women possess the same qualities as men, though perhaps in a different degree, their sex cannot free them from the claim of the public for their proportion of usefulness. That the major part of the sex, especially of those among the higher orders, neglect to fulfil this important obligation, is a fact that must be admitted, and points out the propriety of an enquiry into the causes of their deficiency.

The indolent indulgence and trifling pursuits in which those who are distinguished by the appellation of gentlewomen, often pass their lives, may be attributed, with greater probability, to a contracted education, custom, false pride, and idolizing adulation, than to any defect in their intellectual capacities. [...]

In civilized nations it has ever been the misfortune of the sex to be too highly elevated, or too deeply depressed; now raised above the condition of mortals, upon the score of their personal attractions; and now debased below that of reasonable creatures, with respect to their intellectual endowments. The result of this improper treatment has been a neglect of the mental powers, which women really possess, but know not how to exercise; and they have been contented to barter the dignity of reason, for the imaginary privilege of an empire, of the existence of which they can entertain no reasonable hope beyond the duration of youth and beauty.

Of the few who have raised themselves to pre-eminence by daring to stray beyond the accustomed path, the envy of their own sex, and the jealousy or contempt of the other, have too often been the attendants; a fate which doubtless has deterred others from attempting to follow them, or emulate, even in an inferior degree, the distinction they have attained.

* * *

It is far from my present design, to point out all the various pursuits which may consistently engage the talents, or employ the industry of women, whose refinement of manners unfit them for any occupation of a sordid menial kind; such an undertaking would require an extensive acquaintance with the distinct branches of the fine arts, which adorn, and of the numerous manufactures which enrich, this country. But a few remarks upon the nature of those employments, which are best adapted to the higher classes of the sex, when reduced to necessitous circumstances, may, perhaps, afford useful hints to those, who are languishing under the pressure of misfortune, and induce abler pens to treat a subject hitherto greatly neglected.

Numerous difficulties arise in the choice of occupations for the purpose. They must be such as are neither laborious nor servile, and they must of course be productive, without requiring a capital.

For these reasons, pursuits which require the exercise of intellectual, rather than bodily powers, are generally the most eligible.

Literature affords a respectable and pleasing employment, for those who possess talents, and an adequate degree of mental cultivation. For although the emolument is precarious, and seldom equal to a maintenance, yet if the attempt be tolerably successful, it may yield a comfortable assistance in narrow circumstances, and beguile many hours, which might otherwise be passed in solitude or unavailing regret. The fine arts offer a mode of subsistence, congenial to the delicacy of the most refined minds, and they are peculiarly adapted by their elegance, to the gratification of taste. The perfection of every species of painting is attainable by women, from the representation of historic facts, to the minute execution of the miniature portrait, if they will bestow sufficient time and application for the acquisition of the principles of the art, in the study of those models, which have been the means of transmitting the names and character of so many men, to the admiration of posterity. The successful exercise of this imitative art requires invention, taste and judgment: in the two first, the sex are allowed to excel, and the last may be obtained by a perseverance in examining, comparing, and reflecting upon the works of those masters, who have copied nature in her most graceful forms.

Compared with the numbers of the other sex, it does not appear that many females, either in ancient or modern times, have rendered themselves celebrated in this line of excellence; but the cause of this disproportion may surely, with greater probability, be attributed to its having been attempted by so few women, than to incapacity; among the very small number of female artists, who have practised painting as a profession, there have not been wanting some instances of rare merit. But it is to the genial influence of education only, that society must stand indebted for the frequent recurrence of such examples: rare, indeed, is that genius which overcomes all obstacles; too often do the powers of the mind, like the undiscovered diamond in the mine, lie dormant, if they be not called forth by a propitious combination of circumstances. As it is not customary for girls to study the art of painting, with a view to adopt it as a profession, it is impossible to ascertain the extent of their capacity for the pencil; but certainly there appears no natural deficiency, either mental or corporeal, to prevent them from becoming proficient in that art, were the bent of their education favourable to the attempt. It must be allowed, that within the last twenty years, it has been a general fashion for young ladies to learn to draw, and that it is not unusual to see performances executed in such a manner as to excite a reasonable expectation that their powers, if properly cultivated, would produce testimonials of no inferior ability. But as the view of the generality is only elegant amusement, they do not endeavour to attain any degree of excellence, beyond that of copying prints or drawings; original design is too arduous, and it is conceived that the qualifications it requires, would engross too large a portion of time. They neither read those books which treat of the subject in a scientific manner; they do not associate with those persons, whose conversation is adapted to form their taste, nor have they an opportunity of imbibing the enthusiasm, which is produced by the

contemplation of the precious models of antiquity. No surprise can therefore be excited, that those fruits are not visible, which are the effects of such necessary preparation.

But as neither exalted genius, nor the means of cultivating that portion of it which nature has bestowed, to the utmost extent, are likely to be very generally possessed; it is fortunate for those who are less liberally endowed, that there are many profitable, though inferior branches of design, or of arts connected with it. The drapery and landscape both of portraits and historical pieces, are often entrusted to the pupils of the master, and constitute a branch of the art, for which women might be allowed to be candidates. The elegant as well as the humorous designs which embellish the windows of print-sellers, &c. also sketches for the frontispieces of books, and other ornaments of the same kind, must employ many artists, nor does it appear that any good reason for confining them to one sex has been assigned.

Colouring of prints is a lucrative employment; there was a few years ago in London, a French woman, who had a peculiar method of applying water colours to prints, by which she might have gained a very liberal income, had her industry and morals been equal to her ingenuity. Designs for needle-work, and ornamental works of all kinds, are now mostly performed by men, and those who have a good taste, obtain a great deal of money by them; but surely this employment is one, among many, which has been improperly assumed by the other sex, and should be appropriated to women. The delicate touches of miniature painting, and painting in enamel, with devices for rings and lockets in hair-work, are more characteristic of female talents than of masculine powers. The delineation of animals or plants for books of natural history, and colouring of maps or globes may be followed with some advantage. Patterns for calico-printers and paper-stainers are lower departments of the same art, which might surely be allowed as sources of subsistence to one sex with equal propriety as to the other.

Engraving, though it differ from painting in the execution, may be said to have the same origin, both being regulated by similar principles, as far as relates to design and shadow; therefore, if the faculties of women are capable of directing the pencil, there can be no apprehension that they are not also equal to guide the graver with the same success.

Statuary and modelling are arts with which I am too little acquainted to hazard any opinion concerning, but the productions of the honourable Mrs. Damer, and a few others, authorize an assurance, that women have only to apply their talents to them in order to excel. If the resistance of marble and hard substances be too powerful for them to subdue, wax and the other materials of a softer nature, will easily yield to their impressions. The necessity of vigour and perseverance in cultivating natural talents, is equally great in attaining perfection of any kind.

3 Pierre-Henri de Valenciennes (1750–1819) from ‘Advice to a Student on Painting, and particularly on landscape’

Valenciennes was born in Toulouse, and spent his early years combining training in history painting with small-scale studies of the French landscape. He was in Italy in 1769 and for

a longer period between 1777 and 1785. Responding to instruction from Joseph Vernet, in the latter part of this period he made a number of open-air studies in oil on paper, the most remarkable of which show wide and atmospheric skies above low horizons. He was received as an Academician in 1787, and from then until his death regularly submitted large-scale landscapes with idealized classical motifs painted in an attenuated neo-classical style. His more informal and more interesting work was not well known until a large number of his oil sketches were donated to the Louvre in 1930. His importance for subsequent developments thus rests largely on his major theoretical work, *Elémens de perspective pratique, à l'usage des artistes* (Elements of Practical Perspective, for the Use of Artists), to which was appended *Réflexions et Conseils à un élève, sur la peinture, et particulièrement sur le genre du paysage*, Paris: Desenne and Duprat, 1800. This was the first treatise to be written on painting which assumed that landscape painting was a genre deserving of exposition and instruction, that it required appropriate forms of study and practice, and that it was not to be dismissed either as a mere support to history painting or as a refuge for those unable to rise to the challenge of the higher genre. It was to remain a basic resource for French painters for the best part of a hundred years. In 1812 Valenciennes was appointed Professor of Perspective at the Ecole Impériale des Beaux-Arts (the Napoleonic replacement for the Académie Royale). It was a consequence of his efforts to raise the status of the genre that a special Rome Prize in 'historical landscape' was instituted in 1816. The prize came too late, however, to breathe new life into the kind of large-scale classical composition it was designed to stimulate. The positive effects of Valenciennes' teaching were instead to be felt in the longer term in works by Corot and the Impressionists that shared some of the spontaneity and informality of his own sketches – works that he himself would have classed as mere preparatory exercises. Our excerpts are taken from the *Réflexions et Conseils*, in the original 1800 edition of the *Elémens de perspective pratique*, pp. 380–8, 404–9, 417–27, translated for the present volume by Christopher Miller.

There are two ways of envisaging nature; each offers a myriad nuances that form and determine the artist's talent.

The first directs us to see nature just as it is, and to represent it as faithfully as possible. In this manner, objects insufficiently interesting are excluded; those that show some affinity are set side by side, however far apart they were found; harmonies and contrasts are sought; in short, the artist selects a particular view because it seems more agreeable and more picturesque.

The second directs us to see nature as it might be: such as the embellished imagination represents it to the man of genius who has seen much. His choice of what nature offers is the fruit of careful comparison, analysis and reflection. He knows nature's beauties and its defects; when he reads, his imagination takes fire; he identifies with those celebrated poets who have described and hymned the beauty of nature; in a poetical description, he sees the place itself. In the works of Homer, Xenophon, Diodorus [Siculus], Pausanias and Plutarch, he has an eye for both custom and costume. Such a man lives now with Anacreon and Sappho, now with Venus, Cupid and the Graces; now he descends into Tartarus with Virgil, and sees Sisyphus straining at his rock and Ixion turning his wheel; now he wanders over the arid rocks and deserts peopled by the phantoms of Ossian's imagination, or seeks to lose himself in the delicious valleys of Arcadia or Tempe; he makes himself, in short, the companion of men from every country and century by reading and learning their history.

There can be no doubt that this way of seeing and studying nature is far more difficult than the first. One must be born with genius, travel a great deal and reflect on one's travels still more. One must nurture oneself on the ancients and moderns; familiarize oneself with the productions of the great painters; one must, in short, have endowed oneself with creative faculties, if one is to beget masterpieces that command the attention of the philosopher and the man of learning. Only then can one successively produce in one's works all those sensations by which one has been affected oneself, inspiring in the soul of the spectator various emotions – melancholy or fright, calmness or trembling, sadness or rejoicing – but never less than admiration and enthusiasm. When the artist is thus prepared, the nature that he portrays is no cold, inanimate, insignificant entity; he paints it so that it speaks to the soul. In his hands, it has an impact on the feelings; the sentiments it expresses are specific, and easily communicate themselves to the man of sensibility.

How great a difference there is between a painting showing a cow and sheep at pasture, and that of the funeral of Phocion; between a landscape portraying the banks of the Meuse, and one showing the shepherds of Arcady; between rainy weather in Ruysdael and the Flood in Poussin! The former are painted with a feeling for colour, the latter with the colour of feeling.

In that first way of envisaging nature, models are never lacking; whatever the country, there they stand, before one's eyes; and several artists ancient and modern have amply demonstrated that, by choosing the least little object and copying it, even with abject fidelity, one can, with a sense of touch and a feeling for colour, make 'a pretty picture'.

But what models did Poussin copy when he sought to represent the earthly paradise? What models did he study to paint the landscape of his Polyphemus? His sublime genius has shown us by turns Egypt, Greece, Syria, and Chaldaea; the sublime Rome of Coriolanus, and Rome abased beneath the Popes. He has successively interpreted Moses, Joseph[us Flavius], Homer, Plutarch and others, to such perfection that when we see his immortal works we are convinced that he lived with these great men: that he drew their dwellings, copied their costumes, and depicted their domestic scenes just as nature presented them, in order to hand them down to posterity.

* * *

Every artist is convinced that there is in nature an ideal beauty; the Greeks clearly perceived, and contrived to represent it, in the figures of their gods and heroes: the Apollo, the Venus, the head of Medusa, the Olympian Jupiter, and the Farnese Hercules are irrefutable proof of this. The men of genius who, so to speak, created these figures, had exalted their imaginations to such a pitch that they believed themselves to be of the gods' society, and therefore capable of transmitting their portraits to mortals – in whom these figures inspired so profound an effect, that, astonished by this wonder, they at length adored those images of divinity that the perfection of art presented for their homage.

We shall not speak here of ideal beauty in general; Winckelmann and other well-known authors have defined it and analysed its every part; we shall simply attempt to prove that there is also an ideal beauty in historical landscape painting, and that the works of the great masters who perceived this have nothing to fear but the ravages of

time; for as long as they exist, they will be admired by every man of certain taste and sensitivity.

Happy indeed is the artist who, surrendering to the charms of illusion, thinks that he sees nature such as nature should be! His joy is unbounded; he has the satisfaction, he feels the pride and nobility of creating, as it were, a perfection of nature too rare ever to be encountered. Of necessity, what he creates is new, because his imagination, inflamed and nourished by the descriptions of the poets, assumes infinite variety and multiplicity. Having set before us the furious north wind, tumultuously bursting from the deep caverns where Aeolus had imprisoned it, he likes to regain his calm by showing Narcissus at the margin of a fountain, whose calm and limpid waters give back in every detail the visage of this unhappy lover: those languorous, blighted features, which prefigure the relentless fate by which his soul must be laid to rest. He moves from the darkness of Tartarus to the serenity of the Elysian Fields; from the smoking mouth of Etna to the plain of Amphitrite; he brings forth Venus from the breast of the foaming deep, whose silvery waves advance to bestow on the goddess of beauty an amorous caress.

When the man of genius wishes to repose and refresh his imagination, he opens his eyes to nature again. He contemplates and observes it; he seeks all around him the models that may help him paint what his enthusiasm has revealed to him. Alas! He finds little or nothing; he sees nature as it is; he admires but is not satisfied. Rocks seem to him pitiful, the mountains abased, and the precipice without depth. His genius at first contracts, as it is assailed on every side by the myriad details presenting themselves to his eye. But soon, he severs the links by which they are bound; then, freeing himself of the scrupulous verities by which he was enchained, he magnifies the rocks and carries the mountain peaks to the clouds; hurling his imagination into the chasms, he invests them with the depth of the abyss. Now these oaks are vast and majestic; they are the forest of the Druids. The smallest objects acquire nobility and fire; everything takes life beneath his sorcerer's brush. The very reeds that quiver in the wind have ceased to be those simplest productions of marshy soil, and become the unhappy monument of Pan's lover, bathed by the limpid waters of the river Ladon, and already yielding the plaintive harmonies of the flute.

The obstacles in the way of one seeking to make his name in the genre of historical landscape are many, it is true, but they are not insurmountable, as Poussin has shown. Though none has since equalled that great man, one should not believe the task impossible; the torch of genius has not been extinguished. We have great models; with the courage to imitate them, and a noble conviction of our power to succeed, we may come close to their talent. Boldness and tenacity attain the most difficult goals. Virgil first said it: *Labor omnia vincit improbus*. It is in this conviction that we set out to give advice to the young artist, and to show him the route that he must follow, and the studies to which he must devote himself if he is to acquire a talent that may one day make him commendable in the eyes of men of sensitivity and learning. To merit the approval and esteem of such men is eminently pleasing; for it must be admitted that, of all the praise and criticism one receives, either positive or negative, there is little enough by which the artist's vanity should be swayed. True connoisseurs are so rare, compliments so common, and criticism so facile that it is proper to be on one's

guard, and of all that one hears, believe only what bears the hallmark of justice and carries conviction.

We shall attempt to instruct a pupil in whom we suppose a good general aptitude for painting, and an innate sentiment of good taste in this art. We shall outline the knowledge that is prerequisite; we shall direct him in our studio, so that his eye is practised and his hand assured; we shall then take him into the countryside, to study nature; finally, we shall take him travelling in distant countries, in order to break his routine and vary his talent. Hiding nothing of what we know, we shall teach him to learn even what we ourselves do not know. If he is able to make good use of our lessons, which are the fruit of study and experience; if he feels the strength and the compulsion to raise himself above the common herd of painters; if he has the courage to undertake what others do not, he will surely be no ordinary man; he will merit the name of artist, and his productions will speak to the heart and mind alike.

We should not conceal from him the difficulties that he will have to surmount and the disappointments he will have to endure; he must reconcile himself to toil, fatigue and reverses. But when he thinks where his studies will lead: of the talent that he can acquire, of the joy of being considered a great artist, of the hope that his country will one day be proud to count him among the illustrious men that it has produced, his soul will be magnified, and his courage will rise above the obstacles. He will hasten to undertake studies that give constant pleasure, and will seek, by perseverance, to bring forward the hour when he reaps the fruits of his labour.

The counsels that we give are those that we received from our masters, and those that experience has suggested; those that we have followed, and even those that we could not turn to account. We shall add certain observations concerning nature and the places through which we have passed. We shall have attained our goal, and consider ourselves happy indeed, if this modest essay on an art that is our sole delight should prove of service to a single pupil, and help to mould a single artist in the genre of landscape.

* * *

For some months, our pupil has been drawing under our supervision; he has copied several paintings by the greatest masters; but he has not seen nature. He needs to consult it, and in the summer we go together to the countryside. There we communicate our observations on the proper way to make studies that will subsequently be of service in composing paintings. These observations are important for *all* painters, in that most of them, out of negligence, misunderstanding, or lack of thought, commit a grave error; they insist on bringing too high a level of finish to studies that should be nothing more than hasty sketches, intended to catch nature in the act.

A history, portrait, flower or still-life painter copies nature in his studio, where it is constantly illuminated by the same light. Since this light is only secondary, it is more or less even and uniform during the hours when the sun lights the atmosphere; its few variations are all but imperceptible. When the sky is covered with clouds that absolutely interrupt the great original source of light, daylight is more or less the same from morn till night, as it is in the studio; under those circumstances, one has the time carefully to complete and finish all the details of the object one is studying.

But when this object is lit by the sun, and sunlight and shadows are changing continuously because of the movement of the earth, one cannot take one's time copying nature; the chosen light-effect varies so quickly that it is no longer recognizable in the state with which one began. We have already indicated that the effects of nature are almost never the same at the same instant or hour of the day. These variations depend on a host of different circumstances, such as the purity of the light, the quantity of vapour in the atmosphere, the wind, the rain, the elevation of the site, and the different reflections of the clouds, caused by their colour, weight or weightlessness; in short on an infinite number of causes, so many that they cannot all find a place in this very short work. But what we have said must suffice to show that it is absurd for an artist to spend an entire day copying a single view from nature. He can hardly fail to see that in this way he would paint the sky at sunrise, the background a little later, the distance at midday, the middle distance at four in the afternoon, and the foreground in the light of the setting sun. The sky is consequently of a silvery colour, the background misty, the distance is evenly illuminated without any long shadows, the middle distance is touched with gold, and the foreground is lit by the setting sun. The shadows in the background stretch out towards the front of the picture; those of the foreground point inward to the back; those in the distance point one way, and those in the middle distance another. It should not be thought that this criticism is intended as an unwarrantable exaggeration; we have seen a picture by Locatelli charming in both its colours and composition, but which was lit half from one side and half from the other.

We have seen innumerable pictures painted by less famous artists, in which all the mistakes enumerated above are to be found. Those who painted them called them studies from nature, but they were errors, perverse errors, and traduced nature. To seek to bind together all the successive instants of the day and their graduated effects in a single moment is the height of falsity, and clearly demonstrates a complete lack of judgement.

There are others, and they are a majority, who copy nature only during a two-hour interval, and who return the following day at the same time to continue their studies. These are undoubtedly more reasonable than the first, in that their works possess a greater unity of effect. But who can vouchsafe, when they break off their work today, that they will find the same mist, the same tones of light, shadow and reflection, on the morrow? It is an old adage, and a true one, that one day comes after another, and never two alike. So true is it that we have known artists of merit helpless to finish their many half-completed studies because they were unable to find the same effects in nature.

The pupil who wishes to work from nature must therefore take a different way about, or lose his pains. First, one must confine oneself to copying, as best one may, the main tones of nature in the effect one has chosen. Begin your study with the sky, which gives the tone of the background; this, in its turn, gives those of the planes with which it connects. In this way, gradually advance towards the foreground, which consequently is always harmonious with the sky used to create the local tone. Clearly, using this method, nothing can be treated in detail. Indeed, all studies should be made rigorously within the space of two hours at the most; if the effect is that of the rising or the setting sun, no more than an hour should be spent on it.

We know only too well that great abilities and much practice at painting from nature are necessary if one is to make anything worthwhile. But follow these rules, and this indispensable practice will easily be acquired; in short order, you will learn to make an extremely rapid sketch from nature.

It will no doubt be objected, that he who follows this method cannot learn how to finish a painting. There is some truth in this. But one can study the finishing of pictures from nature by copying parts of it when the weather is overcast, and objects are deprived of sunlight throughout the day. Then one seeks to render, as accurately as possible, every detail that one sees; and this form of study is indeed imperative, in that it teaches one to finish a painting and enrich it with absorbing details.

It is certainly much easier to finish the detailed parts of a painting than to capture the overall view, the local tone, and the light of the particular moment of the day that one seeks to paint. If one already has, in a well-executed sketch, the local tone of the effect one wishes to render, one can use it to establish the tone of the effect, and subsequently finish it from particular studies, which then serve only for touch and colour. For the tone in the details must always be at one with the local colour recorded in the sketch, which serves to determine the overall effect and define the unity of tones prevailing at the chosen time of day.

You must also be intimately persuaded that the overall effect of a painting depends on the tone of the sky; if one should fail to render the truth of this tone, the rest will necessarily jar. So if you should not at first succeed with the local colour of the sky, you must start again, whatever pains you have taken. Otherwise you will have a disagreeable experience, that of producing an effect contrary to the one you initially conceived. Rubbing out the sky is a better resource than rubbing out the rest.

It is a good thing to paint the same view at different times of day, in order to observe how light alters forms. So clearly perceptible and so astonishing are these changes that the objects are scarcely recognizable.

After these general principles, we enter upon the question of detail: 'There are objects,' we tell our pupil, 'that you can study separately, because they are fixed, such as monuments, ruins, cottages, trees, boulders, and so on; in short, anything that will maintain its natural state. And this sometimes includes an entire landscape, if the sky remains overcast throughout the day, or the light varies only imperceptibly.'

* * *

One essential thing, on which you must concentrate most particularly, is to acquire the habit of making studies from memory. These should reproduce the studies that you make daily, either by imitating the masters or by copying nature. It is a sure means of training the memory and stocking it with objects of interest; it facilitates genius, and its utility is clearer still when one is travelling. On the road, one is not always master of one's time; one often passes superlative landscapes without being able to stop and sketch them. Sometimes when a storm blows up, it affords extraordinary effects, such as striking pockets of moonlight, in short, all of those short-lived phenomena of nature that cannot, for lack of drawing materials, be captured on the instant. Unless one's memory is trained by habitual exercise, these objects quickly fade from it, however strongly it was first struck by them. They are replaced by those that came immediately thereafter, which may have less claim on our attention; whereas, if one is accustomed to working from memory, one can, at the first halt,

make a sketch of objects only fleetingly seen, but whose outline remains fresh. These sketches serve thereafter as a repertoire; what has been set down on paper recalls the parts needed to complete the main body of the places or things that deserve to be represented.

We have known artists of merit who, with great talent for imitating nature, entirely lacked the faculty of recalling scenes that were no longer before their eyes. Accustomed to having a model, they could not execute the least detail without it. It is, no doubt, an excellent thing to use a model; but since it is, in many cases, impossible to procure one, the painter who cannot work from memory is constantly brought up short or reduced to unsatisfactory execution, because he does not have enough recall of things he has seen.

We therefore exhort you: when you have made a study of something, do it again without looking at the model. Then, when you have strained your memory for the least detail and nothing more is forthcoming, you should compare the second study with the first; you will see the things you added and the things you left out. Your first few efforts will no doubt prove embarrassing; but be assured, you will soon accustom yourself to the method, and when you have, in this way, gradually stocked your mind, you will compose your works with much greater facility. [. . .]

In speaking of the ordering and composition of a landscape, we shall perhaps contradict the feelings of certain artists, who believe that, to make a good picture, it is quite sufficient to copy nature as it is. Their opinion would be correct if nature were always and everywhere beautiful, either overall or in detail. But as nature is perfect only in part, it is essential, in the composition of a painting, to select and then combine objects of beauty. Tact and learning are required in making this choice, in order to distinguish the beautiful from the defective and even from the mediocre; for there are objects which seem agreeable to the eye but cannot be accommodated in painting; while others would be perfectly satisfactory on their own, but lose all merit when combined with other masses. This discernment can be acquired only by seeing much, comparing what one has seen, and reflecting both on nature and on what the great masters have made of it. To these carefully worked pictures we owe insights that we should be long in acquiring, if we were obliged to seek them ourselves in consultation with nature. The labours of men of genius abbreviate our own; by making the most of their discoveries, we save precious time, and put ourselves in a position to make new ones.

Knowing beauty – how to find it, and how to capture it where it is found – one is already close to desiring it where it is lacking. To support this statement, here is an example:

Let us imagine ourselves in a beautiful place where variegated nature lays much of its bounty before us. Sitting in the shadow of an oak, we see, some fifty paces off, a fountain built of large stones, whose basin is only slightly raised; some of the spring water brims over and flows babbling down the slope. The sinuous rill bends its course now here, now there, half covered by newly grown grass and wild flowers. In front of the fountain is a great leaning tree, its trunk garlanded with moss, ivy and wild vine. Between the ends of its limbs, here and there, healthy and vigorous branches emerge; their leaves flutter down to earth under the impulse of a light breeze. On the side of the great stones of which the fountain is made, various aquatic

plants are growing. Dark green reeds and lake-tinted brambles partly cover this mass of stones, as do the shrubs that give it shade. A little further on, beside a lane, there is a dense wood that limits the view and concludes this landscape.

We are unsatisfied with this view, which, though picturesque in every detail, offers only one level for our painting. We look to one side and make out the end of the wood, which, extending into the plain, allows us to see, in part, a wide river that winds majestically through meadowland populated with cattle. Beyond this we can see plantations and thickly wooded areas, a village, and some isolated dwellings scattered along the slope of a hill, behind which there gradually rise groups of beautiful mountains that border the horizon. To make a delicious painting from this new viewpoint, all that is lacking is a foreground of the kind we have just described.

The imagination transports this agreeable fountain and its accessories, placing it at the foot of the second view. The artist takes his pencil, draws them, and makes, by this combination of two beautiful objects, a more perfect painting than if he had copied them separately. It remains to animate this landscape and place figures in it to impart a sense of action. One desires such figures ardently; the lane running past the fountain permits us to hope that we have not long to wait. And indeed, here comes a peasant woman in the distance; her red corslet, lit by the sun, will surely catch the light when she passes the fountain. She comes forward, arrives at that point, and one seizes the moment when she passes it to mark the place and thereby ensure the almost complete effect of the painting.

Above that part of the foreground on which the light lies and is caught by the figure, there is a cloud that also catches the light; the contrast of its brightness diminishes that of the peasant woman. We stop work for a moment, and wait for the slowly moving cloud to be carried by the wind into a part of the painting where it reflects no light; there we place it in the drawing, and the effect is the more striking for the contrast it provides.

This example should make clear what is meant by a composition from nature; by this means, and through our indispensable knowledge of architecture and perspective, a little hut set on the summit of a mountain can, at the stroke of a pencil, become an elegant temple; bushes become vigorous trees; a stone becomes a boulder, and a boulder a mountain. But to allow oneself such changes, one must have studied nature a great deal, studying detail above all; otherwise, one is liable to make a great tree no larger than a bush, and an enormous boulder that retains the form and physiognomy of a pebble.

To these preliminary rules we shall add some general observations on sketches and the composition of landscape.

You should take care to avoid a small, scant, dry manner in your composition; we have advised you to study details, but they should not lead you into narrow, mean compositions. Expansive fore- and backgrounds prove one capable of a grand gesture, and this is the mark of an accomplished artist.

Most landscape painters are in the habit of placing a dark mass in the foreground of their paintings, in order to make the background seem more remote; they call it a *repoussoir*. It is a fault to be avoided; you will be astonished to find that, if you place several paintings side by side, all these corners look alike, and the effect is ridiculous.

Never confuse the effects produced by masses with those made by objects that stand out through local colour. Rembrandt produces his effects through *chiaroscuro*, and Titian through local colour. The latter hides his secrets better, and is the more magical for doing so, whereas Rembrandt shows his finesse by the great sacrifices that he makes; not everyone likes this.

In the countryside, examine the movement of the little streams whose winding course beneath the willows is hemmed with reeds. There are marvellous paintings to be chosen in these places, and they are very easy to organize, because the play of the current through the reeds allows you to place the light as you will, since it is always moving hither and thither. Moreover, a great variety of plants and flowers grow by the water or on its banks. The aquatic birds that live by the water or swim on its surface can be made attractive, when they are intelligently used to give life to certain places, and bring echoes of light to them. All these springs, which are at first separate but later join to form a river, produce very pleasant movements and are bound to be effective in the foreground. Only think of those clusters of aquatic plants that intertwine in clumps, whose large colourful leaves float on the surface of the water. It is hardly conceivable that one finds no trace of these in landscape paintings, even in those of the greatest masters. Is this apparent proscription of such delightful objects deliberate and premeditated on their part? Despite our veneration for their sublime talents, we are convinced that there are many things, forgotten or neglected by them, of which much could be made. They did a great deal for the perfection of art; but how much remains to be done! Such discoveries await the men who are bold enough to attempt them! Unfortunately, the artists we see today are all stay-at-homes or timid travellers who dare not leave the high road and venture down unknown paths.

An artist who has consulted and studied nature at length will eventually be able to discern at a glance the objects that deserve to enter a composition. What the vulgar find magnificent in its monotonous regularity, a vast and extensive perspective in which there is no mass upon which the eye may repose, and which offers no contrast in either its depths or its foreground, will be of little interest to him. On the contrary, he is looking for a place that is by turns rugged, harmonious and contrasted; and these are characteristics that he seeks not only in the great masses but in the details. Sometimes the least little pocket of landscape will attract his attention; there he is delighted with an old tree that he wants to paint. It has lost some of its sap, but beside the withered branch it still shows foliage of a manly, vigorous green. The deeply fissured trunk is covered in moss, and ivy surrounds and is supported by it. At its side, a young sucker grows, proudly sporting a stalk whose frail branches display all the fresh brilliance of youth. Here the greensward is studded with undergrowth, there boulders stand out amid a clump of bushes. At the water's edge, the black trunk of a broken-down willow seems barely able to carry the weight of its branches, and forms an image of old age struggling against weakness and incapacity.

Generally speaking, there is never a bad moment to copy and represent nature; it is always beautiful when one knows how to choose it. But certain moments lend themselves more than others to the capture of its more pleasing and brilliant aspects. One should, for example, take care not to paint after a gale has blown, because the dust raised by high winds carries onto the trees and everything else, discolouring and fading them, and giving a false impression of their true shades. Wait till the rain has

washed them and restored their brilliance. Yet you should not paint immediately after the rain: give the earth time to drink in the water lying on its surface, which would otherwise make it too brown. Give the branches and bark of the trees time to dry out, as they are darkened by the moisture. Immediately after the rain, every colour has a blackish tinge. But after an hour, when natural colours return to every object, that is the moment to seize upon. The clouds are broken up and dispersed through the sky; their mass is imposing and variously lit; sunlight pierces them and spreads its dazzling rays of light. The colours of the boulders are vivid; trees and plants take on a new vigour; leaves that hung down, seemingly withered, rise on their stems and clothe themselves in shiny fresh green. The calyx of the flower reopens; the emerald tones of moss and greensward are again apparent. In all nature, whatever lives now seems to have gained new life. The health-giving water penetrates and stimulates the vegetable faculties; the birds who had taken cover or hidden during the storm joyfully reappear and present their soaked feathers to the beneficial rays of the sun, which dries and colours them. It is as if they sought, by their warbling, to thank the Supreme Being and hymn the marvels of nature. What man can resist this sublime spectacle? *A fortiori*, what painter can see it without enthusiasm?

4 John Constable (1776–1837) Letters to Dunthorne, 1799–1814

Constable more than any other English artist is associated with the development of a naturalistic form of landscape painting, and with the elevation of landscape to the status of the highest genres. He was introduced at an early stage in his career to debates on the picturesque, and in 1806 made a seven-week tour of the Lake District, the subject of one of Gilpin's *Observations*, published in 1786 (see VB5). As Constable's early letters make clear, his practice as a painter was informed both by his attachment to specific rural scenery and by his admiration for the work of earlier painters, Gainsborough, Claude Lorrain and Jacob Ruisdael foremost among them. His development of a fluent oil-sketching technique after nature was crucial in enabling him to reconcile these two interests. John Dunthorne was a friend from his youth in East Bergholt, in whose company he had painted before gaining admission to the Royal Academy Schools in 1799. (The 'Johnny' mentioned in the letter of 1814 was Dunthorne's son, whom Constable occasionally employed at that time as an assistant.) In 1802 Constable was offered a post as drawing-master at the Royal Military Academy, through the intercession of Dr John Fisher, then Canon of Windsor. He rejected the post on the advice of Benjamin West, then President of the Academy (see VIIB1), and of the painter Joseph Farington and the painter and collector Sir George Beaumont, the Academicians largely responsible for his instruction. The letter Constable wrote to Dunthorne on 29 May following his rejection of the post is the fullest surviving statement of his early views on his profession. It contains several echoes of Reynolds' Discourses (IVA7, 8), with which the artist was clearly familiar. In the same year he exhibited for the first time at the Academy. Constable's maturity as a painter is marked by a series of highly individual Suffolk landscapes painted in 1814–15. As he recorded particular places and particular moments from the calendar of rural activities, he brought a lucid compositional organization to the results. And a few years later, when he came to work on large set-piece compositions, he was able to bring an animating naturalism to their atmosphere and detail. Our text of the letters is taken from *John Constable's Correspondence II: Early Friends and Maria Bicknell*, ed. R. B. Beckett,

Ipswich: Suffolk Records Society, volume VI, 1964, pp. 22–4, 31–5, and *John Constable's Correspondence: The Family at East Bergholt 1807–1837*, London and Ipswich: HMSO and Suffolk Records Society, volume IV, 1962, p. 101. (For later writings by Constable see *Art in Theory 1815–1900*, IB4, 7 and 8.)

London. February 4th, 1799.

Dear Dunthorne

I am this morning admitted a student at the Royal Academy; the figure which I drew for admittance was the Torso. I am now comfortably settled in Cecil Street, Strand, No. 23. I shall begin painting as soon as I have the loan of a sweet little picture by Jacob Ruysdael to copy. Since I have been in town I have seen some remarkably fine ones by him, indeed I never saw him before; yet don't think, by this, I am out of conceit with my own, of which I have seen a print, 'tis of the same size and reversed.

I shall not have much to show you on my return, as I find my time will be more taken up in *seeing* than in painting. I hope by the time the leaves are on the trees, I shall be better qualified to attack them than I was last summer. All the time that you can conveniently spare from your business may be happily spent in this way, perhaps profitably, at any rate innocently. . . .

Smith's friend Cranch has left off painting, at least for the present. His whole time and thoughts are occupied in exhibiting an old, rusty, fusty head, with a spike in it, which he declares to be the real embalmed head of Oliver Cromwell! Where he got it I know not; 'tis to be seen in Bond Street, at half a crown admittance.

How goes on the lay figure? I hope to see it finished when I return, together with some drawings of your own from nature. . . .

John Constable

[Spring 1800]

Dear Dunthorne

I have copied a small landscape of A. Caracci, and two Wilsons, and have done some little things of my own. I have likewise begun to copy a very fine picture by Ruysdael, which Mr. [Philipp] Reinagle and myself have purchased in partnership for £70. . . .

I hope to see you in the spring, when the cuckoos have picked up all the dirt. Every fine day makes me long for a walk on the commons. . . .

I have finished my copy from Ruysdael, all but the glazing, which cannot be done till the picture is dry. It has been roasting in the sun these two or three days. Tomorrow I hope to go on with my copy from Sir George Beaumont's little Claude. I shall remain in town the chief of this summer. Indeed I find it necessary to fag at copying, some time yet, to acquire execution. The more facility of practice I get, the more pleasure I shall find in my art; without the power of execution I should be continually embarrassed, and it would be a burthen to me.

This fine weather almost makes me melancholy; it recalls so forcibly every scene we have visited and drawn together. I even love every stile and stump, and every lane in the village, so deep rooted are early impressions. . . .

John Constable

London. 29 May 1802.

My dear Dunthorne,

I hope I have done with the business that brought me to Town with Dr. Fisher. It is needless now to detail any particulars as we will make them the subject of some future conversation – but it is sufficient to say that had I accepted the situation offered it would have been a death blow to all my prospects of perfection in the Art I love.

For these few weeks past I believe I have thought more seriously on my profession than at any other time of my life – that is, which is the shurest way to real excellence. And this morning I am the more inclined to mention the subject having just returned from a visit to Sir G. Beaumont's pictures. – I am returned with a deep conviction of the truth of Sir Joshua Reynolds's observation that 'there is no *easy* way of becoming a good painter.' It can only be obtained by long contemplation and incessant labour in the executive part.

And however one's mind may be elevated, and kept up to what is excellent, by the works of the Great Masters – still Nature is the fountain's head, the source from whence all originally must spring – and should an artist continue his practice without refering to nature he must soon form a *manner*, & be reduced to the same deplorable situation as the French painter mentioned by Sir J. Reynolds, who told him that he had long ceased to look at nature for she only put him out.

For these two years past I have been running after pictures and seeking the truth at second hand. I have not endeavoured to represent nature with the same elevation of mind – but have neither endeavoured to make my performances look as if really *executed* by other men.

I am come to a determination to make no idle visits this summer or to give up my time to common place people. I shall shortly return to Bergholt where I shall make some laborious studies from nature – and I shall endeavour to get a pure and unaffected representation of the scenes that may employ me with respect to colour particularly and any thing else – drawing I am pretty well master of.

There is little or nothing in the exhibition worth looking up to – there is room enough for a natural painture. The great vice of the present day is *bravura*, an attempt at something beyond the truth. In endeavouring to do something better than well they do what in reality is good for nothing. *Fashion* always had, & will have its day – but *Truth* (in all things) only will last and can have just claims on posterity.

I have received considerable benefit from exhibiting – it shows me where I am, and in fact tells me what no body else could. There are in the exhibition fine pictures that bring nature to mind – and represent it with that truth that unprejudiced minds require.

These are reflexions that at this time I should have written for my own use – but as I know that I could not write to you on a subject that would be more agreahle, I send you them as a letter.

And indeed I have had much ado to keep my mind together enough to write to be understood owing to a reumatick pain in one side of my head, particularly in my teeth and lower jaw, which has caused one cheek to swell very much. I believe I got cold at Windsor as I was there in the late severe weather.

Should you want any thing in the pencil way &c let me know next week for I hope the next to leave London.

Remember me kindly to your wife & believe me

to be sincerely yours
John Constable

London. May 23rd 1803.

Dear Dunthorne,

I have for some time felt a weight on my mind from having so long neglected writing to you. Indeed there is this strange fatality about me, that I seem to neglect those whose love and friendship I most value. . . .

My voyage I will mention first. I was near a month on board, and was much employed in making drawings of ships in all situations. I saw all sorts of weather. Some the most delightful, and some as melancholy. But such is the enviable state of a painter that he finds delight in every dress nature can possibly assume.

When the ship was at Gravesend, I took a walk on shore to Rochester and Chatham. Their situation is beautiful and romantic, being at the bottom of finely formed and high hills, with the river continually showing its turnings to great advantage. Rochester Castle is one of the most romantic I ever saw. At Chatham I hired a boat to see the men of war, which are there in great numbers. I sketched the 'Victory' in three views. She was the flower of the flock, a three decker of (some say) 112 guns. She looked very beautiful, fresh out of Dock and newly painted. When I saw her they were bending the sails – which circumstance, added to a very fine evening, made a charming effect. On my return to Rochester, I made a drawing of the Cathedral, which is in some parts very picturesque, and is of Saxon Architecture.

I joined the ship again at Gravesend, and we proceeded on our voyage, which was pleasant enough till we got out to sea, when we were joined by three more large ships. We had almost reached the Downs when the weather became stormy, and we all put back under the North Foreland, and lay there three days. Here I saw some very grand effects of stormy clouds. I came on shore at Deal, walked to Dover, and the next day returned to London.

The worst part of the story is that I have lost all my drawings. The ship was such a scene of confusion, when I left her, that although I had done my drawings up very carefully, I left them behind. When I found, on landing, that I had left them, and saw the ship out of reach, I was ready to faint. I hope however I may see them again some time or other. Now I think I must have tired you, and I will change the subject.

The exhibition is a very indifferent one on the whole. In the landscape way most miserable. I saw, as I thought, a great many pictures by Sir F. Bourgeois [Sir Peter Francis Bourgeois, elected R.A. in 1793], but it proved that not half of them belonged to him, but to another painter who had imitated his manner exactly. Sir Francis was the hangman, and was so flattered by these imitations that he has given them as good places as his own. There are, however, some good portraits in the exhibition.

I have seen some fine pictures lately, and have made a few little purchases – twelve prints by Waterloo, and four fine drawings by him, with some other prints. But my

best purchases are two charming little landscapes by Gaspar Poussin, in his best time. . . .

I feel now, more than ever, a decided conviction that I shall some time or other make some good pictures. Pictures that shall be valuable to posterity, if I reap not the benefit of them. This hope, added to the great delight I find in the art, buoys me up, and makes me pursue it with ardour.

Panorama painting seems all the rage. There are four or five now exhibiting, and Mr. Reinagle is coming out with another, a view of Rome, which I have seen. I should think he has taken his view favourably, and it is executed with the greatest care and fidelity. This style of painting suits his ideas of the art itself, and his defects are not so apparent in it – that is, great principles are neither expected nor looked for in this mode of describing nature. He views Nature minutely and *cunningly*, but with no greatness or breadth. The defects of the picture at present are a profusion of high lights, and too great a number of abrupt patches of shadow. But it is not to be considered as a whole. . . .

I shall soon be at home again. The weather is not however very tempting, and while I find so much to interest me, at this busy time of the Arts, in London, I shall stay a week or two longer. . . .

John Constable

Charlotte St., Feby. 22nd, 1814

My dear Dunthorne,

I am rather disappointed in not seeing Johnny here yet, but as the weather is now fine tho' yet cold I wish you would let him come. I am rather desirous of having him now for I think he may be useful to stimulate me to work, by setting my palate &c. &c. – which you know is a great help and keeps one cheerfull. Be so good as to let me know when and where he comes to, and what time I must send to meet him. It is quite convenient for us to have him.

I am anxious about the large picture of Willy Lott's house, which Mr. Nursey says promises uncommonly well in masses &c., and tones – but I am determined to detail but not retail it out. Mr. Nursey is in Town to ship his son John to the East Indies.

I have added some ploughmen to the landscape from the park pales which is a great help, but I must try and warm the picture a little more if I can. But it will be difficult as 'tis now all of a peice – it is bleak and looks as if there would be a shower of sleet, and that you know is too much the case with my things. I dread these fields falling into Coleman's hands as I think he will clear them a good deal and cut the trees – but we cannot help these things.

Tell Abram that Mr. Cox intends having my Windmill engraved and has put it into Mr. Landseer's hands for that purpose, who is a very superior landscape engraver. This I am glad of, for it is a pretty subject – it is one of the Stoke mills I was at with you & Mr. Frost when I did it many years ago.

I have much to say to you about finishing of my studies more in future – but I look to do a great deal better in future. I am determined to finish a small picture on the spot for every one I intend to make in future. But this I have always talked about but

never yet done – I think however my mind is more settled and determined than ever on this point. Hitherto (as Shakespeare says) ‘I have been too infirm of purpose.’

I was glad to hear by Abram that you were all well. Remember me kindly to Mrs. Dunthorne, and family, and believe me, my dear fellow, – to be always sincerely yours

John Constable

5 Thomas Wedgwood (1771–1805) and Humphry Davy (1778–1829) ‘An Account of a Method of Copying Paintings Upon Glass, and of Making Profiles’

Artists had been making use of the device known as the *camera obscura* since the Renaissance (see IIIA9). Moreover, experiments in the making and fixing of images by the action of light on a sensitive medium had been going on throughout the eighteenth century, and were sufficiently well known to have attracted the attention of imaginative authors (see IIIB11). As early as 1727 Johann Heinrich Schulze had discovered the light-sensitivity of silver salts. Thereafter the work had been carried on by Beccarius, Scheele, Bergmann, Priestley, Senebier and others, with a particular upsurge of activity in the 1770s and 1780s. Bergmann’s report of his 1776 experiments was read in 1797 by Tom Wedgwood, younger son of the founder of the pottery, who then began to try and produce pictures by laying objects on paper and leather sensitized with silver nitrate solution. Wedgwood was joined in the photographic experiments by Humphry Davy, later one of the most eminent scientists of his time but then a young chemist working in Bristol. The experiments were successful insofar as images were produced, but no way could be found to fix them. A report titled ‘An Account of a Method of Copying Paintings Upon Glass, and of Making Profiles, by the Agency of Light Upon Nitrate of Silver’, was published in the *Journal of the Royal Institution of Great Britain* in 1802, pp. 170–4. We have used the text as reprinted in Beaumont Newhall ed., *Photography: Essays and Images*, New York, Museum of Modern Art, 1980/London: Secker and Warburg, 1981, pp. 15–16. We have omitted a technical footnote given by Wedgwood and Davy. (For more texts on the early development of photography and for debates about its status as an art, see *Art in Theory 1815–1900*, IIC6 and 7, and IVC *passim*.)

White paper, or white leather, moistened with solution of nitrate of silver, undergoes no change when kept in a dark place; but, on being exposed to the day light, it speedily changes colour, and, after passing through different shades of grey and brown, becomes at length nearly black.

The alterations of colour take place more speedily in proportion as the light is more intense. In the direct beams of the sun, two or three minutes are sufficient to produce the full effect. In the shade, several hours are required, and light transmitted through different coloured glasses, acts upon it with different degrees of intensity. Thus it is found, that red rays, or the common sunbeams passed through red glass, have very little action upon it: yellow and green are more efficacious; but blue and violet light produce the most decided and powerful effects.

The consideration of these facts enables us readily to understand the method by which the outlines and shades of painting on glass may be copied, or profiles of

figures procured, by the agency of light. When a white surface, covered with solution of nitrate of silver, is placed behind a painting on glass exposed to the solar light; the rays transmitted through the differently painted surfaces produce distinct tints of brown or black, sensibly differing in intensity according to the shades of the picture, and where the light is unaltered, the colour of the nitrate becomes deepest.

When the shadow of any figure is thrown upon the prepared surface, the part concealed by it remains white, and the other parts speedily become dark.

For copying paintings on glass, the solution should be applied on leather; and, in this case, it is more readily acted upon than when paper is used.

After the colour has been once fixed upon the leather or paper, it cannot be removed by the application of water, or water and soap, and it is in a high degree permanent.

The copy of a painting, or the profile, immediately after being taken, must be kept in an obscure place. It may indeed be examined in the shade, but, in this case, the exposure should be only for a few minutes; by the light of candles or lamps, as commonly employed, it is not sensibly affected.

No attempts that have been made to prevent the uncoloured parts of the copy or profile, from being acted upon by light have as yet been successful. They have been covered with a thin coating of fine varnish, but this has not destroyed their susceptibility of being coloured; and even after repeated washings, sufficient of the active part of the saline matter will still adhere to the white parts of the leather or paper, to cause them to become dark when exposed to the rays of the sun.

Besides the applications of this method of copying that have been just mentioned, there are many others. And it will be useful for making delineations of all such objects as are possessed of a texture partly opaque and partly transparent. The woody fibres of leaves, and the wings of insects, may be pretty accurately represented by means of it, and in this case, it is only necessary to cause the direct solar light to pass through them, and to receive the shadows upon prepared leather.

When the solar rays are passed through a print and thrown upon prepared paper, the unshaded parts are slowly copied; but the lights transmitted by the shaded parts, are seldom so definite as to form a distinct resemblance of them by producing different intensities of colour.

The images formed by means of a camera obscura, have been found to be too faint to produce, in any moderate time, an effect upon the nitrate of silver. To copy these images, was the first object of Mr. Wedgwood, in his researches on the subject, and for this purpose he first used the nitrate of silver, which was mentioned to him by a friend, as a substance very sensible to the influence of light; but all his numerous experiments as to their primary end proved unsuccessful.

In following these processes, I have found, that the images of small objects, produced by means of the solar microscope, may be copied without difficulty on prepared paper. This will probably be a useful application of the method; that it may be employed successfully however, it is necessary that the paper be placed at but a small distance from the lens.

With regard to the preparation of the solution, I have found the best proportions those of 1 part nitrate to about 10 of water. In this case, the quantity of the salt

applied to the leather or paper, will be sufficient to enable it to become tinged, without affecting its composition, or injuring its texture.

In comparing the effects produced by light upon muriate of silver, with those produced upon the nitrate, it seemed evident, that the muriate was the most susceptible, and both were more readily acted upon when moist than when dry, a fact long ago known. Even in the twilight, the colour of moist muriate of silver spread upon paper, slowly changed from white to faint violet; though under similar circumstances no immediate alteration was produced upon the nitrate.

The nitrate, however, from its solubility in water, possesses an advantage over the muriate: though leather or paper may, without much difficulty, be impregnated with this last substance, either by diffusing it through water, and applying it in this form, or by immersing paper moistened with the solution of the nitrate in very diluted muriatic acid.

To those persons not acquainted with the properties of the salts containing oxide of silver, it may be useful to state, that they produce a stain of some permanence, even when momentarily applied to the skin, and in employing them for moistening paper or leather, it is necessary to use a pencil of hair, or a brush.

From the impossibility of removing by washing, the colouring matter of the salts from the parts of the surface of the copy, which have not been exposed to light; it is probable, that both in the case of the nitrate and muriate of silver, a portion of the metallic oxide abandons its acid, to enter into union with the animal or vegetable substance, so as to form with it an insoluble compound. And, supposing that this happens, it is not improbable, but that substances may be found capable of destroying this compound, either by simple or complicated affinities. Some experiments on this subject have been imagined, and an account of the results of them may possibly appear in a future number of the Journals. Nothing but a method of preventing the unshaded parts of the delineation from being coloured by exposure to the day is wanting, to render the process as useful as it is elegant.

6 Karl Ludwig Fernow (1763–1808) ‘On Landscape Painting’

The German artist and writer Karl Ludwig Fernow was born in Blumenhagen in the Uckermark. To escape Prussian military service he fled to Lübeck where he formed a close friendship with Asmus Jacob Carstens (see VA14). After a number of years as an amateur painter and a private tutor in Ratzeburg, Lüneberg and Schwerin, he took up the study of philosophy at the University of Jena. In 1793 he moved to Rome. According to Goethe’s friend and artistic adviser, Heinrich Meyer, in the winter of 1795/6 Fernow gave a series of lectures on Kant’s *Critique of Judgement* (see VA10) which were well attended and which succeeded in introducing the philosopher’s ideas to the large colony of German artists working in the city. From 1795 to 1802 he shared a house with the landscape painter, Johann Christian Reinhart (1761–1847), whose work provided the primary inspiration for many of the ideas articulated in ‘On Landscape Painting’. Indeed, when Fernow republished the article in his *Römische Studien* (Zurich, 1808) he dedicated it to the painter, declaring that ‘the major portion of the essay is the fruit of the many informative hours which I spent in your studio observing and discussing your sketches, studies and finished works.’

However, the theoretical apparatus which underpins the essay is largely drawn from Kant, above all, from the account of 'aesthetic ideas' given in section 49 of the *Critique of Judgement* (reproduced in VA10 above). What is new is Fernow's attempt to apply Kant's arguments directly to landscape painting. He starts out with a fairly conventional distinction between topographical views and ideal landscape painting. In this latter the artist produces his own composition rather than imitating an actual scene in nature. Fernow goes on to argue that such ideal scenes are particularly well suited to produce the state of mental attunement or harmony identified by Kant as the basis of aesthetic pleasure. Insofar as a landscape painting can move us without presenting any determinate subject or content, he likens it to music. However, he is not fully prepared to accept the devaluation of narrative, suggesting that landscape becomes 'more aesthetically interesting' when peopled with figures. 'Über die Landschaftsmalerei' was first published in two parts in Wieland's *Neuer Teutscher Merkur*, Weimar, November and December 1803. The following excerpt has been translated for the present volume by Jason Gaiger from Part I, pp. 527–30, 533–43.

Painting, whose domain encompasses the entire visible world, has a particular branch dedicated to the representation of *places* or *natural scenes*. Its sites are the *land* and the *sea*, and both are often be found together in the same picture. Insofar as it is principally given over to landscape scenes or to scenes of water, this branch is divided into *landscape painting* and *marine painting*.

The same distinction which is made in respect of the depiction of human beings between the *faithful* imitation of *real* individuals and the *free* representation of *ideal* individuals is also to be found in this branch of the art. A landscape or marine painting is either *faithfully copied* after nature or it is *poetically invented*. In the latter case, the picture is a representation of an *ideal* landscape or seascape; in the former case it is a *prospect* of a place which really exists. Consequently, this art can be divided into the *representation of ideal natural scenes* and *prospect painting*.

There is no ideal of a beautiful place, that is to say, no originary image which corresponds to a determinate concept through which the artist can lift himself above reality in the representation of natural scenes so as to bring forth something more perfect and beautiful. In the same way, there is no ideal of a beautiful tree, of a beautiful rock, or of a mountain, for individual objects of this sort are not bound to any specific genus or type, although each of them has its own distinct character. There are, however, *ideal natural scenes* which the artist invents in accordance with an idea which he holds in his mind and which is capable of infinitely varied modification. Such pictures are not borrowed from reality, but are created in the artist's imagination. In the same way, the artist forms the individual objects he represents, the trees, the rocks, the mountains, the clouds, and so forth, not after real models chosen from nature but from an idea in his mind – and yet each is formed in accordance with its own natural character. In this way, both the individual parts and the whole of his ideal representation remains like nature and true to it, yet without being a copy.

In order to determine the aesthetic status of the different arts we should not consider the nature of the objects they depict nor the greater or lesser difficulty which they require to master, but rather the *greater or lesser capacity for expressing aesthetic ideas* which each art possesses. By aesthetic ideas I mean those representa-

tions of the imagination which are capable of setting into play the sensuous and intellectual forces of the soul and of bringing them into a state of free and harmonious accord.

For this reason, it is not animal painting which should be considered next in status after history painting but landscape painting. For landscape painting is more capable of bringing the mind into an aesthetic state.

* * *

We may concede that animal painting, as the art of depicting living creatures, requires a greater gift of imagination and more knowledge of physiognomy in order to capture the proper character of each type of animal and to articulate with truth and animation the fleeting expression of different movements and feelings. Nonetheless, we must recognize that landscape painting presupposes a higher aesthetic culture in the artist than animal painting. If the artist wishes to bring about in us a state of aesthetic harmony through his work, he must himself have felt the same concord in respect of the idea which informs it. And whoever seeks to lift our souls above reality to the level of ideas must himself have cultivated his imagination in such a way that he is responsive to this domain. The strings which he seeks to sound harmoniously within us must first have sounded harmoniously within him. Such effects, which cannot be demanded from a work of animal painting, are expected from ideal landscapes. This is the principal reason why so few amongst the large number of landscape painters who invent their subject have achieved anything great in the poetic aspect of their art. The majority are satisfied with a pleasing manner, insignificant compositions and empty effects, for they do not have an elevated conception of their art and lack sufficient aesthetic culture to regard nature poetically.

History painting has greater interest for the heart and the mind, and greater beauty than landscape painting. Yet even when the truth of the expression allows us to place ourselves in the situation of the characters who are depicted, we still participate in the action only as *spectators*. By contrast, the grace of a beautiful landscape allows us to roam through its fields, to wander into the delightful distance and to rest in its cool shadows. We are no longer mere spectators, but find ourselves in the natural scene which is represented. That a landscape painting does not have a specific content like a history painting, but merely depicts natural scenes in which the harmonious combination of a plurality of different objects creates a total effect upon our feelings, makes it all the more capable of bringing the soul into a purely aesthetic state. In this it is related to music. The harmony of the colours which are spread across a landscape has a similar effect upon the soul as the melodies and harmonies of music.

As the representation of an action, a situation or an event, involving real or imaginary persons, history painting always has a determinate historical or poetic content. Only once this content is articulated through the appropriate form of expression does it give rise to an aesthetic mood and the spectator can always give clear reasons for his response. By contrast, landscape painting which represents ideal natural scenes has no need for a *determinate* content. It brings together a plurality of things from nature into a whole in accordance with an idea. The total effect is sufficient to bring about a certain mood and this effect is always realized before the mind starts to make clear to itself the content of the landscape.

In a history painting the various individual figures make a claim upon our interest through the action they carry out and the significance which is attached to it. We recognize the necessity of their relation to the whole and judge their aesthetic effectiveness accordingly. They must be exactly as they are, and not otherwise. Nothing here can appear arbitrary or contingent. For the specific content of the representation determines all the different parts which go to make it up. In a landscape, however, every object appears more contingent and arbitrarily chosen. And this is how things should appear, even though here too every part is chosen by the artist so as to contribute to the harmony of the whole. No individual object has its own independent aesthetic meaning or interest. Rather, it gains both through the connection and harmony it enjoys with the other parts; it is this which makes the whole into something meaningful and beautiful. This is not so much known as immediately *felt* in the conception of the whole. Even when a landscape is given a particular character and content through specific natural phenomena or some significance in the staffage, this is to be regarded as something accidental. However, it does contribute to the classification of landscape into landscapes of effect, historical landscapes, and so forth, in which a particular interest is bound up with the aesthetic mood. But this mood must always derive primarily and immediately from the landscape itself. It can be supported, modified, and more closely determined by ancillary ideas, but these cannot be its source. Whatever content a landscape may have, if this effect is missing, if it does not make a claim upon our feelings through the impression of the whole in which the keynote is given by the landscape itself, then it lacks what is essential, the poetry of the scene, and it is not the product of a poetically attuned imagination, not a genuine work of art.

The state of aesthetic harmony or concord which nature and art bring about in the mind actually consists in the mind freeing itself of all determinate content whilst yet remaining active. It embraces the entire compass of aesthetic feelings in all their different modifications, from the delightful and the graceful through to the fearful and sublime. However, the object which brings about this state of harmony must itself have an aesthetic character; it must appear in a situation which makes a claim upon the mind. And this is something which the natural landscape possesses, for different places have different aesthetic characters and the landscape appears in a variety of constantly changing guises.

The character of a place or a landscape is contained in what is *enduring* and is principally determined by the forms of each of the individual objects and by the composition of the whole. The source of the individual features and their variations which determine the character of different landscapes is partly to be found in the different shapes which the surface of the Earth takes, but also in differences of climate and in the products of human culture. The first determines the form of inanimate natural objects, the mountains, valleys, fields, shores and so forth. The second determines the different types of vegetation. And both of these together determine the transitory phenomena which nature displays in its different sites. Finally, culture determines the character of the buildings which adorn a place, though this too is influenced by climate.

The mountainous regions of Switzerland have a completely different character from those in Italy. Think of the shape of the mountains, the way in which they are

ranged behind one another in narrow valleys like a stage backdrop, the steep, jagged, snow-covered peaks, the valleys of ice and the glaciers, the green alpine meadows crowned with dark pine forests from which roaring streams plunge downwards, and the pure ethereal atmosphere, which even from a great distance leaves the local colours of objects scarcely modified. In Italy the lines of the mountains are softer and more elongated, the valleys broader and more open, the bare peaks generally without snow and vegetation, the floor of the valleys full of chestnut trees, the air warmer and the distances more hazy. The evergreen oak, the pine, the cypress, the plane tree, the laurel, the olive, the fig, the aloe, the Babylonian willow and the palm tree belong to the South, whereas the darker fir, the German oak, the beech, the lime, the hardy willow and so forth give to the landscapes of the northern countries their own climatic character. The flat landscapes of lower Germany have a different physiognomy from the flat lands of Lombardy. The sky and the sea appear different on the coast of the Mediterranean than on the North Sea coast. The atmosphere, too, is different. In the North it is generally clear, but hard and bright, whereas in the South it is always hazy, warm and harmonious.

These are just a few of the more conspicuous differences in the character of the landscapes proper to different regions. Just as manifold are the different *situations* which are caused by *changes in what is transitory*, such as the time of day and the time of year, the light, the clouds, storms, showers, volcanoes, and other natural phenomena. Each of these has its own individual character. Some are delightful, graceful, cheerful, relaxing or touchingly beautiful. Others are great, splendid, festive or magisterial. Yet others serious, dark, eerie, terrifying, horrible or fearfully sublime. Corresponding to these different characters and situations, the aesthetic mood in which the soul is placed is modified in a variety of different ways.

In these reflections I have sought to investigate the aesthetic properties of the natural landscape independently of all the ancillary effects which are brought about by other objects. We are now in a position to conclude that the essence and proper goal of landscape painting can only be: *to bring about an aesthetic mood or state of harmony through the representation of ideal natural scenes*. To achieve this goal, the natural scene represented must have a specific aesthetic character and must appear in a situation which makes a claim upon the soul.

This definition gives us what is essential to the goal of landscape painting, but it does not express everything which it can achieve nor every purpose it fulfils. It establishes only the necessary condition, without which no good landscape is possible. Whatever significance the other aspects of a landscape may have, and whatever interest they carry with them, the landscape itself should possess a particular character and it should reveal nature in a particular situation. Only in this way can it give rise to an aesthetic mood and be considered interesting and beautiful *as a landscape*.

Although landscape painting, which we look at, speaks to the senses more clearly than music, which merely expresses feelings, the aesthetic effect of both is approximately the same. Both bring about a state of aesthetic responsiveness by harmoniously combining a manifold of different impressions into a total impression. Music does so successively through melody and the harmony of the tones; painting does so simultaneously through a unified and harmonious impression made up of manifold forms

and colours. Music on its own can awaken sentiments and set the mind in a certain mood without expressing any determinate content. However, if music is set to a text or accompanied by actions, it can connect concepts and images to these sentiments and bring a series of connected ideas to the mere mood. The impression which it makes is then clearer, more interesting, and more satisfying. In the same way, a landscape can be made more significant, its character more determinate, its content richer and more poetic, and the impression it creates clearer and more satisfying. In short, the representation of an ideal natural scene becomes more aesthetically interesting when, like real nature, it appears as the abode of living creatures, that is to say, when it is animated by human beings and animals, cultural artefacts, interesting events, and occurrences. A landscape which shows a delightful but completely unpopulated scene without any trace of human habitation would for that very reason please less and for all its beauty leave us unsatisfied. For the full harmony of the chord to be sounded, a note would still be missing.

7 Charles Bell (1774–1842) from *Essays on the Anatomy of Expression in Painting*

Bell was born in Edinburgh and studied medicine at the university there. In 1804 he moved to London, where he held a variety of surgical and teaching posts. His *New Idea of the Anatomy of the Brain* (1811) was regarded as the 'Magna Carta' of modern neurology. Knighted in 1831, he returned to Scotland where he ended his career as Professor of Surgery at Edinburgh University. His *Essays on the Anatomy of Expression in Painting* offered an unparalleled resource to artists. Its six chapters provided detailed anatomical analyses, including studies 'Of the skull and form of the head' (Essay II), 'Of the muscles of the face in man and animals' (Essay III) and 'Of the expression of passion as illustrated by a comparison of the muscles in man and animals' (Essay IV). The text was supported by detailed engravings of the bones and muscles, as well as by more theatrical sketches of facial expressions. Going beyond the earlier efforts of academicians such as Le Brun (see IB14), Bell sought to ground the representation of expressed emotion in a scientific understanding of how those expressions were physiologically produced. We have made selections from the preface and opening chapter in which Bell argues his case for the importance of a study of anatomy by artists, and – the other side of the same coin – against an over-dependence both on classical models and on academic poses. To speak with benefit of hindsight, however, there was a historical irony attendant upon Bell's project. At a certain moment in the early nineteenth century, experimental science was able to provide artists with the materials for an accurate replication of expressions of emotional states. But this moment preceded by only a few decades the point at which advanced art turned definitively away from mimesis as such. Well before the end of the century, the skills Bell sought to inculcate in artists in order to facilitate their expressive genius had become irredeemably conservative. (For a modernist account of artistic expression which explicitly rejects the aim of reproducing the 'passions glowing in a human face or manifested by violent movement', see *Art in Theory 1900–2000*, IB6.) The extracts from Bell are taken from *Essays on the Anatomy of Expression in Painting*, London: Longman, Hurst, Rees and Orme, 1806, pp. vi–viii, 2–4, 8–12.

By anatomy, considered with a view to the arts of design, I understand not merely the study of the individual and dissected muscles of the face, or body, or limbs; I consider it as including a knowledge of all the peculiarities and characteristic differences which mark and distinguish the countenance, and the general appearance of the body, in situations interesting to the painter or statuary. The characters of infancy, youth, or age; the peculiarities of sickness or of robust health; the contrast of manly and muscular strength, with feminine delicacy; the appearances of diseases, of pain, or of death; the general condition of the body; in short, as marking to the eye of the beholder interesting situations; – all these form as necessary a part of the anatomy of painting as the tracing of the muscles of expression in their unexerted state, and of the changes induced upon them as emotions arise in the mind.

The anatomy of painting, taken according to this comprehensive description, forms not only a science of great interest, but that from which alone the artist can derive the true spirit of observation; learn to distinguish what is essential to just expression; and be enabled to direct his attention to appearances which might otherwise escape his notice, but on which much of the effect and force, and much even of the delicacy of his delineations, will be found to depend.

Among the errors into which a young artist is most likely to be seduced, there are two against which the study of anatomy seems well calculated to guard him. The one of these is, the blind and indiscriminate imitation of the antique; the other, an opinion that in the academy figure he will find a sure guide in delineating the natural and true anatomy of the living body. These are subjects on which it may be excusable to insist somewhat at large.

If, as I fear it too often happens, an artist should make the imitation of the antique the beginning and the end of his studies, instead of adopting it as a corrective of his taste, after having laid a sure ground-work in the study of anatomy and a close observation of nature, and after having attained a correct and powerful execution, he will be apt to degenerate into a tame and lifeless style; he will be in a danger of renouncing, in pursuit of ideal beauty, the truth of expression and of character. – Nay, I cannot help suspecting that many painters have copied after casts of the antique for years, without perfectly understanding what they should imitate, without even perceiving the necessity of previously studying the nature of the subject; entering fully into the idea of the artist; and being aware of the peculiarities of his mode of composition. Into this fault, one who is learned in the science and anatomy of painting can never fall. But he who has not compared the natural with the antique head, or learned the characteristic differences, or studied the principle on which the ancient artists composed, may be betrayed into the grossest misconceptions by too implicitly following their models. In painting a hero, for example, on whom an ancient would have bestowed strong character, with bold anatomy and powerful expression, he may follow the ideal form of a deity, in which the Grecian artist had studiously divested his model of all that could indicate natural character, or might seem to pertain to humanity. The ancient artist, in following the mythology of his country, and the description of her poets, studied to bestow the character of divinity, by giving repose to the limbs without any indication of muscles or veins, and by exhibiting a face full of the mild serenity of a being superior to the passions of mankind, as shadowing out a state of existence in which the will possesses the most

perfect freedom and activity without the exertion of the bodily frame. But those ideal forms are scarcely ever to be transferred to the representation of the human body; and a modern artist who indiscriminately follows such a model, misapplies the noblest lessons of his art. [...]

Perhaps, I may be thought to have sufficiently pointed out how dangerous it is, for one solicitous to excel as a painter, too closely and indiscriminately to imitate the antique, and especially the productions of ancient sculpture. But it is not unnatural for the student to believe that the study of the academy figure may serve as a guard against all such danger; and afford him a sure criterion for judging of the anatomy of his figures.

The study of the academy figure is, undoubtedly, most essential, but unless conducted with some regard to science, it necessarily leads to error.

In the first place, it may be remarked, that the academy figure can give no aid in the study of the countenance. Here the lessons of anatomy, taken along with the descriptions of the great poets, and the study of the works of eminent painters, afford the only resource.

But even for the anatomy of the body and limbs, the academy figure is very far from being an infallible guide. The display of muscular action in the human figure is but momentary, and cannot be retained and fixed for the imitation of the artist. The effect produced upon the surface of the body and limbs by the action of the muscles, the swelling and receding of the fleshy parts, and that drawing of the sinews or tendons, which accompanies exertion, or change of posture, cannot be observed with sufficient accuracy, unless the artist is able to class the muscles engaged in the operation; and unless he have some other guide than the mere surface presents, which may enable him to recollect the varying form.

When the academy figure first strips himself, there is a symmetry and accordance in all the limbs; but when he is screwed up into a posture, there appears a constraint and want of balance. It cannot be supposed, that, when a man has the support of ropes to preserve him in a posture of exertion, the same action of muscles can be displayed as if the limbs were supported by their own energy; and, in all academy drawings, we may perceive something wrong where the ropes are not represented along with the figure. In natural action there always is a consent and symmetry in every part. When a man clenches his fist in passion, the other arm does not lie in elegant relaxation: When the face is stern and vindictive, there is energy in the whole frame: When a man rises from his seat in impassioned gesture, there pervades every limb and feature a certain tension and straining. This universal state of the body it is difficult to excite in those who are accustomed to sit to painters; I see them watch my eye, and where they see me intent, they exert the muscles. The painter, therefore, cannot trust to the man throwing himself into a natural posture; he must direct him, and be himself able to catch, as it were intuitively, what is natural, and reject what is constrained. Besides, those soldiers and mechanics who are employed as academy figures are often stiff and unwieldy; and hard labour has impaired in them the natural and easy motion of the joints.

Until the artist has gained a perfect knowledge of the muscles, and is able to represent them in action without losing the general tone of the figure, he is apt to produce an appearance like spasm or cramp in the limbs from one part being in

action, while the other is loose or relaxed. For it is always to be remembered, that whether the body be alive or dead, whether the limbs be in action or relaxed in sleep, a uniform character must pervade the composition. Whether the gently undulating line of relaxed muscle be the prevailing outline; or the parts be large and strong, and the muscles prominent, bold, and angular; there must be perfect accordance, otherwise there will be no beauty of expression.

I think, that in the sketches, and even in the finished paintings of some artists, I have observed the effect of continuing to draw from the model, or from the naked figure, without due attention to the action of the muscles. I have seen paintings, where the grouping was excellent, and the proportions exact, yet the figures stood in attitudes when they were meant to be in action; they were fixed as statues, and communicated to the spectator no idea of exertion or of motion. This sometimes proceeds, I have no doubt, from a long continued contemplation of the antique, but more frequently from drawing after the still and spiritless academy figure. The knowledge of anatomy is necessary to correct this; but, chiefly, a familiar acquaintance with the classification of the muscles, and the peculiarities and effect of their action.

The true use of the living figure is this; – after the artist has learnt the structure of the bones and the classification of the muscles, he should attentively observe the play of the muscles when thrown into action and attitudes of violent exertion; but, chiefly, he should mark the action of the muscles during the striking out of the limbs. He will soon, in such a course of observation, learn to distinguish between posture and action, and to avoid that tameness which results from neglecting the play of the muscles. And in this view, the painter, after having learnt to draw the figure, as it is usually termed, would do well to make the academy figure go through the exercise of pitching the bar, or throwing or striking. He will then find that it is chiefly in straining and pulling in a fixed posture, that there is an universal tension and equal prominence of the muscles; and that in unrestrained actions only a few muscles rise strongly prominent, and are distinctly characteristic of that action. He will not, perhaps, be able to catch the character of muscular expression, and commit it to paper at once; but with accurate notions of the classification of the muscles, and of the effect of each action in calling into exertion particular sets of them, knowing to what point his observation should be applied, and correcting his preconceived notions by the actual appearance of the limb, each succeeding exhibition of strength will accelerate his progress in the knowledge of anatomical expression, and in correctness of design.

The true corrective for the faults we have pointed out, is to be found in the study of anatomy. It may well be said, that anatomy is the true basis of the arts of design; and it will, infallibly, lead to perfection those who, blessed with true genius, can combine correctness and simplicity with the higher graces and charms of the art. It bestows on the painter a minuteness of observation, which he cannot otherwise attain; and, I am persuaded, that while it will enable him to give vigour to the whole form, it will, also, teach him to represent certain niceties of expression, which, otherwise, are altogether beyond his reach.

8 Philipp Otto Runge (1777–1810) Letter to Goethe, 3 July 1806

The initial inspiration for Runge's study of colour was given by the mystical writings of Jacob Böhme (see VIB5, in particular Runge's letter to his brother of 7 November 1802). From 1804 onwards, however, his enquiries took on a more methodical and 'scientific' character. He was primarily concerned with colour as an observable phenomenon, rather than with its physical basis. His studies were published in the short text, *Farben-Kugel* (Colour Sphere), in Hamburg in 1810. The book was intended to serve as a manual for practising artists, and all reflections on the associational and symbolic character of colours were left to an afterword by the philosopher of nature, Henrik Steffans (1773–1843). In Runge's own artistic practice, however, colour continued to fulfil an important symbolic role. In the painted version of *Morning* (Kunsthalle, Hamburg), for example, the predominance of red is used to signify the dawn of life. In *Farben-Kugel* Runge uses a number of hand-coloured prints to illustrate his theory. The 'colour sphere' itself is a transparent three-dimensional sphere in which twelve individual coloured fields are separated at the two poles by the 'non-colours' of black and white. The model is used to demonstrate the interrelation of colours and the role of light in revealing and dissolving colour. The earliest coherent statement of Runge's theory is contained in the following letter to Goethe of 3 July 1806. We have used it here because it is not dependent upon colour illustrations, as is the book itself. The previous year Runge had sent the poet etchings of his *Times of Day* series, which were warmly received. Goethe offered considerable encouragement to the younger artist and later published the letter in his own *Theory of Colours* (see VIIA9). Runge's ideas were to exercise a powerful influence upon later artists, including Paul Klee, Johannes Itten and members of the *Blaue Reiter*. The letter has been translated complete for the present volume by Nicholas Walker from Philipp Otto Runge, *Die Begier nach der Möglichkeit neuer Bilder: Briefwechsel und Schriften zur bildenden Kunst*, ed. Hannelore Gärtner, Leipzig: Philipp Reclam, 1982, pp. 177–85.

On returning from a brief walking tour through our delightful island of Rügen, where the quiet gravity of the ocean is broken in so many ways by friendly peninsulas and valleys, by hills and rocks, I found, together with the friendly welcome of my family, your esteemed letter. It is a great relief to my mind to find that my sincere wish has been fulfilled, that my work has really found favour in some way. I appreciate very much how you can esteem an approach that does not take the path which you yourself would wish art to pursue; it would be just as foolish for me to impart my reasons for working in this way as it would be to try and persuade you that my way is the right one.

If the skills that are required by painting are associated with such great difficulties for everyone, then this is pre-eminently the case for a person in our time who has begun to practise in quite elementary fields at an age when the intellect has already reached a superior level. It is therefore impossible for such a person, without falling apart, to abandon his individuality and participate in a common effort. One who loses himself in the infinite abundance of the life spread all around him, and is therefore drawn irresistibly to imitate that life, also finds himself seized most powerfully by the total effect in question. He will certainly, in pursuing every characteristic detail, also explore the relationships within nature, the force of great masses. Anyone who, with constant feeling, observes the great masses of all that lives right down to the tiniest

details, and is in turn affected by his observations, cannot imagine how to proceed without a special sense of relationships and connections, cannot even begin to represent his subject without investigating all the basic motifs involved. And in doing so he cannot attain any primary freedom until he has to some extent worked down to the solid foundation.

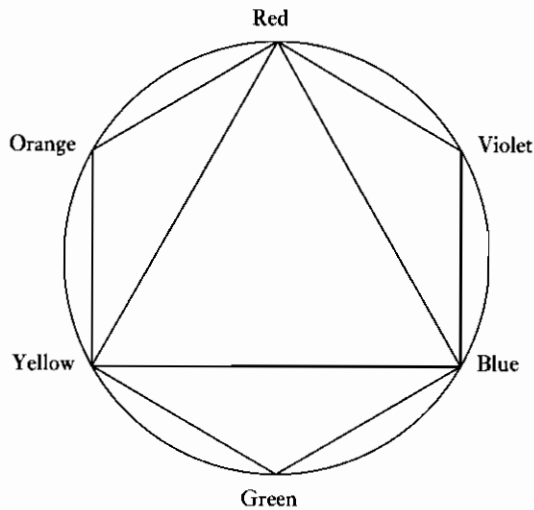

To make my meaning clearer: I believe that the old German artists, if they had understood the nature of form, would have forfeited precisely that directness and naturalness with which they succeeded in expressing their figures, at least until they could attain a certain level of technical expertise. There have been many people who have been able with a free hand to produce bridges, architectural structures, and truly artistic objects. It may require a long time, but if the artist attains a certain level and suddenly hits upon certain mathematical conclusions for himself, it is quite possible to lose all his talent as a result, unless and until he thoroughly works through the science himself and thereby acquires his freedom once again. For this reason I found it impossible to find respite after I was initially astonished by the special phenomena involved in the combination of colours, until, that is, I was able to develop an image of the entire world of colours, one that would be comprehensive enough to encompass every change and every phenomenon.

On beholding a beautiful landscape, on being touched in some way by an effect of nature, it is most natural for a painter to ask himself with precisely what mixture of substances this effect should be reproduced. This question drove me to investigate the peculiarities of the various colours, to try and penetrate if possible so deeply into their particular qualities that I would clearly understand what these colours can accomplish, what is affected by them, and what in turn affects them.

I hope that you will peruse with generous forbearance this essay which I have written solely with the aim of explaining my views, which I believe must be expressed in their entirety if they are to prove at all useful. However, I do not think that looking at colours in this way is useless for the art of painting, or that the latter can be pursued without it. This opinion will also neither contradict nor render superfluous any optical experiments undertaken in order to acquire more definite knowledge of colours. Since I cannot offer you any incontestable proof based upon exhaustive empirical investigation, I would beg you instead to rely upon your own feeling in interpreting what I meant in saying that the painter need not concern himself with any elements beyond those that are listed here.

1. As is well known, there are really only three colours: yellow, red and blue. If we regard them in all the fullness of their power and represent them to ourselves in a circle, for example, then the three colours give rise to three transitional hues: orange, violet and green (I call orange everything that falls between yellow and red or which tends in this direction from the extremes of yellow and red), and these hues, which represent the pure mixtures of colours, are at their brightest in the intermediate position.

2. Trying to imagine a bluish orange, a reddish green or a yellowish violet can only strike us like the idea of a southwesterly north wind. But there is perhaps some substance in what follows that will explain the possibility of a warm violet, and other similar effects of nature.

3. Two pure colours like yellow and red produce a pure mixture: orange. But if we now mix blue with such a hue, it only becomes dirty, and indeed if this is done with equal parts of both the colour is entirely transformed into a dull grey. Two pure colours can be mixed with one another, whereas two intermediate colours simply annul or dirty one another since part of the third colour has also been added. If the three pure colours are transformed to grey, then the three mixtures of orange, violet and green do the same in their intermediate position because the three colours are again all equally strong here. Now since the entire circle only contains the pure transitions of the three colours, which combine with one another only to produce the addition of grey, there is beyond them only black and white to facilitate the multiplication of further possibilities.

4. All colours are dulled when mixed with white, and even if they become lighter they still lose their clarity and ardour.

5. Black makes all colours dirty, and even if it makes them darker, they too lose their purity and clarity.

6. White and black when mixed together produce grey.

7. One can easily see that this range of three colours, together with white and black, does not exhaust the impressions communicated to us through the eye by the elements of nature. Since white renders colours dull and black makes them dirty, we are therefore tempted to assume a gradation of light and dark. But the following observations will show how far this is really tenable.

8. Apart from this distinction between light and dark in the pure colours, nature also presents us with another striking and important distinction. If we assume, for example, the bright and pure presence of red fabric, paper, satin, taffeta or velvet, of a red sunset or a transparent red glass, there is also the distinction concerning the transparency or opacity of the material in question.

9. If we mix three opaque colours like red, blue and yellow with one another this yields a grey, which can equally be produced by mixing white and black.

10. If therefore we mix the three transparent colours with one another in such a way that no one colour is preponderant, we obtain a dark hue which cannot be produced by either of the other constituent parts.

11. Both white and black alike are opaque or corporeal colours. One should not really object to the expression: a 'white' glass, where it is clear that we mean a clear glass. But one cannot properly imagine water, which is pure, as white, any more than we can imagine the idea of clear milk. If black merely made colours dark, then it could indeed be clear; but since it actually dirties them, it cannot be so described.

12. The opaque colours stand between the colours of white and black, and they can never become as light as white or as dark as black.

13. The transparent colours, whether in brightness or in darkness, are unlimited, just as fire and water can be regarded as marking their height and depth respectively.

14. Grey, the product of the three opaque colours, cannot be rendered pure once again through light, nor through any further mixture of colours. It either fades away into white or darkens into black.

15. Three pieces of glass, each one corresponding to one of the three pure transparent colours, and superimposed upon one another, would produce a dark hue which is deeper than any of the colours taken individually. And precisely in this way: three transparent colours together will yield a dark colourless hue which is deeper than any of the colours themselves. Yellow is, on the one hand, the lightest and brightest of the three colours, and yet, if we mix yellow with a very dark violet until they annul one another, the darkness is strengthened to a very high degree.

16. If we take a dark transparent glass, like a typical optical glass, together with a polished piece of coal of the same thickness, and place both of them upon a white background, then the glass will appear lighter. But if we duplicate both, the piece of coal will appear the same by virtue of its opacity, whereas the glass will darken further in infinite degrees, even though this remains imperceptible to the human eye. This kind of darkness can also be attained by the individual transparent colours, whereas black on the other hand will only appear like a dirty stain.

17. If we attenuate such a transparent product of the three transparent colours in this way and allow the light to shine through, this will also yield a kind of grey, but one very different from the mixture of three opaque colours.

18. The brightness of a clear sky at the rising of the sun, either directly round about the sun itself or in its immediate path, can be so great as to be almost unbearable to us. Now if we wished to infer from this colourless clarity, as the product of the three colours, to the colours themselves, then they would be so bright, would so far transcend our own powers, that they must remain as fundamentally mysterious to us as they are when shrouded in darkness.

19. But now we can also see that brightness and darkness cannot be compared or related to the transparent colours in the same way that black and white can be compared and related to the opaque colours. They represent rather a single quality at one with clarity and colour itself. If one imagines a pure ruby, as thick or thin as one likes, it is always one and the same red, nothing therefore but a transparent red which can become bright or dark depending upon whether it is roused or abandoned by the light. Light naturally also ignites the product of these colours in all its depth and elevates the same to a gleaming clarity which allows every colour to shine

through it. This illumination, of which every colour is capable, insofar as light ignites it to an ever higher intensity of ardour, often wells imperceptibly around us, revealing surrounding objects in a thousand transformations which would never have been conceivable through any simple combination of colours, leaving or even intensifying everything in its own clarity. Thus it is that we can often sense a certain mood diffused over the most indifferent of objects, a mood which more often tends to inhabit the illuminated air that lies between ourselves and the objects than in the actual illumination of the objects themselves.

20. The relationship between light and transparent colour is, if we are prepared to immerse ourselves within it, infinitely appealing. And the sudden intensification of colours, the way in which they merge with one another, along with their reappearance and disappearance, resembles some kind of breathing in the mighty pauses in between one eternity and the next, from the greatest intensity of light right down to the lonely and immortal peace of the deepest tones of all.

22. The opaque colours, on the other hand, resemble flowers which dare not measure themselves against the heavens, and yet participate on the one hand in weakness, that is in white, and on the other in evil, that is in black.

22. But the opaque colours are also precisely capable, when they are combined with neither white nor black but are thinly superimposed upon them, of producing such attractive variations and such natural effects that the practical application of ideas must hold fast precisely to these colours; thus in the final analysis the transparent colours come to play like spirits above the former, serving solely to heighten and intensify their power.

The firm belief in a certain spiritual connection between the various elements can at least offer the painter a comfort and encouragement that he is incapable of discovering in any other way. Even as he loses himself entirely in his work, the cause, means and aims of his art together produce in him, at last, a certain perfection, a perfection that certainly requires the exercise of constant, diligent and faithful effort and cannot therefore fail to exert a beneficent effect upon others.

If I consider the materials with which I work, and maintain the appropriate standard of quality, I certainly know precisely where and how to employ them, since no material that we work with is ever entirely pure. I cannot say much more about the technical aspects here, first because this would prove too lengthy, and secondly because my intention was simply to explain the point of view from which I try and observe colours. I will also readily confess that what I say is still infected with much error. But you will, at the least, be able to acknowledge my efforts here, and further that I will not allow anyone to deter me from the method which, such is my opinion, must be adopted if the stupidities involved in the technical aspects of painting today are to be effectively resisted from within. Nor do I believe that I have followed this path until now without being able to benefit others. But I do lack the requisite chemical and mathematical knowledge to accomplish something more fundamental. I desire with all my heart to find the opportunity of acquiring this knowledge.

If this expression of my views has been successful in clarifying for you certain things in the four engravings [*The Times of Day*], I am sure that I shall be able to

clarify them even more if I might one day send you a sketch in oils. I hope you will also have gathered from my preceding remarks just how little commentary of this sort can succeed in making such things properly intelligible.

For your own information I should say that the sheets in question were not actually engraved by me. 'Morning' and 'Evening' were engraved by Herr Seifer in Dresden, and with regard to the two other pieces, the figures were engraved by Herr Krüger and the ancillary details by Herr Darnstedt, also in Dresden. Since I did my original drawings directly with the pen which they subsequently copied in pencil and imprinted on the plate, it was possible to maintain the design very accurately, although a lot is still lost in the process, as you will see yourself if I may take the opportunity of sending you the original drawings.

As soon as I have time I shall attempt to comply with your further desire to receive some flowers and a silhouette, and it will always prove a pleasure to serve you in any way I can.

I would be most grateful if you would extend my heartfelt greetings to Herr Voigt and his wife, and remain yours in devoted friendship,

Phil. Otto Runge

9 Johann Wolfgang Goethe (1749–1832) from *Theory of Colours*

Like Runge (see VIIA8), Goethe was primarily concerned with colour and light as perceived phenomena and with the accurate description of our actual *experience* of colour. However, his substantial *Theory of Colours*, first published in 1810, formed part of a more ambitious attempt to overcome the divisions attendant upon modern science. He rejects the priority given to mathematics and calculation in the natural sciences, promoting instead a view of science as the discernment of primal phenomena (*Urphänomena*) and primal polarities (*Ürpolaritäten*). A significant part of the *Theory of Colours* is given up to a sustained, and largely unconvincing, attack on Newton's theory of optics. Nonetheless, Goethe's rehabilitation of subjective experience and his reliance upon the eye as a sufficient tool for the study of colour led to the inclusion of a wealth of observational detail. This made his book a rich source for painters and other interested non-specialists. Whereas Newton maintained that colours were a division of light, Goethe contends that light is homogeneous and that colour arises only when light is disturbed by darkness. There are two primary colours: yellow and blue. The first is positive because of its proximity to light, the second negative because of its proximity to darkness. The two interact through a process of 'augmentation' (*Steigerung*) to produce a third colour, *purpur*, or pure red. Goethe also sought to address the emotive and symbolic qualities of colour and to incorporate these reflections within the framework of scientific enquiry. *Zur Farbenlehre* was first published in Tübingen in 1810. It was translated into English by Charles Eastlake as *Theory of Colours* (London: John Murray) in 1840. Turner read this translation in the 1840s, noting in the margin of his copy the words 'Light and Shade' alongside Goethe's table of polarities given at §696 (see Gage, 1993). One of his own late paintings, on the subject of the 'The Deluge' (Tate Gallery, London) bears the title *Light and Colour: Goethe's Theory*. The following excerpts, from the preface and from parts IV and VI, keep Goethe's original paragraph numbering. We have used the reprint of Eastlake's translation published by MIT Press, Cambridge, Massachusetts, 1970, pp. xxxvii–xl, 273–9, 304–18.

It may naturally be asked whether, in proposing to treat of colours, light itself should not first engage our attention: to this we briefly and frankly answer that since so much has already been said on the subject of light, it can hardly be desirable to multiply repetitions by again going over the same ground.

Indeed, strictly speaking, it is useless to attempt to express the nature of a thing abstractedly. Effects we can perceive, and a complete history of those effects would, in fact, sufficiently define the nature of the thing itself. We should try in vain to describe a man's character, but let his acts be collected and an idea of the character will be presented to us.

The colours are acts of light; its active and passive modifications: thus considered we may expect from them some explanation respecting light itself. Colours and light, it is true, stand in the most intimate relation to each other, but we should think of both as belonging to nature as a whole, for it is nature as a whole which manifests itself by their means in an especial manner to the sense of sight.

The completeness of nature displays itself to another sense in a similar way. Let the eye be closed, let the sense of hearing be excited, and from the lightest breath to the wildest din, from the simplest sound to the highest harmony, from the most vehement and impassioned cry to the gentlest word of reason, still it is Nature that speaks and manifests her presence, her power, her pervading life and the vastness of her relations; so that a blind man to whom the infinite visible is denied, can still comprehend an infinite vitality by means of another organ.

And thus as we descend the scale of being, Nature speaks to other senses – to known, misunderstood, and unknown senses: so speaks she with herself and to us in a thousand modes. To the attentive observer she is nowhere dead nor silent; she has even a secret agent in inflexible matter, in a metal, the smallest portions of which tell us what is passing in the entire mass. However manifold, complicated, and unintelligible this language may often seem to us, yet its elements remain ever the same. With light poise and counterpoise, Nature oscillates within her prescribed limits, yet thus arise all the varieties and conditions of the phenomena which are presented to us in space and time.

Infinitely various are the means by which we become acquainted with these general movements and tendencies: now as a simple repulsion and attraction, now as an upsparkling and vanishing light, as undulation in the air, as commotion in matter, as oxydation and deoxydation; but always, uniting or separating, the great purpose is found to be to excite and promote existence in some form or other.

The observers of nature finding, however, that this poise and counterpoise are respectively unequal in effect, have endeavoured to represent such a relation in terms. They have everywhere remarked and spoken of a greater and lesser principle, an action and resistance, a doing and suffering, an advancing and retiring, a violent and moderating power; and thus a symbolical language has arisen, which, from its close analogy, may be employed as equivalent to a direct and appropriate terminology.

To apply these designations, this language of Nature to the subject we have undertaken; to enrich and amplify this language by means of the theory of colours and the variety of their phenomena, and thus facilitate the communication of higher theoretical views, was the principal aim of the present treatise.

* * *

General Characteristics.

688. We have hitherto, in a manner forcibly, kept phenomena asunder, which, partly from their nature, partly in accordance with our mental habits, have, as it were, constantly sought to be reunited. We have exhibited them in three divisions. We have considered colours, first, as transient, the result of an action and re-action in the eye itself; next, as passing effects of colourless, light-transmitting, transparent, or opaque mediums on light; especially on the luminous image; lastly, we arrived at the point where we could securely pronounce them as permanent, and actually inherent in bodies.

689. In following this order we have as far as possible endeavoured to define, to separate, and to class the appearances. But now that we need no longer be apprehensive of mixing or confounding them, we may proceed, first, to state the general nature of these appearances considered abstractedly, as an independent circle of facts, and, in the next place, to show how this particular circle is connected with other classes of analogous phenomena in nature.

The faculty with which colour appears.

690. We have observed that colour under many conditions appears very easily. The susceptibility of the eye with regard to light, the constant re-action of the retina against it, produce instantaneously a slight iridescence. Every subdued light may be considered as coloured, nay, we ought to call any light coloured, inasmuch as it is seen. Colourless light, colourless surfaces, are, in some sort, abstract ideas; in actual experience we can hardly be said to be aware of them.

691. If light impinges on a colourless body, is reflected from it or passes through it, colour immediately appears; but it is necessary here to remember what has been so often urged by us, namely, that the leading conditions of refraction, reflection, &c., are not of themselves sufficient to produce the appearance. Sometimes, it is true, light acts with these merely as light, but oftener as a defined, circumscribed appearance, as a luminous image. The semi-opacity of the medium is often a necessary condition; while half, and double shadows, are required for many coloured appearances. In all cases, however, colour appears instantaneously. We find, again, that by means of pressure, breathing heat, by various kinds of motion and alteration on smooth clean surfaces, as well as on colourless fluids, colour is immediately produced.

692. The slightest change has only to take place in the component parts of bodies, whether by immixture with other particles or other such effects, and colour either makes its appearance or becomes changed.

The force of colour.

693. The physical colours, and especially those of the prism, were formerly called '*colores emphatici*,' on account of their extraordinary beauty and force.

Strictly speaking, however, a high degree of effect may be ascribed to all appearances of colour, assuming that they are exhibited under the purest and most perfect conditions.

694. The dark nature of colour, its full rich quality, is what produces the grave, and at the same time fascinating impression we sometimes experience, and as colour is to be considered a condition of light, so it cannot dispense with light as the co-operating cause of its appearance, as its basis or ground; as a power thus displaying and manifesting colour.

The definite nature of colour.

695. The existence and the relatively definite character of colour are one and the same thing. Light displays itself and the face of nature, as it were, with a general indifference, informing us as to surrounding objects perhaps devoid of interest or importance; but colour is at all times specific, characteristic, significant.

696. Considered in a general point of view, colour is determined towards one of two sides. It thus presents a contrast which we call a polarity, and which we may fitly designate by the expressions *plus* and *minus*.

<i>Plus.</i>	<i>Minus.</i>
Yellow.	Blue.
Action.	Negation.
Light.	Shadow.
Brightness.	Darkness.
Force	Weakness.
Warmth.	Coldness.
Proximity.	Distance.
Repulsion	Attraction.
Affinity with acids	Affinity with alkalis.

Combination of the two principles.

697. If these specific, contrasted principles are combined, the respective qualities do not therefore destroy each other: for if in this intermixture the ingredients are so perfectly balanced that neither is to be distinctly recognised, the union again acquires a specific character; it appears as a quality by itself in which we no longer think of combination. Thus union we call green.

698. Thus, if two opposite phenomena springing from the same source do not destroy each other when combined, but in their union present a third appreciable and pleasing appearance, this result at once indicates their harmonious relation. The more perfect result yet remains to be adverted to.

Augmentation to red.

699. Blue and yellow do not admit of increased intensity without presently exhibiting a new appearance in addition to their own. Each colour, in its lightest state, is a dark; if condensed it must become darker, but this effect no sooner takes place than the hue assumes an appearance which we designate by the word reddish.

700. This appearance still increases, so that when the highest degree of intensity is attained it predominates over the original hue. A powerful impression of light leaves the sensation of red on the retina. In the prismatic yellow-red which springs directly from the yellow, we hardly recognise the yellow.

701. This deepening takes place again by means of colourless semi-transparent mediums, and here we see the effect in its utmost purity and extent. Transparent fluids, coloured with any given hues, in a series of glass-vessels, exhibit it very strikingly. The augmentation is unremittingly rapid and constant; it is universal, and obtains in physiological as well as in physical and chemical colours.

Junction of the two augmented extremes.

702. As the extremes of the simple contrast produce a beautiful and agreeable appearance by their union, so the deepened extremes on being united, will present a still more fascinating colour; indeed, it might naturally be expected that we should here find the acme of the whole phenomenon.

703. And such is the fact, for pure red appears; a colour to which, from its excellence, we have appropriated the term 'purpur.'

704. There are various modes in which pure red may appear. By bringing together the violet edge and yellow-red border in prismatic experiments, by continued augmentation in chemical operations, and by the organic contrast in physiological effects.

705. As a pigment it cannot be produced by intermixture or union, but only by arresting the hue in substances chemically acted on, at the high culminating point. Hence the painter is justified in assuming that there are *three* primitive colours from which he combines all the others. The natural philosopher, on the other hand, assumes only *two* elementary colours, from which he, in like manner, develops and combines the rest.

Effect Of Colour With Reference To Moral Associations.

758. Since colour occupies so important a place in the series of elementary phenomena, filling as it does the limited circle assigned to it with fullest variety,

we shall not be surprised to find that its effects are at all times decided and significant, and that they are immediately associated with the emotions of the mind. We shall not be surprised to find that these appearances presented singly, are specific, that in combination they may produce an harmonious, characteristic, often even an inharmonious effect on the eye, by means of which they act on the mind; producing this impression in their most general elementary character, without relation to the nature or form of the object on whose surface they are apparent. Hence, colour considered as an element of art, may be made subservient to the highest æsthetical ends.

759. People experience a great delight in colour, generally. The eye requires it as much as it requires light. We have only to remember the refreshing sensation we experience, if on a cloudy day the sun illumines a single portion of the scene before us and displays its colours. That healing powers were ascribed to coloured gems, may have arisen from the experience of this indefinable pleasure.

760. The colours which we see on objects are not qualities entirely strange to the eye; the organ is not thus merely habituated to the impression; no, it is always predisposed to produce colour of itself, and experiences a sensation of delight if something analogous to its own nature is offered to it from without; if its susceptibility is distinctly determined towards a given state. [...]

764. The colours on the *plus* side are yellow, red-yellow (orange), yellow-red (minium, cinnabar). The feelings they excite are quick, lively, aspiring.

Yellow.

765. This is the colour nearest the light. It appears on the slightest mitigation of light, whether by semi-transparent mediums or faint reflection from white surfaces. In prismatic experiments it extends itself alone and widely in the light space, and while the two poles remain separated from each other, before it mixes with blue to produce green it is to be seen in its utmost purity and beauty. [...]

766. In its highest purity it always carries with it the nature of brightness, and has a serene, gay, softly exciting character.

767. In this state, applied to dress, hangings, carpeting, &c., it is agreeable. Gold in its perfectly unmixed state, especially when the effect of polish is superadded, gives us a new and high idea of this colour; in like manner, a strong yellow, as it appears on satin, has a magnificent and noble effect.

768. We find from experience, again, that yellow excites a warm and agreeable impression. Hence in painting it belongs to the illumined and emphatic side.

769. This impression of warmth may be experienced in a very lively manner if we look at a landscape through a yellow glass, particularly on a grey winter's day. The

eye is gladdened, the heart expanded and cheered, a glow seems at once to breathe towards us.

770. If, however, this colour in its pure and bright state is agreeable and gladdening, and in its utmost power is serene and noble, it is, on the other hand, extremely liable to contamination, and produces a very disagreeable effect if it is sullied, or in some degree tends to the *minus* side. Thus, the colour of sulphur, which inclines to green, has a something unpleasant in it.

771. When a yellow colour is communicated to dull and coarse surfaces, such as common cloth, felt, or the like, on which it does not appear with full energy, the disagreeable effect alluded to is apparent. By a slight and scarcely perceptible change, the beautiful impression of fire and gold is transformed into one not undeserving the epithet foul; and the colour of honour and joy reversed to that of ignominy and aversion. [...]

Red–Yellow.

772. As no colour can be considered as stationary, so we can very easily augment yellow into reddish by condensing or darkening it. The colour increases in energy, and appears in red–yellow more powerful and splendid.

773. All that we have said of yellow is applicable here in a higher degree. The red–yellow gives an impression of warmth and gladness, since it represents the hue of the intenser glow of fire, and of the milder radiance of the setting sun. Hence it is agreeable around us, and again, as clothing, in greater or less degrees is cheerful and magnificent. [...]

Yellow–Red.

774. As pure yellow passes very easily to red–yellow, so the deepening of this last to yellow–red is not to be arrested. The agreeable, cheerful sensation which red–yellow excites, increases to an intolerably powerful impression in bright yellow–red.

775. The active side is here in its highest energy, and it is not to be wondered at that impetuous, robust, uneducated men, should be especially pleased with this colour. Among savage nations the inclination for it has been universally remarked, and when children, left to themselves, begin to use tints, they never spare vermilion and minium.

776. In looking steadfastly at a perfectly yellow–red surface, the colour seems actually to penetrate the organ. It produces an extreme excitement, and still acts thus when somewhat darkened. A yellow–red cloth disturbs and enrages animals. I have known men of education to whom its effect was intolerable if they chanced to see a person dressed in a scarlet cloak on a grey, cloudy day.

777. The colours on the *minus* side are blue, red–blue, and blue–red. They produce a restless, susceptible, anxious impression.

Blue.

778. As yellow is always accompanied with light, so it may be said that blue still brings a principle of darkness with it.

779. This colour has a peculiar and almost indescribable effect on the eye. As a hue it is powerful, but it is on the negative side, and in its highest purity is, as it were, a stimulating negation. Its appearance, then, is a kind of contradiction between excitement and repose.

780. As the upper sky and distant mountains appear blue, so a blue surface seems to retire from us.

781. But as we readily follow an agreeable object that flies from us, so we love to contemplate blue, not because it advances to us, but because it draws us after it.

782. Blue gives us an impression of cold, and thus, again, reminds us of shade. We have before spoken of its affinity with black. [. . .]

Red–Blue.

786. We found yellow very soon tending to the intense state, and we observe the same progression in blue.

787. Blue deepens very mildly into red, and thus acquires a somewhat active character, although it is on the passive side. Its exciting power is, however, of a very different kind from that of the red–yellow. It may be said to disturb rather than enliven.

788. As augmentation itself is not to be arrested, so we feel an inclination to follow the progress of the colour, not, however, as in the case of the red–yellow, to see it still increase in the active sense, but to find a point to rest in.

789. In a very attenuated state, this colour is known to us under the name of lilac; but even in this degree it has a something lively without gladness.

Blue–Red.

790. This unquiet feeling increases as the hue progresses, and it may be safely assumed, that a carpet of a perfectly pure deep blue–red would be intolerable. On this account, when it is used for dress, ribbons, or other ornaments, it is employed in a very attenuated and light state, and thus displays its character as above defined, in a peculiarly attractive manner.

791. As the higher dignitaries of the church have appropriated this unquiet colour to themselves, we may venture to say that it unceasingly aspires to the cardinal's red through the restless degrees of a still impatient progression.

Red.

792. We are here to forget everything that borders on yellow or blue. We are to imagine an absolutely pure red, like fine carmine suffered to dry on white porcelain. We have called this colour 'purpur' by way of distinction, although we are quite aware that the purple of the ancients inclined more to blue.

793. Whoever is acquainted with the prismatic origin of red, will not think it paradoxical if we assert that this colour partly *actu*, partly *potentiâ*, includes all the other colours.

794. We have remarked a constant progress or augmentation in yellow and blue, and seen what impressions were produced by the various states; hence it may naturally be inferred that now, in the junction of the deepened extremes, a feeling of satisfaction must succeed; and thus, in physical phenomena, this highest of all appearances of colour arises from the junction of two contrasted extremes which have gradually prepared themselves for a union.

795. As a pigment, on the other hand, it presents itself to us already formed, and is most perfect as a hue in cochineal; a substance which, however, by chemical action may be made to tend to the *plus* or the *minus* side, and may be considered to have attained the central point in the best carmine.

796. The effect of this colour is as peculiar as its nature. It conveys an impression of gravity and dignity, and at the same time of grace and attractiveness. The first in its dark deep state, the latter in its light attenuated tint; and thus the dignity of age and the amiableness of youth may adorn itself with degrees of the same hue. [...]

Green.

801. If yellow and blue, which we consider as the most fundamental and simple colours, are united as they first appear, in the first state of their action, the colour which we call green is the result.

802. The eye experiences a distinctly grateful impression from this colour. If the two elementary colours are mixed in perfect equality so that neither predominates, the eye and the mind repose on the result of this junction as upon a simple colour. The beholder has neither the wish nor the power to imagine a state beyond it. Hence for rooms to live in constantly, the green colour is most generally selected.

Completeness And Harmony.

803. We have hitherto assumed, for the sake of clearer explanation, that the eye can be compelled to assimilate or identify itself with a single colour; but this can only be possible for an instant.

804. For when we find ourselves surrounded by a given colour which excites its corresponding sensation on the eye, and compels us by its presence to remain in a state identical with it, this state is soon found to be forced, and the organ unwillingly remains in it.

805. When the eye sees a colour it is immediately excited, and it is its nature, spontaneously and of necessity, at once to produce another, which with the original colour comprehends the whole chromatic scale. A single colour excites, by a specific sensation, the tendency to universality.

806. To experience this completeness, to satisfy itself, the eye seeks for a colourless space next every hue in order to produce the complementary hue upon it.

807. In this resides the fundamental law of all harmony of colours, of which every one may convince himself by making himself accurately acquainted with the experiments which we have described in the chapter on the physiological colours.

808. If, again, the entire scale is presented to the eye externally, the impression is gladdening, since the result of its own operation is presented to it in reality. We turn our attention therefore, in the first place, to this harmonious juxtaposition.

809. As a very simple means of comprehending the principle of this, the reader has only to imagine a moveable diametrical index in the colorific circle. The index, as it revolves round the whole circle, indicates at its two extremes the complementary colours, which, after all, may be reduced to three contrasts.

810.	Yellow	demands	Red-blue,
	Blue	demands	Red-yellow,
	Red	demands	Green,

and contrariwise.

10 Joseph Mallord William Turner (1775–1851) ‘Backgrounds, Introduction of Architecture and Landscape’

Turner was a successful student at the Royal Academy schools from the age of 14, and first exhibited in their annual exhibitions in 1796. He was elected an associate member in 1799, and then a full member in 1802. He became Professor of Perspective in 1807.

Despite the extent of his reading, and his possession of what Constable called 'a wonderful breadth of mind', Turner's lectures were notoriously difficult to follow. His course usually consisted of six talks, and was given twelve times between 1811 and 1828. Historians have found his notes virtually unintelligible, and have only been able to piece together small parts of them, though John Gage has provided a notable reconstitution of the fifth lecture on colour, from 1818 (see *Art in Theory 1815–1900*, 1B2). Apart from that, the only lecture to have been published in full is the present one, which was delivered as the last in Turner's inaugural series on 12 February 1811. In view of the uncommon difficulty of Turner's text, it is useful to consider what his editor has had to say: 'Ostensibly the purpose of this lecture was to explain the role of backgrounds in painting. In fact however, Turner set out to do much more. Even though falteringly, he presents a case for a landscape art capable of stimulating the imagination much as a history painting might' (Ziff, p. 131). For Turner, the most eloquent testimony to the status of landscape art was to be found in the Venetian school, and in particular in the work of Titian. He also esteemed Claude Lorrain and Poussin for their acknowledgement of 'the necessity of rules to produce propriety even in landscape'. By contrast he was critical of the Dutch, with the partial exception of Rembrandt, since they seemed to lack the elevation which Turner believed could set Landscape on a par with History painting. From the British school, Turner singled out for approbation the classical landscapes of Richard Wilson. Our extracts are taken from "'Backgrounds, Introduction of Architecture and Landscape": A Lecture by J. M. W. Turner', edited with an introduction by Jerrold Ziff, *Journal of the Warburg and Courtauld Institutes*, vol. XXVI, London, 1963, pp. 124–47; extracts from pp. 133, 135–6, 137–9, 143, 144–7. We have omitted all but one of Ziff's explanatory footnotes.

To select, combine and concentrate that which is beautiful in nature and admirable in art is as much the business of the landscape painter in his line as in the other departments of art. And from the earliest dawn of colouring, or of combinations from nature, there can be traced, as can be found in the work of Pietro Perugino, the value of attending to a method of introducing objects as auxiliaries by which each master endeavoured to establish for himself a different mode of arrangement by selecting what appeared most desirable in nature and combining it with the highest qualities of the Historic school either as a part of the subject, or even at times allowed [it] to be equal in power to the Historic department. [...]

[T]he highest honour that landscape has as yet, she received from the hands of Titian, which proves how highly he considered its value not only in employing its varieties of contrast, colour and dignity in most of his Historical Pictures; but the triumph even of Landscape may be safely said to exist in his divine picture of St. Peter Martyr. No thought of narrow subservience enters the Idea or appears in the arrangement of that truly great specimen of his powers and of art. The Diana and Acteon is of course from his hand, in the Marquis of Stafford's Collection, in which it [landscape] forms part of a whole with respect to the Subject and general style of the picture, a whole in regard to light and shade, and a whole of everything appropriate. And so connected that [it] becomes one of the main objects of the Picture.

The part, tho' small compared with many of his pictures of landscape, which enters into the composition of that picture he painted of Phillip's Mistress, or known by such name of which formerly grac'd the Orleans collection but now of Earl Fitzwilliam at Richmond, is replete with all his love and true regard for the value

he held of landscape. Brilliant, clear and with deep-toned shadows, it makes up the equilibrium of the whole by contrasting its variety with the pulpy softness of the female figure, glowing with all the charms of colour, bright, gleaming, mellow, full of all the voluptuous luxury of female charms rich and swelling. The sight must return and rest there, altho' the landscape insensibly draws the eye away to contemplate how valuable is its introduction. To keep up that union of interest and support its assistance in attracting the eye from the right hand of the picture can be no small honour.

Here then do I rest my claim that backgrounds, as they are generally call'd, should be divided into such, or those whose merit deserves a better title like the one mention'd before be admitted as part of the picture. For History either disgraces herself by being always in debt to such aids, and degrading those aids with a term applicable to the most useless of the name, or places or considers it so subordinate that its situation might be occupied by any other form equally well. [...]

Architectural introductions originated with Paolo Uccello; and Albert Durer continually made use of such arrangements, to the detriment of some of his designs of which his wood plates in the years 1508 to 1515 give ample proof. Yet architecture has been generally admitted as connected with History from its quality as well as the subject of the picture which often requires its introduction. But Paul Veronese has so undoubtedly fixed her powers of combinations for colours, for lights, and for shade as to be of the utmost use, so much so in the picture of the Marriage at Cana as to be inseparable with the design of the whole composition that to take it away a great part of the celebrity of that picture would be taken away with it.

This picture is now at Paris, but it formerly graced the Church of St. George at Venice. The centre is occupied by a sky of pure white and blue; the architecture, light ton'd white marble pavement and the front squares of light colour'd ground without the least indication or intention of shadow across such a space. The figures are wrought to the same high tone as the sky and each figure, single or grouped, relieved from the pure white cloth on the table by the several powers of primitive bright and full toned colours. The only mass of shade exists in the architectural arrangements and the figures under the portico; without the shadow caused by the architecture, no balance or even shade could have been effected so effectively to show his consummate powers of producing so artful an arrangement of light and colour without the appearance of positive shadow or even of it being his intention.

Another specimen which fortunately rests with us is of equal importance to convince everyone of Paolo's powers and of his peculiar choice of architectural Pictures wrought according [to] the words of a great Master upon the same high pitch in the same high key which keynote is likewise blue, but placed on one side of the picture whereas in the former arrangement it holds the centre, forming with the white, the greatest mass of light while the second arrangement is in the Picture of Mercury and Herse in the collection of Earl Fitzwilliam at Richmond. The centre is occupied exclusively by architecture, sculpture and furniture and constitutes the whole mass of shade, particularly a table cover'd with tapestry, making a square form equal to the quarter of the whole. Tho' of different embossed patterns and colours yet it is not allowed to hold the least light. Neither can it be called in shade, possessing a peculiar semi-diaphanous *thermae* [herm] shadow'd by a rich pink damask curtain

hanging from a composite column on the right behind Mercury, whose entrance interrupted by Aglauros between his feet occupies one side of the picture composed entirely of light colours relieved only by the dark, rich, olive-toned garment thrown behind him. Opposed to this mass of light and colour is the figure of Herse clad in positive blue and white upon a white and dark colour'd pavement. A low-toned sky seen through an architectural arrangement of the composite order behind in shadow makes the remaining part of the picture. Thus the very furniture, the sculpture and architecture, as in the former, *constitute* in a great measure this wonderful production which beyond all doubt weakens Fresnoy's principles of colouring.¹ But each as pictures, these such examples of arrangements cannot or ought not to be considered backgrounds where their parts are keys of tones to the whole picture or at least in the making up of the last picture without which no union of light could have been obtained throughout the whole part but by the bright pavement. And supposing a change, must not the whole be changed? If then by such means as those pointed out such a wonderful production of art has been effected, the joint union of the three departments is established of Landscape, architecture, and sculpture with History. For History suffers only by a union with commonality. Whatever is little, mean and commonplace enters not, or ought not, the landscape of History as an assistant or as a Historical Landscape, or Architecture or Sculpture. Each, tho' separately drawn from the same source, yet should be considered separately for its subject by combining what is truly dignified and majestic and possessing Nature of an elevated quality. This [is the] class of Titian and Giorgione landscapes and Paolo's architecture and other works [which] elucidate the coalition of such powerful auxiliaries that in many instances they not only assert their value but dispute for the palm of celebrity.

Such presumptions must have brought down upon them, and particularly landscape, the dire disgrace she suffers under the hands of Paul Bril and Rottenhammer who, as they saw, painted Nature individually, not collectively, while Bassano's Master [i.e. Titian] has left us the greatest specimen of landscape for grandeur and dignified character, arising from the simplest forms in nature, a few mellow lines, but whose aggregate form seems to have aroused the mind of Titian in the composition of St. Peter Martyr to that point which will be the very standard of his powers and, perhaps, of Landscape. [...]

To Nicolas Poussin let me direct your observation. His love for the antique prompted his exertion and that love for the antique emanates through all his works. It clothes his figures, rears his buildings, disposes of his materials, arranges the whole of his picture and landscape and gives, whether from indifference or strength of his ground, a colour that often removes his works from truth. The Flight of Young Pyrrhus is a tablet of his powers in Landscape composition for grandeur and sublimity by simple forms and lines. The parallel triumphal arch in the right with the foreground trees and the classical introduction of the Ancient Hermes, interrupting the parallel lines, constitute the leading features of the arrangement. The group of frighten'd females, the supplicant with the child, the spearman throwing the dart across the allegorical stream at once show his uncommon abilities in detailing his history and his ruling passion for the antique and allegorical allusion.

The six pictures generally called his landscapes, formerly in the Louvre, are now *dispersed*. One of them, the Roman Youth in the collection of Sir Watkin

Williams-Wynn, *The Burial of Phocion in Mr. Hope's and the Street Scene in the late Desenfans' collection*, are with us as powerful specimens of his Historic Landscape. A slight view of them is sufficient to demand our admiration and enforce respect for their purity of conception uncharg'd with colour or of strained effects. Buildings [are] classically consider'd and introduc'd with the rules of parallel perspective everywhere regulating and enforcing the wholesome conviction; namely, the necessity of such *rules* to produce propriety even in landscape. [...]

Pure as Italian air, calm, beautiful and serene springs forward the works and with them the name of Claude Lorrain. The golden orient or the amber-coloured ether, the midday ethereal vault and fleecy skies, resplendent valleys, campagnas rich with all the cheerful blush of fertilization, trees possessing every hue and tone of summer's evident heat, rich, harmonious, true and clear, replete with all the aerial qualities of distance, aerial lights, aerial colour, where through all these comprehensive qualities and powers can we find a clue towards his mode of practice? As beauty is not beauty until defin'd or science science until reveal'd, we must consider how he could have attained such powers but by continual study of parts of nature. Parts, for, had he not so studied, we should have found him sooner pleased with simple subjects of nature, and [would] not [have], as we now have, pictures made up of bits, but pictures of bits. Thus may be traced his mode of composition, namely, all he could bring in that appear'd beautifully dispos'd to suit either the side scene or the large trees in the centre kind of composition. Thus his buildings, though strictly classical and truly drawn from the Campo Vaccino and Tivoli, are so disposed of as to carry with them the air of composition.

But in no country as in England can the merits of Claude be so justly appreciated, for the choicest of his work are with us, and may they always remain with us in this country. [...]

The Flemish school approaches to individual nature, and only two, Rembrandt and Rubens, ever dared to raise her above commonality. Rembrandt depended upon his chiaroscuro, his bursts of light and darkness to be *felt*. He threw a mysterious doubt over the meanest piece of Common; nay more, his forms, if they can be called so, are the most objectionable that could be chosen, namely, the Three Trees and the Mill, but over each he has thrown that veil of matchless colour, that lucid interval of Morning dawn and dewy light on which the Eye dwells so completely enthrall'd, and it seeks not for its liberty, but as it were, thinks it a sacrilege to pierce the mystic shell of colour in search of form.

No painter knew so well the extent of his own powers and his own weakness. Conscious of the power as well as the necessity of shade, he took the utmost boundaries of darkness and allow'd but one-third of light, which light dazzles the eye thrown upon some favourite point, but where his judgment kept pace always with his choice surrounded with impenetrable shade still remains.

Rubens, Master of every power of handicraft and mechanical excellence, from the lily of the field to animated nature, disdained to hide, but threw around his tints like a bunch of flowers. Such is the impression excited in his *Fête in the Louvre*, wholly without shadow compar'd to Rembrandt's mode, obtaining everything by primitive colour, form and execution, and so abundantly supplied by the versatility of his genius with forms and lines, could not be happy with the bare simplicity of pastoral

scenery or the immutable laws of nature's light and shade, feeling no compunction in making the sun and full moon as in the celebrated picture of the Landscape with the Waggon, or introducing the luminary in the Tournament, while all the figures in the foreground are lighted in different directions. These trifles about light are so perhaps in Historical compositions, but in Landscape they are inadmissible and become absurdities destroying the simplicity, the truth, the beauty of pastoral nature in whose pursuit he always appears lavish of his powers. Full of colour, the rapidity of his pencil bears down all before it in multitudes of forms, not the wild incursions full of Grandeur as Salvator Rosa, but [the] swampy vernality of the Low Countries.

Without affecting to do anything, Teniers has given us that individuality, which the great genius of Rubens in his Flemish Fête and pastorals always seem'd in search of. Artfully arrang'd and exquisitely touched tho' looking careless, bearing a freshness and silvery tone pervading everywhere thro' all the diversity of colours, tho' scatter'd upon the innumerable figures of the Flemish Marriage Feast at Louther Castle, yet all the tones tend by his consummate management, concentrated, to one figure in white and grey which binds the whole together.

Cuyp, Paul Potter and Adrian van der Velde sought for simplicity below commonality which too often regulated their choice and alas their introductions, yet for colour and minuteness of touch of every weed and briar long bore away the palm of labour and execution. But Cuyp to a judgment so truly qualified knew where to blend minutiae in all the golden colour of ambient vapour.

Gainsborough, our countryman, rais'd their beauties by avoiding their defects, the mean vulgarisms of common low life and disgusting incidents of common nature. His first efforts were in imitation of Hobbema, but English nature supplied him with better materials of study. The pure and artless innocence of the Cottage Door now in the possession of Sir John Leicester may be esteemed as possessing this class, as possessing truth of forms arising from his close contact with nature, expression, full-toned depth of colour and a freedom of touch characteristically varied with the peculiarities of the vigorous foliage or of decaying nature.

To this rustic simplicity of nature unadorned contrast the meretricious Zucearelli with all the gay materials of Watteau without a grain of Watteau's taste. His figures are often beautiful, but in general poor, plac'd always to demand attention as to colour, yet they defrauded the immortal Wilson of his right and snatched the laurel from his aged brow. In vain did his pictures of Niobe in the possession of Sir George Beaumont and the Duke of Gloucester flash conviction of his powers, or Ceyx and Alcyone and Celadon and Amelia display contending elements or the Cicero at his Villa sigh for the hope, the pleasures of peaceful retirement, or the dignified simplicity of thought and grandeur, the more than solemn solitude that told his feelings. In acute anguish he retired, and as he lived he died neglected.

¹ Turner probably had in mind Du Fresnoy's admonition against using the same key or brightness of colouring.

11 David Cox (1783–1859) from *A Treatise on Landscape Painting and Effect in Water Colours*

As a medium for the recording of topography and for capturing atmospheric effects, watercolour received its most extensive exploration in Britain during the later eighteenth century, where it was associated with widespread interest in landscape as a source of the picturesque. Besides the considerable number of professional artists who worked in watercolours, a host of amateurs adopted the medium with varying degrees of success. As a consequence there was a ready market for practical instruction. David Cox was one of a number of artists of his generation who worked primarily in the medium of watercolour, though he also began to paint in oils at a relatively late stage in his life. After a varied early career in Birmingham, in 1804 he moved to London, where he received some instruction from John Varley. He rapidly made a name for himself as a painter in watercolours, specializing in the relatively new genre of rustic scenery – new insofar as its subjects included the ‘lowly’ and previously unconsidered elements of the countryside: cottages and farms, lanes and rivers, pollarded willows and collapsing fences. He exhibited for the first time with the Royal Academy in 1805 and with the Associated Artists in Water-Colours in 1809. He was made President of the latter the following year, and in 1812 was elected an Associate of the Society of Painters in Water-Colours, founded eight years previously. He began teaching in 1808 and issued three books of instruction between 1813 and 1820. The first of these was *A Treatise on Landscape Painting and Effect in Water Colours, from the first rudiments to the finished picture. With examples in Outline, Effect, and Colouring*, London: S. and J. Fuller, 1813–14. A revised edition was issued in 1840–1. Advances in the technology of reproductive printing in the late eighteenth and early nineteenth centuries did much to enlarge the market both for topographical studies and for books of instruction (see also VIIA12). Cox’s volumes were clearly intended to cater to both. They were handsomely illustrated with soft-ground etchings after his own pencil and crayon drawings, and with aquatints after his sepia studies and watercolours, ‘so selected, as to display an unusual variety of the most picturesque scenes in England and Wales’ (from the advertisement on the cover of the original 1813 edition). Our excerpts from Cox’s introduction are taken from the Studio reprint of the 1813 edition, ed. Geoffrey Home, London: The Studio, 1922, pp. 11–15.

General Observations On Landscape Painting.

The principal art of Landscape Painting consists in conveying to the mind the most forcible effect which can be produced from the various classes of scenery; which possesses the power of exciting an interest superior to that resulting from any other effect; and which can only be obtained by a most judicious selection of particular tints, and a skilful arrangement and application of them to differences in time, seasons, and situation. This is the grand principle on which pictorial excellence hinges; as many pleasing objects, the combination of which renders a piece perfect, are frequently passed over by an observer, because the whole of the composition is not under the influence of a suitable effect. Thus, a Cottage or a Village scene requires a soft and simple admixture of tones, calculated to produce pleasure without astonishment; awakening all the delightful sensations of the bosom, without trenching on the nobler provinces of feeling. On the contrary, the structures of greatness

and antiquity should be marked by a character of awful sublimity, suited to the dignity of the subject; indenting on the mind a reverential and permanent impression, and giving, at once, a corresponding and unequivocal grandeur to the picture. In the language of the pencil, as well as of the pen, sublime ideas are expressed by lofty and obscure images; such as in pictures, objects of fine majestic forms, lofty towers, mountains, lakes margined with stately trees, rugged rocks, and clouds rolling their shadowy forms in broad masses over the scene. Much depends upon the classification of the objects, which should wear a magnificent uniformity; and much on the colouring, the tones of which should be deep and impressive.

In the selection of a subject from Nature, the Student should ever keep in view the principal object which induced him to make the sketch: whether it be mountains, castle, groupes of trees, corn-field, river scene, or any other object, the prominence of this leading feature in the piece should be duly supported throughout; the character of the picture should be derived from it; every other subject introduced should be subservient to it; and the attraction of the one, should be the attraction of the whole. The union of too great a variety of parts tends to destroy, or at least to weaken the predominance of that which ought to be the principal in the composition; and which the Student, when he comes to the colouring, should be careful to characterise, by throwing upon it the strongest light. In his attention to this rule, however, the Student must be particular not to fall into the opposite extreme, by suffering the leading object of his composition so fully to engross his attention as to render him neglectful of the inferior parts. Because they are not to be exalted into principals, it does not follow that they are to be degraded into superfluities.

All the lights in a picture should be composed of warm tints, except they fall on a glossy or reflective surface; such as laurel leaves, glazed utensils, etc., which should be cool, and the lights small, to give them a sparkling appearance: but care must be taken not to introduce a cold colour in the principal light, which, as already mentioned, should be thrown upon the leading feature of a picture, as it conduces to destroy the breadth that should be preserved; while on the contrary, the opposition or proximity of a cool to a warm colour assists greatly in giving brilliancy to the lights. If the picture, for instance, should have a cool sky, the landscape ought to be principally composed of warm tints; as contrast of this description tends to the essential improvement of the general effect.

All objects which are not in character with the scene should be most carefully avoided, as the introduction of any unnecessary object is sure to be attended with injurious consequences. This must prove the necessity of becoming thoroughly acquainted with, and obtaining a proper feeling of, the subject. The picture should be complete and perfect in the mind, before it is even traced upon the canvas. Such force and expression should be displayed, as would render the effect, at the first glance, intelligible to the observer. Merely to paint, is not enough; for where no interest is felt, nothing can be more natural than that none should be conveyed.

Finally, it may be observed, that it is only by a due attention to each distinct part, and by a skilful combination of all, that the whole can be effective and delightful.

On Outline.

The young draftsman who is ambitious of future eminence must be close in his attention to those minute points which, skilfully combined, constitute the excellence of the painter. In the outset, it will be necessary for him to be particular in his designation of the Outline, for the perfection of which, he must possess a clear conception of his subject; otherwise, be his genius what it may, he will wander wildly, without either promoting his own satisfaction, or conveying a definite or correct idea to the observer. Too little attention has generally been paid to this point, by Students: they are too apt to appear disconcerted and discouraged, when the task wears a complexion of difficulty.

A clear and decided Outline possesses a manifest superiority over an imperfect or undecided one, inasmuch as it renders unnecessary those continual references to Nature or to copy, which must be had recourse to, where the Outline is defective. He who devotes his time to the completion of a perfect Outline, when he has gained this point, has more than half finished his piece; while the author of a slovenly Outline creates for himself an infinity of trouble, in order to evade additional errors in the colouring of his subjects; and after all his efforts, finds it impossible to produce a picture perfect in any one part. To attain proficiency in the art of pencilling, the Student is recommended to practise Drawing from the casts of the antique, by which study he will acquire a growing facility in the designation of fine forms, as well as a more correct and decided mode of outlining. The Pupil will also find his progress greatly accelerated by the dedication of his leisure moments to copying objects of still life – a practice which will be found replete with advantage, when he studies combinations of subjects for compositions of landscape scenery.

In tracing the distinct objects of a landscape, it is recommended to attend more particularly to the general forms than to detail: for example, in sketching a mountain, it will be sufficient to describe the extreme Outline, without descending to the diversified and numerous ridges which may appear; for although these uneven divisions arrest the attention of the Student, when engaged in tracing the particular form of the eminence, they are lost to the eye which embraces, at one view, the whole of the scene. A greater degree of minuteness, however, ought to be observed in the Outline of the fore-ground of a picture, where the features of the object assume a more specific appearance, shewing decided forms, and obtruding all their diversities of shape upon the view. To obtain excellence in this respect, it will be necessary to make correct drawings from Nature, of weeds, plants, bark of trees, and such objects as usually constitute the foreground of a landscape.

The Student must first commence with perpendicular, horizontal, and diagonal lines, to give the hand that freedom and certainty which are necessary. The Drawing must be strongly marked in the shade and fore-ground of the subject, but more delicately in the lighter parts, and as the distance gradually increases. Due attention to this cannot fail to give the true spirit and perspective. The Plates of this Work should be copied in regular succession, and any bad line that may be made should be entirely expunged; for all effort to rectify, by retouching, will only give the piece

a scratched and indecisive appearance, and consequently will cause confusion and mistakes in the colouring.

Any little failure must not be made the source of discouragement; and in case the Student should not have succeeded altogether so well as could be wished, in the first attempt, he ought by all means to persevere until completely successful; carefully endeavouring, in his renewed efforts, to avoid the same errors. This mode will assuredly be followed with far greater improvement than can possibly attend hasty transitions from one subject to another, without producing perfection in either.

The best and surest method of obtaining instruction from the Works of others is not so much by copying them, as by drawing the same subjects from Nature immediately after a critical examination of them, while they are fresh in the memory. Thus they are seen through the same medium, and imitated upon the same principles, without preventing the introduction of sufficient alterations to give originality of manner, or incurring the risk of being degraded into a mere imitator.

If the mind be fixed and sincere in pursuit of the Art, difficulties will be easily surmountable: they will rather quicken than damp the desire for improvement; for it is only where talent is required that Genius can be active. The accomplishment of one task will only give additional stimulus for the performance of another. Increasing pleasure will naturally flow from progressive improvement. The mind will ever be busily and pleasingly employed; for 'the effect of every object that meets a Painter's eye may give him a lesson.'

12 William Henry Pyne (1769–1843) Preface to *Etchings of Rustic Figures*

Pyne was trained as an artist in London and worked as a draughtsman, illustrator and writer. He first exhibited at the Royal Academy in 1790 and was a founder member of the Society of Painters in Water-Colour in 1804. He is best known for his volumes of picturesque vignettes, printed in etching and aquatint from his own drawings. The first of these was *Microcosm*, issued from 1803 to 1808. *The Costume of Great Britain* appeared in 1808. Pyne contributed the text to the first two volumes of Rudolph Ackermann's *Microcosm of London*, published in the same year, and wrote on a regular basis for Ackermann's monthly magazine *Repository of Arts*, published from 1809 to 1828. *Etchings of Rustic Figures, for the Embellishment of Landscape* was issued in London in 1815 by M. A. Nattali, with a preface written by the artist. The numerous illustrations provided readily transplanted examples of 'staffage' for painted landscape, in some cases with the addition of suggestive backgrounds. Pyne's text provides evidence both of the prevalence of amateur landscape painting in the early nineteenth century, and of Gainsborough's importance in establishing the genre of 'English pastoral'. The other artists referred to were all known at the time for their work on rural subjects. Richard Westall (1765–1836) painted genre subjects in a style elevated to the point of archness (and is more likely to be the subject of Pyne's reference than his artist brother William). Joshua Cristall (1765–1836) worked mainly in watercolour and brought an interest in classical style to carefully observed genre subjects. Thomas Barker (1769–1847) published his *Impressions of Rustic Figures after Nature* in the new technique of lithography in 1813. George Morland (c.1763–1804) established a widespread reputation both in England and on the Continent.

A large number of his works on rural themes were engraved between 1780 and 1797. Pyne was to be ruined by his next venture, *The History of the Royal Residences*, with 100 engravings illustrating his own text, published between 1816 and 1819. Our complete text of the Preface to *Etchings of Rustic Figures* is taken from the reissued edition of 1820, pp. 3–8.

In no age and in no country perhaps, have the fine arts met that public patronage which they happily experience in England in the nineteenth century. Every respectable member of the superior classes of society appears emulous to afford his children the advantages of an enlightened education: hence the most distinguished professors in every branch of science have ample employment in communicating their knowledge to the rising generation. The art of painting, among the first in utility, forms a material feature in the plan of education; and the encouragement which its professors have experienced, has called forth their utmost energies in producing works that will facilitate the improvement of their disciples: preceptive books, upon almost every department of the art, have been published. The little work here offered to the public will, it is hoped, contribute something to the general stock of information.

Landscape-painting has long been cultivated with the utmost success by British artists, and works have been produced by them that rival those of the Italian, Flemish, or other distinguished ancient schools.

The rage for making tours, which has so long distinguished the British people, has increased for several years, until it has become the prevailing taste of the higher families to explore the country in search of the picturesque. Numerous portfolios are filled every summer with topographical studies made by amateurs, as well as artists, during these excursions, until those who remain at home can indulge in viewing the romantic and rural scenery of our beautiful island by their fire-side.

The study of appropriate figures for the embellishment of these scenes has not been followed with equal ardour: hence many whose taste is displayed in the representation of landscape, lose their credit by the introduction of groups of figures that are greatly inferior to their well-painted designs. To remedy this defect in some measure, these groups have been formed: their costumes, characters, and general employments have been attended to; which may not alone furnish subjects to compose groups from, but may also lead the student to select figures of a similar class in nature, from which they may make their own original studies.

It has not been the object of the author of this work to represent elegant forms, or to aim at correct drawing; his intention has been, simply to sketch the prominent character and habits of the rustic. Those young students who desire to excel in painting groups of figures in their landscapes with original feeling, may commence by drawing from the etchings here offered, and may derive much improvement by contrasting their dresses by the application of such colours as are usually exhibited in great variety, by persons whose attire is regulated by no rules of taste. Those whose travel will improve their knowledge in these matters, by marking in a common-place book the contrasts which they may find in contemplating the dress of this class of people in the towns and villages where they may chance to stop: this practice will be attended with no trouble. Reference to such memoranda, in the painting-room, readily furnishes the mind with what it otherwise might seek for very long, or

perhaps in vain. In London, or other populous towns, where there is a general uniformity of dress, these necessary observations cannot be made.

It has long been the practice of those who make sketches of views from nature, to leave the embellishments of figures, animals, &c. to a future period, fancying that groups for this purpose can be composed at leisure: this practice is erroneous. It is highly essential to sketch figures, animals, or other objects, to embellish the design, upon the spot: the groups then assume the air of nature; their occupations are mostly accordant to the scene; and they are consequently appropriate in action, character, and every essential that constitutes fitness or propriety.

The eye that is accustomed to look for truth of representation in all the embellishments of a landscape, cannot tolerate what is so commonly met with in pictures of great merit in many other respects; namely, the want of character, not only in figures, but in expletives, that should give value from their form and appropriate uses. A pump or well, a wheel-barrow, a cart, plough, or other object, if not represented with attention to mechanical construction, instead of adding to the interest of the piece, really deteriorates its merit.

The student should make himself acquainted with the true form of these objects, by carefully drawing them in every point of view. This study is amusing as well as useful, great satisfaction resulting from a successful imitation of any object that can be introduced into a picture. Our best painters copied nature in detail, or they could never have produced such identity in every object which they represent. Nothing appears a labour to those who have drawn with accuracy at the commencement of their study. Gainsborough, whose pictures appear to the unskilled in art scarcely intelligible, copied weeds, dock-leaves, and all the minutiae of fore-grounds with unwearied accuracy: hence a few touches of his magic pencil described the character of such objects.

It would be no less useful to copy groups of animals from the best prints of these subjects, previously to attempting to draw them from nature: for cows, horses, asses, deer, sheep, dogs, and pigs, should be represented with as much truth of character as the human figure; and a landscape, however well painted, wherein these domestic animals appear defective in character, loses half its charm.

Hills's Etchings of Animals drawn from nature form the most celebrated work designed for this purpose, and should be possessed by all who feel desirous of acquiring a just knowledge of their picturesque character. The whole work may be too voluminous for every one to possess; but as separate parts can be had, 'neat cattle, sheep, horses, deer, asses, mules,' &c. it is recommended, that some specimens of them should be procured, as they comprise all that is excellent in the study of domestic animals.

The same mode of acquiring a certain knowledge of colouring animals should be resorted to as described for figures. The student should sketch, however slightly, the masses of black, brown, red, and other colours that variegates the hides of animals; by which means the most beautiful combinations of tints may be procured, and without which practice this necessary art can never be sufficiently understood.

That species of landscape composition which best suits rustic figures of the humble class, similar to those contained in this work, is most generally cultivated by the artists and amateurs of this country; it has been denominated English pastoral.

To explain what is understood by this term, reference may be made to the compositions of Gainsborough, whose landscapes possessed no other characteristics than those which the woods, copses, hamlets, heaths, lanes, and such places, unadorned by art, offered for his imitation. It was in the midst of such scenes in the county of Suffolk that he first studied drawing. His feeling mind led him to select such parts and such objects as nature, or the rudest works of art, combined with nature, afforded in these sequestered spots. The humble inhabitants that peopled these scenes he made the equal objects of his study, and chose from among them such as were most congenial to his poetic fancy: for all that he copied, although it had the appearance of fidelity to its prototype, yet had a certain portion of his original feeling incorporated therein, that accorded with what the poets have termed the pastoral style.

If he sketched a milk-maid, he selected a girl for his model that captivated by her beauty and native sweetness. Cottage children, whom he delighted to paint, were the offspring of health and innocence. His old men were not like those of Ostade, Hemskirk, and other painters of the Dutch and Flemish schools, sordid boors; they were open, artless, grey-headed swains, scarcely bending beneath the burthen of old age.

The groups that are represented in the accompanying plates, are designed to embellish landscapes wherein the figures are secondary objects. Those who desire to study the same class of characters on a larger scale, may select groups or single figures therefrom, and enlarge them by the addition of a little original feeling of their own, which will afford a useful preparatory exercise, fitting them to draw rustic figures from nature.

To improve in such a pursuit, it is recommended to study the works of those artists who have most excelled in forming pictures representing the peasantry of our country. Westall's compositions will afford them the means of acquiring as much elegance of form and tasteful arrangement as such a style can possibly admit of; indeed, some of the pictures of this artist have a superabundance of these qualities, amounting to a fault. But it is the business of him who wishes to improve, to study those works which possess the greatest degree of originality and boldness of design. A great genius will sometimes outstep the boundary of truth; but the energies of such a mind afford examples that genius alone will venture to produce, stimulating the imitator to try his own strength in bold flights of the imagination, which experience will regulate by sober rules.

The works of Cristall in this department will afford the student the means of much improvement; simplicity of character, united with grandeur of style, distinguish his designs. His cottage groups, gleaners, fishermen, and other subjects of the humble class of life, are admirable specimens of the graphic art.

Another eminent artist, Barker, may be instanced, whose works display a great acquaintance with these subjects. Those who admire the compositions of Gainsborough will find much of his taste in the figures and general compositions of this artist. Perhaps among all the living painters, no one has so successfully continued Gainsborough's style of design.

A work of Rustic Figures has lately been published at Bath by this artist; the characters are well drawn, are natural, and engraven in the polyautographic art. They

would afford improvement to those who would copy them with attention, as the style is not difficult, and is replete with freedom of line.

The engraved Rustic Figures in imitation of the original drawings in chalk by the late George Moreland, are also excellent specimens of style; they are executed with the utmost freedom of pencilling, and exhibit a just observation of character. A knowledge of breadth may easily be acquired by imitating these original works.

In drawing figures of this class from nature, it is recommended, to commence by making a faint outline of the general form of the object; when that is effected, the proportions must be studied, which should also be made out by tender lines. The masses of shadow should next be lightly rubbed in with a blunt pencil or chalk; this prepares the sketch for finishing. The lines towards the light should be drawn delicately and with determination of form. The shadows on the light side must be kept in so low a tone as not to interrupt the breadth of effect. The bolder pencilling should be reserved for the last process, and principally confined to certain shadows of the features, the hair, and the drapery on the shadowed side. By a steady adherence to these rules, when drawing from nature, the character of masterly execution may with certainty be attained.

13 Henry Richter (1772–1857) from *Daylight: A recent Discovery in the Art of Painting*

Richter was an English engraver and watercolourist active in the Associated Artists in Water-Colours, who had some success with small-scale genre scenes on paper. His eccentric publication was directed 'to the Governors and Directors of the British Institution for promoting the Fine Arts in the United Kingdom'. It is prefaced by a brief 'Advertisement' in which he disparages 'the present style of Art in Paris' for pursuing an impossible perfection, and for preferring 'the imitation of an imitation to the more active and immediate study of the great original'. In contrast he expresses his hope for a new 'period of intellectual grandeur', informed by the example of Shakespeare's genius, by the achievements of Hogarth and Reynolds, and by the philosophy of Immanuel Kant. The conclusion to his Advertisement is that 'Originality is the Soul of Art'. The text that follows – the *Daylight* of Richter's title – is framed as an imaginary and humorous discussion between the author and a number of Dutch and Flemish painters, Teniers, Cuyyp, Rubens, Van Dyck and Rembrandt among them, at the closing of an exhibition of Dutch and Flemish pictures at the Royal Institution (the event that presumably motivated Richter in the first place). The discussion concerns the relative darkness of the paintings on display, and the changes that might be effected by lighting painting as though by daylight with the sun overhead. Richter's apparent purpose is to suggest that differences in style are to be accounted for by differences in the conceptions imposed upon nature. His 'daylight' functions as a kind of metaphor for the 'direct appeal to Nature itself', which he sees as the mark of originality. The imaginary discussion occupies a mere dozen pages, but it is accompanied by a further fifty pages of footnotes. The majority of these are taken up by note 4, which is indexed to a question voiced by Richter concerning 'The diversity of styles, or, as they are termed, the different ways of seeing Nature'. The note expands into a lengthy discourse upon the theory of painting. We include four excerpts. The first offers a critique of David's *Brutus* (Louvre, Paris) as an example of painting regulated by a classical ideal (see IVB2, 3).

The second is concerned with the indispensable role of invention in history painting, and in art in general. The third argues for the status of painting as a form of language. In the fourth Richter argues that the intrinsic poetic function of painting is to be found in its relation to Mind, and that in modern times this function can only be obscured by dependence on irrelevant classical mythology. Our text is taken from the original edition, *Daylight; A recent Discovery in the Art of Painting: with hints on the Philosophy of the Fine Arts, and on that of the Human Mind, as first dissected by Emanuel Kant*, London: R. Ackermann, 1817, pp. 20–3, 33–6, 36–40, 50–4.

How general and simple in its form is the *nose* of the EARLY ANTIQUE bust! – It is made by the means of a few measurements from half a dozen points accurately and judiciously settled in the mind of the sculptor, and then transferred to the marble.

There was never, in fact, *such a nose* on any living face; but it serves admirably well as the *nose of a statue*. The same thing may indeed be said even of the most refined of the antique marbles.

The affectation of this *marble style*, with the addition unfortunately of no small portion of the very matter and substance of the marble itself, forms the basis of the *bel idéal* of the modern French.

It may be said, perhaps, that there is actually buried within each of their marble figures one of their admirable stuffed *Dolls*, and that the surface is only a case of *cement*, cut after the antique fashion; – but, plausible as this may seem, whoever looks upon the BRUTUS of DAVID will see too plainly, that the dolls there exhibited have at least a *heart of stone*.

The following rude outline of the method used in the production of certain works in the *grand style* of Art in Paris, though strongly marked, and describing the mechanical part of the process only, is by no means uncharacteristic.

The artist takes as many *Dolls*, of the size of life, as he means to have figures in his picture, and sets them all up in such attitudes as suit his notions of composition – dresses them in the actual costume required by his subject, according to the best authorities, with helmets, swords, shields, &c. of *papier mâché* painted or gilt: – he then goes off to a distance, and makes a correct drawing of the whole.

Here begins the more difficult part of the work.

He takes his drawing to the Louvre, before the public is admitted, or refers to his own private collection of antique casts, and there he picks out such legs, arms, heads, hands, feet, &c. as come the nearest in attitude to those of his drawing which remain uncovered by drapery.

From these casts he copies the markings of the anatomy with great minuteness, finishing with the finger and toe-nails, and the clotting of the hair after the manner of the stony wigs of the Greeks.

The DESIGN being thus completed, the artist returns to his *atelier*. There stand his *Dolls*, and his canvas *fair* and *smooth*. He delivers the drawing to his *élève*, to enlarge and transfer to the cloth; and, in the mean time, walks on the Boulevards to receive the salutes and congratulations of his friends.

Again he returns to his patient and indefatigable *Dolls*. From them he paints his picture. Still *something* is wanting. Even French taste would not be yet content with it.

'Il y manque un peu de nature, d'âme, de sentiment.'

'Eh bien donc, voici ce qu'il fait.'

He hires a *valet de place*, shifts a Doll at a time, and puts him in the room of it; first strips one leg and then another; and *from the very life itself*, by a thin glazing, tinges the naked parts of his figures with the colours of *real skin*.

Nothing is now wanting but the last magical touches, 'pour y donner l'expression.'

Madame, or Mademoiselle, who has already obliged the painter by the display of her *carnations* for the skin of his female figures, and Messieurs, his male friends, are now called upon to perform their last kind and important offices, by sitting for the gloss of the eyes and teeth, as in the intervals of the work they had indeed occasionally done, for the knitting of the brows and the other contortions of the face.

'Et voila tout. Ah, qu'il est naturel et imposant!'

It would be no bad test of pictures to conceive them suddenly endowed with life, and that each figure should express the thought that might fairly be supposed to pass in its mind.

A trial of this sort really took place in the Louvre upon the *Brutus* of Baron David.

The headless trunks of the sons began to move forward. The lictors, one of whom is evidently the same young gentleman that looks on with so much graceful indifference at their execution in M. le Thiere's picture, are bringing the bodies into the very chamber where the wretched mother and sisters have retreated.

'Ah, que le moment est interessant!' said a Frenchman at my back.

'Quel fond d'esprit il faut que M. David ait eu pour choisir une telle position!!!' said I.

'Diable! vraiment il a beaucoup d'invention.'

At this instant we all started to hear the wife of Brutus exclaim, 'Où avez vous laissé leurs têtes? – Pourquoi ne les avez vous pas apportées avec vous? – Allez quelqu'un – les chercher.'

And one of the daughters immediately added, 'Ah, qu'ils sont vilains sans têtes!'

Brutus himself sat quietly in the corner. With one hand he griped hard a roll of parchment, the other inclined gently toward his head. We heard his toe-nails scratch the pavement; but, to our great disappointment, he said nothing.

Some English officers who were present laughed heartily at this little farce, and the Frenchman muttered, 'John Bull!'

So much for the *abuse* of the OLD ANTIQUE, and for the *marble manner* which the French painters have founded upon it. What better use will be made of the NEW antique remains to be seen.

When the marbles of Phidias shall have been more profoundly studied, and after repeated copyings the happy students shall have 'plucked out the heart of their mystery,' I am in hopes that we may be favoured with an *exposé* of the principles upon which *their peculiar excellence* is founded, with some concise and clear directions for the production of works equally *accurate*, *noble*, and *original*; and to those students I leave for the present the task of comparing them with the other STONES of the ANCIENTS. I shall also be extremely anxious to learn from their successful labours, whether, after the fall of the Apollo, the Torso, the Gladiator, &c. &c. the objects of our hitherto BLIND IDOLATRY, the claim of ABSOLUTE INFALLIBILITY is to be set up *anew* in favour of these NEW DIVINITIES; to the 'uncriticizing' and 'brooding' admiration of

which, the modern artist, during TWO THIRDS, if not THE WHOLE OF HIS LIFE, is again to be held in a state of 'subjection,' and taught that 'HE MUST STILL BE AFRAID OF TRUSTING HIS OWN JUDGMENT.'

* * *

I conclude it to be the opinion of most people, that, were it possible to arrest the course of events at the precise *moment* when some great action was arrived at its crisis, the faithful representation of *this* would, in all cases, constitute the most perfect picture of the action; but the venerable President of the Academy knew well, when he painted the DEATH OF WOLF, that this was a very great mistake. The business of Nature and of Life is not to construct pictures; and the hero in the midst of his action no more adapts his attitude to the requisites of painting, than his words to the language of poetry.

It is from the *general storehouse* of Nature that the Painter selects the materials for each individual work, surveying at once all that is connected either in fact or by association with the incident he depicts; he adopts all that can convey and impress the sentiment or explain the action, and rejects whatever might distract the judgment or weaken the feeling.

HISTORICAL PAINTING is, in fact, not a representation of a written history, it is not even a strict imitation of an historical event; it is A HISTORY IN ITSELF, told in a peculiar language of its own: and INVENTION, viewed in *this* light, must be admitted to be completely TECHNICAL, requiring a peculiar education and habit of mind in the Painter.

It speaks a language, indeed, highly congenial to our nature, being founded upon that lively *play of the judgment* which we denominate *Fancy*, and which adorns and illustrates its more serious labours.

This faculty, of which our enthusiastic Professor of painting speaks with an ardour that well becomes one so highly endowed with it, he rightly terms a power of 'unpremeditated conception.' It operates according to natural and unerring laws, subject only to the restrictions which the legislation of Reason itself, in the organization of a systematic whole, imposes upon it.

This, in the Fine Arts, is GENIUS – the INVENTIVE FACULTY *itself*. It consists entirely in an exuberant activity of the judgment, which, in seeming sport, darts through the fields of thought, and often lights on regions never before explored, bringing home the treasures of science on the light wings of the wit. [. . .]

When MAN is the object which the Painter aspires to represent, it is beneath HIS intellectual and moral dignity that the human form should be displayed as a mere beauty of Nature, for HIS *chief* excellence does not consist in this. Even corporeal action, however applied, does not sufficiently characterize HIM; it ranks him but as an instrument. It is MAN, the impassioned, the reasoning self-ruling power alone, whose actions are interesting to beings of a similar high character. No act, which does not imply this nature in the agent, or produce a lively consciousness of it in the mind of the spectator, is really *worthy*, or indeed *capable*, of the high interest which this Art, at its summit, is qualified to excite, or of the exertion of those talents and endowments which its votaries are required to possess.

From *this* root alone, all great and permanent interest must spring; and *this*, therefore, is the central point from which all LEGITIMATE INVENTION must radiate.

In glancing the eye through the LOUVRE, with a view to invention merely, how *few* subjects were there, comparatively, that possess either a powerful or a lasting claim to our attention!

Unfortunately, the Art has at all times, in a great measure, been deprived of this its noblest member. Its vital part has been too often inconsiderately torn away, and it is even now made *a question*, whether it ever really possessed A SOUL OF ITS OWN.

It is evident, that in proportion to the comparative value of the various excellencies required to be combined in an Art, should be the honour and encouragement bestowed upon those who successfully cultivate those excellencies.

To require at once a *combination of all*, however desirable, or to exact the meaner and pardon the neglect of the more noble, were to destroy, not to patronise.

This I am aware has long been felt by the higher order of amateurs in this country, and they have given some decided proofs of it: the Exhibition of the Cartoons of RAPHAEL at the BRITISH INSTITUTION, in comparison with so many works highly estimable for the inferior excellencies, was well calculated, as it was no doubt intended, to spread the same conviction in the public mind.

Yet I cannot help thinking, that even those who have reflected upon the *Art as a whole*, and with a view to its general aim and character, have almost uniformly considered INVENTION not as an *essential* and *technical* part of it, but as something extrinsic, and depending merely upon that taste which is the result of 'general education.'

I have endeavoured to shew, that this is really not the ease, and I could wish to impress the idea, that INVENTION, the soul of Art, the heir of Nature, animated by a genuine sentiment of humanity alone, and bearing the stamp and distinguishing characteristic of a natural and fortuitous COMPOSITION, is the quality that should be *first* sought for. CHARACTER to be appropriate must build itself upon *this*, and DESIGN to be just must be founded upon Character. ART, therefore, must spring up entire from LIVING NATURE, and it is in vain to attempt to *steal* it from the triumphal monuments of its departed glory. They stand, indeed, the finger-posts upon the road, but they do not shorten the journey *one single step*. The Genius of Invention of Originality is the only traveller that will ever be seen upon that road.

* * *

... Painting must be considered not as a mere art of mechanical imitation, but as a LANGUAGE – THE LANGUAGE OF VISIBLE IMAGERY. In this light Raphael and Hogarth equally viewed it, and the chief law which governed them in its use was THE LAW OF INTELLIGIBILITY, to which every other 'rule of consistency,' whether it be the *unity of time*, of *place*, or even of *chiaroscuro* itself, must be considered subservient. Excellent as these inferior principles undoubtedly are, confined within their proper limits, yet when opposed to the higher, they no longer regulate but destroy.

The WORDS of this Language are Figures, or Images consisting of Form and Colour.

They represent their objects as they have been previously conceived in the mind of the Painter.

FORM is that on which the *meaning* of the Painter's Words chiefly depends.

The variations of Light and Colour are equivalent to the sound and tone of the voice: they may sometimes add emphasis and communicate feeling; but the chief use

of colour, like that of sound, is *distinctness to the sense*. The sensations of sound and colour render words audible and figures visible, without much contributing to their intelligibility, which in Painting may be expressed by mere Lines coloured or cut, as in the Hieroglyphics or Monograms of the ancients.

Colour is then the medium of communication, Form the idea communicated – not form as belonging to any object in itself, but form as the artist, whether ignorantly or intelligently, has conceived it. These WORDS of the Painter cannot be given to him, they must be composed by himself from the great alphabet of Nature, out of which he must create his own vocabulary.

As he performs this task well or ill, and it requires an original if not an inventive act to accomplish even this – as his words approach to the general language, or are restricted to a particular dialect, he will be qualified to speak either to the ignorant or to the enlightened, to the vulgar or to the more elevated and refined.

Suppose him possessed of Words, let us now examine how he is to convert them into speech. What is required to constitute a *sentence*? It must be some relation of the *words* to each other. But how shall the *fixed* Images of Painting be made to *act* upon one another? They cannot really act, nor is the art at all *illusory* in this respect; all its Images are evidently lifeless, they have not an atom of power. Shaftesbury therefore made a fatal mistake in conceiving this ART as ‘completely imitative and illusive,’ and as ‘aspiring in a directer manner towards *deceit* and a command over our very sense,’ than all other human fiction, or imitative arts, making ‘her chief province *the specious appearance* of the objects she represents.’ Who was ever deceived by the Cartoons of Raphael? Who mistakes the figures drawn and framed upon a wall, or the statue fixed upon its pedestal, for beings endowed with life?

The Drama is much more a deceptive Art than Painting. Which of us has not been for a moment at least totally lost and absorbed in the contemplation of a great actor, *scarcely* conscious that we were sitting at a play? Painting can never work so powerfully on the sense; and perhaps this power is *sometimes* abused and carried to an excess too painful even upon the stage itself.

It is an essential characteristic of Painting, that its Images are silent and immoveable: the idea of their speech and motion, and of their action upon each other, must therefore be conveyed by a *substitute* for action and for speech.

The imagination of the spectator must be excited to supply this radical deficiency in the Art. The Painter cannot make his figures ‘fight’ and ‘fall;’ yet he must somehow convey this history of successive events, since all action is successive, or he will tell no story at all. The character and attitude of the agent must serve as *the Sign of the Act*, and in the patient we must see *some token of the consequent Effect*.

The understanding will then indeed very readily connect these Signs, and willingly interpret these *lispings* of the Fancy in the language of Art, for the sake of that truth which her infantine expression serves but to render more interesting by the enthusiasm it evinces to contend with the impediments to its utterance. Painting speaks a *dumb* language; and shall she not be allowed to express herself by *signs*? Shall the arm and the finger of her indication be as rigidly bound down to her side, as if she had a tongue to speak with? Must she be dumb to the Eye as well as to the Ear?

[...]

That painting, at its commencement, was a species of *written language* is generally agreed. The common 'tool' originally employed in painting and writing is a circumstance of trifling importance; but the common object which these two Arts originally had in view, ought never to be lost sight of, for it will be found, that in all its subsequent application, though superseded in its necessity by literature, Painting has uniformly preserved its original character.

It is, indeed, either a Language, or it is nothing – nothing deserving the attention of an enlightened mind.

That the ancient Artists used it as a Language, and that the world interpreted it as such, and was indeed deeply read in it, the whole mass of the imagery of the heathen mythology is an unanswerable proof.

That this innocent and delightful Art became the tool of idolatry and superstition, will not perhaps, in these enlightened days, be held a sufficient cause for persecuting her, when it is duly considered, on the other hand, how much more inexcusably guilty the *direct written language* of man has been in this respect, and how much the abuse of *speech* itself, the elder offspring of the mind, has contributed to darken and to enslave it.

The Language of Painting, however, has not always been employed in furthering the views of those who either wished, or were compelled, to govern by delusion; in the hand of Genius it has sometimes been a warning to Tyranny itself.

* * *

If it be admitted, that Painting is essentially a Language, whose *Forms* are its Words, speaking through the eye to the mind; the compositions it presents may be justly considered but as another species of poems; and I cannot foresee how it will be possible to refuse them this character.

It will follow also, unless I have been so unfortunate as that the whole view which I have taken of the Art is erroneous, a view which has arisen on no ground systematically assumed, but which has freely sprung up from a reflection ever open to the lessons of experience; – it will follow that the technical principles of the Art of Painting must, like those of every other species of Poetry, be sought in the peculiar circumstances to which it is subjected by the *means* it has recourse to.

It will then be necessary to examine first what Painting is in itself, before we venture upon an elaborate comparison of it with any other Art; at least it will be prudent to do so before we consent, that the laws imposed upon other Arts, whether wisely or not, should transfer their authority to this.

According to the principles, therefore, which have spontaneously formed themselves in my mind, I am compelled to reject the use of the terms *Epic* and *Dramatic* as applicable to Painting, or at all requisite to its illustration; I can see no other possible result from this figurative and indefinite use of them, but to render the theory of that Art confused and unintelligible, which in its own nature might perhaps be found to be extremely simple.

There is indeed one characteristic of Painting which, it might be imagined, would have deterred the most ardent assertor of this analogical theory from proceeding to lay a second stone of his edifice.

There lies between the *pure Poetry of Words* and that which has recourse to visible and fixed Images, a gulph never to be passed but by a flight of the poetic mind itself.

We must always remember, that the Conceptions of the Poet are vague and indeterminate, and the Images of the Painter strictly limited and defined: these actually visible and substantial; those in their very nature incapable of being either seen or felt, and in many instances totally inconsistent and beyond the reach of the understanding itself.

It is very easy for the Epic Poet to mount up to the grandeur of *indefinite conceptions*, to mingle with the pure phantoms of an imaginary world, and to give even to nothingness itself, as the phrase is, 'a local habitation and a name.' He has but to say, 'Let there be light, and there is light'; he need but pronounce the words, 'height, depth, the vast, the grand; darkness, light; life, death; the past, the future; man, pity, love, joy, fear, terror, peace, war, religion, government'; heaven, earth, hell; – and all these rise up in their utmost abstraction, or agreeably to the different tastes and habits of thinking of each individual, in the fancy of his hearers. Let but his magic word call up a Venus from the sea, and every man beholds in her the mistress he adores, or rather that phantom of beauty which he has chosen her to designate and to realize to his sense.

The *word Beauty*, whether in the mouth of the Poet or the Actor, is absolutely *perfect*; and were a very angel in human form to descend upon earth, no higher title of admiration could be bestowed upon her: such are the unlimited powers of the Poetic Art. But can the painter of a Venus flatter himself, that he shall ever be able to give universal satisfaction by any *determined* form he may adopt, however admirable it may really be? Ah, no! Has it not even been boldly and very justly asserted, that 'no face of Raphael's is perfectly beautiful.'

Where indeed upon this earth, either in the works of Nature or of Art, is this perfection to be found? The central form, or rather the vague phantom of beauty in most men's minds, the casual result of a limited experience, may indeed be distinctly reflected to their sight, and its character elevated and enlarged in the definite Form presented to them by some great Artist: but it is yet not absolutely perfect; the vague imagination still advances, urged by an immortal impulse, and the pursuit of Genius never comes to an end.

Great as have been the attainments of the Greek Artists, it is an evident absurdity to pretend, that they actually arrived at a point which in the nature of things it is impossible for any human power to reach. The '*superlative*' panegyrics bestowed upon them cannot be said to convey *instruction*, they rather tend to cloud the mind of the student with a superstitious terror, that represses the aspiring flame of genuine devotion.

They disguise from him the true nature of the Art, hold out to him an unattainable perfection as actually existing, and at the same time bid him despair of realizing it.

The absolute perfection of the *ideal*, in which the Poet easily indulges to the utmost excess of riotous extravagance, is totally and for ever excluded from the definite forms of the Painter, which are but steps upon a ladder that ascends to infinity.

Painting, then, differs essentially from every other branch of the Poetic Art; it is not Epic, it is not Dramatic – it has a nature of its own, and a name which sufficiently expresses it.

It is true indeed that these sister Arts embrace, sustain, and mutually adorn each other, and it is highly desirable that their intercourse should be of the most intimate and friendly nature.

May that *unnatural* hand repent its deed which rashly struggled to unlock this fond embrace! May that poetic voice subside into the silence of reflection that has pronounced, though in a whisper, the sentence of its scorn! 'Go,' it exclaimed, 'thou Art of silent mockery, nor aspire beyond the strict limits of imitation; let Painting attempt nothing which she cannot more completely accomplish than any other Art.'

And will Poetry abide the retaliation of such severity? Will she relinquish all attempts where Painting or Music is *her* superior? Will the Epic submit to refund all that may be justly claimed of her by the Dramatic, or which the stage has appropriated to itself by this novel and dangerous right of ejection and possession, founded upon the presumption of a more complete occupancy? And shall the Drama, because it adds *motion* to the exhibition of its figures, deny to Painting the use of figures and of exhibition altogether?

The diversity of opinion which evidently prevails in whatever relates to this difficult Art, renders it highly desirable that its principles should be thoroughly examined; and there is a more encouraging motive to enter upon such an inquiry at present than at any former time, since a disposition has been strikingly manifested, and a variety of efforts made, for the promotion of the Fine Arts. Whatever may be thought of the success which has hitherto attended those efforts, it must surely be gratifying to all *parties* and *persons* concerned; to reflect, that *some attempt at least has been made*, and that a *public pledge* has been given of that favour and protection, which, as it becomes more experienced and enlightened, cannot but ultimately attain its end.

Hitherto it has been customary to look more to the ancient character and origin of the Arts, than to their intrinsic and essential nature, founded upon the permanent basis of their relation to the Mind.

It ought to be considered, however, that all traditionary systems derived from remote antiquity are involved in great doubt and obscurity, and that the exact progress of Grecian Art is but matter of conjecture. In attempting to imitate that progress, therefore, we must always proceed in doubt. But what is still a more important consideration is this: Ancient Art had for its preceptor and patron the superstitions of ancient Mythology, now sunk for ever. The Gods of Homer have fallen asleep, never to awake again; the Deities of 'Athens and Olympia' have 'migrated' far beyond 'Pella;' Alexander himself has yielded his mock thunder to the Jupiter of the Luxemburg, and he has danced into oblivion over the boards of the Italian opera. It is not, therefore, choice but necessity that drives back modern Art to the simple and pure principles from which Art originally sprang, and which urges it to divest them of that garb in which a perishable mythology once clothed them. That idolatrous, that colossal and monumental style which chilled the blood in the veins at the aspect of a man formed of the rock, who seemed to hide within his breast the dormant powers of Nature; that boasted god-creating style, the admiration and the scourge of ignorance, refined afterwards and at length dissipated by a more humane taste, is now completely wasted away; nor can it ever grow again to the same height by *similar means*. Is it indeed to be wished that it should?

14 Elisabeth Vigée-Lebrun (1755–1842) Advice on the painting of portraits

The daughter of a Parisian portrait painter, Elisabeth Vigée-Lebrun enjoyed early success as an artist, practising professionally from the age of 15. By 21 she was in receipt of her first royal commissions, and over the next decade became closely associated with the court circle of the *ancien régime*. She was a member of the Académie de St Luc from 1774, but was excluded from membership of the Académie Royale (ostensibly on the grounds that her husband was an art dealer) until personal intervention by the royal family ensured her admission on 31 May 1783. (For a review of her first Salon exhibition, see IVB1.) Her success with Marie-Antoinette, who sat for no less than thirty portraits, allowed Vigée-Lebrun to command higher fees than her male contemporaries, history painters included. This close association with the Queen led to her leaving France in October 1789, within three months of the Revolution. Thereafter she pursued her career abroad in court circles in Italy until 1793, then in Vienna, Prague and Berlin, and from 1795 to 1801 in Russia, principally St Petersburg. Vigée-Lebrun's French citizenship was restored in 1800, but at first she was unsettled in Paris, and she lived in London from 1803 to 1805. She finally returned permanently to France in 1805. Throughout this peripatetic period Vigée-Lebrun maintained a career as one of the foremost portrait painters of the day, with a roster of aristocratic and artistic clients throughout Europe, from Catherine II of Russia to Byron. She was far from being merely an ornament of society. She lived an extraordinarily independent life for a woman of any rank at that time, and combined her career with responsibility for the upbringing of her daughter. After her daughter's death in 1819, Vigée-Lebrun developed an affection for her niece. The girl studied painting, and this prompted the artist to compose the present text. In the three volumes of Vigée-Lebrun's *Souvenirs*, this is the only part which bears directly on her painting practice. It is a clear statement of the mixture of precise observation, technical acuity and psychological knowingness at the disposal of the successful eighteenth-century portrait painter. The date of composition is uncertain, but the text was written late in her life, probably between 1820 and 1830. Our version is taken from the unabridged French edition of the *Souvenirs* (Paris: Charpentier et Cie, 1869), in *The Memoirs of Elisabeth Vigée-Lebrun*, translated from the French by Siân Evans, London: Camden Press, 1989, pp. 354–7.

Points That Should Be Observed Before You Begin To Paint

You should always be ready half an hour before the model arrives. This helps to gather your thoughts and is essential for several reasons:

- 1 You should never keep anyone waiting.
- 2 The palette must be prepared.
- 3 People or business should not interfere with your concentration.

An Essential Rule

You must sit your model down, but at a higher level than yourself. Make sure that the women are comfortable, that they have something to lean against, and a stool beneath their feet.

You should be as far away from your model as possible; this is the only way to catch the true proportion of the features and their correct alignment, as well as the sitter's bearing and particular mannerisms which it is essential to note; the same applies when trying to achieve an overall likeness. Do we not recognise people we know from behind, even when we cannot see their face?

When painting a man's portrait, especially that of a young man, he should stand up for a moment before you begin so that you can sketch the general outline of the body. If you were to sketch him sitting down, the body would not appear as elegant and the head would appear too close to the shoulders. This is particularly necessary for men since we are more used to seeing them standing than seated.

Do not paint the head too high on the canvas since it makes the model look too tall, though if you draw the head too low, the model will become too small; when drawing the body, take care to allow more space on the side to which the body is turned.

You should also have a mirror positioned behind you so that you can see both the model and your painting at the same time, and it should be in a place where you can refer to it all the time; it is the best guide and will show up faults clearly.

Before you begin, talk to your model. Try several different poses. Choose not only the most comfortable but also the most fitting for the person's age and character, so that the pose will only add to the likeness. Likewise for the head, which should either be facing forward or at a three-quarter turn; this adds to the resemblance, especially for the public; the mirror might also help you decide upon this point.

You should try and complete the head, or at least the basic stages, in three or four sittings; allow an hour and a half for each sitting, two hours at the most, or the models will grow bored and impatient and their expression will change noticeably, a situation to be avoided at all costs; this is why you should allow models to rest and aim to keep their attention for as long as possible. My experience with women has led me to believe the following: you must flatter them, say they are beautiful, that they have fresh complexions etc. This puts them in a good humour and they will hold their position more willingly. The reverse will result in a visible difference. You must also tell them that they are marvellous at posing; they will then try harder to hold their pose. Tell them not to bring their friends to the sitting, for they all want to give advice and will spoil everything, although you may consult artists and people of taste. Do not be discouraged if some people cannot find any likeness in your portraits; there are a great many people who do not know how to look at a painting.

While you are working on the head of a woman dressed in white, drape her in a neutral-coloured fabric like grey or light green, so that your gaze does not wander from the model's head; if however you wish to paint her in white, keep a little white fabric to drape around the head, for it too should receive some of the reflected light.

The background to the sitter should in general be a subtle and uniform tone, neither too light nor too dark; if the background is sky then the rules are different and you should put something blue behind the head.

Whether you are painting in pastels or oils, you should build up from the darkest colour, then paint the mid-tones and finally the highlights.

Always thicken the highlights and always make them golden. Between the highlights and the mid-tones there is another tone not to be overlooked, which has tints of violet, blue and green. Study van Dyck. The mid-tones should be broken up and less

thick than the highlights, and the highlighting on the head should emphasise the bone and muscle, the latter being weaker than the former.

Immediately after the first layer comes the flesh tone, chosen according to the complexion of the sitter; this will eventually blend with the mingling, shifting mid-tones.

Shadow must be strong but transparent at the same time, that is to say not a thick but a ripe tone, accompanied by a strong reddish touch in the cavities, such as the eye socket, the nostrils and the darker, interior parts of the ear etc. The colour of the cheeks, if they are unpowdered, should have a peach tone in the hollows and a golden rose colour on the more fleshy parts, the two colours merging imperceptibly with the highlights to emphasise the facial bones which should be golden. There should always be highlights on the brow bone, the cheek bone near the nose, above the upper lip, in the corner of the lower lip and at the top of the chin and they should always blend in with the surrounding tones. You should take care that the highlights diminish gradually and that the most salient and consequently the brightest part is always the most luminous. On the head, the sparkling lights, both sharp and diffuse, are either in the pupil or in the white of the eye, depending upon the position of the head and the eye; these two highlights often give way to others less golden in the middle of the upper eyelid, in the middle of the lower eyelid, or at least along some part of it, according to the way light falls upon the head, then on the middle of the nose, on the bridge and the lower lip. The sharper the nose, the finer the light should be. Never use a heavy consistency of paint on the pupils: they will look more real if they have a transparent quality. You should paint in as much detail as possible, take care not to give the sitter an ambiguous gaze, and ensure that you make the pupils round. Some people have large pupils and others small, but they are always perfectly round. The upper half of the pupil is always intercepted by the upper eyelid, but if the person is angry you will often see the whole pupil. When the eye smiles, the lower half of the pupil is intercepted and covered by the lower eyelid. The white of the eye in shadow should be a pure and pristine tone, and the mid-tones, although they are not quite the natural colour (this is so with any object you paint), should never look grey or dirty. Sometimes the eye should reflect light from the nose and share some of its shadow. The eyelashes in the shaded part are clear and stand out bright and this is why you should use ultramarine when painting a light part that is in shadow. Observe the eye socket, which should be darker or lighter depending on its shape. It is made up of shadow and highlights, mid-tones and reflections from the nose. The eyebrow should be prepared in warm tones and one should be able to see the flesh beneath the gleam of the hairs which should be light and delicate.

The setting of the eye is always painted in delicate blueish or violet tones, depending upon the whiteness and delicacy of the skin. Take care not to be too heavy with the latter or the eye will look as though it's full of tears. For this reason one should sometimes break into the blue tones with gold, but always cautiously.

Observe the forehead well; it is vital for a true likeness and is a very important key to the personality. When the forehead has a square but prominent bone, such as in the self portraits of Raphael, Rubens or van Dyck, there is a definite concentration of light on these prominent areas. The first is at the top of the forehead, just beneath the hairline. It is then interrupted and reappears near the eyebrow. This in turn gives

way to the colour of the temple where there will often be a blue vein visible, especially if the sitter's skin is very fine. In between these highlights is the natural flesh tone which fades into the centre. The light returns, if more feebly, on the same bone on the other side. This mid-tone mingles softly with all the other mid-tones, eventually becoming the shadow that defines the shape of the brow bone. After this shadow, there is a slightly golden reflection, depending upon the colour of the hair. Above the eyebrow, the tone should become a little warmer: the accumulation of these hairs has the same effect as a mass of curls falling onto a well lit forehead. The shadow is warm. Look at the heads of Greuze and study the way in which your model's hair grows, this will add to the likeness and the painting will be more truthful. You should observe the part where the hair falls next to the skin so that you will be able to render it as realistically as possible; there should never be a hard line between the two; the hair and the skin should mingle slightly, in form and colour; this way the hair will not look like a wig, an inevitable error if one does not follow the method I have just described.

The hair should be drawn in a body and should remain as such for the most part; it is probably better to use a glaze, otherwise the colours may bleed into the shadow and the main flesh tones of the face. The highlights on the hair are only visible on the prominent parts of the head; curls reflect light in the centre and a few stray hairs break the uniformity. The edge of the hair should, like metal, have something of the background colour, for this helps to accentuate the turn of the head.

It is also essential to study the ear and to place it in the correct position, understanding that it is a link between the head and the neck; you should make the shape as beautiful as you can; study the art of antiquity or beautiful examples in nature. For example, you might notice how in general the German, and especially the Austrian race, have ears that are situated a little too high according to perfect proportion. Likewise, the way the neck sits upon the shoulders is different from that of other peoples: it is wide, thick and rises high behind the ear. These people also have very strong temple bones. So if you happen to be painting a German, you should conserve this characteristic trait, along with the prominent forehead and the usually flat, sunken cheeks. As far as possible, try and paint the complete ear and study its cartilage formation well, even if you are going to paint hair over it. The colour that determines its shape should be warm and transparent, apart from the earhole which should always be dark and opaque. Its flesh tones, even when highlighted, should in general be less luminous than the cheek, which is more prominent. The shadow thrown on the neck by the ear is very warm in daylight; the jaw should be drawn in subtle tints with delicate mid-tones in order to obtain the depth between jaw and neck. If the head belongs to a woman, the base of the jaw should have warmer tones than that of a man, whose beard absorbs the naturally warm flesh tones beneath. The shadow on the neck should also be very subtle and less ruddy than the face. It is essential to observe the proportion of the collarbones relative to the position of the head, as well as the way they reflect light; the chest area becomes a little deeper in colour towards the point where the collar bones meet; in general the articulations, such as the elbow, the kneecap, the heel and the knuckles are always darker than the rest of the body.

If you have to paint breasts, put the model in a position where they are well lit; the best conditions for painting breasts occur when the light is direct and the colour should grow gradually stronger towards the nipple; the mid-tones which curve around the breast should be as light and fresh as possible; the shadow between the breasts should be warm and transparent.

There are rules for the gradation of light, such as I have described for the head, for the rest of the body. If the figure is seated, the light focuses strongly upon the thighs and will gradually fade towards the heel.

VIIB

The Continuity of Symbols

1 Benjamin West (1738–1820) ‘Discourse to the Students of the Royal Academy’

West had been one of the forty founders of the Royal Academy, and on the death of Joshua Reynolds in 1792 he was elected to its Presidency. For a period during the early 1800s he fell out of royal favour as a consequence of his support for the French Revolution and for Bonaparte, and there was a brief hiatus in his Presidency of the Academy in 1805–6, but his career revived thereafter and he remained a central figure in the development of English and American art for the remainder of his life. His address to the students of the Academy was given on 10 December 1792. It is notable for the evidence it provides of a widening in the canon of art deemed relevant to the aspiring practitioner. Reference to the ‘great masters of Spain’ is rare before this date, while it would have come as a surprise to West’s audience to learn that anything deserving to be considered as art had emerged from the native cultures of South or North America, of India or the Middle East. This liberalization in the understanding of other and earlier cultures was a general consequence of the spread of Enlightenment. Where the Christian ‘God’ might be replaced by the wider notion of a ‘Supreme First Principle’, a far greater range of cultures could be allowed to have had a ‘theology’ – and thus to have endowed their artefacts with symbolic meaning. More specifically, West’s liberalism may be associated with his personal sympathy for the anti-authoritarian and anticlerical tendencies in French and American thought. His address was published as *A Discourse delivered to the Students of the Royal Academy, on the Distribution of the Prizes by the President*, London: Royal Academy, 1793. Our excerpt is taken from the original pamphlet, pp. 15–23. (See also IVA5, 6.)

A COLLEGE of arts, founded in this part of the world, cannot be expected, like a COLLEGE of literature, to lay before its young members all that may be necessary to complete their depth of knowledge and their taste. What is to be had from books, may be had almost every where. But the books of instruction, by which the artist must be perfected, are those great works which still remain immoveable in that part of the world, where the fine arts were carried to their highest perfection in modern ages; and where they afford a most wonderful field of examples, from the study of which

no feelings of taste can return unripened. This COLLEGE of arts, from its own stores of instruction, can fill the mind with principles, and give all the foundation on which either taste or genius can rise. It can lead that taste and genius to great lengths. But as the discriminations of both are infinite, these discriminations can only be wound up fully to their respective points, by contemplating the infinitely discriminated perfections of those original works which the various schools of Italy in their purest days brought forth, and that which was formed in Flanders under the illustrious RUBENS; with some works of a few great masters in Spain, and others to be met with on the continent of Europe, the authors of which were nevertheless formed in some of the Italian schools. Thus it is that genius and taste will best become finished; and, at least, the fire of either must be caught in those enchanting walks that are beyond the sea. Is there not wisdom then in the provision, which encourages and assists the young artist to travel? I trust a period will come, when this Academy will be able to send him, not from one spot or one seminary to another, but to gather that improvement from every work of art, wherever situated, by which alone he can become a luminary in his profession.

These provisions interwoven in our foundation are the kind means of opening and assisting the first choice of professional art. But the progress and all the future success of the artist must depend upon himself. He engages in one of the most elegant pursuits, to which the human mind can be attached; and it is necessary that all the passions of his mind should go along with him in that engagement. He must be in love with his art, or he will never excel in it. And in order to feel the impressions of that affection, it is necessary that his mind should be possessed with those views of his profession, which may reasonably give it consequence and estimation; and from whence he may reflect with satisfaction, that he stands on a ground extremely flattering to every man that has chosen it for his own. Feeling himself and the art which he has embraced in these views, he will throw into his profession all the ardour which is ever felt by those who are proud of what they cherish, and which should be felt by every mind for that which is of all things most liberal in its nature. On this subject I wish to press some observations on the minds of the young artists, for their encouragement.

That the arts of design were among the first impressions vouchsafed by heaven to mankind, is not a proposition at which any man needs to start, who will look into all the evidences of its truth. That truth is manifested by every little child in the world, whose first essay is to make for itself the resemblance of some object to which it has been accustomed in its nursery.

In those arts of design were conveyed the original means of communicating ideas, which the discoverers of countries shew us to have been seized upon, as it were involuntarily, by all the first stages of society. Although the people were rude in knowledge, in manners, and indeed in every thing; yet they were possessed of the means by which they could draw the figures of things, and they could make those figures speak all their purpose to every other person as well as to themselves. The Mexicans conversing with one another in that way, when CORTES came among them, and the savages of North America still employing the same means of conveying intelligence to others, are among a thousand instances which might be adduced from every rude people upon the earth.

When therefore you have taken up the arts of design as your profession, you have embraced that which has not only been sanctioned by the cultivation of the greatest antiquity, but to which there is no antiquity prior, unless the visible creation.

Religion itself, in the earlier days of the world, would probably have failed in its progress, without the arts of design. That religion was emblematic. The emblematic spirit soon began to seize on the early mind. It was conceived to be more reverential, although it became in the end to be much more dangerous, to worship the SUPREME FIRST PRINCIPLE through the medium of an emblem than in abstract idea. But what could an emblematic theology do without the aid of the fine arts, and especially of sculpture, to give it all its effect, and to spread that effect through the earth? They sprang up therefore together, introduced by the same people, and they went hand in hand devoted to each other's spirit; first through the continent of Asia, then through Egypt, next through Greece and its colonies, and in process of time through every part of Italy, and also through all the north of Europe. How soon that joint career commenced in the world, is not impossible to be told. Many of its early evidences however are still existing. In the pagodas of India, in some caverns of ancient Media, and in various ruins in Persia, whose age and destination have been strangely mistaken, are to be seen those early monuments of emblematic art, stupendous in themselves, and wrought in all the possible difficulties of skill. If we are not pledged to particular systems of chronology for the age of the world, and if we will be decided by proofs drawn from astronomical observations which will bring us to many of those facts themselves, some of them may be demonstrated to have been wrought above three thousand years before the christian æra. Combined with that theology, whose records are still found in the archives of those Asiatic nations, and particularly of India, the spirit and purpose of those monuments is no more difficult to be understood, than their antiquity is to be ascertained. With that clue all that is ænigmatical in the sculptural arts of Egypt will readily be solved: with that clue all the most ancient coins, and medals, and other sculptures of Greece, will soon become plain to our apprehensions: and without it, all is confusion, perplexity, and darkness in the ancient world.

So early then were those arts, which you have taken for your profession, called forth as the records of all that was most valuable to the consideration of the human mind: and so early were the treasures and labours of empires devoted to raise those monuments, which no length of ages might destroy.

When in the space of two thousand years after the erection of some of those monuments, the fine arts came to be established in Greece on a better spirit than the emblematic, on the spirit of nature and truth, for the first essays of which the Greeks were indebted to DÆDALUS one thousand two hundred and sixty years before our æra: when, I say, the true spirit of the arts came to feel its strength in Greece: let the young artist look there for that character of his profession, which should always be present before his eyes. A higher estimation could not be annexed to any circumstance in Society, than was given to those arts by that wise and elegant people. They were looked upon as the public records of the country, as the means of perpetuating all public fame, all private honor, and all valuable instruction. The professors of them were considered as public characters, who watched over the events that were passing, and who had in their hands all those powers so important or pleasing to all.

And is not the case still the same with the artists of every country, how varied soever may be its maxims, or its system of action, from those of Greece? Is he not that character, to whom the country looks for all those powers? Is he not by the energy of his own mind, and by his attachment to his art, that watchman who observes the great incidents of his time, and rescues them from oblivion? Is it not from his hands that every scene, which is interesting to a present age, is most completely carried down to another?

2 Jacques-Louis David (1748–1825) ‘The Painting of the Sabines’

During the period of his imprisonment in 1794–5 (see IVB12), David had started work on a large history painting, taking as his subject the intervention of the Sabine women in the battle between Roman and Sabine men – a theme significant of reconciliation. (As he observes in a footnote to the following text, the connected episode of the Rape of the Sabine Women had been treated by Poussin.) In contrast with the ‘Roman’ vigour and austerity of the *Oath of the Horatii* and the *Brutus* (see IVB1–3), the *Sabines* makes reference to the smoother style then associated with Greek sculpture, while the entire composition is both more complex and more reliant upon sensuous effects than the earlier works. The painting occupied him for four years. In order to recover his costs, and perhaps with the aim of re-establishing his public identity on different terms, David arranged for it to be shown publicly in a separate room in the Louvre, to which – exceptionally – visitors were to be charged entrance. The exhibition was advertised in advance in the press, David assuring his fellow citizens that this was not a ‘vile speculation’ but an ‘honourable initiative on behalf of art and artists’, in order that he might receive the recompense of the public for his four years’ work. For the entry fee of 1 franc 24 centimes they would also receive a printed booklet, the full text of which is reproduced here. The exhibition opened on 21 December 1799 and remained open during the next five years. The proceeds were sufficient to finance David’s acquisition of a property in the country. In his foreword to the booklet the artist defends his method of exhibition, referring to the successful precedents of West’s *Death of General Wolfe* (see IVA6) and Copley’s *Death of Chatham* (see IVA5), which he mistakenly also attributed to West. In the following section David explains his historical theme and its significance, adding a note in justification of the nudity of his heroes. Our complete text is taken from *Le Tableau des Sabines, exposé publiquement au Palais National des Sciences et des Arts, salle de la ci-devant Académie d’Architecture, par le Citoyen David, membre de l’Institut National*, as reproduced in J.-L. Jules David, *Le Peintre Louis David 1748–1825*, Paris: Victor Havard, 1880, pp. 352–8, translated for this volume by Akane Kawakami.

The Painting of the Sabines exhibited to the public at the National Palace of the Sciences and the Arts

Room of the former Academy of Architecture
by Citizen David, Member of the National Institute

Antiquity has never ceased to be the great school for modern painters, the source of the beauties of their art. We seek to imitate the ancients in the genius of their conceptions, the purity of their drawings, the expression of their faces and the

grace of their forms. Can we not take one step further, and imitate them also in their morals and the institutions established by them in order to bring the arts to a state of perfection?

The painter's practice of exhibiting his works to the eyes of his fellow citizens, in return for individual remunerations, is not a new one. The abbot-scholar Barthélemy, when speaking of the famous Zeuxis in his *Voyage of the young Anacharsis*, does not miss the opportunity to observe that this painter collected such sums from exhibiting his works that he often made presents of his masterpieces to the nation, saying that no individual could afford to pay for them. He cites the witnesses of Aelian and Pausanias on this subject. They prove to us that, with regard to painting, the practice of public exhibitions was accepted by the Greeks; and we can hardly doubt that, in the realm of the arts, we need not fear of losing our way by following in their footsteps.

In our day this practice is observed in England, where it is called *exhibition*. The paintings of the *Death of General Wolf* and of *Lord Chatham*, painted by our contemporary West, earned him immense sums in that country. The exhibition has existed for a long time there, having been introduced to England by Van Dyck in the last century, whose public came in droves to admire his works; by this method he amassed a considerable fortune.

Is it not an idea as just as it is wise; one which procures the arts with the means to exist independently, to maintain themselves through their own resources, and to enjoy the noble independence which so befits genius, without which the flame which gives it life is soon extinguished? On the other hand, what worthier method could there be to take honourable advantage of the fruit of one's labours, than to submit it to the judgement of the public, and to expect no recompense other than what it deigns to give him? If the work is mediocre, the judgement of the public will soon do it justice. The author, receiving neither glory nor indemnity, will learn from harsh experience ways in which to make good his faults, and to capture the attention of his viewers with happier conceptions.

Of all the arts which profess genius, painting is incontestably the one which requires the greatest number of sacrifices. It is quite common to spend up to three or four years to finish a historical painting. I will not enter here into any of the details concerning the preliminary expenses necessary to a painter, but even the cost of costumes and models is considerable. These difficulties, we do not doubt, have repelled many an artist; and it may well be that we have lost many a masterpiece conceived by the genius of several of them, and that their poverty impeded them from executing. Let me go further: how many honest and virtuous painters, who would never have taken up their brushes to paint anything but noble and moral subjects, have been forced to degrade and debase them through sheer need! They have prostituted their works for the money of the Phrynes and the Lais: it is solely their poverty which has made them guilty; and their talent, formed to fortify respect for mores, has contributed to their corruption.

How wonderful it would be, how fortunate I would consider myself, if, by giving one example of a public exhibition, I could bring about the practice of it! if this practice could offer talented artists a means of saving them from poverty, and if, as a consequence of this first advantage, I could contribute to returning the arts to their

true destination, which is to serve morality and elevate the soul, by transmitting the noble emotions which the artists' works remind us of, into the souls of the viewers! The power to move the human heart is a great secret; and this means of doing it can give a great impetus to public energy and national character. Who can deny that, until the present day, the French people have been strangers to the arts, that they have lived in their midst without participating in them? Whenever painting or sculpture produced a rare work, it would immediately turn into the conquest of a rich man who would make off with it, often at some mediocre price, and who, jealous of his exclusive ownership, would suffer only a small number of his friends to see it: the rest of society would be banned from the privilege. At the least, by favouring the system of public exhibitions, the people, for a small contribution, would enter into a share of the riches of genius: they would become enlightened about the arts, to which they are not as indifferent as some people claim; their knowledge would increase, their tastes would become formed; and although they would not be sufficiently experienced to judge of the finer points or difficulties of art, their judgement, being always dictated by nature, and always produced by emotion, will often flatter, and even at times instruct an author who knows how to appreciate it.

What is more, how regrettable and painful it is (for men who are sincerely attached to the arts and to their country) to witness the departure of a considerable number of priceless monuments into foreign nations, monuments of which their own nation, which had produced them, is hardly aware! Public exhibitions tends to keep masterpieces in the happy land where they were born; they are the means by which we must hope to relive the golden age of Greece, where an artist, satisfied by the sums that were procured for him by the remuneration of his fellow citizens, was pleased to make a present to his country of the very masterpieces that she had admired; having honoured her with his talents, he became most worthy of her by his generosity.

No doubt it will be objected that each nation has its practices, and that the practice of public exhibitions of art objects has never entered France. First, I would respond that I make no attempt to explain human contradictions, but I ask you: does not a playwright give his work the greatest possible publicity, and does he not receive a portion of the spectators' money in exchange for the emotions or different pleasures that he has caused them, through his painting of the passions or of ridicule? Is a composer of music, who has given his life and soul to a lyrical poem, ashamed to share with the author of the words the profits of its performance? Can it be that what is honourable for some can be humiliating for others? and if the different arts make up a family, may it not be that all artists regard each other as brothers, and may follow the same rules to attain fame and fortune?

I would also respond that we should hasten to do what has not been done, if some good is to come of the result. What prevents us from introducing into the French Republic something which both the Greeks and the modern nations practise? Our former prejudices are no longer opposed to the exercise of public freedom. The nature and the course of our ideas have changed since the Revolution; and we will not return, I hope, to the false sophistication which repressed genius in France for so long. For my part, I can think of no greater honour than that of being judged by the public. I fear from it neither passion nor partiality: its contributions are voluntary gifts which prove its inclination for the arts; its praises are the free expression of the

pleasure that it feels; and such rewards are, no doubt, worth as much as those of the reign of the academies.

These reflections that I have proposed here, and the system of public exhibitions, of which I will have been the first to give an example, were suggested to me principally by the desire to procure for professional painters a means of being indemnified for their time and expenses, and to secure for them a resource against poverty, which is all too often their sad fate. I have been encouraged and aided in upholding these views by the government, who, in this instance, have given me a great proof of the welcome protection it gives to the arts, furnishing me with a location for my exhibition, and other considerable instances of help: but I will have received the most flattering of recompenses if the public coming to see my painting opens a useful route for artists, which in turn, by firing their enthusiasm, may contribute to the advancement of art, and to the perfecting of morals, which is the goal that we must ceaselessly pursue.

Having declared my true intentions, there is nothing more for me to do here except to give the public an explanatory note of the subject that I offer their eyes.

[the experts may wish to bear this in mind]

Exhibition: The Painting of the Sabines

The origin of the Roman Empire is shrouded in darkness. The fact about which historians are the least divided is that after the fall of Troy, a few Trojans who had set sail were thrown by the winds onto the coast of Tuscany, disembarked near the Tiber, and settled at the foot of the Palatine hill.

It is beyond the scope of my subject to enter into details concerning the events preceding the existence of Romulus. I will simply concentrate on explaining the ideas of greatness and of divine extraction that the Roman people were pleased to bestow upon their founder.

That which is but fiction for the historian is an incontestable truth for the painter and the poet: to their eyes, Romulus and Remus, his brother, are the twin children of Mars and Rhea, a priestess consecrated to the cult of Vesta.

Amulius, king of Alba and father of Rhea, considering the maternity of his daughter with opprobrium, resolved to let the children perish by having them exposed, the two of them in the same cradle, on the waters of the Tiber. These offspring of a god were saved by a double miracle. They were thrown onto the riverbank; and a she-wolf, casting aside for them her natural ferocity, took care to suckle them. The shepherd Faustulus, witnessing this prodigious event, was struck with wonder at it; and, touched by the graces of these little children, he took them home, and brought them up as if they were his own.

From their earliest childhood, an air of nobility and greatness which surrounded their whole person, together with their extraordinary height, seemed to presage for them a noble destiny. Romulus, however, was superior to his brother, as much in the strength of his character as in the boldness of his ideas. The children of the neighbouring shepherds, their companions, were not slow to recognize his superiority: so they named him their leader, and made him their captain in all their games.

Romulus loved war. His natural ambition was fortified further by revelations made to him through certain oracles, predicting that one day he would found a city which would reach the zenith of splendour and glory. As soon as he had laid out the foundations of Rome, he spared no pain in order to attract shepherds from neighbouring countries, fugitive slaves, and any strangers ready for grand enterprises. Such were the feeble beginnings of an empire which, in later years, would subjugate the universe. *Genus unde latinum* [Whence the people of Rome].

In these early stages, the Romans had few women. The daughters of the Sabines, a people who lived in the neighbourhood of Rome, about five miles away, had attracted their attention. They were already celebrated for their beauty and their modesty. In order to avail himself of them, Romulus used a method familiar to all warring peoples: violence.

First, he circulated rumours that he had discovered underground the altar of a god called Consus, a divinity greatly venerated by his neighbours, who was believed to be an equestrian Neptune. When this rumour began to be believed, he let it be known everywhere that on a day fixed by him he would make a solemn sacrifice, after which there would be a celebration with a feast and games, to which he invited all kinds of strangers, and in particular the Sabines, whose women he coveted. The strangers flocked to this spectacle from all over. Romulus, decked out in purple, and flanked by the most important Romans, was seated in the most prominent place. He had arranged the following signal: he would stand up, fold over a swathe of his robe, then unfold it, at which point his soldiers would throw themselves on the Sabine daughters, seize them and bear them away, leaving the men to flee freely.

This bold plan was executed, and the young Sabine women, despite their prayers, their despair and their cries, were abducted, and led to Rome, where the Romans married them, and treated them with all due respect.¹

The punishment was to follow sooner or later. The Sabines, cut to the quick by the outrage done to their daughters, attempted to take revenge on several occasions. Three years later, after the Sabine women had become mothers, Tattius, their king, still outraged by the odious abduction, once again assembled his bravest warriors and fell upon Rome, to exterminate the ravishers. Rome was taken by surprise; already the Sabines were upon the ramparts of the Capitol, of which they had taken possession through the treachery of Tarpeia. When they heard this news, the Romans hastily armed themselves, left their houses, and marched on the enemy. Fighting commenced with both sides attacking, when the two leaders, moved with an equal fury and meeting in the thick of the fight, readied themselves to do single combat, following the practice of that heroic age.

But what can resist the joint effect of conjugal and maternal love? Suddenly the Sabine women who had been abducted by the Romans ran onto the battlefield, their hair flying, carrying their little children naked on their breasts, across the piles of dead bodies and the horses excited by the fighting. They cried out loudly for their fathers, their brothers and their husbands, now addressing the Romans, now the Sabines, calling them by these, the sweetest of names known to men. The soldiers, moved to pity, let them pass; Hersilia, one of the women and wife to Romulus, to whom she had given two children, stood between the two leaders and cried out: 'Sabines, what have you come to do under the walls of Rome? Here are no more

daughters for you to take back to their parents, nor ravishers for you to punish; you would have done better to drag us from their arms when we were still strangers to them: but now that we are linked to them by the most sacred of chains, you have come to take wives away from their husbands, mothers from their children. The help that you wish to give us now is a thousand times more painful than the abandonment in which you left us when we were abducted. If you have come to fight for some cause which is not ours, even then we would have some right to your pity, as it is by us that you have become ancestors, fathers-in-law, brothers-in-law, and allies of the very people you are fighting. But if this war was undertaken for our sake, we beg you to give back to us, from amongst yourselves, our fathers and our brothers, without depriving us, from amongst the Romans, of our husbands and our young children.² These words spoken by Hersilia, and accompanied by her tears, echoed in all their hearts. Amongst the women who were with her, there were some who put their children at the feet of the soldiers, who let fall their bloody swords from their hands; others lifted up their infants in the air, holding them up like shields against the forest of spears, which were lowered at the sight. Romulus lowered the javelin he was about to throw at Tatius. The general of the cavalry put his sword back into its scabbard. Soldiers lifted their helmets in a sign of peace. The emotions of conjugal, paternal and fraternal love spread from rank to rank in the two armies. Soon the Romans and the Sabines embraced each other, and were as one people.

A note on the nudity of my heroes

A complaint which has already been made to me, and which will no doubt be made again, is the issue of the nudity of my heroes. There are so many examples to be cited in my favour in what remains of the works of the ancients that my sole difficulty is one of choice. Here is my response. It was an accepted practice amongst the painters, sculptors and poets of Antiquity to depict nude the gods, heroes and all kinds of men in general that they wished to paint. If they painted a philosopher, he would be nude, save for a cloak on his shoulders, and the attributes of his character. If they painted a warrior, he would be nude, a helmet on his head, his sword attached to a shoulder-strap, a shield on his arm, and boots on his feet; sometimes they would add a piece of cloth, if they judged that it would enhance the grace of his figure: as with others, such as my Tatius, or better still in the figure of Phocion, newly arrived from Rome, on display for all to see in the Central Museum of Fine Art. Are the two sons of Jupiter not nude, Castor and Pollux, the works of Phidias and Praxiteles, which can be seen in Rome at Monte Cavallo? The Achilles at the Villa Borghese is similarly nude. At Versailles, on the vase called the Medici vase is a bas-relief depicting the sacrifice of Iphigenia: Achilles is nude there too, as are most of the warriors around the vase. Amongst the works of the sculptor Giraud, which can be seen in his museum on the Place Vendôme, is the bas-relief of Perseus and Andromeda. In it the hero is nude, although he has just fought a monster who spits venom. The same thing is to be found in the book of prints of Herculaneum in the Bibliothèque Nationale, the print of Hippolytus departing for the hunt, in the presence of Phaedra; he is nude. And how many other authorities could I not cite? Those which I have just described will no doubt be sufficient for the public not to be surprised that I have attempted to

imitate these great examples in my Romulus, who is himself the son of a god. But here is one I have kept until last, because it complements all the others; it is Romulus himself, who is depicted on a medal, at the moment when, having killed Acron, king of the Caeninenses, he is carrying on his shoulders a trophy made up of his weapons, which he deposits later in the temple of Jupiter Feretrius; these came to be known as the first instance of the spoils of war. Now that I believe I have responded in a satisfactory fashion to the reproach made to me, or which may be made to me in the future, on the subject of the nudity of my heroes, allow me to call my fellow artists to my defence. They know better than anyone how easy it would have been for me to have clothed my figures: let them tell you how clothes and drapes would have furnished me with far easier ways of bringing my figures out in relief from the canvas. I believe, on the contrary, that they will be grateful to me for the difficult task that I imposed on myself, filled with this truth, that he who is capable of the more difficult is capable of the less difficult. In a word, my intention, in creating this painting, was to paint the *mœurs* of Antiquity with such precision that the Greeks and the Romans, upon seeing my work, would not have found me a stranger to their customs.

¹ Let us note here, in passing, that the moment of this abduction has already been dealt with by the sensitive and precise paintbrush of Poussin, to whom the modern Romans have conferred the epithet of 'divine'. I have dared to depict the continuation of the same subject, at the moment when the Sabine women come to separate the armies of the Sabines and the Romans.

² See Plutarch, *Life of Romulus*.

3 Pupils of David: 'Discourse addressed to Vien'

Joseph-Marie Vien (1716–1809) was an influential advocate of the reform of art in France through the revival of an archaeologically correct classicism and through concentration upon drawing and painting from the life. David studied with him as a well-regarded pupil from c.1765 until 1771, when their relations were strained by the younger artist's unsponsored and unsuccessful application for the Prix de Rome. In 1775, however, David accompanied his teacher to Rome on the latter's appointment as Director of the French Academy. Vien returned to Paris in 1781 and was appointed Premier Peintre du Roi eight years later. As the last President of the Académie Royale before it was transformed into a state institution, he was responsible for organization of the Salon of 1789, in which David's *Brutus* was shown. Thereafter his relationship with David afforded him a measure of protection, though he was to withdraw from Salon exhibition after 1793. During the revolutionary period, festivals of one kind or another had been much employed as means to celebrate publicly the achievement of liberty and to establish solidarity. In 1799 a succession of artists' banquets was staged to celebrate the success in that year's Salon of Pierre-Narcisse Guérin's neo-classical painting *The Return of Marcus Sextus*. At one of these Vien was fêted as a progenitor by some fifty younger artists. Guérin had been a pupil of Jean-Baptiste Regnault, who had in turn been taught by Vien. Regnault had been David's contemporary at the French Academy in Rome, and when he established his own teaching studio in Paris in the 1780s it was a potential rival to David's. The fête given in Vien's honour in 1800 may be seen as a response to the earlier celebration and as an attempt by

David's pupils to re-establish the 'true' line of succession. It also furnishes evidence of David's position as an object of devotion to a number of loyal though competing younger artists, many of whom had worked on his major paintings and on replicas made from them. The point that the heritage of classical culture was rightfully claimed by the modern guardians of liberty was one regularly made at revolutionary and post-revolutionary festivals. It was also used to justify the large-scale appropriation of classical works from Italy that took place under Napoleon. Vien was ennobled by Napoleon in 1808. The address was originally published in pamphlet form as *Discours adressé au citoyen Vien, membre du Sénat Conservateur, par les Elèves du citoyen David, dans une fête qui lui ont donnée le 9 brumaire an 9*, Paris: De l'imprimerie Giguet et Cie, 1800. Our complete text is taken from the original pamphlet, translated for this volume by Akane Kawakami.

When at the Olympic Games, amidst the applause of a people impassioned by glory, the athletes received their illustrious crowns, the heralds proclaimed, together with the names of the winners, the names of their fathers, of the masters who had instructed them, and of the fortunate cities which had witnessed their birth. Virtuous children, moved to gratitude by the spectacle of public recognition, triumphantly lifted up on their shoulders the father who had brought them up to be courageous and virtuous, saying to the people: it is not us that you must applaud; here is the winner, here he is; we owe our victory to him, and it is for his sake that our victory is so sweet; please accept, father, our most glorious homage; the radiant olive branch should encircle your silver hair.

Such are the emotions that we needed to express to you, courageous founder of the new French School, the glorious author of a long posterity of artists, you who were the guide, the friend, the father of our master, and whom, for this reason, we lovingly nominate our ancestor. When our imaginations transport us to Delphi or Olympia; when we feel as if we have received immortal crowns there, we bring them all here to place on your venerable head, we deposit them on your heart, we lift you up in triumph on our shoulders: we will consecrate these crowns in the temple of Minerva, and our filial hands have written there the following words: Vien was the master of David, David was our master; our glory is David's, and David's is Vien's.

Celebrated old man! how gloriously filled your long career has been! Your latter days are as beautiful as those in which your genius, at its dawn, struggled against tastelessness; as those in which your genius saw tastelessness perish in the flames of its noon.

You have vanquished false masters whose opinions were made even more dangerous by the fact that they believed themselves to be inspired; you overturned systems which were fatal because, by teaching that we should surpass nature, they made us forget it; they honoured the false, the mannered, the gigantic, telling us that these proud follies were the product of what was then known as genius and taste.

Hearing these humiliating adages about art gave you much pain: that the arts were the offspring and slaves of luxury; that they were the frivolous pastimes of lazy minds; that as it is the rich man who pays for them, it is for the rich man to lead them. In contrast, you hear and sustain today these fecund truths: the arts are the children of liberty, and should also be its support; it is to encourage public virtue that

we should demand masterpieces of the artists; who should lead them? public taste; to lead them to perfection, they must be made useful, because it is only then that they will be truly loved, and judged by sentiment alone.

You see in a government which appreciates the arts in this way, a minister, as profound in his opinions as he is wise in his eloquent speeches, a friend of the arts as much from his own inclination as from sagacious policy; giving up, in spite of his wisdom, his ministerial but destructive right to make his own judgements of the works of art; encouraging emulation by competitions, and giving homage, even in matters of taste, to the sovereignty of public opinion.

There are two routes to immortality for an artist; by way of their work and by way of their pupils. You are striding along both. David, your pupil (the Greeks would have called him your son) held up the torch you handed to him with a new energy, spread and distributed a light which grew brighter and brighter. He taught, he produced, and every day his new masterpieces augmented your glory and his own.

Note, if you would, the moment that we have chosen to declare our gratitude to you, and you will see that we are doing nothing but paying a part of the public's debt to you. This is the moment when the masterpieces of ancient sculpture are about to appear in all their glory in front of the eyes of France, who has conquered them; it is the moment when the divine Homer, Plato, the Muses, Apollo himself, who, ever faithful to the free peoples of this world, have chosen to live amongst the French, and are to be adored in their living images. Ah! Who would be able to step into the temple of these divinities without saying to himself: these masterpieces, these gods had ceased to be gods for us; the cult of Antiquity had been forgotten; who would believe it? Cold idols had taken their place; their worshippers had been chased away; it is Vien, it is David, who then made themselves into their apostles and ministers; it is through them that this great revolution, which has at least given us the hope of creating gods ourselves, has taken place in the arts.

Let us tell you again that this is the moment in which three of us have just received crowns in the competition of the public school; the moment in which a Salon is about to close, a Salon in which works by our elder brothers in craft have shown you the vitality of the sap that we have received from you!

Pupils of the illustrious rivals of our master, this feast would not be complete without the expression of our feelings for you! Yes, Vien belongs to us all. His principles germinated in all the schools. Friendship, frank criticism, sincere admiration of true talent, a constant search for perfection; these are the objects of the only rivalry that should exist between us, and the emotions of which we give our solemn assurance. May we surpass you in our art, so that you may surpass us in your turn, and so that, with renewed efforts, we may surpass you once more! Finally, in the same way that an enlightened government has placed the father of our painters amongst the custodians of our laws, raising our art to the highest point of sublimity, let us swear together . . . we swear it here ourselves, that we will never let our works serve anything but the establishment and maintenance of good morals, the propagation of virtue, and the conservation of a wise and generous liberty!

4 François-René, Comte de Chateaubriand (1768–1848) ‘Of the Subjects of Pictures’ from *The Genius of Christianity*

At the height of the Revolution in 1791, Chateaubriand left France for America, returning a year later to fight as a royalist before escaping to exile in England, where the present work was largely written (see also VB17). He returned to France in 1800 and published a novel *Atala, ou les amours de deux sauvages dans le désert* in Paris in 1801 (the source for Girodet's painting *The Burial of Atala*, exhibited in the Salon of 1808 and now in the Louvre). *Le Génie du christianisme* was well received on its publication in 1802, coming as it did at a time of reconciliation between the French government and the papacy. (The revolutionary régime had decreed an end to Christian worship in 1793.) Opposition to Napoleon was nevertheless to prevent Chateaubriand from pursuing a successful public career until after the Bourbon Restoration. The significance of his book for the study of art lies in its assertion of the *aesthetic* superiority of works of art produced in the name of the Christian religion. It is also significant in the very fact of its appearance at the commencement of the nineteenth century. Published by a sophisticated writer and welcomed by cultured readers, a work celebrating the relative *beauties* of Christian costume and Christian iconography can hardly be seen as testifying to a revival of the religious spirit, albeit this is exactly what Chateaubriand sought to achieve. (He later claimed that his ‘Génie’ had reopened the doors of the churches after the Revolution.) Rather it furnishes compelling evidence on the one hand for the replacement of religious concepts by aesthetic values, and on the other for an incipient decline in the status of the classical. Chateaubriand's work was originally published as *Le Génie du christianisme, ou beautés de la religion chrétienne*, Paris, 1802. Our text of Book III, chapter IV, ‘Of the Subjects of Pictures’, is taken from the translation by Charles I. White, published as *The Genius of Christianity; or the Spirit and Beauty of the Christian Religion*, Baltimore: John Murphy & Co., second revised edition, 1856, pp. 378–80.

Fundamental truths.

Firstly. The subjects of antiquity continue at the disposal of modern painters; thus, in addition to the mythological scenes, they have the subjects which Christianity presents.

Secondly. A circumstance which shows that Christianity has a more powerful influence over genius than fable, is that our great masters, in general, have been more successful in sacred than in profane subjects.

Thirdly. The modern styles of dress are ill adapted to the arts of imitation; but the Catholic worship has furnished painting with costumes as dignified as those of antiquity.

Pausanias, Pliny, and Plutarch, have left us a description of the pictures of the Greek school. Zeuxis took for the subjects of his three principal productions, Penelope, Helen, and Cupid; Polygnotus had depicted, on the walls of the temple of Delphi, the sacking of Troy and the descent of Ulysses into hell; Euphranor painted the twelve gods, Theseus giving laws, and the battles of Cadmea, Leuctra, and Mantinea; Apelles drew Venus Anadyomene with the features of Campaspe; Ætion represented the nuptials of Alexander and Roxana, and Timantes delineated the sacrifice of Iphigenia.

Compare these subjects with the Christian subjects, and you will perceive their inferiority. The sacrifice of Isaac, for example, is in a more simple style than that of Iphigenia, and is equally affecting. Here are no soldiers, no group of people, none of that bustle which serves to draw off the attention from the principal action. Here is the solitary summit of a mountain, a patriarch who numbers a century of years, the knife raised over an only son, and the hand of God arresting the paternal arm. The histories of the Old Testament are full of such pictures; and it is well known how highly favorable to the pencil are the patriarchal manners, the costumes of the East, the largeness of the animals and the vastness of the deserts of Asia.

The New Testament changes the genius of painting. Without taking away any of its sublimity, it imparts to it a higher degree of tenderness. Who has not a hundred times admired the *Nativity*, the *Virgin and Child*, the *Flight in the Desert*, the *Crowning with Thorns*, the *Sacraments*, the *Mission of the Apostles*, the *Taking down from the Cross*, the *Women at the Holy Sepulchre*. Can bacchanals, festivals of Venus, rapes, metamorphoses, affect the heart like the pictures taken from the Scripture? Christianity everywhere holds forth virtue and misfortune to our view, and polytheism is a system of crimes and prosperity. Our religion is our own history; it was for us that so many tragic spectacles were given to the world: we are parties in the scenes which the pencil exhibits to our view. A Greek, most assuredly, felt no kind of interest in the picture of a demi-god who cared not whether he was happy or miserable; but the most moral and the most impressive harmonies pervade the Christian subjects. Be forever glorified, O religion of Jesus Christ, that hast represented in the Louvre the *Crucifixion of the King of Kings*, the *Last Judgment* on the ceiling of our court of justice, a *Resurrection* at the public hospital, and the *Birth of our Saviour* in the habitation of those orphans who are forsaken both by father and mother!

We may repeat here, respecting the subjects of pictures, what we have said elsewhere concerning the subjects of poems. Christianity has created a dramatic department in painting far superior to that of mythology. It is religion also that has given us a Claude Lorraine, as it has furnished us with a Delille and a St. Lambert. But what need is there of so many arguments? Step into the gallery of the Louvre, and then assert, if you can, that the spirit of Christianity is not favorable to the fine arts.

5 Franz Pfaff (1788–1812) Letter to Passavant, 6 January 1808

Franz Pfaff was one of the founder members of the Lukasbrüder (Brotherhood of Luke). Together with a number of other young artists, including Friedrich Overbeck (see VIII B6), he sought to regenerate German art by reorienting it to earlier schools of painting, above all the art of Dürer. He was born in Frankfurt am Main in 1788 and underwent his earliest training with his father, the painter Johann Georg Pfaff (1745–98), and with Johann Tischbein the younger (1742–1808). In 1805 he enrolled at the art academy in Vienna but was out of sympathy with the pervading ethos of neo-classicism. In this letter to Johann David Passavant, a friend from Frankfurt who later wrote a historical study of the Nazarenes, he voices strong criticism of the exclusive focus on classical subjects. Above all, he

criticizes the lack of *feeling* and the absence of truth which the reliance on classical models engenders. In its place he identifies the Middle Ages as a valid source of inspiration and insists that art should fulfil a moral function. The Englishman of whom he speaks is Henry Fuseli (see VIA10), the Swiss-born professor of painting at the London Royal Academy, whose *Lectures on Painting* (1801) appeared in a German translation in 1803. Pffor's early death from tuberculosis prevented him from seeing through his programme for artistic reform, but he did complete a number of major works on medieval themes, such as the *Entry of Rudolf von Habsburg into Basle in 1723* (Städelsches Kunstinstitut, Frankfurt 1808–10). The letter has been translated for the present volume by Nicholas Walker from Fritz Herbert Lehr, *Die Blütezeit romantischer Bildkunst, Franz Pffor, der Meister des Lukasbundes*, Marburg: Verlag des kunstgeschichtlichen Seminars der Universität Marburg, 1924, pp. 268–70.

[...] I can hardly say how much I agree with you when you take the artist to be the happiest of men, but with one small qualification, to wit, that he is equally the unhappiest of men. I have not advanced very far in art, and yet the sufferings I have endured for her sake are already great. I do not heed the physical sufferings to which the artist, particularly as a learner, finds himself subjected, for it is still easier to forgo things that would delight a young man of any profession than to endure restless labour without a goal. For the path of the artist is indeed without a goal, he must restlessly push forward without pause; if he stands still, alas, he actually regresses, he sees what lies behind him sink away into the blue haze, and hence perceives no glimmering end to his path. So he rushes onwards until he is overtaken by death. And then when he has graciously departed from the scene, what is his fate? That a few individuals value him and lovingly admire his works, while most will only regret that a man has given himself to art – not as an artist, but because he would have benefited everyone the more if he had chosen a more sensible profession, a benefit well and truly lost since he actually became an artist. I hardly think I am exaggerating in saying this, for there are so many people who simply place the artist on a level with a wandering vagabond! I am far from thinking that a city without artists must be an unhappy one, but I do believe that there are few people who can have such an effect upon morality and virtue as the artist. I also find it quite difficult, therefore, to reject entirely the widely shared and common view that art has suffered a great decline. When one considers the purposes to which art is put today, one cannot but regret that this decline is so widespread. There was a time when the painter's labours were all designed to inspire piety through the presentation of revered subjects, to encourage emulation through the depiction of noble deeds, but now? – A naked Venus with her Adonis, or a bathing Diana, what possible good can come of such conceptions? And why do we try and search out subjects that are so remote that they lose all interest for us, rather than finding those which concern us directly? We find far more material in ancient Jewish history than in any other. Tell me if there is any story which presents such a beautiful picture of valour and intelligence, of moderation and love of justice, of the sacrifice of everything one possesses for the sake of virtue and the common good, than the story of the priest Mattathias and his sons in the books of Maccabees? Do the Middle Ages not offer us subjects which are worthy of being treated for all time, but who represents them to us now? – Everyone is chasing after an ideal that has been set before us by a few individuals who entertained

a disproportionate regard for the works of Greek and Roman art. What man of feeling can conceal his distaste on reading how a certain Englishman esteems the painting of the ancients, which neither he nor anyone else of our time has ever seen, higher than our cherished Raphael, or claims that the latter might have achieved something had he had better subjects at his disposal, if he had painted a Medea or a raging Ajax instead of the *School of Athens* or the *disputo del sacramento*. Is it not pitiful to see how people can be so deluded? I must confess that even the most beautiful ancient figure has always struck me as little more than an attractively embellished stone where one seeks in vain for that soul or the heart which the artists of the fifteenth and the early sixteenth century knew so perfectly how to express. I am really convinced that I harbour little bias in favour either of the old or the more modern painters, but what I have written to you here I hold to be an incontrovertible truth; just as I also firmly believe that art, from a practical point of view, has indeed fallen very low. The old painters sought to produce works that are good, the modern painters works that appear good. And this is also the reason why a painting by the old artists makes little effect in the first instance but increasingly draws us in the longer we contemplate it, while a modern painting exercises exactly the opposite effect. In the latter case we are surprised and astonished, our attention is entirely drawn to the principal subject, which is fully treated and developed, while the viewer does not notice the rest in the first instance. But now we begin to examine it all in a colder spirit. We are immediately struck by the unnatural fact that it is almost only the principal group or the principal figure that is fully worked out and developed, that is fully treated in terms of light. But if one goes further and seeks for nature and truth, where on earth can they be found in our flying robes, our rippling muscles, our exaggerated postures? And yet one continues to hear praise for the masterly execution, for the boldness and facility with which everything has been painted, so that in the end one hardly sees the object any longer and merely admires the artistry revealed in the bravura of the brushwork! The old artists are often reproached for the harshness and firmness of their contours, but that is a failing I should very much like to possess. Which is easier, to delineate the contour of a figure to the accuracy of a hair's breadth, or one that is two fingers broad and fades away into the background to boot? It would seem to me that the answer is obvious. But our eyes have been spoiled and ruined, so that what we no longer properly perceive we now call harsh and sharp. And I would merely ask you to consider nature. I do not feel that we can so easily transgress the determinate character possessed by nature itself.

6 Friedrich Overbeck (1789–1869) 'The Three Ways of Art'

Born in Lübeck, Overbeck studied from 1806 to 1809 at the Akademie in Vienna, where Franz Pferr was a fellow student, and where the instructors included Eberhard Wächter, a disciple of Asmus Jakob Carstens (see VA14). A growing sense of discomfort with the academic regime was fuelled both by his reading in such writers as Wackenroder and Friedrich Schlegel and by a conviction that the Christian religion was the true source of spiritual value in art. In 1809 he formed the Lukasbrüder (Brotherhood of Luke) with Pferr (see VIIB5) and a group of other like-minded artists. Following the French occupation of

Vienna, the brotherhood moved to Rome, where they occupied an empty monastery, dedicating themselves to the pursuit of an art purged of both classical and modern impieties. In their conviction of the endemic 'beauty' of Christian themes they were on common ground with Chateaubriand (see VIIB4), and they were to be followed in their advocacy of a moral and unclassical art by the English Pre-Raphaelite Brotherhood (see *Art in Theory 1815–1900*, IIC *passim*). Overbeck's 'Three Ways of Art' borrows from the tradition of religious homilies contrasting the paths of vice and virtue. It was originally addressed to his fellow Nazarenes – as the community came to be called – and was written as part of their programme of study and self-examination. After 1810 new recruits came south to Rome, among them Peter Cornelius (see VIIB7), but the community left the monastery after Pforr's death in 1812, and effectively disbanded. Overbeck remained in Rome, however, and worked with Cornelius on a series of frescos commissioned for the Palazzo Zuccari. His *Triumph of Religion in the Arts* of 1831–40, painted after his return to Germany, was to be the subject of a trenchant critique by Friedrich Theodor Vischer (see *Art in Theory 1815–1900*, IIB5). 'The Three Ways of Art' was written about 1810. Pforr's transcript of the text was published in F. H. Lehr, *Die Blütezeit romantischer Bildkunst: Franz Pforr, der Meister des Lukasbundes*, Marburg: Verlag des kunstgeschichtlichen Seminars der Universität Marburg, 1924, pp. 303ff. Our version is taken from the English translation of this text in Lorenz Eitner ed., *Neoclassicism and Romanticism 1750–1850: Sources and Documents*. Volume II. *Restoration/Twilight of Humanism*, Englewood Cliffs, NJ: Prentice-Hall, 1970, pp. 37–9.

Three roads traverse the Land of Art, and, though they differ from one another, each has its peculiar charm, and all eventually lead the tireless traveller to his destination, the Temple of Immortality. Which of these three a young artist should choose ought therefore to be determined by his personal inclination, guided and fortified by reflection.

The first is the straight and simple Road of Nature and Truth. An uncorrupted human being will find much to please his heart and satisfy his curiosity along this road. It will lead him, for better or for worse, through fair, productive country, with many a beautiful view to delight him, through he may occasionally have to put up with monotonous stretches of wasteland as well. But, above these, the horizon will usually be bright, and the sun of Truth will never set. Of the three roads, this is the most heavily travelled. Many Netherlanders have left their footprints on it, and we may follow the older ones among them with pleasure, observing the steadiness of their direction which proves that these travellers advanced imperturbably on their road: not one of these tracks stops short of the goal. – But the most recent footprints are another matter; most of them run in zig-zags to the right and the left, indicating that those who made them looked this way and that, undecided, wondering whether or not to turn back and take another road. Many of these tracks, in fact, disappear into the surrounding wastes and deserts, into impenetrable country. What the traveller on this road must chiefly guard against are the bogs along one side where he may easily sink into mud over his ears, and the sandy wastes on the other side which may lead him away from the road and from his destination. But if he manages to continue along the straight, marked path, he cannot fail to reach his destination. The level country makes this road agreeable to travel, there are no mountains to climb, and the walking is easy, so long as he does not stray to one side or the other,

into bog or desert. Besides, there is plenty of company to be found on this road, friendly people, representing all nationalities. And the sky above this country is usually serene. The careful observer will find here everything the earth offers, he need never be bored on this road. And yet, I must warn the young artist not to raise his expectation too high, for, frankly, he will see neither more, nor less than what other people also see, every day, in every lane.

The second road is the Road of Fantasy which leads through a country of fable and dream. It is the exact opposite of the first. On it, one cannot walk more than a hundred steps on level ground. It goes up and down, across terrifying cliffs and along steep chasms. The wanderer must often dare to take frightening leaps across the bottomless abyss. If he does not have the nerve for it, he will become dizzy at the first step. Only men of very strong constitution can take this road and follow it to the end. – Strange are its environs, usually steeped in night; only sudden lightning flashes intermittently illuminate the terrible, looming cliffs. The road often leads straight to a rock face and enters into a dark crevice, alive with strange creatures. Suddenly, a ray of light pierces the darkness from afar, the light increases as one follows it through the narrow crevice, until abruptly the rocks recede and the brightness of a thousand suns envelops the traveller. Then he is seized, as if by heavenly powers, he eagerly plunges into the bright sea of joy, drinking its luminous waters with wild desire, then, intoxicated and full of fresh ardor, he tears himself from the depths and soars upward like an eagle, his eyes on the sun, until he vanishes from sight. Thus joy and terror succeed each other in sharpest contrast. Not the faintest glimmer of the light of Truth penetrates into these chasms, insurmountable mountains enclose the land, and only rarely do fleeting shadows or dream visions which can bear the light of Truth venture to drift across the barriers, where they then seem to stride like giants from peak to peak.

Just as this land is the opposite of the land of Nature in every feature, it is its opposite also with respect to population. In the other land, the road is constantly thronged with travellers; here it is usually empty. Few dare to enter this region, and even these few have little in common with one another, they go their separate ways, each sufficient to himself, none paying attention to the others. Michelangelo's luminous trace shines above all in this darkness. What distinguishes this road from the other is the colossal and sublime. Never is anything common or ordinary seen here, everything is rare, new, unique. Never is the wanderer's mind at peace: wild joy and terror, fear and expectation beset him in turn.

Let those who love strong emotion and lawless freedom travel this road, and let them walk boldly, it is sure to take them most directly to their destination. But those who love gentler impressions, who can neither grasp the colossal, nor bear the humdrum, and who like neither the bright midday light of the land of Nature, nor the stormy night of the land of Fantasy, but would prefer to walk in the gentle twilight, my advice to them is to take the third road which lies midway between the other two: the Road of the Ideal or of Beauty. Here he will find a paradise spread before him where the flower-fragrance of spring combines with autumn's fruitfulness. – To his right rise the mountains of Fantasy, to his left the view sweeps across fertile vineyards to the beautiful plain of the Land of Nature. From this side, the setting sun of Truth sheds its light; from the other, the morning light

of Beauty rises from behind the golden mountains of Fantasy and bathes the entire countryside in its rosy haze. Thus sunrise and sunset, Truth and Beauty alternate here, and combine, and from their union rises the Ideal. Here even Fantasy appears in the light of Truth, and naked Truth is clothed in the rose-fragrance of Beauty.

This road, besides, is neither so populous as the first, nor so deserted as the second, and the travellers on it differ from those of the second road by their sociability. One sees them walking in pairs, and friendship and love, their constant companions and guides, strew flowers on their way. Then, too, this road is neither so definitely marked as the first, nor so unkempt as the second. It runs, in beautiful variety of setting, from hill to meadow, from lake shore to orange grove. Every imaginable loveliness contributes to this variety. But in the very charm of this road there lies a danger to the traveller, for it may cause him to forget his destination, and cause him to lose all desire for the Temple of Immortality. Thus it happens that some of the travellers are overtaken by death before they reach the Temple. A loving companion may then carry their body to the Temple's threshold, where it will at once return to life and everlasting youth.

These then, dear brothers in art, are the three roads; choose between them according to your inclination, but test your powers first, by using reason. Whichever road you choose, I should advise you to go forward on it without looking too much to the left or right. [...] the proof that each of the three roads leads to the goal is given by three men who went separate ways and whose names are equally respected by posterity: Michelangelo took the road of Fantasy, Raphael the road of Beauty, and Dürer that of Nature, though he not infrequently crossed over into the land of Beauty.

7 Peter Cornelius (1783–1867) Letter to Joseph Görres

Cornelius was born in Düsseldorf, where he remained until 1809, studying at the Akademie and working in the prevailing classical manner. After a move to Frankfurt am Main he modified his graphic style by reference to earlier German work, particularly the prints of Albrecht Dürer, though in common with many artists of his generation who reacted against academic classicism, he regarded Raphael's work as the model for a revived religious art. He travelled to Rome in 1811 and was drawn to the circle of the Nazarenes (VII B6), who shared his ambition for an art that would be at once religious and specifically German. While in Rome he also became preoccupied with the need – as he saw it – for a revival of the techniques of fresco painting, by which means art could reclaim its position on the walls of churches and other public buildings. These were the views which he expressed to Josef Görres (see VIA4), the nationalistic editor of the *Rheinischer Merkur*, in a letter written in November 1814. The opportunity to put his views into practice came with a commission from the Prussian Consul-General in Rome to decorate a room in the Palazzo Zuccari. This work was undertaken in 1816–17 by Cornelius together with Overbeck and two further members of the Nazarenes (the resulting paintings are now in the Nationalgalerie, Berlin). Cornelius' letter to Görres was published in H. Uhde-Bernays, *Künstlerbriefe über Kunst*, Dresden: Jess Verlag, 1926. Our text is taken from the translation printed in Elizabeth Gilmore Holt ed., *From the Classicists to the Impressionists: Art and Architecture*

in the 19th Century (1966), London and New Haven: Yale University Press, 1986, pp. 97–101.

Rome, November 3, 1814

My friends from Frankfurt notified me that you had been kind enough to try to secure a pension for me at the Prussian court. Please accept my most sincere gratitude not only for the benefits which the success of your kind attempt would have for the practice of my art, but also for the good faith and trust which you have in my minor talents and their application. Therefore, please accept my apologies, if I open my heart to you – stimulated by the same faith – to say a few words to you about a topic which fills it completely; I mean Art, that is the art of our fatherland. Unfortunately one must say that at the present time it has been surpassed by the Italians in true culture, as well as in spirit and life. The least of their heroes who voluntarily joined that veritable crusade carried in his breast a higher poetry – if I may call it that – than the foremost professors of any very wise academy, befogged by the gloom of their negative *eclectic storeroom of antiquated ideas about art*. This, however, seems to me to be the harshest word of judgment on any spiritual endeavor in the world and above all in art, for it should be a part of the salt of the earth. If such salt, however, has become tasteless, it is good for nothing, except to be thrown into the alleys and trodden on by the people. You will undoubtedly consider it to be a most desirable, excellent thing, if art in our fatherland would awaken to its old power, beauty, and simplicity, and would keep in step with the reborn spirit of the nation; if it would follow quietly, clearly, and lovingly its powerful but mysterious longing for higher realms, not breaking any power, but putting it in order, directing it to the highest Being, as is the task of all true education, as true art has done at all times and among all noble ancestors. Our fatherland has reached a point where it should not lack such art; it could be a mighty tool for many excellent things! I do not doubt in the least that such an art can rise again like the Phoenix from its ashes; the seed lies embedded deeply in the German mother earth, and spring is near – this thought first and above everything else! Secondly, I believe that God wants to make use of all the splendid seeds that lie within the German nation, in order to propagate a new life, a new kingdom of his power and glory on the earth. Thirdly, I believe that the nation is free, free by its own power and virtue and through God, who has endowed it with this freedom; the nation knows this power and longs for its original source in everything positive; it does not want to lose this precious, unique possession, and it has a genuine joy in every fruit that comes forth from its womb. Fourthly, a small number of German artists – permeated as if by divine revelation by the true nobility and godliness of their art – have begun to clean the grown-over path to their holy temple, in order to prepare it for him who shall come, in order to rid its interiors of buyers and sellers. This small group waits for a worthy opportunity and burns with the desire to show to the world that art can now enter gloriously into life, as it did before, if it will only stop being a venal servant of presumptuous masters, a shop-keeper and a miserable maid-servant of fashion; if overpowered by a mighty love, it will go about in a vassal's garb, with no other adornment than love, purity, and the power of faith as the true patent of its divine origin.

The factors which terribly hinder the free development of such an art are, in my opinion: first, the total lack of sensibilities of a higher nature among our princes and noblemen. They are truly the camel that is to go through the eye of a needle; their hearts are not where the hearts of the people are; they have drunk too deeply from the cup of the great whore! Secondly, there is the lying spirit of modern art in general, which, with its negative eclecticism, agrees perfectly with the vanity and weakness of our nobles. Especially the deadly art academies and, in our country, their stiff directors, who have as goal only themselves, their machine-like correctness, and nothing else, and know how to direct into their channels everything important that the state wants to do for art, where it just dissolves in foam and smoke. For as long as academies have existed, nothing great has been created, and those things that were created are good only when they distance themselves from their spirit and powerless existence. Yet with all this inner nothingness, this lank academic Philistine armed with all the worthiness of bourgeois life, entrenched behind a thousand bulwarks and breastplates of hundred-year-old authority, seems invincible; he even quotes nature, Raphael, and the ancients continuously and calls to them, as the Pharisees did to Moses and the prophets. However, I am of the firm conviction that sooner or later a small rock will be slung at his forehead.

Finally, I will speak of what according to my innermost conviction is the most powerful – I would like to say – the infallible remedy to give German art the basis for its direction to a new great age, worthy of the spirit of the nation. This is nothing but the reintroduction of fresco painting as it was in Italy during the time of the great Giotto up to the time of the divine Raphael. Since I have seen works of this epoch, have familiarized myself with them, and have compared them with those of our ancestors, I must indeed confess that the latter art has an intention just as high, pure, and true, perhaps even deeper and most certainly more unique. However, with reference to the former, I must agree with those who are of the opinion that it has developed more freely, more perfectly and greater in its nature. Next to the extraordinary and true encouragement, which art received through the lively participation of the whole nation, and next to other external causes, I consider the practice of fresco painting as the foremost that caused this. Of course, I presuppose inner causes; because if the spirit of God is not with art, all other means do not help at all, and the greatest efforts and encouragement are nothing but trifles. Presupposing this spirit, fresco painting is well suited to adopt all the elements of art in the freest and greatest manner. Instead of merely wanting to unite incompatible external properties in the manner of empty eclecticism, it centers as in a focal point all the life rays radiating from God in a blazing fire that benevolently lights and warms the world. From a spiritual and a physical viewpoint, these works belong actually to that spot on the earth where they were created; they are in most beautiful unison with God, nature, time, and surrounding life; no educated barbarian will carry them away; they are like a noble, excellent man, whose power and high value of humanity is in general a blessing, a joy. Yet the most beautiful, the most effective part, the most tender relations of his life belong to a small, close circle of selected hearts, who actually possess him. For the furtherance of a good beginning in this matter nothing would be more desirable and more effective than to have well-deserved confidence in someone who has seized the truth in art with a brave heart and has increased and formed its

power in the struggle. Thus united powers should be used – according to their unanimous wish – for a great, dignified, extensive work in a public building in any German city. Public life is poor indeed in all noble ornamentation, and much talent and power is consumed in unsatisfied longing for activity and employment. Of what use is a light burning under a bushel when it should shine before the world? There is, after all, enough darkness in the world. If my suggestion were realized, I believe I could predict that this would give the signal from the mountain tops to a new noble upsurge in art. In a short time, powers would show themselves of which no one had believed our modest people were capable of in this art. Schools would be founded in the old spirit which would pour their truly exalted art with effective power into the heart of the nation, into the full life of man, and would adorn it so that from the walls of high cathedrals, of quiet chapels, and lonely monasteries, of city halls, stores, and halls, old, patriotic, well-known figures in renewed, fresh abundance of life would tell the new generations in sweet color language of that old love, old faith, and in the new generations the old strength of our forefathers would be reborn, and therefore the Lord God would be again reconciled with his people. These, my most worthy man, are the words that shout from a full German heart to you across the Alps into the fatherland. Would to God that the arrow of their truth might pierce your heart in spite of the feeble talent of the speaker, and that you would be the man who could find between us and our people the tie of unity that is lacking in order to apply and further develop, for God's honor and that of our nation, the powers which He and nature have given us!

Finally, I do not beg your forgiveness for my frankness, so you may not believe that I have spoken for myself and for my advantage; rather, I put my hand on my heart, unstained by that fault, with the assurance that I have spoken with the purest, most ardent love (a measure of which you can find only in your own heart) and in the name of many richly talented, noble, and proven people, not in my own; and to you as one of the noblest members of our people. Please accept this as a token of our gratitude, our veneration, and our love. I commend myself especially to your further good will and remembrance.

P. CORNELIUS,
German painter, at the Café Greco.

8 Edmé François Jomard and others (active 1800–10) from *The Description of Egypt*

Parts of ancient Egypt had been explored by European travellers during the sixteenth and seventeenth centuries, and by the mid-eighteenth century Egyptian artefacts and engravings of monuments were circulating among interested amateurs. By this time the Grand Tour was occasionally extended as far as Cairo, though rarely further south. The Comte de Caylus was one of the first writers to identify Egyptian culture as a significant pre-classical phase and to conceive of its products as forms of art (see II A11). The effects of fascination with the 'Egyptian' style were much in evidence during the later eighteenth century – in the engravings of Giovanni Battista Piranesi, in the architectural designs of Etienne-Louis Boullée and Claude-Nicolas Ledoux, in the pottery of Josiah Wedgwood, and in the design

of fashionable interiors. A major turning-point in knowledge and understanding of Egyptian culture came with Napoleon's Egyptian campaign of 1798–9. Though the military objectives were abandoned at an early stage, the expedition was accompanied by a team of 175 savants, draughtsmen and engineers. An Egyptian Institute was established in Cairo and the majority of the team remained for several years, excavating, describing, measuring and drawing in the Nile Valley from Nubia to the Mediterranean. Their discoveries included the Rosetta Stone, which enabled Jean-François Champollion finally to decipher Egyptian hieroglyphics in the early 1820s. A first report on the expedition's findings was published in 1802 by Vivant Denon, appointed in that year as Director-General of the Imperial Museums. The major project of publication, however, was the massive *Description de l'Égypte, ou recueil des observations et des recherches qui ont été faites en Égypte pendant l'expédition de l'armée française*. This was edited principally by Edmé François Jomard, and was issued in phases between 1809 and 1828, the earliest volumes by the Imprimerie Impériale in Paris and later ones by the Imprimerie Royale. Nine large volumes of text were accompanied by a further volume of *Explication des planches* (Explanation of the Plates), and by the plates themselves, some 900 separate engravings designed to be bound in up to twelve volumes of two different sizes. (Due to the sequential form in which the material was issued, and to the complexity of its overall organization, different bindings of the first edition tend to vary both in the order of individual sections and in the overall tally of volumes.) In 1820, before the first edition was complete, a second was begun by the Parisian bookseller C. L. F. Panckoucke. This comprised twenty-four octavo volumes, with a further twelve volumes of plates. It was completed in 1830. Our first passage is from the *Préface historique* (Historical Preface) by Baron Joseph Fournier. In the first edition this was attached to the *Explication des planches*, published in 1809 and designed to follow the nine main volumes of text. In the second edition, however, the *Historical Preface* appears in volume I. The following excerpt is taken from pp. cxxxii–cxli of the latter edition. The second and third passages are taken from sections II and VII respectively of the 'General Description of Thebes' in the first edition of 1809, where they appear in volume I, chapter IX, pp. 4–6 and 185–7. The authors of the material on Thebes are MM. Jollois and Devilliers, who are described as 'Engineers of Bridges and Highways'. The material has been translated for the present volume by Jason Gaiger.

Historical preface

Prior to the French expedition we had only a defective knowledge of the monuments which immortalized Egypt, or rather, we were completely ignorant of them. The following work will offer a meticulous description of them. The exact geographical position of each monument has been established and is indicated on the maps. Detailed topographical plans have been drawn up which show the relative positions of buildings in the same town, and their position in relation to the Nile or the neighbouring mountains. We have also provided a large number of picturesque views of these magnificent ruins. The artists responsible for this work were too struck by the beauty of the subject and by its peculiar grandeur to import any arbitrary composition. They have devoted themselves to truthful imitation in order faithfully to transmit the impression the spectacle of Egypt made upon them. Never have the works of man offered a more sublime subject to the genius of drawing.

The dimensions of the buildings together with their principal parts and accessories have been measured several times with the greatest care and attention. All these monuments are represented by plans, elevations, views taken from different sides and perspective views. The drawings and the descriptions which give the results of these measurements leave nothing to be desired as regards the study of Egyptian architecture; they can be used to construct buildings which resemble those described in every respect. Let us observe here that this work was not restricted to a few isolated ruins which had escaped the effects of time but included the principal monuments of an enlightened nation [*nation éclairée*] to whom the majority of other nations owe their institutions. Southern Egypt does not suffer from the multiple causes which lead to the continual destruction of buildings in other climates and which often efface them down to the last vestiges. The very size of the monuments also protects them against the efforts of man. For this reason it is possible today to form a picture of the architecture of the Egyptians with the certitude of having included their most beautiful buildings. It is clear that those which still exist at Thebes, at Apollinopolis, at Abydos and at Latopolis are the palaces that were occupied by the kings, or were the most remarkable temples, and that these are the same monuments which were described by Hecataeus, Diodorus and Strabo. Nothing can be of greater importance for the history of the arts than knowledge of these great models which aroused the admiration of the Greeks and helped give rise to their genius.

Great efforts have been made to copy exactly the innumerable sculptures which decorate these edifices. The designs of the bas-reliefs represent the widest variety of objects and throw new light on the science of Antiquity: they relate to the practices of war, religious ceremonies, astronomy, government, public customs, domestic habits, agriculture, navigation and all the civil arts. We have sought to transcribe exactly the hieroglyphic characters on a large number of these designs and to conserve not only the individual forms but also the order and relative disposition of the signs. We have gathered the ancient inscriptions which are of interest to literature and to history. And we have carefully copied the colours which still adorn several monuments and seem to have lost nothing of their original brilliance.

To the topographical plans, picturesque views, architectural plates and drawings of bas-reliefs have been added extended descriptions which draw together all those useful observations which cannot be communicated by means of drawings. These descriptions contain the results of a prolonged examination that involved the co-operation of several witnesses. The goal of these descriptions is to make known the current state of the monuments and the deterioration they have suffered over time, the type of materials used, and several other circumstances worthy of attention. They also contain a variety of observations on the architecture, the method of its construction, the colours, the forms and the use of the objects that are represented, the nature of the soil, the changes which result from the periodic floods, and other questions which are not sufficiently extensive to require treatment in a separate report.

The same care has been employed in describing the magnificent sepulchres of the ancient kings of Thebes, the funeral chambers in which domestic piety led the ancient Egyptians to perpetuate the memory and the mortal remains of their ancestors, and the other underground chambers which seem to have been dedicated to mysterious ceremonies.

The famous pyramids of Memphis are of less interest in relation to the fine arts. But other motives guided our careful research into these vast monuments, which have given rise to so many uncertain observations. We have determined with precision their geographical location, the direction of their sides in respect of the meridian line, the exterior dimensions and the dimensions of all the rooms into which it is possible to enter; finally, we have described all the accessory buildings.

The obelisks, the sphinxes, the colossal statues, the sarcophagi and various other monoliths are reproduced in separate drawings. It would not have been possible to transport these precious ornaments of the buildings and sacred places to Europe without a degree of effort impossible under the circumstances. But there are a large number of other objects of smaller dimensions which have been gathered and preserved by different people and which are now in public museums. We have brought from Egypt engraved stones, complete and truncated statues, bronzes, fragments of enamel and porcelain, stones which have been cut or polished and which bear inscriptions, together with other objects of the arts which relate to the ancient religion, to the sciences and the customs of this country. We have carefully examined a vast quantity of mummified human beings, quadruped animals, reptiles and birds, of which we have preserved several. In the boxes or vases which contained the desiccated bodies we found cloths made of a precious fabric, gold necklaces, amulets, rings and a large number of remarkable fragments. From these boxes we removed several volumes of papyrus covered in hieroglyphic signs or alphabetic characters. These objects were discovered in the middle of the ruins of ancient towns, in numerous excavations, which required the examination of the buildings, in public or royal sepulchres, and even, on occasion, in dwelling-places that are still occupied. They were collected throughout the French expedition and we judged it necessary to insert drawings of them into the general collection.

The plates relating to modern Egypt represent: (1) the mosques, the palaces, the gateways of the towns, the squares, the tribunals, the aqueducts, the sepulchres, the areas and buildings dedicated to commerce, inscriptions and medals; (2) the gardens, the baths, the schools, tools relating to the arts, arms, family tombs, the houses of citizens, buildings intended as workshops, machines, studios, and instruments relating to different professions; (3) annual ceremonies, processions, public gatherings, meetings, domestic celebrations, military exercises, funeral customs, marriages, births, the purchase of slaves and their emancipation; (4) finally, remarkable individuals within the different classes of inhabitants or from foreign races, and the clothes and arms which distinguished them.

§II General outline of the ancient monuments of Thebes

There is a small number of scattered villages in the middle of a plain once occupied by a vast town. These miserable dwellings contrast in a striking manner with the opulent remains of a superb city.

Towards Libya, Koum el-Ba'yrât, Medynetabou and Qournah still possess the remains of large monuments. Halfway between these last two villages, there is a site

devoid of Arab buildings which all the ancient and modern travellers have designated with the name *Memnonium*, and which is equally full of antique buildings. Towards Arabia, Luxor and the two *Karnaks*, built upon magnificent ruins, are connected by an unbroken series of ancient remains. From some distance to the north there can be seen at Med-a'moud several columns which are still upright and a man-made mound covered in the remains of old buildings.

The remains of the city of Thebes are not to be looked for only in the area which is watered by the Nile. As if the portion of the valley which it occupied was insufficiently vast to contain it, this ancient city extended as far as the mountains. In fact, the part of the Libyan chain next to the monuments which still exist is pierced by an innumerable quantity of underground chambers; several of these may well have served as places of refuge for the first troglodyte inhabitants of Egypt. But all of them must be seen as the last abode of the citizens of this ancient capital.

For the reader to experience all the feelings which are aroused on arriving at a place which awakens so many memories, we would have to be able to describe that state of anxious curiosity in which one's desire is to embrace everything at once. It seems that the senses lag behind, so that one is unable to take in all that is there; the mind is confronted with a million questions it wishes to resolve, a million facts it seeks to confirm at the same time. Where are the hundred gates of which Homer sang, and through which one did the 200 chariots armed for war depart? Surrounded on all sides by magnificent ruins, it is easy to surrender oneself to one's imagination; all the exaggerations of poetry seem to take on reality. Where is the statue of Ozymandias, vaunted by Hecataeus as the most colossal of all those which Egypt once contained? Where was the famous circle of gold one cubit high and 365 cubits in circumference, on which was shown the rising and setting of the stars for every day of the year? Where was the site of that great *Diospolis* whose vastness was celebrated by ancient authors and which contained one of the largest edifices that the Egyptians ever built? Where were the dwelling-places of those kings whose renown was such that their wisdom raised them to the rank of gods, and whose precious and useful institutions still solicit the admiration of all those who come to understand them? Where, finally, is that colossal statue of Memnon whose voice sounding at dawn was heard by so many illustrious people? Did Thebes have a city wall? And do traces of it still remain? All of these questions, and a thousand others, present themselves to the mind of the traveller. They cast him into a singular state of agitation, stimulating a desire for action that cannot be satisfied. Drawn towards a multitude of new objects, and a colossal architecture to which his eye is not accustomed, he examines everything with avid curiosity. The vast quantity of sculptures, which cover the walls of the temples and palaces, awakens his astonishment no less than the grand and beautiful lines of the architecture. When after leaving the monuments he seeks to gather together and take stock of what he has seen, he finds that his memory and powers of reflection furnish only confused ideas and he is forced to recognize the insufficiency of his first encounter.

It is only through frequent visits to the same monuments, and only after having carefully studied their shapes, that the visitor is able to comprehend the gravity which characterizes all the works of Egypt and to understand the

powerfully expressed intention of their founders that they should be made indestructible.

It is not only those who have dedicated themselves to the study of the arts whose feelings are awakened by the view of Thebes. Its magnificent buildings offer beauties of such high degree that they draw the attention of men whom one would think least inclined to appreciate them. They are like great accidents of nature or dazzling phenomena which not only capture the minds of those equipped to examine them but also produce the most vivid and profound impression upon the mass of people. The soldiers were at first struck with astonishment at the sight of these imposing masses, but then set off in search of the smallest of ornaments which decorate them.

A traveller who arrives close to the monument that he intends to study begins by forming a general idea of the whole without dwelling on any detail in particular. If there is one place where the spectator is driven to follow this natural sequence with particular attention, it is the area over which the remains of Thebes are scattered. Whatever impression one may have formed of this spectacle through the many tales which have come down to us over the centuries, it presents so many and such unexpected sights that even the most avid curiosity must be continuously nourished and reawakened again.

§VII Description of the ruins of Luxor

[. . .] If he has been led there by an appreciation for art and antiquities, as soon as a traveller arrives at Luxor he quickly crosses the area covered in ruins which separates the river from the monument. He then finds himself transported into the middle of a forest of columns, some six metres, others ten metres in circumference. To the right there are numerous vestibules, to the left are the obelisks and the imposing mass of the gateway: on every side grandeur and magnificence surround him. He traverses several porticoes and colonnades; he climbs the highest mounds to gain a perspective upon the entire mass of ruins; he hastens as if the monument were at any moment about to collapse and disappear for ever. After this poorly executed examination, which leaves the eye and the mind equally exhausted, he returns to the rowing boat, more astonished than satisfied. If the threats of the anxious inhabitants or the caprice of some sheikh forces him to leave the river bank, he will take with him only a confused idea of the buildings of Luxor. And if he seeks to comprehend what he has seen, he will have only an uncertain grasp of the massess of the monuments and an exaggerated picture of the distinctive characteristics of its architecture without being able to call to mind the beauty of the details, for these depend upon the precision with which they were executed and cannot be rendered with the same exactness. Everything is unnatural; he takes from it and he brings to it only false ideas. Such errors merely perpetuate and further reinforce the unfavourable prejudices of the reader, for whom the monument is nothing but a shapeless mass and proof of the barbarism and ignorance of those who built it. Such have been for the most part the results of the encounter which resulted from the majority of journeys to Egypt prior to the French expedition.

In contrast, someone who is able to recall in perfect security the most striking of the objects he has seen, to reunite them in his thought and to co-ordinate them with one another, is in a position to develop a more methodical plan of examination with which to carry out future searches. This was the favourable situation in which we found ourselves. It was easy for us to see that we had entered the palace from one of its sides somewhere towards the middle and that because of the irregular route we had taken we were unable to gain a correct conception of the buildings as a whole.

We then tried to gain access to the square in front of the first gate from inside the village. It can be reached by two different roads. The first begins at the riverbank from which one normally set out; it leads to the entrance of the palace past ruins which lie close to modern habitations, making a double detour in the opposite direction along narrow lanes. The other road leads from Karnak. It is now the principal road of Luxor and is undoubtedly built upon the remnants of the old road that united the two districts of Thebes situated on the eastern bank of the Nile. The discovery of the remains of sphinxes along the whole extent of this road, reaching all the way to Karnak, led us to assume that it had once been lined with sphinxes. The remains of pedestals alternated with fragments of sphinxes possessing the body of a lion and the head of a woman. The closer we approached Karnak, the more numerous the fragments became and the less they were disfigured; at Karnak itself we discovered complete sphinxes still raised upon their pedestals. When the Nile floods, the waters flow along this road. Should we not believe that they also did so at the time of the splendour of Thebes and that these sphinxes were situated along the banks of a canal that was full of boats during the period of inundation and that afterwards was used as one of the main avenues?

As we arrived in front of the palace of Luxor we were met by an increasing number of monuments of a colossal grandeur which aroused both astonishment and admiration. Above all, we noticed two monolithic obelisks in red granite. The excellent quality of this granite, which can only be found in a single part of Egypt, would have been sufficient reason for us to believe that these obelisks had been taken from the mountains of Syène, if in the quarries close to the town we had not also discovered unequivocal traces that these sorts of monument had been worked upon. The hieroglyphs which decorate the obelisks of Luxor are sculpted with the ultimate precision; the figures of the animals above all combine the beauty and finish of the sculptures with a great purity of design. The hieroglyphs are arranged in three lines or vertical columns. Those in the middle have been brought to a perfect polish and are embedded at a depth of five centimetres; those on the two outer sides have only been carved on the surface, whilst those parts of the sides which have not been sculpted have been dressed with care. This variation in the degree of work, joined with the fact that the depth of the sculptures in the middle is twice that of the others, gives rise to differing tones and reflections. Contrasts are established which render everything clear and distinct so that even the smallest details are easy to see. This was evidently the goal of the Egyptian artists and it is hard to conceive how anyone can have taken for a state of imperfection what is the result of a highly intricate scheme.

9 John Flaxman (1755–1826) ‘Style’

Flaxman’s father had been a maker of plaster casts, for the Wedgwood pottery among others, and the son showed promise as a sculptor from an early age. However, at the age of 20 he failed to win the Royal Academy gold medal that would have underwritten a trip to Italy. Instead he built up his business in England, mostly in the field of monumental sculpture, while also working for the Wedgwood concern. He eventually undertook the journey to Rome in 1787 with money he had made himself. While there he met Canova and became successful both with sculptures and with engraved illustrations of literary classics such as the *Iliad*, the *Odyssey* and Dante’s *Divine Comedy*. These almost exclusively linear works brought him success throughout Europe. He continued to produce monuments, with an increasingly religious inflection, becoming the foremost English sculptor of his time. He was elected Professor of Sculpture at the Royal Academy in 1810, from which time he regularly delivered his series of lectures on the techniques and history of the subject. The final lecture on ‘Style’ offers a brief overview of art from the Greek classical age, through a decline under Rome to the inception of Christianity, culminating in the rebirth of classical style with the added bonus of Christian content in the Renaissance. Before launching his survey, however, Flaxman provides us with an instance of contemporary thinking on the relation of pre-classical, non-Western visual cultural artefacts to the succeeding Western tradition: a relation he expresses through a metaphorical contrast between the ‘earliest dawn’ and the ‘sunrise of human intelligence’. Our extracts are taken from ‘Lecture VII. Style’, in Flaxman’s *Lectures on Sculpture*, London: John Murray, 1829, pp. 196–202, 211–12.

The introduction to a theory, whether of science or art, practical or abstracted, should contain such a compendious view of the subject, as will connect all the branches or members with the principle on which they depend for their essential quality, and peculiar characteristic distinction; so that our view of the whole should comprehend the parts of which it is composed, and our inquiries concerning the parts should be guided and regulated by that common principle in which they are all united.

This universal and indispensable maxim, applied to a course of Lectures on Sculpture, will naturally lead us to some well-known quality which originates in the birth of the art itself – increases in its growth – strengthens in its vigour – attains the full measure of beauty in the perfection of its parent cause – and, in its decay, withers and expires! – Such a quality will define the stages of its progress, and will mark the degrees of its debasement; – it will point out how, and when, proportions were obtained by measure and calculation – when geometrical figures more simple, or complicated, decided form – how the harmony of lines in composition produce energy by contrast, and sympathy by assimilation. – Such a quality immediately determines to our eyes and understanding, the barbarous attempt of the ignorant savage – the humble labour of the mere workman – the miracle of art conducted by science, ennobled by philosophy, and perfected by the zealous and extensive study of nature.

This distinguishing quality is understood by the term Style, in the arts of design. This term, at first, was applied to poetry, and the style of Homer and Pindar must

have been familiar long before Phidias or Zeuxis were known; but, in process of time, as the poet wrote with his style or pen, and the designer sketched with his style or pencil, the name of the instrument was familiarly used to express the genius and productions of the writer and the artist; and this symbolical mode of speaking has continued from the earliest times through the classical ages, the revival of arts and letters, down to the present moment, equally intelligible, and is now strengthened by the uninterrupted use and authority of ancients and moderns.

And here we may remark, that as by the term style we designate the several stages of progression, improvement, or decline of the art, so by the same term, and at the same time, we more indirectly relate to the progress of the human mind, and states of society; for such as the habits of the mind are, such will be the works, and such objects as the understanding and the affections dwell most upon, will be most readily executed by the hands. Thus the savage depends on clubs, spears and axes for safety and defence against his enemies, and on his oars or paddles for the guidance of his canoe through the waters: these, therefore, engage a suitable portion of his attention, and, with incredible labour, he makes them the most convenient possible for his purpose; and, as a certain consequence, because usefulness is a property of beauty, he frequently produces such an elegance of form, as to astonish the more civilized and cultivated of his species. He will even superadd to the elegance of form an additional decoration in relief on the surface of the instrument, a wave line, a zig-zag, or the tie of a band, imitating such simple objects as his wants and occupations render familiar to his observation – such as the first twilight of science in his mind enables him to comprehend. Thus far his endeavours are crowned with a certain portion of success; but if he extend his attempt to the human form, or the attributes of divinity, his rude conceptions and untaught mind produce only images of lifeless deformity, or of horror and disgust.

When we consider these weak and inefficient attempts for a moment, with what astonishment shall we turn to the almost breathing statue, whose mimic flesh seems yielding to the touch! whose balance alarms with the expectation of movement! whose countenance beams with the sweetest charities of humanity! In these opposite descriptions we contemplate the productions of man just emerging from gross and savage nature, and civilized man, formed to moral habits, intellectual enjoyments, and delighting to trace the Creator in his works. Such is the difference between the beginning and the perfection of art. [. . .]

The characters of style may be properly arranged under two heads, the Natural and the Ideal.

The Natural Style may be defined thus: a representation of the human form, according to the distinctions of sex and age, in action or repose, expressing the affections of the soul.

The same words may be used to define the Ideal Style, but they must be followed by this addition – ‘selected from such perfect examples as may excite in our minds a conception of the supernatural.’

By these definitions will be understood, that the natural style is peculiar to humanity, and the ideal to spirituality and divinity.

In our pursuit of this subject we are aware of the propensity to imitation common in all, by which our knowledge of surrounding objects is increased, and our

intellectual faculties are elevated; and we consequently find in most countries attempts to copy the human figure, in early times, equally barbarous, whether they were the production of India, Babylon, Germany, Mexico, or Otaheite. They equally partake in the common deformities of great heads, monstrous faces, diminutive and mis-shapen bodies and limbs. We shall, however, say no more of these abortions, as they really have no nearer connection with style, than the child's first attempts to write the alphabet can claim with the poet's inspiration, or the argument and description of the orator.

We shall now proceed to mark the character, and trace the progress of style, not from the earliest dawn, but rather from the sun-rise of human intelligence, when the imitative faculty is assisted by rule, and corrected by reflection – when the representation partakes, in some degree, of man's dignity in countenance and figure. In this state we find painting and sculpture among the Egyptians, whose application to geometry, and inquiries concerning the animal structure, enabled them to give a general, though imperfect, proportion and outline to their figures, whose forms, however, were more determined by simple geometrical lines, than a scrupulous attention to nature. [...]

The Egyptian statuary were laborious mechanics; their works were lifeless forms, menial vehicles of an idea, or the fixed slaves of uniformity in a temple or a palace.

In Greece, painting and sculpture were liberal arts: they were studied by the noblest and best-educated persons; they were improved by the accumulation of science; they were employed to excite and celebrate virtue and excellence: and, finally, to exalt the mind of the beholder to the contemplation of divine qualities and attributes.

Neither our present limits nor the intention of this Academy, permits us to extend our inquiries beyond a rational theory to regulate the study of design; but strictly within these limits we may observe, that in whatever instances the institutions of Greece cultivated and rendered more powerful the virtuous exertions of mind and body, the arts of design also were animated by their beneficial effects, to a degree which surpassed the other nations of antiquity, and has laid a foundation of principles and practice for all succeeding ages.

10 Georg Friedrich Creuzer (1771–1858) from *Symbolism and Mythology of the Ancient Peoples, particularly the Greeks*

The German philologist and classical scholar Georg Friedrich Creuzer was born in Marburg. He studied theology and philology at his home university and in Jena, and in 1804 he took up a professorship at the University of Heidelberg, where he was broadly sympathetic to the aims and ideas of the Heidelberg Romantics. Aspects of Joseph Görres' lectures on early myth and culture (subsequently published as *Mythengeschichte der asiatischen Welt*, 1810) were assimilated into his major work, *Symbolism and Mythology of the Ancient Peoples*, published in four volumes between 1810 and 1812. (For Görres' earlier *Aphorisms on Art*, see VIA4.) Creuzer challenges the opposition between the classical and the modern which is still present in the work of figures such as Friedrich Schiller (see VA12) and August Wilhelm Schlegel (see VIA9) by identifying an earlier 'symbolic' stage prior to

the harmony or resolution of the classical world. The symbolic is marked by the awareness of an unbridgeable gulf between the finite vehicle of artistic expression and the divine content which this is intended to articulate. Unlike allegory, which merely stands in for or points to something not physically present, the symbolic aims to provide immediate sensuous access to that which is infinite and unconditioned. Creuzer's ideas exercised a decisive influence upon the formation of Hegel's aesthetics, in which the symbolic forms the first of three great historical stages of art (see *Art in Theory 1815–1900*, IA10). Hegel formed a close friendship with Creuzer during his period at Heidelberg and he frequently acknowledged the importance of the latter's work. The following excerpt has been translated for the present volume by Jason Gaiger from *Symbolik und Mythologie der alten Völker, besonders der Griechen*, volume 1, Leipzig and Darmstadt: Karl Wilhelm Leske, 1810, pp. 65–85.

§28 – After these preliminary remarks, let us proceed to discuss expression through images. The characteristics identified by Aristotle through the examples he gives of metaphor (μεταφορα) and simile (εικων) lead us directly to the fundamental concepts of symbolic representation. This critic observed that when the poet says ‘Achilles leapt forward like a lion’ he presents us with a simile, but when he uses the expression ‘the lion leapt forward’ in relation to Achilles he presents us with a metaphor.¹ A range of different properties, such as strength, courage, the inspiration of irresistible terror and so on are gathered together in the focal point of a single phrase which expresses Achilles' character at a stroke. This is true of all the various sorts of metaphors which employ tropes, whether they rest upon a perceived similarity (metaphor) or upon an external or internal connection between two things (metonymy and synecdoche). The essential characteristic of this form of representation is that it presents something single and indivisible. The understanding, whose task is to distinguish things and to combine them, brings together the various features of an object in order to form a concept, and, in the same way, separates a succession of things into their component parts. In contrast, the vivid procedure of metaphor offers us everything all at once and in a single moment. A glance suffices to take in the whole. [...]

§29 – But if the soul wishes to achieve something greater, that is, if it wishes to ascend to the realm of ideas, and to make the image into a representation of the infinite, it is confronted by a great and irreducible contradiction. For how can what is limited become, so to speak, the vessel or dwelling-place of what has no limits? How can what is sensuous stand in for what is not accessible to the senses, for what can be known only in pure thought? Trapped in this contradiction and cognizant of it, the soul at first finds itself in a state of longing or yearning. It seeks to grasp the essence completely and without alteration and to give it life; but the essence cannot be constrained within the limits which this form imposes. The desire to give birth to the infinite in the finite is a painful yearning. The mind which is trapped in this nocturnal underworld seeks to raise itself up and to break through to the full clarity of the daylight world. It wants to perceive the sole and invariable truth without veils, as it exists in itself, and to capture its image in the changeable world of shadowy existence.

Thus the soul hovers between the world of ideas and the world of the senses, seeking to bring the two into connection and to discover the infinite in the finite.

How can it be otherwise than that things which are produced out of such a struggle bear the mark of their origin, betraying this double nature in their own essence? And indeed, this double origin is clearly revealed in the essential elements and features of the symbol.

§30 – At first the symbol is characterized by just this state of *suspension*, by a condition of indeterminacy between form and essence. In the symbol there is a universal concept which approaches and withdraws but which eludes our grasp whenever we seek to seize hold of it. Although the concept arises from the world of ideas and – to use a Platonic expression – radiates with the full light of the sun like an astral body, it is obscured by the medium through which it travels and by which it enters the eye. Just as the colours of the rainbow arise from the broken image of the sun against dark clouds, so the symbol breaks up the simple light of the idea into a coloured ray of meaning.

For the symbol first becomes meaningful and stimulating precisely through this incongruity between its essence and its form, through the superabundance of its content in comparison to its mode of expression. A symbol is all the more stimulating the more it incites us to reflection. For this reason, the ancients valued the symbol above all for its capacity to raise people out of the habitual character of their everyday lives and to awaken them to higher endeavours. A critic who thought about the nature of language with unusual acumen has rightly observed that ‘What is implied always strikes more terror than that which lies uncovered in front of us. That is why the mysteries are revealed in the form of symbols, as in night and darkness. In fact, the symbolic should be likened to darkness and to night.’²

§31 – The ability of symbols to stimulate and to unsettle us is connected with another important property – that of *brevity*. A symbol is like a sudden apparition, a bolt of lightning which momentarily lights up the dark night. It is an instant which makes a claim upon our whole being, a glance into the infinite distance from which our minds return enriched. This momentary quality is highly fertile for the responsive mind. The intellect experiences a lively pleasure in separating and then gradually assimilating into itself the constituent parts of the diversity of things which are locked together in the pregnant moment of the image, and it is satisfied by the fullness of the gain which it gradually begins to oversee. For this reason too, the ancients showed a preference for this form of expression. If at first they were led to it by a fortunate natural impulse, they subsequently took full account of it, likening the symbol to Spartanism in virtue of its fruitful brevity. Here too, Demetrius provides a helpful explanation: ‘In all circumstances the Spartans had a natural inclination towards brevity in speech. Brevity, after all, is more forceful and peremptory, while length in speech suits supplications and requests. This is why symbols are so forceful, since they resemble brevity in speech. We are left to infer a great deal from a short statement, as in the case of symbols.’³

However, only pregnant brevity is forceful. The capacity to stimulate stands in exact relation to the importance of the content. The person who says something trivial but employs contrived taciturnity in order to suggest that he is saying something important fails to achieve his goal and becomes risible. It is the same with

symbolism. To cover a shallow thought in the cloak of symbolism is like covering one's wretchedness in a sumptuous costume. Whoever was hoping to learn something will inevitably experience disappointment at a false expectation and will take revenge through laughter. Only what is meaningful can become significant and only what is important can take on the dignity of the symbol. That which we intimate or fear, that which makes a claim upon our entire being, recalling the mystery of our existence, animating and giving content to our life, the most precious bonds and connections, unity and separation, love and abandonment, that upon which the happiness of our life as a whole depends – these are the things which require a symbol and with which it seeks to enter into unity. [...]

§32 – This leads us to an increase in the potency of the symbol, or to its higher use. When the creative mind comes into contact with art, when it dares to embody religious intuitions and beliefs in a visual form, it must extend the symbol into the realm of the infinite and limitless. It seeks to raise itself above itself and to find embodiment for the highest and most universal concepts. But how is form to be given to the inexhaustible fullness and unfathomable depths of the essence? This is a task which, properly considered, must annul itself. For how can what is conditioned take the place of the unconditioned, how can what is mortal become the vehicle of what is immortal? Since the symbol is always insufficient for such a task it enters into a dual striving. The first is to follow its natural tendency towards the infinite, and to seek, as its sole task, to satisfy its desire to be significant. In this case, it does not seek merely to express many things – it must express everything. It must measure the immeasurable and compel the divine into the restricted sphere of human forms. Always insufficient, the symbol nevertheless follows the hidden impulsion of unidentified intimations and beliefs. Without respect for any natural laws it transgresses all boundaries, but for just this reason it remains in a state of suspended indeterminacy and becomes enigmatic. The inexpressible prevails, and although the essence seeks expression in terrestrial forms it eventually shatters all such vessels through the infinite power it contains. Thereby clarity of vision is itself destroyed and only speechless wonder remains. Here we have characterized the most extreme case and we may term this form of symbolism *mystical*. Yet as long as the limits upon the symbol are recognized, and it does not strive for the utmost, this way of proceeding can succeed in giving meaningful expression to religious faith.

The other alternative is that the symbolic imposes restrictions on itself, keeping to a delicate middle line between spirit and nature. Through this restraint it achieves what is most difficult of all. It is able, to a certain degree, to render the divine visible. Far from lacking significance, it is charged with meaning through the great content which it expresses. With irresistible force it draws the spectator towards it, seizing hold of our soul with the same necessity as the world spirit itself. From the symbol there streams forth an exuberance of living ideas. What reason in combination with the understanding strives to attain through a series of inferences, the symbol, in union with the senses, attains all at once and at a single stroke.

Here the essence does not overflow beyond every boundary. Instead it obeys nature, adapting itself to nature's forms, penetrating them and giving them life. The conflict between the infinite and the finite is resolved and the infinite, limiting

itself, takes on a human scale. From the purification of the image-realm, on the one hand, and the free renunciation of the boundless on the other, there blossoms forth the most beautiful fruit of all symbolism: the symbol of the god, which wondrously combines beauty of form with the highest plenitude. Since this reaches its perfection in Greek sculpture we may call this the *sculptural* [*plastische*] symbol.

§33 – The highest product of man's creative capacity we term the *symbol* and it is to this narrow sphere of embodied ideas that this term should be restricted in its strict scientific sense. It expresses everything that is proper to this genre, raising it up to the highest level: *immediacy*, *totality*, the obscurity of its origin and *necessity*. This single word serves to designate the appearance of the divine and the transfiguration of the terrestrial image. As we have shown, it is fully in accord with the higher use of language of the ancients, even though they extended the scope of this richly significant word to include other, lesser concepts.

In contrast, the German word for symbol, *Sinnbild*, lacks this higher significance and dignity. For this reason its use should be restricted to the lower spheres of artistic activity and it should not be used to refer to symbolic utterances. It is often employed to characterize those forms of representation which require the use of an accompanying text. The Greeks rarely made use of this sort of support and in high Antiquity they employed it principally for reliefs and upon vases. [...]

§34 – This reference to *Sinnbilder* which are accompanied by a text leads us to consideration of certain *demands* which are placed upon the symbol. Here we shall limit ourselves to a discussion of the most important, for the rest will be explained by what follows. First and foremost is the demand for clarity. Yet this demand appears contradictory insofar as it threatens to annul the essential character of the symbol. For as the ancients already recognized, the symbol is by nature dark and obscure. How then can it deny its own nature and become clear? Insofar as the symbol possesses something that no image possesses, or rather, insofar as it strives to represent the highest idea of the divine in the form of an image, it cannot send out the full light of the divine radiance undimmed. It betrays its terrestrial origin through its twilight character and its dark gleam. Although the symbol strives to escape the earth and to reach the very highest, it quickly overreaches itself when it ignores the constraints imposed upon it. The demand for clarity, then, is no more than a reminder of the laws of nature which can never be transgressed without penalty. In other words, the symbol wishes to and should express a great deal; it wishes to and should point us towards the divine. But what it has to say it must say decisively, without distraction or confusion. It should express its meaning simply and clearly.

These demands are particularly necessary in relation to symbolism in art. The Greeks, in their best period, observed them rigorously, renouncing all distracting accessories. Whereas more recent symbolism requires all sorts of support, the Greeks were satisfied with a small number of articulate characteristics. How much they achieved with so little! They remained true to nature and avoided what lacked proportion. Thereby, too, they avoided obscurity. Brevity was their second law; they sought to reach their goal by the shortest possible path. They aimed to achieve expression in a way which is pleasing to the senses. Not to offend the senses was their

first concern, and through rigorous abstinence under fortunate circumstances they achieved *loveliness* and *beauty*. Their art was appropriate to this sense of measure. And yet the Greeks also possessed another form of symbolism. When they sought to express a higher wisdom and to elevate their secret teachings above common beliefs, they made the symbol into the organ of mysterious truths and intimations. In fulfilling this vocation the most important thing was for the symbol to be significant, without concern for what is pleasing or beautiful. The more it fulfilled this holy requirement, the more it tended towards obscurity, until ultimately it became an embodied mystery. This is the origin of a large part of the most ancient Greek and Roman temple symbolism. It is often the case that a highly significant temple image is open to several interpretations. This is even more so in the case of properly mystical symbols. Here we need only read what Clement of Alexandria said about the many interpretations of Orphic thallopory.⁴ We are astonished that such a simple custom could possess so many meanings. We have lost the key which was passed on through initiation into the mysteries. The symbolism which was employed in these secret duties presupposed instruction which the novice received from the priests and the exegetes. For the symbolism of the art work to be fully and clearly comprehensible, and for what we term education to have enabled someone to understand it, they must first have been given special instructions which could allow them to break through its hard shell to the meaning which lay hidden underneath.

§35 – We have presented the symbolic as the root of all expression through images and at the same time as its highest articulation or flowering. We must now confirm this by comparing the symbol with the other main forms of iconicism. Let us start with *allegory* which in everyday speech is so often confused with the symbol. The essence of the allegorical image is best explained through contrasting it with a historical image, or, as it is perhaps properly expressed, the curiological. Place someone before a history painting and ask him to explain what he sees. What must he do? He must put into words what he sees, and if painting is mute poetry as the ancients claimed, then it will lend the viewer the words with which to speak. Here the viewer is asked to transpose what is expressed in the image into a different form, but he does not need to transpose his own soul into the image. He reports, he does not interpret. Now place the same person before an allegorical picture. Here too, he reports what he sees. But has he thereby exhausted the meaning of the image? Has he taken from it what it contains? Not at all. A mere report such as this will not satisfy anyone. The viewer needs to add something further, something which reveals the meaning lying below the surface. He must articulate more than simply what he sees. He must interpret the picture. Let the painting represent the metamorphosis of Odysseus' companions. If we look at it as a history painting, we will describe only what we see with our eyes. However, if like Socrates and the other ancients we see in this story – and hence in the painting – a representation of the debasement of man through sensuous desire, then we must begin to interpret it. This is expressed both by the older term for this form of representation, *υπονοια*, as well as by the more recent term, *αλληγορια*, for both signify a veiled or hidden meaning, indicating that the picture says or means something else.

We can now clearly identify the difference between symbolic and allegorical representation. Allegory presents a general concept or an idea from which the representation remains distinct. But a symbol is itself the embodied idea made accessible to the senses. Allegory involves a form of substitution: we see an image which then refers us on to a concept which we have to seek out. But a symbol shows us the concept itself descended into the physical world: we see the symbol immediately in the image. Accordingly, the distinction between the two is to be found in the quality of immediacy, which allegory lacks. The symbol presents the idea completely and in a single moment, seizing all our psychic energy. It is a beam of light which enters our eye directly from the dark ground of being and of thought. In contrast, allegory entices us to look up and to follow in our own minds the passage of thought that is hidden in the picture. Whereas the symbol gives us everything in a single moment; allegory gives us a sequence of separate stages. [...] Our soul is seized by the symbol and we are dominated by a sense of nature's necessity. Allegory and symbol are similar insofar as both hide deep and important truths under a dark exterior. However, the symbol is like a half-closed flower-bud which holds what is most beautiful sleeping and undeveloped in its chalice, whereas allegory is like the wide climbing branches of a rich and luxurious plant. The most successful allegories of the ancients provide proof of the close relationship and the differences between these two forms.

11 The Debate on the Elgin Marbles 1808–1816

The surviving elements of the Parthenon frieze and its related sculptures were stripped from the temple on the Acropolis in Athens between 1801 and 1803 on the orders of Thomas Bruce, Earl of Elgin and British Ambassador to the Ottoman Empire. After several vicissitudes, including shipwreck and the imprisonment of Elgin himself by the French, the marbles were put on display in London in 1807, housed in a temporary enclosure set up in the garden of Elgin's home. They immediately became the object of controversy, not least because of Elgin's intention to sell them to the government. In this he was inspired by a mixture of motives ranging from a personal interest in Antiquity to the desire for profit and a wish to outdo the French, who had recently been sequestering art treasures from the rest of occupied Europe and installing them in the Louvre. A volatile issue lay concealed behind both the financial aspect and the misgivings voiced, even at that early date, by the Society of Dilettanti: misgivings that the government would be condoning plunder if it purchased the marbles for the nation (albeit others spoke of Elgin saving the marbles from neglect and barbarism). The issue was this: classical Antiquity was the absolute cornerstone of modern Western culture (as has been evident from documents throughout the present anthology). The problem with the Parthenon marbles was that if they were genuine they caused difficulties with received notions of the classical ideal, particularly as that ideal was enshrined in the dominant artistic credo of the period, neo-classicism. Among the key points at issue then are: the merit of the sculptures as art; their potential value to the British

nation; and the value of an abstract ideal for art relative to the pursuit of natural truth. The status of Greece at the head of the Western canon was beyond challenge. Nonetheless, times were manifestly changing. What is in play in many of the accounts is a rereading of the Greek heritage, in terms of a more modern disposition to greater naturalism. Succeeding decades saw this revision of the canon mutate further into a challenge to the canon itself under the growing impact of modernity. (For a selection of texts representative of this shift, see *Art in Theory 1815–1900*, sections I and II *passim*.) We reproduce here a selection of documents from the debate over the provenance and the implications of the Parthenon marbles.

11 (i) George Cumberland (1754–1845) Letter to the *Monthly Magazine*

Cumberland, a friend of William Blake, was an engraver as well as an advocate of the need for a national collection. He was among the first to see the marbles and immediately wrote to the *Monthly Magazine* to publicize them. His letter is mainly descriptive, but it conveys a good sense both of the impact the marbles had on one seeing them for the first time, and of the intertwining of national rivalry with considerations of the public benefit that might accrue from their acquisition. Cumberland's letter was published in the *Monthly Magazine*, London, 1 July 1808, pp. 519–20. We have taken the text from Elizabeth Gilmore Holt (ed.), *The Triumph of Art for the Public*, Princeton, NJ: Princeton University Press, (1979) 1983, pp. 116–20.

Sir,

Ever since the year 1762, when the first volume of *Stuart's Athens* made its appearance, has the public curiosity been raised to the highest pitch, to view even small fragments of the sculpture still abounding in that celebrated city and its vicinity. I well remember the pride with which the architect Reveley [i.e. Revett], who was there with Dr. Richard Worsley, once shewed me a piece of moulding that for many years he had carefully carried about with him, and which was equally remarkable for the delicacy of its finish, and the justness of its proportions. Since that period, another traveller, a Mr. Walker, brought over a few fragments, one of which, a small figure in bas-relief, now in my possession, he had carried on a mule above eight hundred miles. But I know of nothing else of any size, or likely to convey to us an idea of the grandeur of art, at the period of the building of the temple in the *Acropolis*, until Lord Elgin, availing himself of his advantageous situation at Constantinople, found means to acquire that noble collection, now happily deposited near Hyde-Park Corner, in a building erected purposely for their security; and, on Saturdays and Sundays, most liberally opened to the inspection of the public, as such things ought to be, without fee or reward, or even the necessity of previous application.

These now consist first of a considerable part of the frieze that surrounded the porticos under the soffit of Peripterous. They are three feet four inches in height, and were continued all round the outside of the wall of the temple; so that the whole, consisting of a procession, measured above five-hundred feet. This procession was the *Panathenaic*, consisting of horsemen and charioteers, some clothed in

the chlamys and tunic, others in the tunic only, and many, as from the bath, quite naked.

Among those of Lord Elgin's marbles are the three scaphephori, or men carrying trays, the sacrificers of the ox, the noble sitting figures of *Neptune* and *Ceres*, the *Hydriaphorae*, or women carrying pitchers of water, the *Canephorae*, or basket carriers, and others that I cannot now recollect; for, at the first view of such stupendous works of art, the mind is too much elated for the memory to exert its activity with precision. Next we find the greater part of the *Metopes* of the frieze of the south side; many in fine preservation, and nearly statues; for they are in very protuberant alto-relievo, consisting of part of the groupes of figures on the south side also, which were ninety-two in number, each representing a centaur combating one of the *Lapithae*; all infinitely varied, and some not much injured by the hand of time.

Thus we are become possessed of two species of specimens of Greek sculpture in their utmost perfection; but what renders this noble museum complete, is, we find these entire figures from the pediment, and statues of the *Caryatides* from the temple of *Erechtheus*, in the most perfect preservation.

Of the statues from the pediment, that of Theseus reposing on a skin of the feline kind is the first that commands our attention. It was, I apprehend, to the right of the western pediment of the portico, that, in the time of Stuart and Revely [Revett], was a mere fragment of a vast pediment filled with excellent sculpture.

This figure is reposing, nearly naked, with the head, trunk, and limbs, almost entire; every part is simple, composed, and dignified; it is a genuine fine specimen of what the Italians would call the *Pastoso*, in marble, soft, plump, and fleshy, looking truly like a figure covered with skin; a gentle relaxation pervades the whole recumbent image; while it represents that species of strength, which belongs to blood rather than bone. [...]

There are also, on this magnificent pediment, four or five other statues, particularly two dressed figures sitting, that look as if the sculptor had worked in clay instead of marble, so profound are the folds, and so flowing the lines, of their draperies; – to speak of the beauties of which, as they deserve, would, in this place, take up too much room. We may, however, venture from these to prognosticate, that the art of sculpture will now take good footing in this country; our artists having before them in the British Museum, the high Egyptian antiques, the Greek and Roman specimens selected by the late Mr. Townley; and, not to mention the numerous fine casts we possess, Mr. Knight's inestimable collection of bronzes in Soho-square; Tassie's vast collection of gems; and, lastly, these treasures of Lord Elgin's snatched from the Turks; consequently we may boast, that scarce any helps are wanting towards the revival of the noblest art that the faculties of man have hitherto produced. [...]

Such a treasure as we here have before us, would have gratified the ambition of any of the Roman Emperors; and will at this day excite the envy of every collector in Italy. Even the French, after all their depredations, must at a peace, submit to cross the channel, if they wish to see such specimens of art, as Paris, with all its boasted splendour, cannot exhibit. [...]

I trust that this opportunity of completing our studies, so as to rival our neighbours on the Continent, will not be neglected; and that the parliament of England

will, among other subsidies, consent to subsidize the arts; by purchasing, if possible, this entire collection, and building a well-lighted museum to contain it, so situated that the whole public may benefit by the magnificent exhibition.

Your's, &c.
G. Cumberland

11 (ii) Benjamin West (1738–1820) Letter to the Earl of Elgin

West was an American-born painter who succeeded Joshua Reynolds as President of the Royal Academy. He was best known for history painting, in particular for his representation of *The Death of General Wolfe* (1771, see IVA6). Then aged 70, West evidently made numerous studies from the antique sculptures, which he combined into ambitious compositions of his own. For another vivid account of drawing from the marbles, see Haydon at (iii) below. Like Cumberland, West also stresses both the unrivalled status of the sculptures as works of art and their potential role in raising the level of the national culture. We reprint the text of West's letter of 6 February 1809 included in the pamphlet *Memorandum on the Subject of the Earl of Elgin's Pursuits in Greece*, Edinburgh: Balfour, Kirkwood and Co., 1810, pp. 29–33.

My Lord,

I have to acknowledge the receipt of your Lordship's obliging letter from your residence in Scotland; and have to thank you for the indulgence you afforded me, to study, and draw from, the sculptures by Phidias, in your Lordship's house in Piccadilly.

I have found in this collection of sculpture so much excellence in art, (which is as applicable to painting and architecture,) as well as to sculpture, and a variety so magnificent and boundless, that every branch of science connected with the fine arts, cannot fail to acquire something from this collection. Your Lordship, by bringing these treasures of the first and best age of sculpture and architecture into London, has founded a new Athens for the emulation and example of the British student. Esteeming this collection as I do, my Lord, I flatter myself it will not be unacceptable for your Lordship to know, what are the studies I have made from it.

I must premise to your Lordship, that I considered loose and detached sketches from these reliques, of little use to me, or value to the arts in general. To improve myself, therefore, and to contribute to the improvement of others, I have deemed it more important to select and combine whatever was most excellent from them, into subject and composition.

From the Centaurs in *alto rilievo*, I have taken the figures of most distinguished eminence, and formed them into groupes for painting; from which selection, by adding female figures of my own, I have composed the Battle of the Centaurs. I have drawn the figures the size of the originals, on a canvass five feet six inches high, by ten feet long.

From the equestrian figures in *relievo*, I have formed the composition of Theseus and Hercules in triumph over the Amazons, having made their queen Hippolita a prisoner. In continuation, and as a companion to this subject, I have formed a

composition, in which Hercules bestows Hippolita in marriage upon Theseus. Those two are on the same size with the Centaurs.

From the large figure of Thescus, I have drawn a figure of that hero, of the same size with the sculpture. Before him, on the ground, I have laid the dead body of the Minotaur which he slew. As, by this enterprise, he was extricated from the Labyrinth by the aid of Ariadne, I have represented that Princess sitting by his side, gazing on him with affection. In the back ground, are the Athenian youths, whom he delivered from bondage; and near them, the ship 'with black sails,' (in the poetic fancy of Pindar), which brought him to Crete. The size of this canvass is six feet high, by nine feet long. [. . .]

In order to render the subjects, which I selected with perspicuity, and the effect, which arises from combined parts and the order of arrangements, comprehensive, I have ventured to unite figures of my own invention with those of Phidias [. . .] In following this system of combination, I had the singular good fortune, by your Lordship's liberality, to select from the first productions of sculpture which ever adorned the world in that department in art; which neither Raphael, nor any of the distinguished masters, had the advantage to see, much less to study, since the revival of art. I may, therefore, declare with truth, my Lord, that I am the first in modern times who have enjoyed the much coveted opportunity, and availed myself of the rare advantage of forming compositions from them, by adapting their excellencies to poetic fictions and historical facts. I sincerely hope that those examples of art, with which your Lordship has enriched your country, and which has made London, if not the first, one of the most desirable points in Europe to study them – will not only afford to the British people, the frequent opportunity of contemplating their excellencies; but will be the means of enlightening the public mind, and correcting the national taste, to a true estimation of what is really valuable and dignified in art. The influence of these works will, I trust, encourage the men of taste and opulence in this country, to bestow a liberal patronage on genius to pursue this dignified style in art, for the honour of genius, themselves, and the country.

11 (iii) Antonio Canova (1757–1822) Letters to Quatremère de Quincy and the Earl of Elgin, 1815

The Italian sculptor, painter, draughtsman and architect Antonio Canova was born in Possagno, near Treviso. He quickly rose to become one of the most celebrated artists in Europe, pursuing a long and highly productive career. After leaving Venice for Rome he developed an innovative neo-classical style. His work was compared by his contemporaries with the best sculptures remaining from Antiquity and many saw him as having succeeded in realizing Winckelmann's ideal of beauty. In 1802 he was appointed by Pius VII as 'Inspector General of Antiquity and Fine Arts' for the Papal States. He took considerable interest in ongoing archaeological excavations and did what he could to prevent the break-up and exportation of the remains that were uncovered. In 1815 he was invited to London to certify the authenticity of the Parthenon marbles which the Earl of Elgin had brought back from Greece. As his letter to Quatremère de Quincy reveals, he was greatly affected by what he saw. In his detailed and careful report he recommended that the marbles should be left unrestored for fear of causing further damage. The letter to Quatremère has been

translated for the present volume by Jason Gaiger from Paola Barrochi, *Testimonianze e polemiche figurative in Italia*. Messina and Florence: Casa Editrice G. D'Anna, 1972, pp. 57–8. The book by Quetremère referred to in the letter is probably his archaeological study, *Le Jupiter Olympien, ou l'art de la sculpture antique, considérée sous un nouveau point de vue* (Paris, 1815), which revealed for the first time the polychromatic character of Greek sculpture. The letter to the Earl of Elgin is taken from *A Letter to the Earl of Elgin and Two Memoirs read to the Royal Institute of France on the Sculptures in the Collection of the Earl of Elgin; by the Chevalier E. Q. Visconti*, London: John Murray, 1816, pp. xxi–xxii.

Letter to Quatremère de Quincy

9 November 1815

Here I am in London, my dear and excellent friend, a remarkable city of beautiful streets, beautiful squares, beautiful bridges and great cleanliness; what surprises me above all is that one sees everywhere the well-being of humanity. But to turn to what concerns us! I have seen the marbles brought from Greece. You and I perhaps already had some idea of the bas-reliefs from copies and from the casts and pieces of marble we had already seen. But of the complete figures, in which the artist was truly able to display his knowledge and ability, we knew nothing.

If it is true that these are the works of Phidias, or if they were created under his direction and merely given the finishing touch by him, they clearly show that the great masters were true imitators of beautiful nature [*la bella natura*].

There is nothing mannered or exaggerated about them; nor is there anything hard or anything that could be described as geometrical or conventional. On this account, I conclude that all of those statues which reveal an excessive dependence on conventions must be copies made by the numerous sculptors who copied beautiful Greek works in order to send them to Rome.

But these works of Phidias are true living bodies [*vera carne*], that is to say, beautiful nature. The Belvedere Mercury without arms is a living body, the Torso is a living body, the fighting Gladiator is a living body, the numerous copies of the Satyr of Praxiteles are living bodies, the Cupid of which so many fragments are found is a living body, the Venus is a living body, and the Venus which belongs to this Royal Museum is a living body, just like the two small Satyrs, etc.

I must confess, my dear friend, that seeing these beautiful things has aroused my own *amour propre*; for I had always felt that the great masters must have worked in this way and in no other. Do not believe that the style of the bas-reliefs from the interior of the temple of Minerva is any different; all have the same fine form and carnal quality, for human beings have always been made of the same supple flesh and not of bronze.

I have spoken to many people about your excellent book, and your treatise is now being printed in English. Continue in that love towards me which you have shown on every previous occasion by speaking frankly and without reservation about every aspect of my work.

Give my regards to the most esteemed Madame Quatremère. With all his heart and soul your friend embraces you.

Canova

Letter to the Earl of Elgin

London, 10th November, 1815.

Allow me, my Lord, to express to you the lively sentiments of pleasure which I feel, from having seen in London the inestimable antique marbles brought by your Lordship from Greece. I can never satisfy myself with viewing them again and again; and although my stay in this great metropolis must of necessity be extremely short, I am still anxious to dedicate every leisure moment to the contemplation of these celebrated relics of ancient art. I admire in them the truth of nature combined with the choice of beautiful forms: every thing about them breathes animation, with a singular truth of expression, and with a degree of skill which is the more exquisite, as it is without the least affectation of the pomp of art, which is concealed with admirable address. The naked figures are real flesh, in its native beauty. I esteem myself happy in having been able to see these masterpieces with my own eyes; and I should be perfectly contented with having come to London on their account alone. I am persuaded therefore that all artists and amateurs must gratefully acknowledge their high obligations to your Lordship, for having brought these memorable and stupendous sculptures into our neighbourhood. For my own part I give you most cordially a thousand thanks; and,

I have the honour to be,
&c. &c. &c.
Canova.

11 (iv) From *Report of the Parliamentary Select Committee on the Earl of Elgin's Collection of Marbles*

In response to Elgin's campaign urging that the government should purchase the Parthenon marbles for the nation, a House of Commons Select Committee was appointed on 15 February 1816 with a brief to take evidence from leading figures in the art world. The hearings began on Thursday 29 February with two days of testimony by the Earl of Elgin. They then continued through the following two weeks, taking evidence from sixteen prominent artists and Members of both Houses of Parliament, and concluding on 18 March with the written testimony of Benjamin West, in his capacity as President of the Royal Academy. We include a passage from the Committee's report, and extracts from the testimonies of Joseph Nollekens (1737–1823), John Flaxman (1755–1826), Richard Westmacott (1775–1856), Thomas Lawrence (1769–1830), Richard Payne Knight (1751–1824) and Benjamin West (1738–1820). Our source is the *Report of the Parliamentary Select Committee on the Earl of Elgin's Collection of Marbles*, London, 1816, pp. 6–7 (from the Report by the Committee's Chairman, Henry Bankes); p. 30 (Nollekens); pp. 31–2 (Flaxman); pp. 34–6 (Westmacott); pp. 37–8 (Lawrence); pp. 39 and 42–3 (Payne Knight); pp. 58–60 (West).

[A]lthough in all matters of Taste there is room for great variety and latitude of opinion, there will be found upon this branch of the subject much more uniformity

and agreement than could have been expected. The testimony of several of the most eminent Artists in this kingdom, who have been examined, rates these Marbles in the very first class of ancient art, some placing them a little above, and others but very little below the Apollo Belvidere, the Laocoon, and the Torso of the Belvidere. They speak of them with admiration and enthusiasm; and notwithstanding the manifold injuries of time and weather, and those mutilations which they have sustained from the fortuitous, or designed injuries of neglect, or mischief, they consider them as among the finest models, and the most exquisite monuments of antiquity. The general current of this portion of the evidence makes no doubt of referring the date of these works to the original building of the Parthenon, and to the designs of Phidias, the dawn of every thing which adorned and ennobled Greece. With this estimation of the excellence of these works it is natural to conclude that they are recommended by the same authorities as highly fit, and admirably adapted to form a school for study, to improve our national taste for the Fine Arts, and to diffuse a more perfect knowledge of them throughout this kingdom. [. . .]

It is surprising to observe in the best of these Marbles in how great a degree the close imitation of Nature is combined with grandeur of Style, while the exact details of the former in no degree detract from the effect and predominance of the latter.

The two finest single figures of this Collection differ materially in this respect from the Apollo Belvidere, which may be selected as the highest and most sublime representation of ideal form, and beauty, which Sculpture has ever embodied, and turned into shape.

Joseph Nollekens, Esquire, R. A. called in, and Examined.

Are you well acquainted with the collection of Marbles brought to England by Lord Elgin? – I am.

What is your opinion of those Marbles, as to the excellency of the work? – They are very fine; the finest things that ever came to this country.

In what class do you place them, as compared with the finest Marbles which you have seen formerly in Italy? – I compare them to the finest of Italy.

Which of those of my Lord Elgin's do you hold in the highest estimation? – I hold the Theseus and the Neptune two of the finest things; finer than any thing in this country.

In what class do you place the bas reliefs? – They are very fine, among the first class of bas relief work.

Do you think that the bas reliefs of the Centaurs are in the first class of art? – I do think so.

Do you think the bas relief of the frieze, representing the Procession, also in the first class of the art? – In the first class of the art. [. . .]

To which of the works you have seen in Italy do you think the Theseus bears the greatest resemblance? – I compare that to the Apollo Belvidere and Laocoon.

Do you think the Theseus of as fine sculpture as the Apollo? – I do.

Do you think it is more or less of ideal beauty than the Apollo? – I cannot say it is more than the Apollo.

Is it as much? – I think it is as much.

Do you think that the Theseus is a closer copy of fine nature than the Apollo? – No; I do not say it is a finer copy of nature than the Apollo.

Is there not a distinction amongst artists, between a close imitation of nature, and ideal beauty? – I look upon them as ideal beauty and closeness of study from nature.

John Flaxman, Esquire, R. A. called in, and Examined.

Are you well acquainted with the Elgin collection of Marbles? – Yes, I have seen them frequently, and I have drawn from them; and I have made such enquiries as I thought necessary concerning them respecting my art.

In what class do you hold them, as compared with the first works of art which you have seen before? – The Elgin Marbles are mostly basso-relievos, and the finest works of art I have seen. Those in the Pope's Museum, and the other galleries of Italy, were the Laocoon, the Apollo Belvidere; and the other most celebrated works of antiquity were groups and statues. These differ in the respect that they are chiefly basso-relievos, and fragments of statuary. With respect to their excellence, they are the most excellent of their kind that I have seen; and I have every reason to believe that they were executed by Phidias, and those employed under him, or the general design of them given by him at the time the Temple was built; as we are informed he was the artist principally employed by Pericles and his principal scholars, mentioned by Pliny, Alcámenes, and about four others immediately under him; to which he adds a catalogue of seven or eight others, who followed in order; and he mentions their succeeding Phidias, in the course of twenty years. I believe they are the works of those artists; and in this respect they are superior almost to any of the works of antiquity, excepting the Laocoon and Toro Farnese; because they are known to have been executed by the artists whose names are recorded by the ancient authors. With respect to the beauty of the basso-relievos, they are as perfect nature as it is possible to put into the compass of the marble in which they are executed, and that of the most elegant kind. There is one statue also which is called a Hercules or Theseus, of the first order of merit. [...]

In what estimation do you hold the Theseus, as compared with the Apollo Belvidere and the Laocoon? – If you would permit me to compare it with a fragment I will mention, I should estimate it before the Torso Belvidere. [...]

Do you think it of great consequence to the progress of art in Britain, that this Collection should become the property of the Public? – Of the greatest importance, I think; and I always have thought so as an individual.

Richard Westmacott, Esquire, R. A. called in, and Examined.

Are you well acquainted with the Elgin Marbles? – Yes.

In what class of art do you rate them? – I rate them of the first class of art.

Do you speak generally of the principal naked figures, and of the metopes and the frieze? – I speak generally of their being good things, but particularly upon three or four groups; I should say that two are unequalled; that I would oppose them to any

thing we know in art, which is the River God and the Theseus. With respect to the two principal groups of the draped figures, I consider them also of their kind very superior to any thing which we have in this Country in point of execution.

Do you reckon the metopes also in the first class of art? – I should say generally, for style, that I do.

Do you say the same of the frieze? – I think, both for drawing and for execution, that they are equal to any thing of that class of art that I remember. [. . .]

In what rate should you place the Theseus and the River God, as compared with the Apollo Belvidere and the Laocoon? – Infinitely superior to the Apollo Belvidere.

And how as to the Laocoon? – As to the Laocoon it is a very difficult thing for me to answer the question, more particularly applying to execution, because there is not so much surface to the Theseus or Ilissus as there is to the Laocoon; the whole surface to the Laocoon is left, whereas to the other we cannot say there is more than one-third of the surface left.

Which do you prefer; the Theseus, or the River God? – They are both so excellent that I cannot readily determine; I should say the back of the Theseus was the finest thing in the world; and that the anatomical skill displayed in front of the Ilissus, is not surpassed by any work of art. [. . .]

Do you think these Marbles are well calculated for forming a school of artists? – I have no doubt of it.

You state, that you think the Theseus much superior to the Apollo Belvidere; upon what particular view do you form that opinion? – Because I consider that the Theseus has all the essence of style with all the truth of nature; the Apollo is more an ideal figure.

And you think the Theseus of superior value, on that account? – Yes; that which approaches nearest to nature, with grand form, Artists give the preference to.

Sir Thomas Lawrence, Knt. R. A. called in, and Examined.

Are you well acquainted with the Elgin Marbles? – Yes, I am.

In what class of art do you consider them? – In the very highest.

Do you think it of importance that the Public should become possessed of those Marbles, for the purpose of forming a school of art? – I think they will be a very essential benefit to the arts of this Country, and therefore of that importance. [. . .]

Have you had opportunities of viewing the antique sculpture which was formerly in Italy, and recently at Paris? – Very recently at Paris.

Can you form any estimate of the comparative merit of the finest of the Elgin Marbles, as compared with the finest of those works of art? – It is rather difficult; but I think that the Elgin Marbles present examples of a higher style of sculpture than any I have seen.

Do you conceive any of them to be of a higher class than the Apollo Belvidere? – I do; because I consider that there is in them an union of fine composition, and very grand form, with a more true and natural expression of the effect of action upon the human frame, than there is in the Apollo, or in any of the other most celebrated statues.

You have stated, that you thought these Marbles had great truth and imitation of nature; do you consider that that adds to their value? – It considerably adds to it, because I consider them as united with grand form. There is in them that variety that is produced in the human form, by the alternate action and repose of the muscles, that strikes one particularly. I have myself a very good collection of the best casts from the antique statues, and was struck with that difference in them, in returning from the Elgin Marbles to my own house.

What do you think of the Theseus, compared with the Torso Belvidere? – I should say that the Torso is the nearest, in point of excellence, to the Theseus. It would be difficult to decide in favour of the Theseus; but there are parts of the Torso in which the muscles are not true to the action, and they invariably are in what remains of the Theseus.

Richard Payne Knight, Esquire, called in, and Examined.

Are you acquainted with the Elgin Collection? – Yes; I have looked them over, not only formerly, but I have looked them over on this occasion, with reference to their value.

In what class of art do you place the finest works in this Collection? – I think of things extant, I should put them in the second rank – some of them: they are very unequal; the finest I should put in the second rank.

Do you think that none of them rank in the first class of art? – Not with the Laocoon and the Apollo, and these which have been placed in the first class of art; at the same time I must observe, that their state of preservation is such I cannot form a very accurate notion; their surface is gone mostly.

Do you consider them to be of a very high antiquity? – We know from the authority of Plutarch, that those of the Temple of Minerva, which are the principal, were executed by Callicrates and Ictinus, and their assistants and scholars; and I think some were added in the time of Hadrian, from the style of them.

Do you consider what is called the Theseus and the River God, as works of that age? – The River God I should think, certainly – of the Theseus I have doubts whether it was in that age or added by Hadrian; there is very little surface about it therefore I cannot tell: the River God is very fine.

Do you consider the River God as the finest figure in the collection? – Yes, I do.

In what class do you rank the fragments of the draped female figures? – They are so mutilated I can hardly tell, but I should think most of them were added by Hadrian; they are so mutilated I cannot say much about them: they are but of little value except from their local interest, from having been part of the Temple. [...]

Have those statues which have lost the surface, suffered materially as models to artists? – Very greatly, I think.

Have you examined minutely the parts that are most perfect in the River God? – Yes; the under parts.

Do not you think that is as highly finished as any piece of sculpture you know? – It is highly finished, but it is differently finished from the first-rate pieces; there are no traces of the chissel upon it; it is finished by polishing. In the Laocoon and the things

of acknowledged first-rate work, supposed to be originals, the remains of the chissel are always visible. That is my reason for calling these of the second-rate. [...]

Do you consider the River God as considerably superior to the Theseus? – Yes, I do.

Then do you consider the Theseus as vastly inferior to the Torso of Belvidere? – I consider it considerably inferior, not vastly inferior; it is difficult to speak to the degrees of things of that kind, especially when the surface is so much corroded. [...]

Have you formed any estimate of the value of these Marbles, wholly unconnected with their value as furniture, and merely in the view of forming a national school for art? – The value I have stated, has been entirely upon that consideration of a school of art; they would not sell as furniture; they would produce nothing at all. [...]

QUESTIONS sent to the President of the Royal Academy, his Health not permitting him to attend the Committee; with his Answers thereto.

1. Are you well acquainted with the Elgin collection?
2. In what class of Art do you rank the best of these Marbles?
3. Which, among the Marbles; do you consider as the most excellent?
4. In what class do you rank the draped female figures? [...]
12. As compared with the Apollo Belvidere, the Torso of the Belvidere, and the Laocoon, how do you estimate the Theseus or Hercules and the River God or Ilissus?
13. Do you consider it of importance to promoting the study and knowledge of the Fine Arts in Great Britain, that this Collection should become public property? [...]
17. Does the close imitation of nature (in your opinion) which is observable in the statues of the Theseus, Ilissus, and some of the best Metopes, take from, or add to their excellence? [...]
30. Can you compare, in money value, Lord Elgin's Marbles, or any part of them, with the money value of the Phygalian, or the Townley collection?

ANSWERS to the foregoing QUESTIONS. [Benjamin West]

1. – I am – having drawn the most distinguished of them, the size of the original Marbles.
2. – In the first of dignified art, brought out of nature upon unerring truths, and not on mechanical principles, to form systematic characters and systematic art.

3. – The Theseus, the Ilissus, the breast and shoulders of the Neptune, and the horse's head.
4. – In the first class of grandeur. [...]
12. – The Apollo of the Belvidere, the Torso, and the Laocoon, are systematic art; the Theseus and the Ilissus stand supreme in Art.
13. – I think them of the highest importance in Art that ever presented itself in this Country, not only for instruction in professional studies, but also to inform the public mind in what is dignified in Art. [...]
17. – The close imitation of nature visible in these Figures, adds an excellence to them which words are incapable of describing, but sensibility feels, and adds to their excellence. [...]
30. – I judge of the Elgin Marbles, from their purity and pre-eminence in art over all others I have ever seen, and from their truth and intellectual power.

11 (v) Benjamin Robert Haydon (1786–1846) from *The Judgement of Connoisseurs upon Works of Art*

Haydon was a history painter whose career was dogged by controversy. A mixture of unpropitious circumstances in the landscape- and portrait-dominated English art world, exacerbated by his own combative personality, led ultimately to failure and suicide. Nonetheless he was a prominent figure in the early years of the nineteenth century and he played a major role in the campaign concerning the Parthenon marbles. He had been deeply impressed by them since he first saw them in 1808, and in his *Autobiography* he left a vivid account of how he 'drew at the marbles ten, fourteen and fifteen hours at a time; staying often till twelve at night, holding a candle and my board in one hand and drawing with the other'. In 1816, during the deliberations of the Parliamentary Committee, he published a pamphlet extolling the virtues of the carvings, and attacking those connoisseurs such as Richard Payne Knight (see VB14 and VIB13) who had doubted their authenticity. The influence of the anatomical teachings of Charles Bell (see VIIA7) may be discerned in Haydon's vigorous argument that the Greek artists' point of departure was naturalistic. Likewise there is a clear sense of the imminent overthrow of what he calls 'the old antique', that is to say, of neo-classicism. Our extracts are taken from *The Judgment of Connoisseurs upon Works of Art compared with that of Professional Men; in reference more particularly to the Elgin Marbles*, London: J. Carpenter & Son, 1816, pp. 3–11.

That the Nobility and higher classes of this country have so little dependence on their own judgment in elevated Art, is principally owing to a defect in their education. In neither University is Painting ever remembered: its relations, its high claims, the conviction that taste is necessary to the accomplishment of a refined character, and to complete the glory of a great country, neither the public tutors of the Nobility, nor the private tutors of the Prince, ever feel themselves, or ever impress upon their

pupils. Thus the educated, the wealthy, and the high-born, grow up and issue out to their respective public duties in the world, deficient in a feeling, the cultivation of which has brightened the glory of the greatest men and most accomplished Princes; but, soon aware of their defects, and soon anxious to supply them, they either fly to that species of art which they can comprehend – the mere imitation of the common objects of our commonest perception; or, if they are desirous to encourage the more refined department, being too proud to consult the artist of genius, they resign their judgment to the gentleman of pretension. – He that is learned in antiquity, and versed in its customs, is believed to be equally learned in nature, and sensible to its beauties. To know one master's touch, and another master's peculiarity; to trace the possessors of a picture as we trace the genealogy of a family; to be alive to an error and insensible to a beauty; are the great proofs of a refined taste and a sound judgment, and are sufficient reasons to induce an amiable nobleman, desirous of protecting art, to listen to his advice and to bow to his authority. In no other profession is the opinion of the man who has studied it for his amusement preferred to that of him who has devoted his soul to excel in it. No man will trust his limb to a connoisseur in surgery. No minister would ask a connoisseur in war how a campaign is to be conducted. No nobleman would be satisfied with the opinion of a connoisseur in law on disputed property. And why should a connoisseur of an art, more exclusively than any other without the reach of common acquirement, be preferred to the professional man? What reason can be given why the painter, the sculptor, and the architect, should not be exclusively believed most adequate to decide on what they best understand, as well as the surgeon, the lawyer, and the general?

I have been roused to these reflections, from fearing that the opinion of Mr. Payne Knight, and other connoisseurs, may influence the estimation of the Elgin Marbles. Surely the Committee will never select this gentleman as one to estimate the beauty of these exquisite works of art! Are they aware of the many mortified feelings with which he must contemplate them? Do they know the death-blow his taste and judgment have received, in consequence of their excellence being universally established? Have they been informed that he at first denied their beauty and originality? And are they so little acquainted with human nature, as to expect from any human being an impartial judgment under such circumstances? – Perhaps they never heard that Mr. Payne Knight at first denied their beauty – then said that they were of the time of Adrian! – then, that they were the work of journeymen, not worthy the name of artists! – and now, being driven from all his surmises, by the proper influence of all artists and men of natural taste, at last hints they *may* be original, but are too much broken to be of any value! Far be it from Mr. Knight to know, that in the most broken fragment the same great principle of life can be proved to exist as in the most perfect figure. Is not life as palpable in the last joint of your forefinger, as in the centre of your heart? – Thus, break off a toe from any fragment of the Elgin Marbles, and *there* I will prove the great consequences of vitality, as it acts externally, to exist. The reasons are these:

All objects, animate and inanimate, in nature, but principally men and brute animals, are the instruments of a sculptor and painter, as influenced by intention or passion acting on feature or form, excited by some interesting object or some powerful event. Man being the principal agent, and his features and form being the

principal vehicle of conveying ideas, the first thing to ascertain is, the great characteristic distinction of man in form and feature as a species, and as an intellectual being, distinguished from brute animals: the next thing, the great causes of his motion, as a machine directed by his will: and the last, what of these causes of motion are excited at any particular passion or intention. We know not how an intention acts by the will on the frame, any more than we know what vitality is; – we only know it by its consequences: and the business of the artist is, to represent the consequences of an idea acting on the form and feature, on the parts which it does influence, and on the parts it does not, so truly, as to excite in the mind of the spectator the exact associations of the feelings intended to be conveyed. The bones are the foundation of the form, and the muscles and tendons the means by which a man moves them, as his passions excite him. Each particular intention or passion will excite a certain number of these means to execute its intentions and express its meanings, and none more or less than are requisite: the rest will remain unexcited. The bones (the things moved) and the muscles (the things moving) are all covered by *skin*, and the mechanism of the art is to express the passion or intention and its consequences by the muscles that are, and those which are not influenced, and to exhibit the true effect of *both*, acting *beneath* and showing *above* the skin that covers them. When the mind is thoroughly informed of the means *beneath* the skin, the eye instantly comprehends the *hint above* it; and when any passion or intention is wanted to be expressed, the means and their consequences, if the artist be deeply qualified, will be as complete in form, and as true in effect, as nature; and the idea represented will be doubly effectual by the perfection of the means of representation. If the character be a god, his character, in feature and in form, must be built on these unalterable principles; for how can we represent a god but by elevating our own qualifications?

These are the principles, then, of the great Greek standard of figure: – first, to select what is peculiarly human in form, feature, and proportion; then, to ascertain the great causes of motion; to remember that the opposite contours of a limb can never be the same from inherent formation; nor of a trunk, if the least inclined from the perpendicular; that the form of a part varies with its action or its repose, and that all action is by the predominance of some of the causes of motion over the others; for, if all were equally to act, the body would be stationary. The peculiar characteristics of intellect and causes of motion, and none more or less, being selected, as external shape depends on internal organization acting on external covering, the forms will be essential. This is the standard of man's figure as a species, and *the principle by which to estimate the period of all the works of antiquity*. The various characters of humanity must be left to the artist's own choice and selection; and an ideal form must never be executed without the curb of *perpetual* and *immediate* reference to nature.

It is this union of nature with ideal beauty, the probabilities and accidents of flesh, bone, and tendon, from extension, flexion, compression, gravitation, action, or repose, that rank at once the Elgin Marbles above all other works of art in the world. The finest form that man ever imagined, or God ever created, must have been formed on this eternal principle. The Elgin Marbles will as completely overthrow the old antique, as ever one system of philosophy overthrew another more enlightened: were they lost, there would be as great a gap in the knowledge of art, as there would have been in philosophy, if Newton had never existed. This is truth, and truth

it can be proved; and let him who doubts it, study them, as I have done, for eight years, daily, and he will doubt it no longer.

11 (vi) William Hazlitt (1778–1830) ‘The Fine Arts’ from Supplement to the *Encyclopaedia Britannica*

Hazlitt had contemplated becoming an artist before turning to a career as a writer. One of the foremost essayists of his time, he wrote over fifty articles and reviews on art. (Two of these can be found in *Art in Theory 1815–1900*, IA9 and IB3.) His antipathy to conceptions of Idealism in art was fuelled alike by his nonconformist education and by his consistent commitment to liberty and to the ideals of the French Revolution. Due to the debate over the Elgin marbles, the issue of the competing claims of Naturalism and the Ideal were very much in the air at the time when Hazlitt composed his essay on ‘Fine Art’ for the new Supplement to the *Encyclopaedia Britannica* in 1816 (subsequently incorporated into the seventh edition of 1830–42). Hazlitt’s article comes down strongly on the side of Naturalism, going so far as to link the vigour of the Greek sculptures to the tradition of the Dutch and Flemish schools and even Hogarth, rather than to neo-classicism. For Hazlitt, the perfection of the Greeks can be attributed to their attention to nature rather than to any supposed turning away from it in favour of an abstract ideal. Our extract is taken from Hazlitt’s text as reprinted in *Painting and the Fine Arts: being the articles under those heads contributed to the seventh edition of the Encyclopaedia Britannica*, by B. R. Haydon and William Hazlitt, Edinburgh: Adam and Charles Black, 1838, pp. 8–12.

The term Fine Arts may be viewed as embracing all those arts in which the powers of imitation or invention are exerted, chiefly with a view to the production of pleasure by the immediate impression which they make on the mind. But the phrase has of late, we think, been restricted to a narrower and more technical signification; namely, to painting, sculpture, engraving, and architecture, which appeal to the eye as the medium of pleasure; and, by way of eminence, to the two first of these arts. In the following observations we shall adopt this limited sense of the term; and shall endeavour to develop the principles upon which the great masters have proceeded, and also to inquire, in a more particular manner, into the state and probable advancement of these arts in this country.

The great works of art at present extant, and which may be regarded as models of perfection in their several kinds, are the Greek statues – the pictures of the celebrated Italian masters – those of the Dutch and Flemish schools – to which we may add the comic productions of our own countryman Hogarth. These all stand unrivalled in the history of art; and they owe their pre-eminence and perfection to one and the same principle, – *the immediate imitation of nature*. This principle predominated equally in the classical forms of the antique and in the grotesque figures of Hogarth: the perfection of art in each arose from the truth and identity of the imitation with the reality; the difference was in the subjects – there was none in the mode of imitation. Yet the advocates for the *ideal system of art* would persuade their disciples, that the difference between Hogarth and the antique does not consist in the different forms of nature which they imitated, but in this, that the one is like and the other unlike nature. This is an error the most detrimental perhaps of all others,

both to the theory and practice of art. As, however, the prejudice is very strong and general, and supported by the highest authority, it will be necessary to go somewhat elaborately into the question in order to produce an impression on the other side.

What has given rise to the common notion of the *ideal*, as something quite distinct from *actual* nature, is probably the perfection of the Greek statues. Not seeing among ourselves any thing to correspond in beauty and grandeur, either with the features or form of the limbs in these exquisite remains of antiquity, it was an obvious, but a superficial conclusion, that they must have been created from the idea existing in the artist's mind, and could not have been copied from any thing existing in nature. The contrary, however, is the fact. The general form, both of the face and figure, which we observe in the old statues, is not an ideal abstraction, is not a fanciful invention of the sculptor, but is as completely local and national (though it happens to be more beautiful) as the figures on a Chinese screen, or a copperplate engraving of a negro chieftain in a book of travels. It will not be denied that there is a difference of physiognomy as well as of complexion in different races of men. The Greek form appears to have been naturally beautiful, and they had, besides, every advantage of climate, of dress, of exercise, and modes of life to improve it. The artist had also every facility afforded him in the study and knowledge of the human form; and their religious and public institutions gave him every encouragement in the prosecution of this art. All these causes contributed to the perfection of these noble productions; but we should be inclined principally to attribute the superior symmetry of form common to the Greek statues, in the first place, to the superior symmetry of the models in nature; and in the second, to the more constant opportunities for studying them. If we allow, also, for the superior genius of the people, we shall not be wrong; but this superiority consisted in their peculiar susceptibility to the impressions of what is beautiful and grand in nature. It may be thought an objection to what has just been said, that the antique figures of animals, &c., are as fine, and proceed on the same principles, as their statues of gods or men. But all that follows from this seems to be, that their art had been perfected in the study of the human form, the test and proof of power and skill; and was then transferred easily to the general imitation of all other objects, according to their true characters, proportions, and appearances. As a confirmation of these remarks, the antique portraits of individuals were often superior even to the personifications of their gods. We think that no unprejudiced spectator of real taste can hesitate for a moment in preferring the head of the Antinous, for example, to that of the Apollo. And in general it may be laid down as a rule, that the most perfect of the antiques are the most simple, – those which affect the least action, or violence of passion, – which repose the most on natural beauty of form, and a certain expression of sweetness and dignity, that is, which remain most nearly in that state in which they could be copied from nature without straining the limbs or features of the individual, or racking the invention of the artist. This tendency of Greek art to repose has indeed been reproached with insipidity by those who had not a true feeling of beauty and sentiment. We, however, prefer these models of habitual grace or internal grandeur to the violent distortions of suffering in the Laocoon, or even to the supercilious air of the Apollo. The Niobe, more than any other antique head, combines truth and beauty with deep passion. But here the

passion is fixed, intense, habitual; – it is not a sudden or violent gesticulation, but a settled mould of features; the grief it expresses is such as might almost turn the human countenance itself *into marble!*

In general, then, we would be understood to maintain, that the beauty and grandeur so much admired in the Greek statues were not a voluntary fiction of the brain of the artist, but existed substantially in the forms from which they were copied, and by which the artist was surrounded. A striking authority in support of these observations, which has in some measure been lately discovered, is to be found in the *Elgin marbles*, taken from the Acropolis at Athens, and supposed to be the works of the celebrated Phidias. The process of fastidious refinement and indefinite abstraction is certainly not visible there.

The figures have all the ease, the simplicity, and variety, of individual nature. Even the details of the subordinate parts, the loose hanging folds in the skin, the veins under the belly or on the sides of the horses, more or less swelled, as the animal is more or less in action, are given with scrupulous exactness. This is true nature and true art. In a word, these invaluable remains of antiquity are precisely like casts taken from life. The *ideal* is not the preference of that which exists only in the mind to that which exists in nature; but the preference of that which is fine in nature to that which is less so. There is nothing fine in art but what is taken almost immediately, and as it were, in the mass, from what is finer in nature. Where there have been the finest models in nature, there have been the finest works of art.

12 Jean-Auguste-Dominique Ingres (1780–1867) from Notebooks and Letters

Ingres was born in Montauban and studied in Toulouse before entering David's studio in Paris in 1797. He worked on the older painter's portrait of *Madame Récamier* (Louvre, Paris), though he was not among the more favoured of his acolytes. Among the resources that helped to direct Ingres' deep engagement with the classical were Winckelmann's writings on Greek art (see IIIA5) and Flaxman's illustrations to Homer and Dante, which were widely circulated in engraved form (see VIIB9). He was awarded a Prix de Rome in 1801, but due to the financial problems of the administration was not able to take it up until five years later. In the interim he received a commission for a portrait of Napoleon from the city of Liège. He finally left for Rome in 1806, pursued by adverse criticism of the portraits he had left on exhibition in the Salon, which included the ambitious *Napoleon I on the Imperial Throne* (Musée de l'Armée, Paris). His submissions to the 1808 and 1810 Salons included the *Valpinçon Bather* (Louvre, Paris) and *Jupiter and Thetis* (Musée Granet, Aix-en-Provence) respectively, but these were no better received. Though Ingres was able to support himself through portrait commissions in Italy, the reaction to his work in Paris may account in part for that occasional need for self-reassurance which is revealed in his early writings. A second reason was the high standard he set himself. He idolized Raphael and seems often to have been so painstaking in his pursuit of the ideal that paintings remained unfinished for decades. His reputation as a history painter was established first in Rome following commissions in 1812–13. After 1815, however, the withdrawal of Napoleonic forces obliged him to turn to new means of support, among them the making of portrait drawings for tourists. After an acquisition from the restoration government, he submitted

to the Salon once again in 1819, only to find his *Grande Odalisque* (Louvre) condemned for the apparent arbitrariness of its anatomy. He was to stay in Italy until 1824, moving in 1820 from Rome to Florence. Ingres made few formal statements on his art, but left written observations in notebooks and other manuscripts. After his death these were transcribed by H. Delaborde and were published, together with surviving correspondence and with statements recorded by pupils, in his *Ingres. Sa vie, ses travaux, sa doctrine, d'après notes, manuscrit et lettres du maître*, Paris: Henri Plon, 1870. Much of this material is undated and was organized by Delaborde under thematic headings. We have selected items which can be directly attributed to the artist and which can be positively identified with the early stages of his career. Delaborde's organization of the material was largely followed by Walter Pach in his *Ingres*, New York and London: Harper & Bros., 1939. Our translations are taken from this source, pp. 144–7, 197. (For later material by Ingres see *Art in Theory 1815–1900*, IIB1 and IIID1.)

When one knows one's craft well, when one has learned well how to imitate nature, the chief consideration for a good painter is to *think out* the whole of his picture, to have it in his head as a whole, so to speak, so that he may then execute it with warmth and as if the entire thing were done at the same time. Then, I believe, everything seems to be felt together. Therein lies the characteristic quality of the great master, and there is the thing that one must acquire by dint of reflecting day and night on one's art, when once one has reached the point of producing. The enormous number of ancient works produced by a single man proves that there comes a moment when an artist of genius has a feeling as if he were being swept along by his own means, when, every day, he does things which he thought he could not do.

It seems to me that I am that man. I am making advances every day; never was work so easy for me, and yet my pictures are by no means scanted: the exact opposite is the truth. I am finishing more than I used to do, but much more rapidly. My nature is such that it is impossible for me ever to do my work in any other than the most conscientious fashion. To do it quickly in order to earn money, that is *quite impossible for me*. (1813)

I went with Paulin to see the *Stanze*. Never had Raphael seemed so beautiful to me, and, more than ever before, I was conscious of the way that divine man stands out above other men. I am convinced that he worked according to the dictates of his genius and that he carried the whole of nature in his head, or rather in his heart. When a man reaches that point, he is like a second Creator.

The *Disputa* and above all the *Mass of Bolsena* appeared before my eyes as marvelous masterpieces. In the latter work, what portraits! And in the other, what beautiful and noble symmetry! one that he has almost always employed, and that gives to his compositions that air which is so grand, so majestic!

In the *Heliodoros*, he placed, according to custom (and it is a beautiful one), the principal groups at the edges, leaving an empty space in the middle.

The folds look as if they wanted to make place for others, so well do they imitate nature and movement.

I should need a book, volumes, to dwell upon the qualities of Raphael and upon his incomparable inventions: but I will say that the frescoes of the Vatican are, by

themselves, of far more value than all the picture galleries put together. That beautiful museum is so varied, the man who made it touched so well all the strings, so well imitated the suppleness of nature in the very diversity of his effects! And all of that was painted by Raphael from drawings!

And so let us go on, and strive to imitate him, to understand him; I am, myself, in the unhappy position of having to regret, throughout my life, that I was not born in his century. When I think that, three hundred years earlier, I might actually have become his disciple! (1814)

As regards the arts, I am what I have always been. Age and reflection have, I hope, rendered my taste more certain without lessening its warmth. My adorations are still Raphael, his century, the ancients, and above all the divine Greeks; in music, Gluck, Mozart, Haydn. My library is composed of some twenty volumes, immortal masterpieces – you can well guess which ones; and, with those things, life has many charms. (1818)

To brave everything with courage, never to work save with the idea of pleasing first one's conscience, then a small number of other persons: there is the duty of an artist; for art is not merely a profession, it is also an apostleship. All such courageous effort has its recompense, sooner or later. I shall have mine. After so many days of shadow, the light will come. (1820)

To live with moderation, to limit one's desires and think oneself happy is to be so in reality. To be neither rich nor poor is a blessed state. It is the best of conditions in which to live. Luxury corrupts the virtues of the heart, for the unhappy truth is that the more one has the more one wants to have, and the less one thinks to have. Without the stupid dissipations of what is called society, one lives with a small number of friends whom one has gained through inclination and experience; one practices the arts with delight; literature and the study of mankind may occupy you at any hour and render you different from the crowd. The sources of such enjoyment are inexhaustible. Here then, in my opinion, you see the happy man, the true sage, true philosophy. (1821)

Down to the present time (April 20th, 1821), I have produced a good many works at least as good as those of others, and perhaps, indeed, directed toward a better goal: but never has the desire for gain caused me to be hasty in the way I have produced my pictures, which are conceived and executed in a spirit that is foreign to the modern spirit; for after all, in the eyes of my enemies, the greatest defect of my works is that they do not sufficiently resemble their own work. I do not know whether they or I will turn out to be right in the end; the matter is not yet judged: it is necessary to await the slow but equitable decision of posterity. In any case, I am willing to have it known that for a long time my work has recognized no other discipline than that of the ancients, of the great masters of that century of glorious memory when Raphael laid out the eternal and incontestable boundaries of the sublime in art. I think I have proved in my pictures that my sole ambition is to resemble them, and to continue art by taking it up at the point where they left it.

I am therefore a conservator of the good doctrines, and not an innovator. Neither am I, as my detractors claim, a servile imitator of the schools of the fourteenth and fifteenth centuries, though I know how to make use of them with more of results than they can see. Virgil could find pearls in the manure of Ennius. Yes, even should I be accused of fanaticism for Raphael and his century, I shall never have any modesty except as concerns nature and as concerns their masterpieces. (1821)

I count very much on my old age: it will avenge me. (1821)

It must not be thought that the exclusive love which I have for this painter (Raphael) causes me to ape him: that would be a difficult thing, or rather, an impossible thing. I think I shall know how to be original even when imitating. Look: who is there, among the great men, who has not imitated? Nothing is made with nothing, and the way good inventions are made is to familiarize yourself with those of others. The men who cultivate letters and the arts are all sons of Homer. (1821)

If nature has endowed me with any intelligence, my effort is to penetrate more deeply to the truth, through study of every kind; and if I feel that I sometimes make a few steps ahead, it is precisely because I see *that I know nothing*. Yes, since the moment when I first came to feel what grandeur and perfection are, I find myself admitted to an advantage which may well bring one to despair: that of measuring the extent of these qualities. I destroy more than I produce and I am too slow in arriving at a combination of the results of beauty, for I am above all a lover of the true, and see the beautiful only in the true, the quality which has produced the beauty of Homer and of Raphael.

Add to that the ignorance and the stupidity of the public and you see that I have enough occupation to fill up every moment of my time and to give me sleepless nights. In reality, all this trouble and labor resemble the delightful suffering of lovers, or rather the courageous and tender suffering of motherhood. A success, a bit of acclaim, above all a conscience that has been more or less satisfied – and one resumes one's beloved pain. (1821)

13 Richard Payne Knight (1751–1824) from *An Inquiry into the Symbolical Language of Ancient Art and Mythology*

In 1781 Knight was elected to the Society of Dilettanti. In 1786 his *An Account of the Remains of the Worship of Priapus* was published privately by the society, accompanying a letter from Sir William Hamilton asserting that phallic worship survived in Christian ceremonies in Sicily. The *Account* was based in part on a work in French by the Baron d'Hancarville, published the previous year, which attempted a systematic account of the symbolic language of ancient Greek art. Knight's work was widely regarded as obscene and anti-religious. The *Inquiry* was written as a preface to the second of two illustrated volumes of *Specimens of Ancient Sculpture*, on which Knight worked with his friend Charles Townley, a supporter of d'Hancarville's ideas and a major collector of classical sculpture. In the event, though the first volume of the *Specimens* had been published in 1809 (by the Society of Dilettanti), the second was delayed until 1835 through lack of funds, and it was

decided to issue the *Inquiry* separately in advance. Continuing the quasi-anthropological project established by d'Hancarville and by Knight's own *Worship of Priapus*, the *Inquiry* investigates the genetic character of symbols and the patterns of their occurrence in different cultures. Knight drew upon considerable reading, in classical authors, in accounts by travellers, and in previous forms of early anthropology (his copious footnotes and citations have been excluded from our excerpts). He also drew upon his own resources as a collector. On his death he left 5,205 coins, 111 gems, 800 bronzes and a large number of drawings and prints to the British Museum. In the breadth of his curiosity about the myths, practices and artefacts of human cultures, and in his treatment of Christianity as one religion among many, Knight continued the intellectual commitments of the Enlightenment. The *Inquiry* also gathered copious material on human symbolism and mythology which was later to be mined by the anthropologist James Frazer, author of *The Golden Bough* (1890, revised edition 1911–15), and by the psychoanalysts Sigmund Freud and Carl Jung. Our excerpts are taken from the original edition of 1818, published in London by the Society of Dilettanti, pp. 7–8, 12–18, 93–6. The passages in square brackets are transcriptions from Knight's own marginal additions in the copy held in the British Library.

12. The art of conveying ideas to the sight has passed through four different stages in its progress to perfection. In the first, the objects and events meant to be signified, were simply represented: in the second, some particular characteristic quality of the individual was employed to express a general quality or abstract idea; as a horse for swiftness, a dog for vigilance, or a hare for fecundity: in the third, signs of convention were contrived to represent ideas; as is now practised by the Chinese: and, in the fourth, similar signs of convention were adopted to represent the different modifications of tone in the voice; and its various divisions, by articulation, into distinct portions or syllables. This is what we call alphabetic writing; which is much more clear and simple than any other; the modifications of tone by the organs of the mouth, being much less various, and more distinct, than the modifications of ideas by the operations of the mind. The second, however, which, from its use among the Ægyptians, has been denominated the hieroglyphical mode of writing, was every where employed to convey or conceal the dogmas of religion; and we shall find that the same symbols were employed to express the same ideas in almost every country of the northern hemisphere.

13. In examining these symbols in the remains of ancient art, which have escaped the barbarism and bigotry of the middle ages, we may sometimes find it difficult to distinguish between those compositions which are mere efforts of taste and fancy, and those which were emblems of what were thought divine truths; but, nevertheless, this difficulty is not so great, as it, at first view, appears to be: for there is such an obvious analogy and connection between the different emblematical monuments, not only of the same, but of different and remote countries, that, when properly arranged, and brought under one point of view, they, in a great degree, explain themselves by mutually explaining each other. There is one class, too, the most numerous and important of all, which must have been designed and executed under the sanction of public authority; and therefore whatever meaning they contain, must have been the meaning of nations, and not the caprice of individuals.

14. This is the class of coins, the devices upon which were always held so strictly sacred, that the most proud and powerful monarchs never ventured to put their portraits upon them until the practice of deifying sovereigns had enrolled them among the gods.

* * *

17. By opening the tombs, which the ancients held sacred, and exploring the foundations of ruined cities, where money was concealed, modern cabinets have been enriched with more complete serieses of coins than could have been collected in any period of antiquity. We can thus bring under one point of view the whole progress of the art from its infancy to its decline, and compare the various religious symbols which have been employed in ages and countries remote from each other. These symbols have the great advantage over those preserved in other branches of sculpture, that they have never been mutilated or restored; and also that they exhibit two compositions together, one on each side of the coin, which mutually serve to explain each other, and thus enable us to read the symbolical or mystical writing with more certainty than we are enabled to do in any other monuments. It is principally, therefore, under their guidance that we shall endeavour to explore the vast and confused labyrinths of poetical and allegorical fable; and to separate as accurately as we can, the theology from the mythology of the ancients: by which means alone we can obtain a competent knowledge of the mystic, or, as it was otherwise called, the Orphic faith, and explain the general style and language of symbolical art in which it was conveyed.

18. Ceres and Bacchus, called, in Ægypt, Isis and Osiris; and, in Syria, Venus and Adonis, were the deities, in whose names, and under whose protection, persons were most commonly instructed in this faith.

* * *

21. General tradition has attributed the introduction of the mystic religion into Greece, to Orpheus, a Thracian; who, if he ever lived at all, lived probably about the same time with Melampus, or a little earlier. The traditions concerning him are, however, extremely vague and uncertain; and the most learned and sagacious of the Greeks is said to have denied that such a person had ever existed: but, nevertheless, we learn from the very high authority of Strabo that the Greek music was all Thracian or Asiatic; and, from the unquestionable testimony of the Iliad, that the very ancient poet Thamyris was of that country; to which tradition has also attributed the other old sacerdotal bards, Musæus and Eumolpus.

22. As there is no mention, however, of any of the mystic deities; nor of any of the rites with which they were worshipped, in any of the genuine parts either of the Iliad or Odyssey, nor any trace of the symbolical style in any of the works of art described in them; nor of allegory or enigma in the fables, which adorn them; we may fairly presume that both the rites of initiation and the worship of Bacchus, are of a later period, and were not generally known to the Greeks till after the composition of

those poems. The Orphic hymns, too, which appear to have been invocations or litanies used in the mysteries, are proved, both by the language and the matter, to be of a date long subsequent to the Homeric times; there being in all of them abbreviations and modes of speech not then known; and the form of worshipping or glorifying the deity by repeating adulatory titles not being then in use, though afterwards common.

23. In Ægypt, nevertheless, and all over Asia, the mystic and symbolical worship appears to have been of immemorial antiquity. The women of the former country carried images of Osiris, in their sacred processions, with a moveable phallus of disproportionate magnitude, the reason for which Herodotus does not think proper to relate, because it belonged to the mystic religion. Diodorus Siculus, however, who lived in a more communicative age, informs us that it signified the generative attribute, and Plutarch that the Ægyptian statues of Osiris had the phallus to signify his procreative and prolific power; the extension of which through the three elements of air, earth, and water, they expressed by another kind of statue, which was occasionally carried in procession, having a triple symbol of the same attribute. The Greeks usually represented the phallus alone, as a distinct symbol, the meaning of which seems to have been among the last discoveries revealed to the initiated. It was the same, in emblematical writing, as the Orphic epithet ΠΑΓΓΕΝΕΤΩΡ, *universal generator*; in which sense it is still employed by the Hindoos. It has also been observed among the idols of the native Americans, and ancient Scandinavians, nor do we think the conjecture of an ingenious writer improbable, who supposes that the may-pole was a symbol of the same meaning; and the first of May a great phallic festival both among the ancient Britons and Hindoos; it being still celebrated with nearly the same rites in both countries. The Greeks changed, as usual, the personified attribute into a distinct deity called Priapus, whose universality was, however, acknowledged to the latest periods of heathenism.

24. In this universal character, he is celebrated by the Greek poets under the title of Love or Attraction, the first principle of animation; the father of gods and men; and the regulator and disposer of all things. He is said to *pervade the universe with the motion of his wings, bringing pure light: and thence to be called the splendid, the self-illuminated, the ruling Priapus*; light being considered, in this primitive philosophy, as the great nutritive principle of all things. Wings are attributed to him as the emblems of spontaneous motion; and he is said to have sprung from the egg of night, because the egg was the ancient symbol of organic matter in its inert state; or, as Plutarch calls it, the material of generation, containing the seeds and germs of life and motion without being actually possessed of either. It was, therefore, carried in procession at the celebration of the mysteries, for which reason, Plutarch, in the passage above cited, declines entering into a more particular disquisition concerning its nature; the Platonic Interlocutor, in the Dialogue, observing, that though *a small question, it comprehended a very great one, concerning the generation of the world itself, known to those who understood the Orphic and sacred language; the egg being consecrated, in the Bacchic mysteries, as the image of that, which generated and contained all things in itself.*

25. As organic substance was represented by the symbol of the egg; so the principle of life, by which it was called into action, was represented by that of the serpent; which having the property of casting its skin, and apparently renewing its youth, was naturally adopted for that purpose. We sometimes find it coiled round the egg, to express the incubation of the vital spirit; and it is not only the constant attendant upon the guardian deities of health, but occasionally employed as an accessory symbol to almost every other god, to signify the general attribute of immortality. For this reason it served as a general sign of consecration; and not only the deified heroes of the Greeks, such as Cecrops and Erichthonius, but the virgin Mother of the Scythians, and the consecrated Founder of the Japanese, were represented terminating in serpents. Both the Scythians and Parthians, too, carried the image of a serpent or dragon, upon the point of a spear, for their military standard; as the Tartar princes of China still continue to do; whence we find this figure perpetually represented on their stuffs and porcelaine, as well as upon those of the Japanese. The inhabitants of Norway and Sweden continued to pay divine honors to serpents down to the sixteenth century; and almost all the Runic inscriptions, found upon tombs, are engraved upon the sculptured forms of them; the emblems of that immortality, to which the deceased were thus consecrated. Macha Alla, the god of life and death among the Tartars, has serpents entwined round his limbs and body to express the first attribute, and human skulls and scalps on his head, and at his girdle, to express the second. The jugglers and divines also, of North America, make themselves girdles and chaplets of serpents, which they have the art to tame and familiarise; and, in the great temple of Mexico, the captives taken in war, and sacrificed to the sun, had each a wooden collar in the shape of a serpent put round his neck while the priest performed the horrid rites. In the kingdom of Juuda, about the fourth degree of latitude, on the western coast of Africa, one of these reptiles was lately, and perhaps is still, worshipped as the symbol of the Deity; and when Alexander entered India, Taxilus, a powerful prince of the country, showed him a serpent of enormous size, which he nourished with great care, and revered as the image of the god, whom the Greek writers, from the similitude of his attributes, call Dionysus or Bacchus. The Epidaurians kept one in the same manner to represent Æsculapius; as did likewise the Athenians, in their celebrated temple of Minerva, to signify the guardian or preserving deity of the Acropolis. The Hindoo women still carry the lingam, or consecrated symbol of the generative attribute of the Deity, in solemn procession between two serpents; and, in the sacred casket, which held the egg and phallus in the mystic processions of the Greeks, was also a serpent. Over the porticoes of all the ancient Ægyptian temples, the winged disc of the sun is placed between two hooded snakes, signifying that luminary placed between its two great attributes of motion and life. The same combination of symbols, to express the same attributes, is observable upon the coins of the Phœnicians and Carthaginians; and appears to have been anciently employed by the Druids of Britain and Gaul, as it still is by the idolaters of China. The Scandinavian goddess Isa or Disa was sometimes represented between two serpents; and a similar mode of canonization is employed in the apotheosis of Cleopatra, as expressed on her coins. Water-snakes, too, are held sacred among the inhabitants of the Friendly Islands; and, in the mysteries of Jupiter Sebazius, the initiated were consecrated by having a snake put down their bosoms.

120. The allegorical tales of the loves and misfortunes of Isis and Osiris are an exact counterpart of those of Venus and Adonis; which signify the alternate exertion of the generative and destructive attributes. Adonis or Adonai was an oriental title of the Sun, signifying Lord; and the boar, supposed to have killed him, was the emblem of Winter; during which the productive powers of nature being suspended, Venus was said to lament the loss of Adonis until he was again restored to life: whence both the Syrian and Argive women annually mourned his death, and celebrated his resurrection; and the mysteries of Venus and Adonis at Byblus in Syria were held in similar estimation with those of Ceres and Bacchus at Eleusis, and Isis and Osiris in Ægypt. Adonis was said to pass six months with Proserpine, and six with Venus; whence, some learned persons have conjectured that the allegory was invented near the pole: where the sun disappears during so long a time: but it may signify merely the decrease and increase of the productive powers of nature as the sun retires and advances. The Vistnoo or Jaggernaut of the Hindoos is equally said to lie in a dormant state during the four rainy months of that climate: and the Osiris of the Ægyptians was supposed to be dead or absent forty days in each year, during which the people lamented his loss, as the Syrians did that of Adonis, and the Scandinavians that of Frey; though at Upsal, the great metropolis of their worship, the sun never continues any one day entirely below the horizon. The story of the Phœnix; or, as that fabulous bird was called in the north, of the Fanina, appears to have been an allegory of the same kind, as was also the Phrygian tale concerning Cybelè and Attis; though variously distinguished by the fictions of poets and mythographers.

121. On some of the very ancient Greek coins of Acanthus in Macedonia we find a lion killing a boar; and in other monuments a dead boar appears carried in solemn procession; by both which was probably meant the triumph of Adonis in the destruction of his enemy at the return of spring. A young pig was also the victim offered preparatory to initiation into the Eleusinian mysteries, which seems to have been intended to express a similar compliment to the Sun. The Phrygian Attis, like the Syrian Adonis, was fabled to have been killed by a boar; or, according to another tradition, by Mars in the shape of that animal; and his death and resurrection were annually celebrated in the same manner. The beauty of his person, and the style of his dress, caused his statues to be confounded with those of Paris, who appears also to have been canonised; and it is probable that a symbolical composition representing him in the act of fructifying nature, attended by Power and Wisdom, gave rise to the story of the Trojan prince's adjudging the prize of beauty between the three contending goddesses; a story, which appears to have been wholly unknown to the ancient poets, who have celebrated the events of the war supposed to have arisen from it. The fable of Ganymede, the cup-bearer of Jupiter, seems to have arisen from some symbolical composition of the same kind, at first misunderstood, and afterwards misrepresented in poetical fiction: for the lines in the Iliad alluding to it, are, as before observed, spurious; and according to Pindar, the most orthodox perhaps of all the poets, Ganymede was not the son of [a Trojan King], but a mighty genius or deity who regulated or caused the overflowings of the Nile by the motion of his feet. His being, therefore, the cup-bearer of Jupiter means no more than that

he was the distributor of the waters between heaven and earth, and consequently a distinct personification of that attribute of the supreme God, which is otherwise signified by the epithet *Pluvius*. Hence he is only another modification of the same personification, as *Attis*, *Adonis*, and *Bacchus*; who are all occasionally represented holding the cup or *patera*; which is also given, with the *cornucopiæ*, to their subordinate emanations, the local *genii*; of which many small figures in brass are extant.

122. In the poetical tales of the ancient Scandinavians, *Frey*, the deity of the Sun, was fabled to have been killed by a boar; which was therefore annually offered to him at the great feast of *Juul*, celebrated during the winter solstice? Boars of paste were also served on their tables during that feast; which, being kept till the following spring, were then beaten to pieces and mixed with the seeds to be sown, and with the food of the cattle and hinds employed in tilling the ground. Among the *Ægyptians* likewise, those who could not afford to sacrifice real pigs, had images of them in paste served up at the feasts of *Bacchus* or *Osiris*; which seem, like the feasts of *Adonis* in *Syria*, and the *Juul* in *Sweden*, to have been expiatory solemnities meant to honor and conciliate the productive power of the Sun by the symbolical destruction of the adverse or inert power. From an ancient fragment preserved by *Plutarch*, it seems that *Mars*, considered as the destroyer, was represented by a boar among the *Greeks*; and on coins we find him wearing the boar's, as *Hercules* wears the lion's skin; in both of which instances the old animal symbol is humanised, as almost all the animal symbols gradually were by the refinement of *Grecian* art. [The ceremony of serving up a decorated Boar's Head on Christmas day, not yet quite extinct, is a Relick of the same symbolical superstition.]

* * *

229. This triform division of the personified attributes or modes of action of one first cause, seems to have been the first departure from simple theism, and the foundation of religious mythology in every part of the earth. To trace its origin to patriarchal traditions, or seek for it in the philosophy of any particular people, will only lead to frivolous conjecture, or to fraud and forgery; which have been abundantly employed upon this subject: nor has repeated detection and exposure either damped the ardor or abashed the effrontery of those, who still find them convenient to support their theories and opinions. Its real source is in the human mind itself; whose feeble and inadequate attempts to form an idea of one universal first cause would naturally end in generalising and classing the particular ideas derived from the senses, and thus forming distinct, though indefinite notions of certain attributes or modes of action; of which the generic divisions are universally three; such as goodness, wisdom, and power; creation, preservation, and destruction; potential, instrumental, and efficient, &c. &c. Hence almost every nation of the world, that has deviated from the rude simplicity of primitive Theism, has had its Trinity in Unity; which, when not limited and ascertained by divine revelation, branched out, by the natural subdivision of collective and indefinite ideas, into the endless and intricate personifications of particular subordinate attributes, which have afforded such abundant materials for the elegant fictions both of poetry and art.

230. The similitude of these allegorical and symbolical fictions with each other, in every part of the world, is no proof of their having been derived, any more than the primitive notions which they signify, from any one particular people; for as the organs of sense and the principles of intellect are the same in all mankind, they would all naturally form similar ideas from similar objects; and employ similar signs to express them, so long as natural and not conventional signs were used. Wolves, lions, and panthers, are equally beasts of prey in all countries; and would naturally be employed as symbols of destruction, wherever they were known: nor would the bull and cow be less obvious emblems of creative force and nutrition; when it was found that the one might be employed in tilling the earth, and the other in constantly supplying the most salubrious and nutritious of food. The characteristic qualities of the egg, the serpent, the goat, &c. are no less obvious; and as observation would naturally become more extensive, as intellect became more active, new symbols would everywhere be adopted, and new combinations of them be invented in proportion as they were wanted.

Bibliography

This bibliography combines the following types of reference in one alphabetical listing, with cross-references where appropriate.

1 Sources for all those texts which are printed and excerpted in the anthology, with dates of original publication given in brackets, where these are different. Texts are listed by author. The editorial prefaces to the individual anthologized texts should be consulted for more detailed references to original occasions of publication.

2 Collections of theoretical and critical materials in which these and related texts may be found, by artist/author, or by editor for compilations from more than one artist/author.

3 Sources for relevant authors and texts not themselves included in the anthology, but referred to or quoted within either editorial matter or anthologized texts.

4 Some further sources for material from the period 1648 to 1815 of relevance to concerns addressed in the anthology.

5 Studies of the art, art theory and criticism of the period which the editors have found of particular value in the selection and tracing of texts.

Zuccarelli, Francesco 1094

Zuccaro, Frederico 32, 261

Edited by
Charles Harrison, Paul Wood
and Jason Gaiger

"All three of these books are essential additions to any public or private library concerned with Art ... They provide a superb first entry point to an otherwise bewildering array of publications concerned with the theory of art. Rather like a jigsaw puzzle they encourage the reader to make the connections that will complete the picture. But more importantly, what each of these anthologies does brilliantly is to tempt the relative novice to go further with their research. Through the erudite selection of sensitively edited primary texts, the reader is subtly invited to seek out the originals and flesh out their understanding. For those who are more experienced in the field they cleverly provide a means of prompting new ideas within the reader's field of enquiry."
