Acknowledgements

In the task of selecting, tracing and compiling material for this anthology we have benefited greatly both from the work of those who have written on the art of the period, and from the advice and assistance of friends and colleagues at the Open University and elsewhere. Among those who have been particularly helpful are Robert Anderson, Emma Barker, Jay Bernstein, Jeroen Boomgaard, Michael Charlesworth, Anthony J. Coulson, Thomas Crow, Jo Dahn, Katerina Deligiorgi, Steve Edwards, Trish Evans, Michael Fried, Andrew Hemingway, Gillian Perry, Michael Rosenthal, Nicholas Walker, Linda Walsh, Roberta Wood and Hester Ysseling. We are grateful to Joel Snyder for research facilities provided for Charles Harrison at the University of Chicago, and to Katherine Long for help in tracing material there.

We have benefited greatly from the commitment of those who have translated material for this volume: Katerina Deligiorgi, Susan Halstead, Akane Kawakami, Christopher Miller, Jonathan Murphy, Nicholas Walker and Hester Ysseling.

Our thanks go to those copyright-holders who have given permission where we have needed to reproduce modern translations or edited versions of texts. We are also grateful to the Leverhulme Trust for the initial funding of Jason Gaiger's Research Fellowship at the Open University, and for the Research Committee of the University's Faculty of Arts for continuing to support the Fellowship through the period of production of the present volume. At Blackwell Publishers, Senior Commissioning Editor Andrew McNeillie responded positively to our proposal for a two-volume survey of the art theory of the early modern period, to accompany *Art in Theory 1900–1990*, originally published in 1992. Jackie Newman was responsible for tracing copyright-holders and for securing permissions. We would also like to record our gratitude to Jane Robertson, formerly of Blackwell Publishers, who guided the earliest stages of our work on the *Art in Theory* project.

J. G., C. H., P. W.

A Note on the Presentation and Editing of Texts

Where a published document was originally given a title, this has generally been used for the present publication, in single quotation marks. Titles of books are given in italics. Where a specific subtitled section of a document has been taken, this subtitle is used for the extract. The title of the whole work is then given in the introduction to that text. In the absence of original published titles we have given descriptive headings without quotation marks. The term 'from' preceding a title signifies that we have taken a specific extract or extracts from a longer text, without seeking to represent the argument of the whole. Otherwise texts are given in their entirety or are edited so as to indicate the argument of the whole.

It is the aim of this anthology that it should be wide-ranging. We have therefore preferred the course of including a greater number of texts, of which several must appear in abbreviated form, to the course of presenting a small number in their entirety. Texts have been variously edited to shorten them, to eliminate references which cannot be explained within the space available, and where necessary to preserve the flow of argument. We have provided information as to the sources for complete versions of all edited texts. We have also clearly marked where texts have been edited.

The following conventions have been used throughout. Points of suspension '...' are used to denote the omission of words or phrases within a sentence. Suspended points within square brackets '[...]' are used to denote omissions extending from a complete sentence to a paragraph or several short paragraphs. Asterisks '* * *' denote substantial omissions of more than one paragraph, and may denote exclusion of a complete subdivision of the original text. It should be noted that a paragraph may end thus [...], either if the last sentence of that paragraph is omitted or if the following paragraph is omitted. A paragraph may also start thus [...] if one or more sentences at the beginning of that paragraph have been omitted, or if a previous paragraph has been omitted.

Notes and references have only been included where we judged them necessary to the text as printed. We have generally avoided the insertion of editorial footnotes, but have supplied essential references in the introductions to individual texts.

We have corrected typographical errors and errors of transcription where we have discovered them in the anthologized texts, but otherwise we have left idiosyncrasies of punctuation, spelling and style unchanged.

General Introduction

The aim of this book is to provide students of art, art history and aesthetics, as well as the interested general reader, with a substantial and representative collection of texts, drawn from a wide variety of sources from the mid-seventeenth century to the early nineteenth. As the third of a series, this volume completes a long project begun with *Art in Theory 1900–2000* (new edition) and continued with *Art in Theory 1815–1900*. The result is a comprehensive overview of the art theory of a broadly defined modern period. *Art in Theory 1648–1815* is similar to its two companion volumes both in extent and in the principles of selection and organization employed. It continues our enterprise to improve access to the written materials associated with the development of art, both by rendering a broad selection more generally available for study and by providing information about original editions and about relevant complementary publications. While we have included those texts that are deservedly canonical, we have also aimed to improve understanding of the range and diversity of artistic theory during the period surveyed. Many of the relevant documents are difficult to trace without the resources of a specialized library, and several documents are reprinted here for the first time in a century or more. There are also many important texts that have not previously been published in English. The present volume includes original translations of material from French, German, Italian, Dutch and Latin sources, amounting to approximately a third of the contents.

The Extent of the Modern

Art in Theory 1900–2000 was motivated by the need for an up-to-date anthology of twentieth-century documents at a time when the end of the modern was being widely announced. When we originally undertook to compile it, we had no plans for further publications. A provisional proposal for a single additional volume was developed in response to two complementary promptings. One was the warm welcome extended to our first publication. The other was a growing conviction that most proclamations of the demise of the modern entailed unexamined assumptions about its historical character and its duration. If these assumptions were to be adequately reviewed, it would be necessary to consider relevant material from well before the beginning of the twentieth century. Accordingly, we envisaged a companion

volume extending back from the close of the nineteenth century to the last decades of the eighteenth, which is as early as modern art historians have generally been wont to look.

We aimed to preface this volume with a short selection of documents from the previous hundred years or so. These were to represent the practical and theoretical materials from which the modern had emerged. Two mutually reinforcing factors led us to revise this plan, however. It turned out to be very difficult to restrict the extent of the proposed preliminary section. And we found ourselves faced with an extraordinary wealth of potentially relevant material from the late eighteenth and nineteenth centuries, much of it now difficult of access or as yet untranslated into English. It seemed that if we were properly to trace the theoretical development of the modern in art, we would need to accord due proportional weight to its earlier phases. We were also obliged to recognize that the artistic culture of the modern had had a longer and a richer life than we had at first believed. Taken together, these factors led us to conclude that we should consider not one but two new volumes to cover the earlier period.

Art in Theory 1815–1900 was accordingly published in 1998, representing a first division of material from this extended period. The present volume, covering the earlier phase, was from the start planned to follow as its complement. The end of the Napoleonic Wars provides as convenient a point of termination for our present period as it did previously for a commencement. In general and in the long term, the settlements that followed the battle of Waterloo were such as either to enable or to recognize government in the interests of the capitalist middle class, at a time when the powers of that class were sustained and increased among the countries of the West by the spread of industrialization. But as we acknowledged in our previous volume, an account of the modern that *starts* circa 1815 assumes a connection between the emergence of the bourgeoisie and the development of artistic modernism that must have its roots in the previous century. Other relevant issues are also left in need of examination, not least those which concern the identification of modernism with the currency of the Enlightenment project. If we were not to begin at some arbitrarily chosen date, it seemed that we could fix no *later* starting-point for the entire *Art in Theory* project as a whole than the middle of the seventeenth century. Accordingly we have taken as our marker for the commencement of the present volume that critical twelve-month period which brought the foundation of the French Academy in 1648 into a near coincidence with the end of the Thirty Years War, the achievement of independence by the Dutch Republic, and the execution of the English king.

Some of our texts pre-date 1648 by a few years. But we feel that all of these have something to contribute to the picture we are presenting. Thus, to take an example, while Franciscus Junius' *The Painting of the Ancients* first appeared a decade before the foundation of the Academy, we have felt able to include extracts because the text offers an unparalleled summation of the state of knowledge of the art of Antiquity. The legacy of Antiquity was itself of unparalleled significance for debates about the way forward to an adequately 'modern' seventeenth-century art. The materials of history do not fit into clean compartments. That said, whatever the actual dates of a few of our anthologized texts, our conceptual starting-point is the foundation of the

French Academy; just as our conceptual finishing point for this first phase of the art theory of the modern period is the end of the Napoleonic Wars.

We anticipate some deprecatory comment from those already well-versed in the art and art theory of the seventeenth and eighteenth centuries, along the lines that it takes an ignorant modernist to be surprised by the wealth of material from earlier periods. We are happy to acknowledge that we have been engaged in an absorbing process of self-education. However, it is of the essence of that process, and of the *Art in Theory* project as a whole, that we have worked with the idea of a modern art always in mind. We have been at least as concerned to enrich our readers' understanding of the present as to provide adequate reference material for the study of earlier periods. Overall, our aim has been to deepen the historical ground from which significant issues can be seen to have emerged, and to enlarge the problem-field on which evaluative judgements are made.

We remain aware of the dangers of anachronism. Yet while our selection of texts has never been entirely determined by considerations of their relevance to subsequent practice, we have felt it legitimate in our editorial matter to draw attention to features of historical debates which were to become significant for the work of later writers and artists. Again, we offer an example. There is nothing particularly modern, let alone 'modernist', about the recipes for making a painting published by the Spaniards Pacheco and Hidalgo. Yet they offer a fascinating glimpse into the sheer physical business of art-making: an aspect of art which tended to be sidelined at the time, the better to defend the case for painting as a liberal – and hence gentlemanly – pursuit; an aspect which it remains important to stress now, even if the material in question is video-tape rather than pigeon-droppings. We have always been less concerned to dig up the past for its own sake than to present an interesting archaeology of the modern. After all, if 300-year-old art theory is not of *some* relevance to our concerns in the here and now, it must appear a prime candidate for being consigned to what Marx called 'the gnawing criticism of the mice'.

One clear advantage in commencing a study of the modern with the theoretical writings of the mid-seventeenth century is that it serves to remind us how deeply the very concept of the modern is implicated in a contrast with the ancient. It thus becomes easier to understand why the classical should for so long have retained its powerful fascination, both as a positive repository of authority and as a negative image of resistance to change. The classical heritage received its first wholesale rebuff from the Romantic generation at the turn into the nineteenth century. Thereafter, the avant-garde tended to set its concern with modernity against a sense of the classical-as-moribund. But by the end of the century, avant-gardists such as Cézanne were re-engaging with the classical precisely as a way of advancing their modernism. So it continued into the twentieth century, with figures as different as Jeanneret (Le Corbusier) and De Chirico explicitly drawing on the legacy of the past, while others such as Marinetti were still sufficiently exercised by Antiquity to want to smash it to bits. Even in the allegedly post-modern period it is not unusual to find artists drawing in various ways on the imagery and narratives of Classicism, particularly in countries such as Italy which possess a deeply rooted classical tradition.

It is also significant that while the Academies served to maintain the prestige of classical art and culture, they also acted to focus debate about the different

requirements of the modern. While they generally paid due respect both to the heritage of Christian art and to the authority of the established Churches, the Academies were also fundamentally secular institutions, within which religious subjects generally had to jostle for a place along with the rest. We are reminded that in the establishment of distinctly modern theories of art, the process of secularization is a further significant strand, gaining in force throughout the eighteenth century. The type of criticism represented in the writing of Denis Diderot and his associates would be unthinkable in a culture still dependent on Christian doctrine for the establishment of its highest values. Indeed, the search for substitutes for religious values and functions is one of the impelling factors in the art theory of the later eighteenth century. And this search in turn needs to be understood in relation to the development of new social orders and market structures, within which art would have to establish its position in order to survive.

In *Art in Theory 1815–1900* we were at pains on the one hand to emphasize the relation between emergent modernism and the rise of the Western bourgeoisie, and on the other to stress art's relative independence from values associated with the market as such. In surveying the theory of the period 1648–1815, we confront a world in which many of these concepts are far less securely established or only emerging into currency. Thus, even the notion of the West was far less clearly defined at the beginning of this period than it was by the close, while its modern history had yet to be clearly detached from its roots in the ancient world. Nevertheless it needs to be acknowledged that there were powerful negative factors at work in defining the West from the start. The very manner in which the writers of the seventeenth century laid claim to the legacy of the Ancients served both to rule out alternative claims to that legacy, from the cultures of the Middle East among others, and to eliminate from significant consideration those contemporary cultures, particularly in the Far East, that were untouched by the classical heritage. The more the 'known' world enlarged during the eighteenth century, the more strongly a continuous Western culture came to be identified with civilization itself. In the margins of seventeenth- and eighteenth-century thought on the arts, we often encounter as an interesting supplementary theme the question of the relation of the Western canon to the visual cultures of the 'rest' of the world – the 'rest', that is, both geographically and historically speaking. A sense of the universality of taste or truth or value often sits uneasily with the acknowledgement of a certain cultural relativism. Our authors frequently display a willingness, deeply unengendered to the contemporary sensibility, to trade in uncomplicated oppositions of civilization and barbarism, and in assumptions about the naturalness of gender and class distinctions. And yet they are equally often involved in sophisticated consideration of the competing claims of nature and culture, of the grounds of judgement either in experience or in the structure of our minds, and of the possibility that value in art might be somehow internally given, rather than being the result of mere fidelity to some external standard.

Terms of reference for social classes provide further examples of relative instability in central concepts. To speak with the late seventeenth century in mind of a middle class, or *a fortiori* of a bourgeoisie, is to conceive a social constituency still largely in the process of emergence, with a much less secure relationship to the very idea of culture, let alone of art, than it was to acquire by the end of the ensuing century. In

much of the material anthologized in the present volume, the practical possibility of an ambitious art remains inextricably associated with the interests of aristocracy, if not of royalty. The struggle to dissolve this association, we suggest, was a further condition of the emergence of a modern art, and one to which many of our texts bear vivid witness. Similarly, it was not until the very end of the period now under review that the idea of the aesthetic emerged clearly in its modern – or modernist – form, as a value to be set against the monetary or the utilitarian.

The Selection of Texts

As regards our principles of selection we repeat a point asserted in the introduction to *Art in Theory 1900–2000*: ‘It is art we are concerned with, and the theory it is made of; not the culture it is made of, nor the theory of the culture.’ Our attention has been primarily concentrated upon the practices of painting and sculpture as fine arts, and we have considered theory as relevant *prima facie* where it can be clearly connected to the pursuit of these practices or to the business of their critical reconsideration. We have also devoted considerable space in the present volume to the emergence and development of art criticism as a specific literary practice bearing upon the practice of art.

This conception of our primary concern carries with it an implication for our book relative to the concerns of much contemporary writing in the fields of art and cultural history. Much of the most influential work of the recent past has consciously sought to blur the boundaries of art history and cultural studies, or to expand the purview of the former to include issues hitherto deemed the proper concern of the latter. Numerous books and exhibitions have featured an interest in, say, science or the body, in sexuality or surveillance, or have issued from a redirected emphasis on the so-called ‘minor’ arts as important sites of women’s creativity. The list of such revisions is endless. They provide recent historical writing with much of its distinctive flavour, and with the grounds of its claims to interest and innovation. But in compiling an anthology of those ideas out of which art has been made in the modern period, we have had to draw our boundaries somewhere. Thus, the writings of the Marquis de Sade may have been influential upon the artwork of, say, the mid-twentieth-century Surrealists, or upon some contemporary feminist work. But as far as we are able to establish, it was neither influential upon the art of his contemporaries nor in any way responsive to it. The logbook of Captain Cook’s voyages to the southern continent may have much to tell us about Western men’s perceptions of other cultures in the 1760s and 1770s, while the modern art of the Pacific area may in turn have much to say about the impact of European colonization in the aftermath of Cook’s and others’ voyages of exploration. There is no doubt that such texts, as well as related accounts and books of drawings and so forth were of significance to European civilization and to its sense of itself. But again, we have felt that the connections to art practice *per se* are too tenuous to merit the inclusion of such texts in our collection. For the most part, we have confined ourselves to texts and debates which were either responses to, or in some relatively direct manner influential upon, the practice of the arts in the period with which we are concerned. There are grey areas. Sometimes we have included texts to which these criteria may not be

thought to apply. As our guiding principle, however, we have always aimed to represent the ideas that bore upon the making of art, and we have looked for those texts that would enrich and animate our account of them. In the end we have tried to let that be the qualification, in all its historical ebb and flow, which decides our various inclusions and exclusions.

As with our two previous volumes, the process of selection of material started with a review of the work done by our predecessors to establish a body of relevant texts. Even in cases where we have decided not to duplicate the choice of any specific material, we have learned from previous surveys of the field. We have had reason again to be grateful for the extensive publications of Elizabeth Holt, in particular to the third volume of her *Documentary History of Art: From the Classicists to the Impressionists*, first published in 1966, and to her subsequent collection *The Triumph of Art for the Public 1785–1848* (1970). We are indebted to the two volumes of *Neo-Classicism and Romanticism*, edited by Lorenz Eitner, and to *Italian and Spanish Art 1600–1750*, edited by Robert Engass and Jonathan Brown, all first published in 1970 in the series *Sources and Documents*. Joshua Taylor's *Nineteenth Century Theories of Art* (1987) has also been a useful guide.

Invaluable as these various resources have been, we have been obliged both to look into areas of theory opened up by more recent publications, and to take account of those changes in the interests of art history which have led to a broadening of the very field of theory itself. Viewed through the legacy of modernism, the place of art in theory becomes ever harder to fix with any security. It is a consequence of the exorbitation of theory itself that, when one seeks to distinguish those theoretical considerations that are relevant to the production of art from those that are not, there are relatively few decisions that the art historian can still make *a priori* on secure methodological grounds. In the face of this circumstance, rather than seeking to reimpose an overview on the material surveyed, we have sought to profit from the opportunities for revision and expansion. As with both *Art in Theory 1900–2000* and *Art in Theory 1815–1900*, we have been more concerned to represent a body of ideas, of arguments and of concerns than to assemble a corpus of artist-authors or to do full justice to specific careers. We have intended no *a priori* distinction between authors. A text is a text whether the writer be a practising artist, a critic, a philosopher, or a functionary in a relevant institution. In general we have felt justified in positively pursuing such themes as seemed both to emerge from the material and to resonate with those concerns that may be identified with the longer development of a modern art. Once again, we have done what we can to strengthen the otherwise poor representation of women's voices within the established literature of art theory. But once again we have stopped short of retrospectively redressing those powers and mechanisms by which women were deprived of opportunity or otherwise silenced at the time.

In one significant respect, the problem of selection of texts has increased the earlier we have looked into the larger period surveyed by the *Art in Theory* project. Among the twentieth-century documents that come up for the count, there are many manifestos, letters, artists' statements and critical reviews. Of the items included in the present volume, however, very few presented themselves as complete texts capable of being anthologized without reduction. The typical seventeenth-century

treatise is a substantial work in several sections; in the later eighteenth century a Salon review might be a substantial book (Diderot's *Salon of 1767* ran to some 400 pages); an essay in aesthetics might run to several volumes. Faced with such quantities, we have hoped to reconcile two related though not always identical aims: to provide a representative selection of some relevance to a continuing body of concerns or to the wider development of art; and to interest the reader in the ideas of the author concerned. We are aware that some readers will be disappointed to find relatively few texts printed in their entirety. We hope that they will take consolation from the sheer range and variety of our selection. We have attempted to compensate for the necessities of excerpting and editing, on the one hand by providing careful indications of any excisions, and on the other by supplying full bibliographical information concerning dates and locations of original publications and, where these differ, of editions consulted.

Principles of Organization

The organization of material for this book has been the subject of a continuing conversation between us over the period of its production. This conversation was begun by Charles Harrison and Paul Wood in work on *Art in Theory 1900–2000* and was joined by Jason Gaiger at an early stage of work on *Art in Theory 1815–1900*. Argument among us has continually focused on the division of material into sections and subsections. At the heart of our project there has thus been a persistently discursive and dialectical process. Respecting the interests of a larger history, we have attempted to group the material into broad chronological divisions, but we have often had to reconsider what seemed like secure forms of periodization when the currency of theoretical debates proved these to be inappropriate. On the other hand, we have tried to recognize the tendency of the material to cluster about certain themes and issues, but have sometimes had to recognize that the significance of an aesthetic issue changes when the historical context of debate has shifted beyond a certain limit.

The titles of our sections and subsections represent the fruits of this process, in the form of topics and concepts. We have divided the material into seven broadly chronological sections. These contain the cross-currents of debate as to the role and concerns of art. Each section is introduced with an essay outlining major practical developments and theoretical concerns during the relevant period and, where appropriate, relating these to the wider political and economic forces at work in the history of the time. Within each of these sections texts are then grouped under thematic subheadings. Within each subheading the arrangement is generally chronological – the exceptions being where we have grouped a number of texts under a common author, or where we have meant to preserve a sequence of debate or a geographical connection. Each individual text is then provided with a brief introduction, specifying the original occasion of its publication and, where relevant, explaining its connection to contemporary events or controversies. A given text may thus be read for its independent content, as a moment in the development of a specific body of argument, or as a possible instance of a larger tendency or body of concerns within a broad historical period. Our organization of material intentionally reflects the

interests of a retrospective regard. But we hope that the categories we have devised are sufficiently open to encourage rather than to inhibit the exercise of historical imagination.

Finally, we should reiterate a point made in respect of the two previous volumes of *Art in Theory*. We have aimed to be responsive to the demands of curricula and of modern developments in theory and in art-historical work. But the agenda for this book has nevertheless been largely determined by a specific body of practical work to which nothing can now be added except through rediscovery: those actual paintings and sculptures of the period that constituted the practical outcomes of artists' aims and ideas, that stimulated the production of critical theories, and that served to illustrate debates on aesthetic and cultural matters. In the end, it is this absent resource that serves as an organizing principle for the material in the pages that follow. Like its companions, this anthology will be of greatest benefit to those readers who treat it not simply as a resource for the study of art history, but as an accompaniment to the first-hand experience of works of art.

Part I

Establishing the Place of Art

I

Introduction

On 20 January 1648 a petition was delivered to Louis XIV requesting the establishment of a Royal Academy of Painting and Sculpture (IB4). Just ten days later the Royal Academy held its founding meeting and drew up a series of statutes and regulations which officially confirmed its status as a professional association dedicated to the pursuit of 'virtue' (IB5). The dignity of painting and sculpture as liberal arts was to be upheld through the emulation of the great models bequeathed by the Renaissance and Antiquity, and by dissociating the work of the Academy from the 'abject trades' and merely artisanal activities pursued by the guilds and corporations. Prominent among the tasks laid before the Académie Royale de Peinture et de Sculpture was the glorification of the French monarch and the visible projection of his achievements. Indeed, the foundation of the Royal Academy has become inextricably associated with the rise of absolutism and with the political ambitions of the 'Sun King'.

Yet when the court artists presented their petition, Louis XIV was just 10 years old and France was wracked by the Fronde, a series of civil wars which came close to toppling the regency of Anne of Austria and her first minister, Cardinal Jules Mazarin. Within the space of a year the Royal Household was forced to flee Paris for Rueil and in 1651 Mazarin was sent into exile. It was not until 1652, when the Fronde was finally brought under control, that the Academy succeeded in obtaining the registration of its privileges by the French Parliament. It would take another twenty years of financial and political struggle and the personal intervention of Jean-Baptiste Colbert, the most powerful of Louis XIV's ministers, before the Academy could defeat the challenge of the guilds and establish exclusive control over the training of artists and the distribution of commissions.

The first half of the seventeenth century has been termed an 'age of crisis' in reference to the violent upheavals which occurred across the whole of Europe. At the same time as the Fronde uprisings in France, England was suffering the final convulsions of a lengthy civil war between the armies of the king and the defenders of Parliament. In 1649 the failed absolutist Charles I was to be beheaded in London. Art and politics often seem to proceed in different worlds. But when those worlds touch, the flash can illuminate the real conditions of both: blind history finds meaning in an image; 'high' art drags its feet in the mud. In a scenario heavy with symbolism for the artistic advocates of absolute monarchy, Cromwell had Charles walk to his execution through the very room which Rubens, the 'modern Apelles', had decorated with resounding allegories of his father's royal magnificence. *Ars longa, vita brevis*

indeed. Across central Europe, order was only just being restored after thirty years of conflict, with the signing of the Treaty of Westphalia. The Thirty Years War had started in 1618 with upheavals in the Austrian monarchy but had quickly spread to the Holy Roman Empire, drawing in practically the whole of Europe, including the Netherlands, Sweden, Poland, Spain and France. The wars were a result not only of the increasing political and territorial fragility of the old Holy Roman Empire but also of the enormous changes brought about by the Reformation. Two separate struggles intersected and reinforced one another. The first involved a political contest between the ambitions of the Emperor and the claims of the princes who strove to preserve the independence of their various territories. The second was a religious conflict between the Catholicizing zeal of the Emperor and the resistance of Lutheran and Calvinist communities to the forces of the Counter-Reformation.

Large swathes of central Europe were devastated by the war. The destruction of towns and the scorched-earth policy of retreating armies compounded the losses suffered in the actual fighting. In certain regions the population fell to less than a third of its pre-war level. A general stagnation of trade and the loss of consecutive harvests forced many peasants into serfdom at the hands of local lords, and in many towns long-standing practices of self-government were eradicated.

The deeper causes of the crisis in Europe have been much debated. The expansion of absolutism seems to have been both a consequence and a condition of the instability. The policy of increasing centralization and the extension of administrative control pursued by the monarchs of Austria, Spain, England, France, Prussia, Sweden and Russia was fiercely resisted by the older aristocratic families, who sought to sustain their ancient privileges. The growing burden of taxation required to fund expansionist ambitions, combined with the removal of traditional privileges and rights of trade, led to violent protest and rebellion both by impoverished peasants and by the mercantile classes. On the other hand, the damage inflicted by internal conflict and the risk of a complete breakdown of social order also seemed to provide justification for absolutist control. Throughout the second half of the seventeenth century most of Europe saw the growth of monarchical power and the ever more efficient employment of the apparatus of the state.

The important exceptions were England and the Dutch Republic. Whereas the succession of the monarchy remained unbroken in France, the resistance of the English Parliament to the absolutist ambitions of Charles I led to an eleven-year 'Commonwealth'. In 1660 the restoration of Charles II brought stability of a kind, though it was experienced as a tragic defeat by those who had invested their hopes of political and religious freedom in the idea of the English Revolution. Then in 1685 the country was once again thrown into upheaval by the accession of James II. The new king was determined to enforce the Catholicism and absolutism he had learnt to admire in France and Spain during his years of exile. He encountered fierce opposition, however, and this time the opposition's success was permanent. Absolutism was extirpated from England by the 'Glorious Revolution' of 1688, when James II was replaced by William of Orange, Stadholder of Holland, who was both his son-in-law and his nephew. William's acceptance of the Revolution Settlement and his signing of the Bill of Rights enshrined the powers of Parliament and of property-owners and effectively restricted the authority of the Crown.

The consequences of this liberty were far from uniformly positive for the arts. Given the relative weakness of the English monarchy, there was no question of matching the great displays of patronage and power produced by its European rivals. Louis XIV built the palace of Versailles and funded the vast decorative schemes of Charles Le Brun. No major new palace was to be brought to completion by the Crown in England before the nineteenth century. Charles I was the last great royal patron of the arts, and his collection of paintings was dispersed after his execution. During the Puritan regime of Oliver Cromwell the visual arts were associated with monarchical decadence and with Catholicism (see ID4). The proscription of visual images upheld by some sections of the Protestant Church was in general motivated by criticism of the abuses of ecclesiastical authority. More positively, it was also fuelled by belief in the validity of the Second Commandment ('Thou shalt not make unto thee any graven image or any likeness of anything that is in heaven above, or that is in the earth beneath, or that is in the water under the earth'). In predominantly Protestant countries such as England and Holland, not to mention the new colonies in America, there was widespread acceptance that priority should be accorded to scripture, by means of which each individual would be allowed unmediated access to the word of God (ID8). Powerful arguments were mounted against the harnessing of art as a tool either for personal aggrandizement or for persuasion. Though he does not specifically address the visual arts, the True Leveller Gerrard Winstanley associates the imagination with all that is false, idle and misleading in human consciousness, and with the potential corruption of moral virtue (ID4). Writing from a very different perspective, Horace Walpole was later to observe, 'The arts were, in a manner, expelled with the royal family from Britain.' It is certainly true that the political and religious climate of the English Commonwealth served for some while to depress those kinds of painting and sculpture that could be connected to the legacy of classical and Renaissance art. In 1685 William Aglionby (IA5) lamented England's failure to produce 'an Historical Painter, Native of our own Soyl'.

The United Provinces, a confederation of republics, had been federalist in structure since the Union of Utrecht in 1579, but in 1648 the Dutch Republic finally obtained its independence from Spanish rule. At the mid-century it was the most densely populated country in Europe, Italian city-states apart, with more than half its population living in towns. Success as a commercial and trading centre and an unusual degree of freedom and tolerance accorded to its citizens led to what has become known as the Golden Age of Dutch culture. Despite waves of iconoclasm during the anti-Catholic wars, the visual arts flourished in Protestant Holland. But they did so in a distinctive fashion. Unlike the classically dominated traditions of the Catholic courts in Italy, France and elsewhere, the tendency of Dutch painting was to eschew idealization and instead to maintain an apparent focus on the mundane realities of contemporary bourgeois life. In this unusual concern with the conditions of its own modernity, the art of seventeenth-century Holland seems sometimes like a salient of the present, isolated in an otherwise alien past. As a counter to this impression, however, it may be observed that Dutch paintings were often imbued, through the use of allegory or emblems, with a spiritual and religious content that would have been readily comprehensible to their intended public at the time.

An astonishing quantity of paintings was produced in Holland to satisfy the demands of an expanding middle class. Collections of pictures between 100 and 250 in number are not exceptional in the surviving inventories of wealthy households. One effect of the Dutch embrace of the quotidian, however, was a relative lack of concern with the classics; and one effect of *that* was an equal indifference to high-level theorizations of the place of art relative to poetry and the rest of the classical canon. It seems there was no attempt during the short-lived Golden Age in Holland to produce a sustained body of artistic theory such as emerged from Italy or France. The legacy of the Ancients was as much a part of the consciousness of educated Dutch writers as of other Europeans of the mid-seventeenth century, but there remain few contemporary treatises on Dutch art (see, however, IE4, IE7).

England and Holland were exceptions to the general rule. But whatever the situation in the political and economic spheres, Protestant states seemed to match or even to exceed the dynamism of their Catholic rivals. The second half of the seventeenth century was marked by a shift in the *cultural* leadership of Europe from Italy to France. Italy still enjoyed enormous cultural prestige (see, for example, IB7 and IC3) but the rise of France as a continental power enabled Louis XIV and his ministers to provide unrivalled conditions for the expansion of the arts. The Académie Royale was a crucial instrument of this expansion. Given rivalry with the existing guild system, if the new academic artist was to convince as a Learned Gentleman, some distance had to be established between himself and the mere artisan. As might be expected under these conditions, such theoretical justification as accompanied the establishment and early development of the Académie Royale was intentionally distinct from those kinds of writing about art that were concerned principally with the transmission of practical knowledge and skills. Edward Norgate's *Miniatura or the Art of Limning* offers a vivid example of the latter type. Originally composed in 1627–8 and substantially revised in 1648, it contained detailed advice on the preparing and grinding of colours, on the use of binding media and on the preparation of surfaces (IE1). Other treatises written in France, Spain, Portugal and the Netherlands provided guidance in matters such as perspective, composition, the methods and techniques for achieving different effects and the employment of appropriate iconography (IE4–9). These kinds of text tell us a great deal about the actual practice of painting at the beginning of the early modern period and reveal what an arduous, labour-intensive business it was. This was not, however, an aspect of art which the Académie Royale was keen to emphasize in its theoretical deliberations.

In the transition of artistic initiative from Italy to France the key figure was the painter Nicolas Poussin. His standing as the 'learned painter' par excellence was a powerful motivating force to the new school of French painting (IB1–3). Though Poussin was born in France and though he sustained an important network of French patrons, he spent most of his career in Rome, where he assimilated the achievements of the Italian Renaissance and developed a new style of austere classicism. His life and his art alike were regularly cited as models to be followed by aspiring artists. In the 'Conferences' initiated by the French Royal Academy in 1667 canonical works of art were brought before the assembly of academicians so that their technique and underlying principles might be studied and demonstrated. The subjects of the first seven conferences were a cast of the Antique statue of *Laocöon*, one work each by

Titian and Veronese, and two works each by Raphael and Poussin (IB9–13). Among those thus dignified, Poussin was the only living artist.

Important changes within the Royal Academy itself may be measured in terms of developments in the role and character of its conferences. Under Félibien's editorship, the publication of the first series in 1667 reflected animated debate between academy members. However, the 'Table of Precepts' published by Henri Testelin in 1680 distilled academic doctrine into a system whose fixed and regulative structure was intentionally both impervious to challenge and readily assimilable by aspiring artists (IB15). The Academy had originally been founded in the name of artistic freedom in opposition to the restrictive practices of the guilds. But under the guiding hand of Jean-Baptiste Colbert it was indeed incorporated into the absolutist project. As an efficiently administered medium of regulation and royal patronage, it served increasingly to extend state control over the arts.

Seventeenth-century France inherited from Italy both a profound admiration for Greek and Latin arts and letters, and its corollary: controversy over the respective merits of the Ancients and Moderns. Thus while the achievements of Antiquity were taken to be paradigms of perfection, whose imitation offered the only possibility for future greatness in the arts, towards the end of the century these assumptions were subject to challenge. The resulting debate became known in France as the *Querelle des anciens et des modernes* (IA6–8). The quarrel was sparked at a meeting of the Académie Française in 1687, when Charles Perrault read a poem entitled 'The Century of Louis the Great'. A number of those present, including the poet and critic Nicolas Boileau, were scandalized by Perrault's comparison of the reign of Louis XIV with the Augustan age in Rome:

La belle Antiquité fut toujours venerable;
 Mais je ne crus jamais qu'elle fust adorable.
 Je voy les Anciens sans plier les genoux,
 Ils sont grands, il est vray, mais hommes, commes nous;
 Et l'on peut comparer sans craindre d'estre injuste,
 Le Siecle de Louis au beau Siecle d'Auguste.

[Beautiful Antiquity has always been an object of veneration / but I do not believe that it has ever been worthy of adoration. / I look upon the Ancients without bending the knee; / they were great it is true, but they were men just like us; / without fear of being unjust we may compare / the century of Louis with the century of Augustus.]

Whilst belief in the political greatness of France undoubtedly contributed to the growing confidence of the moderns, the deeper source of the conflict is to be traced back to the scientific revolution of the sixteenth and seventeenth centuries. Many of the fundamental conceptions which dominated the medieval view of the world had been inherited from Antiquity, above all, from the ideas of the Greek philosopher Aristotle (384–322 BC). When these long-standing ideas were challenged by the work of figures such as Copernicus, Kepler, Bacon, Galileo, Descartes and Newton, many began to question whether in the domain of science the moderns had not indeed surpassed the Ancients. The methods of inductive reasoning, of experimentation and of systematic observation of natural phenomena offered a possibility of progress in

understanding the natural world which far outstripped the achievements of the Ancients. This, in turn, raised the question of whether there had been an unequal development in different domains. Some contributors to the debate argued that whereas the Moderns had outstripped the Ancients in the field of science, the Ancients remained superior in the domain of art. Comparison of the different levels of achievement led to a clear distinction being made for the first time between the arts and sciences. However, there was also a great deal that was held in common between the two sides in the dispute. All of the participants agreed that the goal of art was the ideal imitation of nature, that great art transcended time and that it was underpinned by universal values: beliefs which were to be increasingly questioned during the period covered by the present anthology.

One of the principal obstacles to the cult of Antiquity in the visual arts was the lack of any surviving manual of classical art theory. Whereas there were numerous treatises on rhetoric and poetry, there was no surviving work on painting and sculpture which could compare with the example of Horace's *Ars poetica* [The Art of Poetry]. An early attempt to rectify this situation was made by Franciscus Junius with his *De Pictura Veterum*, originally published in Latin in 1637 and subsequently translated by the author as *The Painting of the Ancients*. This provided a compilation of quotations gleaned from a wide variety of classical sources and woven into a continuous text (IA1). A further and more concerted attempt to make good this absence was made by Charles-Alphonse du Fresnoy. His *De Arte Graphica* [The Art of Painting] was a Latin poem, consciously modelled on Horace's example, through which he sought to give concentrated expression to the available wisdom on the practice of painting (IC4). In the mid-seventeenth century the prestige attached to Antiquity was acknowledged throughout Europe, even in the Low Countries (see IA2, IA4).

At the heart of the *doctrine classique* lay the conviction that reason was the instrument both of artistic creativity and of rational reflection. The true imitation of nature demanded that the artist not merely copy the external features presented by the natural world, but also penetrate through to the essential. The production of a work of art is guided by a set of eternally valid rules whose original apprehension is owed to the Ancients, but whose enduring validity is authorized by reason itself. In France, the dominance of rationalism and classicism resulted in a significant counter-tendency which emphasized the importance of those features of the work of art which seemed to escape determination by rules: the *je ne sais quoi* and the quality of 'grace' (ID6 and 7). Ironically, it is these minority positions which most seem to prefigure later developments in the evolution of modern art. In some respects, the story of modernism is a story of the move of subjectivity and sensibility from the margin to the centre of the discourse of art. It is as though, over a long period, rule-breaking rather than rule-following becomes a new rule in itself. The emergence of an alternative conception of the role of the artist, placing emphasis on the discriminatory capacities of the individual subject, can be traced back to the writings of the Spaniard, Baltasar Gracián (IDI and 2). Though primarily concerned with the problem of right action in courtly and political life, Gracián placed a new emphasis on the concept of 'taste' and the *je ne sais quoi*. Since right action is grounded in the correct judgement of particular cases, an important role is accorded to the individual's own responses. The priority given to the role of feeling or sentiment

contributed to the formation of an aesthetic of *délicatesse* or individual sensitivity. Under the subsequent impact of empiricist philosophy in the first quarter of the eighteenth century, this tendency was to issue in a sustained challenge to rationalism (see section IIB).

Within the French Royal Academy itself a significant challenge rose from the so-called partisans of colour, who used a long-standing debate over the relative priority of *disegno* and *colore* to contest the authority of its leading figures (see IC4–5 and IC7–10). In the official doctrine of the Academy the priority of design was asserted to uphold the status of painting as a liberal art against the rival institution of the guilds. Line was associated with that part of painting which involved ‘invention’ and the production of an ‘idea’. It showed that the artist was working with his mind or intellect rather than merely with his hands. By contrast, colour was associated with the manual task of grinding pigments and staining cloths, and was said to appeal primarily to the senses rather than to the mind. So closely interlinked were the pedagogical, theoretical and political functions of the Academy that an attack on one was construed as an attack on the others. The defence of line mounted by Philippe de Champaigne and Charles Le Brun has strong moral overtones, contrasting the aesthetic purity and austerity of drawing with the seduction or deception of colour. At stake, too, was the exemplary status of the great artists of the past. The defenders of colour sought to elevate Venetian artists such as Titian and Veronese, and the Flemish painter Rubens, alongside acknowledged classicist masters such as Raphael and Poussin.

The most eloquent and sustained defence of colour was mounted by Roger de Piles (see IC5, 10 and IIA2). By introducing a distinction between physical ‘colour’ and the art of ‘colouring’ De Piles showed that the correct imitation of colour is as much the work of the intellect as is drawing. Indeed, he contends that the neglect of colouring by the Academy was due to the greater difficulty of attaining excellence in this domain and to the impracticality of formulating appropriate precepts and rules. De Piles ultimately succeeded in bringing about a remarkable reversal of priorities. By according a positive value to colour’s capacity to deceive and charm the eye, he developed a theory which elaborated the specifically *visual* interest of painting. A successful painting should be judged in terms of the ‘whole together’ and should strike the viewer powerfully and immediately. This celebration of the ‘beautiful artifice’ of painting restored the importance of physical properties and drew attention to the manner of composition and execution. With the death of Charles Le Brun in 1690 and the appointment of Jules Hardouin-Mansart as the new protector of the Royal Academy in 1699, De Piles was made an *amateur honoraire* and became the Academy’s chief theoretician. This represented a decisive shift in the balance of power and marked the ultimate victory of the partisans of colour.

In the first section of the anthology, we have chosen to deal with these complex and intersecting issues in the art theory of the seventeenth century by placing discussion about the legacy of the Ancients first. This is followed by a selection of texts concerning the establishment of the Academy, and then by material from the rival protagonists of form and colour. Next we provide a sample of views alternative to those of the Academy, gathered under the rubric of the *je ne sais quoi*. The section ends with a collection of writings on the practical resources from which, all the theory notwithstanding, art continued to be made.

IA

Ancients and Moderns

1. Franciscus Junius (1589–1677) from *The Painting of the Ancients*

Junius was the son of an eminent Protestant theologian. He grew up in the milieu of the University of Leiden, where his father worked until his death in 1602. Junius followed in his father's footsteps and trained for the clergy, but he reacted against the sectarian disputes in the newly independent United Provinces and by 1620 he had left the Church. On the recommendation of prominent Dutch Protestants, however, he was able to take up a post in England in 1621 as librarian to the Earl of Arundel (see IE1). Arundel had the greatest art collection in England after the king himself, as well as an extensive library. It was from these resources that Junius compiled two major works, the *Catalogus*, a lexicon of classical artists, and *De Pictura Veterum*, an attempt to reconstitute a classical theory of art. This latter was published in Latin in 1637, and was followed a year later by Junius' own English translation, *The Painting of the Ancients*. The text is a tapestry of quotations from every surviving ancient source, woven together by Junius' own passionate advocacy of the improving power of the visual arts. *The Painting of the Ancients* consists of three Books. The first defines the fundamentals of art. The second is a kind of history or survey of art works from the ancient world. In the third, the 'parts' of art are discussed in sequence, as follows: 1. Invention, that is, the Idea or Content of the work; 2. Design, or Drawing; 3. Colour; 4. Expression, or in Junius' terms, the investing of the work with Action and Passion; 5. Disposition, or Ordering of compositional elements; and lastly that indefinable quality which Junius calls 'Grace', and which is referred to elsewhere as the *je ne sais quoi* (see section ID). This idea of the parts of art was indebted to Italian Renaissance theory, and the model was to remain influential throughout the seventeenth and eighteenth centuries, its authority reflected in writers as diverse as Fréart de Chambray (see IB6), Bellori (see IB8), Du Fresnoy (see IC4), Shaftesbury (see IB3) and Reynolds (see IVA7). Our selections are all taken from the first Book of *The Painting of the Ancients*. Here Junius establishes at the outset that the principal business of art is imitation, going on to argue that this imitation is not merely mechanical copying but requires the work of imagination (or phantasy). It is this basis in imagination which makes the visual arts into an elevated equivalent of poetry. This is the doctrine of *ut pictura poesis*, or 'the sister arts', which held sway at least until Lessing (see IIIA10). Junius then turns from the practice of art to its judgement, establishing that this too requires the exercise of learning and imagination. The contemplation of art, no less than its production, is an intellectual and moral pursuit. Our

extracts are taken from Book One, chapters I, II, IV and V of Franciscus Junius, *The Painting of the Ancients*, edited by Keith Aldrich, Philipp Fehl and Raina Fehl, Berkeley and Oxford: University of California Press, 1991, pp. 11–66.

I

THE GOOD and great maker of this Universe, created the world after so glorious and beautifull a manner, that the Greekes together with the Romanes, a consent also of the Nations perswading them thereunto, have called it by the name of an *Ornament*.¹ Moreover, Man, whom many ancient Authors call the little world, is not made after the image of God to resemble the wilde beasts in following of their lusts, but that the memory of his originall should lift up his noble soul to the love of a vertuous desire of glory. This opinion was of old grafted in the hearts of good men; neither doe the learned onely, but the vulgar sort also esteem the way of vertue to be the true way by which our mortall and transitory condition attaineth to an everlasting fame. But among such a number of vertuous courses as may serve to get a great and durable renowne, every one doth most commonly deliberate with his own naturall inclination. The one by a praiseworthy boldnesse undertaketh to compasse with his understanding the unmeasurable measures of heaven, ‘leaving unto the following ages a full account of the innumerable number of heavenly lights, as a most certain and sure inheritance,’ sayth *Plinie*, ‘if peradventure afterwards anyone would take upon him to be heire thereof.’ Another doth not stick to prie into the most profound mysteries of Nature; neither will he give his mind any rest till he hath in some measure conceived the nature of the floting clouds, the cause of thunder, lightning, and of all those things that above or about the earth doe terrifie the heart of man. He goeth about the search of those things with a very great confidence, as knowing himselfe to be placed in this stately theater, to view and to consider all such wonders of God. *Anaxagoras* being asked to what end he was brought forth, answered; ‘To behold the Sunne, Moone, and Heavens.’ Yea what is man, I pray you, but ‘a creature approaching nearest unto God,’ as *Quintilian* speaketh, ‘and ordained to the contemplation of the things contained in the world.’ Although now *Quintilian* and all the other Authors speak very well to the purpose; *Tullie* for all that commeth a great deal neerer to the point we have in hand; ‘man himselfe,’ sayth he, ‘is borne to contemplate and to imitate the world; not being any manner of way perfect, but onely a small parcell of what is perfect.’ [. . .]

‘The painters,’ sayth *S. Chrysostome*, ‘after the mixing of their colours, endeavour to set forth a lively similitude of diverse visible things: thus doe they paint reasonable and unreasonable creatures, trees, warres, battels, streames of bloud, pikes, Kings, ordinary men; they make also a royall throne, the King sitting, a barbarous enemy throwne downe under his feet, the points of speares, running rivers, goodly medowes: to be short, they prepare unto the spectators a very pleasant sight, whilest they study by the force of their Art to expresse all manner of visible things.’ The words of *Isidorus Pelusiota* are likewise worth noting; ‘the Painters,’ sayth he, ‘when they make bodily shapes of things without bodie, use sometimes to paint a lone hand which setteth a crowne upon the head of the Princes of this world; signifying, that this soveraign power is given them from heaven.’ *Socrates* toucheth also the large

extent of this Art, when he sayth, 'the Painters studie with their colours to expresse, hollow and swelling, darke and lightsome, hard and soft, rough and smooth, new and old bodies.' [. . .]

It remaineth . . . that among so many Arts as doe procure us everlasting glory, this Art [i.e. painting] is none of the meanest. And as it is a very great matter to carry in our mind the true images both of living and lifelesse creatures, so is it a greater matter to worke out a true and lively similitude of those inward images; especially if the Artificer doth not tie his imitation to some particular, though never so faire a body; but followeth rather the perfection of an inward image made up in his mind by a most earnest and assiduous observation of all such bodies as in their owne kind are most excellling. 'Such as carve images,' sayth *Maximus Tyrius*, 'having gathered all that in severall bodies is reputed to be faire, bring it by the means of their art in one singular imitation of a convenient, pure, and well-proportioned beautie to passe; neither shall you find in haste a body so accurately exact, as to compare it with the beautie of a statue: For the Arts doe ever seeke what is fairest.' [. . .]

Such Artificers therefore as carry in their mind an uncorrupt image of perfect beautie, do most commonly powre forth into their workes some certaine glimmering sparkles of the inward beautie contained in their minds: neither may we thinke this to be very easie; 'for,' according to *Apollonius Tyaneus* his opinion, 'that which is best, is alway hard to be found out, hard to be judged.' It is also well observed by an ancient Orator, that 'the imitation of a most absolute beautie is ever most hard and difficult; and as it is an easie matter to set forth a true similitude of deformitie by her owne markes, so on the contrary the similitude of a perfect beautie is as rarely seene as the beautie it selfe.' It was not unknowne unto *Zeuxis*, sayth *Tullie*, that Nature would never bestow upon one particular hodie all the perfections of beautie; seeing that nothing is so neatly shaped by Nature, but there will alwayes in one or other part therof some notable disproportion be found; as if nothing more should be left her to distribute unto others, if she had once conferred upon one all what is truly beautifull. Wherefore, when this noble Artificer intended to leave unto the inhabitants of Crotona a choice patterne of a most beautifull woman, he did not thinke it good to seeke the perfection of a faultlesse formositie in one particular body; but he pick'd out of the whole Citie five of the well-favouredst virgins, to the end he might find in them that 'perfect beautie,' which, as *Lucian* speaketh, 'of necessitie must be but one.' So doth *Xenophon* very fitly to this purpose bring in *Socrates* his discourse held with the Painter *Parrhasius*, 'seeing it is not so easie,' sayth *Socrates*, 'to meet with any one that doth altogether consist of irreprehensible parts, so is it, that you having chosen out of every part of severall hodies what is fittest for your turne, bring to passe that the whole figures made by your Art seeme to be most comely and beautifull.'

Out of this most absolute sort of imitation there doth bud forth the Art of designing, the Art of painting, the Art of casting, and all other Arts of that kind. So doth *Philostratus* also call this same Imitation 'an ancient invention, and altogether agreeing with Nature.' The prooffe of which point could here most readily be drawne out of that busie eagernesse we do see in almost all young children, that follow the tender imaginations of their rude and unexercised conceits in making of babies and other images out of clay or wax, but that we thinke it better not to trouble our selves too much with the prooffe of a thing which is cleare enough in it selfe, seeing every

one may sufficiently informe himselfe concerning this point, who will but cast an eye upon the daily pastimes used among little ones. Let us onely observe out of *Quintilian*, that ‘all such things as are accomplished by Art, doe ever draw their first beginnings out of Nature;’ as also, that ‘the greater part of Arts,’ to use the words of the same Author, ‘doth consist in Imitation’ [...]

II

BESIDES THIS newly-mentioned imitation of naturall things, by whose meanes Artificers doe expresse all kinds of visible things after the life, we are also to marke another sort of imitation, by which namely the Artificer emboldeneth himselfe to meddle also with such things as doe not offer themselves to the eyes of men: and although the chieffest force of this Imitation doth consist in the Phantasie, so must wee for all this thanke our eyes for the first beginnings as well of the Phantasie as of the Imitation it selfe. For the inward Imaginations that doe continually stirre and play in our minds, cannot be conceived and fashioned therein, unlesse our eyes some manner of way are made acquainted with the true shape of the things imagined, or at least that we have felt them with some of our senses. ‘Our mind,’ sayth *Strabo*, ‘maketh up the conceivable or intelligible things out of the sensible: for as our senses doe certifie us of the figure, colour, bignesse, smell, softnesse, and taste of an apple; so doth our mind out of these things bring together the true apprehension of an apple; so falleth it likewise out with great figures, that our sense seeth the parts of them, but our mind putteth the whole figure out of those visible parts together.’ *Themistius* doth wonderfull well expresse all this: ‘the phantasie,’ sayth he, ‘is like a print or footstep of sense: for as a leaver mooved by the hand mooveth a stone, and as the sea stirred by the winde stirreth a ship, so is it no wonder at all that our sense should be subject to the same: for our sense being stirred by outward sensible things, and receiving the shape of such things as doe stirre it, stirreth also in perfect creatures another power of the soule, commonly called *phantasie*: whose nature is to lay up the prints delivered her by sense, and to seale them up after so sure a manner, as to keepe still the footsteps of the same, after that now the visible things are gone out of our sight.’

So doth then this same most fertile power of our soule, according to *Plato* his opinion, yeeld two sorts of Imitation; the first medleth onely with things seene, whilst they are set before our eyes; the other on the contrary studieth also to expresse things prefigured only and represented by the phantasie. [...]

Hence it is that *Phidias*, when he made *Jupiter*, did not cast his eyes upon any thing generated, but he fetched the patterne of his worke out of a *Jupiter* conceived after *Homers* description. Other famous Writers, besides *Proclus*, doe also very much harp upon this string, urging alwayes *Phidias* his example as an infallible rule of Art: and it seemeth by their words, that they held *Phidias* to be so excellent an Artificer, because he had a singular abilitie to imagine things invisible after a most majesticall manner. ‘Nothing is in my opinion so beautifull,’ sayth *Tullie*, ‘but we must always conceive that to be fairer from whence the former, even as an image was wont to be made after a face, is expressed; which cannot be perceived by our eyes, nor eares, nor any of our senses, since we doe apprehend it onely by thought and minde. Hence it is that we

can imagine something fairer yet then *Phidias* his images, although our eyes cannot behold any thing fairer in that kinde. Neither did that same Artificer, when he made the images of *Jupiter* and *Minerva*, fixe his eyes upon one after whom he should draw such a similitude; but there did abide in his minde an exquisitc forme of beautie, upon the which he staring, directed both his Art and his hand to the similitude of the same. There is then in the forme and shape of things a certaine perfection and excellencie, unto whose conceived figure such things by imitation are referred as cannot be seene.' *Plato*, a most grave Author and teacher, not of knowing onely, but also of speaking, doth call these figures Ideas [*Cicero*].' [...]

The words of *Philostratus* are worth rehearsing. 'It is so,' sayth *Thespesion*, 'that *Phydias* and *Praxiteles* climbing up to heaven, and there expressing the severall shapes of the Gods, have afterwards applied them to the Art, or is there something else, that hath taught these Artifieers to counterfeit?' 'Something else,' replied *Apollonius*, 'and that full of wisdom.' 'What is that?' sayth *Thespesion* againe; 'seeing you can, besides the Imitation, name nothing.' 'Phantasie,' answered *Apollonius*, 'hath accomplished these things; an Artificer farre exceeding Imitation in wisdom: for Imitation doth worke out nothing but what shee hath seene: Phantasie on the contrary doth take in hand also what shee hath not seene; for shee propoundeth unto her selfe unknowne things with a relation to such things as are. A certaine kinde of astonishment doth also often hinder our Imitation; whereas nothing can disturb the Phantasie, being once resolved to follow undauntedly what shee undertaketh. As for an Artificer that meaneth to conceive in his mind an image not unworthy of *Jupiter*, the same must see him accompanied with the foure seasons of the yeare, with the constellations, with the whole heaven: for such a one did *Phidias* then imagine. . . .

We doe see then plainly that the Artificers stand very much in need of the mentioned Imaginative facultie: and although wee must ingenuously confesse that they doe not so much want it, who eontent themselves with the Imitation of visible things, following stroke after stroke; for the exercise of this same faculty doth more properly belong unto such Artificers as labour to be perfect, studying alwayes by a continuall practise to enrich their Phantasie with all kinde of perfect Images, and desiring to have them in such a readinesse, that by them they might represent and resemble things absent, with the same facilitie others doe expresse things present: yet shall we more strongly be convicted² of the necessitie of this same exercise, if we take this into our consideration, that Artificers are often to expresse such things as can but seldome, and that onely for a little while be seene: as namely, the burning of a Citie, of a village, or else of a company of scattered cottages; the miserable confusion of them that run their ship against a rock; the bloody skirmish of a drunken mercilesse crew, dying in a most horrid hurlie burlie on heaps. It is most certain that we doe but seldome meet with such spectacles, neither doe they stay our leisure to let us take a full view of them; all is but a flurt,³ and away. It is left therefore that our Imagination should lay up carefully what she hath seen, still increasing her store with Images of things unseene, as farre forth as it is possible to conceive them by a relation of what we sometimes beheld. 'What shall we doe,' sayth *Seneca* the rhetorician, 'if wee are to paint a hattle? shall wee arme two severall parties, to see them discomfit one another? must wee needs see how a sad and dejected multitude of captives commeth drouping

after the lascivious shouting, though all beblouded conquerours? as if the greatest part of mankind had better perish, then the Painter faile.'

It is then not onely profitable but also necessary, that an Artificer should by a daily practice carefully provide himselfe of such kinde of Images, as might be ready at his call when he is to imitate things absent, and such things as never came before his eyes: 'and wee shall with much ease attaine to this,' sayth *Quintilian*, 'if wee are but willing: for as among the manifold remissions of our minde, among our idle hopes and wakefull dreams, these Images do follow us so close, that wee seeme to travell, to saile, to bestirre ourselves mightily in a hot fight, to make a speech in the midst of great assemblies, yea wee doe so lively propound all these things unto our minds, as if the doing of them kept us so busie, and not the thinking: shall wee then not turne this same vice of our minde to a more profitable employment?' [. . .]

IV

'ALL ARTS,' sayth *Tullie*, 'that doe belong to humanitie, have a common band, and are ally'd one to another, as by a kind of parentage.' *Tertullian* speaketh to the same effect, when he sayth; 'there is no Art, but shee is the mother of another Art, or at least of a nigh kindred:' seeing then that the connexion of the worke in hand enticeth us to prove the truth of these sayings by a mutuall relation there is between *Poesie* and *Picture*, it followeth also that wee should propound some properties of them both, out of which it might be perceived that they are very neere of the selfe same nature. Both doe follow a secret instinct of Nature: for we do daily see, that not *Poets* onely, but *Painters* also are possessed with the love of those Arts, not so much by a fore-determined advise,⁴ as by a blind fit of a most violent and irresistible fury. As for *Poets*, 'there is a God in us,' sayth *Ovid*, 'by whose tossing of us we are enflamed: this same forwardnesse hath in it selfe the seeds of a sacred minde.' As for *Painters*, '*Nicophanes* had a most forward mind,' sayth *Plinie*, 'and there are but a few that may be compared with him in this.'⁵ The same Author speaking of *Protogenes*, sayth againe in the same place, 'the forwardnes of his mind, and a certain inclination or pronenesse to the Art, have carried *Protogenes* to these things.' And it is very aptly put in here, that a certaine forward pronenesse to the Art made *Protogenes* so excellent an Artificer; seeing they do alwayes with the greatest ease and best successe exercise an Art, who out of a free desire give themselves so readily to it, that they cannot so much as give an account of this same most forward desire. The Peripatetike Philosophers seeme to have understood this perfectly when they doe maintaine, that 'no body can doe any thing neatly and finely, unlesse he hath a very good minde to it,' sayth *Tullie*. It is required therefore, that all such as would willingly attaine to these Arts, doe find in themselves some swift motions of their wits and minds, both quicke to invent, and copious to expresse what is found: neither may we thinke that the first beginnings of these Arts proceed from Art, seeing it is a gift of Nature that any man findeth this same aptnesse in himselfe; and our case standeth well enough, if Art can help such tender seeds to a full growth; for that Art should infuse them into us, is altogether impossible. Out of this observation there doth arise a question propounded and answered by *Horace*: 'it hath been very much questioned,' sayth he, 'whether Nature or Art doth accomplish a Poeme. I cannot see what helpe there is in study without a

rich veine, or else in a rude wit; so doth one of these two alwayes require the others helpe, and they doe both very lovingly conspire.' [. . .]

As for the particular nature of the Artificers, it hath ever been so, that the livilinesse of great spirits cannot containe it selfe within the compasse of an ordinary practice, but it will alwayes issue forth, whilst every one doth most readily expresse in his workes the inward motions of his most forward minde: so doe we also finde that the bravest Artists have spent their labour most prosperously about such things as they did much delight in by a violent driving of their passion, or else by a quiet guiding of their Nature. [. . .]

[W]e see it daily how Poets and Painters do with a bold hand describe not onely the shapes of their devised Gods, demi-gods, Worthies, other ordinary men, but they strive also by a mutall emulation to set forth the manifold actions of men: they doe represent the lascivious mirth of banquets, the toilesome pleasure of hunting, the bloody outrageousnesse of fighting, the unevitable horror of ship-wrack, the lamentable and ruffull sluttishnes of them that lie chained up in the deep night of a deadly dungeon. As for the Poets alone, 'Poesie,' sayth *Hermogenes*, 'is an imitation of all kinde of things: and he is the best *Poet*, that can with a ready and full utterance of words imitate speaking Orators, singing Musicians, with all other persons and things.' Of Poets and Painters both together are the following words of *Philostratus*, 'Whosoever doth not embrace Picture,' sayth he, 'wrongeth the truth, he wrongeth also the wisdome of the *Poets*; seeing both are alike busie about the shapes and deeds of the Worthies.' *Dio Chrysostomus* speaketh likewise of both together; 'Painters and Carvers,' sayth he, 'when they were to resemble the Gods, departed not one inch from the *Poets*; not onely to shun the punishment offenders in such a kinde undergoe; but also because they saw themselves prevented by the *Poets*, and that now the manner of Images made after their conceit went currant, as being upholden by antiquitie: neither would they seeme to be troublesome and unpleasant by lying novelties, but they have for the most part made their Images after the example of *Poets*: Sometimes for all that have they added one or other thing of their own, professing themselves to have an emulation with *Poets* about the same Art of imitation, endeavouring likewise to lay open before the eyes of more and poorer spectators, what *Poets* have plainly rehearsed to the cares of men.' Although now the words of *Philostratus* and *Dio Chrysostomus* may serve us for a sufficient proofe of that same great affinitie there is betwixt Painting and Poesie, yet hath *Simonides* expounded this point somewhat neatlier when he affirmeth that 'Picture is a silent *Poesie*, as *Poesie* is a speaking *Picture*:' and upon occasion of these words sayth *Plutarch*, 'the things represented by *Painters* as if they were as yet adooing before our eyes, are propounded by Orators as done alreadie: seeing also that *Painters* doe expresse with colours what *Writers* doe describe with words; so is it that they doe but differ in the matter and manner of Imitation, having both the same end [. . .]

Both doe hold the raines of our hearts, leading and guiding our Passions by that beguiling power they have, whithersoever they list. Of the *Poets* sayth *Horace*, 'it seemeth to me that such a Poet is most like to walke upon a stretched out rope, the which doth torment and vex my thought about matters of nothing; in chaunterlike angring, appeasing, and terrifying me with idle feares; conveying and at his pleasure transporting me sometimes to *Thebes*, some times to *Athens*.' Saint *Basil* speaketh of

both, 'Eloquent Writers and Painters,' sayth he, 'doe very often expresse the warlike deeds of valiant men; and both do stirre up a great many to courage; whilst the one studieth to set forth in lively colours, what the other goeth about to adorne with eloquence:' both then have a hidden force to move and compell our minds to severall Passions, but Picture for all that seemeth to doe it more effectually; seeing 'things that sinke into our hearts by the means of our eares,' sayth *Nazarius*, 'doe more faintly stirre our minde, then such things as are drunke in by the eyes.' *Polybius* doth likewise affirme, that 'our eyes are more accurate witnesses then our eares:' and it may be very well that *Quintilian* out of such a consideration hath drawne this same conclusion; 'Picture,' sayth he, 'a silent worke, and constantly keeping the same forme, doth so insinuate it selfe into our most inward affections, that it seemeth now and then to be of greater force then Eloquence it selfe.' [..]

Both are most of all advanced by the ready help of a strong and well-exercised Imagination: 'the Art of Painting,' sayth the younger *Philostratus*, 'is found to be a kin to Poesie; seeing both do therein agree, that as well the one as the other requireth a forward Phantasie. The Poets bring the presence of the Gods upon a stage, and all what is pompous, grave, and delightfull. The painters likewise doe designe as many things upon a boord, as the Poets possibly can utter.' So doth then the *Art of Painting* as well as *Poesie* relie upon a generous and bold strength of Imagination, so that they will no more creepe and crawl to feele and to follow the steppes of them that are gone before, but they take upon themselves to trie it somewhat further, if by chance they might be esteemed worthy to lead others the way. [..]

Having now spoken at large of the manifold fruits the Artificers reape out of the continuall exercise of their Imaginative facultie; it remaineth that wee should shew how they have need to stir up all the powers of fancie that are in them that would view the works of excellent masters with the contentment of a sound and well-grounded judgement.

V

NO MAN hath ever beene able to conceive the miracles of these Arts that doe meddle with the imitation of all things, unlesse hee enjoying his hearts ease, hath likewise now and then holpen this same delicate studie of a most busie contemplation by the secresie of a retired and more solitarie place. 'None are more curious then such as are at leisure,' saith the younger *Plinius*. 'Poesie doth require retirednesse of the writer and leisure,' saith *Ovid*: wee may adde very well, that not Poets only, but such also as meane to reade Poets with good attention, and such likewise as desire to looke upon choice Pictures, and excellent Statues with a sound judgement (to adde this same propertie also to the comparing of Poets and Painters handled immediately before) have great need of retirednesse; 'the multitudes of necessary duties and affaires doe withdrawe and turn all men from the contemplation of such things,' saith *Plinie*, 'because such an admiration is only agreeahle with leisure and a great stilnesse of place;' the reason is at hand, and may be drawne out of our former discourse, where we doe shew that solitary and silent places doe mightily helpe and nourish our Phantasie, the only means Artificers doe worke, and lovers of Art doe judge by: seeing also that a perfect and accurate admirer of Art is first to conceive the true

Images of things in his minde, and afterwards to applie the conceived Images to the examination of things imitated, it is cleare that neither of these can bee performed without the Imaginative facultie [...]

As manie therefore as resolve to follow this same contemplation earnestly, doe sometimes purposely take certaine Images of things conceived, and turne them many wayes, even as one lumpe of waxe useth to be wrought and altered into a hundred severall fashions and shapes: but principally do they labor to store up in their Phantasie the most compleat Images of beautie. Such Artificers as worke in brasse and colours receive out of the naturall things themselves those notions by the which they do imitate the outward lineaments, light, shadows, risings, fallings; they pick out of every particular body the most excellent marks of true beautie, and bestow them upon some one body: so that they seem not to have learned of Nature, but to have strived with her, or rather to have set her a law. For who is there, I pray you, that can shew us such a compleat beautie of any woman, but a quick-sighted Judge will easily find in her something wherein she may be esteemed to come short of true perfection? For although the whole absolutenesse of perfection doth consist in the rules and dimensions of Nature; yet doth the commixtion of both parents, the constitution of the place, aire, and season very often detract something from the naturall forme: seeing then that Artificers themselves doe not borrow the Image or patern⁶ of a most excellent beautie from one particular worke of Nature; so is it likewise requisite, that Lovers and Well-willers of Art should not content themselves with the contemplation of any one particular body, but that they should rather cast their eyes upon severall bodies more exactly made by Nature, observing in them the differences of age, sexe, condition: and you shall seldome see them rest here, but they will fixe their eyes also upon many other naturall hodies, studying alwayes to enrich their Phantasie with lively impressions of all manner of things. They doe marke the wide heaven beset with an endlesse number of bright and glorious starres; the watery clouds of severall colours, together with the miraculously painted raine-bow; how the great Lampe of light up-rearing his flaming head above the earth, causeth the dawning day to spread a faint and trembling light upon the flichering gilded waves; how the fiery glimmering of that same glorious eye of the world, being lessened about noon-tide, lesneth the shadowes of all things; how darksome night beginneth to display her coal-black curtain over the brightest skie, dimming the spacious reach of heaven with a shady dampe:⁷ they observe likewise the unaccessable height of the mountaines, with their ridge somtimes extended a good way, somtimes cut off suddenly by a craggie and steep abruptnesse; pleasant arbors and long rowes of lofty trees, clad with summers pride, and spreading their clasping armes in wanton intricate wreathings; thick woods, graced between the stumpes with a pure and grasse-greene soile, the beames of the Sunne here and there breaking through the thickest boughes, and diversly enlightning the shadie ground: gently swelling hillocks; plaine fields; rich meadows; divers flowers shining as earthly starres; fountaines gushing forth out of a main rock,⁸ sweet brooks running with a soft murmuring noise, holding our eyes open with their azure streames, and yet seeking to close our eyes with the purling noise made among the pebble-stones; low and smoakie villages; stately cities, taking pride in the turrets of their walls, and threatning the cloudes with the pinnacles of their spear-like steeples. They doe consider in Lions, horses, eagles, snakes, and all other creatures,

wherein the absolute perfection of their shapes doth consist: propounding unto themselves likewise parliaments, sacrifices, festivall meetings and dauncings, husbandrie-worke, smiths forges, footmen running a race, fishers, sailers putting off from the shore, or else landing, faire and foul weather, the sea calme and boisterous, great armies of men, depopulations of the countrie, surprisings of cities, and whatsoever useth to fall out in an expugnation⁹ of a great and populous towne [...]

It appeareth now what care the well-willers of Art use to take about the exercising and preparing of their phantasie, seeing they do by a most accurat Imagination designe and make up in their mindes the compleat pictures of all kind of naturall things; and thus provided, they doe very often examine the works of great Artificers with better successe then the Artists themselves, the severitie and integritie of whose judgements is often weakened by the love of their owne and the dislike of other mens workes. As for the common sort of people, of them saith a certaine *Painter* very well in *Plutarch*, that ‘rude spectators and such as are nothing at all acquainted with matters of Art, are like them that salute a great multitude at once; but that neat spectators on the contrarie, and such as are studious of good Arts, may be compared with them that salute one by one: the first namely doe not exactly looke into the workes of the Artificers, but conceive onely a grosse and unshapen image of the workes; where the others going judiciously over every part of the worke, looke upon all and observe all what is done well or ill.’ *Tullie* doth call this same facultie of our mind ‘intelligens judicium,’ that is, an ‘intelligent judgement.’ We learne likewise out of the same Author that Lovers and well-willers of Art were named ‘elegantes,’ that is, ‘neat and polished men;’ and that they on the contrary were called ‘idiotae,’ that is, ‘idiots,’ the which had no skill at all and did not care for the delicacy of rare workes: ‘how many things doe Painters see in the shadows and eminences,’ sayth *Tullie*, ‘the which wee cannot see?’ Wherefore, ‘as that kinde of hearing that doth onely discerne the sound,’ sayth *Epictetus*, ‘may very well be called the common hearing; and the hearing that doth discerne the tunes, is now no more a common but an artificiall hearing;’¹⁰ so is there also great difference of seeing: ‘the sight of one man is better by nature,’ sayth *Plutarch*, ‘then the sight of another: so are likewise the minds of Painters by Art exercised to discerne beautie in all kinde of shapes and figures. *Nicomachus* therefore hath very fitly answered an idiot, that could see no beautie in that same famous *Helena* painted by *Zeuxis*, “Take my eyes,” sayd *Nicomachus*, “and you shal think her to be a goddesse.” *Aelianus* doth tribute this same apophthegme to *Nicostratus*: it doth then appeare that it is not enough wee should have eyes in our head as other men have, but it is also required here that we should bring to these curiosities ‘eruditus oculos,’ that is, ‘learned eyes,’ as *Tullie* termeth them.

¹ Junius here directly follows, and in the Latin more fully quotes, Pliny who, persuaded by the ‘consent of the nations,’ recognizes the inner connection between beauty, order, and the universe which is manifested in the terms the Greeks and Romans employ for *universe*. [...]

² ‘Convicted’ = convinced.

³ ‘Flurt’: a quick or sudden movement.

⁴ ‘By a fore-determined advise’ = on the basis of previously established principles.

⁵ ‘Forward’ = impulsive or passionate.

⁶ 'Image or patern' translates *idea*.

⁷ 'Lesneth': lessens. 'Shady damp': probably the evening mist.

⁸ 'Out of a main rock' = out of a solid rock.

⁹ 'Expugnation' = storming.

¹⁰ 'Artificiall' = trained, skilled.

2 Peter Paul Rubens (1577–1640) Letter to Franciscus Junius

Although he was born in the German city of Heidelberg and spent most of his working life in England, Junius considered himself Dutch. It is therefore not surprising that when *De Pictura Veterum* was published in 1637 he should have sent copies to the two most prominent artists of the period whose careers likewise manifested a close connection between England and the Low Countries. Van Dyck and Rubens both seem to have appreciated the gift, but Rubens composed the more considered response. Apart from Flemish salutations, he did so moreover in formal Latin, which ensured that his letter was incorporated as a testimonial in subsequent editions. That said, Rubens was far from unequivocal in his praise of Junius' work. The burden of his reservation lay precisely in the area of the relation between the classical and the contemporary. The issue was in the air: in France the 'quarrel of the Ancients and Moderns' was about to get under way (see IA6 and 7). And Junius' book, for all its erudition, for all its concern to establish the visual arts as the equal of literature, contained not a syllable on the achievements of the Italian Renaissance. So Rubens, although fulsome in his praise of Junius' scholarship, nonetheless expressed the hope that someone could perform a similar task not for lost works of art, but for living works which it was possible to see, and against which intellectual claims could be measured. In essence, as Junius' modern editors have pointed out, Rubens wanted a *De picturis Italorum*. We have taken the text of Rubens' letter from the translation printed as Appendix II to Franciscus Junius, *The Painting of the Ancients*, edited by Aldrich, Fehl and Fehl, op. cit., pp. 325–30.

Sir:

*You must for some time have wondered why you did not hear from me that I had received your book, which, as appears from your letter of 24 May, was sent to me before that date. However, I beg you to believe that the book was handed to me only a fortnight ago by a certain Leon Hemselroy of this city with many apologies for such a late delivery. That is also the reason why I did not answer your letter; I first wanted to see and to read the book, and this I have now done with attention. And, in truth, I find that you have done great honor to our art by digging out again with such diligence this immense treasure from all of antiquity, and by making it available to the public in such excellent order. For, to sum it up in one word, your book is truly a generously proffered hoard of all the examples, the opinions, and the tenets promoting the dignity and splendor of the Art of Painting which the ancients enshrined in their literature and which have, to our very great benefit, survived to our day. I find that you have to perfection done justice to the title and design of your book *De pictura veterum* and, moreover, that the admonitions and the rules, the judgments, and those examples which you have inserted afford us the greatest illumination and are put forth with admirable erudition and in a most elegant language. The entire work is laid out perfectly in proper sequence, and filed and polished with unusual care, from head to foot.*

But now that we can more or less respond to the *exempla* of the ancient painters in our imagination – as well as each of us is able – I, for my part, would like it if at some time it were possible to compose with the same diligence a like treatise on the paintings of the Italians. They provide examples, or prototypes, which to this day are before the public. One can point at them with one's finger and say: 'here they are!' For those things which touch our senses are more sharply imprinted on the mind; they remain with us and demand a more minute examination. In addition they offer students a more fruitful scope for their improvement than does the study of a subject which reveals itself to us only through our imagination, in a dream, as it were, and to such an extent overlaid with words that, grasped three times in vain, they often elude us (as the image of Euridice eluded Orpheus), and frustrate a student in his hope. In this matter we artists speak from experience. When we attempt to render visible in its proper dignity a famous painting by Apelles or Timanthes that Pliny or other authors describe in detail, who among us will not produce a piece of work that is insipid or alien to the grandeur of the ancients? Each, indulging his own genius, makes a new wine instead of the bittersweet Opimian of the ancients and injures those great shades whom I honor with profound veneration. I adore their very footprints, as it were, rather than that I claim to come near them, even in my imagination.

I beg you, Sir, to receive in good part what I have in a friendly spirit felt free to say in the hope that after such a good entrée you will not refuse us the main course itself for which we all eagerly long because so far none of the persons who have offered us such matter has satisfied our appetite: there is need to proceed to particular cases, as I said.

With this I wholeheartedly solicit your favor and, thanking you greatly for the honor which you bestowed on me by the presentation of your book and by your friendship,

I remain ever, Sir,
your humble and affectionate servant,
Pietro Paolo Rubens

Antwerp, in a hurry and
'standing on one foot,'
the first of August 1637

3 Francisco Pacheco (1564–1644) from *The Art of Painting, its Antiquity and Greatness*

Pacheco was a painter and poet as well as a writer on the theory of art. The bulk of his career was spent in Seville, although he visited Madrid and Toledo, among other centres of Spanish art. He also maintained contact with other painters, including El Greco. Pacheco was an established artist, though never a very eminent one outside Seville. He could, however, claim to have been the first teacher of Diego Velázquez; indeed Velázquez subsequently married his daughter. Pacheco played a leading role in the intellectual life of Seville. The intelligentsia there was closely bound up with the Church and Pacheco was no exception. His most important commissions came from the Church and his ideas about both the purpose and the subjects of art were influenced by his religious orthodoxy. Moreover, this was no merely ideological commitment to the Counter-Reformation. Pacheco took an active role as an inspector – and censor – of art for the Inquisition. He

is now best known for the compendious treatise on art, the *Arte de la pintura: su antigüedad y grandeza*, which he compiled throughout most of his career. The manuscript is believed to have been complete by the late 1630s, but it was only published posthumously in 1649, five years after his death. The *Arte de la pintura* is in three books, the first two of which concern the theory of art, the third being a handbook of practical instructions for the making of a painting. Extracts from the third book are printed below as IE5. The present selection is made from the first two books. The majority of texts in the present section of part I concern the relationship of modern art to the art of pagan Antiquity. But in the age of the Reformation and Counter-Reformation, another important aspect of determining the importance of art concerned its relation to the almost equally long-lived Christian tradition. In Catholic Spain, this was pre-eminent. Pacheco discusses technical parts of art, such as the composition of a picture and the colours to be employed, but his main emphasis is on painting as a means to a higher end. In his view painting matters because, more than any other art, it can transcend earthly existence and assist in the apprehension of the divine. From this perspective, art is far from an independent pursuit. The value of a work of art is directly related to the correctness of its religious content. In our selections, Pacheco begins by asserting that the principal task of art is imitation. But he has a very specific form of imitation in mind. For Pacheco the purpose of art is to instil belief in Christian truth, and what he does here is to prescribe the correct criteria of imitation for specific religious subjects: Angels, the Immaculate Conception and the Annunciation. The extracts have been translated by Nicholas Walker, from F. J. Sánchez Canton ed., *Arte de la Pintura*, Madrid: Instituto de Valencia de D. Juan, 1956, vol. I, pp. 212–19, vol. II, pp. 193–4, 200–4, 208–12, 231–4.

Book I. Chapter XI: On the Purpose of Painting and of Holy Images, and the Good they do, and on the Authority they hold within the Catholic Church

When elucidating the purpose of painting, as we have here essayed to do, it is imperative to employ a distinction, one that has already been drawn by the Church Fathers, in order to clarify the issue: they say that the work has one purpose [*fin*] and the worker [*operante*] who produces it another. And in accordance with this teaching, I would likewise say that the painter has one purpose, and painting another. The purpose of the painter, considered simply as a craftsman, will be to acquire, by means of this his art, wealth, fame or credit, to procure enjoyment, to perform a service for another, or to labour for his own pastime or some such similar reason. The purpose of painting, ordinarily speaking, will thus be to depict, through imitation, the represented object with all possible boldness and propriety. This is what some call the very soul of painting because it endows the same with apparent life and treats beauty and the manifold variety of colour and other embellishments merely as accessories thereto. Hence it was that Aristotle averred that in confronting two different paintings, the one adorned with beautiful colours but little resembling its object and the other executed in straightforward lines but very faithful to the truth, the former must be adjudged inferior in relation to the latter. And this is because the former presents merely accidental features, while the latter encompasses the fundamental character and substance of the object and thus involves representing what is to be imitated through good drawing and perfect fidelity. If we now consider, however, the aim of

the painter precisely as a Christian craftsman (and it is only with such that we are here concerned), he could be said to entertain two purposes, one principal and another secondary or subsidiary. The latter, and less important, purpose might be to ply his craft for gain or fame or some other reason (as remarked above). But this should still be governed by the appropriate circumstances of person, place, time, and form, so that no one could fittingly accuse him of exercising his talent in a reprehensible fashion, or of working to thwart the highest purpose of all. The principal purpose, on the other hand, will be this: to attain unto a condition of blessedness through the study and the toil of his profession as undertaken in a state of grace. For a Christian, who has been expressly created for holy things, cannot feel satisfied in his deeds if his eyes are set so low that he strives merely after human reward and worldly recompense. Much rather will he desire to lift his eyes to heaven and pursue a different end, one far greater and more excellent, and one freely devoted to things eternal. And precisely in this sense Saint Paul would often warn both servants and all other men to remember, when ministering unto their neighbours, that this was chiefly for the sake of God, saying unto them: 'You who are servants obey your masters on earth not from due compliance or a wish to appear well in their eyes, but rather as servants of Christ who know that each one will receive his reward from the Lord in accordance with their deeds.' And again elsewhere he says: 'Whatsoever thing you do, do it from the heart as if you knew that you were at once serving and not serving men, that you will receive your full reward from the Divine Majesty.' And if we claimed before that the aim of painting, considered solely as an art, was that it must resemble with propriety what it undertakes to copy, we may here add that, practised as a craft by a Christian man, it will assume a still nobler shape, and find itself raised thereby into the very highest rank of the virtues. This privilege has its source in the greatness of God's law: all acts and deeds, therefore, which might otherwise be seen as very lowly, if they are only closely meditated upon and dedicated to the eternal purpose, will fortify and adorn themselves with the proper merits of virtue. And on this account, the purpose of art in itself is neither denied nor destroyed, but finds itself rather exalted and magnified by addition of this new perfection. Speaking therefore of our present theme of painting, which identified the sole purpose of the latter as the faithful depiction of what it essays to imitate, we see how, as an act of virtue, it comes now to wear a new and richer vestment still. For over and beyond the question of resemblance, painting here elevates itself to a supreme purpose in looking to eternal glory. And in serving thereby to turn men's faces away from every kind of vice, painting itself leads them rather towards the true veneration of God our Lord.

Thus we can see that Christian images are directed not only towards God, but also towards ourselves and our fellow men. For there is no doubt that all virtuous works are capable of serving at once the glory of God, our own instruction, and the edification of our fellow men. And the more these three elements are present, the more the work will be esteemed, for it is these elements which comprise the sum of Christian perfection. [...] Thus the pagans, in their blindness, when they wished to celebrate Jupiter, Minerva, Neptune or any of the other gods, could find no fitter way of doing so than by fashioning images and statues in great abundance. The Greeks, the Romans, and other nations, have also all availed themselves of this activity in

order to glorify their emperors or other celebrated men of record. Indeed all peoples, by a very instinct of nature, have done the same: desiring to give evidence of their respect and reverence towards some great prince or other eminent personage, they have erected a public statue to the latter. Thus it is no cause for marvel if the Christian law has likewise availed itself of the same means (although its own purpose is divine and sacrosanct) and permitted the use of sacred images in order to honour the true God through his saints, and thereby to extend His infinite power, mercy, justice and wisdom even further and spread the glory and majesty of His name into every corner of the earth.

As we have said, these images also serve us. Since our Lord God desires that all should praise Him with body and soul, such holy images help to procure outward expression for the reverence we bear within us and allow us to dedicate this reverence to God as an oblation and kind of sacrifice. Thus we give proof of the obligations we have towards Him, and of the boundless joy we feel upon beholding His Divine Majesty represented always before our eyes through painting that shows Him as Our Father and Lord.

These images, moreover, provide marvellous help in fulfilling both the practical needs and the spiritual edification of our fellow men. If we now consider the three kinds of good discussed by the philosophers – namely those of pleasure, utility and honest truth – we see that holy images encompass all of them perfectly, in so far as we promote these qualities by means of such holy images. Experience teaches us that nothing is more pleasing to the eye than is a perfectly executed work of painting, as Petrarch puts it in this celebrated passage: ‘The delight which a well-painted picture procures, if properly considered, is one that elevates us to the realm of heavenly love by revealing its own divine origin. For is there anyone who delights in the little brook and hates the spring from whence it is born?’

As far as utility is concerned, the holy images perform innumerable services by disguising imperfections and wonderfully delighting the senses; they reveal splendour and beauty wherever they are displayed, for there is no place, no matter how lowly or crude it may be, which is not fittingly enhanced through decoration with the same; and they preserve antiquity, in so far as many things would now be forgotten had they not been once depicted for us. And furthermore, they serve the common good by acting as books for those who cannot read. Leaving aside much that could be said on this score, we shall now pass on to consider the quality of honest truth.

It is difficult to overstate the good to be obtained from holy images: they perfect our understanding, move our will, and refresh our memory of divine things; they reproduce within the soul the greatest and most powerful effects that can be produced by any and every thing in the world; they present heroic and magnanimous acts of patience, justice, chastity, meekness, charity and contempt for worldly things before our very eyes and so impress them upon our hearts that we are instantly moved to seek virtue and to shun vice, and thereby they serve to set us upon the proper road that leads to blessedness.

In addition to what has been said, there is also another very important effect of Christian painting that concerns the very purpose of the Catholic painter: for in the guise of an orator, the latter endeavours to persuade the people and bring them, by means of painting, to embrace things conducive to religion. For the sake of greater

clarity let us follow the teachers of oratory who distinguish between the office and the purpose of the orator. What I call the office of the orator involves all the means that are employed to attain a given purpose, and the purpose that constitutes his ultimate end and fundamental intention. Thus, as the means of the orator is speech that is appropriate and to the point, so his purpose will be to convince us of his argument. This purpose does not, as such, lie within his own hands, although the various means designed to accomplish it do. Just as the physician as such is incapable of healing the sick person, which is the proper purpose of medicine itself, although he is capable of treating him in a knowledgeable fashion, so too it is with the painter who, like the orator, will be obliged to paint in such a way as to attain his express purpose by means of the holy images he depicts. And this is not always successfully accomplished. If only the painters of today properly fulfilled these obligations! But how many of them indeed are even capable of understanding these my words? And what an irreparable shame this represents! This purpose, which consists simply in persuasion, will be achieved differently in accordance with the particular circumstances, just as the orator whose first desire is to persuade his hearers will nonetheless argue now for peace, and now for war, now to punish or to forgive or to reward, and so forth. Thus the painter may have several purposes in mind, according to the variety of things he is called upon to depict. But I claim that the principal purpose, as far as Christian images are concerned, will always be to persuade men to piety and raise them towards God. Touching immediately upon religion as these images do, and possessing the virtue of inspiring us to the required worship of God, it follows that their proper function is to move men to obedience and subjection. While it is quite possible that other specific purposes may also be involved, like encouraging men to penitence, to suffering gladly, to charity and contempt for the world, or to other virtues, these are all so many ways of uniting man with God, which latter is itself the very highest purpose to which the painting of holy images can aspire, as we have now discussed, it seems to me, at sufficient length already.

* * *

Book II. Chapter XI: Some Remarks of Importance concerning the Sacred Stories and the Truth and Fidelity with which they are to be Painted, in Accordance with Divine Scripture and the Holy Doctors of the Church

Although it may seem that in my book I have already insisted sufficiently and often enough upon the fidelity which is to be preserved in the painting of sacred scenes in the measure to which the latter have been dictated by the Holy Spirit and acknowledged by the Holy Doctors of the Church, these few further counsels will not be without value. And this in especial for the less cautious artists (since those that are skilled in this art love not merely their freedom, but tend to bear the yoke of reason with some reluctance).

The philosophers can exercise their quills to marvellous effect in the matter of these humble precepts, and in effect, as I have already averred, *tractent fabrilia fabri* ('each to his own office'). Harvested as they have been from my own seventy years of experience, these views will furnish good counsel to others. Whatever good and

excellent merits they may have, I owe them principally to the Company of Jesus. Since the year 1605 I have found myself, on occasion and according to my own desire, most richly rewarded with the teachings and observations approved by the wisest of men. Thus my words of advice to painters concerning the fidelity with which they must proceed will not appear alien to my own profession, particularly since as I have been expressly honoured by the Holy Tribunal of the Inquisition in being granted a special permission to examine the faults committed in such paintings, either through the inadvertence or malice of the artists concerned, a responsibility officially laid upon me on 7 March 1618. The following is an extract from the same:

‘Given the full confidence that we entertain in the person of Francisco Pacheco, resident of this town, and excellent painter and brother of Juan Pérez Pacheco, Member of the Holy Office, and after having acknowledged his wisdom and prudence, we commit and charge him henceforth with the special care of overseeing the painting of sacred matters and of inspecting the said paintings in their workshops and in public places.

[...] If he find anything whatsoever to reprimand in such paintings, he must draw them at once to the attention of the Masters of the Inquisition in order that, once the pictures have been seen, the appropriate steps may consequently be taken.’

On the Painting of Angels

The question concerning the depiction of angels should be treated . . . by virtue of the perfection of their own nature and the circumstance that they represent the faithful image of their Creator. Some painters depict them with the face and body of a woman, and not merely with their hair decorated with buckles and braid, but also endowed with breasts, which is quite unworthy of their perfection.

Yet it appears from the divine writings, and this is also approved by all the councils of the faith, that they bear the face of a man and not a woman, and that is why they are commonly given the name of *viri* in Holy Scripture (as one learned member of the Company of Jesus, reputed for the subtlety of his observations, has already emphasized).

And on this account I have heard it said that a certain number of the interpreters of sacred things have refused to follow Arias Montano in claiming that one of the cherubim of the Ark of the Covenant bore the figure and face of a woman: this rather denotes a weakness, being an unworthy thing in respect to angelic spirits that are vigorous substances of a spiritual order.

One should therefore represent angels as youthful, between the age of 10 and 20 years, which is the median age and corresponds, according to Saint Denis, to the force and vital power that remains ever constant in the angels, youthful beardless beings with beautiful and pleasing faces, with lively and shining eyes – although the virile gaze, the abundant and shining hair, fair or chestnut in hue, alluring and well-proportioned, is itself an external sign of the beauty of their souls, as Saint Augustine says of the appearance of the Archangel Gabriel when he attends upon the Most Holy Virgin. In the Old and New Testaments the angels also most commonly show themselves under the aspect of young men of suchlike age and comely presence.

Sometimes they also reveal themselves as magnificent children, as is recounted in the history of the virgin and martyr Saint Dorothea: 'There appeared an angel with the figure of a child: he bore a basket which contained three magnificent apples and three wonderful roses which the Saint was sending to Theophilus from the garden of her husband.' [...]

The cherubim of the Ark of the Covenant were also children, and it is with the face of children that one ought to depict the seraphim as well. Furthermore, it also transpires that angels, through the will of the Lord, through human necessity and the variety of the tasks they are called upon to perform, may assume the form of a captain, of a soldier at arms, of a traveller, of a pilgrim, of a guide or shepherd, of a guardian or minister of divine justice, of an ambassador or herald of good news, of a consoler, of a musician playing upon his instruments, as properly required in each case.

Thus it is with Saint Michael in his struggle against the devil, with the angel that guards the portals of Paradise, with the angel which brought death to the first-born, with the angel that utterly destroyed the army of Sennacherib . . . with the angel that appeared to Tobias, with the three angels that appeared to Abraham and consumed the cities with fire, with those that attended the birth of Christ, His Resurrection and His Ascension. Those painters who depict garments and devices in strict accordance with the historical story will succeed best in this respect.

And here I would also specify something which is well understood amongst the Doctors of the Church, namely that the angels, the virtues and the hierarchs, in accordance with the ancient histories, must be depicted girt with weapons and Roman armour, and that one should quite shun what is done in this regard in our times.

One may also depict some angel-children as naked new-born babes: including here those which are shown flying in a decent and responsible manner; the arms and shoulders of the other ones naked, the feet clad in ancient buskins or naked, dressed in tunics of silk or variously coloured cotton against pure white and shining vestments: they have often thus appeared in white, a symbol of their innocence and purity, the rich buckles of their belts studded with precious stones, an image of their eagerness to serve the Lord and a sign of chastity. [...]

Ordinarily one should paint angels with magnificent wings, diversely coloured in imitation of nature . . . not so much because God has created them thus but rather to convey their essentially ethereal character, the agility and speed with which they are endowed, the manner in which they may swoop down from the heavens quite unburdened with corporeal weight, their spirits ever concentrated upon God, moving amongst the clouds because the heavens are indeed their proper abode and from whence they may gently communicate to us that inaccessible light in which they rejoice.

How to Paint the Immaculate Conception of our Lady

Some say that this subject should be painted with the Christ Child in Her arms because some older images of this kind have been found. This opinion is likely founded upon the fact, as the learned Jesuit Father Alonso de Flores has observed,

that Our Lady enjoyed freedom from the taint of original sin from the very first instant by virtue of her dignity as the Mother of God, even though the moment had not yet arrived when she conceived Jesus Christ in the womb. Thus from that instant onwards, as the Saints know, she was Mother of God and never ceased at any time to be so. She was in such a way that it was quite beyond possibility for her to be better, just as it was quite beyond possibility for her to bear a better son. But without disputing the right of painting Her with the child in Her arms, for those devoted to painting Her thus, we hold nevertheless with those who paint Her without the Child. This is the more customary manner of proceeding. [. . .]

In this most lovely mystery the Lady should be painted in the flower of her youth, 12 or 13 years of age, as a most beautiful young girl, with fine and serious eyes, a most perfect nose and mouth and roseate cheeks, wearing loose her most beautiful golden hair, in short with as much perfection as the human brush is capable of achieving. Man is possessed of two beauties, that of the body and that of the soul, and the Virgin was possessed of both without compare. In body She was a miracle, as Saint Dionysos averred, and no other being so closely resembled her Son who was the model of all perfection. Other children may delight in reflecting the attributes of their father and mother who represent different principles. But Christ our Lord, not having any earthly father, resembled in everything His mother who, after Her son, was the most beautiful thing that God created. And thus we find her praised by the Holy Spirit: *tota pulchra es amica mea* (a text that is always cited in this kind of painting). She should be painted with a white tunic and a blue mantle, just as She once appeared to Dona Beatrice de Silva, a Portuguese lady, who later entered the Royal Convent of Santo Domingo in Toledo to found the Order of the Immaculate Conception, confirmed by Pope Julius II in 1511. She is clothed in the sun, an oval sun of whites and ochres must surround the whole image, sweetly fusing the latter with the sky. She is crowned with stars, twelve in all, arranged in an illuminated circle betwixt the rays that shine forth from Her sacred forehead. The stars are painted as very light spots of pure, dry white excelling all rays in their brightness. The monk Don Luis Pascal painted these better than anyone else in the Scenes of Saint Bruno which he fashioned for the great Carthusian monastery. An imperial crown should adorn Her head which should not hide the stars. Beneath Her feet we behold the moon. Although it is a solid planet, I myself rendered it light and translucent, hanging over the landscape as a half-moon with the extremities pointing downwards. If I am not mistaken, I was probably the first to lend more majesty to these adornments, something in which others have since followed. Especially with regard to the moon, I observed the learned opinion of Father Luis del Alcázar, illustrious son of Seville who writes: 'The painters commonly turn the moon at the feet of this figure upwards. But it is evident amongst mathematicians that if the sun and the moon are face to face, both extremities of the moon must be turned downwards lest the figure be represented as standing upon a convex form.' This was necessary in order that the moon, receiving its own light from the sun, would then illuminate the female figure standing upon it. Standing upon a solid but translucent body, as we have said, the figure had to rest upon the outer surface of the same. In the upper part of the painting one usually arranges God the Father or the Holy Ghost, or both, together with the words spoken by the Heavenly Spouse, as adverted to above. The various

attributes of the earth will be suitably distributed in the landscape, and those of heaven will be arranged, if so desired, amongst the clouds. Seraphim or full-bodied angels bearing some of these attributes may also be introduced. I forgot the dragon, the common enemy of man, whose head the Virgin broke when She triumphed over original sin. I always find it easy to forget this figure. And the truth is that I always depict him much against my will, and indeed omit him whenever I can in order not to embarrass my painting with him. But regarding all that I have said, other painters are, however, quite at liberty in this to try and do better.

The Painting of the Annunciation

[. . .] Our Holy Lady must be depicted on her knees, for that is surely what is most probable; before her some kind of table or dais bearing an open book; with a candlestick to one side . . . This is properly approved by the venerable Father Juan Jeronimo of the Company of Jesus, with reference to a painting from my own hand. The angel should not suddenly appear from above or flying in upon the scene with naked legs, as some artists have depicted it; on the contrary, the angel should be clothed with all decency, should himself be kneeling upon the ground, as a sign of reverence and respect, before his Lady and Queen; while she, at the age we have here ascribed to her – of 14 years and 4 months – must appear humble, modest and very beautiful, with a delicate veil covering her spreading hair. She is dressed in a blue mantle and a pink robe secured with a girdle, as was the general custom amongst the Hebrews and as Christ himself also wore. The angel will have brightly coloured wings and will be dressed in refulgent white garments, just as Federico Zuccaro has properly succeeded in depicting the scene in a painting of *The Annunciation* now in Rome; one may also place some lilies in the angel's left hand, for this is how it has traditionally been depicted since the time of the Apostles. Our Lady has her hands folded or her arms crossed as if she were about to say the final words: *ecce ancilla Domini*. And indeed, as soon as these words were uttered, the holy mystery was itself accomplished: God was made man within Her womb. Right at the top of the picture the artist generally depicts a scene of heavenly glory with resplendent images of the Eternal Father, the seraphim, the angels, and the Holy Spirit in the likeness of a dove. One should here take great care not to paint any other angel that could rival the figure of Gabriel, lest the scene of salutation be thereby obscured!

Although these words should suffice upon this subject, I should like to add, for the sake of greater clarity, some further remarks on the latitude that painters of this scene have generally been accorded, and which we have ourselves observed amongst the best of them, in order that they might dispense with the same in future.

Michelangelo and Titian have both produced engravings of the scene. The former depicted the Virgin standing, as if she were about to flee from the angel, while the latter showed her turning away her face as the angel enters. Both of them represented the angel as more or less naked. But the boldest step of all was taken by the anonymous author of an engraving characterized by a scriptural text appended at the bottom: *Suscitabo David germen justum* (Jeremiah 23). For here, instead of the Holy Spirit, we are presented with a ray of light falling upon the head of the Virgin, and upon the ray a naked infant Jesus bearing a cross on His shoulder, amidst a

jubilation of angels with God the Father in glory. This picture is not merely a source of error, and dangerous in itself, but is actually heretical, as Molanus has said, in suggesting the interpretation of Valentinus and his followers, which the Holy Church has long since condemned as heresy for teaching that Christ Our Lord came down from heaven in corporeal form already. [. . .]

The lily held in the hand of the angel corresponds to Holy Scripture; it signifies the exaltation of the Virgin from the humble state in which she originally found herself to the highest and noblest state of all, that of the Queen of Heaven and Mother of God, according to a learned member of the Society of Jesus.

4 Jan de Bisschop (1628–1671) Dedication to Constantijn Huygens from *Icones I*

The Dutch draughtsman and etcher Jan de Bisschop was responsible for two substantial collections of prints, the *Signorum veterum icones*, published in The Hague in two volumes in 1668 and 1669, and the *Paradigmata graphices variorum artificium*, published in 1671, first in The Hague and then, in a revised form, in Amsterdam. The *Icones* contain 100 prints after classical and classicizing sculptures. De Bisschop was dependent on material available in the Northern Netherlands, and his work is largely based on drawings made by other artists, most of them from Roman figures that had been heavily restored. Some statues are shown in multiple views. The prints in the *Paradigmata* reproduce drawings by established masters, the majority of them Italians from the sixteenth and early seventeenth centuries. The volumes were highly successful in their intended aim, to furnish Dutch artists with a source of ideal instructive models for figures and figure compositions. In fulfilling this function they played an early and significant part in the revival of the classical tradition in the Low Countries during the later seventeenth century. In his dedication, De Bisschop rehearses a litany of classical authority – from ancient times, via Raphael and Michelangelo, to Poussin – that was the common currency of artistic theory at the time, particularly in France. In his acknowledgement of those ‘who contend that nature herself is the best example’, there may be some recognition of the relatively *unclassical* work of those Dutch artists who were De Bisschop’s own contemporaries. Yet in the matter of what to select, it is to the ‘guiding hand’ of Antiquity that he recommends artists to look, while in the dedication of the *Paradigmata* he is clear in his condemnation of those Dutch artists who find artistic virtue in ‘ugliness’. The dedication to *Icones* was originally printed in both Dutch and Latin. De Bisschop’s use of the latter suggests that this was a publication designed to attract the interest of educated humanists. Constantijn Huygens the Younger (1628–1697) was a close friend of De Bisschop, a member of a cultured family of scholars and collectors (see IE2, 3), and a fellow amateur artist. The present translation, made from the Latin text, is taken from Jan G. van Gelder and Ingrid Jost, *Jan de Bisschop and his Icones and Paradigmata*, ed. K. Andrews, Doornspijk: Davaco Publishers, 1985, pp. 89–90.

To His Worship Constantyn Huygens Lord of Zeelhem

It is not only on account of the many reasons which so closely attached me to you in the past, but also on account of one in particular that I thought it not unfitting to set your name at the head of this slight work of mine: you clearly feel the same as I do in

the estimation of those things whose images are shown here; namely that these antique monuments, sculptures, statues and marble tablets are of the highest artistic perfection, and the very best example for serious students of painting. This is no recent opinion of mine, but one which has become ingrained with time; from day to day it seems more true and indisputable, whether I consider it in my own judgement or that of another. When one examines the judgement of others, one is presented not only with the immense value attached to these things by experts, both in the past (Cicero in his *Verrine Orations*, Pliny in his *Natural History*, and other reliable authors refer to wonderful things almost exceeding belief) and in the present (as personal experience testifies), but also with the unanimous opinion of the greatest artists. Raphael of Urbino, Michelangelo Buonarroti and others are all known to have declared it in words and demonstrated it in what they did. They set all their work against this standard, so much so that they were often unashamed of transferring whole parts to their own works, incurring the charge of plagiarism as a result of their desire to imitate. The beholder is of the same opinion too, since he adjudges the most praiseworthy parts of their works those which most call forth the antique. Even the Venetians, whose excellence has always consisted more in colour and the art of the brush than in their use of drawing, could be adduced as evidence: Mantegna, Palma and others as well are said to have profited very greatly indeed from these examples. But let us look at the judgement of more recent times. Is not the sole thing which has made France (now deservedly owed the palm in this art) so skilled in art the fact that it paid close and thorough attention to the statues at Rome, and honourably received and esteemed Poussin, the imitator of statues? Now let me turn to my own judgement. Although it is weak, and can scarcely grasp a part of such skill, and I only see dimly, yet when I cast my still-wakening eyes around, and look on the muscles and superhuman strength of the Hercules, the gladiatorial energy of the athletes, manly old age in the Laocoon, an almost feminine softness in Antinous, youthful handsomeness in Apollo, well-turned limbs in Bacchus, a firm leanness in the Satyrs and Fauns, and the women represented now with delicate bodies and now with plump ones – and I pass over the various ages, actions, gestures, conditions, clothes, and many other things – I cannot stop wondering at the perfect grace in each and the most accurately distinguished variety of all of them, joined with the greatest simplicity and all the other excellent qualities. One can guess how many and how fine these are from the fact that even the greatest artists have rarely satisfied either themselves or others in restoring one or another part of a mutilated statue, and have not easily ventured upon the undertaking of this hazardous task. Still, I do not condemn those who contend that nature herself is the best example, and that it is she who should especially be followed. Inasmuch as all the perfection of the old masters takes its origin from her, she should also be sought out by more recent artists. But since antiquity so judiciously selected from so great a variety of things whatever is excellent in nature herself (where the beautiful is often mixed with the unadmirable) it is rightly regarded as the best guide and the Ariadne's thread, as it were, of this road. Not, indeed, that anyone should be solely intent on the qualities of the antique and be blind in his contemplation of nature and the living. Relying on the guiding hand of its example he should be able to select the beautiful and admirably turn the whole of nature to his own use. Without it this would clearly be difficult and uncertain. For

these reasons, therefore, I have been impelled to undertake what others have set out to do before me, and most recently, with everyone's applause, that great artist François Perrier; and I am publishing some images of this kind under the lustre of your name to gain favour for the work and authority for the opinion. In collecting them I have made use of the kindness and works of friends who drew them at Rome and were not unwilling to allow me to use them for this purpose. There are some other drawings besides, whose authors are unknown to me. I have thus made use of the eyes of others; but they are superior to my own. A greater number of drawings would have appeared if there had been a larger supply at my disposal. Should anyone be dissatisfied that several aspects of the same sculpture are represented, let him trust that they will be both of service and of pleasure to beginners. If there are any mistakes in the descriptions it will readily be forgiven, since I have not made use of my own knowledge, but have relied on the authority of others. Should this slight work win your favour and be of some value to you, and by your example to others as well, it will serve as a stimulus to greater undertakings, and will certainly testify that I remain,

Your Lordship's
most faithful servant,
Jan de Bisschop.

5 William Aglionby (d.1705) from *Painting Illustrated in Three Dialogues*

Despite the efforts of artists, scholars and patrons, including figures as eminent as Van Dyck, Rubens, Junius and the Earl of Arundel, the visual arts were not established in England during the seventeenth century as successfully as they were in France. This comparative failure is reflected in William Aglionby's *Painting Illustrated in Three Dialogues*. Besides providing an exposition of key concepts, Aglionby also felt bound to equip his audience with brief sketches of the lives of the most eminent modern painters, and perhaps most tellingly, with 'an explanation of the Difficult Terms'. Almost forty years after the founding of the Academy in Paris (see section IB), Aglionby's first concern is still to establish that the Painter is no mere 'Mechanick' but has a 'Title to the Liberal Arts'. It is noteworthy that, writing in the Restoration period, Aglionby is quick to lay blame for the comparative backwardness of the arts in England at the door of the Revolution. In his preface he observes that Charles I 'had once Enriched our Island with the noblest Collection that any Prince out of Italy could boast of: but those Barbarous Rebels, whose Quarrel was as much to Politeness and the Liberal Arts, as to Monarchy and Prelacy, dissipated and destroyed the best part of it' (p. 13). The following extracts are taken from the Preface and from the First and Third Dialogues 'Between a Traveller and his Friend'. The Preface asserts the status of painting as a liberal art (our extracts are from pp. 1–2 and 4–7). The First Dialogue introduces the Parts of art (our extracts are from pp. 1–11, 13–15 and 16–18). The Third turns to the matter of making informed judgements about art (our extracts are from pp. 97–9, 101–2, 104–6 and 115–22). Our source was *Painting in Three Dialogues, Containing some Choice Observations upon the Art together with the Lives of the Most Eminent Painters from Cimabue to the time of Raphael and Michelangelo*, London: John Gain, 1685.

Preface

If the desire of perpetuating our Memorys to posterity, be one of the noblest of our Affections here below, certainly those ARTS by which we attain that kind of Immortality, do best deserve to be Cultivated by us. Therefore Historians and Poets, who keep, as it were, the Registers of Fame, have always been Courted by the Great and by the Good, as knowing that the Merit of their Actions depended upon their Pens; but because those very Men through whose Hands such Glorious Atchievements were to pass, might either be led away with Passion, or swayed with *Prejudice*, to make a false Representation of them to the World. Providence yet kinder, gave us two Arts, which might express the very Lines of the Face, the Air of the Countenance, and in it a great part of the Mind of all those whom they should undertake to Represent; and these are, Sculpture and Painting. [. . .]

I shall not undertake to determine here, which of these two Arts deserves our Admiration most: The one, makes Marble-Stone and *Brass* soft and tender: the other, by a strange sort of Inchantment, makes a little Cloth and Colours show *Living* Figures, that upon a flat Superficies seem Round, and deceives the *Eye* into a Belief of Solids, while there is nothing but Lights and Shadows there: But this I may say in favour of the Art of Painting, whose praises I am now to Celebrate, That it certainly is of a greater Extent than Sculpture, and has an Infinites Latitude to delight us withal.

To see in one Piece the Beauty of the Heavens, the Verdant Glory of the Earth, the Order and Symmetry of Pallaces and Temples; the Softness, Warmth, Strength, and Tenderness of Naked Figures, the Glorious Colours of Draperies and Dresses of all kinds, the Liveliness of *Animals*; and above all, the Expression of our Passions, Customs, Manners, Rites, Ceremonies, Sacred and Prophane: All this, I say, upon a piece of portative Cloth, easily carried, and as easily placed, is a Charm; which no other Art can equal. And from this *Idæa* of the Art, we may naturally derive a Consequence of the Admiration and Esteem due by us to the Artist; he who at the same time is both Painter, Poet, Historian, Architect, Anatomist, Mathematician, and Naturalist; he Records the Truth, Adorns the Fable, Pleases the Fancy, Recreates the Eye, Touches the Soul; and in a word, entertains you with Silent Instructions, which are neither guilty of Flattery, nor Satyr; and which you may either give over, or repeat with new Delight as often as you please.

If these *Qualities* do not sufficiently recommend the Owner of them to our Esteem, I know not what can; and yet by a strange Fatality, we name the word Painter, without reflecting upon his Art, and most dis-ingeniously, seem to place him among the *Mechanicks*, who has the best Title to all the Liberal Arts.

First Dialogue

FRIEND: The extream delight you take in Pictures, is a Pleasure you have acquired abroad, for I remember before you travelled, all Pictures were alike to you, and you used to laugh at the distinction that some of your Friends did use to make of the Pieces of this and the other Master, saying, it was nothing but Humor in them.

TRAVELLER: What you say is very true, and when I reflect upon it, I cannot but blush at my own Ignorance, or rather willful Stupidity, that deprived me of one of the most Refined Pleasures of Life, a Pleasure as Lasting as Life it self, full of Innocency and Variety, and so Entertaining, that, alone, it often supplies the place of Company and Books; and when enjoyed in the company of others, it improves by being shared, and grows greater by the number of its Enjoyers, every one making some Observation, according to his Genius and Inclination, which still Illustrates the whole.

FRIEND: I must confess I envy you this Pleasure extreamly, for living, as we do, in a Country where the severity of our Climate obliges us to be much within Doors: Such a Pleasure as this ought to be Cherished, by all those who do not place their Felicity, as too many of us do, in a Glass of Claret: And I own, I would willingly be of your Society, but that there goes such a deal of knowledge to judg of a good Picture, that I despair of ever being qualified that way, being naturally not much given to take pains for any Pleasure.

TRAVELLER: You are very much mistaken, every one naturally is so far a judg of Painting, as to observe something in a Picture, that is like to somewhat they have observed in Nature, and that alone is capable of giving them delight, if the thing be well represented; but those indeed who joyn to that Delight, the particular knowledg of the manner how the Painter has mannaged his Lines, his Colours, his Lights and Shades, and how he has disposed his Figures, and with what Invention he has adorned his Story. They indeed, have more Pleasure, as having in all this a greater scope for their Observations; and yet this, though infinitely hard for the Painter to Execute, is but moderately difficult for the Spectator to judg of it, requiring only a Superficial Knowledg of the first Principles of the Art, and a constant Observation of the Manners of the Different Artists, which is acquired by viewing their Works often, and Conversing much amongst them.

FRIEND: That Superficial Knowledg of the Principles which you speak of, is wrapt up in such a company of hard Words, and crabed Terms of Art, that a Man must have a Dictionary to understand them, and a good Memory to retain them, or else he will be at a loss.

TRAVELLER: If he undertake this Task with Order and Method, it will prove extream easie; for by following each part of Painting in its proper Division, he will come to the knowledg of the Terms of the Art insensibly.

FRIEND: Pray in the first place, give me a Definition of the Art of Painting, that I may at once see what is aimed at by it, and performed.

TRAVELLER: The Art of Painting, is the Art of Representing any Object by Lines drawn upon a flat Superficies, which Lines are afterwards covered with Colours, and those Colours applied with a certain just distribution of Lights and Shades,

with a regard to the Rules of Symetry and Perspective; the whole producing a Likeness, or true Idæa of the Subject intended.

FRIEND: This seems to embrace a great deal; for the words Symetry and Perspective, imply a knowledg in Proportions and Distances, and that supposes Geometry, in some measure, and Opticks, all which require much Time to Study them, and so I am still involved in perplexities of Art.

TRAVELLER: It is true, that those Words seem to require some Knowledg of those Arts in the Painter, but much less in the Spectator; for we may easily guess, whether Symetry be observed, if, for Example, in a Humane Body, we see nothing out of Proportion; as if an Arm or a Leg be not too long or short for its Posture, or if the Posture its self be such as Nature allows of: And for Perspective, we have only to observe whether the Objects represented to be at a distance, do lessen in the Picture, as they would do naturally to the Eye, at such and such distances; thus you see these are but small Difficulties.

FRIEND: Pray, would you not allow him to be a Painter, who should only Draw the Objects he intended to represent in Black and White, or with bare Lines upon Paper.

TRAVELLER: Yes without doubt, if what he did were well Designed, for that is the Ground-work of all Painting, and perhaps the most difficult thing in it.

FRIEND: What is it you call Design?

TRAVELLER: Design is the Expressing with a Pen, or Pencil, or other Instrument, the Likeness of any Object by its out Lines, or Contors; and he that Understands and Mannages well these first Lines, working after Nature still, and using extream Diligence, and skill may with Practice and Judgment, arrive to an Excellency in the Art.

FRIEND: Me thinks that should be no difficult Matter, for we see many whose Inclination carys them to Draw any thing they see, and they perform it with ease.

TRAVELLER: I grant you, Inclination goes a great way in disposing the Hand, but a strong Imagination only, will not carry a Painter through; For when he compares his Work to Nature, he will soon find, that great Judgment is requisite, as well as a Lively Fancy; and particularly when he comes to place many Objects together in one Piece or Story, which are all to have a just relation to one another. There he will find that not only the habit of the Hand but the strength of the Mind is requisite; therefore all the Eminent Painters that ever were, spent more time in Designing after the Life, and after the Statues of the Antients, then ever they did in learning how to colour their Works; that so they might be Masters of Design, and be able to place readily every Object in its true situation.

FRIEND: Now you talk of Nature and Statues, I have heard Painters blam'd for working after both.

TRAVELLER: It is very true, and justly; but less for working after Nature than otherwise. *Caravaggio* a famous Painter is blam'd for having meerly imitated Nature as he found her, without any correction of Forms. And *Perugin*, another Painter is blam'd for having wrought so much after *Statues*, that his Works never had that lively easiness which accompanies Nature; and of this fault *Raphael* his Scholar was a long time guilty, till he Reform'd it by imitating Nature.

FRIEND: How is it possible to erre in imitating Nature?

TRAVELLER: Though *Nature* be the *Rule*, yet *Art* has the *Priviledge* of Perfecting it; for you must know that there are few *Objects* made naturally so entirely *Beautiful* as they might be, no one *Man* or *Woman* possesses all the *Advantages* of *Feature*, *Proportion* and *Colour* due to each *Sence*. Therefore the *Antients*, when they had any Great Work to do, upon which they would Value themselves did use to take several of the *Beautifullest Objects* they designed to *Paint*, and out of *each of them*, Draw what was most *Perfect* to make up One *exquisite Figure* [. . .]

FRIEND: Then you would have a Painter study these Figures of the Antients to use himself to those Proportions and Graces which are there Expressed, but how can that be here with us where there are few such or none at all?

TRAVELLER: I confess the want of them is a great hinderance to our Painters, but we have so many Prints and Casts, the Best things of that kind, and those so well done, that they may in a great measure supply the want of the *Originals*; and this added to the study of *Nature* it self, will be a sufficient Help to any one.

FRIEND: Would you have a Painter study nothing but Humane Figures?

TRAVELLER: That being the most difficult in his Art, he must chiefly Study it: But because no Story can be well Represented without Circumstances, therefore he must Learn to Design every thing, as Trees, Houses, Water, Clothes, Animals, and in short, all that falls under the notion of Visible Objects; so that by that, you may guess how much Time he must spend in this one part of Painting, to acquire that Readiness, Boldness, and Strength, to his Designs; that must be, as it were, the Ground-work of all he does. [. . .]

FRIEND: When a Painter has acquired any Excellency in Designing, readily and strongly; What has he to do next?

TRAVELLER: That is not half his Work, for then he must begin to mannage his Colours, it being particularly by them, that he is to express the greatness of his Art. 'Tis they that give, as it were, Life and Soul to all that he does; without them, his Lines will be but Lines that are flat, and without a Body, but the addition of

Colours makes that appear round; and as it were out of the Picture, which else would be plain and dull. 'Tis they that must deceive the Eye, to the degree, to make Flesh appear warm and soft, and to give an Air of Life, so as his Picture may seem almost to Breathe and Move.

FRIEND: Did ever any Painter arrive to that Perfection you mention?

TRAVELLER: Yes, several, both of the Antient and Modern Painters. Zeuxis Painted Grapes, so that the Birds flew at them to eat them. Apelles drew Horses to such a likeness, that upon setting them before live Horses, the Live ones Neighed, and began to kick at them, as being of their own kind. And amongst the Modern Painters, Hannibal Carache, relates of himself, That going to see Bassano at Venice, he went to take a Book off a Shelf, and found it to be the Picture of one, so lively done, that he who was a Great Painter, was deceived by it. The Flesh of Raphael's Picture is so Natural, that it seems to be Alive. And so do Titians Pictures, who was the Greatest Master for Colouring that ever was, having attained to imitate Humane Bodies in all the softness of Flesh, and beauty of Skin and Complexion.

Third Dialogue.

FRIEND: I have read with great pleasure the Lives of most of those Painters whom we discoursed of at our last Meeting, and that Study has given me so much Insight into the Art, that I must needs own, that a General Painter, such as *Raphael* and some others were, is a most extraordinary sort of Man; it being necessary he should not only have a Genius and Spirit infused from above, but also, that he be fraught with all the best part of acquired Knowledg here below; and I do no longer wonder now, that we have so few of such Transcendent Artists.

TRAVELLER: The World here in our Northern Climates has a Notion of Painters little nobler than of Joyners and Carpenters, or any other Mechanick, thinking that their Art is nothing but the daubing a few Colours upon a Cloth, and believing that nothing more ought to be expected from them at best, but the making a like Picture of any Bodys Face.

Which the most Ingenious amongst them perceiving, stop there; and though their Genius would lead them further into the noble part of History Painting, they check it, as useless to their Fortune, since they should have no Judges of their Abilities, nor any proportionable Reward of their Undertakings. So that till the Gentry of this Nation are better Judges of the Art, 'tis impossible we should ever have an Historical Painter of our own, nor that any excellent Forreigner should stay amongst us.

FRIEND: What you say is very true, and therefore I think it would be a good work to inform us how we should Judge of Paintings, and distinguish the Good from the Bad [...]

TRAVELLER: I must then repeat to you what I told you at our first Meeting; which is, That the Art of Painting has three Parts, which are, Design, Colouring, and Invention; and under this third, is that which we call Disposition; which is properly the Order in which all the Parts of the Story are disposed, so as to produce one effect according to the Design of the Painter; and that is the first Effect which a good Piece of History is to produce in the Spectator; that is, if it be a Picture of a joyful Event, that all that is in it be Gay and Smiling, to the very Landskips, Houses, Heavens, Cloaths, &c. And that all the Aptitudes tend to Mirth. The same, if the Story be Sad, or Solemn; and so for the rest. And a Piece that does not do this at first sight, is most certainly faulty, though it be never so well Designed, or never so well Coloured; nay, though there be Learning and Invention in it; for as a Play that is designed to make me Laugh, is most certainly an ill one if it makes me Cry. So an Historical Piece that doth not produce the Effect it is designed for, cannot pretend to an Excellency, though it be never so finely Painted. [...]

The next thing to be considered in an Historical Piece, is the Truth of the Drawings, and the Correction of the Design, as Painters call it; that is, whether they have chosen to imitate Nature in her most Beautiful Part; for though a Painter be the Coppist of Nature, yet he must not take her promiscuously, as he finds her, but have an Idea of all that is Fine and Beautiful in an Object, and choose to Represent that, as the Antients have done so admirably in their Paintings and Statues: And 'tis in this part that most of the Flemish Painters, even Rubens himself, have miscarried, by making an ill Choice of Nature; either because the Beautiful Natural is not the Product of their Countrey, or because they have not seen the Antique, which is the Correction of Nature by Art; for we may truly say that the Antique is but the best of Nature; and therefore all that resembles the Antique, will carry that Character along with it.

FRIEND: I remember, you reckoned it to me among the Faults of some *Painters*, that they had studied too long upon the *Statues* of the Antients; and that they had indeed thereby acquired the Correction of *Design* you speak of; but they had by the same means lost that Vivacity and Life which is in Nature, and which is the true Grace of *Painting*.

TRAVELLER: 'Tis very true, that a Painter may fall into that Errour, by giving himself up too much to the Antique; therefore he must know, that his Profession is not tyed up to that exact Imitation of it as the Sculptor's is, who must never depart from that exact Regularity of Proportion which the Antients have settled in their Statues; but Painters Figures must be such as may seem rather to have been Models for the Antique, than drawn from it; and a Painter that never has studied it at all, will never arrive at that as Raphael, and the best of the Lombard Painters have done; who seem to have made no other Use of the Antique, than by that means to choose the most Beautiful of Nature. [...]

FRIEND: Pray, what is properly *Invention* in a Picture?

TRAVELLER: Invention is the Manner of Expressing that Fable and Story which the Painter has chosen for the Subject of his Piece; and may principally be divided into Order and Decorum. By the first, the Painter places the parts of his Subject properly, so as the Spectator may imagine that the thing did not happen otherwise than as it is there Represented; and so as the whole Content of the Story, though it imbrace never so many Figures, make but one BODY, Agreeing with its self in all its Parts.

For Example: Suppose a Painter to Represent the Story of the Jews gathering Manna in the Desert; he must so order it, that the Persons employed in the Piece do all do the same thing, though in different Aptitudes; and there must appear in their Countenances the same Joy and Desire of this Heavenly Food; and besides, he must Represent a Countrey proper, and give his Figures their Draperies according to the Customs and Manners of the Nation he Represents: all this Raphael has done in this very Story: and indeed, that part of Invention was so great in him, that he seldom Designed a Story in his first SCHIZZOS, that he did not do it four or five several ways, to choose at last the best. But to do this, a Painter, besides a Fanciful, Flourishing Genius of his own, must help himself by reading both History and Fable, and Conversing with Poets and Men of Learning; but above all, the Painter must have a care that he pitch not upon such an Invention as is beyond his Forces to perform.

Some Observations there are about the Number of Figures fit to be employed in an Historical Piece. Hannibal Carrache was of Opinion, that a Piece that contained above twelve Figures, could never be free from Confusion; and the Reason that he used to give, was; first, That he thought that no Piece could be well with more than three great Gruppos, or Knots of Figures: And Secondly, That that Silence and Majesty which is necessary in Painting, is lost in that Multitude and Croud of Figures. But if your Subject be such as constrains you to a Multitude, such as the Representation of a Battle, or of the Last Day of Judgment, then you are likewise dispensed from that great Care of Finishing; but must chiefly study Union, and the disposing of your Lights and Shadows. The Painter must also take Care, that his Scene be known by his Piece at first view, by some Ingenious Invention to express the Countrey: Such was that of Nealces a Greek Painter, who having Drawn a Sea-Fight between the Ægyptians and the Persians; to express, that the Action happened at the Mouth of the Nile, made an Ass drinking by the side of the River, and a Crocodile ready to devour him; that being the proper Animal of that River.

The second part of Invention is Decorum; that is, that there be nothing Absurd nor Discordant in the Piece: and in this part, the Lombard Painters are very faulty; taking Liberties that move one almost to Laughter; Witness Titian himself, who Drew Saint Margaret a Stride upon the Dragon: and most of the Lombard Painters are subject to a certain Absurdity of Anachronisaie's Drawing. For Example, our Saviour upon the Cross, and Saint Francis and Saint Benedict looking on, though they did not live till eight hundred Years after our Saviour's Passion. All Indecencies are likewise to be avoided: and Michael Angelo doth justly deserve to be Censured, in his great Picture of the Day of Judgment, for having exposed to view in the Church it self, the secret parts of Men and Women, and

made Figures among the Blessed that kiss one another most tenderly. Raphael on the contrary, was so great an Observer of Decorum, that though his Subject led him to any Libertics of that kind, he would find a way to keep to the Rules of Modesty: and indeed, he seems to have been Inspired for the Heads of his Madonna's and Saints, it being impossible to imagine more Noble Physionomies than he gives them; and withal, an Air of Pudour and Sanctity that strikes the Spectator with Respect.

FRIEND: This puts me in mind of the moving part of Painting; which is, the stirring of the Affections of the Spectator by the Expression of the Passions in the Piece; and methinks this might well be called a part of Painting.

TRAVELLER: It is Comprehended under that of Invention; and is indeed the most difficult part of it, as depending intirely upon the Spirit and Genius of the Painter, who can express things no otherwise than as he conceives them; and from thence come the different Manners; or, as one may call them, Stiles of Painting; some Soft and Pleasing, others Terrible and Fierce, others Majestick, others Low and Humble, as we see in the STILE of POETS; and yet all Excellent in their Kinds.

6 Bernard Le Bovier de Fontenelle (1657–1757) ‘A Digression on the Ancients and Moderns’

Fontenelle sided resolutely with the Moderns in the great quarrel of the Ancients and Moderns which raged in France during the last quarter of the seventeenth century. A nephew of the French playwright, Corneille, he found an easy entry into literary circles in Paris but failed to achieve success as a dramatist. On the other hand, his success in bringing the work of figures such as Descartes and Copernicus to a much wider audience suggests that his real vocation lay in the popularization of science. He was elected to the French Academy of Sciences in 1697 and was subsequently made its permanent secretary. The starting-point of his ‘Digression on the Ancients and the Moderns’ is uncompromisingly naturalistic: since we have no reason to assume that trees were any larger in Homer’s time than our own, we should not suppose that human nature was any different. Nature has always operated with the same basic ‘clay’. Whilst Fontenelle acknowledges the influence of climate, he insists that any such differences are levelled out through the advance of time and the progressive exchange of ideas. Although the Ancients had the privilege of coming first, they were inevitably exposed to a wider range of mistakes and errors. The accumulation of knowledge and experience, together with the important advances in scientific thinking made in the seventeenth century, render the Moderns inevitably superior to the Ancients. It is possible that the arts represent an exception, however, for these may have flourished most successfully at the time of their inception. Nonetheless, Fontenelle concludes by seeking to replace the traditional image of mankind’s youth, maturity and declining old age with a vision of potentially limitless progress. The *Digression sur les Anciens et les Modernes* was originally published as an appendix to Fontenelle’s *Poésies pastorales*, Paris: M. Guérout, 1688. The following excerpts are taken from the translation in Scott Elledge and Donald Schier eds., *The Continental*

Model: Selected French Essays of the Seventeenth Century, revised edition, Ithaca and London: Cornell University Press, 1970, pp. 358–67.

Once the whole question of the pre-eminence of the ancients and moderns is properly understood, it boils down to knowing whether the trees which used to be seen in the countryside were taller than those of today. If they were, Homer, Plato, Demosthenes cannot be equaled in these latter centuries; but if our trees are as tall as those of former times, then we can equal Homer, Plato, and Demosthenes.

Let us explain this paradox. If the ancients were more intelligent than we, the reason must be that brains in those days were better arranged, made of firmer or more delicate fibers, and filled with more animal spirits; but why should the brains of those days have been better arranged? Trees too, then, would have been taller and more beautiful; for if Nature was then younger and more vigorous, trees as well as human brains must have felt the effect of that vigor and youth.

The admirers of the ancients ought to be very careful when they tell us that the ancients are the sources of good taste and reason as well as of knowledge destined to illuminate all other men; that one is intelligent only in proportion as one admires them; and that Nature wore herself out in producing those great originals; for in fact these admirers make the ancients of another species from ourselves, and science is not in agreement with all these fine phrases. Nature has at hand a certain clay which is always the same and which she unendingly turns and twists into a thousand different shapes, thus forming men, animals, and plants; and certainly she did not shape Plato, Demosthenes, or Homer from finer or better-prepared clay than she used for our philosophers, orators, and poets of today. As to our minds, which are not of a material nature, I am concerned here only with their connection with the brain (which is material) and which by its varying arrangements produces the differences between one man and another.

But if trees are equally tall in all centuries they are not so in all countries. Similar differences occur also among minds. The various ideas are like plants or flowers which do not flourish equally in all climates. Perhaps French soil is not suitable for Egyptian lines of thought as it is not for their palm trees; and not to go so far afield, perhaps orange trees, which do not grow so well here as in Italy, are an indication that in Italy there is a certain kind of mind which does not have its exact equal in France. In any case it is sure that through the connection and reciprocal interdependence which exist among the parts of the material world, the differences of climate, whose effect is observable in plants, must produce some effect on human brains as well.

However, this effect is smaller and less obvious because art and culture work more successfully on brains than on the land, which is of a harder and less manipulable substance. Thus the thoughts of one country can be more easily carried to another than its plants, and we would not have as much difficulty in capturing the Italian genius in our literary works as we would have in raising orange trees.

* * *

... the main question concerning the ancients and the moderns now seems to me resolved. Centuries do not put any natural differences among men. The climate of Greece or Italy and that of France are too much alike to be the cause of a perceptible

difference between the Greeks and the Romans and ourselves. Even if some such difference existed it would be very easy to eliminate, and after all would be no more to their advantage than to ours. So we are now all perfectly equal, ancients and moderns, Greeks, Romans, and Frenchmen. [...]

‘The ancients discovered everything’; on this point their partisans triumph. ‘Therefore they were much more intelligent than we’; not at all, but they were ahead of us. I should be just as willing to see them praised for having drunk first the waters of our rivers and for us to be blamed because we drink only what they left. If we had been in their place we would have done the discovering; if they were in ours, they would add to what has already been discovered. There is no great mystery about that.

I am not speaking here of the discoveries brought about by chance and for which credit may perhaps be given to the stupidest man in the world; I am concerned only with those discoveries which required thought and some mental effort. It is sure that the crudest of these were reserved for the greatest geniuses, and that all Archimedes could have done in the earliest ages would have been to invent the plough. Archimedes living in another century burns the Roman fleet with mirrors – if indeed that is not just a tale.

A man concerned to utter specious and brilliant remarks would maintain to the glory of the moderns that the mind need not make a great effort for first discoveries, and that Nature seems herself to lead us to them; but more effort is needed to add to them and a still greater effort in proportion to the amount already added because the subject is more nearly exhausted and what remains in it to be discovered is less apparent to the naked eye. Perhaps the admirers of the ancients would not neglect a line of reasoning as good as that if it favored their side, but I admit in all good faith that it is not very solid.

It is true that to add to earlier discoveries often requires a greater effort of mind than the original discoveries did, but one is in a much more advantageous position to make the effort. The mind has already been enlightened by the very discoveries one has before one’s eyes; we have conceptions borrowed from others which can be added to those we form ourselves; and if we surpass the first discoverer, he himself has helped us to do so; thus he still has a share in the glory of our work, and if he withdrew what belongs to him we should have nothing more left than he.

So far do I carry the equity with which I consider this point that I give the ancients credit for numberless false ideas they had, for faults of logic they committed, and for foolish statements they made. In the nature of things it is not given to us to arrive quickly at a reasonable opinion on anything; we must first wander about for a long time and pass through many kinds of mistakes and many kinds of irrelevancies. It seems now that it would always have been easy to conceive the idea that the whole working of nature is explained by the shapes and movements of various bodies; however, before arriving at that point we had first to try the ideas of Plato, the numbers of Pythagoras, and the qualities of Aristotle; only when these had been recognized as false were we driven to accept the correct theory. I say we were driven to it, for in fact no other remained, and it seems that we avoided the truth as long as we could. We are grateful to the ancients for having worn out most of the false ideas conceivable; it was absolutely necessary to pay to ignorance and error the tribute the

ancients paid, and we ought not to be harsh toward those who discharged this debt for us. The same thing is true of various subjects about which we would say foolish things if they had not already been said and, so to speak, preempted; however there still are occasionally moderns who return to them, perhaps because these things have not yet been said as many times as necessary. Thus, enlightened by the ideas of the ancients and by their very mistakes, we might be expected to surpass them. If we only equaled them we should be far inferior to them by nature; we should barely be men compared with them.

However, if the moderns are to be able to improve continually on the ancients, the fields in which they are working must be of a kind which allows progress. Eloquence and poetry require only a certain number of rather narrow ideas as compared with other arts, and they depend for their effect primarily upon the liveliness of the imagination. Now mankind could easily amass in a few centuries a small number of ideas, and liveliness of imagination has no need of a long sequence of experiences nor of many rules before it reaches the furthest perfection of which it is capable. But science, medicine, mathematics, are composed of numberless ideas and depend upon precision of thought which improves with extreme slowness; sometimes indeed these studies must be helped by experiences which chance alone brings forth and which it does not produce at the desired place. It is obvious that all this is endless and that the last physicists or mathematicians will naturally have to be the ablest.

And in fact, the most important aspect of philosophy, and that which is applicable not only to philosophy but to everything, I mean the way we think, has been very much improved in this century. I doubt that many will be able to understand the remark I am about to make; nevertheless I shall make it for the sake of those who understand the problem of philosophical thought; and I may boast that it is evidence of courage to expose oneself for the sake of truth to the criticisms of all the others, whose number is assuredly not negligible. No matter what the subject is, the ancients rarely reason with absolute correctness. Often mere expediency, petty similarities, frivolous witticisms, or vague and confused discourse pass among them for proofs; therefore, it cost them very little effort to prove anything. However, what an ancient could prove in all frivolity would cause a good deal of trouble nowadays to a modern, for are we not much more rigorous in the matter of reasoning? Reasoning must be intelligible, it must be exact, it must be conclusive. Scholars are cunning enough to pick out the slightest ambiguity in ideas or in words; they are harsh enough to condemn the cleverest thing in the world if it does not bear on the point. Before Descartes reasoning was done more comfortably; past centuries are very fortunate not to have had that man. It is he, as I believe, who introduced this new method of reasoning which is much more estimable than his philosophy itself, for of that a considerable part has been shown to be false or uncertain according to the very rules he taught us. In sum, there now reigns not only in our good scientific and philosophical works but also in those on religion, ethics, and criticism a precision and an exactness which have scarcely been known until now.

I am even convinced that these will be carried yet further. A few arguments in the style of the ancients still slip into our best books, but we shall be the ancients some day, and will it not be just for our posterity in its turn to rectify our mistakes and to

go beyond us, especially in the technique of reasoning which is a science in itself and the most difficult as well as the least cultivated of all?

As far as eloquence and poetry are concerned, since these are the subject of the principal dispute between the ancients and the moderns although they are not very important in themselves, I think the ancients may have attained perfection in them because, as I have said, such perfection can be achieved in a few centuries, and I do not know exactly how many are necessary.

* * *

My intention is not to go into critical detail; I merely wish to point out that since the ancients were able to achieve ultimate perfection in certain things and not in others, we ought, in gauging their success, to show no respect for their great names nor have any indulgence for their faults; we ought, instead, to treat them as though they were moderns. We must be capable of saying, or of hearing others say without blinking the fact, that there are irrelevancies in Homer or in Pindar; we must make bold to believe that mortal eyes can see faults in these great geniuses; we must be able to accept a comparison between Cicero or Demosthenes and a man with a French name, perhaps even a commoner's name: this will require a great, a prodigious effort of the reason!

In this connection I cannot keep from laughing at the ridiculousness of men. Prejudice for prejudice, it would be more reasonable to favor the moderns than the ancients. Naturally the moderns have outdone the ancients: prepossession in their favor is thus well founded. What are, on the other hand, the foundations of prejudice in favor of the ancients? Their names, which sound better in our ears because they are Greek or Latin; the reputation they had of being the greatest men of their century; the number of their admirers, which is very great because it has had time to grow through a long period of years. Taking all that into consideration, it would still be better to be prejudiced in favor of the moderns, but mankind, not content to abandon reason for prejudices, often chooses among these the ones which are the most unreasonable.

Once we have decided that the ancients have reached the point of perfection in something, let us be satisfied to say they cannot be surpassed, but let us not say they cannot be equaled, as their admirers are very prone to do. Why should we not equal them? As men we always have the right to aspire to do so. Is it not odd that we need to prick up our courage on this point and that we, whose vanity is often based on nothing solid, should sometimes show a humility no less insecure? It is thus certain that no manifestation of the ridiculous will be spared us.

* * *

The comparison . . . between the men of all periods and an individual man may be extended to the whole question of the ancients and the moderns. A cultivated intelligence is composed, so to speak, of all the intelligences of preceding centuries; one intelligence only has been cultivated during all that time. Thus Mankind, which has lived from the beginning of the world to the present day, has had a childhood, during which he concerned himself only with the most pressing needs of life; and a youth, during which he succeeded rather well in the things of the imagination such as poetry and eloquence, and when he even began to think, but with less soundness than enthusiasm. He is now in the prime of life and reasons more forcefully and more

incisively than ever; but he would be much farther advanced if the passion of war had not occupied him for a long time and filled him with scorn for that learning to which he has at last returned.

It is a shame not to be able to carry to the end a comparison which is going so well; but I am forced to admit that mankind will never have an old age; in each century men will be able to do the things proper to youth as they will more and more those which are suited to the prime of life; that is to say, to leave the allegory, that mankind will never degenerate, and the sound views of all subsequent thinkers will forever be added to the existing stock.

* * *

7 Charles Perrault (1628–1703) Preface and ‘Second Dialogue on the Three Visual Arts’ from *Parallel of the Ancients and Moderns*

Perrault is best known today for his celebrated collection of fairy tales, the *Histoires ou Contes du temps passé* (1697), which includes ‘Red Riding Hood’, ‘Bluebeard’ and ‘Sleeping Beauty’. However, it was Perrault’s aggressive defence of the superiority of modern letters that initiated the quarrel of the Ancients and Moderns. This was contained in his poem ‘The Century of Louis the Great’ read before the French Academy in 1687. The *Parallel of the Ancients and Moderns* was published in a series of four volumes between 1688 and 1697. Each of the volumes addresses a different subject, ranging from eloquence and poetry through to geography and the natural sciences. Here we include a section from the Preface in which Perrault asserts his commitment to the cause of the Moderns and reminds his readers of the origins of the conflict. Our principal extract, however, is from the ‘Second Dialogue’, dedicated to the arts of architecture, sculpture and painting. Through the various partners in the dialogue, Perrault identifies Antiquity, the Renaissance and the age of Louis XIV as the three main periods in which the arts have flourished, but in each case argues for the superiority of the modern age. Achievements in relief and perspective have enabled modern sculpture to rise to new heights and to avoid the limitations imposed by the depiction of isolated figures. Similarly, advances in the use of chiaroscuro, perspective and compositional unity have brought painting to a new position of pre-eminence in the goal of the idealized imitation of nature. The two paintings he discusses in some detail are Veronese’s *The Disciples at Emmaus* (1559–60, Paris, Louvre) and Le Brun’s *The Tent of Darius* (sometimes known as *The Queens of Persia at the Feet of Alexander*), which is now at Versailles. *The Tent of Darius* was commissioned by Louis XIV and painted in his presence between 1660 and 1661. The two paintings were hung opposite each other in the King’s Cabinet in the Tuileries. Perrault’s praise of Le Brun’s painting as a richly differentiated whole, achieved through the subtle gradation of light, colour and aerial perspective, is indebted to Le Brun’s own account of Nicolas Poussin’s *The Israelites Gathering the Manna* in a lecture given to the Royal Academy the previous year (see IB13). Trajan’s Column is a monument erected to the Roman Emperor, Marcus Trajan, in the Forum of Trajan in Rome (dedicated AD 113). The gardens at Rueil were laid out between 1633 and 1642 for Cardinal Richelieu and contain a full-scale *trompe l’oeil* by Jean Lemaire (1598–1689). Both the Preface and the ‘Second Dialogue’ were published in volume I of the *Parallèle des anciens et des modernes*, Paris: Jean-Baptiste Coignard, 1688. These extracts are taken from the Preface (unpaginated) and

from pp. 188–90, 195–201, 206–15, 219–32. They have been translated for the present volume by Christopher Miller.

Preface

Nothing is more natural or reasonable than to show the utmost veneration for whatever is possessed of true merit in itself and has the additional merit of age. This sentiment, so right, proper and universal, redoubles the respect that we feel for our ancestors; by virtue of it, laws and customs show themselves still more authoritative and inviolable. But destiny has always decreed that the best things become prejudicial by excess, and this in proportion to their original excellence. Honourable in its inception, this reverence has subsequently become a criminal superstition, at times extending even to idolatry. Princes of extraordinary virtue secured the happiness of their people, and the earth resounded to the fame of their exploits; they were beloved in their lifetime and their memory was revered by posterity. But as time went by, people forgot that these were mere men, and began to offer them incense and sacrifice. The same thing happened to those who first excelled in the arts and sciences. The prestige that accrued to their century, and the utility that it derived from their inventions, brought them much glory and renown in their own lifetimes, and their works were admired by posterity, which made of them its greatest delight, and celebrated them in praises boundless and immoderate. Respect for their memory so increased that no taint of human weakness could be attributed to them, and their very faults were deemed sacred. A thing had only to be done or said by these great men to become incomparable, and even today, for certain scholars it is a sort of religion to prefer the least production of the Ancients to the finest works of any modern author. I confess to a sense of injury at this injustice; there seems to me such blind prejudice and ingratitude in the refusal to open one's eyes to the beauty of our century, on which heaven has bestowed a thousand distinctions altogether refused to Antiquity, that I have been unable to restrain a sense of veritable indignation. Of this indignation came the little poem, *The Century of Louis the Great*, which was read to the French Academy when it assembled to thank the Lord for the complete recovery of its august protector. All those present at that illustrious assembly seemed quite satisfied with it, save two or three fanatical admirers of Antiquity, who asserted that it had greatly offended them. It was hoped that their discomfiture might give rise to criticisms such as would disabuse the public; but their sense of offence has boiled away in protest at my attack, and in empty and ill-defined words. [...]

So many honourable persons have informed me, with a most tactful and gracious air, that I had, in their eyes, ably defended a bad cause, that I have taken it upon me to state unequivocally, and in prose, that there is nothing in my poem that is not seriously intended. That I am, in short, utterly convinced that, excellent as the Ancients are – on this point there is no disagreement – the Moderns are no whit inferior, and indeed surpass them in many respects. This is a clear statement of my position, which I claim to demonstrate in my dialogues.

* * *

Second Dialogue

* * *

L'ABBÉ: [...] Sculpture is indeed one of the finest arts to occupy the intellect and endeavours of mankind. But it can also be said that it is the simplest and most restricted of any of them; this is particularly true of figures in the round. All that is required is to choose a handsome model, place it in an agreeable pose, and then faithfully copy it. The many and various reflections thrown up by the passage of time are of no service here, nor any accumulation of precepts by which to proceed. No more is required than that men of genius be born and apply themselves to their task. It should further be noted that success in this form of work met with extraordinary rewards; the sculptor bestowed very gods upon entire nations and even on the princes of these nations, and when he had succeeded, he was little less honoured than the god formed by his hands. It was therefore possible for the Ancients to excel at sculpture in the round, without exhibiting the same degree of merit in other and more composite arts that require greater elaboration of reflection and precept. This is so true that, in the elements of sculpture *itself* in which reasoning and reflection count for most, such as low relief, the Ancients were noticeably weaker. Of the secrets of this branch of sculpture, a vast quantity were unknown to them even as they constructed Trajan's Column, in which there is neither perspective nor degradation.¹ In this column, the figures are almost all on the same line; where there are any to the rear, they are as big and as clearly defined as those in the foreground, as though they were raised on tiers to be visible one on top of another.

* * *

L'ABBÉ: Most ancient low reliefs, if closely examined, will be found not to be true examples of that art; they are sculpture in the round sawn in half from top to bottom, with the larger part applied and fixed to a uniform background. One need only look at the low relief of *The Dancing Girls*. The figures are, by all means, of extraordinary beauty, and nothing is more noble, lithe and attractive than the air, form and posture of these young *danseuses*. But they are, as I said, figures in the round, sawn in two, or as if half of their bodies had been sunk into the surface that bears them. This clearly demonstrates that the sculptor who made them, excellent as he was, lacked those skills that time and contemplation have since arrived at, and which have, in our own day, attained the utmost perfection. I refer to the skills by which a sculptor uses two or three inches of relief to make figures that not only seem to project out into the round, but also seem more or less recessed into the depths of the relief. I should add in passing that the principal beauties of the relief of *The Dancing Girls* are owed to a sculptor of our time. When Poussin brought it from Rome to France, it was only a rather formless outline, and it was the elder Anguier who gave it the elegance for which it is now admired.

LE PRÉSIDENT: If modern sculpture is so far superior to the ancient in the respect that you cite, it follows that today's painting must greatly exceed that of the

Ancients, since it was from painting that sculpture learnt all these secrets, such as degradation and perspective.

L'ABBÉ: I quite agree. The inference is correct. But since we are now talking of painting, we should begin by distinguishing the various periods in which it has flourished, and define three categories: the time of Apelles, Zeuxis and Timanthes, and of all those great painters whose wondrous achievements are known to us through literature; the time of Raphael, Titian, Paul Veronese and a number of other excellent Italian masters; and our own time. If we follow the common opinion, which almost invariably defines merit in terms of seniority, we shall place the century of Apelles far above that of Raphael, and that of Raphael far above our own. But I positively reject this hierarchy, and notably the preference accorded to the century of Apelles over that of Raphael.

LE PRÉSIDENT: But how can you fail to admit so reasonable and universal an opinion, especially when you have once acknowledged the excellence of the sculpture of Pheidias and Praxiteles? If the sculpture of that time exceeds that of all subsequent centuries, must we not, *a fortiori*, say the same of painting, when we consider that painting offers a host of refinements and pleasures of which sculpture is incapable?

L'ABBÉ: But that is precisely why your conclusion is inadmissible. If painting were as simple and restricted an art as sculpture is, in respect of works in the round – for only in that department did the Ancients excel – I should concede your point. But painting is so vast and so extensive an art that it has required the entire sum of the centuries for its every secret and mystery to be discovered. To convince you of the scant beauty of ancient painting, and establish how far below that of Raphael, Titian and Paul Veronese and, indeed, the paintings that are made today, we should esteem it, I need no other arguments than the praises bestowed upon it. It is said that Zeuxis represented grapes so accurately that birds came to peck at them. Is that so very wonderful? Multitudes of birds, attempting to fly through it, have hurled themselves against the sky in the perspective at Rueil, but the fact has elicited little astonishment, and has barely been cited in the praises bestowed on this perspective.

LE CHEVALIER: Recently, walking along the Fossé des Religieuses Anglaises, I saw an event as flattering to modern painting as the story of Zeuxis' grapes is to that of the Ancients, and vastly more entertaining. The door of Monsieur Le Brun was open, and a freshly painted picture had been taken out into the courtyard to dry. In the foreground of this painting was a perfect representation of a large thistle. A woman came past leading an ass, which, when it saw the thistle, plunged into the courtyard; the woman who was hanging on to its bridle was dragged off her feet. If it hadn't been for a couple of sturdy lads who gave it some fifteen or twenty blows each with their sticks to force it back, it would have eaten the thistle – and I say *eaten*, because the paint was fresh and would all have come off on its tongue.

L'ABBÈ: This thistle is no whit inferior to Zeuxis' grapes, of which Pliny makes so much. Pliny also tells us that Parrhasius had imitated a curtain so exactly that Zeuxis himself was taken in. Such *trompe-l'oeil* effects are commonly found today in works of no repute whatsoever. Often enough, cooks have reached out for accurately represented partridges or capons, intending to put them on the spit, and what happens? Everyone laughs, and the painting stays in the kitchens.

* * *

L'ABBÈ: [...] This sort of skill was long considered a great merit in painters. The 'O' of Giotto illustrates this. Pope Benedict IX was searching far and wide for excellent painters, and had their works brought to him so that he could establish their competence. Giotto refused to present a painting, but, in the presence of the Papal Envoy, took a sheet of paper, and with a single pen or pencil stroke, drew an 'O' as round as if it had been made with a compass. On the basis of his 'O' the Pope preferred him to all the other painters; indeed, it gave rise to a proverb which is still current throughout Italy, where, if you wish to imply that a man is stupid, you say that he is round as Giotto's 'O'. But skills of this kind have long ceased to be esteemed among painters. Monsieur Menage told me that he knew a monk who could not only draw a perfectly round 'O' with a single pen-stroke, but could place a dot precisely at its centre. This monk never took it upon himself to pass for a painter, and was content to be praised for his own little talent. Poussin, when his hand had begun to tremble, and he found it difficult to place his brush and colour as he wished, nevertheless painted pictures of indescribable beauty, while countless painters capable of drawing a line ten times as fine as the most delicate of Poussin's brushstrokes have painted only pictures of the greatest mediocrity. This kind of exploit is a clear sign of painting still being in its infancy. Some years before Raphael and Titian, there were paintings made – they still survive – the principal beauty of which lies in the fineness of line; you can count every hair in the beard and on the head of each figure. Though Chinese art is very ancient, they have remained at this stage. They will, perhaps, soon learn to draw properly, to place their figures in noble attitudes, and attain exact expressions of all the passions. But it will be a long time before they attain a perfect understanding of *chiaroscuro*, the degradation of light, the secrets of perspective and the judicious organization of a large composition. To make my meaning clear, I should like to distinguish three qualities in painting: the representation of figures, the expression of passions, and the overall composition in which these are organized. In the first of these, I include not only the accurate delineation of their contours, but also the application of true and fitting colours. By the expression of passions, I mean the different characters of the faces and the various postures of the figures, which indicate what they intend to do, what they are thinking, in a word, all that is happening in the depths of their being. By overall composition, I mean the judicious assemblage of these figures, placed with understanding, and with their colours degraded according to their position within the picture. What I say here of paintings in which there are several figures should be understood to apply no less to a painting in which there is only one, since the relations between the different parts of the single figure are like those holding between multiple figures. Appren-

tice painters begin by learning how to draw the outline of figures, and to fill them in with their natural colours. Next they study how a figure can be given noble attitudes, and how to express the passions with which they wish it to seem animated. But it is only much later that they learn the rules to be observed in organizing the composition of a picture: the proper distribution of dark and light, and the placing of all the elements in accordance with the rules of perspective, in respect both of line and of the degradation of light and dark. In the same way, those who first began to paint in this world at first concentrated only on the exact representation of the outline and colour of objects; they desired nothing more than that those who saw their works should be able to say, 'This is a horse,' 'This is a tree' – though often enough they put this in writing, to spare the pains of those attempting to guess. Then they went on to arrange their figures in noble attitudes, and to animate them in a lively fashion with every passion imaginable. These are the two stages of painting to which we cannot but believe that Apelles and Zeuxis attained, if we consider the likely progress of their art and what the ancient authors report of their works; they never knew, or knew only very imperfectly, the third part of painting, which is concerned with the composition of a picture, according to the rules and criteria that I have explained above.

LE PRÉSIDENT: How is all this to be reconciled with the wonders that are related of the works of these great men? For whom, though they were paid in bushels of gold, no reward was thought sufficient? Paintings that restrained the fury of the assailant and curbed the greed of the conqueror, so that the fear of endangering these works by fire prevailed in their hearts over the desire to capture famous cities.

L'ABBÉ: Despite the marvellous powers of ancient painting, I persist with my thesis. For it is not the beautiful arrangement of a picture, the proper distribution of light and the well-judged degradation of the objects, nor, indeed, any part of the third element of painting, the one of which I have spoken, that touches, charms and overwhelms. It is only the accurate delineation of objects furnished with their true colours that makes such a strong impression on the onlooker, and, above all, the lively and natural expression of the impulses of the soul. For it should be said that, just as there are three parts to painting, there are three parts in man by which he may be moved: the senses, the heart and reason. The precise delineation of objects, combining with colour, makes a pleasant impression on the eye; the natural expression of the stirring of the soul goes right to the heart, where, by imparting the passions it represents, it affords distinct pleasure. And finally the understanding demonstrated by the proper distribution of light and shade in the degradation of figures according to their place in the picture, combined with the beauty of a harmoniously balanced composition, satisfies the faculty of reason; the joy thus felt is less keen, it is true, but more intellectual, and worthier of mankind. It is the same with the works of all the other arts. In music, the beautiful sounds and the tunefulness of the voice charm the ear; the cheerful or languishing movements of this voice, varying with the passions that it expresses, move the heart; and the harmony of the various parts mingled in admirable order and disposition

affords pleasure to reason. In rhetoric, pronunciation and gesture affect the senses, touching metaphors win the heart, and the beautiful organization of the speech rises to the superior part of the soul, giving it a peculiar and entirely intellectual joy that it alone can feel. I therefore assert that, for Apelles and Zeuxis to win universal admiration, no more was required than that they charm the eye and touch the heart; they did not need the third part of painting, which satisfies the rational faculty alone. So far from charming the common man, this part often has the contrary effect, and merely repels him. Indeed, how many there are who would prefer distant figures to be as clearly and definitely indicated as those in the foreground, the better to see them, and who would willingly spare the painter the pains that he takes in the composition of his picture and the degradation of the figures according to their position in the painting. In particular, they would be delighted if the painter were to omit shadows cast on the face, especially in the portraits of their loved ones.

* * *

Moreover, I can prove the relative incompetence of ancient painters by pointing to the few pieces of ancient painting still visible in one or two places in Rome. These works are not of exactly the same period as Apelles and Zeuxis, but they are clearly in the same manner, so that the only possible difference is that the masters who painted them were slightly less ancient, and might, as such, have a greater knowledge of painting. I have seen the *Wedding* in the Aldobrandini Vineyard, and the work called the *Tomb of Ovid*. The figures are well defined, the attitudes are wise and natural, and there is great nobility and dignity in the port of the heads. But little understanding is shown in the mixture of colours, and none at all in the perspective or overall arrangement. Every colour is as strong as the next, nothing in the picture either stands out or recedes. All the figures are on the same line, so that it is less a picture than an ancient low relief coloured in; everything in it is dry and motionless; it lacks unity, connection, and the softness by which the living body is distinguished from the marble and bronze that represent it. It follows that the major difficulty is not to prove that today we excel Zeuxis, Timanthes, Apelles and their like, but to demonstrate that we also in some measure surpass Raphael, Titian, Paul Veronese and the other great painters of the last century. Yet I make bold to state that, if we consider art in itself, considered as an accumulation, a collection of precepts, we shall find it more accomplished and perfect at present that it was at the time of these great masters. Let us, if you please, compare the picture of the *Pilgrims at Emmaus* by Paolo Veronese with that of *Darius and his Family* by Monsieur Le Brun; we have, after all, just seen them both in the antechamber of the *grand appartement* of the King, where they have been placed one opposite another as if to facilitate comparison.

LE PRÉSIDENT: What more remains to be said of these two pictures, after the *mot* of an Italian prelate? Monsieur Le Brun's painting, he said, is very beautiful; it is in every respect excellent, but it has an implacable neighbour. By which he meant that, handsome though it is, it can hardly be described as such when it has just been compared with the work of Paolo Veronese.

L'ABBE: Since the French tend no less to scorn the work of their countrymen than Italians systematically to elevate the merit of their compatriots whenever occasion arises, this *bon mot* was doubtless applauded. No doubt several persons took it upon themselves to repeat it, in order to suggest that they are possessed of exquisite taste and of a genius superior to that of their country. By this I am quite unmoved. I saw another Italian prelate do something still more discourteous in respect of the painting of the family of Darius. He passed it not only without a glance, but without raising his eyes from the ground, as though the picture might have offended his sight. This affectation at first made me angry, but a moment later, it made me laugh; I rather enjoyed it. At all events, I agree that the painting of the *Pilgrims* is among the most beautiful in existence; the figures are full of life, and it is as if their thoughts were no less visible than their outward actions. But a painting is a silent poem, in which the unity of time, place and action must be as religiously observed as it is in a veritable poem, since the place is fixed, the time indivisible and the action instantaneous. Let us consider how that rule is observed in this picture. All the protagonists are indeed in the same room, but they are as little together as if each had been in a different place. Here, between two of his disciples, our Lord breaks the bread; there are Venetian men and women who pay almost no attention to the mystery that forms the subject of the painting; and in the middle are little children playing with a big dog. It would surely be more reasonable for these three subjects to be featured in three different pictures rather than in a single composite to which they can impart no unity.

LE PRÉSIDENT: Yet you must admit: you can almost hear these people speak. And the breast of the woman in the foreground is true flesh and blood.

L'ABBÈ: I agree, but was it either necessary or fitting that these people should speak, or that the woman should display her flesh in such a place?

LE PRÉSIDENT: The convention of placing in a religious picture those who commissioned it, and their whole family besides, is so well established that this assemblage of persons of different times and places should have come as no surprise to you.

L'ABBE: I am aware of the convention, and do not condemn it; though painters have little to thank it for. In Nativity scenes one often sees those who commissioned the picture, but they are kneeling in adoration, like the shepherds. They are often seen in Crucifixion scenes too, but prostrate, and with their eyes raised towards the Saviour. In this way their own individual gestures are linked to the main action of the picture, and contribute to the same end. Here it is as if the protagonists were unable to see each other, and only the will of the painter has set them in one and the same place.

LE PRÉSIDENT: The faults that you find are not with the painter as such, but with the painter as historian.

L'ABBÈ: True, if you confine the painter's function to that of accurately representing an object, without troubling himself to consider verisimilitude, propriety and common sense in his composition. But I cannot believe that painters would willingly sacrifice the requirement that their paintings observe criteria as just and necessary in a work as these. Moreover, I would argue that simply as a painter, Veronese has had little more regard for the unity required in composing a subject than he has as a historian; there are two different points of view in the painting, one for the landscape, and the other for the room where our Saviour is sitting, with his disciples, at the table. The horizon of the landscape is much lower than the table, whose top is visible and suggests a different and much higher viewpoint. This is an error of perspective that we should find unpardonable today in the work of a schoolboy of 15. None of these criticisms can, I believe, be made about the picture of Darius and his family. It is a true poem in which all the unities are observed. The unity of place is this tent, in which we find only those persons who *should* be there. The unity of time is the moment when Alexander says that, in mistaking Hephaestion for himself, they erred but little, since Hephaestion is his second self. If one considers the care with which all things have been made to concur towards a single end, nothing could better connected, unified or united than the representation of this story. At the same time, if you consider the different postures of the protagonists, and the individual expressions of their feelings, nothing could be more diverse and varied. Everything combines to represent the astonishment, admiration, surprise and fear caused by the arrival of the most famous conqueror on earth, and these passions, which all have the same object, receive different expressions in the various people who feel them. Darius' mother, borne down by the combined weight of suffering and age, worships the conqueror and prostrates herself, embracing his feet, and attempting to sway him by the extremity of her grief. Though she is stronger, Darius' wife is no less affected, and, her eyes running with tears, she gazes fearfully at the man who holds her destiny in his hands. Statira, whose beauty is the more touching for the tears that she sheds, seems to have no resource but that of tears. Parisatis is younger, and consequently less affected by her misfortune; in her eyes we see the curiosity characteristic of her sex, combined with her pleasure at contemplating a hero of whom such prodigies are related. As his mother presents him to Alexander, Darius' young son seems surprised, but full of the noble self-assurance imparted by his birth and rank; he is, after all, accustomed to seeing men-at-arms like Alexander. And all the other protagonists are similarly characterized, so well that one perceives not only the general feelings that animate them, but the nature and degree of these feelings, in accordance with their age, condition and nationality. The slaves bow their heads to the ground in profound adoration, the weak, timid eunuchs seem overwhelmed rather by fear than astonishment, and the women seem to mingle with their alarm a measure of trust in the proprieties owed to their sex. And how beautiful and various are the postures of the heads in this picture: they are all, without exception, great and noble; indeed, they are, if I may put it thus, all heroic in their own way. One might say the same of the clothing of the protagonists, to which the painter has devoted the most extraordinary and meticulous attention. In Veronese's picture of the pilgrims, all the heads and all the robes, with the exception of

Christ and his two disciples, in whom some nobility inheres, are taken (men and women alike) from the painter's acquaintance. This debases the composition of the picture in the highest degree, creating the kind of ill-assorted mixture that might result if, in the sublimest tragedy, one should introduce scenes in a low, comic style. If we now attend to the art of painting as such, we find that [in Le Brun's painting] perspective is correctly observed throughout. Moreover, nothing can be added to the beautiful organization of the whole. Though the light falling on the figures seems almost identical, there is nonetheless a degradation of light such that, if any of the figures were moved, their harmony would be disrupted; for their colours, which seem identical as they stand, would seem very different if they were displaced. This cannot so positively be asserted of Veronese's *Pilgrims*, nor indeed of many of the paintings of his time. There is thus an analogy between excellent modern works and the live body; in each, the parts are so intimately connected with each other that they cannot be placed anywhere but where they are. Whereas most ancient paintings I compare to a heap of stones or other things thrown haphazardly together, which could be arranged in a completely different fashion without anyone noticing the difference.

* * *

¹ Translator's note: Perrault's term *dégradation* (which he spells without the accent) corresponds to the technical sense of the English word 'degradation': 'The gradual lowering of colour or light in a painting; especially that which gives the effect of distance'. He applies it in the latter sense to sculpture as well as painting. To avoid confusion, no other sense of the word has been used in these extracts.

8 William Wotton (1666–1727) from *Reflections upon Ancient and Modern Learning*

Wotton was born in the parish of Wrentham in Suffolk where his father, Henry, was the local Church of England incumbent. Henry was committed to the idea of a classical education, and had composed an 'Essay on the Education of Children' (posthumously published in 1753). The crowning glory of these ideals was his son. William was a child prodigy. By the age of 6 he could read Latin, Greek and Hebrew, and at 10 he was admitted to Cambridge. By the age of 21 he was a Fellow of the Royal Society. In his *Reflections upon Ancient and Modern Learning* he attempts to address the most pressing intellectual problem of the day across the whole field of human knowledge. The book, which runs to twenty-nine chapters and over 350 pages, considers two broadly distinct kinds of endeavour: on the one hand those where the Moderns have indubitably surpassed the Ancients; on the other, those where it may still be possible to claim pre-eminence for the Ancients. Under the former he lists 'Natural History, Physiology, and Mathematics, with all their Dependencies'. Under the latter he includes 'Poesie, Oratory, Architecture, Painting and Statuary' (p. 19). A conservative disparagement of modern achievement had been the burden of a recently published essay on the same subject (*An Essay Upon Ancient and Modern Learning*, 1690) by the eminent scholar and diplomat Sir William Temple (1628–99). Wotton is concerned to argue the case for the Moderns, and to this end he takes much from Perrault (IA7). In fact, his chapter VI, 'Of Ancient and Modern Architecture, Statuary and Painting', consists almost entirely of quotations from the French author. Out of his collage of quotations Wotton

produces what is, in effect, a new text. We have included it here because it offers a vivid testimony to the eager assimilation of contemporary French artistic and cultural theory by progressive intellectuals in the English-speaking world. Our extracts are taken from chapter VI of *Reflections upon Ancient and Modern Learning*, London: J. Leake, 1694, pp. 61–3 and 68–77.

Hitherto the Moderns seem to have had very little Reason to boast of their Acquisitions, and Improvements; Let us see now what they may have hereafter. In those Arts, sure, if in any, they may challenge the Preference, which depending upon great Numbers of Experiments and Observations, which do not every Day occur, cannot be supposed to be brought to Perfection in a few Ages. Among such, doubtless, Architecture, Sculpture and Painting may, and ought here to be reckoned; both because they were extremely valued by the Ancients, and do still keep up their just Price. They are likewise very properly taken notice of in this Place, because they have always been the Entertainments of Ingenious and Learned Men, whose Circumstances would give them Opportunity to lay out Money upon them, or to please themselves with other Men's Labours. In these Things, if we may take Men's Judgments in their own Professions, the Ancients have far out-done the Moderns. The Italians, whose Performances have been the most considerable in this kind, and who, as Genuine Successors of the Old Romans, are not apt to undervalue what they do themselves, have, for the most part, given the uncontested Pre-eminence to the Ancient Greek Architects, Painters and Sculptors. Whose Authority we ought the rather to acquiesce in, because Michael-Angelo and Bernini, two wonderful Masters, and not a little jealous of their Honour, did always ingenuously declare, that their best Pieces were exceeded by some of the ancient Statues still to be seen at Rome.

Here therefore I at first intended to have left off; and I thought my self obliged to resign what I believed could not be maintained, when Monsieur Perrault's *Parallel of the Ancients and Moderns* came to my Hands. His Skill in Architecture and Mechanicks was sufficiently manifested long ago, in his admirable Translation of, and Commentaries upon Vitruvius: And his long Conversation with the finest Pieces of Antiquity, and of these Later Ages, fitted him for judging of these Matters better than other Men. So that, though there might be great Reason not to agree to his Hypothesis of the State of Ancient and Modern Eloquence and Poesie; yet in Things of this Nature, where the *Mediums* of Judging are quite different, and where Geometrical Rules of Proportion, which in their own Nature are unalterable, go very far to determine the Question, his Judgment seemed to be of great weight. I shall therefore chuse rather to give a short View of what he says upon these Subjects, than to pass any Censure upon them of my own. [...]

Of Sculpture he says; 'That we are to distinguish between entire Statues, and *Basso Relievo's*; and in entire Statues, between naked and cloathed Pieces. The naked Images of the Ancients, as Hercules, Apollo, Diana, the Gladiators, the Wrestlers, Bacchus, Laocoon, and some few more, are truly admirable: They shew something extremely noble, which one wants Words for, that is not to be found in Modern Work: Though he cannot tell whether Age does not contribute to the Beauty. That if some of the most excellent of the Modern Pieces should be preserved 1500 or 2000 Years, or ting'd with some Chymical Water, that could in a short time make them

appear Antique, it is probable they would be viewed with the same Veneration which is now payed to Ancient Statues. That the naked Sculpture of single Figures is a very noble Art indeed, but the simplest of any that has ever charmed Mankind; not being burthen'd with a Multiplicity of Rules, nor needing the Knowledge of any other Art to compleat it; since a Man that has a Genius, and Application, wants only a beautiful Model in a proper Posture, which he is faithfully to copy: And therefore, That in the Cloathed Statues of the Ancients, the Drapery wants much of that Art which is discernable in some Modern Pieces; they could never make the Clothes sit loose to the Bodies, nor manage the Folds so as to appear easie and flowing, like well-made Garments upon living Bodies. That the *Basso Relievo's* of the Ancients plainly show, that the Statuaries in those Days did not understand all the Precepts that are necessary to compleat their Art; because they never observed the Rules of Perspective, they did not lessen their Figures gradually, to make them suitable to the Place where they stood, but set them almost all upon the same Line; so that those behind were as large, and as distinguishable, as those before; as if they had been purposely mounted upon Steps, to be seen over one another's Heads. That this is visible in the Columna Trajana at this Day, though that is the noblest ancient Performance in Basso Relievo still remaining; wherein, together with some very beautiful Airs of some of the Heads, and some very happy Postures, one may discern that there is scarce any Art in the Composition of the whole, no lessening of the Relievo in any part, with great Ignorance in Perspective in the whole. That the ancient Works in Basso Relievo did not truly deserve that Name, being properly entire Statues, either sawed down perpendicularly, from Head to Foot, with the fore-part fastned, or glued to a flat Ground, or sunk half way in: Whereas the true Art consists in raising the Figures so from their Ground, which is of the same Piece, that with two or three Inches of Relievo, they may appear like distinct Images rising out of the Ground, some more, some less, according to the several Distances in which they ought to be placed'.

Of Painting, he says; 'That three Things are necessary to make a perfect Picture; To represent the Figures truly; To express the Passions naturally; and, To put the whole judiciously together. For the First, It is necessary that all the Out-Lines be justly drawn, and that every Part be properly coloured. For *the* Second, It is necessary that the Painter should hit the different Airs and Characters of the Face, with all the Postures of the Figures, so as to express what they do, and what they think. The whole is judiciously put together, when every several Figure is set in the Place in which we see it, for a particular Purpose; and the Colouring gradually weakned, so as to suit that part of the Plain in which every Figure appears. All which is as applicable to the several Parts of a Picture that has but one Figure, as to the several Figures in a Picture that has more. That if we judge of Ancient and Modern Paintings by this Rule, we may divide them into three Classes: The First takes in the Age of Zeuxis, Apelles, Timanthes, and the rest that are so much admired in Antiquity. The Second takes in the Age of Raphael, Titian, Paul Veronese, and those other great Masters that flourished in Italy in the last Age. The Third contains the Painters of our own Age; such as Poussin, Le Brun, and the like. That if we may judge of the Worth of the Painters of the First Classe by the Commendations which have been given them, we have Reason to say, either that

their Admirers did not understand Painting well, or that themselves were not so valuable, or both. That whereas Zeuxis is said to have painted a Bunch of Grapes so naturally, that the Birds pecked at them; Cooks have, of late Years, reached at Partridges and Capons, painted in Kitchens; which has made By-standers smile, without raising the Painter's Reputation to any great height. That the Contention between Protogenes and Apelles shewed the Infancy of their Art: Apelles was wonderfully applauded for drawing a very fine Stroke upon a Table: Protogenes drew a Second over that, in a different Colour; which Apelles split into two, by a Third. Yet this was not so much as what Giotto did, who lived in the Beginning of the Restoration of Painting in Italy; who drew, without Compasses, with a single Stroke of a Pencil, upon a Board, an O, so exquisitely round, that it is still proverbial among the Italians, when they would describe a Man that is egregiously stupid, to say, That he is as round as the O of Giotto. That when Poussin's Hand shook so much, that he could scarce manage his Pencil, he painted some Pieces of inestimable Value; and yet very indifferent Painters would have divided every Line that he drew, into nine or ten Parts. That the Chineses, who cannot yet express Life and Passion in their Pieces, will draw the Hairs of the Face and Beard so fine, that one may part them with the Eye from one another, and tell them. Though the Ancients went much beyond all this; for the Remains of the ancient Painting discover great Skill in Designing, great Judgment in Ordering of the Postures, much Nobleness and Majesty in the Airs of the Heads; but little Art, at the same time, in the Mixing of their Colours, and none at all in the Perspective, or the Placing of the Figures. That their Colouring is all equally strong; nothing comes forward, nothing falls back in their Pictures; the Figures are almost all upon a Line: So that their Paintings appear like Pieces in *Basso Relievo*, coloured; all dry and unmoveable, without Union, without Connexion, and that living Softness which distinguishes Pictures from Statues in Marble or Copper. Wherefore, since the Paintings of these Ancient Masters were justly designed, and the Passions of every several Figure naturally expressed, which are the Things that the Generality of Judges most admire, who cannot discern those Beauties that result from a judicious Composition of the whole, so well as they can the distinct Beauties of the several Parts, there is no Wonder that Zeuxis and Apelles, and the other Ancient Masters, were so famous, and so well rewarded. For, of the three Things at first assigned, as necessary to a perfect Painter, true Drawing, with proper Colouring, affect the Senses; natural Expressing of the Motions of the Soul move the Passions; whereas a Judicious Composition of the whole, which is discernable in an Artful Distribution of Lights and Shades, in the gradual Lessening of Figures, according to their respective Places, in making every Figure answer to that particular Purpose which it is intended to represent, affects the Understanding only; and so, instead of Charming, will rather disgust an unskilful Spectator. Such a Man, and under this Head almost all Mankind may be comprehended, will contentedly forgive the grossest Faults in Perspective, if the Figures are but very prominent, and the View not darkned by too much Shade; which, in their Opinion, spoils all Faces, especially of Friends, whose Images chiefly such Men are desirous to see'.

When he compares the Paintings of Raphael and Le Brun together, he observes, 'That Raphael seems to have had the greater Genius of the two; that there is

something so Noble in his Postures, and the Airs of his Heads; something so just in his Designs, so perfect in the Mixture of his Colours, that his *St. Michael* will always be thought the first Picture in the World, unless his *H. Family* should dispute Precedency with it. In short, he says, That if we consider the Persons of Raphael and Le Brun, Raphael perhaps may be the greater Man: But if we consider the Art, as a Collection of Rules, all necessary to be observed to make it perfect, it appears much more compleat in Monsieur Le Brun's Pieces: For Raphael understood so little of the gradual Lessening of Light, and Weakning of Colours, which is caused by the Interposition of the Air, that the hindmost Figures in his Pieces appear almost as plain as the foremost; and the Leaves of distant Trees, almost as visible as of those near at hand; and the Windows of a Building four Leagues off may all be counted as easily as of one that is within twenty Paces. Nay, he cannot tell whether some part of that Beauty, now so peculiar to Raphael's Pieces, may not, in a great Measure, be owing to Time, which adds a real Beauty to good Paintings. For, in Works of this kind, as in New-killed Meat, or New-gathered Fruit, there is a Rawness and Sharpness, which Time alone concocts and sweetens, by mortifying that which has too much Life, by weakning that which is too strong, and by mixing the Extremities of every Colour entirely into one another. So that no Man can tell what will be the Beauty of Le Brun's *Family of Darius*, *Alexander's Triumph*, *the Defeat of Porus*, and some other Pieces of equal Force, when Time shall have done her Work, and shall have added those Graces which are now so remarkable in the *St. Michael*, and the *H. Family*. One may already observe, that Monsieur Le Brun's Pieces begin to soften; and that Time has, in part, added those Graces which it alone can give, by sweetning what was left on purpose, by the judicious Painter, to amuse its Activity, and to keep it from the Substance of the Work.' Thus far Monsieur Perrault.

Whether his Reasonings are just, I dare not determine: Thus much may very probably be inferred, That in these Things also the World does not decay so fast as Sir *William Temple* believes; and that Poussin, Le Brun and Bernini have made it evident by their Performances in Painting and Statuary, *That we have had Masters in both these Arts, who have deserved a Rank with those that flourished in the last Age, after they were again restored to these Parts of the World.*

IB

The Academy: Systems and Principles

1 Nicolas Poussin (1594–1665) Letters to Chantelou and to Chambray

The French painter Nicolas Poussin was born in the small village of Les Andelys in Normandy, but spent most of his working life in Italy. In 1640 he was recalled to Paris to serve as court painter to Louis XIII, but he was temperamentally unsuited to the demands of the post and he returned to Rome in 1642, where he remained until his death in 1665. Poussin avoided grand public and decorative projects, preferring to work on relatively small-scale paintings for a circle of erudite and like-minded collectors who were highly appreciative of his austere but poetic treatment of subjects from classical mythology and ancient history. The most important of his French patrons was Paul Fréart de Chantelou (see IC3), who commissioned a number of paintings, including the second series of the seven *Sacraments*, now housed in the National Gallery of Scotland in Edinburgh. The immediate occasion for the letter reprinted below was Chantelou's complaint that the artist had taken more care over his painting of *The Finding of Moses* for Jean Pointel than he had over the *Ordination* from the series of *Sacraments*. Poussin responds by pointing out that different subjects require different treatment and defends his position by elaborating a theory of the musical Modes in relation to painting. Poussin's suggestion that the disposition of the painting as a whole can be adapted to convey a mood or emotion exercised a considerable influence on later theorists, including André Félibien (see IB9) and Antoine Coypel (see IIA8 and 9). The second letter, written six months before Poussin's death, is to Roland Fréart de Chambray, Chantelou's brother and the author of *An Idea of the Perfection of Painting* (see IB6). This letter reaffirms Poussin's rationalist view of painting, whilst casting light on the unique fusion of Christian and pagan themes which characterizes his last paintings. It has been seen as a sort of artistic credo of his later years. The following translations are taken from Anthony Blunt, *Nicolas Poussin*, London: Phaidon, 1967, pp. 367–72. Blunt has shown that the source for Poussin's account of the Modes is a treatise by Gioseffe Zarlino, *Istituzioni harmoniche*, first published in 1553.

Poussin to Chantelou

Rome, November 24, 1647

Sir,

This letter will serve as an answer to your two last, one of the twenty-third of October and one of the first day of this month. I am keeping the promise I made you and that is that I shall not use my brushes for anyone but you until I have finished your Seven Sacraments. Therefore, having sent you the Last Supper, which is the sixth, I have taken in hand the last, the one you say you care for least; be that as it may, I promise it will not be inferior to the one you like most.

I have been paid for the last picture I sent you by an agent for M. Giericot. In any case, you must be aware of this from the letter of exchange that has surely reached you and from the one I wrote you about the dispatch of the picture which, I am sure, you will have received before the present letter.

I have decided to serve Monsieur de Lysle since you order me to do so, despite the fact that I had resolved, from now on, to do some work as though for myself, without having to submit any longer to the caprice of others and especially of those who only see through the eyes of others. Nevertheless, this gentleman must prepare himself to be patient, a difficult thing for a Frenchman.

I presented your regards to the Cavaliere dal Pozzo who reciprocates them with his customary courtesy.

Regarding what you write me in your last letter, it is easy to dispel your suspicion that I honor you less and that I am less devoted to you than to others. If this were so, why should I have preferred you, over a period of five years, to so many persons of merit and quality who ardently desired that I should do something for them and who offered me their purses? why was I satisfied with such a modest price that I would not even accept what you yourself offered me? And why, after sending you the first of your pictures composed of only sixteen or eighteen figures – so that I could have made the others with the same number or fewer in order to bring such a long labor to an end – why did I enrich them further with no thought except to obtain your good will?

Why have I spent so much time running here and there in hot or cold weather for your personal errands, were it not to prove to you how highly I esteem you? I don't wish to say more because I should go beyond the limits of the devotion that I have vowed you. You must certainly believe that I have done for you what I would not do for any living person and that I shall persist in my resolve to serve you with all my heart. I am not fickle or changing in my affection once I have given it to a person.

If you find the painting of the Finding of Moses which belongs to M. Pointel so attractive, is this a reason for thinking that I did it with greater love than I put into your paintings? Cannot you see that it is the nature of the subject which has produced this result and your state of mind, and that the subjects that I am depicting for you require a different treatment? The whole art of painting lies in this. Forgive my liberty if I say that you have shown yourself precipitate in your judgment of my works. To judge well is very difficult unless one has great knowledge of both the

theory and the practice of this art. We must not judge by our senses alone but by reason.

This is why I want to tell you something of great importance which will make you see what has to be observed in representing the subjects of paintings.

Those fine old Greeks, who invented everything that is beautiful, found several Modes by means of which they produced marvelous effects.

This word Mode means, properly, the *ratio* or the measure and the form that we employ to do anything, which compels us not to go beyond it, making us work in all things with a certain middle course or moderation. And so this mediocrity or moderation is simply a certain manner or determined and fixed order in the process by which a thing preserves its being.

As the Modes of the ancients were composed of several things put together, the variety produced certain differences of Mode whereby one could understand that each of them retained in itself a subtle distinction, particularly when all the things that pertained to the composition were put together in proportions that had the power to arouse the soul of the spectator to divers emotions. Observing these effects, the wise ancients attributed to each [Mode] a special character and they called Dorian the Mode that was firm, grave, and severe, and they applied it to matters that were grave, severe, and full of wisdom.

And passing on from this to pleasant and joyous things they used the Phrygian Mode because its modulations were more subtle than those of any other Mode and because its effect was sharper. These two manners and no others were praised and approved by Plato and Aristotle, who deemed the others useless; they held in high esteem this vehement, furious, and highly severe Mode that strikes the spectator with awe.

I hope within a year to paint something in this Phrygian Mode; frightful wars provide subjects suited to this manner.

Furthermore they considered that the Lydian Mode was the most proper for mournful subjects because it has neither the simplicity of the Dorian nor the severity of the Phrygian.

The Hypolidian Mode contains within itself a certain suavity and sweetness which fills the soul of the beholders with joy. It lends itself to divine matters, glory, and Paradise.

The ancients invented the Ionic which they employed to represent dances, bacchanals, and feasts because of its cheerful character.

Good poets have used great diligence and marvelous artifice in adapting their choice of words to their verse and disposing the feet according to the propriety of speech, as Vergil has observed throughout his work, because to all three manners of speech he accommodates the actual sound of the verse with such skill that he seems to set before our eyes with the sound of the words the things he is describing. So, when he is speaking of love, he has cleverly chosen certain words that are sweet, pleasing, and very grateful to the ear. Where he sings of a feat of arms or describes a naval battle or accident at sea, he has chosen words that are hard, sharp, and unpleasing, so

that on hearing them or pronouncing them they arouse fear. If, therefore, I had painted you a picture in which this manner was followed, you would imagine that I did not love you.

Were it not that it would amount to composing a book rather than writing a letter, I would like to bring to your attention several important things that should be considered in painting, so that you could fully realize how much I exert myself in your service. For though you are very knowledgeable in all matters, I fear that the frequentation of the many insensate and ignorant people that surround you may corrupt your judgment by contagion. I remain as always

Sir
Your very humble and very faithful
servant
Le Poussin

Poussin to Chambray

Rome, March 1, 1665

Sir,

After such a long silence one must at last try to arouse oneself while the pulse still faintly beats. I have had ample leisure to read and examine your book on the perfect Idea of Painting which provided sweet refreshment to my afflicted spirit and I rejoiced that you should be the first among Frenchmen to have opened the eyes of those who only see through the eyes of others, allowing themselves to be deceived by false, generally accepted opinions. Now you have enlivened and softened a material that is rigid and difficult to handle, and, thanks to this, in the future some person may appear who, because of your guidance, may manage to give us something of his own for the benefit of painting.

After reflecting on the way Franciscus Junius divides this beautiful art into parts I have dared to set down here briefly what I have learned about it.

In the first place it is necessary to know what this kind of imitation is and to define it.

Definition:

It is an imitation with lines and colors on any surface of all that is to be found under the sun. Its aim is delectation.

Principles that any man capable of reasoning can learn:

- Nothing is visible without light.
- Nothing is visible without a transparent medium.
- Nothing is visible without boundaries.
- Nothing is visible without color.
- Nothing is visible without distance.
- Nothing is visible without instrument.¹
- What comes after this cannot be learned.
- These parts are the painter's affair.
- But first about subject matter –

It must be noble and not have taken on any common quality so that the painter may show his spirit and industry. It must be chosen so as to be capable of taking on the most excellent form. The painter must begin with disposition, then ornament, decorum, beauty, grace, vivacity, *costume*, *vraisemblance*, and judgment in every part. These last qualities spring from the talent of the painter and cannot be learned. They are like Vergil's Golden Bough which none can find or pick, unless he is guided by destiny.

These nine parts contain many beautiful things which deserve to be written about by good and learned hands, but I beg you to consider this small sample and to give me your opinion of it without ceremony. I know well that you know not only how to snuff a lamp but how to feed it with good oil. I would say more but nowadays when I overheat the front of my head by great concentration, it makes me ill. Moreover I am always ashamed to see myself placed on the same level with men whose merits and worth are farther above me than the Star of Saturn is above our head.

It is a result of your friendship that makes you see me as far greater than I am. For this I feel forever indebted to you and I am

Sir
Your very humble
and very obedient servant
Le Poussin

I very humbly kiss the hands of your elder brother M. de Chantelou.

¹ These six 'principles' are the conditions of sight as generally accepted by seventeenth-century writers on optics, whose ideas on this subject were still based on their medieval predecessors, such as Vitellio and Alhazen [Blunt].

2 Nicolas Poussin (1594–1665) Observations on Painting

Poussin's 'Observations on Painting' have come down to us through their inclusion in Giovanni Pietro Bellori's *Le vite de' pittori, scultori et architetti moderni* (The Lives of Modern Painters, Sculptors and Architects), where they form the culmination of his life of the artist (see IB3 and 8). Organized under a series of thematic headings, they consist largely of passages excerpted from a variety of classical and Renaissance authors. It has been suggested that the choice of notes may reflect Bellori's own theoretical priorities. Nonetheless, it is clear that Poussin has drawn upon these sources in order to give expression to his own most fundamental views on painting. Painting is viewed as a rational activity whose primary goal is the expression of beauty and truth. Its proper concern is the depiction of noble human action. Poussin's emphasis on expression and clarity, and on the avoidance of all unnecessary detail, contrasts with the goals of the Italian Baroque as practised in Rome by contemporaries such as Pietro da Cortona. This translation is taken from Anthony Blunt, *Nicolas Poussin*, London: Phaidon, 1967, pp. 361–6, including the accompanying notes which identify the original source of Poussin's observations.

Of the Example of Good Masters

Even though instruction concerning practice follows the study of theory, unless theoretical precepts are confirmed by evidence they do not impress on the mind the working habits that are the result of practical experience; in fact, by leading the young man down long and winding paths, they rarely direct him to the desired end of his journey unless the firm guidance of good examples points the way to more rapid methods and less esoteric ends.

[The source of this passage has not so far been identified, but it probably comes from some sixteenth-century treatise on literary theory.]

Definition of Painting and of the Imitation Proper to it

Painting is simply the imitation of human actions, which, properly speaking, are the only actions worthy of being imitated; other actions are not imitable in themselves, as principal parts, but incidentally, as accessories; in this manner one can imitate not only the actions of animals but all natural things.

[This passage is copied from Tasso's *Discorso del poema eroico* (Torquato Tasso, *Prose*, Milan and Naples, 1959, p. 497). Poussin has simply changed the word 'poesia' to 'pittura.']

How Art Surpasses Nature

Art does not differ from nature nor can it go beyond her limits. Thus the light of knowledge, which, like a gift of nature, is scattered here and there and appears in different men at different times and places, comes together by means of art. This light in its entirety or in a large part is never to be found in a single man.

[The idea expressed here is also to be found in a letter of Poussin to Chantelou of June 27, 1655 (*Correspondance*, pp. 434f), in which he quotes almost verbatim a passage in Quintilian's *Institutio oratoria* 12. 10.]

How the Impossible Constitutes the Perfection of Painting and Poetry

Aristotle, using the example of Zeuxis, wants to prove that the poet has license to say impossible things provided they are better [than the possible]. So it is impossible by nature that a woman should possess every beauty gathered in her one self as was the case with Helen who was very beautiful and consequently better than the possible. See Castelvetro.

[Here Poussin himself gives the clue to his source. In fact, the passage is taken from Castelvetro's *Poetica d'Aristotele* (Basel, 1576, p. 668).]

Of the Bounding Lines of Drawing and Color

A painting will appear elegant when its extreme elements join the nearest by means of intermediate ones in such a fashion that they do not flow into one another too feebly nor yet with harshness of line and colors; and this leads one to speak of the harmony or discord of colors and of their bounding lines.

[The source of this note has not as yet been identified.]

Of Action

There are two instruments which will affect the minds of your hearers, action and diction. The first is in itself so valuable and efficacious that Demosthenes gave it the first place in all rhetorical devices, and Marcus Tullius [Cicero] calls it the speech of the body. Quintilian attributes such efficacy and such power to it that he esteems conceits, proofs, and effects useless without it; and without it, lines and colors are useless.

[The gist of this passage is to be found in Quintilian's *Institutio oratoria* 11.3. 1–6, but in a different form. Poussin may have copied it from some sixteenth- or seventeenth-century critic who was summarizing the ancient author.]

On Certain Forms of the Grand Manner. On Subject Matter, on the Conceit, on Composition, and on Style

The grand manner consists in four things: the matter, that is, the subject, the conceit, the composition, and the style. The first thing that is required, as the foundation of everything else, is that the matter and the subject should be something lofty, such as battles, heroic actions, religious themes. But as the subject with which the painter is contending is grand, the most important advice is that he must avoid excessive details with all his power, in order to preserve the dignity of his story, and must not skim lightly over things great and magnificent to lose himself in vulgar and frivolous matters. Therefore the painter must exert his art not only in treating the subject but also his judgment in understanding it, and he must select it of such a nature that it may be endowed with every ornament and perfection; but those who select lowly subjects seek refuge in them because of the infirmity of their minds. Therefore lowly and base subjects should be scorned as being far removed from any artifice which may be used in their presentation. As for the conceit, this is purely a product of the mind that speculates about things, as was the conceit of Homer or that of Phidias when he conceived the Olympian Zeus who by a nod can move the universe; however, the design of things should be such as to express the conceits of these same things. The structure or composition of the parts should not be worked out with obvious effort, or labored, but natural. Style is a particular manner and skill in painting and drawing which comes from the particular genius of each individual in

his way of applying and using ideas; this style, manner, or taste comes from nature and intelligence.

[The principal ideas expressed in this note are to be found in Agostino Mascardi's *Dell'arte historica*, published in Rome in 1636, but, if this is his source, Poussin has put together passages scattered about in different parts of the book. Some points are also to be found in Paolo Aresi's *Arte di predicar bene* (Venice, 1611, Bk. III, ch. 28) and yet others in the first discourse of Tasso's *Discorsi dell'arte poetica* (ed. cit., p. 350).]

Of the Idea of Beauty

The idea of beauty does not descend into matter unless it has been prepared as much as possible: this preparation comprises three things: the order, the mode, and the species or form. The order concerns the interval of the parts, the mode relates to quantity, the form has to do with lines and colors. Neither the order nor the interval of the parts is sufficient, nor is it sufficient that all the limbs of the bodies be in their natural place unless, besides this, according to the mode, each limb be proportioned to the size of the body and, according to the species, all the lines be handled gracefully and with a suave harmony of lights adjacent to shadows. From all these considerations it is apparent that beauty is entirely removed from the physical aspects of the body and only comes close to them when it is prepared by these insubstantial preparations. And thus we conclude that painting is nothing but an idea of incorporeal things even though it shows bodies, for it only represents the order and the mode of the species of things and it is more intent upon the idea of beauty than on any other thing, so much so that there are those who have maintained that this only was the mark and the goal of all good painters, and that painting, looking on beauty with an enamored eye, was the Queen of the arts.

[As was first pointed out by Panofsky (*Idea*, p. 117) this note corresponds closely to a passage in the *Idea del tempio della pittura* (Milan, 1590) of G. P. Lomazzo who in his turn had borrowed the text from Marsilio Ficino's *Sopra lo amore over'convito di Platone* (Florence, 1544). But Poussin's text corresponds even more closely to a passage in the Italian translation of Dürer's treatise made by G. P. Gallucci and published in Venice in 1599 (*Della simmetria dei corpi humani libri quattro*, ch. 57). This text contains one sentence which is missing in both Ficino and Lomazzo and which corresponds to Poussin's sentence beginning: 'Et qui si conclude. . .'

This appears to be the only case in which Poussin copied out a passage expressing Neo-Platonic ideas.]

Of Novelty

Novelty in painting does not consist above all in choosing a subject that has never been seen before but upon a good and novel arrangement and expression, thanks to which the subject, though in itself ordinary and worn, becomes new and singular. In this connection one should recall the *Communion of St. Jerome* by Domenichino in

which the emotions and movements differ from those of the same subject by Agostino Carracci.

[The idea expressed in this note corresponds to one in the first discourse of Tasso's *Discorsi d'ell'arte poetica* (ed. cit., p. 352).

Poussin is here defending his master Domenichino, who had been attacked for plagiarism in his painting of the Last Communion of St. Jerome, now in the Pinacoteca Vaticana, which was said by his critics to be a mere variant of Agostino Carracci's painting of the same subject, now in the Pinacoteca in Bologna.]

How to Make up for the Poverty of a Subject

If the painter wants to arouse admiration in people's minds but has not in hand a subject apt to produce it, he will not introduce strange and new things contrary to reason but will force his mind to make his work marvelous by the excellence of its manner, so that people will say: 'Materiam superabat opus.'

[The main points of this note can be found in contemporary writers on literature (e.g., Mascardi, op. cit., p. 158). Poussin is here no doubt alluding to the quarrel between the Baroque and Classical parties in the Academy of St. Luke and siding with the latter.]

Of the Form of Things

The form of each thing is distinguished by its function or purpose; some are intended to arouse laughter, others terror, and these are their forms.

[This definition of form, which goes back ultimately to Aristotle, was almost universally accepted by philosophers in the Middle Ages and the Renaissance.]

Of the Charms of Color

Colors in painting are a snare to persuade the eye, like the charm of the verse in poetry.

[Poussin has once again modified a passage from Tasso to make it apply to painting instead of literature. His source is found in the second discourse of the *Discorsi del poema eroico* (ed. cit., p. 537).]

3 Various Authors: Recollections of Poussin

Already during his lifetime Poussin was acclaimed as the embodiment of 'the perfect painter'. In France he was revered as the 'new Raphael' and as the only contemporary artist whose work could stand comparison with the achievements of the Ancients. His work was central to the foundation of the new French school of painting and was accorded

exemplary status within the newly formed Royal Academy of Painting and Sculpture. The image of Poussin as a 'philosopher-painter', who lived a life of austere nobility and artistic virtue, came to play an important role in promoting the ideal of the learned artist. Here we include excerpts from three texts which did much to consolidate this view. The first, *An Idea of the Perfection of Painting*, by Roland Fréart de Chambray, was published in 1662, three years before the artist's death. Poussin's measured response is given in the letter reproduced above (see IB1 and 6). The second is taken from Giovanni Pietro Bellori's 'Life of Poussin' published in Rome in 1672 as the last of his *Lives of Modern Painters, Sculptors and Architects* (see IB2 and 8). The third is from the eighth of André Félibien's *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes* (Conversations on the Lives and Works of the Most Excellent Ancient and Modern Painters), which was published in France in 1685 (see IB9 and ID6). The eighth *Entretien* is entirely devoted to Poussin's life and work and is presented as the crowning achievement of the work as a whole. Our selections are taken from the translations by Fabia Claris and Bridget Maison appended to Alain Mérot, *Nicolas Poussin*, London: Thames and Hudson, 1990, pp. 314–17.

Roland Fréart de Chambray: *Idée de la perfection de la peinture démontrée par les principes de l'art* (Paris, 1662), pp. 121 ff.

[. . .] this Poussin is indeed a mighty eagle in his profession, or, to put it more clearly and without using metaphors, he is the most accomplished and perfect of all our modern painters. It is not difficult to convince scholars of this, men who study and judge matters in the manner of mathematicians, that is to say with precision, on the basis of pure demonstration, through analysis of the principles involved, and without allowing opinion or favour, which are the bane of truth, to intrude. Others, however, who have only a superficial knowledge, but yet have a very over-inflated view of their own judgment, will see this statement as a paradox, and in so doing render themselves incapable of ever being shown its truth. That is why I leave them to argue about it, and content myself with having established in this treatise the fundamental principles and the method by which it should be dissected, without involving myself any further in this dispute. I would only add by way of information that anyone who is curious enough to get to the stage of seeking decisive proof of Poussin's worth will find it amply demonstrated in his set of *Seven Sacraments* . . . which are to be seen in Paris at the residence of Monsieur Chantelou, a steward in ordinary to the King, and a close friend of this illustrious Poussin. It is a series of seven uniform pictures, moderate in size, but of extraordinary diligence, in which this noble painter seems to have given us not only a perfect demonstration of the art in accordance with all the parts examined in this treatise, but also an illustration of the highest state of excellence which can be achieved, through his innovation and inventiveness, the nobility of his ideas on each subject, his scholarly and judicious observance of costume (in which he is almost unique), the force of his figures' expressions, and, in a word, all the same qualities discernible in the great geniuses of antiquity, among whom he would, I believe, have held one of the topmost places, since in all his works he demonstrates all the same parts of excellence which Pliny and the others pointed out in Apelles, Zeuxis, Timanthes and Protogenes, and the rest of that first class of painters.

Gian Pietro Bellori: *Le Vite de' Pittori, Scultori et Architetti moderni* (Rome, 1672).

He led an extremely well-ordered life, for many are they who paint according to whim and who work for a time, full of ardour, but who then tire and cast aside their brushes for some long while. Poussin was in the habit of rising early in the morning and taking some exercise for an hour or two, sometimes walking through the City, more usually on the Monte della Trinità which is the Pincio hill, not far from his house, from which it is reached by way of a gentle slope, delicious with trees and fountains, whence the beautiful view of Rome and her pleasant hills unfolds, which together with its buildings is both scenic and theatrical. He lingered here with his friends, immersed in deep and learned conversations; returning home, he set about painting without a break, until midday. After a pause for refreshment, he continued painting for several hours; and thus he achieved more through continuous study than another artist would through practice. In the evening he again went out, and walking beneath the same hill, in the piazza, amid the crowd of foreigners who were wont to gather there. Here he was always surrounded by a retinue of intimate admirers; and those who, by dint of his reputation, desired to see him and to treat him as a friend found him here, admitting all good men to his circle. He listened readily to others, but then his observations were very serious, and attentively received: he would often talk about art, and with such expertise that not just painters but cultivated people in general came to hear him discourse on the supreme purpose of painting, not to educate [his listeners], but simply as ideas came to him. Having read widely and observed acutely, there was no subject about which he was ill-informed, and his words and ideas were so appropriate and well-ordered that they never gave the impression of being impromptu, rather the results of lengthy meditation. His unique talent was the reason for this, combined with the variety of his reading, in which history, fables and erudite tomes prevailed, but which also encompassed the other liberal arts and philosophy. His recollection of the Latin language, albeit imperfect, served him well, and his Italian was as good as if he had been a native of Italy. His reasoning was perspicacious, his ability to choose acute, his memory retentive: he thus possessed the most prized gifts of intelligence. The figures he drew in Leonardo's *Treatise on Painting*, printed with his drawings in Paris in 1651, are proof of his learning. He maintained that painting and sculpture were but one art, both dependent upon drawing and differing only in their execution, although the former was more artificial by dint of its feigning appearances . . .

As regards the style of this craftsman, it can be said that he envisaged a study, such as he had begun in Paris during his youth, based on the antique and on Raphael, such as when he wanted to create his compositions: having thought up his inventions, he then made a rough sketch of what he had in mind; he then made small wax models, half a hand's breadth in height, of all the figures striking their attitudes, and then constructed the story or the fable in relief in order to study the natural effects of the light and the shadow of the bodies. He then made larger models, which he dressed, so as to make a separate study of their attire and the folds of material on the naked form, and

for this purpose he used fine canvas, or wet cambric, with just a few pieces of cloth providing a variety of colours. Thus he gradually sketched nude life studies, and the drawings emanating from his imaginings were done with simple lines, using simple chiaroscuro watercolours, which nonetheless effectively conveyed movement and expression. He continually sought action in historical subjects and maintained that it was the painter himself who had the right to choose the subject matter and that he should avoid subjects that had no meaning; and this is certainly evident in his compositions. He read Greek and Latin histories and made notes, which he then used when the occasion arose. With regard to this, we have heard him condemn those who make up a story of six or indeed eight figures, or another set number, which a half figure more or less could ruin, and laugh about them. With his great knowledge of art, it was easy for him to see where others went astray and he was openly critical of their errors, unswayed by groundless opinions and firm in his own reasoning. . . .

He was a tall and well-proportioned man with an exceptional temperament; his complexion was quite olive and his black hair had mostly turned grey with age. His eyes were almost sky-blue, his nose sharp and his forehead wide, all of which gave his face a noble yet modest look. . . .

As regards his habits and his intellectual pursuits, apart from what has already been said, Poussin was very perceptive and very wise. He avoided Court life and the conversation of great men, though he was by no means at a loss when he met them, in fact his virtuous spirit rendered him superior to their worldly fortunes. . . .

He treated himself honestly; he did not wear fine clothes, but dressed soberly, and it suited him. Nor was he afraid when away from home to deal personally with his own affairs. There was nothing ostentatious about his home, and he treated all his friends alike, whatever their rank. One day Monsignor Camillo Massimi, now a very distinguished Cardinal, of whom Poussin was very fond and whose opinions he respected, visited his studio. They discoursed together until late at night, and when the time came for his guest to leave, Poussin accompanied him downstairs to his carriage, lantern in hand, causing his visitor to say 'How sorry I am that you have no servant', to which Poussin replied 'And I am even more sorry for your Illustrious self, because you have many.' He never discussed the price of his paintings either with this gentleman or with any other of his friends, but when he delivered their paintings he marked the back of the canvas, and payment in full was immediately sent round to his home. One day I was visiting some ruins with him in Rome, together with a foreigner who was very desirous of taking some rare antique back to his own country. Poussin said to him 'I should like to give you the most beautiful antique you could possibly desire,' and, stretching out his hand, he picked out of the grass a handful of earth and pebbles, with tiny fragments of porphyry and marble turned almost to dust, saying 'Here, Sir, take this to your museum and tell them this is ancient Rome.' He had always planned to write a book about painting, making notes on various subjects or writing down his thoughts during the course of his readings and contemplations, with the intention of assembling them when he became too old to paint, for he was of the opinion that elderly painters should abandon their brushes once their spirits failed, as many of them have given us cause to think. . . .

André Félibien: *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes*, fourth part, 8th Entretien (Paris, 1685), pp. 250–5.

... I know too that he scarcely ever stooped to copy other pictures, and even when he saw something worthy of note among the classics, he would do no more than make quick sketches of it. But he would look long and hard at whatever he saw that was of exceptional beauty, firmly fixing the image in his mind, often commenting that a painter increased his skill by observing things rather than by wasting his energies on copying them.

This immensely sound and fine understanding which he displayed from his earliest years, coupled with the great passion he had for his art, meant that he was more than happy to devote himself to it wholeheartedly and that he never found greater enjoyment than when he was working. He regarded every day as a day to work and study, and every minute he spent painting or drawing was a recreation for him. He took every opportunity to study, wherever he happened to be. As he walked through the streets, he would watch everyone around him, and if he saw anything remarkable he would note it down in a book he always carried expressly for this purpose. He would avoid gatherings whenever possible and would steal away from his friends and go off on his own into the vineyards and remotest corners of Rome, where he was free to stop and look at any classical statue or pleasant views, and to observe the finest effects of nature. It was on these retreats and solitary walks that he would make quick sketches of things which he encountered and thought suitable either for landscapes – like terraces, trees, or particularly beautiful lighting effects – or for history pictures – like satisfying arrangements of figures, combinations of clothes, or other details of decoration – sketches which he would later put to such good and judicious use.

He was not content simply to know the world through his senses, or to base his knowledge on the examples of the greatest masters: he strove particularly to discover the causes of the different sorts of beauty discernible in art, convinced as he was that a workman cannot achieve the perfection he seeks unless he knows the means by which he can do so and the traps he may fall into. For this reason, in addition to looking to the best books he could find to teach him what it was that constituted the good and the beautiful, what it was that caused ugliness, and in what way judgment should be exercised in the choice of subjects and in the execution of all the parts of a work, he also sought to make himself more competent in the practice as well as the theory of his art, by studying geometry, and particularly the science of optics, which is a vital instrument in painting, and helps set the senses straight, and prevent them, either from weakness or otherwise, from being deceived at times and taking illusions of form for solid truths. For this he turned to the writings of the Theatine, Father Matteo Zaccolini, of whom I have spoken to you. No painter has ever grasped the rules of perspective or understood the reasons for light and shade better than this priest. These writings are in the Barberini Library, and Poussin had a large part of them copied and studied them assiduously. Because some of his friends saw them in his hands, and because he talked so knowledgeably about [the science of] optics and made such felicitous use of it, people thought he had composed a treatise on light and shade. In fact, however, he never wrote anything on the subject; his own paintings

were sufficient evidence of all that he had learnt from Father Zaccolini, and indeed from the works of Alhazen and Vitellion. He also had a high regard for the writings of Albrecht Dürer and for Leone Battista Alberti's *Traité de la peinture*. He had learnt about anatomy while he was in Paris; but he studied it again and with even greater application when he was in Rome, as much through the writings and illustrations of Vesalius, as through the lessons he took with a learned surgeon who often performed dissections.

It was at the time when most of the young painters who were in Rome, attracted there by Guido Reni's great reputation, were flocking to copy his painting of *The Martyrdom of St Andrew* which is in S. Gregorio Magno. Poussin was almost alone in preferring to draw the painting by Domenichino in the same church; and so good was his exposition of its beauty that, swayed by his words and his example, the majority of other painters abandoned Guido Reni and copied the Domenichino instead.

For although Poussin looked primarily to the beautiful works of classical antiquity and to the works of Raphael, against which he measured all his own ideas, this did not prevent him from holding other masters in high esteem. He considered Domenichino to be the best of the Carracci school as a model for drawing and for powerful expressions. He also admired other artists for their fine brushwork, and it cannot be denied that in his early years he was more than a little influenced by Titian's use of colour. But it is notable that, as he perfected his skills, he became more and more insistent as regards the form and accuracy of drawing, which he rightly saw as the major aspect of painting, as have all the greatest painters who have, so to speak, abandoned all other aspects in its favour as soon as they have understood the essence of the excellence of their art.

4 Martin de Charmois (1609–1661) Petition to the King and to the Lords of his Council

On 20 January 1648 Martin de Charmois made a successful petition to the Regency Council of Louis XIV for the founding of a Royal Academy of Painting and Sculpture. His proposals represent an ambitious attempt to limit the power of the medieval guilds and to overturn their historic privileges. In 1646 the guild of master painters and sculptors, known as the *Maitrise*, had put forward a request to Parliament limiting the number of *brevetaires*, or royal painters, who operated under the king's protection and thus beyond the guild's control. Charles Le Brun and other court painters responded by seeking to form a rival institution which could challenge the monopoly of the guilds. They found an able champion in Charmois, a former secretary to the French Ambassador in Rome, who was also an amateur painter. Charmois's petition, no doubt drawn up with the help of Le Brun, contrasts the role of the Academy in elevating painting and sculpture to the status of a 'liberal art' with the artisanal or merely 'mechanical' aspirations of the guilds. The *Maitrise* had successfully imposed restrictions on the importation of foreign works of art and on the admission of foreign artists. Charmois rejects these as damaging to the flourishing of the arts. In place of the archaic and insular practices of the old corporations, he proposes a new system of education and training which will allow the arts to prosper in the service of the king. At the outset of the petition, he refers to an older Academy of Painting and Sculpture which had been founded under Louis XIII but which had survived for only a couple

of years. This translation of the complete text of the petition has been made for the present volume by Christopher Miller from L. Vitet, *L'Académie royale de peinture et de sculpture: Étude historique*, Paris: Michel Lévy, 1861, pp. 195–207.

Sire, the Academy of Painters and Sculptors, weary of the persecution that it has suffered these long years through the hostility of certain master craftsmen, who take the name of painters or sculptors only to oppress those who have spent their youth toiling at the study of beautiful things in order to merit this title, has finally been constrained to abase itself at the feet of Your Majesty, humbly soliciting his attention, in order to point out that the patience with which [the Academy] has endured these violent proceedings has so inflated the courage of its antagonists that they not only presume to oblige the most erudite exponents of this art to work for those who grind their colours and polish their statues, merely because these men have purchased the title of masters, but they also wish to limit the powers of Your Majesty, by reducing to a certain number those whom he has honoured with the name of painters and sculptors to the King. And this is the result of their ignorance, for they find the lustre of virtue insufferable, and wish to veil it in darkness, so that their failings cannot be distinguished from the beauty of knowledge. For a long time now these masters have inflicted their tyranny on the most excellent men of this profession working in Paris, and, after forcing some among them to become members of its corporation, they would already have obliged the others to do the same, if these had not garnered some support in their effort to prevent these noble arts falling into the void. But since this support, though it is of great assistance, does not remove them from the imminent danger in which they find themselves, and since their enemies are even now making renewed efforts to reduce them to the rank of the most abject trades, they here have recourse to the sovereign power, in order to be restored to their true status; to become such as they were in the time of Alexander in the Academy of Athens, when, as everyone knows, they occupied the first ranks among the liberal arts. And since Your Majesty has, since his earliest childhood, shown himself more marvellous in his actions than that great prince ever was in the flower of his age, they have the right to hope that they will be delivered from this oppression. For it is a deed worthy of Your Majesty, and they will glory in their past persecutions if they owe their liberty to the hand of a prince, whose birth and whose perfection are, at such a tender age, admired by the entire universe. Alexander allowed only the great Apelles to paint his portrait. We have only one Alexander, but Paris has several men such as Apelles and many such as Phidias and Praxiteles, who can ensure that the radiance of his august face is felt in the most distant climes, and that the handsome traits and graces bestowed on it by the heavens are revered in those places. Your Majesty will not allow these ignorant men to paint that face; he will have the practice of such elevated arts forbidden to slaves, as indeed it once was; he will preserve the nobility of these arts, and leave in captivity those who have voluntarily submitted thereto by creating a trade corporation and thus placing themselves on the same footing as the basest of artisans.

Nevertheless, the Academy intends no disservice to those painters and sculptors who, having been forced to qualify as master craftsmen because they were foreign, or lacked the resources to speak out against powerful enemies, or were received at such a young age that they were not able to understand the departure from duty this

entailed, will now leave the tumultuous crowd, and re-ascending Parnassus, willingly and happily renounce the prerogatives of an abject troop in order to attach themselves to the interest of those who would rather suffer voluntary poverty and conserve their honour than seek advantage by submitting to shameful laws such as would tarnish their reputation. It would indeed be a lamentable thing if these arts should suffer, when the other arts are universally cherished by all great men. It would be sad indeed if a city that is the refuge of foreign nations should lend its hand to the oppression of either its own children or those who have come to France in order to embellish it, and if those who flee from the sound of the cannon to seek in Paris a safe haven, should find in it a form of persecution more violent than that of the armies and encampments. Protogenes was as calm amid his enemies as in time of peace. Our Academy members, by contrast, remain at war at the very time when our neighbours envy France's good fortune and its happy government, particularly since the Regency, when their Majesties chose a minister who is alone comparable to his predecessor, so that one's knowledge of the war is confined to news of the victories daily won against those who threaten this state. The Academy might fear to state its petition at excessive length, and make ill use of Your Majesty's leisure, had it not often seen him take respite from the most important matters, in order to relax among the virtuous, and allow them to represent on canvas the external beauties that the heavens have bestowed on him. This persuades the Academy that Your Majesty will not refuse to cast his eye over its just complaints; or rather, to restore its former liberty, since he cannot learn of its misfortunes without seeking their remedy. It may seem that it spoke too boldly, when it boasted that it could imitate the attractions that shine forth from the face of Your Majesty so that they live on through several centuries. And it acknowledges, Sire, that nothing could more clearly suggest the degree of perfection to which our arts may rise. And nevertheless, it will go further, since the Academy can glory in the claim that it is composed of many painters and sculptors who are no whit inferior to the Ancients, whose chisels and paintbrushes were so expert, that one may judge the inclinations and favourable or unfavourable destiny of those who are represented in their pictures or statues. It even dares to say that, though Your Majesty has distinguished himself by very remarkable actions, his portraits, which are carried into the further reaches of the world, have played a great part in converting to adoration the admiration elicited in foreign minds by his renown.

This vanity should be pardoned, for, on the one hand, it is a truth very generally acknowledged, and on the other, those who are oppressed feel a certain relief and show that their hearts are not cast down when they thus attempt to raise themselves by praises of which they are not unworthy. Yes, painters and sculptors may pride themselves, Sire, that they can not only express the very least lineaments of the face, but that they can go beyond these to inclinations, and exhibit these to the eyes of those who have the least tincture of physiognomy. One might indeed add, that those who laid the foundations of the Ottoman Empire had these arts in such high esteem that they banned them in every land that came under their yoke; either because they deemed men unworthy to enter into competition with their Creator, or because they wished to maintain their subjects in ignorance, lest painting, which is a form of writing, if we are to trust to the interpretation of it given by the Greeks, should enlighten and improve them no less than the characters of printed books or

manuscripts. The first of these considerations has a very clear rationale, since it is certain that painters are the imitators of the works of their Creator; with dust soaked in oil or water, they make use of a flat surface to put before the eye everything that has or may have existed, or of which we can form any idea. As to the second, we read that Pythagoras and other ancient philosophers went to Egypt to learn this universal form of writing, which shows in an instant that which writers strive to express in many words; they sought to discover through these arts the beauty of the sciences and the mysteries of their religion. Indeed, one of the greatest men who has ever enlightened the Church with his writings, having spoken a funeral oration over the body of a saint of his own century, felt himself obliged to exclaim, on seeing the paintings of the saint's life: 'O what an advance painting today has over speech! Who could have imagined that dumb eloquence could be so strong and so persuasive? I have set out in many sentences the life and miracles of a holy man, and the painters have made them manifest to a single glance! They have touched the soul through the noblest of the senses, and have explained themselves without intermediary to all the peoples of the earth.' And yet the Academy does not seek to draw any conclusion from this praise, or to magnify itself at the expense of orators or writers, since their goal is no different from the painter's; all these arts have their beauties, and what one does with the paintbrush the other does with the pen. In a word, their object is simply to express things as we see them or conceive them. Nor does it seek to rob sculpture of the portion of these praises it is owed, or give painting some kind of primacy over sculpture. Painting explains itself through colour, sculpture through marble or other more tractable substances; painting by accretion, sculpture by excision. They are sisters, and their common father is drawing; and neither can dispute the nobility or antiquity of the other, since the bodies that God has created were simultaneously clothed in accidental qualities. Thus no objects can ever have appeared without being painted in their colours, which pertain to painting, nor could painting subsist without bodies, which pertain to sculpture.

This short digression seemed not irrelevant, inasmuch as it bars the route towards a question often raised, and which has always remained in the balance. Moreover, precautions must be taken to avoid either of these two arts bridling at the fact that no hierarchy is observed here, and that first one and then the other is accorded priority. An end must be put to this domestic divorce. Our hostility must be concentrated on those persecutors who stretch their arms in our direction rather in order to suffocate than support us, and who wish to ally themselves with us merely for our dishonour. The purpose of the Academy is to illustrate to Your Majesty their insolent attempt to claim to speak with his voice and curb his power, to seek admission to the councils of princes where sculptors and painters are admitted, when these others are employed only to paint the door of the farm courtyard or to polish some piece of marble. It would fain ask them whether painting and sculpture have been degraded or disgraced since emperors, kings – men such as [Caius] Fabius [Pictor] – and the greatest men of history have practised them as their most agreeable pastime. We have no need to seek examples abroad or in the remote past; we need not speak of the payments given for pictures (a single one having been sold for 106 talents), or of the liberality of Parrhasius, who could no longer receive payment for his works in gold coin, which was brought to him in bushels, because he was unwilling to take the trouble to count

or weigh them, and therefore presented them to the public, the Athenian Republic having declared that nothing could be of equal value to them. We have only to consider the esteem shown by our last six kings to sculptors and painters: the posts, profits and pensions that they accorded them, and the love and affection that they felt for them, to the point of visiting them when they were ill and holding them in their arms when they breathed their last. No one need open a book to remember that this honour was accorded to Leonardo da Vinci, who expired in the arms of François I, and that he honoured painters by bestowing the golden lily upon their arms, amid three escutcheons. Henri II loaded Primaticcio, the Abbé de Saint Martin and pupil of Giulio Romano, with honorary positions and benefits; Charles IX was immensely fond of M. Janet; and Henri IV bestowed signal honours on Messieurs Freminet, du Breuil and Bunel. This continued almost to our very day. We have seen the late king, not content with sending his carriages to bring Monsieur Poussin to Fontainebleau and treating him and his suite with great magnificence, receive him at the door of his room, showing by this extraordinary generosity that he honoured the arts in the very person of one of his subjects. Those who are unaware of the excellence of Poussin will be astonished by this, but he knew it well, as Poussin had often painted members of his court, and the king wished to encourage many young men who have indeed been enthused by this example and have attained a considerable standard in this profession. For there is no greater stimulus to virtue than the hope of honour and the reward that is its concomitant. Our enemies will no doubt reply that they no longer have any memory of these events, and that painting and sculpture have since become a matter for commoners. And they are certainly right to speak thus, since they wish to place painting in the category of trades incompatible with nobility. Those who profess the fine arts have too great a confidence in the justice of Your Majesty to fear this disgrace, and they judge by the proofs he daily gives of his great genius that he will not merely emulate the fine parts with which the heavens had adorned so great a prince, but must believe that, just as his good fortune has allowed him to extend the boundaries of his states and carry his arms into kingdoms where the name of François [I] seemed forever buried, his excellent education will provide him with insights and knowledge such as have never been noted in any of his predecessors. For which reason, they have resolved not to let themselves be charmed by the vain arguments of those who envy them or be intimidated by their threats. They wish to defend the name and the prerogatives attached to their profession after so many sleepless nights devoted thereto, not simply in order to win the rewards that Dony, in the volume about his medals, says were previously awarded to those who, having excelled in the arts, were honoured by the governments of the provinces, but in order to protect themselves from the infamy into which their enemies seek to deliver them. If your Majesty were to do the Academy's enemies the honour of listening to them, he would hear of nothing but the protection of public interest and the damage caused by the swarms of foreigners and the ignorant. But the only remedy that they ask in order to obviate all these disorders is money, whether or not an artist is competent; on condition he submit to the jurisdiction of the masters, all difficulties will be resolved. Whereas the Academy can have no difficulty in showing that it is important to the public that painters and sculptors who have learnt their arts in Italy or elsewhere with much hard labour should return to embellish the first city of the

universe. It is as easy to show that their works, which are intended only to ornament temples and excite the devotee to piety, enhance the palace and other buildings, and instruct and entertain the eye, should not be exposed to the scrutiny of the commoner like goods necessary to life; or like the painting of a *porte-cochère*, which must be visited to determine whether the colours are oil or distemper and whether they can withstand inclement weather. Yet if Your Majesty were to follow their counsels, he would ban Michelangelo and Raphael of Urbino (if they were alive today) from working in Paris, unless under a master, when these masters are not worthy to grind the colours or polish the statues of these great men. It offends common sense to require that these excellent men, who were flattered and esteemed by the greatest princes on earth, should have ceased producing such beautiful representations unless they subjected themselves to some upholsterer; or that the said upholsterer should have the right, if [one of them] had painted a portrait of Your Majesty and the Queen Regent, to confiscate it injuriously without respect for so sacred an image. It offends common sense to claim that the number of painters to Your Majesty and the Queen should be limited, and that his family should lose their privileges after the painter's death, and that they should only be able to work if one of the masters order them to make a professional visit, were it indeed to the palace of Your Majesty; that it is a crime to profess virtue in a place of refuge; that painting and sculpture, which have been freely exercised in all kingdoms and republics, should be debased in Paris; that the other arts should be in all their glory here, and that the painters and sculptors who make use of them in order to perfect their works should be placed on a footing with the merest artisan. This truly is an extravagant claim, and one which could only occur to crude and malevolent minds. If anyone should doubt the fact that those who devote themselves to these arts make use of others if they wish to proceed with certainty and attain perfection, they will soon come round to our view if they refer to Vitruvius, who insists that no art should be unknown to the architect, since a painter must be a good architect if he is to represent buildings in his picture with due proportion and measure. This reason should be convincing in itself, but even were it not, everyone knows the inscription that Apelles had placed above his door, refusing entry to all who were not geometers; so there we have geometry; as to the perspective of lines and colours, it is so necessary to painters that they can do nothing without it, since painting and low-relief sculpture are nothing but true perspective. Music, which seems least likely to enter into it, is one of its main components, since we read that Praxiteles had established relations between the proportions of the human body and those of musical tones, and had called them harmonic, to the extent that he knew precisely what consonance the parts had with one another, and wrote a book about this, which has been lost, along with many another fine work. I have said nothing of arithmetic, given that without it one cannot be a good geometer. Astronomy is absolutely indispensable to the architect, and consequently to painters and sculptors. They must moreover have the art of logic, know the nature of animals in order to represent them correctly, learn fables and history in order not to make mistakes in their compositions, and be excellent anatomists in order to understand the relations of the part of the body and their movements. They must also understand physiognomy in order accurately to express passions in their pictures and paint in faces the virtues and vices to which those whom they paint incline. If, after an

Academician has spent several years acquiring all this knowledge, he finds himself reduced to requesting employment in the shop of a grinder of colours, a gilder or an upholsterer, for it is in this fashion that these master painters should describe themselves, or in that of a marble worker, who abusively seeks to claim the title 'sculptor', there will be no one who does not lose heart and hereafter there will be more sense in remaining ignorant than in toiling to acquire virtue.

In consideration of which, Sire, and given that the painters and sculptors do not in the least seek to destroy the privileges of the said gilders, upholsterers and marble workers, but only to remove themselves from this body of base artisans, as indeed several of those who have qualified as masters have already done; given that we do not here request bills against persons of whom we ask nothing; that most of those of the Academy have letters patent as painters and sculptors to Your Majesty, and that our remonstrance is also in favour of those others, French or foreign, who are currently living in Paris, or who may do so, inasmuch as the Academy seeks to preserve on their behalf the freedom enjoyed by those who practise noble and privileged arts;

May it please your graces, Sire, to place a very express ban and impediment on the said Masters, so-called painters and sculptors, hereinafter to assume that title while they keep a shop or belong to the said guild, and limit them to that of upholsterers or gilders; as regards these so-called painters and marble workers, to forbid them to undertake figure or history paintings or portraits or landscapes, figures in the round or in low relief for churches or other buildings public or private, permitting them only to gild, paint or make in relief Moorish, grotesque, arabesque, leaf and other decorations such as they are commissioned to make, on pain of a fine of 2,000 *livres* and the confiscation of the said pictures or sculptures; prohibiting them from troubling or harassing the said painters and sculptors of the Academy by inspections, distraint, confiscations or otherwise in whatsoever fashion or manner, under the same pains, and each painter and sculptor shall, in his own right, continue not only his zeal and long nights of work, in order to make himself the more capable of being employed in the embellishment of his buildings, but also his wishes and prayers for the prosperity and health of Your Majesty.

5 Statutes and Regulations of the Académie Royale de Peinture et de Sculpture

The first meeting of the French Royal Academy of Painting and Sculpture was held on 1 February 1648, just ten days after the granting of Charmois's petition to the king (see IB4). However, the rules governing its organization were not officially ratified by Parliament until June 1652. In pointed contrast to the rituals of communal pleasure which were so central to the collective practice of the guilds, the statutes of the new Academy expressly forbade the holding of festivals and banquets, together with all forms of 'inebriety, debauch and gambling'. Dedicated to the pursuit of 'virtue', the Academy sought to establish itself both as a professional association and as a school for training young artists. At its centre lay the provision of life-drawing classes, something which was too expensive for individual masters to keep up. The Academy sought to emulate the Italian academies in Florence and Rome, which had long incorporated drawing from the model. This was seen as the source

of the superiority of Italian art and as the indispensable route to competence in both painting and sculpture. Teaching was to be carried out by the twelve *anciens* (Elders), including Le Brun, Jacques Sarazin and Henri Testelin, whose signatures are to be found at the end of the document. This translation of the complete text has been made for the present volume by Christopher Miller from L. Vitet, *L'Académie royale de peinture et de sculpture: Étude historique*, Paris: Michel Lévy, 1861, pp. 211–15.

I: The place of assembly being dedicated to virtue, it shall be held in particular veneration both by those who compose the Academy, by interested parties whom they see fit to introduce therein, and by youths who do not form part of the Body of the Academy, but who shall be received there for drawing and for study. On this account, whoever shall blaspheme the Holy Name of God, or shall speak of religion and holy matters derisively or insultingly, or shall proffer impious words, shall be banished from the said Academy and shall forfeit the grace that His Majesty has been pleased to accord.

II: In the said Academy, only the Arts of Painting and Sculpture and questions arising therefrom shall be discussed, and no other subject shall be broached.

III: It is not proposed that festivities or banquets be held there, either for the reception of those deemed worthy of belonging to the body of the Academy, or for any other reason whatsoever. On the contrary, inebriety, debauch and gambling will be rigorously excluded. Moneys received from the pecuniary fines to which those who contravene these Statutes and Rules are sentenced, shall be placed in the hands of a bourgeois or banker by the Elder in charge at the end of the month, and shall be employed exclusively in the business of the Academy and in the decoration of the place where it assembles.

IV: The Academy shall be open every day of the week, with the exception of Sundays and devotional feast days, in winter from three until five in the afternoon, and in summer from six till eight in the evening, in which period the young and students will be admitted to draw, and to take advantage of the lessons that shall be given. They shall pay every week the price usually paid to ensure the services of the model, who will be posed by the Elder on duty that month. Whenever it pleases His Majesty to undertake these expenses, after the manner of the Grand Duke of Florence, anyone shall be able to draw there without payment.

V: The Elders, of whom there shall be twelve, meet on the first Saturday of every month at the Academy's [opening] hour in order to deliberate with the Rector (who shall act as President and shall announce the result of any vote) concerning the affairs of the Community. This they shall do on the aforesaid days and at Extraordinary Assemblies, whether in order to judge infractions of the present statutes or for the reception of candidates or for other cause. The other painters and sculptors of the Academy shall be present, if they wish, at these deliberations, and if any of the twelve Elders should be absent, the most senior of the others present shall take his place after the last of the Elders. If a larger number should be absent, the same rule

applies. In the said assemblies, the motions shall be prepared by the duty Secretary of the month, the permission of the Rector of the Academy having once been obtained, along with that of the duty Elder of the month. Should one of the said Elders be missing, either through his decease or because of a long absence, the others will nominate another of the Academicians in his place; each shall make thier vote in writing, in order that everyone may proceed sincerely, and without fear of offending anyone. This shall be done without intrigue, cahal or partisan feeling, both in respect of this matter and of any other in which a decision must be taken.

VI: New recruits to the Academy shall follow the last of existing members.

VII: The Secretaries will serve alternately, as allocated at the start of the year. They shall inform the Academicians by letter when necessary, shall attend to matters in hand, and when they have a legitimate impediment, they shall hand over their functions to one of their colleagues. Failing this, they shall pay the sum of 10 *livres* to the Elder on the first occasion, double that on the second, and on the third they shall be stripped of the privileges of the Academy, and will no longer number among the body of Academicians.

VIII: The duty Elder of the month shall be punished in the same way if he fails either to present himself for the opening of the Academy, pose the model and perform the other functions for which he is responsible, or to request another of the Elders to be present in his stead. Even in the latter case, he must recompense his absence by attending for opening as many times in the following month as he absented himself when on duty.

IX: There will be close and friendly relations among members of the Academy, there being nothing so antithetical to virtue as envy, malicious gossip and discord. If any should incline thereto, and should be unwilling to amend after reprimand by the Elder, he shall be excluded from the Academy. Academicians shall, on the contrary, mutually communicate in all respects the enlightenment that is theirs, since it is impossible for any single individual to understand everything, nor make progress without assistance in arts so profound, difficult and little known. In this way, we shall see these arts daily invigorated and augmented. And if a more favourable occasion should allow the princes to seek the beauty of these arts, and devote some of their leisure thereto, it is proper to hope that they will outdo the princes of Antiquity, whether by the esteem they display towards the excellent men with whom the Academy is filled, or by the rewards with which they recompense their works. The said Members shall therefore freely express their sentiments to those who raise artistic difficulties, so that these may be resolved, or when they display their drawings, pictures or relief works, so that they may hear the Members' views.

X: The assembly can change the premises that it chooses for the Academy, until such time as it please the king to provide premises, and if it decides to have one built at its own expense, it shall not be permitted to sell or alienate it for any cause or occasion whatsoever.

XI: All proceedings shall be written in the Academy Register of the Academy by the duty Elder of the month, who shall hand it over to his successor.

XII: All resolutions made in the general assemblies and inscribed in the Academy Registers as special regulations, and which are not contrary to the present, shall be considered of equal standing thereto and implemented without delay or temporization.

XIII: The provisions for admitting to the body of the Academy those who are thought capable shall be sealed with the stamps of its arms, and signed by the duty Elder of the month, in whose hands they shall swear to keep and observe the Statutes and Rules religiously. They shall do this in the presence of the Members, and in pursuance of the above, Monsieur de Charmois, Conseiller d'Etat, is elected Rector of the Academy.

The said statutes signed Le Brun, Perrier, Jacques Sarrazin, de la Hire, Charles Errard, Corneille, Juste d'Egmont, Girard Vanopstal, Sébastien Bourdon, les Beau-bruns, Guillain, L. Testelin, H. Testelin.

Beside this is written: registered, witnessed the Procureur Général du Roy, to be kept and observed in its entirety as to form and contents, under the obligations signalled in this day's decree. At Paris, in Parlement, 7 June 1652. Signed DU TILLET.

6 Roland Fréart, Sieur de Chambray (1606–1676) from *An Idea of the Perfection of Painting*

Chambray had spent several years in the 1630s studying art and architecture in Rome. In 1639–40 he had been one of the leading actors in the episode of Poussin's abortive move to Paris as First Painter to the King (see IB1). He was deeply committed to classical principles in art, and in the Quarrel of the Ancients and Moderns became one of the leading defenders of Antiquity. For Chambray the intellectual appeal of geometrically based principles of design eclipsed the sensual dimension of art associated with colour. The latter was in fact regarded by him as the hallmark of decadence, a charge which he laid at virtually the whole modern school, from Michelangelo, through Titian to Caravaggio and Rubens. The main exceptions to his censure of the modern were Raphael and Poussin, whom he regarded as the only modern artists to match up to the classical ideal (see IB3). Chambray's literary career reflected his enduring commitment to rational principles and to Antiquity. He translated Palladio and Euclid, and in 1651 published Leonardo da Vinci's treatise on painting. The *Idea of the Perfection of Painting* appeared in 1662. The central part of the book consists of a systematic attempt to legislate all the aspects of painting in a series of chapters explicitly based on 'the learned Hollander' Franciscus Junius (see IA1). Junius' breakdown of the 'Parts' of art is followed exactly, but is then supplemented with a series of case studies. Several works by Raphael, Michelangelo and others, including Poussin, are measured against the general criteria regarding Invention, Proportion, Colour, and so on. Our selection is drawn from Chambray's preface and his introductory chapter. What is conveyed here is not only his sense of a decline in art from the golden age in

Greece but also his equally important motivating belief that the modern age has the potential once again to rival Antiquity, if only it adheres to the severest classical principles and abjures the temptations of modernity. The extracts are taken from John Evelyn's English translation, published as *An Idea of the Perfection of Painting: demonstrated from the Principles of Art and by Examples conformable to the Observations which Pliny and Quintilian have made upon the most celebrated Pieces of the Antient Painters, parallel'd with some Works of the most famous Modern Painters, Leonardo da Vinci, Raphael, Julio Romano and N. Poussin*, London: Henry Herringman, 1668, preface (unpaginated) and pp. 1–11.

Preface

There is hardly that Man living, but has some inclination for PAINTING, and that does not even pretend sufficient Abilities to controll the Works which it produces: for not only Learned men, and persons of Condition, who are ever probably the most rational, are emulous of this Knowledge; but the very Common-People will adventure to spend their Judgements too; so as it seems, this Art is in some sort, the Universal Mystery.

Neither is this presumption a Vice peculiar to the French alone, or of this Age of ours only; 'tis as old as Painting it selfe, and sprung from her very Cradle in Greece. This is evident hy that which Pliny has recorded of Apelles; who before he gave the last touches to his Pieces, was wont to expose them in Publique to the Censure of all the Passengers, whilst he conceal'd himselfe behind them, that he might hear what every one said, and make use of it accordingly; whence the Proverb, *Apelles post Tabulam*. Most of our Painters do to this day observe something of this very Custome, or at least, something like it, but which they have turn'd into a kind of Complement: For they usually request such as have the Curiosity to visit their Works, freely to tell them what they *think* of them; and whether they observe any thing which needs *reforming*. But as Complements are but vain and insignificant *words*, they seldom produce any real Effects upon these encounters; and to speak sincerely, these Painters would be but justly punish'd, should one really take the liberty of effectually rendring them this friendly Office, which they ask but in Ceremony, and that instead of those ordinary compliances with which they usually flatter them, they did ingeniously discover to them their miserable failings. But instead of receiving this Instruction in good part, and gratifying the Censure as becomes them, they would certainly be offended at the freedom, and we should see them rather Confounded than Reform'd by it; because they do not so much seek to be Able men, as they desire to appear so. The days of Apelles are now past, and our Modern Painters are quite of another strain from these Old Masters, who never came to be Considerable in their Professions, but by the study of Geometrie and Perspective, the Anatomy of Bodies, the assiduous Observation of those Characters which expres'd the Passions and Emotions of the Soul; by the Lecture of the Poets and good Historians; and in fine, by a continual research of whatever might best contribute to their Instruction.

They were in those days so Docile and Humble, that they not only would submit their *Works* to the Criticismes and Animadversion of Scholars and Philosophers, but

even to the Common People also, and to Artificers of all *Trades*, who did frequently and sometimes judiciously reprehend them. This was (I confess) something of a tedious way, and is indeed inaccessible to a great part of our Painters in this Age, who have neither the Genius of these illustrious Antients, nor the same Object in their working.

In effect, those Painters propos'd to themselves, above all other things, the Glory and Immortality of their Names, for the sole, and principal Recompense of their Labours; whereas, most of our Moderns, regard only the emergent Profit, and therefore they hold a quite different Method, and strive as much as they can to compass only their propos'd aime.

To this purpose, they have introduc'd into their Cabals I know not what kind of licentious Painting, totally differing from those pretended subjections, which heretofore rendred this Art so incomparable and so difficult, whilst this incapacity of theirs makes them imagine, that this rare Painting of the Antients, was but an old Dotaress, who had only slaves in her service.

Under this pretext, they have dress'd themselves up a new Mistriss, trifling, and full of tattle, who requires nothing of them but Fard and Colour to take at first sight, without being at all concern'd whether she pleas'd long or not. [...]

What's now become of the Glory with which those antient Greeks, those Gallant souls had Crowned Painting, when they pronounc'd her Queen of all the Arts, and permitted only the most noble and renowned of men to be of her Retinues? what regard, think you, would they have to this Age of ours, which has so unworthily abandon'd her? and to these abject spirits who daily dishonour her by the contempt and disrespect which they put upon her Laws, and who by a yet more insufferable attempt, have resign'd her sacred Name to this fantastick Idol which they have establish'd in her place? with what indignation may we suppose do true and able Painters look on the temerity of these insolent Rivals, whom they behold so gay and jovial in this present Age, by the Capriciousness of Fortune, and the favour of an ignorant conjuncture? [...]

To recover then its pristine Lustre, and restore her to original Purity, we must of necessity recall that Primitive severity, by which they were wont to examine the Productions of those renowned Painters, who were of old so esteemed; and whose Works have surviv'd their Authors so many Ages, and rendred their own Names Immortal.

To accomplish this, there is nothing more expedient, than the exact observation of those Fundamental Principles, which consummate its Perfection, and without which 'tis imposible she should subsist.

But forasmuch as the long neglect hereof has almost banish'd the Science, to the infinite loss and prejudice of those who are curious of Painting; and since, without this succour, they can never enjoy the satisfaction which a cleer and perfect understanding will present them; I have made it here my particular enquiry; that laying before them in this Dissertation the same Compass by which the Antients steer'd their Course, they may sail by the same Route themselves, and discover those things to the very bottom, which they had never attain'd to without it, but superficially, and with much imperfection.

And since I consider how extreamly difficult it is to disabuse those who are already infected with so common, and pernicious an abuse, under the pretence of a specious

Liberty: I could not think it sufficient to talk of things only, and to prove them from pure and undeniable Reasons; had I not also made it appear, of what importance it is by authentique Demonstrations and examples.

For this effect, I have made choice of some amongst the Works of our most celebrated Painters; to which, having apply'd all those Principles which I have produced, there remains no more cause for us to suspect their Fidelity. And that I may the better and more generally comprehend the good and bad effects which result from them, by either observing or neglecting these Rules, I shall here present them in Order.

Raphael Urbino, the most excellent of the Modern Painters, and universally so reputed by those of the Profession, is the Person whose Works I shall propose as so many Demonstrations of the absolute necessity of exactly observing the Principles which we have establish'd in this Treatise. And on the contrary, Michael Angelo, superior in Fame, but far inferior to him in Merits, shall by his extravagant Compositions, amply furnish us to discover the Ignorance and Temerity of those Libertines, who trampling all the Rules and Maximes of Art under their feet, persue only their own Caprices.

An Idea of the Perfection of Painting

'Tis a very subtle and curious *Enquiry*, to know, from whence it should come to pass, that the Art of Painting is so much degenerated from that perfection, which it once obtain'd, and how it happens, that considering the weakness of its productions, compared with those admirable Master-pieces of the Antients, it seems of late to present the World with nothing but the meer shadow and phantosmes of it.

For my own part, I conceive, the principal cause of its decadence to have proceeded from that little esteem which it preserv'd, during the ignorance and barbarity of the Lower Empire, which did so far ignoble and debase it of its pristine Honour; that instead of that preheminece which it then held amongst the Sciences, it is now reduc'd and reckon'd amongst the most vulgar Trades; sufficient to let us see, how much the spirit and Genius of these latter Ages, have declined, in which the rare Inventions and Lights of this Divine Art are, for want of encouragement, almost totally extinguish'd.

However yet, that good Genius, which by a certain providence of Nature does still preside over Noble things, has always furnish'd us with some excellent Men, preserving, as it were, some Seeds of them from time to time: But as we find it in Trees, and even in the most perfect Bodies, that they attain not to their consummate forme upon the suddain, and till after many years; notwithstanding which they are yet obnoxious to destruction every instant, without any means of restauration, but the same from whence first they sprung: even so it is in the productions of Wit, which coming once, through negligence, to be lost, or opprest under the Tyranny of evil Government, never recover themselves but by a long and laborious research; so, as 'tis realy prodigious; that in the Age of Leonardo da Vinci, and Raphael (who were the Protogenes and Apelles of the Modern Painters) we should see the Art revive again with so much vigour, and flourish in so short a space. For Painting is none of those simple Arts, which Chance does now and then present us with, without any

disquisition, and which every one may light on without an extraordinary Talent, or study to attain them.

There is happily nothing of Ingenious amongst Men, of more sublime, and whose Perfection is more difficult to attain, than that of Painting, the Noblest Instance which humane wit can boast of: 'Tis therefore plainly an insupportable abuse, to obscure and confound her amongst the Mechanical Arts; since she is established upon a demonstrative Science, infinitely more inlightned and reasonable, than that Pedantick Philosophy, which produces in us nothing but frivolous Questions and uncertainties, whence some have styl'd it, The Art of Doubting, a steril and idle speculation; whereas Paynting, founded upon the real Principles of Geometrie, makes at once a double demonstration of what she represents: But it will indeed require different Eyes to contemplate and enjoy her Beauty intirely: For the Eye of the Understanding, is the first and principal Judge of what she undertakes.

It will, in my opinion, be necessary therefore, in order to the restauration of her Honour, to evince by undeniable reasons, that she is still as worthy of the rank and dignity, which she formerly possess amongst the Greeks, the worthies of Genius's that ever Nature form'd, and that the shameful desertion, which has since arriv'd her, could proceed from no other cause but an universal depravation.

She has moreover had this particular misfortune, that all the Writings and Works which should contribute to her Instruction, and that divers excellent Painters had long since publish'd for the better intelligence of their Art, have been buried and lost by tract of time. [...]

The same unhappiness arriv'd to Architecture: All the Antient Books of it being utterly lost, that single work of Vitruvius being only excepted, which is very defective too, for want of its Profiles and lineal Demonstrations [...] But as Architecture is more gross and material in what it undertakes; the Solidity of it, which constitutes one of its very Principles, has honour'd it with some preheminance, even above Painting it selfe. It stands firm, and has continu'd many of its productions, which wonderfully supply the defect of those Books that are lost; whereas Painting, which is, as it were, altogether Spiritual, has not been able to furnish us with such permanent monuments. And yet for all this, she has within these two Ages reviv'd with so much vigor, as if she had receiv'd the very same assistances. And truely, she seems to me to have been the Restauratrix of Architecture; since we find, that almost all the first Masters of that Profession were also great Painters; such as Bramante, Baldassar Petrucci, Raphaelo, Julio Romano, and several more, which is no other then the result of being able to designe well, which is in truth the veritable Principle and only Basis, not of Painting alone; but, as one may well affirm, the universal Organ and Instrument of all the politer Arts. [...]

Supposing then, that all Arts whatsoever have their Fundamental Principles, the knowledge whereof is absolutely necessary for those who intend the Profession, and that This of Painting is superior to the rest, and consequently more difficult: It is not to be expected, there should any considerable progress be made without a due and perfect cognisance of those Principles; and they consist of no mean speculations, Perspective and Geometry; without which, a Painter can never emerge a good Artist.

Seeing now, it is not enough, that to the forming an able Painter, he be learned in these two Points alone (which study will soon accomplish) without three or four other

more curious Qualities, which he ought to be Master of; but which are not usually attain'd to without a singular favour of Nature; it happens that there appear so very few good Workmen amongst the multitudes of this Profession, that it may well be verified of Them, which was said of the Poets; That a Painter is so born, not made; and really their Genius is so conform, as it became Proverbial; That Picture was mute Poesie, and Poesie vocal Painting.

7 Jean-Baptiste Colbert (1619–1683) Letter to Poussin

After the death of Cardinal Mazarin, Jean-Baptiste Colbert rose to become the most powerful of Louis XIV's ministers. In 1664 he was made 'Superintendent of Royal Buildings, Arts and Manufactures', and in 1665 'Controller-General of Finances'. It was under Colbert's protection that the Royal Academy of Painting and Sculpture was finally given the power and financial support it required to triumph over the guilds. He established a new and enlarged code of rules in 1664 and provided the Academy with a monopoly on the training of artists. Although founded in the name of artistic freedom, the Academy was incorporated into Colbert's larger project of centralized state control and its growing power reflected his refusal to tolerate the comparative freedom of private societies and associations. Colbert's letter to Poussin, drafted by his secretary, Charles Perrault, concerns, first, his project for a new façade for the Louvre, and second, his plans for the founding of an Academy of France in Rome. (For further information on the Louvre project and for Chantelou's report of Bernini's subsequent visit to France, see IC3.) The letter was never sent, perhaps because its despatch was forestalled by news of Poussin's death late in 1665. The letter reveals the manner in which the new regime sought to project itself through a revival of the arts and sciences. Rome still enjoyed a high prestige and Colbert sought to found the future greatness of French art upon Italian cultural traditions rather than any native French school. Students at the French Academy in Rome were to serve the interests of the king by copying the achievements of Roman Antiquity and the Renaissance and transmitting them to France. The whole letter has been translated for this volume by Katerina Deligiorgi from Charles Perrault, *Mémoires de ma vie*, Paris: Libraire Renouard, 1909, pp. 54–7.

Sir,

This letter will acquaint you with the high esteem in which the king holds your talent. His Majesty, having decided to send to Rome the plans and elevations of his palace at the Louvre in order to solicit the opinions and thoughts of the most famous architects who live there, and requiring, to that end, a most intelligent and able person to consult them on his behalf on this matter, believes that this affair cannot be entrusted to better hands than yours. He has taken into consideration not only that your perfect knowledge of painting makes you highly suitable for this task, but also that your long stay in Rome, together with your talent, will surely have earned you the friendship of all the excellent men who reside there, so that you alone can gather the ideas and opinions we seek from them. The plans and elevations I send you are accompanied by an explanatory discourse which will give you sufficient information on the matters on which you will need to consult the architects. I need only add some observations on the manner in which you should conduct yourself towards them.

Before assembling them, I think it might be necessary to visit them, communicating our intentions to each separately and even leaving them some time to form their ideas individually. In this way their thoughts will display greater diversity, and also each will receive full recognition for what he has invented, since no one could be reproached with having been aided by someone else's idea. It would then be good to bring them all together, if this is possible, and to hear their praise or criticism of each other's plans, so as to form a general idea about the direction in which the opinion of the assembly tends and to find out what most gains the general approbation. I do not place any limit upon the number of those you may consult. Care should be taken, however, not to protract the proceedings by inviting indiscriminately all sorts of men to give their opinion. On the other hand, it is important not to forget those who have a great reputation, such as Pietro da Cortona, Reynaldi Areveti, the Cavalier Bernini, and a few others among the most famous. It is necessary to ask them all to give their opinion in writing. I think they will do so willingly, as it is unlikely that they will remain indifferent to the glory which they will receive for having made proposals for the most beautiful and most splendid palace in the world, and, if their opinion be followed, for having been chosen among the most famous architects of their century. It is especially important to impress upon them that whenever they criticize something in the plans we send them, they should add their reasons for doing so, and, similarly, when they put forward some thought or some plan, they should base it on architectural reasons or on important antecedents. This is how I think the matter should be handled. Nonetheless, since it is possible to encounter unforeseen difficulties as you proceed in this way, I trust to your prudent judgement and I leave to you the choice of arrangements you consider appropriate. This is, of course, a very important matter, for it will allow the most beautiful building in the world to be perfected and, if possible, made worthy of the grandeur and magnificence of the prince who will inhabit it. I do not doubt, Sir, that the decision of the king to bring his palace at the Louvre to completion makes you rejoice, since this plan clearly shows the love that His Majesty has for all the fine arts you possess. He certainly intends to bring them to the highest point of perfection they have ever reached and wants his reign to be famous not only for his own great deeds, but also for the great number of illustrious men in every profession who equal and even surpass those of Antiquity. To this end, he neglects nothing that can naturally excite virtue in the heart of those who have some disposition for great things, giving them, on his part, all the means they require to perfect themselves. To stimulate the sciences, he has given liberal endowments to all the men of letters who have a great reputation in some particular field. Wherever talent shines, not only in France, but also in the whole of Europe, there have appeared signs of his royal generosity. With respect to painting and sculpture, which His Majesty particularly loves and regards as two arts which must especially promote his glory and transmit his name to posterity, he omits nothing from what is required for their perfection. It was from this noble and laudable motive that he established in Paris, some years ago, a Royal Academy of Painting and of Sculpture. He engaged professors for the instruction of the young, offered prizes to the students, and granted to this assembly all the privileges they could wish for. This institution has not been without fruit: in it are formed young men who are very promising and who will, one day, become excellent masters. But, as

the young men of your profession appear still to require to spend some time in Rome in order to form their taste and style on the originals and models of the greatest masters of Antiquity and of recent centuries, and since it often happens that those with the greatest genius and gift neglect to undertake this trip – or cannot, on account of its expense – His Majesty has decided to send to Rome every year a certain number of students chosen from the Academy and to support them during their stay there. Considering further that it would be very useful for the advancement and progress of these young men to be under the direction of an excellent master who can guide their study, impart good taste, transmit the style of the Ancients, and reveal, in the works they copy, the secret and almost inimitable beauties which go unnoticed by the majority and are perceived by the ablest only, His Majesty has decided to have permanently in Rome an illustrious master who will take care of and direct the students sent there. For this, he has chosen you, Sir, and has named you as the one who is now in charge of this task. It is on this account and for this purpose that he has commanded me to send you the sum of 1,200 *écus* which you will receive with the enclosed letter of credit. This is, Sir, what His Majesty has commanded me to write. I do not doubt that he will receive from you every satisfaction in the execution of the two important things with which he entrusts you. For my part, I assure you that the honour that the King has conferred upon you gives me great pleasure and that I would be always prepared to do the same for persons of your talent.

8 Giovanni Pietro Bellori (1613–1696) ‘The Idea of the Painter, Sculptor and Architect, Superior to Nature by Selection from Natural Beauties’

Giovanni Pietro Bellori was an antiquarian, collector and theorist, who worked in Rome. In 1671 he was appointed secretary to the Accademia di S. Luca (Academy of St Luke), at that time under the direction of Carlo Maratti. He had been brought up in a circle of scholars and artists, but was not himself primarily a practitioner of art. In his interpretation of classical theory he was close to Junius (see IA1), and followed his example in drawing together quotations from Greek and Latin authors in order to advance his own argument. He also shared with Junius the belief that the greatest artists were those who formed a concept of perfect beauty through judicious selection from nature. Where his predecessor had concerned himself with the painting of the ancients, however, Bellori wrote to establish a modern canon of ‘classical’ art. He reserved particular enthusiasm for the work of Raphael, Annibale Carracci, Domenichino and Poussin, who was a close friend. (See IB2 for Poussin’s observations on painting as recounted by Bellori.) Caravaggio is cited, by contrast, as one who ‘was criticized for being too natural in painting likenesses’ and, by implication, for ‘having imitated the worst and most vile’ (Il Bamboccio – Pieter van Laer – was a Dutch painter and printmaker working in Rome in the early seventeenth century, known for his scenes of low life.) The ‘idea’ of the title refers us back to the Neoplatonism of earlier Italian art theory. As Panofsky has shown, however, Bellori sought to steer a middle course between the ‘naturalism’ of Caravaggio and the equal and opposing danger of descent into a mannerism, in which the study of nature was disdained in favour of mere ‘phantastical ideas’. Art should imitate nature, he believed, but in what it selects it should be

guided by the example of the great artists of the past. Bellori's 'Idea del pittore, del scultore, e del architetto...' was originally delivered as a lecture at the Accademia di S. Luca in Rome in 1672, the year following his election as rector. In 1689 he was made an honorary member of the Académie Royale de Peinture et de Sculpture in Paris. The lecture was first published as the preface to Bellori's *Le vite de' pittore, scultori e architetti moderni* ('Lives of Modern Painters, Sculptors and Architects', Rome 1672), where it immediately precedes the life of Annibale Carracci. (See IB3 for Bellori's life of Poussin). This translation by Victor A. Velen is taken from Erwin Panofsky, *Idea: A Concept in Art Theory* (1924, revised 1960), trans. Joseph J. S. Peake, Columbia: University of South Carolina Press, 1968, Appendix II, pp. 155-72. The 'Venus of Cnidos', the 'Athenian Minerva', the 'Farnese Hercules' and the 'Medicean Venus' were all surviving classical statues believed at the time to be Greek originals. Ludovico Castelvetro was a sixteenth-century commentator on Aristotle's *Poetics*.

The highest and eternal intellect, author of nature, in fashioning his marvelous works looked deeply into himself and constituted the first forms, called Ideas, in such a way that each species was expressed by that original Idea, giving form to the marvelous context of things created. But the celestial bodies above the moon, not subject to change, remained forever beautiful and well-ordered, so that we come to know them from their measured spheres and from the splendor of their aspects as being eternally most just and most beautiful. Suhlunar bodies on the contrary are subject to change and deformity; and although nature always intends to produce excellent effects, nevertheless, because of the inequality of matter the forms change, and human beauty is specially disarranged, as we see from the infinite deformities and disproportions that are in us. For this reason the noble Painters and Sculptors, imitating that first maker, also form in their minds an example of superior beauty, and in beholding it they emend nature with faultless color or line. This Idea, or truly the Goddess of Painting and Sculpture, when the sacred curtains of the lofty genius of a Daedalus or an Apelles are parted, is revealed to us and enters the marble and the canvases. Born from nature, it overcomes its origin and becomes the model of art; measured with the compass of the intellect it becomes the measure of the hand; and animated by fantasy it gives life to the image. Certainly, according to the statements of the major philosophers, the exemplary motives reside with assurance in the spirits of the artists forever most beautiful and most perfect. The Idea of the Painter and the Sculptor is that perfect and excellent example of the mind, to which imagined form, imitating, all things that come into sight assimilate themselves: such is Cicero's fiction in his book on the orator, dedicated to Brutus... Thus the Idea constitutes the perfection of natural beauty and unites the truth with the verisimilitude of what appears to the eye, always aspiring to the best and the most marvelous, thereby not emulating but making itself superior to nature, revealing to us its elegant and perfect works, which nature does not usually show us as perfect in every part. Proclus confirms this value in *Timaeus* when he says that if you take a man fashioned by nature and another formed by sculptural art, the natural one will be less excellent, because art fashions more accurately. But Zeuxis, who formed with a choice of five virgins the most famous image of Helen, given as an example by Cicero in the *Orator*, teaches both the Painter and Sculptor to contemplate the Idea of the best natural forms in making a choice among various bodies, selecting the most elegant.

Hence I do not believe that he could find in one body alone all these perfections that he sought for in the extraordinary beauty of Helen, since nature makes no particular thing perfect in all its parts... Thus Maximus Tyrius claims that the image of the Painters taken this way from different bodies produces a beauty such as may not be found in any natural body that approaches the beautiful statues. Parrhasius conceded the same to Socrates, that the Painter who has placed before him natural beauty in each of its forms must take from various bodies together what each has most perfect in its individual parts, since it is impossible to find a perfect being by itself. Thus nature is for this reason so inferior to art that the copyist artists and imitators of bodies in everything, without selectivity and the choice of an Idea, were criticized. Demetrius was told that he was too natural, Dionysius was blamed for having painted men resembling us and was commonly called *anthropographos*, that is, painter of men. Pausanias and Peiraeikos were condemned even more for having imitated the worst and the most vile, just as in our time Michel Angelo da Caravaggio was criticized for being too natural in painting likenesses, and Bamboccio was considered worse than Michel Angelo da Caravaggio. Thus Lysippus reproached the vulgarity of the Sculptors who made men as they are found in nature, and prided himself for forming them as they should be, following the advice given by Aristotle to Poets as well as Painters. This shortcoming was not attributed to Phidias, on the other hand, who made marvels of the forms of heroes and gods and imitated the Idea rather than nature. Cicero asserts that Phidias, in shaping Jupiter and Minerva, did not look at any object that he could have taken for a likeness, but conceived a form full of beauty, in whose fixed image he guided his mind and hand to achieve a likeness... Hence it appeared to Seneca, although he was a Stoic and a severe judge of our arts, to be a great thing, and he marveled at how this Sculptor, never having seen either Jupiter or Minerva, had nevertheless conceived their divine forms in his mind... Apollonius of Tyana teaches us the same thing, that fantasy makes the Painter wiser than imitation, because the latter creates only those things that are seen, while fantasy creates even those that are unseen. Now if we want to confront the precepts of the sages of antiquity with the best methods of our modern teachers, Leone Battista Alberti maintains that we love in all things not only the likeness but mainly the beauty, and that we must select the most praiseworthy parts from the most beautiful bodies. Thus Leonardo da Vinci taught the painter to form this Idea, to consider what he saw and to consult himself, choosing the most excellent parts of everything. Raphael of Urbino, the great master among those who know, wrote thus to Castiglione of his *Galatea*: 'In order to paint a beauty I would have to see several beauties, but since there is a scarcity of beautiful women, I use a certain Idea that comes to my mind.' Guido Reni, who surpasses all the other artists of our century in creating beauty, wrote to Monsignor Massani, housemaster for Urban VII, when he sent the painting of Saint Michael to Rome for the Church of the Capuchins: 'I would have liked to have had the brush of an angel, or forms from Paradise, to fashion the Archangel and to see him in Heaven, but I could not ascend that high, and I searched for him in vain on earth. So I looked at the form whose Idea I myself established. An Idea of ugliness may also be found, but that I leave to the devil to explain, because I flee from it even in thought, nor do I care to keep it in my mind.' Thus Guido also boasted that he painted beauty, not as it appeared to his eyes, but as

he saw it in the Idea; hence his beautiful abducted Helen was esteemed as an equal of that by Zeuxis. But Helen was not as beautiful as they pretended, for she was found to have defects and shortcomings, so that it is believed that she never did sail for Troy but that her statue was taken there in her stead, for whose beauty the Greeks and the Trojans made war for ten years. It is thought therefore that Homer, in order to satisfy the Greeks and to make his subject of the Trojan War more celebrated, paid homage in his poem to a woman who was not divine, in the same way that he augmented the strength and intelligence of Achilles and Ulysses. Hence Helen with her natural beauty did not equal the forms of Zeuxis and Homer; nor was there ever a woman who had so much extraordinary beauty as the Venus of Cnidos or the Athenian Minerva, known as the beautiful form; nor did a man exist of the strength of the Farnese Hercules by Glycon, nor any woman who equaled in beauty the Medicean Venus of Cleomenes. For this reason the best Poets and Orators, when they wanted to celebrate some sublime beauty, turned to a comparison of statues and paintings. Ovid, describing Cyllarus, the most beautiful Centaur, praises him as most like the most famous statues: . . . And elsewhere he wrote in high praise of Venus that if Apelles had not painted her, she would have remained until now submerged in the sea where she was born . . . Philostratus upholds the beauty of Euforbus as similar to statues of Apollo and he claims that Achilles surpassed the beauty of Neoptolemus, his son, as beauties are surpassed by statues. Ariosto, in creating the beauty of Angelica tied to the rock, likens her to something moulded by the hands of an artist . . . Marino, in celebrating the Magdalena painted by Titian, hails the work in the same way and places the Idea of the artist above natural things . . . It appears that Aristotle, on Tragedy, was unjustly criticized by Castelvetro, who maintains that the virtue of painting is not in creating a beautiful and perfect image, but in resembling the natural, either beautiful or deformed, for an excess of beauty lessens the likeness. This argument of Castelvetro is limited to icastic [i.e. figurative] painters and portraitists who keep to no Idea and are subject to the ugliness of the face and body, unable to add beauty or correct natural deformities without violating the likeness. Otherwise the painting would be more beautiful and less accurate. The Philosopher does not mean such icastic imitation, but he teaches the tragedian the methods of the best, using the example of good Painters and Makers of perfect images, who rely on the Idea. These are his words: 'Since tragedy is the imitation of the best, we should imitate the good painters, because, in expressing the form proper to their subjects, they create them more beautifully . . .'

However, making men more beautiful than they ordinarily are and choosing the perfect conforms with the Idea. The Idea is not one beauty; its forms are various – strong, noble, joyful, delicate, of any age and both sexes. We do not, however, praise with Paris on lovely Mount Ida only soft Venus, or extol the tender Bacchus in the gardens of Nyssa, but we also admire in the wearying games of Maenalos and Delos the quiver-bearing Apollo and Diana the huntress. The beauty of Jupiter in Olympia and of Juno in Samos, as well as of Hercules in Lindos and Cupids in Thespieae, was certainly different again. Thus different forms conform with different people, as beauty is nothing else but what makes things as they are in their proper and perfect nature, which the best Painters choose, contemplating the form of each. In addition to which we must consider that Painting being at the same time the representation of

human action, the Painter must keep in mind the types of effects which correspond to these actions, in the same way that the Poet conserves the Idea of the angry, the timid, the sad, the happy, as well as of the laughing and crying, the fearful and the bold. These emotions must remain more firmly fixed in the Artist's mind through a continual contemplation of nature, since it would be impossible for him to draw them by hand from nature without first having formed them in his imagination; and for this the greatest care is necessary, since the emotions are only seen fleetingly in a sudden passing moment. So that when the Painter or Sculptor undertakes to reproduce feelings, he cannot find them in the model before him, whose spirit as well as limbs languish in the pose in which he is kept immobilized by another's will. It is therefore necessary to form an image of nature, observing human emotions and accompanying the movements of the body with moods, in such a way that each depends mutually upon the others. [. . .]

. . . this Idea and divinity of beauty was conceived in the minds of the ancient cultivators of wisdom, by observing always the most beautiful parts of natural things, because that other Idea, formed for the most part from experience, is ugly and base, according to Plato's concept that the Idea should be a perfect understanding of the thing, starting with nature. Quintilian teaches us that all things perfected by art and human ingenuity have their origin in the same nature, from which the true Idea springs. Hence those who without knowing the truth follow common practice in everything create spectres instead of shapes; nor are they dissimilar from those who borrow from the genius and copy the ideas of others, creating works that are not natural children but bastards of nature, so that it seems as though they are wedded to the paintbrushes of their masters. Added to this evil, arising from lack of genius or the inability to select the best parts, is the fact that they choose the defects of their teachers and form an idea of the worst. On the other hand, those who glory themselves with the name of Naturalists have no idea whatever in their minds; they copy the defects of the bodies and satisfy themselves with ugliness and errors, they, too, swearing by the model, as their teachers. If the model is taken from their sight, their whole art disappears with it. Plato likens these first Painters to the Sophists, who did not base themselves on truth but upon the false phantom of opinion; they resemble Leucippus and Democritus, who compose bodies of the vainest atoms at random. Thus the art of Painting is degraded by these Painters in concept and practice, since, as Critolaos argues, eloquence should be a manner of speaking and an art of pleasing . . . a habit without skill and reason, taking function away from the mind and turning everything over to the senses. Hence what is supreme intelligence and the Idea of the best Painters, they would prefer to be common usage, equating ignorance with wisdom; but the high-minded spirits, elevating thought to the Idea of the beautiful, are enraptured by the latter alone and consider it a divine thing. Yet the common people refer everything they see to the visual sense. They praise things painted naturally, being used to such things; appreciate beautiful colors, not beautiful forms, which they do not understand; tire of elegance and approve of novelty; disdain reason, follow opinion, and walk away from the truth in art, on which, as on its own base, the most noble monument of the Idea is built. It remains to be said that since the Sculptors of antiquity used the marvelous Idea, as we have indicated, a study of the most perfect antique Sculptures is therefore

necessary to guide us to the emended beauties of nature and with the same purpose direct our eyes to contemplate the other outstanding masters. [...]

Painters and Sculptors, choosing the most elegant natural beauties, perfect the Idea, and their works exceed and remain superior to nature – which is the ultimate value of these arts, as we have shown. This is the origin of the veneration and awe of men with regard to statues and paintings, and hence of the rewards and honors of the Artists; this was the glory of Timanthes, Apelles, Phidias, Lysippus, and of so many others whose fame is renowned, all those who, elevated above human forms, achieved with their Ideas and works an admirable perfection. This Idea may then well be called the perfection of Nature, miracle of art, foresight of the intellect, example of the mind, light of the imagination, the rising sun, which from the east inspires the statue of Menon, and fire, which in life warms the monument to Prometheus. This is what induces Venus, the Graces and the Cupids to leave the gardens of Idalus and the shores of Cythera and dwell in the hardness of marble and in the emptiness of shadows. In its honor the Muses by the banks of Helicon tempered colors to immortality; and for its glory Pallas scorned Babylonian cloth and vainly boasted of Daedalian linens. But as the Idea of eloquence yields to the Idea of painting, just as a scene is more efficacious than words, speech therefore fails me and I am silent.

9 André Félibien (1619–1695) from *Conversations on the Lives and Works of the Most Excellent Ancient and Modern Painters*

André Félibien des Avaux (see IB3) first conceived the idea for his monumental series of 'lives' during his stay in Rome between 1647 and 1649. As the Preface to the first volume shows, he was profoundly influenced by his encounter with Nicolas Poussin, who awoke in him a life-long interest in the theory and practice of art. His *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes* appeared in a series of ten volumes, published successively in pairs between 1666 and 1688. They comprise a series of biographies of the most significant figures in Western European art from Antiquity to Félibien's own day, interspersed with theoretical excursuses. Félibien deliberately chose the dialogue form to present his ideas, insisting that the best way to make progress in the appreciation and understanding of art is through regular conversation on the subject. Here we include a section from the Preface, which provides an important background to the gestation of the project and which records Félibien's characteristic concern with mastering the actual practice of painting. Our principal excerpt is from the first *Entretien* in which the author, in conversation with his dialogue partner, Pymandre, identifies and ranks the constituent elements of painting. First comes composition, which is carried out in the mind of the artist. Composition represents a form of 'ideal activity' in contrast to the 'physical activity' of the brush or the pencil: conception is anterior to execution, just as theory precedes practice. Next come design and colour, both of which belong to the physical part of painting. However, both require complex skills of considerable subtlety and difficulty. The task of painting is the imitation of idealized natural beauty, and in fulfilling this goal painting participates in the divine order which regulates the visible world. The following extracts have been translated for the present volume by Jonathan Murphy from André Félibien, *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et*

modernes, Trévoux, 1725 (facsimile reprint, Farnborough: Gregg Press, 1967), pp. 17–27, 90–102. The section on grace and beauty to which Félibien refers in the text is reproduced below (see ID6).

Preface

If there were no other examples of great men who had written on sciences and arts that they had never practised themselves, I would be quite fearful of sitting down to write on an art so distant from any occupation in which I myself have been engaged. But as it is the case that here I am imitating some of the greatest minds of the age, let no one be surprised that I am writing on painting, above all because I have had a strong inclination for this beautiful art so long, that there are now very few parts of it of which I do not have a profound knowledge, or where I have not at some point attempted to put into practice my ideas.

It is also true that I have had the advantage of knowing most of the great painters of our day, and that I have spent much time in Italy, where I endeavoured to acquire whenever possible ever more knowledge about this art which interests me so.

Now when I cast my mind back to the ancient buildings, statues and pictures that were so often my greatest pleasure during the time I spent in Rome, I still feel a keen rush of pleasure at remembering so many rare and excellent things.

I had the honour of being employed by the Marquis of Fontenay, extraordinary ambassador for the king at the court of Pope Innocent X, whose first embassy had been to Urban VIII, when he first established the reputation for great ability, wisdom and probity which lives on today in the memory of so many. It was also during this time that the troubles in Naples allowed this worthy minister to demonstrate so many of his qualities, concerning affairs which at the time were the very centre of all that was happening in Europe.

Throughout the time of his embassy there many considerable events held his attention, and I was thus obliged to be almost constantly by his side, and had very little time of my own. But I employed the time that remained in visiting the most notable figures of the day in the fields of the sciences and the arts, and in visiting churches and palaces.

Amongst the great painters of the day then to be found in Rome were figures such as the Chevalier [Giovanni] Lanfranco, Pietro da Cortona, and Poussin, whom I mention last as he was at the time the youngest of the three. I cultivated their acquaintance, and above all frequented M. Poussin, with whom I struck up a close friendship. His merit of course is known to all, and for my part, I feel that there has never been a painter who had such a high idea of the perfection of painting, nor a painter who knew better how to ensure the total success of a painting. So much may be garnered simply from an examination of paintings done by his own hand, but in addition to that are the many fine speeches and writings that he has left. I must own that it was above all through his conversation that I learnt to appreciate all that is most beautiful in the work of the masters, and to take note of the subtle techniques they employed to heighten the perfection of their work.

Although M. Poussin claimed to be an extremely private man when working, this was largely to prevent great numbers of visitors coming to see him while

he worked, who would otherwise have interrupted his concentration. We were sufficiently close for him to allow me to watch him work, and this permitted me to see the interaction of the theory and the practice at first hand: while working, he would demonstrate the truth of the theories that he would expound to me in his discourses.

It was with great pleasure that I was thus able to see the manner in which he would set about representing on canvas the great and noble subjects that had taken shape in his mind. I watched closely as he outlined the figures, bringing out every single trait with a clarity which it seemed was an exact portrayal of his thought. I paid particular attention to the manner in which he would mix and combine colours to achieve the graduated shade necessary for modelling, to emphasize the different lights and shadows, and to produce the different degrees of depth, causing certain parts of the painting to come out and others to recede. All of this he would execute with great art and beauty.

Under his tutelage I began several small works, in an attempt to put into practice what I had learnt, but such were the demands on my time elsewhere, I was unable to finish even the first thing that I had begun. Despite the strength of my passion for an art so noble, I have never had the time to progress in the manner I that desire. But the small amount of experience that I have acquired has made it clear to me that whatever theories one may hold concerning painting, nothing perfect may ever be executed without a tremendous amount of practice. The work I have done has demonstrated that no sooner does one set to work than a thousand difficulties present themselves, and that no amount of intellectual preparation can surmount these difficulties in the execution of a work.

For there is no formula for giving great force, majesty or grace to figures: all depends on the genius of the painter. Neither is there a sure means of guaranteeing the different shades in colour, or the effects achieved through mixing. Such things are learnt slowly, for they demand great experience, much practice, and some solid reasoning. If there is a manner of bringing out different aspects of a painting, and lending certain elements greater force, beauty and grace, then it does not consist of rules that can be learnt, but rather discovered through the light of reason; on occasion one must even go against the normal rules of art. This should not cause inordinate surprise, as in Nature there are thousands of forms of beauty that are extraordinary precisely because they go against the natural order of things.

It should not be imagined that in this Art, any more than in any of the others, there are certainties as there are in geometry, such that one may always work with confidence, nor should it be allowed for an excellent picture to be criticized when in one part it appears to infringe some optical law in some minor sense; the law will have been broken with reason, with some higher purpose in mind.

First Conversation

We went out to go to the Tuileries, but no sooner had we stopped talking of architecture than we struck up a conversation about painting. Pymander spoke of

the paintings in the Louvre, and asked a multitude of questions about works carried out for the king and queen. After we had talked for some time about some of the beautiful paintings that I had described to His Majesty, he asked me why I never wrote about painting, as my friends had asked me to do so long ago now, so that I might share with others the knowledge that I have gradually accumulated about this noble art.

At first I merely smiled at this flattery, but after giving the matter some consideration, I answered him as follows:

‘I would gladly follow your advice, if I felt that what I know would be of use to a number of people, and that I could share it as you feel that I should. But allow me to remark here that your opinion of painting is perhaps not as high as it should be. It is an art that covers so many areas that it would require a mind greater than mine to do it the justice that it deserves.

For you ignore the fact that to write intelligently of all that is necessary to make an excellent painter, and to give people not just a general notion but a detailed description of all that is required for this art, a truly vast design would be required.

To show you how many areas such a treatise would have to cover, and to demonstrate that such a project really is beyond my powers, if it meets your purpose I will draw an outline of the areas of knowledge that such a project would have to embrace.

In order to explain properly all that I have learnt from the greatest painters a work divided into three sections would be required. The first section, covering composition, would include almost all art theory, as it is an operation which is carried out in the mind of the painter, who must thoroughly prepare the work in his own imagination and master it perfectly before its execution.

The remaining parts would speak of drawing and colour, and would look at the practice of art, and thus be more workmanlike. This physical aspect renders them less noble than the first part, which is carried out in complete liberty, and which one may know and master without actually being oneself a painter.

To compose a painting in the correct manner, the painter must have both a general and particular knowledge of all aspects to be covered in the painting. As there is nothing in nature which might not on occasion be represented in painting, the painter must have a perfect knowledge of all natural bodies before undertaking any portrayal of their image. But he must bear in mind that although the art of representation covers all natural subjects both beautiful and ugly, when it comes to the actual execution of the painting, if he wishes to be ranked among the most notable of our painters, he must choose that which is most beautiful, for even though natural bodies are to serve as a model, the fact that they are not all equally beautiful means that he must consider only the most perfect amongst them.

As we are often wrong in our choice of beautiful things, we should first of all define beauty and examine it closely, principally where the human form is concerned, as the human body is the most perfect thing that God created on earth. As we have already remarked that beauty is a result of the proportion of the different parts, we should move on to consider what is necessary in the proportion of these different parts in order to produce this admirable quality, so that the painter may have an exact knowledge of it and may equal the beauty of his subjects when he comes to draw

them from life. We shall then further expand on the question of proportion and measure when speaking of drawing in our second part.

Given that a picture is an image of a particular action, the painter must order his subject and distribute the figures according to the nature of the action that he is representing. As each picture is either a new invention of the painter, or an illustration of an episode from history or mythology already described by historians or poets, we must show how each of these different subjects should be treated, and how the movements of the body and soul should be expressed therein. We should even speak of the passions of the soul: although this is a part which depends on drawing, it must be properly conceived in the mind of the painter beforehand as it cannot really be drawn from life.

What should then be taught is the correct observation of the proprieties, regardless of the subject. To that end, it would be useful to demonstrate how the painter must have a profound knowledge of history and mythology, of the religions of ancient peoples, of the customs of such peoples and of their way of life, of their gods, their temples and buildings, of their sacrificial, funerary, and triumphant ceremonies, of their games, their different attire in times of peace and war, their arms, and their furnishings.

After this long section on the theory rather than the practice of painting, which is of the utmost necessity to any practitioner of the art desirous of achieving perfection, the second part concerning drawing could then begin. This is the most common starting-point for all who wish to learn this art, for it is through the tracing of lines that the first principles of art are learnt, and on these that all subsequent knowledge will rest. Without a solid foundation here, all other parts will come to naught.

This obliges whoever undertakes such a project to lay out principles to guide the progress of apprentices in the art step by step, leading them by the hand; and just as the traveller will learn nothing simply by seeing new provinces and kingdoms unless he also considers the nature of the country and the customs of the peoples, so should this book demonstrate how to teach the art, instructing students in the appreciation of beautiful things so that through remarking upon them they may engrave them on their souls, mixing them with nothing that may be harmful or of little use.

The author should demonstrate the surest and easiest ways of arriving at this destination, and through familiar examples enable students to guide themselves through the work that will become their lives. Above all, he must demonstrate how mathematics is necessary to painting, instilling a knowledge of geometry and perspective which should underpin his whole work.

It will also be necessary to demonstrate how the painter must become expert in matters of anatomy, principally where muscles, nerves, sinews, bones and ligaments are concerned, in order to become expert in their depiction.

He would also note that as proportion goes hand in hand with drawing, it must be observed in all parts of the painter's work. The painter himself must learn to judge the fittingness and balance of each part, and the position of each figure in the picture; to bring them out to their best advantage he must judge the necessary degree of equilibrium or ponderousness that they require, while still attempting as far as possible to attain the degree of excellence in beauty and grace that we referred to above, that inexpressible *je ne sais quoi* which comes entirely from the drawing.

He would then pass to the third part, which would treat colour. Having spoken of the nature of colours, of the union and kinship that exists between them, he would demonstrate how they are employed to produce beautiful effects of chiaroscuro, giving relief and depth to figures inside the painting.

It would also be necessary to talk of the type of perspective known as aerial perspective, which is nothing other than the manner in which distant colours tend to fade, as the quantity of air between the object and the viewer increases; of the accidents of luminous and diaphanous light to be found in nature, and of how observation of this is to be made, of the different forms of light, either as sources or as illuminated bodies, of reflections and shadows, of common errors made by painters working under particular lights, of the different views or aspects of things according to the angle from which they are studied, of the appearance of bodies in water, and of all that produces the force, pride, strength, softness and preciousness of the best colourist paintings; of the different manners in colour, where figures or landscapes are concerned, and of that which must be followed as the most excellent. This teaching must all be accompanied by examples, where the beauty and perfection of these three parts, Composition, Drawing and Colour, are all manifest.

What a work then this would be! Are you genuinely of the opinion that it should be mine? It would require the skill of the greatest painter of the century to reveal all the secrets of practice, but who could speak of painting with the necessary grace? Painting represents objects so nobly through the vivacity of its colours: whose wise and knowing pen could adequately depict the agreement and strength that we find in great paintings?

As I find myself unable to undertake an enterprise so disproportionate to the forces I have at my disposal, please do not think ill of me if I do not bend before your persuasion, but say instead that such a work as I have outlined I myself am incapable of bringing to fruition. I would be quite hurt if you did not accept my reasoning; my intention was merely to draw up the principles for such a work, and provide some information for all those knowledgeable men who today do teach with much success. Indeed some of these people, with whom I have often spoken and from whom I have learnt much, would be incomparably better than I if they chose to undertake such a work.

This is not to say that I will never return to the subject; indeed I hope often to be able to provide you with a degree of satisfaction. Whenever possible I will share with you all that I once noted purely to satisfy my curiosity about the various parts of painting, either through looking at the pictures of the greatest painters, or through different conversations that I have had on this subject.'

Pymander then replied that even if I spoke but little about painting, and treated the subject much less amply than it deserved, I would still demonstrate the advantage that this art enjoyed above all the others. Painters themselves, he continued, would be glad that so many were improved by my conversation, and learned to judge the excellence of their paintings and the beauty of their figures, studying the secrets of the art, and learning through the perfection of the work to take note of its executioner.

'Quite rightly do they take an interest,' I replied. 'The excellence of painting is not merely a matter for the knowledgeable, but should interest all right-thinking people. All too often they consider only the surface of painting, and fail to direct their thoughts to the more profound aspects of this science, which one might say has something of the divine, as nowhere better can man imitate the power of God, who fashioned the universe out of nothing, than in representing all creation merely through the use of colours. As God made man in his image, so does man in turn make an image of himself when he expresses his actions and thoughts in such an excellent manner on a canvas that they remain constantly exposed to our sight for ever, such that not even the diversity of nations prevents this dumb yet eloquent language, more agreeable than all others, from being instantly comprehensible to all.

Whenever one pauses to reflect upon the diverse parts of this art, one cannot fail to own that it constantly furnishes us with ever more material for our meditations, ever returning us to that great first light from which all beautiful ideas emanate, the base of all the noble inventions that we express in our work.

For if in considering the beauty and art of a painting, we admire the invention and spirit of the mind of him who first conceived the idea before his brush first touched the canvas, how can we not admire all the more the beauty of that source from which these noble ideas are drawn? Thus all the different beauties of painting serve to elevate us to that sovereign beauty, and what we see as admirable in the proportion of the different parts causes us to consider how much more admirable still is that proportion and harmony which is to be found in all creatures. The order in a beautiful picture will necessarily cause us to consider the beautiful order of the universe. The light and day that art can capture through the mixing of colour gives us some small idea of that eternal light by which and in which one day we will contemplate all that is beautiful in God and his creation. And finally, when we consider that all the marvels of art which so charm our eyes and surprise our senses here on earth are but a pale imitation of the mind in which they were first conceived, how much greater still will be our admiration of that eternal wisdom which shines the light of art into all minds, and which is itself the eternal and immutable law? Such light is the light of wisdom infinitely superior to the light of all created spirits, as the prophet Isaiah remarks: 'For my thoughts are not your thoughts, neither are your ways my ways, saith the Lord. For as the heavens are higher than the earth, so are my ways higher than your ways, and my thoughts than your thoughts.' (Isaiah, chapter 55, verses 8-9). 'When God created the stars,' a great saint once remarked, 'angels sang canticles of praise, admiring their number, their beauty, their position, their variety, grace, sparkle, harmony, and all the other perfections of those sublime bodies whose excellence they understand far better than we.' (Saint John of the Cross). Thus when we consider the work of the human spirit, with its beauty, grace and charm, as our knowledge increases we notice its perfection ever more; and thus are we led to praise ever more Him who placed such marvels on earth and in the heavens.'

10 André Félibien (1619–1695) Preface to *Seven Conferences*

André Félibien des Avaux was born into the provincial nobility. His education and early friendships with Charles Le Brun, Sébastien Bourdon and others encouraged an interest in the arts and helped to equip him for a role as a critic, historian and administrator. He was in Rome between 1647 and 1649, as secretary to the French Ambassador to the Holy See, and while there made the acquaintance of Claude Lorrain, Nicolas Poussin and Charles du Fresnoy (see IB 9). In the 1660s he benefited from the patronage of Jean-Baptiste Colbert, and was responsible for various publications on the royal collections. In 1669, in his role as historiographer of the Royal Buildings and honorary counsellor to the Royal Academy, he published *Conférences de l'Académie Royale de Peinture et de Sculpture pendant l'année 1667* (Paris: Chez Frédéric Léonard, Imprimeur ordinaire du Roy). Though the entire work is often attributed to Félibien (as in the English version cited below), he seems rather to have acted as the reporter and editor of the lectures. (The French *conférence* is usually translated as 'lecture', though early English translations refer to 'Seven Conferences'. In fact the occasions at the French Academy were generally both 'lectures', insofar as individual speakers opened the proceedings, and 'conferences', insofar as they involved an ensuing discussion.) Félibien's name is clearly attached to the lengthy preface, with its encomium to Colbert. The quality of Félibien's observation and writing lifts his account of painting far above the standard treatises of the time, and his recommendations, prescriptions and verdicts were to be frequently repeated in subsequent publications. Art as he represents it is no mere 'mechanic' practice, to be learned ad hoc. It is 'knowledge which one acquires', for which 'rules are laid down' and for which an elevated mind is required. In Félibien's framework, the highest moral and intellectual demands are made of the painter of elevated *subjects*. According to what became established in the Academy as a hierarchy of genres, the painter of History was thus accorded a status intrinsically superior to the painter of such specialized commodities as portraits, still lifes and landscapes. Félibien's close acquaintance with Poussin's ideas is revealed in his reference in the later part of the preface to the theory of the modes (see IB1), which itself played a part in the theoretical separation of painting into different manners for different functions. The lectures themselves were given by artists and connoisseurs – Le Brun, Bourdon, Philippe de Champaigne, Charles Perrault and the Flemish sculptor Gerard van Opstal – each speaker devoting himself to the virtues of one specific painting or sculpture (see IB11, 12, 13 following). The works selected for the conferences are significant of the academic priorities of the period: two works each by Raphael and Poussin (*The Israelites Gathering the Manna* and *Christ Healing the Blind*), one each by Titian and Veronese, and a cast from the *Laocoön* group. Where appropriate, Félibien's function as transcriber and editor of the lectures was extended over ensuing debates, so that occasional dissenting voices are represented in their printed form. It may have been for this reason that Félibien's publication met with a cool reception among the members of the Academy. The volume as a whole nevertheless serves to convey the impression that valuable instruction is here offered by a group of senior professionals, agreed upon a broad theory of art and upon a canon of excellence by which its findings may be demonstrated. (For reference to the subsequent hardening of the Academy's academic doctrine, see IB15.) The present text is taken from the anonymous English translation, *Seven Conferences held in the King of France's Cabinet of Paintings*, London: T. Cooper, 1740, pp. vi–lx.

[...] Towards the End of the Year 1663, the King, by giving to Mr. Colbert the Office of Superintendant of the Buildings, shewed that he intended to make the Arts flourish more than they had done hitherto. This great Man, who equally understood and loved the fine Arts, as he was zealous for his Master's Glory, re-established the making of Tapestries in Paris, and several other Places, and begun many other Works, 'till then unknown in France. But as he knew that the Art of Painting extends itself to every Kind of Workmanship, and that nothing contributes more to the Glory of a Prince than those immortal Works which Painters and Sculptors leave to Posterity, he afterwards procured from his Majesty new Favours to them that excelled in those Arts, in order to raise Emulation among them from the Prospects of Honour and Reward. [...]

As the particular Affection he bore to [the Academy] made him constantly endeavour to advance it and make it flourish; one Day when he honoured it with his Presence, to distribute the Prizes which the King allowed the Students; after he had examined the Pieces they had drawn, and they had told him what had been treated of in their late Assemblies; he said there was two Ways of teaching Arts and Sciences, by Precepts and by Examples; the one instructed the Understanding, and the other the Imagination: And as in Painting, the Imagination has the greatest Share of the Work, it is manifest that Examples are very necessary to make one perfect in that Art, and are the surest Guides to young Students: He therefore thought that if the Works of the best Masters were exposed in the Academy as Models, and if any one would inform the Students wherein the Perfection of the Art consists; this Method of Teaching, joined to their other Exercises already practised, would be of very great Utility. For though the Perfection of a Piece chiefly depends on the Force and Beauty of Genius; one cannot deny that the Remarks which might be made, would be of great Use, since here, as in all other Arts, Experience discovers many Things necessary to a Student, who, if he makes a proper Use of the Remarks already made by the Learned, may save himself from many painful Researches, which take up a great deal of Time to one who makes them without any Assistance. Thus in several other Arts, particularly Musick and Poetry, which are congenial to Painting, standard Rules have been found out to bring them to Perfection, though all who know them are not equally capable to put them in Practice.

That to instruct Youth in the Art of Painting, it would be necessary to shew them the Works of the greatest Painters, and in publick Discourses to inform them of what chiefly contributes to make up the Beauty and Perfection of Pieces. That every one being at Liberty to speak his Sentiments, they should examine all the Particulars which enter into the Composition of a Subject; and that even their different Opinions would help to discover many Things better than Precepts and Maxims. And, as these Discourses had not been in Use hitherto in their Assemblies, he said, there might perhaps be Persons found out, who though they might be afraid that they could not acquit themselves so well at first, yet they should not think so, for though they met with Difficultys in the Beginning, they would soon surmount them, and take no less Pleasure in discoursing of the Beauties of a Picture, than to shew them by their Pencil and Colours. This Method, be added, would be no less profitable than glorious to their Body, since in treating of the Art of Painting in a Way which had not been practised hitherto, they would one Day be sensible, that if they were not the first who

found out Rules, at least they had the Honour to be the first who brought them to their highest Perfection.

Mr. Colbert having thus shown them how great an Advantage must attend this Conduct and Method of Study, it was resolved they should meet on the first Saturday of every Month in the great Hall of the Academy, or in the King's Cabinet of Paintings, which he gave them the Use of to make their Observations in. That the Chancellor and Rectors of the Academy should open the Conferences in their Turn by a Discourse, in which they were to examine the Picture they had chosen for the Subject of the Day: That Mr. Le Brun, as Chancellor, should begin the first Saturday, and the Intendant of the Buildings should collect all the Conferences, and put them in order, to be published from Time to Time.

In Consequence of this, they began to assemble on Saturday the 7th of May, and we may see by their Conferences during the Rest of the Year, how many important Remarks they have made on Painting.

In short, the Academy being filled with Men of Learning, scarce the smallest Beauty or Fault escaped their Observation: Thus any one might learn to imitate the one and shun the other; and those who had been at more than ordinary Pains to increase their Knowledge, communicated to the Rest the Fruits of their long Study without impoverishing themselves.

They who assisted at these Conferences saw well of what Advantage they might be, not only to Painters, but to all the Lovers of the fine Arts. And as Use makes every Thing easy, we shall find in the Sequel, so great Discoveries in their Remarks on Painting and Sculpture, that very little remains to be said on these Subjects which can promote the Instruction of Students.

We may observe in these Discourses how many Parts of Painting they have already handled with great Accuracy. In the first which has for its Subject the Picture of St. Michael, by Raphael, there are learned Observations upon Design and Expression, which are so many excellent Lessons and important Precepts for such as are learning to design.

In the second they have not confined themselves to what belongs to Drawing only, because Titian, whose Work they examine, was not very famous for that Quality, but excelled in colouring, on which they have made very learned Remarks.

In the third Conference they treat of *Laocoön*, that celebrated and finest Piece of Grecian Antiquity: One may see that there is nothing very useful or necessary for Design and strong Expressions of Colour, which they have not taken Notice of.

The fourth treats of other different Expressions, having one of Raphael's finest Pictures for its Subject. There one may learn the Method of varying the Expressions according to the Quality of the Subject, and how he must distribute Light or Shade, according to the Scene of the Picture.

The fifth treats chiefly the Ordonnance, and as it is true that in these Compositions Ease is rather the Gift of Nature than the Effect of Study, we shall find greater Reason to admire the fine Composition of this Picture of Paulo Veronese, and his easy Manner of Painting, than be able to discover by it, any Means of imitating it. Not but these Observations that are made upon it may give us fine Ideas, with Regard to Colouring, and shew us how to give an Appearance of an easy and judicious Disposition to a Picture.

In the sixth there are several Remarks of different Kinds. As the Subject comprehends many Things, here they speak of Composition, Design, Proportions, Colours and Lights, in a very extensive and learned Manner; and particularly of all the Kinds of Expressions applicable to a History, such as that of the *Fall of the Manna*, represented by Mr. Poussin.

In the seventh, the same Parts of Painting are treated of, but the Subject of the Picture before them being one of Mr. Poussin's representing our Saviour curing the two blind Men, it has so little Resemblance of the other, that the Remarks are absolutely different. The first is chiefly taken up about Decorum, and the Manner of treating History: And the different Opinions of Persons give Occasion to shew how exact a Painter ought to be, to omit nothing that may be necessary to express the Action he would represent.

It is not to be doubted, as I have said, but in the subsequent Conferences many Things will be discovered, which have been hitherto unknown: And that Painters, who would work by the Principles of the Art, will form so clear and just an Idea of what they would represent, that they will be at no Loss in the Execution of it. For certainly the greatest Difficulty in the Production of a Work is in the well-forming of it in the Imagination, as Children untimely born give greatest Pain to their Mothers at their Birth, and but seldom grow up to be Men.

And though the Observations made in these Conferences are not delivered with all the Order that seems necessary, when one would lay down Rules for understanding an Art; all these Lessons being nevertheless expressly applied to particular Pieces, they will not fail to come into a just Arrangement in the Mind, so that when one sees a Picture, all the Ideas we have of the Parts which serve to make it perfect, come without Confusion one after another, and discover the Beauties in Proportion as we attend to it. The same will happen to those that work after having well formed an Idea, and conceived the whole Oeconomy of it.

'Tis true that to judge rightly of this, and to form a distinct Notion of a Work one would execute, we must have a perfect Knowledge of the Subject, and of the Parts of which it ought to be composed, and what Way we must proceed. And this Knowledge which one acquires, and for which Rules are laid down, is in my Opinion what we may call Art.

Now it is certain that the Art of Painting has not been perfectly understood but by the ancient Greeks, and some others, who appeared about two hundred Years ago: For though it deserves a considerable Rank among the liberal Arts, they who have given us any Rules concerning it, have always treated of the less useful Parts; they seem rather to have left it in the Number of mechanic Arts, than to give it the Place it deserves. But, indeed, Painting is of a much higher Class, and in this, surpasses the most celebrated Arts, that by forming as exalted Thoughts, and in treating the same Subject as History and Poetry it is not content to represent them, faithfully, or to invent with Genius, but forms Images of them so admirable that it makes us believe we see the Things themselves: And in showing them to the World agreeably, instructs the ignorant, and gives Pleasure to the greatest Artists.

As the Pleasure and Instruction one receives from Painting and Sculpture arises not only from the Knowledge of Design, and the Beauty of Colours, or from the Value of the Materials; but the Greatness of the Thoughts, and the Knowledge of the

Subject represented, it follows, that there is a peculiar Art different from the Materials and the Hand of the Artist, by which a Painter ought to form his Pictures in his own Mind, and without which he cannot, with a Pencil only, produce a perfect Work: Since it is not in this Art, as in some others, where Industry and Dexterity are sufficient to produce Beauty.

Now it is not the mechanical Part, but a greater Secret, a more useful Accomplishment wholly consisting in a refined Taste, that is to be learned from these Conferences, where all the Parts of which it is composed are treated by the best modern Painters. But that the Reader may understand them with greater Ease, I think it necessary to add a few Words concerning them, that they who have a Mind to learn may at least have a slight Notion of what follows, and may in some Manner be instructed in whatever is essential to make a perfect Painter.

This Art in general extends to all the different Ways of representing natural Bodies; and though Painters sometimes draw things which are not natural, such as Monsters and Grotesque Figures of their own Invention, yet even these, being always composed of Parts known, and taken from different Animals, cannot be said purely to be the Effects of Imagination.

The Representation that is made of a Body by Lines or Colours is considered as a mechanical Employment; for this Reason as there are different Workmen in this Art, who apply themselves to different Subjects; it is certain that in Proportion as one employs himself in the most difficult and noble Parts, he excells those which are low and common, and aggrandises himself by a more noble Study. Thus he who paints fine Landskips, is above him who only paints Fruits, Flowers, or Shells: He who paints after Life is more to be regarded than he who only represents still Life; and as the Figure of a Man is the most perfect Work of God upon Earth, it is also certain that he who imitates God in painting human Figures, is by far more excellent than all others. Moreover though it be no small Matter to make the Picture of a Man appear as if it was alive, and to give the Appearance of Motion to that which has none; one who can only draw Portraits, has not as yet attained to this high Perfection of Art, and cannot pretend to the same Honour with abler Painters. He must for that end advance from Painting one single Figure, to draw several together; he must paint History and Fable; he must represent great Actions like an Historian, or agreeable ones as the Poets. And soaring yet higher, he must by allegorical Compositions, know how to hide under the Vail of Fable the Virtues of great Men, and the most sublime Mysteries. He is esteemed a great Painter who acquits himself well in Enterprizes of this Kind. 'Tis in this that the Force, the Sublime and Grandeur of the Art consists. And it is this particularly that ought early to be learned by young Students.

We see then that a Painter is not only an incomparable Artist, as he imitates natural Bodies and the Actions of Men, but further he is an ingenious and learned Author; as he invents and produces thoughts quite his own. Insomuch that he is able to represent all Nature, and whatever passes in the World; and which is yet more, to produce things quite new, of which he is as it were the Creator.

I have already observed, that this Art is divided into different Parts, either because of the Diversity of the Bodies, and the Actions which are imitated, or the different Manner of imitating them, as in designing with one Colour simply, or in painting with different Colours mixed together, or in Engraving or Sculpture; it seems

necessary to say something of all these particular Manners. But rather than enter into so long a Detail, I believe, it will be better to speak in general of the Composition of a Picture where some Fable or Allegory, or History is represented, which are the more sublime Subjects, and as such, comprehend all the others. It is for this Reason that I have said there are two principal Parts to be considered, one which regards Reasoning or Theory, the other which has respect to the Hand or Practice.

The Parts belonging to the Theory, are these which make one acquaint'd with the Subject, and serve to render it Great, Noble, and Probable, as History or Fable; this is what they call Costume, which is the Truth necessary to express any particular History or Fable, and the Beauty of Thoughts in the proper Disposition of every Part.

The Parts which respect the Hand or Practice are Ordonnance, Design, Colouring, and whatever serves to express them in general or in particular.

What is called History or Fable in a Picture, is an Imitation of some Action which passed or may have passed between several Persons; hut care must be taken that there be but only one Subject in a Picture; and though it may be filled with a great Number of Figures they must all have respect to the principal One, as may be seen in the sixth Conference upon the Picture of the Manna.

Moreover as in Pieces for the Theatre; the Fable is not in its Perfection if it has not a Beginning, a Middle, and an End, to make the Subject of the Piece intelligible; one may likewise in great Pictures (the better to instruct Spectators) so contrive the Ordonnance, and the Disposition of the Figures, that we may even judge what preceded the Action: And this Mr. Poussin has done in the Picture of the Manna, where we see Signs of Hunger in the Faces of the Jews, which they had suffered before they received that Relief from Heaven. And although he may make several Actions be done at the same Time and at the same Place, he ought not for all that to represent them all, for a Painter who is Guilty of Faults like these, will meet with as much censure as Euripides, whose Tragedy of the Trojan Dames has been found fault with by every Body, because he has represented three Actions at once.

Besides this, there must appear in great Subjects, something marvellous in order to raise an Admiration of the History that is treated, and of the Painter's own Genius. This is expressed by the Beauty of the Figures, the noble Adjustments, and by a Grandeur and Majesty which shines through the whole Work, as we may observe in the miraculous Cure of the blind Men, which has given Occasion to the seventh Conference. Further, there must be Possibility in all the Actions, and in all the Motions of the Figures, as well as in the Expression of the principal Subject, to the End that Probability be found throughout as a most necessary Part, and which never fails to please the Eyes of the Beholder. One of the ancient Greek Painters having represented a Bird perched upon a single Ear of Corn which did not yield under it, was reprehended by the Peasants as one of small Judgment. If so minute a Thing does not fail to offend the Eyes of the most ignorant, how will greater Faults which appear in great Subjects, hurt an intelligent Eye. Thus in the fifth Conference, we do not think that the Miracle of breaking Bread at Emaus is treated with Probability, because the Nature of the Place, and the Characters of the Persons that are about our Saviour do not agree with the Action. But in the first Conference, we find that the St. Michael of Raphael could crush the Demon who is under his Feet tho' he does not

touch him; because it is not impossible for an Angel, to whom God has given Power to conquer the Devil, to crush him in that Manner.

What is of greatest Importance to the Perfection of Fable or History, is the different Expressions of Joy and Grief, and all the other Passions proper to the Persons painted: It is this which makes the fine Picture of Raphael so admirable which is the Subject of the fourth Conference. To this we may add the various Airs of Heads and Attitudes, for these are the fine Parts which agreeably affect those who behold a Picture, and which leading us pleasantly into the Knowledge of the Subject, makes us feel the same Sentiments of Joy or Admiration which the Persons represented are supposed to have. This is shewn in the sixth Conference where the Groupes represented by Mr. Poussin serve to instruct us in the History, and to shew the Change among the Israelities passing from a miserable to a more comfortable State.

Nor is this enough: to make a Work perfect, it must have particular Marks to distinguish the principal Figures from one another, and to note to the most extraordinary Actions, as in the Picture of the Manna, we may distinguish Moses from all the rest, as well by his Place as his Mein and his Vestments, and by an Air which gives one an Idea of what he has heard, and finally by the Actions of those about him. But if a Painter must vary his Subject by some particular Actions, he ought to be careful they be neither too many, or too low, even tho' they have some Connection with the History he is painting. Dominiquin's Picture of the Martyrdom of Saint Andrew is censured on this Account, for he has represented one of the Executioners falling as he was drawing a Rope, for which he is laughed at by the Spectators who are seen mocking him by their indecent Gestures; because this Expression, being unworthy [of] so serious a Subject, instead of attracting the Eyes, and raising Compassion for the Saint who is going to be martyred, distracts us by these ridiculous Actions. The expressions therefore of the particular Figures, which ought only to accompany the principal One, must be Simple, Natural, Judicious, and have a decent Relation to the Figure which serves as a Body to the Work of which the others are but as Members.

After having considered what belongs to History, which ought to be a single Action of competent extent, and of Beauty worthy of the Subject, which must be probable, and by its Expressions help to discover what is meant; I shall pass to the Costume, which is nothing else but a strict Observance of all that is proper to the Persons represented, who ought to appear with good or ill, high or low Characters according to those they represent. This is done in the fifth and seventh Conferences: And further it consists in the Knowledge of what is necessary to be observed with Regard to Ages, Sexes, Countries, and different Professions, and to give the Manner and Passions peculiar to each Country. In this Raphael has been admirably well skilled, but neither Titian nor Paulo Veronese have been Masters of this Art. It is nevertheless none of the least Qualifications; on the contrary we see it is one of the most necessary to instruct the ignorant, and most pleasing to intelligent Eyes.

As to the Beauty of Thoughts in the Disposition of every Thing, it consists in representing the Subject in an agreeable easy Manner, and in giving every Figure a natural Expression neither too weak nor too strong; in hitting off the Characters proper to each Person so as not to spoil the principal One in the Picture. We see in

the *Rebecca* done by Mr. Poussin, of which we shall speak in another Conference; how rich and agreeable the Composition is, both by the magnificent Disposition of the Figures, and the Variety of Faces, Actions, and Draperies. But as there are Subjects less noble, they must be treated more simply, not to fall into a Fault like that of the Bassons, and some other Flemish Painters, who in this have observed no Measure at all.

These are the Things which principally regard Theory, and in Truth it is surprising to see how some Painters and Sculptors, with all their Knowledge, all their Imagination and Invention, and all their Skill in the Disposition of great Subjects, do however find themselves as it were deserted by all their natural and acquired Abilities so soon as they attempt to execute what they had intended. On the other Hand, there are not a few who have a very good Hand, and yet have no Invention. Insomuch that it is no great Wonder there are so few excellent Works, since to produce such, not only a very fertile Genius is required, but likewise a solid Judgment to make a right Use of its Inventions, and great Practice to be able to set them in a fine Light.

For this Reason most of the ancient Greek Painters, knowing the great Compass of their Art, contented themselves with making Choice of one Part of it in which they endeavoured to perfect themselves; as a Dionysius who painted Men only, a Nicias of Athens who was famous for painting Women finely, an Aristodemus celebrated for painting Wrestlers: A Calaces remarkable for the Decorations of the Theatre; and even they among them who have excelled in great Compositions, have not been Masters of all the Parts equally, but have raised their Reputation by some one in which they have surpassed others, as Apelles, in the Beauty and Grace of his Figures.

As to Practice, it regards the Manner of disposing a Subject, and putting every Figure in its due Place. For though I have said that Facility in the Ordonnance depends chiefly on the Strength of the Painter's Imagination, who must for that End have a particular Gift from Nature as is observed in the fourth Conference in speaking of Paulo Veronese: Yet a Painter may supply the Defects of Nature, by carefully disposing all his Figures in order, and not putting them in Places where they may create Confusion, or by giving them disagreeable Attitudes; but on the contrary, assembling them by Parts and Groupes in the Manner Mr. Poussin has so finely done in his Picture of the Manna. In him we see all that belongs to Design and Proportion, on which there are Remarks made in the sixth Conference, to shew how they must be handled agreeably to the Age and Quality of the Persons.

'Tis in this Conference and in the seventh, that they handle what belongs to the fine Harmony of Colours, which shews, how to distribute Lights and Shades to the best Advantage, and in observing an agreeable and judicious Contrast in all the Work, yet to preserve a general Union throughout the Body, by which one may at first Sight have a strong Idea of the whole Subject.

Although this second Part which treats of Practice be less noble than the first, we must not imagine it ought to be considered as purely mechanical, because in painting, the Hand does nothing without being conducted by the Imagination, otherwise it cannot draw one single Feature or Stroke of a Pencil with any Success. Insomuch that they who undertake to draw a Portrait even though they do not employ the utmost Efforts of their Genius, and make use of all their Knowledge on that Occasion,

though they do not find so much use for them as in composing a great Work: The Trouble is not very small when one must consider and mark distinctly all the Contours which form the Parts of a Face, for they must all be known from one another by a vast Number of Features which distinguish them, and be all set in their proper Place, and ranged in such a Manner as to imitate very nicely the Object proposed; to set them at a Distance, or bring them nearer differently one from another: To diminish or augment their Compass, and after that to give them such a Colour as may preserve to each of them their particular Character; lastly, to compose one entire Mass where all the Parts are joynd together with so much Union and Sweetness, that the Teints which are employed almost separately in several Places, may seem to make but only one Colour, which changes insensibly according to the different Places it is employed in, but yet in such a Manner that this Mass being enlightened or shaded in some Places more than others, the Lights and Shades, the Strong Teints and the weaker, may lose themselves in one another with so much Art, as to give Relief and Roundness, and represent real Flesh. It is however this ingenious Mixture of Colours, and the Knowledge of Designing well, and preserving the Features, which beget these fine Expressions and natural Motions that appear from the Life, and which imprint on a Face the Passions one Designs to represent. So that the Practice of Designing well, and mixing the Colours artfully, must not be reckoned things of small Account, for a great many Difficulties are to be surmounted in both. On the contrary we may consider, that if in drawing one single Head there are so many things difficult to be well represented, because in Nature herself, although all Faces have the same Parts, one cannot find two of an exact Resemblance; how much more difficult is it to produce a great Work, all the Parts of which ought to be handled with a thousand Considerations, on Account of the different Relations they have to one another either in Drawing, Colouring, or Expression.

Mr. Poussin being perswaded that the Beauty of a Picture consists in making every thing that enters into the Composition have a particular Mark of what the Work represents in general, made that his principal Study: And in all his Productions, the Expression of his Subject is so generally diffused, that there appears throughout an Air of Joy or Sorrow, Anger or Sweetness, according to the Nature of his Story. He was of Opinion that as in Musick the Ear is not delighted but by a just Agreement of different Voices or Sounds: So in Painting the Eye is not charmed but by a fine Harmony of Colours, and a just Agreement of all the Parts with one another. So that when he reflected that different Sounds occasion different Motions in the Soul, as it is touched by grave or sharp Notes, he doubted not but by setting forth Objects in a moving Disposition, and an Expression more or less violent, under different Colours laid one after another, and differently mixed, he might give the Sight different Sensations, which would render the Soul susceptible of as many different Passions.

It is also true, that if Musick can work Miracles, as is told of Pythagoras who by that means gave Health to the Sick: That Asclepiades the Physician cured phrenetick Persons, that a Player on Flutes put Alexander in a Passion, another appeased furious Persons, and all this by the Power of certain Sounds, and the Force of different Accords which struck the Ear in such a Manner, that the Soul which Delights in Proportion and Likeness, was pleased with the Sounds of these Instruments, and

with the Tones of the Voice where the Numbers are entire and harmonious. Thus in Painting, all the Beauty of which consists in Symetry and fine Proportion, if it be handled according to Nature, may raise in the Soul Sentiments of Joy and Delight as strong as Musick does: Since of all the Passions those that enter by the Eyes are the most violent: There are instances of as great Wonders performed by Painting, which have often been raised by the Imagination at the Sight of beautiful and deformed Objects, as any that are reported to have been done by Musick: One has only to find out different Modes in Painting for the Composition of Pictures and the Expression of Subjects, as the Ancients have done in Musick for different Recitals and Songs. We may observe three principal Ones, viz. the Dorian, the Ph[r]ygian, and the Lydian, to which they afterwards added several others: One of them was used to sing the Praises of great Men, others inspired Courage, and animated them in Time of Battle; some were designed to beget Love, others raised Grief, and some excited Joy. As these different Modes sprung from the Manners and Customs of those who invented them, some of them were more moderate, as the Greeks, others more soft and effeminate as the Lydians; we may compare with the different Manners of Painting, what is observed in the Schools of Rome, Florence, and Lombardy, where the first preserves more Majesty and Grandeur, the second more of Fierceness and Motion, the last more of Harmony and Sweetness. But it must be acknowledged there is something singular and incomparable in Mr. Poussin, for having found out the Art to practice all the different Manners, he was so much Master of them, and has laid down so certain Rules for them, that he has given his Pictures the Force to express what Sentiments he pleased, and to inspire the Soul of the Beholder, in the same Manner as in Musick these Modes which have been mentioned move the Passions. He has in this, even outdone the most famous ancient Painters, that in his Works are seen all the fine Expressions which do but meet in different Masters. For Timomachus was not remarkable except for Painting the most vehement Passions as an Ajax whom he has represented in Anger. Zeuxis knew how to express the softer Passions when he did that fine Picture of Penelope in whose Countenance was seen Modesty and Prudence. Clesiles was principally remarkable for Expressions of Grief, having painted a Man wounded and dying, with Characters so natural, that his Strength seemed to diminish gradually, and to shew how short Time he had to live. But as I have observed, Mr. Poussin was equally Master of all these Qualifications, and knew perfectly the Force and Extent of all the different Modes. Thus in his Picture of *Pyrrhus* he seems to have kept one Mode, which was to shew nothing but Fury and Anger; in that of *Rebecca*, all is gracious and delicate; in the *Manna*, we see nothing but Languor and Misery, in the *Cure of the Blind*, Joy and Admiration: and thus it is in all his other Pictures which are so admirably handled that every Part expresses the Quality of his Subject, in the same Manner as in these Modes of Musick all the Sounds contribute to express Joy or Grief. And it is this which he called sometimes the Dorian Modes, when it treated of grave Subjects, at other Times the Lydian, when it painted Bacchanals, sometimes Lesbian, for magnificent Things, and at other Times Ionic, for soft and pleasant Subjects; thus giving them different Names according to the Difference of Subjects.

But as that which rendered these Modes capable to elevate or intimidate, to afflict or rejoice, was the Manner in which the Voices or Sounds were ordered or combined,

some of them were quick, others languid, some were grave, others sharp; and these striking the Ear differently, occasioned a more or less violent Emotion in the Soul. Thus Mr. Poussin has represented his Figures with Actions stronger or weaker, and with more or less lively Colours according to the Subjects he handled; for having found the true Degrees of Force and Weakness which meet in Colours, he knew so well to use them, that in his Works we may see a harmonious Kind of Conduct as in Pieces of Musick. For when he has represented a sad and dismal Subject as in his Picture called the *Plague* in the King's Cabinet, all the Colours are smothered and half extinguished, the Light weak, and the Motions of the Figures slow and enfeebled. But in that of *Rebecca*, which ought to have been graceful, he has employed none but lively Colours which are softly and insensibly lost in one another, and which he has mixed so finely as to ravish the Sight: The Actions are modest and peaceable, a Calm appears throughout, mixed with a becoming Joy, and in this we may say he has imitated the Ionic Mode which is elegant and agreeable. I should enlarge too far if at present I continued the Comparison of all the Manners of Painting with the different Kinds of Musick. 'Twill be sufficient to have said what I have observed of this great Painter, who has been an Honour to the French Nation, and one of the strongest and greatest Genius's that has appeared in that Art: For nothing comes from his Pencil which is not performed with a profound Intelligence, and as he always carefully enquired after those things by which the greatest Masters have arrived to that Height of Science which has made them so famous, He has likewise rendered himself illustrious by the comprehensive Knowledge he acquired, and the inimitable Works he has left behind him. [...]

11 Charles Le Brun (1619–1690) 'First Conference'

The seven conferences referred to above (IB10) were inaugurated on 7 May 1677 by Le Brun, in institutional terms the most powerful French artist of the century, speaking on a painting by Raphael, then the most highly regarded painter of the Italian Renaissance. (Raphael's *St Michael triumphing over the rebel angels* is now in the Louvre.) Le Brun had been in Rome from 1642 to 1645, in company with Poussin, and works by Raphael were prominent among those he copied. In 1648 he was one of the founder members of the Académie Royale. During the 1650s and 1660s he completed an impressive number of paintings and decorative schemes, including those at the palace of Vaux-le-Vicomte, reorganized and supervised the Gobelins tapestry factory and its attendant schools, and took charge of the royal collection of paintings and drawings. In 1664 he was appointed First Painter to the King and between 1668 and 1683 was employed on the decoration of the palace of Versailles. He was made Chancellor of the Académie Royale in 1663 and Rector in 1668. In the following passage, the preliminary description of Raphael's painting was probably supplied by Félibien. Le Brun's account is notable for its appreciation of the quality of outline in the Italian painter's work and for his informed attention to those devices that contribute to its expressive effect. The text is taken from the anonymous English translation, *Seven Conferences held in the King of France's Cabinet of Paintings*, London: T. Cooper, 1740, pp. 1–10. (For Le Brun's 'Sixth Conference', on Poussin's *Israelites Gathering the Manna*, see IB13.)

ALL the Academicians and most of the Students being met in the King's Cabinet of Paintings, the *St. Michael of Raphael* was set before them in a favourable Light.

This Picture is eight Feet long and five broad: In the middle of a great Landskip, which represents a Desart, St. Michael descends from Heaven to Earth, having under him the Devil thrown to the Ground. This Angel is supported in the Air by two great Wings; he is cloathed with a Coat of Armour, made of Scales of Gold, which is tied with a Kind of Stuff of Gold after the Roman Manner, and reaches to his Knee; under that he has another Vestment of blue Stuff embroidered, opening a little, on which is written in Capital Letters, RAPHAEL URBINAS PINGEBAT, 1517.

Above the Armour there is like two Scarfs of a changing Colour floating in the Air, one of the Ends of them are carried away with great Violence between the two Wings of the Angel, the other is buoyed up by its natural Lightness.

He has a Sword by his Side, and holds a half Pike in both his Hands, but having his right Arm a little raised up, his left Arm appears to be drawn under it, because the upper Parts of his Body advance more than the lower. His left Leg is bent, and though the right Leg seems placed upon the Demon, it does not touch him.

His Hair fluttering in the Air makes the same Motion as the Drapery. His Shoes or Sandals are of a changing Colour, like the Scarfs.

The Demon, who is under him, and as it were crushed, is biting his Tongue and grinding his Teeth, and in his red and flaming Eyes we see Marks of Rage and Fury. He is on the Brink of a Precipice, between two Rocks, from whence issue Flames of Fire. He has the Hoofs of a Goat, the Wings of a Dragon, and a Serpent's Tail: He supports himself with the left Hand upon the Earth, and holds in his right Hand an iron Hook instead of a Sceptre, which is the fatal Ensign of his cruel Dominion over other Demons.

Mr. Le Brun, who was commanded to make Remarks on this Picture, observed first the Disposition of the Figure of the Angel, which is so much the more worthy to be considered, that it represents a Body supporting itself in the Air, and in a manner very difficult to be painted.

He shewed through all the Parts of the Body a most agreeable Contrast; for though the Face be fronting us, the fore Parts of the Body do not appear. The right Shoulder is drawn back, and the left coming forwards, only discovers the upper Part of the Stomach.

Below the left Arm we see all the Belly, the right Thigh and Leg, which are full in View, and stretching downward have a Motion contrary to the right Arm which is lifted up, and that of the other Leg which is bended and drawn back.

The Demon is placed with equal Art, his Body is thrown down on the Earth, and appears as it were crushed by the Power of the Angel. All the Members of his Body seem broken and bruised, as Mr. Le Brun observed particularly of his Neck, for his Face is turned about on his Shoulders.

After the Disposition, he observed the Drawing of the Figures in all their Parts; how admirably Raphael had finished even the minutest Things, but above all, how correct he was in Design, as we may be surprised to observe as well in the Contours of all the Members, as in the Arms and Hands, Legs and Feet, where through a fresh and solid Body, we see the Muscles in their natural Position.

As one of the greatest Difficulties in Painting is to form the Outlines well, Raphael has been careful to make them exact and correct, after the Example of the fine ancient Painters, who were so exact as to mark out even the least Members of a Body, to the End that a Picture may appear with the greater Advantage, when the Circumscription of the Lines (if I may use the Word) discover the true Shape of a Body. In this Particular, this great Painter has behaved with so much Discernment, and in so singular a Manner, that without diminishing in the least the Force of his principal Contours, he could give Beauty and Strength to all his Figures, even the most remote in the Piece, without any Hardness or Dryness, though that be the Fault, he seemed to lean to in some of his Works, which is owing to his great Precision in drawing Outlines, of which he was so passionate an Admirer.

Although it seems in painting Angels, who are Beings quite spiritual, one ought to give them a delicate Shape, and under the Bodies they are painted with to exhibit that Sort of Beauty which the ancient Sculptors have so well represented in the Figure of the antique Apollo; yet Mr. Le Brun observed that Raphael being to paint St. Michael in that Action, which expresses the Authority and Power of God, he has given him a masculine and vigorous Beauty: For the Features of his Face, and the Carnation resemble the Delicacy and Freshness of a young Man, together with a Force and Majesty, which expresses something powerful and divine, giving the Joints and Members extraordinary Strength, particularly the Arms, Knees and Fingers, which are firmly knit together by strong Nerves, like those in the most robust Bodies.

Never Painter knew how to express a Subject with more Grandeur than *Raphael*: As fierce and as terrible as the Visage of St. Michael appears, there is at the same Time a great Deal of Sweetness in it, and Grace withal. What Mr. Le Brun observed, discovered the Excellence of it the more. For the Nose being large above, and a little thinner below, discovers the Majesty which shines throughout the whole Countenance, the Forehead large and open in the Middle is the Seat as it were of the Greatness of his Spirit and his Wisdom.

We see a half Tinct between the Eyebrows to shew a Disposition to elevate them, or to let them fall on the Eyes, as commonly happens to Persons capable of great Cares, and trusted with important Affairs, and which also appears when one is in a Passion. But this is only given him to prevent the Face being too smooth. For that Part is without any Motion, the Angel despising his Enemy whom he has overthrown, too much to shew any violent Efforts to conquer him. This Raphael has admirably represented by a certain Air of Disdain, which appears in his Eyes and Mouth: For his Eyes are a little open, and the Eyebrows forming perfect Arches are a Sign of Tranquillity, and even the Mouth where the upper Lip comes a little over the lower, is also another Sign of his Contempt.

We may not only perceive Action in all Parts of the Body, but the Painter has even put the Things about him in Agitation likewise, that there might be more Motion in his Picture.

Mr. Le Brun having made them observe how the Air, pressed by the Weight of the descending Body, lifts at the same Time every Thing that is light, and drives it violently wherever it finds Passage; likewise remarked, that not only the Angel's Hair stands on End, towards the Opening of his Wings, where the Wind passes with

great Violence, but the Scarfs which are about him flutter from one Side to another with such Exactness, that the Extremities of that which appears heaviest descends most, while the other is buoyed up in the Air.

Draperies disposed in this Fashion are admirable Secrets to set off the Motion and Action in a Figure, and in this Raphael has surpassed all other Painters, having never omitted any thing which might contribute to the best Expression of a Subject.

After M. Le Brun had made these Remarks, he begged the Company to give their several Opinions of the Picture, and submitted his own Sentiments to those of the Academy. But every Body was of his Opinion, and found nothing that could be contradicted of all that he had said, but owned that his Remarks were made with a great Deal of Judgement. [...]

12 Philippe de Champaigne (1602–1674) ‘Second Conference’

The second of the ‘Seven Conferences’ (see IB10, 11, 13) was held on 4 June 1667. Born in Brussels, Champaigne spent his working life in France as a highly regarded portrait painter, and as a leading advocate and practitioner of a restrained classicism, exercised for the most part on religious themes. In 1628 he was appointed Painter to the Queen by Marie de Médicis. The tendency to formal austerity in his work may have been encouraged by his increasing commitment to the Jansenist religious movement. Like Le Brun, he was a founder member of the Académie Royale. The subject of his lecture was Titian’s *Entombment of Christ* (now in the Louvre). His account of the painting follows the standard judgement that, whereas Raphael was to be esteemed for the quality of his drawing and formal construction, the strength of the Venetian painter’s work lay in the richness of its colour and expression. A later conference by Champaigne, on Titian’s *Virgin and Child with St. John*, gave rise to a heated debate within the Academy on the relative merits of colour and design (see IC7). The following text is taken from the anonymous English translation, *Seven Conferences held in the King of France’s Cabinet of Paintings*, London: T. Cooper, 1740, pp. 20–30.

The Picture which was chosen for the Subject of this Conference was one of *Titian’s*, who on a Canvass of four Feet and a half long, and six Feet and a half broad, has painted the Body of our Saviour carried to his Tomb by St. John, Nicodemus, and Joseph of Arimathea, accompanied by the Virgin, and Mary Magdalen.

Mr. de Champagne the Elder who had been appointed to display the Beauties of this Piece, began by telling them that it was not to be doubted but it was really done by the Hand of Titian, and that it was one of the finest and best preserved Pictures of that excellent Hand; that it was done with so much Art and Fire, that we may easily judge it had been finished in the Strength and Vigour of his Age, while he painted with the greatest Freedom, and before the vast Intelligence he had acquired began to decline.

There was in that Work, he said, many Parts which well deserved to be examined, but that leaving for the present those of Ordonnance and Design, he would confine himself to speak of the Expression only, and observe with what Art the Painter had

conducted himself in the Distribution of Colours and Lights, in which one may justly say he has far surpassed all other Painters.

As Christ is the principal Figure to which all the others are subordinate, Mr. de Champagne observed that all the Characters of a dead Body meet here; all the Members appear heavy and without Motion, and the Want of Blood and Life makes them pale and livid, so that the Flesh and Veins, Muscles and Nerves, which in a living Body appear firm and round, are here inert, flat, and sunk. Then he desired them to observe in what manner the Body is disposed; the Legs and Feet are advanced, and the Head and Shoulders thrown at a Distance. *Titian* has supposed that the Shaddow of one of those who are carrying the Body must cover part of it, particularly the Face, thus to throw the Head at a Distance, and bring forward the Legs; the better to imprint the Character of Death on every Member of the Body of which Shades and Darkness are a proper Emblem: And to order it so, that in the Obscurity of the Colours, we may not see the adorable Face of the Saviour of the World, who appears now no more with those Beauties, which when he was alive, made him be looked upon as the most beautiful of all Mankind.

He observed, that as the Body was represented bloodless and lifeless, they who carry it discover by their Actions, and the Colours of their Flesh how deeply they are affected, and the Pain they endure in supporting the Weight of the Body. St. John is behind him who is lifting up the Shoulders, and the two other Disciples, one on each Side of him bearing up the rest of the Body; one of them is cloathed in a Garment of a very clear and lively brick Colour, but as it is tucked up, we may see the foldings of it which are of a Colour changing with red and green. He has likewise a Kind of Scarf about his Shoulders of white Cotton strip'd with blue. [. . .]

Mr. de Champagne made several Remarks on the other Parts of this Picture, observing first the Beauty of the Teints which appeared in the Naked, and the Dispositions of Colours so finely laid on one after another in the Draperies, either to sink the remote Parts, or bring out those that are near, and withal to express that Harmony of Colours which is so admirable in the Works of *Titian*.

Then he let them see the vast Art of the Painter in distributing of Lights and Shades: the Academy pointing out certain Glances of Light, and some Flashes in the Heaven behind St. John and about the Head and Arms of Christ, which being of an obscure Teint, make the Brightness of the Heaven and the Force of the Light appear to the greater Advantage; he desired them to observe how that Brightness which naturally ought to strike strongest, is nevertheless so well placed, that the dark Bodies hinder it from advancing, and that those Lights are at a Distance where they naturally ought to be. From hence we may learn, that when the Colours are well used, the Light and Dark are sometimes nearer, and sometimes at a Distance; and that this is the best Manner of disposing a Subject well: The Light and Shades contribute very much to the strengthening or weakening the Colours, and are of great Use either to bring out or set off a Body.

At last they all agreed, that with regard to that Part of painting, *Titian* was a perfect Master; and that in his Pictures we may chiefly observe how artfully he manages the Force of Colours to make the Shades and half Teints set off the great Lights with the better Advantage: But above all, with what skill he strengthens his Lights in order to

add the greater Beauty to his Picture, and that without letting one Part efface another; or one Colour diminish another.

Some of the Company moved to examine the Parts of the Design of this Picture, where they said, there was Ground of Objection against the Figure of St. John, and that of our Saviour; one they alledged was too small and the other too large in Proportion to the other Figures, and blamed *Titian* for having represented the Head of Christ in so great a Shade; a Part of his Body, which seemingly ought to have been most enlightened and appeared to the best Advantage, as it is considered to be the principal Object in the Picture.

To this it was answered, that as *Titian* had not been equally Master in all the Parts of Painting, they must confine themselves to those in which he had excelled, and which Mr. de Champagne had pointed out with great Discernment; and adding their Sentiments to all that had been said, they owned that what was chiefly to be admired in the Piece, was the Colouring, and the fine Harmony of Parts. And that this Harmony proceeded from the Arrangement of the Colours; thus we may observe that if *Titian* has cloathed one of them who are carrying the dead Body in red, it is to make the Body appear paler, and that the Head and Shoulders may seem to be at the greater Distance. And because our Saviour's Legs are enlightened, he has given the Figure who supports them a Garment of dark Green for a Ground.

We may further observe the Difference between the Carnation in the Body of Christ, and that of the Disciples who are carrying it, which *Titian* has express'd by a stronger Colour more inclining to the Red, and the Linnen which is wrapp'd about his Legs and Feet, serves by its Whiteness to make them appear of a fainter and dead-like Colour, and to come out quite from the Picture. But above all we may observe with what Sweetness and Tenderness the Painter has united his Colours; for between that green Habit and the Virgin's blue Mantle, we see Mary Magdalen's Robe which is yellow, but the Browns of it are broken and teinted with the different Colours which surround her; and thus one Colour does not fall immediately from green to blue, or from green to yellow; for though Mary Magdalen's Sleeve be of a deep Yellow and near the green Habit of Nicodemus, *Titian* has known well how to separate these colours by tucking up Nicodemus's Sleeve against the Yellow, and to make the Shades of the one fall into those of the other, so as the Colours do not cut upon those which have an equal Share of Light and Vivacity: always observing this Maxim which was peculiar to him, to make great Masses of Light and Shade.

Further it is to preserve this same Harmony of Colours and this fine Union of Tints, that he has given St. John a red Mantle heighten'd with a little of the yellow upon the light Parts; for thus it agrees well with the green Habit of Nicodemus; and makes an agreeable Harmony with Magdalen's Robe, and likewise with the red Vestment of Joseph of Arimathea; and which is more, serves to set off Christ's Arm which is above it. [. . .]

13 Charles Le Brun (1619–1690) 'Sixth Conference'

Le Brun's second contribution to the Seven Conferences (see IB10, 11, 12) was made on 5 November 1667. His subject on this occasion was the work of a modern painter, Poussin's

Israelites Gathering the Manna of 1637–9 (now in the Louvre). Poussin himself had suggested in a letter to Jacques Stella that the mixture of dispositions and ages represented in this ambitious work would 'not displease those who know how to read them'. Later he wrote to Chantelou, who had commissioned the painting (see IB1), 'Read the story and the picture, so that you can judge whether everything is appropriate to the subject.' As if to meet Poussin's challenge, Le Brun made this painting the focus for a tour de force of analysis and interpretation. The sixth conference is by far the most extensive of the series, and stands as a canonical document in the history of formal exegesis. Particular emphasis is laid by Le Brun on Poussin's use of prototypes from the classical art of the past, and upon his capacity to convey varied emotional content through the characterization and disposition of his figures. In the original published edition, the account of Le Brun's lecture is prefaced by a detailed and lucid description of the painting, no doubt inserted by Félibien for the benefit of those readers who would have no direct access to the work. This has been excluded from our version. The text of the conference is taken from the anonymous English translation published in *Seven Conferences held in the King of France's Cabinet of Paintings*, London: T. Cooper, London, 1740, pp. 85–120.

Mr. Le Brun began by telling the Company, that if the Works of the greatest Painters who had lived in the two last Ages had furnished Matter for their past Conferences, it was but just that the Works of a Painter in our own Day should make up the present Entertainment.

That the first time he had spoken in the Academy, he took for the Subject of his Discourse a Picture of Raphael, the Merit of which had made it the Admiration of his Age, and an Honour to his Country.

But now he was to discourse of a Picture done by Mr. Poussin, who is the Glory of this Age, and an Honour to France.

The Divine Raphael was he on whose Works he had endeavoured to form his Studies; and that the illustrious Mr. Poussin had assisted him by his Counsels and directed him in this great Enterprize; so that he must own these two great Men as his Masters, and make this public Acknowledgment thereof.

When they were examining the Pictures of Raphael, and the Painters of his Age, every one indulged their Conjectures, and deferr'd giving their Opinion; because the Colours having lost their original Strength or true Teints, we cannot fully perceive what those great Men have represented, nor are we able to judge of all the Beauties of their Works. But as he had the advantage to converse often with the great Man of whom he was going to speak, and since his Pictures still retain'd the same Lustre and Vivacity of Colours as when he gave them the last Touches, one might tell his Sentiments of them with more Knowledge and Certainty than of the others.

And if all the particular Talents in every Italian Painter had been taken Notice of, all these Talents met together in our French Painter alone. If there is any one which he has not possessed to the greatest Perfection, he has been Master of them all in their more useful and principal Parts.

Raphael has furnished Matter of Discourse on the Grandeur of his *Contours*, and of his correct Manner of designing them, on the natural Expression of the Passions, and the noble Manner of cloathing his Figures.

In Titian we observe a thorough Intelligence of Colours, and the true Means to find out Union and Melody.

Paulo Veronese had furnished us with Means of Entertainment on his Facility of Handling, and on the Grandeur of his Ordonnance and Composition.

But in this Work of the famous Mr. Poussin all these Qualifications unite, with several others not observed in the Painters hitherto mention'd.

For that reason, he said, he would divide his Discourse into four Parts. In the first he would speak of Disposition in general, and of every Figure in particular. Secondly of Design, and the Proportions of Figures. Thirdly of the Expression of the Passions. And lastly material and aerial Perspective, and of the Harmony of Colours.

Disposition in general contains three things, which are very general in themselves, viz. the Choice of the Scene, the Disposition of the Figures, and the Colour of the Air.

The Composition of Figures which comprehend the Subject, ought to be composed of Parts, Groupes, and Contrasts. The Parts divide the Sight, the Groupes determine and connect the Subject, and Contrast gives Motion to it. [. . .]

Mr. Le Brun observed, that in this Picture we ought to consider the Disposition of the Scene, and to Mind how properly it represented a frightful Desert and an uncultivated Land.

The Painter being to represent the Jews in a Country unprovided of every thing and in extreme Necessity, his Work must carry some Marks to express his Thoughts; and which may agree with his Subject. For this Reason, the Figures are in a languishing Condition, to express the Weariness and Hunger with which they were distressed. Even the Light of the Air appears pale and weak, which imprints a kind of Sadness on the Figures. And altho' the Landskip be disposed in a very elegant Manner, and fill'd with admirable Figures, the Sight cannot find that Pleasure it desires, and which it commonly feels in other Pictures, designed only to represent a fine Country.

There is nothing but great Rocks, which serve as a Ground to the Figures. The Trees have only dry Leaves without any Sap; the Earth neither bears Plants nor Herbs; and there are neither Roads nor By-ways in the Country, to make us believe it has never been inhabited.

What he called Parts, he said, are all the Figures separated into different Places of the Picture, which divide the View, and give Occasion in some measure to lead it round these Figures, to consider the different Plans and Situations of all the Bodies, and the Bodies themselves differing from one another.

The Groupes are formed of the Assemblages of many Figures joined together, which do not divide the principal Subject, but on the contrary serve to unite and fix the Sight, that it may not always be wandering in so great an Extent of Country. For that Reason, when the Groupe is composed of more than two Figures, we must observe which of them appears most as the principal Part of the Groupe; and as for the others which are along with it, we may say that some of them are as it were in the Place, and the rest as Supporters.

Here we may observe that judicious *Contrast* which serves to give Motion, and which proceeds from the different Dispositions of the Figures that compose it; the Situation, Aspect, and Motions of which being according to History, produce that Unity of Action and fine Harmony that are so remarkable in this Picture.

We must observe the Woman, who suckles her Mother, as the principal Figure in this Groupe, and the Mother and Child as the Chain and Link. The old Man who beholds this Action, and the young Man who takes him by the Arm, serve to support the Groupe on each side, giving it a great space in the Picture, and setting the other Figures which are behind at a Distance.

There are none but the Woman who is giving Suck, with the Mother and her Child, which enter into the composition of this Groupe; and, if they had not these Figures to support them, opposed to Moses and the other Figures which are at a greater distance, it is evident that this Groupe would be dry and poor, and that all the Work would appear composed of too many small Parts.

It is the same of the Woman who is turning her Back; she is supported on one Side by a young Man who holds the Basket, and by him who is on his Knees; and on the other Side by these two Figures which are gathering Manna, and by the Man who is tasting it, and by the young Girl who holds out her Robe.

As to the Light, he observ'd it was shed confusedly over all the Objects. And to shew that this Action happened in the Morning, there are some remains of Vapour at the foot of the Mountains, and on the Surface of the Earth, which render it a little obscure, and make the distant Objects less perceptible. This serves to set off the Figures which are before to the greater Advantage. There are certain Gleams of Light striking on them from the opening of the Clouds, which the Painter has done on purpose, that the particular Lights which he distributes in different Parts of his Work may be more natural.

He has even affected to keep the Air darker and thicker on the Side where the Manna falls; the Figures are more enlighten'd there, than on the other Side where the Air is more serene. This he has done to vary all his Figures, and to give a more agreeable Diversity of Lights and Shades to his Picture.

After having made these Remarks on the Disposition of the whole Work, he next examined what regards the Design. And shewed, that Mr. Poussin had been intelligent and exact in that Part; that the Contours of the old Man, who is standing, are great and well designed; that all the Extremities of the Parts are correct, and pronounced with a Precision which leaves nothing further to be desired.

But what he took most Notice of in the Picture, and is indeed well worthy observation, is the admirable Proportion of Figures throughout, which Mr. Poussin has taken from the best Antiques, and perfectly suited them to his own Subject.

He observed, that the Figure of the old Man, who is standing, has the same Proportions as Laocoön, which consists in a well-made Shape, and a Composition of Members suitable to a Man who is neither very robust, nor too delicate. By the same Proportion he has formed the Body of the sick Man; for tho' he be meagre and extenuated, we may yet observe throughout all his Members a just Proportion, capable of making up a fine Body.

As to the Woman who is suckling her Mother, she resembles the Figure of Niobe; all the Parts are designed with much Symmetry and Correctness; and here, as in the Statue of that Queen, there is a masculine Beauty and Delicacy throughout, which shews her high Birth, and agrees perfectly with a middle-aged Woman.

The Mother is done by the same Proportion; but as she is older, she has more Meagerness and Dryness; for as the natural Heat begins to dry up in old People, their

Nerves and Muscles are no longer supported with so much Vigour as formerly, and thus they appear more relaxed, and even occasion certain Appearances upon the Skin, which a Painter ought not to omit, if he would imitate Nature well.

The old Man, who is lying behind these two Women, has his Resemblance from a Statue of Seneca at Rome, in the Garden of Borghese. For as Mr. Poussin had his Imagination stock'd with an infinite Number of fine Ideas, which he had acquired by long Study, he chose the Image of this Philosopher, as the most agreeable to represent exactly a venerable old Man, who seemed also to be a Man of Parts. Here there is a fine Proportion of Members, an Appearance of Nerves and Dryness in the Flesh peculiar to old Age, and to one who has borne much Fatigue.

As for the young Man who is speaking to him, his Proportions are much the same as those of Antinous at Belvedere, and discover in the Contours of the Members a solid Flesh to shew the Force and Vigour of his Youth.

The young Boys, who are fighting, have two different Proportions; the youngest seems to have for his Model, Laocoön's youngest Son; and the better to express his tender Age, the Painter has formed all the Parts of his Body delicate, and not fully shaped. But the other, who seems to be older and more vigorous, has in the Compositions of his Members a Resemblance of one of the Wrestlers in the Palace of Medicis.

The young Woman, who is turning her Back, has the same Resemblance to the Diana of Ephesus in the Louvre; for though this young Woman has more Cloaths on her, the Beauty and Elegance of her Members may be perceived through the Draperies; the fine and delicate Contours of which form that easy and agreeable Stature which the Italians call *Svelta*.

In this last Groupe the Painter has intended an Opposition of Proportions with the other first mentioned, so that there might be a Contrast between them, and that they might appear of different Ages, by the Delicateness of all their Figures, as well as by their Actions. In the young Man who carries the Basket, there is a Delicacy of Beauty which could have no other Model than the antique Apollo, the Outlines of the Members having something more charming than those of the Boy speaking to the old Man, who is not so well born.

The Girl, who holds her by the Robe, has the Air and Proportion of the Venus of Medicis, and the Man on his Knees seems to have been copied from Hercules Commodus.

After M. Le Brun had observed these admirable Proportions, and shewed that the Painter had followed them so well that they did not look like a Copy, and yet not entirely like the Originals, he proceeded to the third Part of his Discourse, and spake next of Expression.

First, he shewed that Mr. Poussin had made his Figures so proper to his Subject, that all their Actions had respect to the State of the Jews, who were reduced to extreme Necessity, and dreadful Weakness in the midst of a Desert, but in a Moment were supplied by Assistance from Heaven; so that some of them suffer without knowing of the Assistance sent them, while others, who were the first that felt the Effects of it, are employed in different Actions.

But in order to enter more particularly into these Figures, and to understand their Actions, not only those they are doing, but also their very Thoughts, he said, he would make an exact Detail of all their Motions.

It was not without design, that Mr. Poussin had represented an aged Man beholding the Woman who was suckling her Mother; because so extraordinary an Act of Charity ought to be considered by a grave Person, the more to heighten it, and be the Subject of Admiration to those who look on the Picture. He has not intended him for a clownish rustie Man, because that Sort of People never reflect on things worthy of Consideration.

As this great Painter has not disposed his Figures merely to fill up Room in his Picture, but also to make them all appear as if they moved of themselves, either by the Action of the Body, or the Motion of the Soul; he observed, that his Man looks like one astonish'd or surpriz'd with Admiration. His Arms are drawn back, and laid across his Body; because, on a great Surprize, all the Members commonly shrink one after another; but chiefly when the Object which surprizes, only imprints Admiration at what passes, and does not occasion Fear or Terror to trouble our Senses, and make us seek assistance to save our selves from the impending Evil. Thus as he is only wondering at a thing so worthy Admiration, he opens his Eyes as wide as he can; and, as if he comprehended the Greatness of the Action by looking more attentively, he employs all the Powers of the Body to assist the Sight in wondering at this Object, which he cannot cease to admire. [...]

In the old Man, who is lying behind these two Women, and who looks up and extends his Arms; and in the young Man, who shews the Place where the Manna is falling, the Painter has intended to express two very different Motions of the Soul: the young Man is filled with Joy on seeing the Food falling, and shews it immediately to the old Man without ever minding from whence it comes: but he, more sage and judicious, instead of looking to the Manna, lifts up his Eyes to Heaven, and adores the Providence of God who has filled the Earth with it.

As the Author of this Picture is admirable in expressing the Diversity of Motions, and knew what way to give Life to his Figures, he has made all their different Actions and Expressions proceed from particular Causes, which have respect to his principal Subject. This was well observed by Mr. Le Brun in the two Boys fighting for the Manna; for by this is signified the extreme Necessity to which the People were reduced; and because it was universally felt, the Painter has made the two Boys fight together, not as if they intended to hurt one another, but only that one may hinder the other from getting that which they both saw was so necessary to them. [...]

One of the finest Pieces in this Picture, as Mr. Le Brun observed, is the Groupe of Figures before Moses and Aaron, some of whom are kneeling, and others in a Posture of Humility, holding Vessels full of Manna, and seem to thank the Prophet, because they had received it. He shews that Moses, by lifting up his Eyes and Hands tells them it is from Heaven they have received this Assistance; And Aaron who is doing the Office of High-Priest, in joining his Hands, teaches them by his Example to be thankful to God.

We may observe, that the other Figures behind Moses are looking up to Heaven and thanking God for the Blessings he is showering down upon them: These are the

most ancient Sages of the Israelites who have a particular Knowledge of the Miracles God has done for them by the Intercession of his Prophet.

Among the Figures which are near Moses and are listening to him, there is a Woman, by her Action discovers her Curiosity; for as she is going to say it is from Heaven the Food is sent to her, she looks up, and that she may defend herself the better from the excessive Light which dazzles her, she interposes her Hand between her and it, as if she would penetrate into the Source of these Blessings.

Besides all these fine Expressions, we may consider further how Mr. Poussin has clothed his Figures; and here it is we may say he has always excelled. The Habits he gives them are real ones, and which cover them entirely; not as other Painters do, who throw them at random, and do not cover the Body but with Labels, with the form of a Garment. In the Pictures of this great Master it is not so; as every Figure has a Body under its Habit, so every Habit is proper to the Body, and covers it well. But there is yet this more, he has not only made the Habits to conceal the Naked, and has not taken all the Fashions of every Country; but has been very careful of the Decorum, and known well how to manage that Part of the Costume, no less necessary in Historical Pictures than in Poetry. For that Reason he has not failed in it, but made use of cloathing as the Custom of the Country, or the Quality of the Persons represented required at his Hands.

Thus be observed, that as among the Jews there were People of all Ranks, and some more fatigu'd than others, the Figures are not all regularly clothed in one manner. Some of them are half naked, as the old Man, who is looking to the Daughter nursing the Mother. And tho' the Folds of the old Man's Cloak be large and free, and made of coarse Stuff, they do not hinder the Nakedness of the Figure from being seen. The kind of Breeches which the Ancients called Bracca, that cover his Ancles and Legs, is not of the same Stuff with the Cloak; it has smaller and closer Folds; and yet the Legs do not appear too close, all the Beauty of their Contours may be seen.

The Rank of every Figure is particularly distinguished by the Beauty of the Draperies, some of which are enriched with Embroideries, and others, larger and more grand, give an Air of Majesty to those that wear them.

As to what regards lineal Perspective in this Picture, Mr. Le Brun shewed, that it is observed to great Perfection. And that Mr. Poussin being to represent a mountainous Country, the Situation of which is very unequal, he has made use of high Terrasses to place his Figures upon, which gives the greater Play and Variety to all the Dispositions of the Figures that compose this Work: and it is even this which serves to discover such a great Multitude in so small a Space, and which places the Figures of Moses and Aaron to the greater Advantage, who are as it were the Heroes of the Subject.

As to the Effusion of Light; having represented a thick Air, and loaded with Morning Vapours, he has hastened more the Diminutions of his distant Figures, and degraded them as much by the Quality, as by the Force of the Colours, to advance these the more, and to make them shine with the greater Vivacity, by the Light which they receive with the greater Force by the opening of a Cloud that is supposed to be above, which he likewise makes natural by other Clouds appearing half open in the Picture.

In the Effects of Light there are three Things worthy of Observation. The first is the principal Light, which shines most. The second is, a Light glancing on Objects. The third is, a faint Light, which is lost and as it were confounded by the Thickness of the Air.

It is this principal Light which strikes upon the Man's Shoulder who is standing surprized; upon the Woman's Head who is giving Suck; on her Mother who is sucking; and upon the Woman's Back clad in Yellow, who is turning about.

'Tis only the upper Part of these Pictures that are illuminated with this strong Light; for the inferiour Parts have only a faint glancing Light; as that of the sick Man, those of the old Man lying, and the young Man helping him up, and even those of the two Boys fighting, and all the rest about the Woman who is turning her Back; the Light of which is degraded by the Thickness of the Air in proportion to their Distances.

As to Moses and those who are about him, they are only enlightened by a Light which is weakened by the Air intervening in the Distance between the others and those which are in the fore Ground of the Picture, and which have yet less Light, as every Figure is at a greater Distance, according to its Situation and the Colour of the Draperies; some being more proper than others to be made appear with a stronger Light than they have.

Yellow and Blue being the two Colours which partake most of the Light and Air, Mr. Poussin has cloathed all his Figures with Stuffs of these Colours; and in all the other Draperies he has constantly made use of these two principal Colours, making the Yellow in a manner prevail more than any other, because the Light which is shed on the Picture is very Yellowish.

After Mr. Le Brun had ended making all these Remarks, every one thought them not only very learned and judicious, but also very useful for understanding that Work, and very necessary for those that would perfect themselves in Painting.

A certain Gentleman said, there was indeed many things in this Picture worthy of Admiration, and which serv'd to recommend it, that he would not do it so much Injury, as to seek an Occasion of finding fault with it: he would likewise have them believe it was not to diminish the Esteem of it, if he ventur'd to say, that tho' Mr. Poussin had been so exact as to omit none of the necessary Circumstances in the Composition of a History, he had not for all that made so just a Representation of what pass'd in the Desert, when God caused the Manna to descend on the Israelites; since he has represented it as if it had happened by Day, and in the Sight of the People, which contradicts the Text in Exodus, that says, they found it fallen in the Morning round about their Camp like Dew, which they went to gather. Further; he found that the great Necessity and extreme Misery, which is expressed by the Woman who is forced to suck her own Daughter, does not agree with the Point of Action which he painted; since when the Manna fell in the Desert, the People had been already relieved by the Quails, which had been sufficient to quench the greatest Famine, and deliver them from so pressing a Necessity, as that the Painter has represented.

That to make a true Representation of the gathering the Manna, it was not necessary to paint the People so astonished; and still less so to make that miraculous Meat fall like Snow, since they found it on the Ground every Morning like Dew.

To this Mr. Le Brun replied: It is not the same [in] Painting as in History. An Historian can express himself by an Arrangement of Words, and a continued Thread of Discourse, which form an Image of what he would say, and represent successively any Action he pleases: But a Painter having only a Moment to take any Image he is going to represent, to shew what passed in that Moment, it is sometimes necessary to join many Accidents together which preceded, in order to make the Subject he is explaining he comprehended; without which they who see his Work will be no better instructed, than if this Historian, instead of repeating the Subject of his History, had contented himself only to relate the Event.

It is for this Reason that Mr. Poussin, intending to shew how the Manna was sent to the Israelites, did not believe it would be sufficient to represent it fallen on the Ground, where the Men and Women are gathering it, but likewise, to display the Greatness of the Miracle, that he must shew at the same Time the State of the Jewish People when that happened. That it was not enough to represent them in a desert Place, some of them pining away, while others are busy gathering Manna, and some are thanking God for his Benefits; these several States and different Actions serving him instead of Words in Discourse, to express his Thoughts: and since Painting has no other Language but these kinds of Expressions, it is this which obliges him to represent the Manna falling from Heaven, because he had no other way left to shew from whence it came. For if one do not see it falling down, but the Men and Women gathering it from the Ground only, he may be ready to take it for some Grain, or Fruit; and so this Circumstance, by which he points out to us, that it is a Food sent from Heaven, would not have place in his Work. [...]

14 Charles Le Brun (1619–1690) ‘Conference on Expression’

There has been some confusion concerning the date of first delivery of Le Brun's influential lecture on the Expression of the Passions. However, Jennifer Montague has argued persuasively that it was given to the Académie Royale in two sessions in April and May 1668, and that it was repeated in the presence of Colbert ten years later (Montague 1994). In the lecture as delivered and in its published forms, Le Brun's introductory discussion was followed by descriptions of the physiognomies associated with individual passions, illustrated by his own line drawings, each duly labelled. (The original drawings are preserved in the collection of the Louvre.) In English translation, the passions are given as Admiration, Esteem, Veneration, Ravishment, Scorn, Horror, Terror, Simple Love, Desire, Hope, Fear, Jealousy, Hatred, Sorrow, Bodily Pain, Joy, Laughter, Weeping, Anger, Extreme Despair and Rage. Le Brun's account of the passions is much indebted to the *Traité sur les passions* of René Descartes, first published in 1649, and to a lesser extent to other recent studies on the physiognomy and definition of the passions. The originality and importance of his work lies in the imagery it furnished for the representation of emotion in art. (For a later application of the science of anatomy to the expression of the passions, see VIIA7.) We have included Le Brun's opening account of the nature of expression, a sample of his descriptions of the effects of emotion on the human face (designed to be accompanied by his drawings), and his concluding remarks on the bodily expression of the passions. Despite the interest it aroused, and notwithstanding a recommendation from Colbert, the lecture remained unpublished during Le Brun's lifetime. It was first printed in Amsterdam

and Paris in 1698, under the title *Méthode pour apprendre à dessiner les passions proposé dans une conférence sur l'expression générale et particulière*. Our text is taken from the first English translation, by John Smith, published under the title *The Conference of Monsieur Le Brun. . . upon Expression, General and Particular*, London: John Smith, 1701, introduction pp. 1–6, 13–15 and pp. 1–4, 10–12, 19–20, 28–9, 33–7.

GENTLEMEN,

At our last Assembly you were pleas'd to approve the Design which I then took to Entertain you upon Expression. It is necessary then in the first place, to know wherein it Consists.

Expression, in my Opinion, is a Lively and Natural Resemblance of the Things which we have to Represent: It is a necessary Ingredient in all the parts of Painting, and without it no Picture can be perfect; it is that which describes the true Characters of Things; it is by that, the different Natures of Bodies are distinguished; that the Figures seem to have Motion, and that every thing therein Counterfeited appears to be Real.

It is as well in the Colouring, as in the Design; it ought also to be observed in the Representation of Landskip, and in the Composition of the Figures.

This, GENTLEMEN, is what I have endeavoured to make you observe in my past Discourses; I shall now Essay to make appear to you, that Expression is also a part which marks the Motions of the Soul, and renders visible the Effects of Passion.

So many Learned Men have Treated of the Passions, that it is hardly possible to say any thing which they have not already written thereupon: And I should not take the pains to Report their Opinion in the Matter, if it were not the better to make you comprehend that which concerns our Art. It seems therefore necessary, that I should touch something upon it, in favour of the young Students in Painting, which I shall endeavour to do with the greatest Brevity I can.

1st. Passion is a Motion of the Soul, residing in the Sensitive Part thereof, which makes it pursue that which the Soul thinks for its good, or avoid that which it thinks hurtful to it: And for the most part, whatsoever causes Passion in the Soul, makes some Action in the Body.

Being true then, that the greatest part of the Passions of the Soul produce Bodily Actions; it is necessary that we should know what those Actions of the Body are, which express the Passions, and what Action is.

Action is nothing but the Motion of some part; and this Alteration cannot be, but by an alteration of the Muscles, and they have no Motion, but by the extremities of the Nerves which pass through them: The Nerves do not Act but by the Spirits which are contained in the Cavities of the Brain; and the Brain receives the Spirits from the Blood, which passing continually through the Heart, is thereby heated and rarefied in such manner, that it produces a certain subtil Air or Spirit, which ascends up to, and fills the Brain.

The Brain thus filled, sends back these Spirits to the other parts, by the Nerves, which are as so many small Channels, or Pipes, that convey the Spirits into the Muscles, more or less, according as the Action requires, in which they are employed.

So as that Muscle which is most in Action, receives the greatest quantities of Spirits, and consequently becomes more swell'd than the others, which are thereof

depriv'd, and by such privation seem more loose and more wasted or shrunk than the others.

Although the Soul be joined to all parts of the Body, yet there are divers Opinions touching the place where it exercises its Functions more particularly.

Some hold, that it is a small Gland in the middle of the Brain, because that only part is single, whereas all the others are double; and as we have two Eyes and two Ears, and as all the Organs of our Exterior Senses are double, it is necessary that there should be some place where the two Images which enter by the Eyes, or the two Impressions which come from one sole Object, by the two Organs of the other Senses may be united together, before they come to the Soul, that they may not represent to it two Objects instead of one.

Others say it is in the Heart, because in this part we feel the Passions. For my part, it is my Opinion, that the Soul receives the Impressions of the Passions in the Brain; and that it feels the Effects of them in the Heart. The exterior Motions I have observed, confirm me very much in this Opinion.

* * *

The Soul, as I have told you, being joined to all parts of the Body, every part of it serves to express its Passions. Fear, for example, may be expressed by a Man running or flying away: Anger, by one who clenches his Fists, and seems to strike at another.

But if it be true, that we have one part where the Soul more immediately exercises its Functions; and that this part is the Brain; we may also say, that the Face is the part where it more particularly makes appear what it feels.

And as we have said, that the Gland in the middle of the Brain, is the place where the Soul receives the Images of the Passions; so the Eye-brow is the part of the Face where the Passions are best distinguished, tho' many have thought it to be in the Eyes. It is true, the Eye-balls by their sparkling, and motion, shew the Agitation of the Soul. The Mouth also and the Nose have a great share in the Expression; but ordinarily, these parts do but follow the Motions of the Heart, as we shall observe in the sequel of this Discourse.

And as it hath been said, that there are Two Appetites in the Sensitive part of the Soul, in which all the Passions are ingendred;

So there are two Motions of the Eye-Brows, by which all the Motions of such Passions are expressed.

These Two Motions which I have remarked, have a perfect resemblance to the Two Appetites, for that which sets up towards the Brain, expresses all the savage and cruel Passions: But I shall farther tell you, that there is something yet more particular in these Motions; and that according as the Passions change their Nature, the motion of the Eye-Brow changes its Form. For a Simple Motion thereof expresses a Simple Passion: and if the Passion is mixt, the Motion is so likewise; If the Passion be gentle, so is the Motion; and if that be violent, the Motion is also violent.

But it is to be observed, that there are Two sorts of Elevations of the Eye-brows.

In one, the Eye-Brow is raised in the middle, and this elevation expresses pleasant Motions.

It is also to be observed, that when the Eye-Brow is raised in the middle, the Mouth is raised at the Corners; and in Sorrow, it is raised in the Middle.

But when the Eye-brow is drawn down in the middle, it shews Bodily Pain, and has a contrary Effect; the corner of the Mouth being then drawn downward.

ADMIRATION

As we have said, that Admiration is the first and most temperate of all the Passions, wherein the Heart feels the least disturbance; so the Face receives very little Alteration thereby; and if any, it will be only in the raising of the Eye-brows, the Ends thereof being yet parallel, the Eye will be a little more open than ordinary, and the Ball even between the Lids and without Motion, being fixed on the Object which causes the Admiration. The Mouth will be open, but will appear without Alteration any more than the other part of the Face. This Passion produces, only a Suspension of Motion, to give time to the Soul to deliberate what she has to do, and to consider attentively the Object before her; if that be rare and extraordinary, out of this first and simple Motion of Admiration is engendred Esteem.

ESTEEM

And Esteem cannot be represented, but by Attention, and by the Motion of the parts of the Face, which seem fixed upon the Object causing this Attention; for then the Eyebrows will appear advanced forward over the Eyes, being depressed next the Nose, and the other ends a little rising, the Eye very open, and the Eyeball turn'd upwards.

The Veins and Muscles of the Front, and about the Eyes, will appear a little swelled; the Nostrils drawing downwards; the Cheeks will be moderately sunk in

about the Jaws; the Mouth a little open, the corners drawing back, and hanging downward.

VENERATION

But if from Esteem proceeds Veneration, the Eyebrows will be depressed in the same manner as before; the Face will be also bowed downward, but the Eye-balls more turn'd up under the Brow; the Mouth shall be open, and the corners drawn back, but a little lower than in the preceding Action. This depression of the Mouth and Eyebrows marks a Submission and Respect of the Soul to an Object She believes above her: The Eye-ball turned upward, seems to mark the Elevation of the Object considered, which it acknowledges, to be worthy of Veneration.

* * *

TERROUR

When it is excessive, causeth the Eye-brow to be very much raised in the middle, and the Muscles, which perform the Motion of these Parts, very much marked and swelled, and pressed one against another, being drawn down over the Nose, which will seem to be drawn up, as also the Nostrils; the Eyes ought to appear entirely open, the upper Eye-lid hid under the Brow; the White of the Eye ought to be environed with red; the Eye-ball as it were wandring, and situated nearer the lower part of the Eye than the upper; the lower parts of the under Lids swelled and livid; the Muscles of the Nose and the Hands also swelled; the Muscles of the Cheeks extreamly marked, and drawn into a Point on each side of the Nostrils: the Mouth shall be very open, and the Corners very apparent; every Thing shall be very much marked about the Forehead and Eyes; the Muscles and Veins of the Neck shall be very much raised and apparent; the Hair standing up on End; the Complexion pale and livid; and more especially, the end of the Nose, the Lips, Ears, and about the Eyes.

If the Eyes appear extreamly open in this Passion, it is because the Soul makes use of them to observe the Nature of the Object which causes the Fright. The Eye-brow, drawn down at one end, and raised at the other, makes appear, that the Part raised seems as if it would be joined to the Brain, to secure it from the Ill which the Soul apprehends; and by the end which is drawn downwards, and appears swell'd, we find, that in this Condition the Spirits come plentifully from the Brain, as it were to cover the Soul, and defend it from the Ill which it fears: The Openness of the Mouth makes appear, that the Heart is oppressed by the Bloud which is retired towards it; which obliges him that is possessed by this Passion, when he would breathe, to make an Effort, which causes the Mouth to open very wide, and which in passing by the Organs of the Voice, makes a kind of inarticulate Sound. Lastly, if the Muscles and Veins appear swelled, and puffed up, it is by the Spirits which are sent from the Brain into these Parts. . .

JEALOUSIE

It is expressed by the Forehead wrinkled, the Eye-brow drawn down and frowning, the Eye sparkling, and the Eye-ball hid under the lids, turning towards the Object which causes the Passion regarding it cross and sideways, contrary to the Situation of the Face; the Eye-ball should appear unsteady and fiery, as also the White of the Eye and the Eye-lids; the Nostrils pale, open, and more marked than ordinary, and drawn back, which makes Wrinkles in the Cheeks; the Mouth may be shut, and make known that the Teeth are set together; the under Lip is thrust out over the upper, and the Corners of the Mouth drawn back, and very much down; the Muscles of the Jaws will appear hollow.

One part of the Face will be inflamed, and another yellowish; the Lips will be pale or blackish.

ANGER

When Anger seizes on the Soul, he who feels this Passion, hath his Eyes Red and Inflamed, his Eye-balls wandring and sparkling, his Eye brows sometimes drawn down, and sometimes raised up one against the other; the Forehead will appear deeply furrowed, and wrinkles between the Eyes; the Nostrils will appear open and widen'd; the Lips pressed one against the other, and the under-Lip surmounting the upper, leaving the corners of the Mouth a little open, forming a kind of cruel and disdainful Grin.

He will seem to grind his Teeth, and to foam at the Mouth; his Face will be in some places Pale, and in others Red and Swell'd; the Veins of the Forehead, the Temples, and the Neck, will be strained and puffed up, the Hair standing upright;

and he who is possessed with this Passion, is swell'd and puffed up by a stoppage of the Breath, the Heart being oppressed by the great quantity of Blood, which retires thither, as it were to its succor.

To Anger sometimes succeed Rage or Despair.

* * *

These (Gentlemen) are part of the External Motions which I have observed in the Face.

But as I have said in the beginning of this Discourse, that the other Parts of the Body may help to express the Passions, it will be proper to speak something of them by the by.

If Admiration makes but little Change in the Face, it produces as little Agitation in the other Parts of the Body; and this first Motion may be represented, by a Person standing upright, having both his Hands open, the Arms near the Body, and his Feet standing together in a like Situation.

But in Esteem, the Body shall be a little bowed, the Shoulders a little raised, the Arms bended and joining to the Body, the Hands open and near together, and the Knees bended.

In Veneration the Body shall be yet more bowed than in Esteem, the Arms and Hands almost joined the Knees on the Ground, and all the Parts of the Body shall mark a profound Respect.

But in an Action which shews Faith, the Body may be bowed intirely down, the Arms folded and joining to the Body, the Hands crossed one over the other, and the whole Action ought to shew a profound Humility.

Ravishment or Extacy may be expressed by the Body thrown backwards, the Arms lifted up, the Hands open; and the whole Action shall mark a Transport of Joy.

In Scorn and Aversion the Body may retire backwards, the Hands as if they were pushing off the Object which causes the Aversion, or else they may be drawn back, as also the Feet and Legs.

But in Horror, the Motions should be much more violent than in Aversion, the Body violently retiring from the Object which causes the Horror; the Hands shall be wide open, and the Fingers spread, the Arms drawn in close to the Body, and the Legs in an Action of Running.

Terrour hath a great deal of these Motions, but they should appear greater and more extended; the Arms shall be stretch'd out straight forward, the Legs in an Action of flying with all their Force, and all the Parts of the Body in Disorder.

The rest of the Passions may produce Actions in the Body, according to their Nature, but there are some which are hardly perceptible; as Love, Hope, and Joy; for these Passions produce no great Motions in the Body.

Sorrow produces only a Dejection of the Heart, by which all the parts of the Face are cast down.

Fear sometimes may have Motions resembling those of Terrour, being only caused by an Apprehension of losing something, or that some Ill should befall us; this Passion may give Motions to the Body, which may be marked by the Shoulders pressed together, the Arms and Hands drawn close to the Body, and the other Parts gathered together and bended, expressing as it were a Trembling.

Desire may be represented by the Arms extended towards the Object desired; the whole Body may incline the same way, and all the Parts will appear in an unquiet and wavering Motion.

But in Anger, all the Motions are very great and violent, and all the Parts agitated; the Muscles should be very apparent, bigger and more swelled than ordinary, and the Veins and Nerves strained.

In Despair all the Parts of the Body are almost in the same State as in Anger; but they should appear more disordered; for you may make one in this Condition, tear off his own Hair, bite and tear his Flesh, or running and precipitating himself.

15 Henri Testelin (1616–1695) Table of Precepts: Expression

Henri Testelin's 'Table of Precepts' has long been seen as the apogee of academic doctrine. The six 'parts' of painting – line, design, expression, proportion, chiaroscuro, ordonnance and colour – are set out into tables, with each part subdivided into its various aspects. This codification of academic doctrine was intended to provide the teaching of the Academy with an enduring structure and to make it assimilable, in a finished and unalterable form, for successive generations of students. The idea for the project came from Charles Le Brun, who on 25 January 1670 charged Testelin with drawing up in written form an orthodox synthesis of the lectures which were given at the Academy in the presence of Colbert. Although Testelin offered a discussion and commentary on each of the six topics between 1675 and 1679, the tables were published on their own in 1680 without any

reference to the larger framework of explication. This presentation of the Academy's teachings stands in stark contrast to Félibien's transcription of the first seven conferences which offered some representation of the diversity of opinion amongst members of the Academy. The Edict of Nantes of 1598 had guaranteed limited rights to France's Huguenot (Protestant) minority. Its revocation in 1681 obliged Testelin to relinquish his post as Secretary to the Academy and to seek exile in the Netherlands. In 1696, however, he was given special permission to publish a second edition of the Table of Precepts, complete with commentaries. The first edition of 1680 was published in Paris under the title, *Sentiments des plus habiles peintres du temps sur la pratique de la peinture, recueillis et mis en tables de préceptes par H. Testelin*. Here we reproduce the table on expression, taken from the anonymous English translation which appeared just eight years later, *The Sentiments of the most Excellent Painters Concerning the Practice of Painting; Collected and Composed in Tables of Precepts*, London: Samuel Smith, 1688. We have included the 'Remarques' made by the anonymous translator who appended them in the form of footnotes, but we have modified his layout of Testelin's table to conform to the design of the present anthology.

The Third Table of the Precepts in Painting: about Expression

What we call *Expression in Painting* is a Representation of things after their nature; which therefore we may consider in reference to,

[A] The Subject in general, where we may observe that,

1. All the parts of the Composition ought to bear the Image and Character of the Subject which we would represent; so that the Idæa may pass from the Picture into the mind of those that look on it, to touch¹ the passions which the Subject requires according to their difference, *e.g.* in a subject of:
 - Joy and Peace, all things ought to appear agreeable and calm.
 - Of War, all must be turbulent and full of Terroure.
 - Of grave and serious things, we must make appear throughout the whole something of Grandeur and Majesty.
2. We must so far tye ourselves to this general Rule, that if we meet with some Circumstance in the Description of History which may invert and take from the Idæa, we must suppress it if it be not absolutely essential to the Subject; however we may joyn the Allegorical Figures to represent the Mythical sense without nevertheless mixing the Fable with the Truth.
3. To this end we must take great care to study well the History, or the Fable in those Authors that describe it, that we may truly conceive and comprehend the Nature and the Character of it, that we may form a true Idæa of it in the Imagination, and spread and carry it thro' all the parts of the whole.
4. We may take the liberty nevertheless of chusing some favourable Incidents, to diversifie the particular expressions, provided they be not contrary to the principal Image of the Subject, or the Truth of the History.
5. We must observe diligently as one of the principal parts, the harmony of the *whole together*,² Whether:

- In the concourse of the Actions, in distinguishing the Statues with the Figures, which ought to appear animated, that we do not give them Attitudes³ answering the several things that pass in their presence;
 - Or, in the agreement and disposition of the light and colour.
6. We must take great care of the Modes and Customs,⁴ as the Italians call them, to conform all things to the Custom of Time, Place and Quality.
 7. We must represent in one Picture only what we can comprehend under these three Unities⁵ of the same time, at the same view, and what the extent of the picture can comprehend.

[B] The particular Affections and Passions, according to:

[B1] Simple Nature, where we must observe among living Creatures, that,

1. Brutes act only by a motion purely of sense, all their passions being form'd either in respect to their self-preservation, or the propagation of their kind.
2. Man is solely endued with understanding, which renders him rational and fit for Conversation, whence arises their difference from irrational Creatures, and these advantages, *Viz.*
 - 2.1 That he carries his face and body upright.
 - 2.2 That he hath his Eyes and Ears, which are the Organs of the Soul, situated in one streight line, whereas Brutes have one point of their Eye low, on the side towards their Nose, the other drawing toward their Ear, their natural sense conducting itself from the smell to the hearing, and thence to the heart.
 - 2.3 That he can move his Eye-brows, whose point draws towards the Nose sometimes; but Brutes move not at all their Eye-brows, their points being always inclin'd downwards.
 - 2.4 That he moves the Apple of his Eye every way, Brutes cannot lift them upwards; whence it follows that men, which have the Angle of the Eye, and their Eye-brows of the same form with those of some Brutes, have likewise something of their nature.
3. Children discern nothing by their understandings but do naturally such actions as express the motion of their passions, and so mark out what they desire, reject, are pleased with, or are vext at.
4. There are two Appetites, or Faculties in the sensitive Soul, the concupiscible, to which we attribute the sweeter passions, and the irascible, to which we give those of the violent kind.
5. As there are two inward Faculties, so there are two exterior Motions which represent, and express them, which depend either on
 - the Brain, which draws towards it all the passions that proceed from thence.
 - Or the Heart, which draws downward all the external signs that depend on it.
6. Every one of these Passions have divers degrees which cause different effects: for if the Passion be sweet, the external Motions are soft; likewise if they be violent and sharp, their external motions are so too.
7. Tho' we may express the Passions of the Soul by the actions of the Body, 'tis in the Face⁶ nevertheless which men more particularly discern them, by the shape of the Eye, and motion of the Eye-brows.

8. There are two sorts of lifting up the Eye-brows, the one at the middle which argues pleasant motions, and which draws up the corners of the Mouth, the other at the point of the side of the Nose, which draws up the middle of the Mouth, and which are the effects of Grief and Sadness.
9. All the Passions may be reduced to these two heads: *Viz.*

TO JOY⁷

- (i) Simple: Which causes a dilation of all the parts: As to the Face, the Eye-brows rise in the middle, the Eyes half open and smiling, the Apple of the Eye sparkling and moist, the Nostrils a little open, the Cheeks full, the Mouth draws the corners a little upwards, the Lips red, the Complexion lively, the Forehead severe. Or
- (ii) Passionate, Whether of love in which the Fore-head is smooth and even, the Eye-brows a little elevated on the side where the Apple of the Eye turns, the Eyes sparkling, pretty open, the Head inclined toward the object, the Air of the Face smiling, and the Complexion pretty ruddy. Or, of Desire, which shews itself by the Body, the Arms extended towards the object, in uncertain and unquiet Motions.

TO SADNESS

- (i) Simple, Where all the Body is cast down, the head carefully hanging aside, the Fore-head wrinkled, the Eye-brows elevated toward the midst of the Fore-head, the Eyes half-shut, the Mouth a little open, the corners downwards, the under-lip pouting and drawn back, the Nostrils swell'd and drawing downwards.
- (ii) Mixt with Fear, Which makes the Body move according to the disposition of the Subject, which causes it, if it be *amused*,⁸ that then all the parts contract and palpitate, the members tremble and fold up, the visage pale and livid, the point of the Nostrils elevated towards the Nose, the Apple of the Eye in the midst of the Eye, the Mouth more open at the sides, the under-lip drawn back; fear adds disorder and great concern.
- (iii) Anger, Whose Motions are great and violent, all the parts stirr'd, the muscles pufft up, the Apple of the Eye sparkling and wild, the point of the Eye-brows being fixt towards the Nose, the Nostrils open, the Lips big and prest down, the corners of the Mouth a little open and foaming, the Veins swell'd, the Hair standing upright.
- (iv) Despair, Whose Motions are like the last, but more excessive and disorder'd; for the more the Passions are stirr'd up, so much more violent are the external Motions.

[B2] Nature judiciously chosen to give every figure its proper character agreeable to the actions, whether it be in reference to:

1. The *Sex*; Man, as he is of more vigorous and resolute nature, ought likewise to appear in his motions and actions more free and bold than the Woman, who must be more tender and modest.

2. The *Age*, whose different times and degrees carry them to different motions, whether by the Agitations of the Mind, or the actions of the Body.⁹
3. The *Condition*, the honours wherewith persons are invested renders their actions more reserv'd, their Motions more grave, contrary to the populacy, who give themselves over for the most part to their Passions; whence it comes that their external Motions are more rude and disorderly.
4. *Bodys Spiritualised* or deifi'd where we must retrench all these corruptible things, which serve only for the preservation of life, *viz.* Veins, Arteries and such like, making only what serves for the Beauty and Form of the Body.
5. *Angels*, which are only symbolical figures, to mark out their Virtues and Offices, where there ought not to appear the draught of any sensual Passions; we must only appropriate their characters proper to their functions or operations of Puissance, Activity and Contemplation.

REMARKS [appended by the English translator]

1. *Toucher*, to express
2. The *tout ensemble*; it generally signifies the harmony that runs through the whole Picture, and which results from the just distribution of the objects that compose the work, we say likewise such a picture is good taken piece by piece, but the *tout ensemble* is not so, which is the sense of this place.
3. Attitudes, signifies no more with us in a manner than action and posture; tho' it signifies really more; And where Action has no place, *e.g.* Action is not applicable to a dead person and we say better, the disposition, than the posture of a dead corps; so we say, not so well, this figure is an handsom posture, but rather in a graceful attitude or disposition.
4. Custom is a judicious expressing things suitable to the subject, as to express the last-Supper by Lamp-light (as a great many Painters forget themselves on that subject) and in the posture us'd in those days and places, which is a very important consideration in reference to St. *John's* lying in our Saviour's bosom; to do otherwise is a sin against Custom: The drawing the figures about our Saviour in proper habits, fit for their quality and Nation; not dressing up two or three squab Boobys in Monks Hoods and bald Crowns, with a knot of Beads and such like baggatels (the most unfit company, if there has been any then, for our Saviour as could be) to do so would be a sin against *coûtume*, wholly barbarous and Gothick. *Michel Angelo's* last Judgment is one whole continued sin against custom, from the beginning to the end, where so many villanous Nudities, such Porter-like contortions of the Muscles, that it seems no more fit to be plac'd in a Chappel than in a Country Ale-house, where the Country-Sessions are kept, where I have seen most of those mimic and rude postures he has in his work: To paint the *Parthians* fighting with other weapons than those of Bows and Arrows, as suppose Musquet and Pike, would be against *coûtume*.
5. We must observe, as they ought on the Stage, the unity of Time, Place and Action, as that Painter did, who to represent where he laid his Scene of a Sea-fight, *viz.* on the *Nile*, he drew an Ass as drinking on the River, and a Crocodile (which is only there to be found) creeping along to surprize it. When in a subject of Joy all appears agreeable, in War all things full of terrour and tumult, in a

serious subject every thing full of majesty; as above in the first Præcept of this leaf, and to do otherwise would be against Custom.

6. Besides the motions of the Face, that express our thoughts, our Hands, Fingers &c. help towards the pronouncing the thoughts; and because this has not been touch'd on much by any Painters, I will enlarge a little on the subject, to shew how the Hands, &c. help to the expressing our sentiments.

The raising of the Hands conjoin'd towards Heaven, is the expression of Devotion.

Wringing the hands, a sign of excessive grief.

To throw up the Hands towards Heaven, a Note of Admiration.

Fainting and dejected Hands, amazement and despair.

Folding the Hands, Idleness.

Holding the Fingers indented, a musing Humour.

To hold forth the Hands together, yielding and submission.

To lift up one Hand to Heaven with the Eyes, calling God to witness.

Waving the Hands from us, to prohibit.

To hold out the bended Fist, Anger.

To extend the right Hand to any, Pity, Peace and Safety.

To lay Hands on another's shoulder, Authority of seizing.

To scratch the Head, thoughtfulness and care.

To kiss one's Hand, veneration or honour.

To lay the Hand to the heart, solemn Affirmation.

Imposition of the Hand on the Head, Benediction.

Holding up the Thumb, approbation.

Fore-finger put forth the rest contracted, *monstrari & dicere hic est.*

Holding up the Fore-finger, forbidding.

Laying the Fore-finger to the Mouth, bidding silence.

To give with Thumb and one Finger, *parce dare.*

7. 'Twas a Remarque of Sir *Harry Wootton*, and a good one too, that tho' grief and joy be opposite in Nature, yet they are such neighbours, and so a-kin in Art, that the least touch of a Pencil will translate a crying Face into a laughing one, and if you attend the Rules here given for joy and grief, you will find they are much alike, as one may find the thing true by experience.
8. *Si il est arrêté*, I think this the sense of the word [Editor's note; actually *if it be stilled or stopped*]
9. Poets and Painters are near a-kin, therefore *vide Horace's Art of Poetry*:

*The Beardless Youth from Pædagogus got loose,
Does Dogs and Horses for his pleasure use, &c.*

IC

Form and Colour

1 Peter Paul Rubens (1577–1640) ‘De Imitatione Statuorum’

The date of composition of the present text is not entirely clear. What is known is that it subsequently came into the possession of Roger de Piles, who translated it from Rubens' original Latin and published it in 1708 as a subsection of his *Cours de peinture par principes* (see IIA2). Because of this uncertain history, the status of *De Imitatione Statuorum* has on occasion been questioned, but recent scholarship reveals it to be a genuine work of Rubens, probably written c.1608–10 (Van Der Meulen, 1994, vol. 1, p. 78, n. 44). The text was written in a notebook in which Rubens jotted down both quotations from ancient authors and his own thoughts. The notebook was destroyed by fire in Paris in 1720. Rubens considers arguments for and against the copying of antique statues as part of the training and practice of modern painters. He has reservations, yet he himself assiduously copied antique sculptures, especially during visits to Rome. He undertook the first of these as early as 1601, when he copied the *Laocoön* and the Farnese *Hercules* amongst others. Later, in the 1620s and 1630s, he also engaged in correspondence on the subject with the French humanist scholar Nicolas Fabri de Peiresc. In essence Rubens is saying that the classical heritage has to be treated with care. On the one hand it can provide a heroic model for grandeur both in conception and literal proportion. On the other, slavish copying can result in dead work if the effects of stone are allowed to supervene over the illusion of living flesh. This question of the relation of colour and form in art was to become a major subject of controversy in the French Academy later in the century; an argument, moreover, in which De Piles himself was involved (see IC7–10). It is for this reason that, despite its early date of composition, we have felt justified in including the text in this section of the present anthology. It is also worth remarking that the other dimension of Rubens' concern, namely the competing claims of ideal form and naturalistic vividness, may be said to have echoed throughout the subsequent history of art, even into the twentieth century. We reprint Rubens' text in full from the English translation of De Piles, published as *The Principles of Painting*, London: J. Osborn, 1743, pp. 86–92.

To some painters the imitation of the antique statues has been extremely useful, and to others pernicious, even to the ruin of their art. I conclude, however, that in order to attain the highest perfection in painting, it is necessary to understand the antiques, nay, to be so thoroughly possessed of this knowledge, that it may diffuse

itself everywhere. Yet it must be judiciously applied, and so that it may not in the least smell of the stone. For several ignorant painters, and even some who are skilful, make no distinction between the matter and the form, the stone and the figure, the necessity of using the block, and the art of forming it.

It is certain, however, that as the finest statues are extremely beneficial, so the bad are not only useless, but even pernicious. For beginners learn from them I know not what, that is crude, liny, stiff, and of harsh anatomy; and while they take themselves to be good proficient, do but disgrace nature; since instead of imitating flesh they only represent marble tinged with various colours. For there are many things to be taken notice of, and avoided, which happen even in the best statues, without the workman's fault: especially with regard to the difference of shades; where the flesh, skin, and cartilages, by their diaphanous nature, soften, as it were, the harshness of a great many out-lines, and wear off those rugged breaks, which in statues, by the force and depth of their shade, make the stone, tho' very opaque, appear still more opaque and impenetrable to light, than it really is. There are, besides, certain places in the *natural*, which change their figure according to the various motions of the body, and, by reason of the flexibility of the skin, are sometimes dilated, and at other times contracted. These are avoided by the generality of sculptors; yet are sometimes admitted into use by the most excellent, and are certainly necessary to painting; but must be used with moderation. To this we must add, that not only the shade, but also the lights of statues are extremely different from the *natural*; for the gloss of the stone, and sharpness of the light that strikes it, raise the surface above its proper pitch, or, at least, fascinate the eye.

He who has, with discernment, made the proper distinctions in these cases, cannot consider the antique statues too attentively, nor study them too carefully; for we of this erroneous age, are so far degenerate, that we can produce nothing like them: Whether it is, that our groveling genius will not permit us to soar to those heights which the antients attained by their heroick sense, and superior parts; or that we are wrapt up in the darkness that overclouded our fathers; or that it is the will of God, because we have neglected to amend our former errors, that we should fall from them into worse; or that the world growing old, our minds grow with it irrecoverably weak; or, in fine, that nature herself furnished the human body, in those early ages, when it was nearer its origin and perfection, with every thing that could make it a perfect model; but now being decay'd and corrupted by a succession of so many ages, vices, and accidents, has lost its efficacy, and only scatters those perfections among many, which it used formerly to bestow upon one. In this manner, the human stature may be proved from many authors to have gradually decreased: For both sacred and profane writers have related many things concerning the age of heroes, giants, and *Cyclopes*, in which accounts, if there are many things that are fabulous, there is certainly some truth.

The chief reason why men of our age are different from the antients, is sloth, and want of exercise; for most men give no other exercise to their body but eating and drinking. No wonder therefore, if we see so many paunch-bellies, weak and pitiful legs and arms, that seem to reproach themselves with their idleness: Whereas the antients exercised their bodies every day in the academies, and other places for that purpose, and exercised them so violently as to sweat and fatigue them, perhaps, too

much. See in *Mercurialis de arte gymnastica*, how many various exercises they took, how difficult, and what vigour of constitution they required. Thus all those parts of the body which are fed by idleness were worn away; the belly was kept within its bounds, and what would have otherwise swelled it was converted into flesh and muscles: For the arms, legs, neck, shoulders, and whatever works in the body, are assisted by exercise, and nourish'd with juice; drawn into them by heat, and thus increase exceedingly both in strength and size; as appears from the backs of porters, the arms of prize fighters, the legs of dancers, and almost the whole body of watermen.

2 Francesco Scannelli (1616–1663) from *The Microcosm of Painting*

Most of what is known about Francesco Scannelli derives from his sole published work, // *microcosmo della pittura*, printed in Cesena in 1657. He was born in nearby Forlì in Emilia in 1616 and was employed as a physician and a priest at the court of Mantua. He was also an enthusiastic amateur and connoisseur of art, entrusted with expanding the collection of Francesco d'Este, the Duke of Modena. The *Microcosmo* is dedicated to Francesco, who was a noted 'virtuoso' and one of the great collectors of his age. After Francesco's death, Scannelli travelled to Milan, Rome and Venice, forming close friendships with a number of artists, including Guercino, to whose studio he had access. The central conceit of a 'microcosm' of painting is based on the idea that the human body – created in God's image – is a microcosm of the universe as a whole. Scannelli relates different artists to different parts of the body, implying that their combination suffices to establish the entire 'corpus' of painting. In the full text Michelangelo is discussed first as the 'spine' or 'backbone', Raphael is the 'liver', Titian the 'heart', Correggio the 'brain', Veronese the 'organs of generation' and the Carracci the 'skin'. It should be borne in mind that Scannelli's conception of the different functions which these organs fulfil differs somewhat from our own and that his knowledge of the body was that of a seventeenth-century physician. He opposed the classicizing tendencies of Florence and Rome, reserving his real enthusiasm for the painterly traditions of Northern Italy, especially the Lombard and Venetian schools. His praise for Correggio, whom he places on a par with Raphael, is particularly remarkable, given the widespread criticism directed at the artist's soft and highly voluptuous painterly style, though it anticipates – and may have helped to establish – the incorporation of Correggio in the canon of established Italian masters. The following excerpts have been translated for this volume by Katerina Deligiorgi from the edition edited by Guido Giubbini, // *microcosmo della pittura*, Milan: Edizioni Labor, 1966, pp. 11–16, 22–3, 109–10.

In order to show clearly the many good qualities that can be observed in particular paintings as well as in a corpus of painting, and to single out the best among them, I shall use the analogy of the perfect microcosm of the human body. Although this is well suited to serve as a model in our study it is not immediately obvious how its different parts can correspond exactly to different parts of the microcosm of painting. The scholar, however, will readily discern which are the principal and most noble parts of this microcosm, whose existence gives nourishment, life and intelligence, and also motion and sustenance, and he will be able to draw other such correspondences, all of which properly conjoined form a composite whole. Let us then say that we can

compare natural talents to the functions of the most valuable and excellent organs within the microcosm of the human body, the liver, the heart and the brain. From these fundamentals we can draw, as if from a real source, the virtues of nourishment, of warmth and of intelligence. Certainly, beside the parts already mentioned, many others suggest themselves, which, however, are inferior by comparison and should reasonably be placed underneath them, as derivative from and attendants to the main ones. Now, there is hardly anybody, even among those less knowledgeable in the matter, who would not grant the work of the exalted Raphael the mark of greatest achievement and who would not recognize his great virtue in the body of painting. Just as the liver lies at the origin of a good disposition in the human body, Raphael holds the principal part in the microcosm of painting because, among other things, he never failed to choose well, with great diligence and characteristic study, from the perfect remnants of Antiquity.

How well the excellent Raphael suits the comparison with the liver in the microcosm of painting! When newly formed, the liver obtains from the maternal blood the fullness and perfection of its being. Raphael likewise draws from mother Antiquity, from whence painting gathers the right fluids and substance of wisdom. Just as the liver absorbs from the nutritious blood the finest and most fitting elements, Raphael extracts from the hard stones and bronzes of the statues subtle and delicate artifice, transmuting it into a delicacy that suits good painting. Once fully grown and transformed, so as to serve as a source itself, the liver sends blood, and with it all the necessary elements, to all the other parts of the body. Similarly, Raphael with his extraordinary judgement and continuous study reached the true essence of good painting, and through his paintings, which are like a surging source and a rich mine, he continues to transmit to other painters the right substance and the spirit of the best painting. It is therefore with good reason that he should be granted the main and principal part in the microcosm of painting. This is widely recognized by those who are of good intelligence and by those who have followed and imitated him in different ways, mostly at the very heart of the city of Rome, where a treasure of such rare substance can still be found and where great talent resides in the circles of the virtuosi who devote themselves with unique taste to this most esteemed profession. [. . .]

Like the heart which does not cease to perfect the nourishing humour which it receives from the liver and which enriches it with the excess heat of the vital spirits, so is the glowing Titian whose work can be compared with such excellent sap. Having received good nourishment, partly from the liver in question and partly from his contemporaries and other worthy precursors, and having thus fortified and fertilized his own talent, Titian was able to create works of great vigour, spirit and vitality. While we can still discern in his works the liver, as the true source of nourishment and the firm foundation, we also see more intense qualities; though its effects are not superior to the original, they are richer in detail and display greater naturalness. We see in Titian's works the results of a similar operation to the one performed by the heart, which fulfils the main functions of the human body and is a source of heat and of life. Likewise Titian, combining the strength of native colour and true imitation of what had previously been observed regarding natural bodies, has been able to give life to his profession. Founded upon a most robust and true style which continues to vivify truly good painting, this life has animated not only Titian's own work but also

that of his followers, who are like slender boughs, circling and imitating the main trunk, and who can stay alive only by drawing from the true vital root. By contrast, those who find themselves separated and unable to commune with the spirit and life of his excellent work waste away, lost. It is clear for all to see that here lies the heart and centre of painting, and I do not think it fitting to say any more to demonstrate yet again a truth that is already obvious, namely that Titian's unique and almost living works, which are stirring and enlivening above all others, have enabled painting to live on in posterity because of their supreme excellence. Painting partook of the value of their formidable strength, lively spirit and great naturalness which will last in the memory of mortals, and so their reputation will abide in this world as a testament to his rare and immortal virtue.

[...] According to the considered opinion of the most notable observers of the workings of the human body, an opinion which is based on reasonable evidence, there is a more noble part, and also a more important one too, in which is manifest the agency required for operations of the highest order and excellence, that is, the operation of reason. It is through the ministrations of this part that the blood from the heart and the vital spirits are put to the service of worthier substances, the animal spirits which are required for the intellect, for perfecting the functions of the head and also for the organs of sense to which they are subsequently distributed and to which they instantaneously communicate the various senses and motion, each according to their particular function. Therefore, this highly esteemed part, sometimes considered divine and standing above all the other natural functions like a treasured garrison, is justly placed above all else in merit and importance. As many scholars have claimed, including the Philosopher [Aristotle] himself, the appointed task of the brain is to refresh the heart. This most noble part, the instrument of the understanding, suits one painter only: Correggio. Notwithstanding the fact that he was a bright sun in the firmament of painting, radiating resplendent excellence and virtue, Correggio was not recognized as such in his own time. His contemporaries, and others who wrote on such matters, misjudged his work. But though in those days he was considered noteworthy chiefly for the feeble qualities of his particular manner of painting, he is in fact a unique master whose almost supernatural talent, worthy of any other, is esteemed in our days by the most discerning, intelligent and knowledgeable men. He is now elevated and praised above all others and is immortal, even though in his own lifetime he was held up as an example of wretchedness. As if lacking any knowledge of painting, his own neighbours and fellow countrymen held him in low esteem. They knew only the superficial parts and considered unworthy and vile that which was the result of a supreme and misunderstood virtue. Yet alongside this ill-thought-of exterior, posterity would shortly receive the inner substance whose contemplation intoxicates the greatest scholars, like nectar or some other celestial spirit, and sends them into wondrous ecstasy. Now that the almost divine achievements of this eminent individual are duly recognized, he is given a place similar to that occupied in the microcosm of the human body by the head, the seat of the most excellent operations. Correggio can thus be put on a par with Raphael, who is the natural source of the well-founded knowledge from which spring inventions and compositions of extraordinarily represented historical narratives, arrangements of rare lustre, original and magnificent attitudes, and also with

Titian, who combines spirit with strength, and vigorous naturalness with proud, impetuous motion. These and other similar qualities, which are usually either scarce or found in excess, in the climate of such an egregious company are exactly restrained and tempered.

* * *

The learned and great researchers of the highest parts of nature add with good reason to the first three and noblest parts of the human body a fourth one in which resides the genitive virtue. Though not as noble and necessary as the other three, this fourth part is said to follow immediately after them and to merit its place above the rest on account of the magnificent effects that are known to derive from it. The same is argued, and just as forcefully, by those who are knowledgeable in painting with respect to the gifted and extraordinary Paolo Veronese, whose achievement and multiple virtues distinguish him from an abundance of excellent and praiseworthy painters, and show him as a true propagator of priceless painting. To this day, this strong feeling seems unshakeable among the majority of the erudite and wise scholars who, with good and sincere judgement, have looked carefully at the rich and excellent works of this great master. His easy and fertile gift shows him to be a master of generous and abundant works and to possess the most excellent qualities of painting. He reveals himself in his paintings as accomplished in every respect, always coupling rich and beautiful invention with easy and rare naturalness. Thanks to his supreme and highly distinguished talent, this master, whose merit can easily be compared to that of any other, has conserved and increased more than anyone else the most worthy *microcosm of painting*. It is thus with justice that Paolo from Verona who is acclaimed by an almost infinite number of scholars is fourth among the principal parts of this composite body.

* * *

The most excellent Carracci were esteemed and praiseworthy reformers. Though in their days painting was ever straying from what is beautiful and natural, through their industry and study they managed to create paintings surpassing even those of the masters who correspond to the principal parts of the microcosm. They were able to develop a particular manner of composition and a temperate, beautiful and natural virtue which became a measure and a standard for future scholars. We might say that, together with the other main proponents of their school, they have served as a temperate epidermis or skin which covers over and finishes off the already well-formed *microcosm of painting*. And just as the less noble and less necessary membranes of the human body are still part of this same epidermis, similarly, in our great body of painting, other good but less important painters of this school united together function as the skin and help to establish the external order of this composite body. Next to these integral and necessary parts of this body we should finally add those which appear by accident and which sometimes form hard and callous growths and sometimes are filth applied to the skin, like superfluous clothing. The first are the product of excessive labour, the latter are added to the surface by those depraved individuals who seek thus to add a foolish beauty to a noble body which is already perfectly finished by mother nature.

* * *

3 Paul Fréart de Chantelou (1609–1694) from ‘Diary of the Cavaliere Bernini’s Visit to France’

When Gian Lorenzo Bernini was called to Paris in 1665 to complete a new façade for the east wing of the Louvre (see IB7) he was at the height of his powers, both as an architect and as a sculptor. A favourite of Pope Alexander II, he had already completed a number of projects for St Peter’s in Rome, including the great colonnade around the piazza in front of the church and the new entrance to the Vatican known as the Scala Regia. Louis XIV’s success in bringing Bernini to Paris reflects both France’s increasing status as a European power and the ambitions of the young king to project his reign in highly visible public projects. For the five months that Bernini remained in Paris, Paul Fréart de Chantelou, a steward to the king and a connoisseur of the arts, acted as his constant guide and companion. Chantelou recorded the details of his stay in a diary, preserved in a copy which was made for his brother, Roland Fréart de Chambray (see IB6). The diary offers a remarkably rich and vivid depiction not only of Bernini’s ideas on art and his working methods but of the conditions under which he was required to work at court. Our selections focus on the execution of the bust of *Louis XIV*, now in Versailles, the one tangible result of his visit to Paris. Bernini’s plans for the Louvre were never realized. They failed to please Louis’ powerful minister, Jean-Baptiste Colbert, and he encountered considerable opposition from Parisian architects jealous of this foreign competitor. We also include Chantelou’s report of Bernini’s visit to his home to view his collection of paintings, including the second series of *Sacraments* by Nicolas Poussin, which Chantelou himself had commissioned (see IB1). This part of the diary offers a rare insight into the conditions under which paintings were looked at. We learn, for example, that the *Sacraments* were normally kept covered by curtains and only revealed one by one. Chantelou’s *Journal du voyage du Cavalier Bernin en France* was first published by Ludovic Lalanne in a series of articles in the *Gazette des Beaux-Arts* from 1877 to 1884. The following excerpts are taken from the edition edited by Anthony Blunt and translated into English by Margery Corbett, *Diary of the Cavaliere Bernini’s Visit to France*, Princeton: Princeton University Press, 1985, pp. 7, 8–11, 14–19, 28–9, 69, 76–80, 88, 115–16, 186–7, 253–4.

1 June

During the evening one of the minister’s servants was sent to look for me. I went over to him, and he told me that the King had chosen me to welcome the Cavaliere Bernini, not in my capacity as maître d’hôtel but as a special emissary to entertain and accompany him while he was in this country. I said this was a great honor but that it gave me cause for some anxiety; the Ambassador Extraordinary of the Knights of Malta was arriving at court the next day, the King was going to entertain him, and I was solely responsible for the arrangements as I was the only maître d’hôtel at Saint-Germain, both for ordinary and special duties. M. Colbert replied that I must send a note that evening to the other maîtres d’hôtel in waiting to come at once to relieve me, and that I should without further delay, leave very early the next morning. [...]

2 June

I took the carriage belonging to M. Colbert and started on the road for Essonne. On leaving Juvisy I met the Cavaliere's party. I signalled to his *litter* to stop and got down from my carriage. He had also alighted and I went to greet him addressing him in French. I realized at once that he did not understand a word and I said in Italian that I would not risk making compliments in his tongue, but begged him to get into the carriage that I had brought. His son and Signor Mattia also got out and came up to greet me. Having exchanged civilities, the Cavaliere and I, as well as my nephew, your son, whom I had taken with me, got into M. Colbert's carriage. Once installed I repeated my speech to him in as good Italian as I could muster. I explained to him the King's orders and with what pleasure I had received them, on account of the very great admiration I had always felt for him and for his talent. I reminded him that he had once done me the honor of giving me some of his figure studies which I treasured dearly. I then recalled to him several maxims on the subject of portraiture in marble, which I had heard him express and had carefully remembered because I had always greatly esteemed his opinions; he could judge for himself, therefore, of my eagerness to obey His Majesty's command to meet him and remain with him during his stay in France. He thanked me most courteously, and said that it was a great honor to be asked to serve a king of France; moreover the Pope, his master, had commanded him. Had it not been for these considerations he would still be in Rome. He had heard on all sides that the King was a great prince with a great heart and a great intelligence, as well as the greatest gentleman in his kingdom. It was this that had chiefly induced him to set out, for he was curious to make his acquaintance and eager to serve him; he only regretted that his gifts were not sufficient to justify the honor done him, nor the high opinion in which he was held. He then turned to the business that had brought him. Beauty in architecture, he declared, as in all else, lay in proportion, the origin of which it might be said was divine; for did it not derive from the body of Adam which not only was shaped by divine hands but was made in the likeness and image of God? The difference between the male and female forms and proportions was the source of the various orders in architecture, and he added many other observations on the same subject, with which we are familiar. Later, when talking about the ambassadors, he said that first Cardinal d'Estrées and then the Cardinal Legate had spoken so highly of M. Colbert, under whose personal direction he would be working, that he had finally made up his mind to come; further, Father Oliva, General of the Jesuit Order and his intimate friend, whose opinion he had sought at the time, had told him that he should not hesitate; if an angel appeared from heaven telling him that he would die during his journey, he would still advise him to go. I replied that we in France had reason to be very grateful to Father Oliva and I was sure that the King would thank him. While we talked, we reached Paris and drove to the hôtel de Frontenac which M. Colbert had had got ready for the Cavaliere and his suite. On alighting, we found M. Du Metz, Keeper of the Royal Furniture and clerk to M. Colbert, who welcomed him with a speech and showed him the apartment that had been prepared. It was very well furnished and fitted up. He then showed him a gallery and smaller rooms in which there was everything necessary for his comfort; apartments for his son Paolo

and Signor Mattia de' Rossi, his architectural assistant, and rooms for his other attendants. Then, as the Cavaliere was tired I took my leave and left him to rest.

* * *

6 June

While the tables and other things necessary for drawing were being installed, we passed the time in conversation, and as the Cavaliere is a man with a great reputation whose name is very famous, I considered as you did, my dear brother, that it would not be entirely fruitless to keep a record of what he said for our common study and even for our amusement. As you have never seen him, perhaps it would help you if I made a little sketch, or *schizzo* as the Italian painters say, of him and his character. Let me tell you then that the Cavaliere Bernini is a man of medium height but well proportioned and rather thin. His temperament is all fire. His face resembles an eagle's, particularly the eyes. He has thick eyebrows and a lofty forehead, slightly sunk in the middle and raised over the eyes. He is rather bald but what hair he has is white and frizzy. He himself says he is sixty-five. He is very vigorous for his age and walks as firmly as if he were only thirty or forty. I consider his character to be one of the finest formed by nature, for without having studied he has nearly all the advantages with which learning can endow a man. Further, he has a good memory, a quick and lively imagination, and his judgment seems perspicacious and sound. He is an excellent talker with a quite individual talent for expressing things with word, look, and gesture, so as to make them as pleasing as the brushes of the greatest painters can do. [. . .]

Speaking of sculpture and the difficulty of making a success of it, and particularly of getting a likeness in marble, he told me a remarkable thing, which he has since repeated on many occasions – that if a man bleached his hair, his beard, his eyebrows, and, if it were possible, the pupils of his eyes and his lips, and showed himself in this state to those who were accustomed to see him every day, they would have difficulty in recognizing him. To prove it he added that the pallor which fainting brings makes a man almost unrecognizable, so that people exclaim, 'He no longer seems to be the same man.' For this reason it is extremely hard to get a likeness in marble that is all of one color. He told me something even more extraordinary, that to imitate nature in marble it may be necessary to put in that which is not there. He said something even more paradoxical, that sometimes in a marble portrait, in order to represent the dark which some people have around their eyes, one must hollow out the marble, in this way obtaining the effect of color and supplementing, so to speak, the art of sculpture, which cannot give color to things. So naturalism is not the same as imitation. Later he made an observation on the subject of sculpture, which did not convince me so entirely. 'A sculptor,' he said, 'makes a figure with one hand raised, the other placed on the breast. Practice makes one realize that the hand in the air must be made larger and broader than the other because the air surrounding the first changes and consumes something of its form or rather of its quantity.' As for me, I believe that in nature itself the object undergoes a certain diminution, so that it is not necessary to put into the imitation what is not in nature. I said nothing at the time, but since then I have remembered that the ancients were careful to make the columns at the angles

of their temples larger by a sixteenth than the others, for, as Vitruvius says, they are surrounded by a greater quantity of air that consumes something of their size and without it would appear slenderer than those next to them, which in fact they are not.

He next compared painting with sculpture, both of which have had their supporters, who during the course of the last two or three hundred years, just as in the time of ancient Greece have argued endlessly about which of them should be regarded as superior and more noble; but he endeavored to show with many excellent reasons that painting is by far the easier art, and that it requires much more ability to obtain perfection in sculpture. To prove his claim, he gave me an example, 'Let us suppose,' he said, 'that the King wants a beautiful piece of sculpture. He discusses the matter with a sculptor and allows him to choose his subject and take one, two, or three years or as long as he likes to complete it. He makes the same proposal to a painter, asking for a product of his art and laying down the same conditions as regards time and subject. If at the end of the given time, he asks the painter whether he has put all his skill into the work, the painter can assent without hesitation, for not only has he been able to imbue it with all the knowledge with which he began, but has been able to add what he has learned during the six or twelve months or longer during which he has been engaged on it. How different is the sculptor's case! If when his work is finished he is asked whether that is the best he can do, he is obliged to reply in the negative and with good reason, for he can add nothing to the knowledge that he possessed in the beginning; the pose must remain that which he first selected, nor can he modify it as he acquires more skill in the practice of his art.'

Then, passing from his room in which we were into the gallery, he told me he had one very similar in his house in Rome; it was there that he designed most of his compositions, walking up and down the while; using charcoal, he drew his ideas on the wall as they came into his head; it is usual for fertile and lively minds such as his to pile up idea after idea on the same subject; when one occurs to them they jot it down; then a second, they jot that down, too; a third and a fourth, without altering or improving any of them; he always preferred the last on account of its novelty. In order to remedy this inclination he found it desirable to leave these different ideas for a month or two without looking at them, until his mind was ready to judge which was the best. But if it so happened that there was need for haste or his patron was unable to give sufficient time for this process, then he resorted to colored spectacles or to a magnifying glass, or one that made objects smaller, or to looking at the sketches upside down; in fact by changing the color, the size, and the position, he tried to correct the illusion which love of novelty engenders, and which nearly always prevents one from choosing the best idea.

11 June

When I went to see the Cavaliere during the morning, I found him drawing heads on paper. I just glanced at them in passing and went over to see Signor Mattia, who was drawing the elevation of the Louvre façade. Having watched him a little at work, I returned to the Cavaliere who stopped what he was doing and, drawing me aside, told

me in confidence he was very annoyed; he had heard from various different sources that the King wanted him to do his portrait, and that of the Queen, but that M. Colbert had said nothing about it; the duc de Créqui had been the first to mention it, then M. de Lionne and Cardinal Antonio Barberini; he had no greater desire than to please and serve His Majesty in every way, so that if it were true that he really wanted the portraits he would like to start as soon as possible; he had planned to leave at the end of August, but for such an undertaking he would willingly stay until the end of October, two months longer than he had intended, but he could not spend the winter here because of the cold, nor set out on his journey later than November on account of his age. I replied that M. Colbert had meant to make the same proposition, that he had spoken to me about it, but as he had not authorized me to talk about it, I had remained silent. I added that the minister had probably waited before making this suggestion until he was less busy with the designs at present in hand. The Cavaliere replied that did not matter, as he could be preparing for the work on the bust while Mattia was finishing the designs; that was why he had asked for clay so that he could try out a pose while waiting to start work on the likeness. He repeated he would gladly stay two more months than he had planned; further, if it needed ten years (had he so long to live) he would give them, even if it meant that he had to die here; that he was so grateful for the honorable way in which he had been received, he felt he ought to devote the rest of his life to the King's service. I offered to write to M. Colbert, but he said it was not necessary; he would think about it between now and Wednesday when M. Colbert was coming again, and then he would speak to him himself; he thought that by Thursday the drawings would be finished and ready to be taken to the King; he would soon know what decisions had been reached.

We then went to see the procession of the Octave of the Blessed Sacrament. While waiting for it to pass, in the parish of Saint-Sulpice, the Cavaliere went into the Luxembourg. He looked at it very carefully, and declared it was the most beautiful building that he had yet seen in France.

22 July

The marquis de Bellefonds sent in the morning to know whether I was there and to say that he was coming. He entered the room where the bust was, and after looking at it said he wished the Cavaliere had put hair over the forehead. I said the forehead was one of the principal parts of the head and from the point of view of physiognomy the most important, that it therefore should be visible; moreover, the King had a forehead of great beauty and it should not be covered up; besides he might not always wear his hair as he did at present. He replied that should the King at some future time not have as much hair as now, he would wear a wig. The Cavaliere said that the sculptor was not so fortunate as the painter who, by means of different colors, could make an object appear through another so that the forehead could be seen even when depicted with the hair falling over it; the sculptor could not do this; each art had its own limitations.

25 July

[...] as he had put aside this morning for looking at Jabach's drawings and the arrangements had gone wrong, he expressed a desire to visit me; it was half past eight. His son and Mattia accompanied him.

On coming into the anteroom he first looked at a bust of myself done in Rome. He threw a glance at a copy after Domenichino, the canvas of which had been knocked and unfortunately was torn just across the head of one of the girls. He noticed it and said with a laugh, 'This was touched with too much vigor.' He looked for a minute at the pictures by Lemaire, saying the architecture was very good. Passing into the small room where the copies of Raphael were, he examined them all thoroughly. I drew his attention to the copy by Mignard and then to the *Virgin with a Cat*, copied by Ciccio of Naples. He remarked that those were the sort of copies that he valued. He looked at the *Madonna della Misericordia* by Annibale Carracci, and asked me who had made the copy. I replied that it was a painter by the name of Lemaire. He looked for a very long time at the portrait of Leo X, saying that Raphael had painted it in the manner of Titian. He admired its truth, its air of grandeur, its beauty and the painting of the velvet and the damask and said, 'It is in his latest and grandest manner, grander even than that of the *Virgin*,' pointing to the copy of Mignard. He studied Poussin's *Virgin* for a long while, without asking whose it was, and everyone admired its beauty and its grandeur. From there, we went into the study; before entering he gazed at length at the portrait of M. Poussin, and then enquired whose it was; I asked him if he did not recognize the features, he said it must be Nicolas Poussin. I then told him it was his self-portrait, and that he was not accustomed to portraiture. He said he thought this one was unique. Everyone admired it and then passed into the study. I told him that there were several copies there, the originals of which were in the château de Richelieu. He looked at the first – the *Bacchanal*, where the masks are thrown on the ground – for a good quarter of an hour at least. He thought the composition admirable. Then he said, 'Truly this man was a great painter of history and fable.' He then studied *Hercules carrying off Dejanira* and said, 'This is beautiful.' Then after considering it again, added, 'He has made the Hercules very elegant and also the little children carrying the club and the skin.' Of the *Triumph of Bacchus*, he said he would not have taken it to be by Poussin. He examined the third thoroughly and praised the foreground and the trees and the whole composition, repeating once again 'Oh! What a great painter of fables.' He then passed into the room where the *Seven Sacraments* were; only the *Confirmation* was uncovered. He looked at it with real interest, remarking, 'In this picture he has imitated the coloring of Raphael; he is a great painter of history: What piety! What silence! How beautiful is that little girl.' His son and Mattia admired the young Levite, then the woman clad in yellow, then each figure, one after another. I had uncovered the *Marriage*, which he examined as he had done the first, in silence, drawing aside the curtain which hid part of a figure that is behind a column, and finally said, 'It is St. Joseph and the Virgin,' and added that the priest was not dressed as a priest. I replied that it was before the establishment of our religion. He answered that there had still been High Priests in Judaism. They admired its qualities of grandeur and majesty and studied the whole with the greatest

attention. Coming to details, they admired the nobility and the intentness of the girls and women whom he has introduced into the ceremony, and among others, the one who is half behind a column. They then saw the *Penitence*, which they also looked at for a long time and greatly admired. I had the *Extreme Unction* got down and placed it near the window so that the Cavaliere could see it better. He looked at it standing for a while, and then got onto his knees to see it better, changing his glasses from time to time and showing his amazement without saying anything. At last he got up and said that its effect on him was like that of a great sermon, to which one listens with the deepest attention and goes away in silence while enjoying the inner experience.

Next I had the *Baptism* brought in and placed near the window, saying to the Cavaliere that it showed the sunrise. He looked at it for a long while sitting, and then again got on his knees, changing his position from time to time in order to see it better, looking at it sometimes from one end, sometimes from the other, and said, 'This one pleases me no less than the others.' He asked me if I had the seven, and I replied that I had. He did not tire of studying them for a whole hour. On getting up he declared; 'Today you have caused me great distress by showing me the talent of a man who makes me realize that I know nothing.' I replied that he should be satisfied to have reached absolute perfection in his own art, and that his works were equal to any of those of antiquity. I then brought him the little picture by Raphael, which he looked at for a long while, turning from time to time to the *Extreme Unction*. At last he said, 'In my opinion these pictures are equal to those of any painter in the world.' He wanted to know on what the picture by Raphael was painted, so I took it from its box to show him that it was on a wooden panel strengthened with cross pieces. I pointed out to him with what force it was painted. He said that was the more extraordinary as the picture was highly finished. He then saw the two other *Sacraments*, and studied them with the same attention. In the *Ordination* there is a sort of tower. He pointed it out to me with a smile, saying that it should please me as it so resembled a French roof. The *Last Supper* greatly delighted him and he drew the attention of MM. Paolo and Mattia to the beauty of the heads, one after the other, and the harmony of the light. He turned from one to the other and then he said, 'If I had to choose one of these pictures, I should be much embarrassed,' and, putting Raphael's with the others, he said he would not know which to take. 'I have always esteemed M. Poussin very highly, and I remember how annoyed Guido (Reni) was with me because of the way in which I spoke of his Martyrdom of S. Erasmus, which is in St. Peter's, as in his opinion I had exaggerated its beauty to Urban VIII, to which I had replied, "If I was a painter I should be mortified by that picture."' He has great genius, and further, he has made antiquity his chief study. Turning afterward to me, he said, 'You must realize that in these pictures you possess a jewel that you must never part with.'

* * *

29 July

I found him working at the bust and saw that he had added a lock of hair where formerly the forehead had shown. I commented on this new feature, and said that it was no doubt in deference to the views of M. de Bellefonds who had pointed out that

the King never wore his forehead uncovered. I added that I had liked it that way as it showed the slight hollow in the middle of the forehead. He agreed with me. I brought him my bust of Ptolemy, or Hephaestion, as some think it is. He looked at it closely, admiring the beauty of this Greek work. He pointed out to me how similar was the forehead to that of the King, and said they were both beautiful in shape; he looked at it from every side and made his son observe it too.

* * *

12 August

[...] At five o'clock in the afternoon M. Le Tellier and M. de Lionne came to see the Cavaliere. They began by praising the beauty of his work. The Cavaliere said the King had come to see it on his arrival from Saint-Germain and declared his satisfaction. M. de Lionne asked what were the black marks in the eyes. The Cavaliere told him that when the work was finished he would make a tap or two where the black was and the shadow of the cavity would represent the pupil of the eye. The two ministers told him that M. Colbert had assured the King, in front of them, that he was always at work whenever the King would like to visit him. He told them that His Majesty had had the goodness to say, as he went out, that he would come back whenever the Cavaliere needed him and that he had replied that he never moved from his work and would be delighted to see His Majesty at any time; that the King and he would have to finish the face together. He had got it to that state in which they saw it from memory, from the image he had formed of it and imprinted on his imagination while drawing at the council room, as they had seen him, with the King walking around and talking as usual without being tied down in any way; had he been constrained to stay in one position, he would not have been able to make the portrait so lively, he had not even used his own drawings, lest he should make a copy of his own work instead of an original: he had made these many studies only 'to soak and impregnate his mind with the image of the King'; those were his own words. He spoke again of the difficulties of doing a portrait in marble, which I have put down at length in one or two places in this journal and will not repeat here. He said Michelangelo was always reluctant to do one.

M. de Lionne mentioned portraits in bronze. The Cavaliere said it was an even less suitable material than marble because it darkened. If it were covered in gilt, the luster made reflections which prevented one from observing the delicacy and beauty of the portrait; on the other hand, nine or ten years after marble had been worked, it acquired an indescribable softness of tone and in the end became the color of flesh. He told these gentlemen how great was his anxiety every time he was forced to undertake a portrait; that he had already made up his mind many times never to do one again, but as the King had done him the honor to ask him for his, he could not refuse so great a prince for whose person he cherished so great a love and admiration. Moreover, his feelings towards him were heightened by the fact that, as far as those sciences that he professed were concerned, he was the most learned man in the country; His Majesty had noticed things in his drawings which those with great knowledge of art might not have recognized.

* * *

10 September

...the Cavaliere took me aside and showed me a design he had made for the pedestal of the bust. It was in the form of a terrestrial globe, with an inscription reading *Picciola basa* [small base]. He asked me what I thought of his idea. I said it was a fine and lofty conception; it signified great things from the King in the future. He pointed out that apart from its innate grandeur it had another advantage, which was that the spherical shape of the globe would prevent people from touching the bust, which is what happens in France whenever there is anything new to be seen. I remarked that his idea recalled very happily the King's *Nec pluribus impar* [But not unequal to many]. The pedestal could not be more imposing; the Cavaliere must put his name to it to show that it was he who had thought of the idea and carried it out, lest it might be thought that it was the King declaring thus that the world was too small a sphere for him. He added that the effect would be splendid, the blue of the sea contrasting with the rest of the globe, which would be of gilt bronze.

* * *

5 October

When I went to the Cavaliere's, I learnt that he was working in his room at his self-portrait in red chalk from the mirror. M. Colbert had asked him for it. When he had finished, his son showed it to me. I thought it in the grand manner and a very good resemblance. He also showed me a drawing of *Cain murdering Abel*, which he had done the evening before. I reminded the Cavaliere that I had begged him to spare me a few hours, in which I could have a likeness made of him and that he had promised me one by himself. At first he pretended to have forgotten, but then it came back to him; when we rose from dinner, he requested me to ask M. Colbert whether the King was coming or not, because if he was not coming he would arrange to do something else. I went to M. Colbert's, who had just come from the Gobelins, where the King had also been. He told me the King would come as soon as he had dined, and in fact he arrived soon after. Directly he saw the bust on the stand, draped round with the velvet, he showed his delight. He studied it for some time and made them all do the same. The duc de Mercoeur, who accompanied the King, admired it extremely, and everyone vied with each other in praising it. His Majesty then placed himself in the usual position and asked if work was being done on the pedestal. The Cavaliere replied that it was not being worked on yet, and leading the prince de Marsillac, who stood near him, to a place where the King could turn his eyes on him, he took a piece of charcoal and marked the pupils on the bust. That done, he said to His Majesty that the work was finished and he wished that it had been more perfect; he had worked at it with so much love that it was the least bad portrait he had done; one thing only he regretted, that he was obliged to leave; he would have been happy to spend the rest of his life in the King's service, not only because he was King of France and a great king, but because he had realized that His Majesty possessed a spirit even more exalted than his position; he could hardly speak and, unable to say more, he broke down and withdrew. The King behaved in the most kindly way in the world, and told

the abbé Buti, who was near, to tell the Cavaliere that, if he had only understood his language, he would be able to communicate his feelings to him and say many things that should make him very happy and would reveal how warmly he returned the Cavaliere's affection.

* * *

4 Charles-Alphonse du Fresnoy (1611–1668) from *De Arte Graphica*

The French painter and writer Charles-Alphonse du Fresnoy is principally known for his poem, *De Arte Graphica* (The Art of Painting), in which he provided a concise and memorable summation of available wisdom on the practice of painting. He worked on the poem for some twenty-five years, polishing and reducing it to just 549 elegant Latin hexameters. Directly modelled on Horace's *Ars poetica*, it was intended to make good the lack of any comparable ancient treatise on painting. Du Fresnoy originally trained to be a doctor and pursued the career of a painter against the wishes of his parents. He studied under François Perrier and Simon Vouet in Paris before moving to Rome in late 1663 or early 1664. There he was strongly influenced by the works of Poussin and Raphael, and by the remains of classical Antiquity. His surviving paintings from this period show a marked classicizing tendency. In 1653 he was called away from Rome on family business, travelling through Lombardy to Venice, where he stayed for eighteen months. Experience of the works of the great Venetian masters served to counterbalance the emphasis on design which he had assimilated in Rome, and he developed a lasting appreciation of the role of colour. This is reflected in the text of *De Arte Graphica*, which acknowledges colour as an essential component of artistic beauty. It was published in its original Latin version shortly after his death in 1668, but its contemporary reception was decisively influenced by the French translation which Roger de Piles published later that same year, together with an extensive commentary (see IC5). The poem together with De Piles' notes was translated into English by John Dryden in 1695. Dryden also wrote a substantial preface entitled 'A Parallel betwixt Painting and Poetry'. As subsequent scholars have pointed out, Dryden relied principally on De Piles' French prose rather than the Latin text. His translation was published as *De Arte Graphica. The Art of Painting, by C. A. Du Fresnoy. With Remarks*, London: J. Heptinstall, 1695. The following excerpts are taken from *The Works of John Dryden*, ed. A. E. Wallace Maurer and George R. Guffey, vol. 20, Berkeley, Los Angeles and London: University of California Press, 1989, pp. 84–98, 100. The original line numbers of the poem are marked in square brackets in the text to facilitate the location of De Piles' remarks (see IC5).

Painting and Poesy are two Sisters, which are so like in all things, that they mutually lend to each other both their Name and Office. One is call'd a dumb Poesy, and the other a speaking Picture. [5.] The Poets have never said any thing but what they believ'd would please the Ears. And it has been the constant endeavour of the Painters to give pleasure to the Eyes. In short, those things which the Poets have thought unworthy of their Pens, the Painters have judg'd to be unworthy of their Pencils. For both of them, that they might contribute all within their power to the sacred Honours of Religion, [10.] have rais'd themselves to Heaven, and, having found a free admission into the Palace of *Jove* himself, have enjoy'd the sight and conversation of the Gods; whose Majesty they observe, and contemplate the wonders

of their Discourse, in order to relate them to Mankind; whom at the same time they inspire with those Cœlestial Flames, which shine so gloriously in their Works. From Heaven they take their passage through the World; and are neither sparing of their pains nor of their study [15.] to collect whatsoever they find worthy of them. They dive (as I may say) into all past Ages; and search their Histories, for Subjects which are proper for their use: with care avoiding to treat of any hut those which, by their nobleness, or by some remarkable accident, have deserv'd to be consecrated to Eternity; whether on the Seas, or Earth, or in the Heavens. [20.] And by this their care and study it comes to pass, that the glory of Heroes is not extinguish'd with their lives: and that those admirable works, those prodigies of skill, which even yet are the objects of our admiration, are still preserv'd. So much these Divine Arts have been always honour'd: and such authority they preserve amongst Mankind. [25.] It will not here be necessary to implore the succour of *Apollo*, and the Muses, for the gracefulness of the Discourse, or for the Cadence of the Verses: which containing only Precepts, have not so much need of Ornament, as of Perspicuity.

[30.] I pretend not in this Treatise to tie the hands of Artists, whose skill consists only in a certain practice, or manner which they have affected, and made of it as it were a Common Road. Neither would I stifle the Genius by a jumbled heap of Rules: nor extinguish the fire of a vein which is lively and abundant. But rather to make this my business, that Art being strengthened by the knowledge of things, may at length [35.] pass into Nature by slow degrees; and so in process of time may be sublim'd into a pure Genius which is capable of choosing judiciously what is true, and of distinguishing betwixt the beauties of Nature, and that which is low and mean in ber; and that this Original Genius by long exercise and customs, may perfectly possess all the Rules and Secrets of that Art.

Precept I. *Of what is Beautifull.* The principal and most important part of Painting, is to find out and thoroughly to understand what Nature has made most beautifull, and most proper to this Art; and that a choice of it may be made according to the gust [i.e. taste] and manner of the Ancients, [40.] without which, all is nothing but a blind, and rash barbarity; which rejects what is most beautifull, and seems with an audacious insolence to despise an Art, of which it is wholly ignorant: which has occasion'd these words of the Ancients: *That no man is so bold, so rash, and so overweening of his own works, as an ill Painter, and a bad Poet, who are not conscious to themselves of their own Ignorance.*

[45.] We love what we understand; we desire what we love; we pursue the enjoyment of those things which we desire; and arrive at last to the possession of what we have pursu'd, if we constantly persist in our Design. In the mean time, we ought not to expect that blind Fortune should infallibly throw into our hands those Beauties: For though we may light by chance on some which are true and natural, yet they may prove either not to be decent or not to be ornamental. Because it is not sufficient [50.] to imitate Nature in every circumstance, dully, and as it were literally, and meanly; but it becomes a Painter to take what is most beautifull, as being the Sovereign Judge of his own Art; and that by the progress which he has made, he may

understand how to correct his errors, and permit no transient Beauties to escape his observation.

II. *Of Theory, and Practice.* In the same manner, that bare practice, [55.] destitute of the Lights of Art, is always subject to fall into a Precipice like a blind Traveller, without being able to produce any thing which contributes to a solid reputation, so the speculative part of Painting, without the assistance of manual operation, can never attain to that perfection which is its object, but sloathfully languishes as in a Prison: for it was not with his Tongue that *Apelles* perform'd his Noble Works. [60.] Therefore though there are many things in Painting, of which no precise rules are to be given (because the greatest Beauties cannot always be express'd for want of terms) yet I shall not omit to give some Precepts which I have selected from among the most considerable which we have receiv'd from Nature, that exact School-mistress, after having examin'd her most secret recesses, as well as those Master-pieces of Antiquity, which were the first Examples of this Art: And, 'tis by this means that the mind, and the natural disposition [65.] are to be cultivated, and that Science perfects Genius, and also moderates that fury of the fancy, which cannot contain it self within the bounds of Reason, but often carries a man into dangerous extremes: *For there is a mean in all things; and a certain measure, wherein the good and the beautifull consist; and out of which they never can depart.*

III. *Concerning the Subject.* This being premis'd, the next thing is to make choice of a Subject beautifull and noble; [70.] which being of it self capable of all the charms and graces, that Colours, and the elegance of Design can possibly give, shall afterwards afford, to a perfect and consummate Art, an ample field of matter wherein to expatiate it self; to exert all its power, and to produce somewhat to the sight which is excellent, judicious, and well season'd; and at the same time proper to instruct, and to enlighten the Understanding.

Thus at length I enter into the Subject-matter of my Discourse; and at first find only a bare strain'd Canvass, on which the whole Machine (as it may be call'd) of the Picture is to be dispos'd, and the imagination of a powerfull, and easy Genius; [75.] which is what we properly call *Invention*.

Invention the first part of Painting. Invention is a kind of Muse, which being possess'd of the other advantages common to her Sisters, and being warm'd by the fire of *Apollo*, is rais'd higher than the rest, and shines with a more glorious, and brighter flame.

IV. *The Disposition or Oeconomy of the whole Work.* 'Tis the business of a Painter, in his choice of Postures, to foresee the effect, and harmony of the Lights and Shadows, with the Colours which are to enter into the whole; [80.] taking from each of them, that which will most conduce to the production of a beautifull Effect.

V. *The faithfulness of the Subject.* Let your Compositions be conformable to the Text of Ancient Authours, to Customs, and to Times.

* * *

VII. *Design, the second part of Painting.* The Parts must have their out-lines in waves resembling flames, or the gliding of a Snake upon the ground: They must be smooth, they must be great, they must be almost imperceptible to the touch, and even, without either Eminences or Cavities. [110.] They must be drawn from far, and without breaks, to avoid the multiplicity of lines. Let the Muscles be well inserted and bound together according to the knowledge of them which is given us by Anatomy. Let them be design'd after the manner of the *Græcians*: and let them appear but little, according to what we see in the Ancient Figures. In fine, let there be a perfect relation betwixt the parts and the whole, that they may be entirely of a piece.

[115.] Let the part which produces another part, be more strong than that which it produces; and let the whole be seen by one point of Sight.

Though Perspective cannot be call'd a certain rule or a finishing of the Picture, yet it is a great Succour and Relief to Art, and facilitates the means of Execution; [120.] yet frequently falling into Errors, and making us behold things under a false Aspect, for Bodies are not always represented according to the Geometrical Plane, hut such as they appear to the Sight.

VIII. *Variety in the Figures.* Neither the Shape of Faces, nor the Age, nor the Colour ought to be alike in all Figures, any more than the Hair: [125.] because Men are as different from each other, as the Regions in which they are born, are different.

IX. *The Members and Drapery of every Figure to be suitable to it.* Let every Member be made for its own head, and agree with it. And let all together compose but one Body, with the Draperies which are proper and suitable to it.

X. *The Actions of Mutes to be imitated.* And above all, let the Figures to which Art cannot give a voice, imitate the Mutes in their Actions.

XI. *Of the principal Figure of the Subject.* Let the principal Figure of the Subject appear [130.] in the middle of the Piece under the strongest Light, that it may have somewhat to make it more remarkable than the rest, and that the Figures which accompany it, may not steal it from our Sight.

XII. *Groupes of Figures.* Let the Members be combin'd in the same manner as the Figures are, that is to say, coupled and knit together. And let the Groupes be separated by a void space, to avoid a confus'd heap; which proceeding from parts that are dispers'd without any Regularity, [135.] and entangled one within another, divides the Sight into many Rays, and causes a disagreeable Confusion.

* * *

XIX. *That we must not tie our selves to Nature, but accommodate her to our Genius.* Be not so strictly ty'd to Nature, that you allow nothing to study, and the bent of your own Genius. But on the other side, believe not that your Genius alone, and the Remembrance of those things which you have seen, can afford you wherewithall to furnish out a beautifull Piece, without the Succour of that incomparable School-

mistress, Nature; [180.] whom you must have always present as a witness to the Truth. We may make a thousand Errors of all kinds; they are every-where to be found, and as thick set as Trees in Forests; and amongst many ways which mislead a Traveller, there is but one true one which conducts him surely to his Journey's end; as also there are many several sorts of crooked lines, but there is one only which is straight.

XX. *Ancient Figures the rules of imitating Nature.* Our business is to imitate the Beauties of Nature, as the Ancients have done before us, [185.] and as the Object and Nature of the thing require from us. And for this reason we must be carefull in the search of Ancient Medals, Statues, Vases and Basso Relievo's: And of all other things which discover to us the Thoughts and Inventions of the *Græcians*; because they furnish us with great Ideas, and make our Productions wholly beautifull. [190.] And in truth, after having well examin'd them, we shall therein find so many Charms, that we shall pity the Destiny of our present Age, without hope of ever arriving at so high a point of Perfection.

XXI. *A single Figure, how to be treated.* If you have but one single Figure to work upon, you ought to make it perfectly finish'd and diversify'd with many Colours.

XXII. *Of the Draperies.* [195.] Let the Draperies be nobly spread upon the Body; let the Folds be large, and let them follow the order of the parts, that they may be seen underneath, by means of the Lights and Shadows; notwithstanding that the parts should be often travers'd (or cross'd) by the flowing of the Folds which loosely incompass them, [200.] without sitting too straight upon them; but let them mark the parts which are under them, so as in some manner to distinguish them, by the judicious ordering of the Lights and Shadows. And if the parts be too much distant from each other, so that there be void spaces, which are deeply shadow'd, we are then to take occasion to place in those voids some Fold to make a joining of the parts. And as the Beauty of the Limbs consists not in the quantity and rising of the Muscles, but, on the contrary, [205.] those which are less eminent have more of Majesty than the others; in the same manner the beauty of the Draperies, consists not in the multitude of the folds, but in their natural order, and plain simplicity. The quality of the persons is also to be consider'd in the Drapery. As supposing them to be Magistrates, their Draperies ought to be large and ample: [210.] If Country Clowns or Slaves they ought to be coarse and short: If Ladies or Damsels, light and soft. 'Tis sometimes requisite to draw out, as it were from the hollows and deep shadows, some Fold, and give it a Swelling, that receiving the Light, it may contribute to extend the clearness to those places where the Body requires it; and by this means we shall disburthen the piece of those hard Shadowings which are always ungracefull.

* * *

XXX. *Gothique Ornaments are to be avoided.* [240.] We are to have no manner of relish for *Gothique* Ornaments, as being in effect so many Monsters, which barbarous Ages have produc'd; during which, when Discord and Ambition caus'd by the too large extent of the *Roman* Empire, had produc'd Wars, Plagues and Famine through

the World, then I say, the stately Buildings fell to Ruin, and the nobleness of all beautifull Arts was totally extinguish'd: [245.] then it was that the admirable and almost supernatural Works of Painting were made Fuel for the Fire: But that this wonderfull Art might not wholly perish, some Reliques of it took Sanctuary under ground, and thereby escap'd the common Destiny. And in the same profane age, the noble Sculpture was for a long time buried under the same Ruines, with all its beautifull Productions and admirable Statues. The Empire in the mean time under the weight of its proper Crimes and undeserving to enjoy the day, [250.] was envelop'd with a hideous night, which plung'd it into an Abyss of errors, and cover'd with a thick darkness of Ignorance those unhappy Ages, in just revenge of their Impieties: From hence it comes to pass, that the works of those great *Græcians* are wanting to us; nothing of their Painting and Colouring [255.] now remains to assist our modern Artists, either in the Invention, or the manner of those Ancients; neither is there any man who is able to restore the Chromatique part or Colouring, or to renew it to that point of excellency to which it had been carry'd by *Zeuxis*: who by this part which is so charming, so magical, and which so admirably deceives the sight, made himself equal to the great *Apelles*, that Prince of Painters; [260.] and deserv'd that height of reputation which he still possesses in the World.

Colouring the third part of Painting. And as this part, which we may call the Soul of Painting and its utmost perfection, is a deceiving Beauty, but withal soothing and pleasing: So she has been accus'd of procuring Lovers for her Sister, and artfully ingaging us to admire her. But so little have this Prostitution, these false Colours, and this Deceit, [265.] dishonour'd Painting, that on the contrary, they have only serv'd to set forth her Praise, and to make her merit farther known; and therefore it will be profitable to us, to have a more clear understanding of what we call Colouring.

The light produces all kinds of Colours, and the Shadow gives us none. The more a Body is nearer to the Eyes, and the more directly it is oppos'd to them, the more it is enlightn'd, because the Light languishes and lessens the farther it removes from its proper Sourse.

[270.] The nearer the Object is to the Eyes, and the more directly it is oppos'd to them, the better it is seen, because the Sight is weaken'd by distancce.

XXXI. *The conduct of the Tones of Light and Shadows.* 'Tis therefore necessary that round Bodies, which are seen one over against the other in a right Angle, should be of a lively and strong Colouring, and that the extremities turn, in losing themselves insensibly and confusedly, without precipitating the Light all on the sudden into the Shadow; [275.] or the Shadow into the Light. But the passage of one into the other must be common and imperceptible, that is, by degrees of Lights into Shadows and of Shadows into Lights. And it is in conformity to these Principles that you ought to treat a whole Groupe of Figures, though it be compos'd of several parts, in the same manner as you would do a single Head.

* * *

XXXIII. *That there must not be two equal Lights in a Picture.* We are never to admit two equal Lights in the same Picture; but the greater Light must strike forcibly on

the middle, and there extend its greatest clearness on those places of the Picture, [315.] where the principal Figures of it are, and where the strength of the action is perform'd, diminishing by degrees as it comes nearer and nearer to the Borders; and after the same manner that the Light of the Sun languishes insensibly in its spreading from the East, from whence it begins, towards the West where it decays and vanishes, so the Light of the Picture being distributed over all the Colours, [320.] will become less sensible the farther it is remov'd from its Original.

The experience of this is evident in those Statues which we see set up in the midst of Publique Places, whose upper parts are more enlighten'd than the lower; and therefore you are to imitate them in the distribution of your Lights.

Avoid strong Shadows on the middle of the Limbs; least the great quantity of black which composes those Shadows, should seem to enter into them and to cut them: [325.] Rather take care to place those shadowings round about them, thereby to heighten the parts, and take so advantageous Lights, that after great Lights, great Shadows may succeed. And therefore *Titian* said, with reason, that he knew no better rule for the distribution of the Lights and shadows, than his Observations drawn from a *Bunch of Grapes*.

XXXIV. *Of White and Black.* [330.] Pure or unmix'd white either draws an object nearer, or carries it off to farther distance: It draws it nearer with black, and throws it backward without it. But as for pure black, there is nothing which brings the object nearer to the Sight.

The light being alter'd by some Colour, never fails to communicate somewhat of that Colour to the Bodies on which it strikes, and the same effect is perform'd by the Medium of Air, through which it passes.

XXXV. *The reflection of Colours.* [335.] The Bodies which are close together, receive from each other that Colour which is opposite to them; and reflect on each other that which is naturally and properly their own.

XXXVI. *Union of Colours.* 'Tis also consonant to reason, that the greatest part of those Bodies which are under a Light, which is extended and distributed equally through all, should participate of each others Colours. The *Venetian School* having a great regard for that Maxim ([340.] which the Ancients call'd *the Breaking of Colours*) in the quantity of Figures with which they fill their Pictures, have always endeavour'd the Union of Colours, for fear that being too different, they should come to incumber the Sight by their confusion with their quantity of Members separated by their Folds, which are also in great number; [345.] and for this reason they have painted their Draperies with Colours that are nearly related to each other, and have scarce distinguish'd them any other way, than by the Diminution of the Lights and Shadows joining the contiguous Objects by the Participation of their Colours, and thereby making a kind of Reconciliation or Friendship betwixt the Lights and Shadows.

* * *

XLV. *The field or ground of the Picture.* Let the Field, or Ground of the Picture, be clean, free, transient, light, and well united with Colours which are of a friendly nature to each other; [380.] and of such a mixture, as there may be something in it of every colour that composes your work, as it were the contents of your Palette. And let the bodies mutually partake of the colour of their ground.

XLVI. *Of the vivacity of Colours.* Let your Colours be lively, and yet not look (according to the Painter's Proverb) as if they had been rubb'd or sprinkled with meal: that is to say, let them not be pale.

Let the parts which are nearest to us, and most rais'd, be strongly colour'd, and as it were sparkling; and let those parts which are more remote from sight, and towards the borders, be more faintly touch'd.

XLVII. *Of Shadows.* [385.] Let there be so much harmony, or consent, in the Masses of the Picture, that all the shadowings may appear as if they were but one.

XLVIII. *The Picture to be of one piece.* Let the whole Picture be made of one piece, and avoid as much as possibly you can, to paint drily.

* * *

5 Roger de Piles (1635–1709) 'Remarks on *De Arte Graphica*'

Roger de Piles was a French diplomat, amateur painter and art theorist. His *Principles of Painting* (see II A2), published at the end of his career in 1708, has been described as the *summa* of academic art theory (Crow, 1985). He had studied philosophy and theology in Paris and in 1662 became tutor to Michel Amelot de Gournay, son of Charles Amelot, President of the Grand Conseil. When Michel Amelot was appointed ambassador to Venice in 1682 De Piles was made his secretary. Further diplomatic missions to Germany, Austria and Portugal enabled him to acquire first-hand experience of a wide range of art. In 1692, however, he was arrested whilst undertaking secret negotiations in the Netherlands during the War of the League of Augsburg, and was imprisoned for five years in The Hague. He used this time to compose his *Abrégé de la vie des peintres*, published in Paris in 1699 and translated into English in 1706 as *The Art of Painting*. His first important contribution to art theory dates from 1668 when he published a French prose translation of Du Fresnoy's Latin poem, *De Arte Graphica*, together with an extensive commentary (see IC4). Both the translation and the 'remarks' helped to present Du Fresnoy's poem as 'a manifesto for a new colourist offensive' (Lichtenstein, 1989) against the theoretical and institutional dominance of the Académie Royale de Peinture et de Sculpture. This challenge was subsequently taken up from within the Academy by Louis Gabriel Blanchard (see IC8). De Piles responded with his *Dialogue upon Colouring* of 1673 (see IC10). *L'Art de peinture de Charles-Alphonse Du Fresnoy, traduit en français, avec des remarques nécessaires et tres amples* was published in Paris by Nicolas Langlois in 1668. The following excerpts are taken from the translation by John Dryden (*De Arte Graphica. The Art of Painting, by C. A. Du Fresnoy. With Remarks*, London: J. Heptinstall, 1695) as reprinted in *The Works of John Dryden*, ed. A. E. Wallace Maurer and George R. Guffrey, vol. 20, Berkeley, Los Angeles and

London: University of California Press, 1989, pp. 126–7, 142–3, 163–4, 168, 170–3, 175–6. Each of the 'Remarks' is prefaced by the corresponding line number of the poem, which is shown in square brackets in the selection.

* * *

[¶ 75.] *Which is what we properly call Invention, &c.* Our Author establishes three parts of Painting, the Invention, the Design or Drawing, and the Colouring, which in some places he also calls the *Cromatique*. Many Authors who have written of Painting, multiply the parts according to their pleasure; and without giving you or my self the trouble of discussing this matter, I will onely tell you, that all the parts of Painting which others have nam'd, are reducible into these three which are mention'd by our Author.

For which reason, I esteem this division to be the justest: and as these three parts are Essential to Painting, so no man can be truly call'd a Painter who does not possess them all together: In the same manner that we cannot give the name of *Man* to any Creature which is not compos'd of Body, Soul and Reason, which are the three parts necessarily constituent of a Man. How therefore can they pretend to the Quality of Painters, who can onely copy and purloyn the works of others who therein employ their whole industry, and with that onely Talent would pass for able Painters? And do not tell me that many great Artists have done this; for I can easily answer you that it had been their better course, to have abstain'd from so doing; that they have not thereby done themselves much honour, and that copying was not the best part of their reputation. Let us then conclude that all Painters ought to acquire this part of Excellence; not to do it, is to want courage and not dare to shew themselves. 'Tis to creep and grovel on the ground, 'tis to deserve this just reproach, *O imitatores servum pecus!* ['Oh, sheep-like flock of imitators'] 'Tis with Painters, in reference to their productions, as it is with Orators. A good beginning is always costly to both: much sweat and labour is requir'd, but 'tis better to expose our works and leave them liable to censure for fifteen years, than to blush for them at the end of fifty. On this account 'tis necessary for a Painter to begin early to do somewhat of his own, and to accustom himself to it by continual exercise; for so long as endeavouring to raise himself, he fears falling, he shall be always on the ground.

* * *

[¶ 129.] *Let the principal Figure of the Subject, &c.* 'Tis one of the greatest blemishes of a Picture, not to give knowledge, at the first Sight, of the Subject which it represents. And truly nothing is more perplexing, than to extinguish, as it were, the principal Figure by the opposition of some others, which present themselves to us at the first view, and which carry a greater lustre. [. . .] A Painter is like an Orator in this. He must dispose his matter in such sort, that all things may give place to his principal Subject. And if the other Figures, which accompany it, and are onely as Accessories there, take up the chief place, and make themselves most remarkable, either by the Beauty of their Colours, or by the Splendour of the Light, which strikes upon them, they will catch the Sight, they will stop it short, and not suffer it to go further than themselves, till after some considerable space of time, to find out that which was not discern'd at first. The principal Figure in a Picture is like a King among his Courtiers, whom we ought to know at the first Glance, and who ought to

dim the Lustre of all his Attendants. Those Painters who proceed otherwise, do just like those who in the relation of a story ingage themselves so foolishly in long digressions, that they are forc'd to conclude quite another way than they began.

* * *

[¶ 256.] *The Cromatique part or Colouring, &c.* The third and last part of Painting, is call'd the *Cromaticque* or *Colouring*. Its object is Colour, for which reason, Lights and Shadows are therein also comprehended, which are nothing else but white and brown (or dark,) and by consequence have their place among the Colours. *Philostratus* says in his life of *Apollonius*, *That it may be truly call'd Painting which is made only with two Colours, provided the Lights and Shadows be observ'd in it: for there we behold the true resemblance of things with their Beauties; we also see the Passions, though without other Colours: so much of life may be also express'd in it, that we may perceive even the very Blood: the Colour of the Hair and of the Beard, are likewise to be discern'd, and we can distinguish without confusion, the fair from the black, and the young from the old, the differences betwixt the white and the flaxen hair; we distinguish with ease betwixt the Moors and the Indians; not onely by the Camus Noses of the Blacks, their woolly Hair and their high Jaws, but also by that black Colour which is natural to them.* We may add to what *Philostratus* has said, that with two onely Colours, the Light and the Dark, there is no sort of Stuff or Habit but may be imitated. We say then, that the colouring makes its observations on the Masses or Bodies of the Colours, accompany'd with Lights and Shadows more or less evident by degrees of diminution, according to the Accidents: First of a luminous Body, as for example, the Sun or a Torch; Secondly, of a diaphanous or transparent Body, which is betwixt us and the object, as the Air either pure or thick, or a red Glass, &c.; Thirdly, of a solid Body illuminated, as a Statue of white Marble, a green Tree, a black Horse, &c.; Fourthly, from his part, who regards the Body illuminated, as beholding it either near or at a distance, directly in a right Angle, or aside in an obtuse Angle, from the top to the bottom, or from the bottom to the top. This part, in the knowledge which it has of the vertue of Colours, and the Friendship which they have with each other, and also their Antipathies, comprehends the Strength, the Relievo, the Briskness, and the Delicacy which are observ'd in good Pictures; the management of Colours, and the labour depend also on this last part.

[¶ 263.] *Her Sister, &c.* That is to say, the Design or Drawing, which is the second part of Painting, which consisting onely of Lines, stands altogether in need of the Colouring to appear. 'Tis for this reason, that our Author calls this part her Sisters Procurer, that is, the Colouring shows us the Design, and makes us fall in love with it.

* * *

[¶ 329.] *A bunch of Grapes, &c.* 'Tis sufficiently manifest, that *Titian* by this judicious and familiar comparison, means that a Painter ought to collect the objects, and to dispose them in such a manner, as to compose one whole; the several contiguous parts of which, may be enlighten'd, many shadow'd, and others of broken Colours to be in the turnings; as on a Bunch of Grapes, many Grapes, which are the parts of it, are in the Light, many in the Shadow, and the rest faintly colour'd to make them go farther back. *Titian* once told *Tintoret*, *That in his greatest works, a Bunch of Grapes had been his principal rule and his surest guide.*

* * *

[¶ 332.] *But as for pure black, there is nothing that brings the Object nearer to the Sight, &c.* Because black is the heaviest of all Colours, the most earthly, and the most sensible: This is clearly understood by the qualities of white, which is oppos'd to it, and which is, as we have said, the lightest of all Colours. There are few who are not of this opinion; and yet I have known some, who have told me, that the black being on the advanc'd part, makes nothing but holes. To this there is little else to be answer'd, but that black always makes a good effect, being set forward, provided it be plac'd there with Prudence. You are therefore so to dispose the Bodies of your Pictures which you intend to be on the fore-ground, that those sorts of holes may not be perceiv'd, and that the blacks may be there by Masses, and insensibly confus'd. See the 47th. Rule.

[...]

This Rule of White and Black is of so great consequence, that unless it be exactly practis'd, 'tis impossible for a Picture to make any great effect, that the Masses can be disentabl'd, and the different distances may be observ'd at the first Glance of the Eye without trouble.

It may be inferr'd from this Precept, that the Masses of other Colours, will be so much the more sensible, and approach so much the nearer to the Sight the more brown they bear; provided this be amongst other Colours which are of the same Species. For example, A yellow brown shall draw nearer to the Sight, than another which is less yellow. I said provided it be amongst other Colours, which are of the same Species, because there are simple Colours, which naturally are strong and sensible, though they are clear, as Vermillion; there are others also, which notwithstanding that they are brown, yet cease not to be soft and faint, as the blue of Ultramarine. The effect of a Picture comes not onely therefore from the Lights and Shadows, but also from the nature of the Colours. I thought it was not from the purpose in this place to give you the qualities of those Colours which are most in use, and which are call'd *Capital*, because they serve to make the composition of all the rest, whose number is almost infinite.

Red Oker is one of the most heavy Colours.

Yellow Oker is not so heavy, because 'tis clearer.

And the Masticot is very Light, because it is a very clear yellow, and very near to white.

Ultramarine or Azure, is very light and a very sweet Colour.

Vermillion is wholly opposite to Ultramarine.

Lake is a middle Colour betwixt Ultramarine and Vermillion, yet it is rather more sweet than harsh.

Brown Red is one of the most earthy and most sensible Colours.

Pinck is in its nature an indifferent Colour, (that is) very susceptible of the other Colours by the mixture: if you mix brown-red with it, you will make it a very earthy Colour; but on the contrary, if you joyn it with white or blue, you shall have one of the most faint and tender Colours.

Terre Verte (or green Earth) is light; 'tis a mean betwixt yellow Oker and Ultramarine.

Umbre is very sensible and earthy; there is nothing but pure black which can dispute with it.

Of all Blacks, that is the most earthy, which is most remote from Blue. According to the Principle which we have establish'd of white and black, you will make every one of these Colours before-nam'd more earthy and more heavy, the more black you mingle with them, and they will be light the more white you joyn with them.

For what concerns broken or compound Colours, we are to make a judgment of their strength by the Force of those Colours which compose them. All who have thoroughly understood the agreement of Colours, have not employ'd them wholly pure and simple in their Draperies, unless in some Figure upon the foreground of the Picture; but they have us'd broken and compound Colours, of which they made a Harmony for the Eyes, by mixing those which have some kind of Sympathy with each other, to make a Whole, which has an Union with the Colours which are neighbouring to it. The Painter who perfectly understands the force and power of his Colours, will use them most suitably to his present purpose, and according to his own Discretion.

* * *

[¶ 382.] *Let your Colours be lively, and yet not look (according to the Painters Proverb) as if they had been sprinkled with Meal, &c. Donner dans la farine, is a Phrase amongst Painters, which perfectly expresses what it means, which is to paint with clear, or bright Colours, and dull Colours together; for being so mingled, they give no more life to the Figures, than if they had been rubb'd with Meal. They who make their flesh Colours very white, and their Shadows grey or inclining to green, fall into this inconvenience. Red Colours in the Shadows of the most delicate or finest Flesh, contribute wonderfully to make them lively, shining and natural; but they are to be us'd with the same discretion, that Titian, Paul Veronese, Rubens and Van Dyck, have taught us by their example.*

To preserve the Colours fresh, we must paint by putting in more Colours, and not by rubbing them in, after they are once laid; and if it could be done, they should be laid just in their proper places, and not be any more touch'd, when they are once so plac'd; it would be yet better, because the Freshness of the Colours is tarnish'd and lost, by vexing them with the continual Drudgery of Daubing.

All they who have colour'd well, have had yet another Maxim to maintain their Colours fresh and flourishing, which was to make use of white Grounds, upon which they painted, and oftentimes at the first Stroke, without retouching any thing, and without employing new Colours. *Rubens* always us'd this way, and I have seen Pictures from the hand of that Great Person, painted up at once, which were of a wonderfull Vivacity.

* * *

6 Marco Boschini (1613–1705) from *The Rich Mines of Venetian Painting*

Boschini has been described as 'an instinctive empiricist, interested above all in colour, light, atmosphere and movement' (Mahon, 1947). He distanced himself from the idealism and classicism promoted by Roman theorists such as Bellori (see IB8), championing instead the art of his native Venice with its rich colourist tradition. He also sought to challenge Vasari's claim that the art of Florence was pre-eminent throughout Italy. Besides his work as a painter, he was also active as a printmaker, cartographer, merchant and restorer. In 1664 he published *Le Minere della Pittura Veneziana*, a guide to the wealth of paintings to be found in Venice. It was prefaced by a vast poem, *La Carta del Navegar Pitoresco* (The Map of Pictorial Navigation), made up of some 20,000 verses in which he developed his ideas on painting through a dialogue between himself and an unidentified Senator. In 1674 he published a second edition of this work entitled *Le Ricche Minere della Pittura Veneziana* in which he summarized the contents of the poem in a set of 'Brief Instructions' to a young novice. Although Boschini recognizes the importance of design, he places equal stress on the role of colour and invention. His suggestion that design without colour is to be likened to the body without a soul anticipates the defence of colour mounted by Roger de Piles, who employs the same metaphor (see IC10). Boschini emphasizes the role of invention over imitation, defending the artist's freedom to transform what he sees in accordance with his own personal vision. The following excerpts have been translated for the present volume by Katerina Deligiorgi from the edition edited by Anna Pallucchini, *La Carta del Navegar Pitoresco, edizione critica con la 'Breve Istruzione', premessa alle 'Ricche Minere della Pittura Veneziana'*, Venice and Rome: Istituto per la collaborazione culturale, 1966, pp. 747–8, 752–6.

Design

It has reached my ear that certain novices, having heard me say that those who are ignorant of design, colour and invention are unable to understand painting, would like me to say something more on these three parts. For their sake I have decided to declare here what I know. As this is not all that can be said on these subjects, I beg the forgiveness of those who know more than myself. Since design is the base and principal foundation of this marvellous art I will begin my discourse with it. Being well aware, however, that those who have already written on design, such as Albrecht Dürer and others, treat only of outline and symmetry and do not go beyond that (despite the fact that the body of design contains an infinity of parts), I am not sure whether it is appropriate for me to exceed these limits. Nonetheless, since the great Mover has bestowed upon me this gift, namely to have been born in Venice, a city from which issue a great many law-givers of painting, and since I have innumerable examples in front of my eyes and have observed many things through my own practice, I will endeavour to discuss this matter as best I can.

I say then that design is the base and principal foundation of the edifice; and just as an edifice cannot exist without foundations, so painting without design is a heap which cannot stand up. As I have said previously, some believe that design consists only of outlines. I say, however, that though outline is necessary to design, it should be treated in the same way as a writer treats a feint line: he uses it while he writes but

throws it away when he is done. This is because painting should follow nature and appear delicate, supple and without a sharp finish. And if the painters of Antiquity had done the same, once the good art was lost, then their works would not seem so dry, hard and harsh. Outline can also be compared to the skeleton of the human body which must be covered with flesh to be perfect. And this is one of the most important parts of design, because over this outline the painter, using *chiaroscuro*, must render conspicuous the fleshy parts. To explain this better, I will give an example. If one wants to draw a round ball, then one must, of course, use a compass to make a circle, but this is not sufficient, for without shadows, highlights and half-tones, this outline, round, or circle could never be said to be a globe or a ball. It would be simply a mathematical circle which requires the artifice of *chiaroscuro* to be rounded up in each of its parts. And this waits for the brushstroke to represent nature with the artifice of colour, for without colour design remains imperfect. [...]

Some people believe that statues should serve as the true model for those who want to acquire knowledge of design and that without studying statues one cannot become a good painter. It is said that statues represent the best of nature, rendered perfect by able sculptors, and also that there is little in nature itself that is perfect.

There is also an opposite opinion on this, which is held by those who concede that everything in nature is not perfect, but add that the same can be said of statues too.

The first reply that this is true, but that they speak of the good ones. But, the others say again, the same can be said of natural forms, and moreover, nature does not receive its perfection from statues, but rather the statues from nature. The first then say that ancient statues, such as the Laocoön, the Farnese Hercules, the Venus of the Medici, are absolutely perfect. The others reply that the most ancient figure is the human figure created by the divine Mover and that it ranks higher than the statues. And then they smile and add that we no longer live in the mythical age of Deucalion and Pyrrha, who made men and women spring forth from stones. Finally, they say that since painting and sculpture imitate nature, one could tell sculptors that they should learn from fine paintings, such as Tintoretto's *Last Judgement* in the Madonna dell'Orto, or many others in the Scuola di San Rocco, and conclude that every man confesses to enjoying being a man and not a statue. The truth, however, is this, that our unique painters have studied both statues and nature, extracting the best from each and creating a blend of true perfection. This is why everybody wants to acquire Venetian paintings and is willing to pay a great deal of gold for them.

Colour

Since I must now expound upon the second topic, colour, I say that painting acquires its name by virtue of the learned brush of the good painter who, clothing his design with colour, renders it alive. We could say that without colour design is a body without a soul. We may reasonably compare colour to light, which enables us to see clearly that which is in the sky and on the earth. Because of its different hues, colour likewise allows us to discern each and every thing to the point that it even adds blood to the flesh and can be likened to a bright sun which enables us to see the perfection of every detail with its luminous rays.

To help the novice understand the topic better, I must now come to the details and, grasping the brush of my own weakness, tinge it with Venetian colour which I shall convey on the page as follows. I will say that just as design has many parts, so colour extends to cover different circumstances and particular applications. Sometimes it is used in *impasto*, and then it forms the base; when it is mottled, it is style; when it is used for blending, it is delicacy; when it is used for staining or smudging, it makes the parts distinct; when it lightens or darkens the hues, it conveys things in the round; used in a 'scornful stroke', it shows assurance in colouring; applied as a veil, or as they say, by brushing against the surface, it finishes off and gives great unity to the work. It is with these and other similar applications that Venetian colour is created. By 'colour', I mean here the nude of the human figure, for different applications are required for colouring other things. But since the colouring of the flesh is essential, it requires as detailed an explanation as possible.

When the Venetian painters – and here I speak of the best – worked on a large canvas, they drew first the outline of the figures of the historical or mythical narrative they wanted to represent and then sketched them in with solid colours which served as the foundation and base of their particular mode of expression. These first oil-sketches and outlines were born out of ideas in the painters' minds. The painters did not consult nature, sculpture or bas-reliefs, for their greatest concern was to arrange harmoniously the inner and outer parts of the composition, that is, to make the figures distinct from the background with the help of *chiaroscuro*; this is one of the most important components of colour and design, and even of invention. Once these basic elements were thus arranged and the oil-sketches dried out, the painters observed both nature and statues, without, however, becoming beholden to either. Instead, from just a few marks on paper, they finished their figures and, without any further reference to nature, they seized their brushes and started to work with brushstrokes on the oil-sketches and paint the colour of the flesh using earths more than any other colours. What they used most was a little cinnabar, red lead, and lacquer [reddish-brown resin]. They loathed like the plague light blues, bright yellows, smalts, azure greens, Naples yellows, and also glosses and varnishes. Once the second coat of paint was dry, to make a figure stand out more and throw it into relief, they would, for example, veil the figure next to it with a darker hue. Or they would paint in some highlights on the head, or the hand, or the foot, to lift them, so to speak, from the canvas. This can be seen in the church of San Rocco on the right of the main altar, where Tintoretto has artfully represented the imprisonment of St Roch. By multiplying these well-judged touches laid on dry in appropriate places, the painters seasoned every harmonious composition. Notice that they never covered all the figures, but, adorning them thus with these vigorous brushstrokes, often putting a coat of pitch on the darker areas, they animated them and always left the great masses in half-tones with much darkness and little light. There is no doubt that, as I have already said, each master established his own style, even though they all followed the same general rules. In the past, there have been those, like our Giovanni Bellini and many others of his time, who allied precision to their blending of colours. Their works are too precise, however, and, despite their exquisite rarity, not so successful, for they lack the delicacy of the works of their successors. Unique among them was Palma Vecchio who rendered the impossible possible, for he combined

precision and delicacy. One sees this in the figure of St Barbara above the altar-table of the Bombardiers in Santa Maria Formosa, which is considered very precious. Always praised for its refinement and precision, this figure, which is not to be enjoyed from a distance, is truly a thing of rarity. On the other hand, the painterly brushstroke, the 'scornful stroke', like that of Schiavone and of Bassano, is an astonishing and miraculous stroke.

We must admit, however, that nature has bonded herself for ever to the immortal Titian. Every adjective conveying perfection of colour is appropriate for him: for not just the flesh, but also the landscapes, the animals, and every other thing in his work is a true twin of reality. Just as an example let us simply contemplate the St Sebastian in the main altar of San Niccolò of the Friars Minor. If anyone does not freely admit that this is more marvellous than nature, he is blindly ignorant and therefore cannot judge anything about colour.

Invention

But what must be said of invention, a treasure kept in the coffers of imagination, a power of the soul which raises images and, with the guidance of a fine understanding, consigns them to the attentive hand which takes them down through its actions. Invention organizes the parts within the whole, disposes the materials, introduces the forms, integrates the incidents, represents the events and renders harmonious the elements of the composition. This part is the most essential in painting. Since it is the first and principal foundation of everything, it is impossible to begin the least thing without it. For the good inventor must perceive not only the historical narrative or fable which he must represent, but also all the incidents and circumstances of his subject, that is, the appropriate number of people, the various objects, the harmonious colours, the site in which the action takes place, the disposition of the figures, the attitudes of the bodies, the passions of the soul, the diversity of garments, the peculiarities of the thoughts and the novelty of things. He who is lacking in invention of his own is not esteemed by others, for he shall never be considered a master. But he who understands all the parts of invention and expresses them well cannot but succeed in becoming a distinguished painter. Such was certainly our Paolo Calliari Veronese who, having made invention his helpmeet, indeed, his disciple, then instructed, guided and assisted it in his greatest works. Oh what marvellous things were produced out of that intellect which went beyond nature and which, having penetrated the things of this world, lifted itself up to celestial spheres and invented divine forms. The human mind delights in these forms since here it finds itself communing with figures from paradise. What better example of this than the painting in the main altar in Santa Cattarina [*The Mystic Marriage of St Catherine*], an admirable architectural composition with a magnificent representation of the Virgin with the child Jesus placing the ring around the finger of the saint, surrounded by angels who combine celestial and musical harmony. The great Agostino Caraccio of Bologna with his immortal graver has certified the uniqueness of this invention. Though there is without doubt an infinite number of such prodigious and distinguished inventions, I cannot stop myself from recalling the dignified *Banquet at Cana*, painted by Veronese in the refectory of the Benedictine monks at San Giorgio

Maggiore. Here, invention is the queen of all the depictions which have been made up to the present day by any master whatsoever, making them all tribute-bearers and vassals. First, there is invention in the structure of the buildings, which are of an architectural majesty which has never been seen before. Then there is invention in the rich decor and ornaments, in the dignified and extravagant garments, in the charms of the colour, in the arrangement of the attitudes that are appropriate for the figures of the guests, the servants and the onlookers. There is invention finally in the ideas, which are so varied and so natural that one could not wish for more. In the ideas of the Saviour and of the Virgin we see figures from paradise which demand our veneration. The invention of the musical concert which appears in the foreground, and these four musicians, could not be better conceived. Veronese sought to season with these his immortal work, for in these four figures he has expressed the extract of what is rarest in painting: the old man who plays the viola da gamba is Titian, another who plays the flute is Giacomo Bassano, the one who plays the violin is Tintoretto, and the fourth one, dressed in white, is Paolo Veronese himself. Whoever can combine the musical harmony of painting better, let him approach with his own instrument. To conclude: no other invention is so well organized in the whole, so well crafted in the detail, so exemplary and so dignified! Veronese, you are the seasoning of painting, because from you is drawn the extract of the finest charms imaginable by a human mind. You are the universal painter who pleases and delights the entire universe. On the subject of invention, I cannot dare to place anyone above you. Thus I declare myself! My only regret is that I lack a similar gift for invention to invent concepts that are fitting to such merits. I admit that I am but a shadow which, lowering itself on the ground, pays the tribute of a humble gift to your resplendent rays. Novice, farewell!

7 Philippe de Champaigne (1602–1674) ‘Conference on Titian’s *Virgin and Child with St John*’

The dispute between the advocates of ‘design’ and the partisans of ‘colour’ raged in France with unusual ferocity in the last forty years of the seventeenth century. Although the arguments employed by the two sides in the dispute were largely the same as those that had been rehearsed in Italy during the previous century concerning the relative merits of *disegno* and *colore*, the conflict in France took on a very different complexion. The difference lies in the fact that the priority of design had been made the official doctrine of the Royal Academy under Colbert and Le Brun. As Jacqueline Lichtenstein has shown (Lichtenstein, 1989), the three functions of the Academy – pedagogical, theoretical and political – were so tightly interwoven that an attack on one was construed as an attack on the others. In his conference on Titian’s *Virgin and Child with St John*, delivered before members of the Academy in June 1671, Philippe de Champaigne (see also 1B12) sought to respond to the new challenge raised by partisans of colour such as Charles du Fresnoy (IC4) and Roger de Piles (IC5). Whilst praising Titian’s excellence in this domain, he criticizes the artist for a corresponding weakness in the drawing of the figures. Champaigne’s attack on colour is voiced in highly moral terms. To give preference to colour over line is like being attracted by the outer appearance of a person rather than by their mind or soul. Colour appeals to the senses rather than to the intellect, operating as a form of

seduction or deception. It was generally accepted that Poussin had been attracted early on to the work of the Venetian colourists, but had renounced these influences in pursuit of the greater virtue and discipline of an art based on line. Once again, his work is held up as exemplary to the artists of the Royal Academy. The painting discussed by Champaigne is now held in the Musée des Beaux-Arts in Dijon and is thought to be a product of Titian's studio rather than the work of the artist himself. The text of the conference was first published by André Fontaine in *Conférences inédites de l'Académie royale de Peinture et de Sculpture*, Paris: Minerva, 1903, pp. 9–13. It has been translated for the present volume by Katerina Deligiorgi.

Gentlemen, I believe that this painting by Titian merits our attention and I am confident that our discussion of it will be beneficial and rewarding in the manner intended by the founders of our Academy, who instituted these seminars for our cultivation and for the elevation and advancement of our profession.

The subject of this painting, as you can see, is the Virgin seated with the infant Jesus in her arms. St John the Baptist appears to be offering a lamb to another figure, seated on the ground, who is in all probability St Anne. The flesh tones of the figures, set against a limpid sky and a bright landscape, are worthy of our admiration. The brilliancy of the tints is achieved without the advantageous contrast of a dark background. Only a painter who has mastered the 'beautiful manner' of painting to the highest degree can achieve such an effect. The infant Jesus is charming and the forward position of his right leg is convincing in every respect. Indeed, it seems to me that together with the head of St Anne these are the most highly achieved parts of this incomparable painting. For you must agree that another work in which tenderness and greatness are thus combined would be difficult to find. This rare and learned colourist has gathered here and blended together with his brush all the elements that good painting requires.

Must not everyone agree that the landscape is extraordinarily beautiful? It is handled and coloured with the same force as the figures, and no attempt is made to render it more conspicuous by using darker tints. Indeed, it looks as if the bright and clear tones of the areas around the figures have made a pact not to clash with one another, entering a special agreement with the painter – this learned imitator of nature. For it is obvious that Titian was not concerned here with avoiding those things which, as a rule, painters seek to avoid for fear of rendering the flesh dull and inconspicuous. Nor was he troubled by awkward contrasts as can be seen, for instance, in the yellow used for the terrace behind St Anne's head, where we can also see a small herd of sheep. For this is a colour one would not usually place next to skin tones. This juxtaposition, however, has not in the least harmed the brilliance of the beautiful colours used for the saint's head. We see here what can be achieved through Titian's extensive and masterful study of the gradation of colours which, together with his practical observations, enabled him to make his paintings like a second nature.

Were we to seek to diminish in some way these enchanting qualities of Titian's brush, we would be committing a great injustice and we would be failing to recognize what an unparalleled gift was bestowed upon him. We must accept that he was born with this talent and that those who have not been so favoured by nature have failed to equal his achievement, despite all their efforts.

As regards the proportions and the correct drawing of figures, it seems that this was not the part of the painting with which Titian most concerned himself. In truth, the legs of the Virgin appear short and the outline from St Anne's waist to her foot is rather poorly drawn, with the curve of her belly hardly prominent. It often happens that the folds of the draperies obscure the contours of the body because the painter copies the adventitious aspects of what he sees. Although we should follow nature, we can discover that which is truly beautiful in her only through diligent searching. Such search is arduous and must occupy the painter most, for it reveals the most beautiful part of painting, namely correct and well-proportioned drawing. This skill is not bestowed by nature, but is only to be acquired through the effort of study.

We know from experience, and all agree, that there are only a few painters who know how to draw correctly and that they are greatly outnumbered by those who have a facility with colours. This is because many artists turn naturally to beautiful colour, having a native propensity for its beautiful external sheen which touches their hearts. I do not deny the importance of this part of painting. However, to give it precedence over the principal part, to make it the exclusive object of study, is to allow oneself to be deceived. It is like choosing a beautiful body and allowing oneself to be dazzled by its splendour while neglecting to discover what animates its beautiful appearance. Whatever its beauty, a body cannot sustain itself without the soul and the spirit that animate it. Let me support my argument by invoking the example of one of the greatest painters of the century, M. Poussin, who is admired by all fellow Academicians without exception. His early studies were directed towards beautiful colour, as if he wanted to force his genius, which was inclined towards the solid, to follow external splendour. This he did succeed in capturing, at least in part, for, although he did not entirely abandon himself to this study as if it were the thing that was closest to his heart, he did spend several years pursuing a career as a colourist. Once he saw the truth, however, his change of mind was so complete that he declared with great confidence that such disproportionate study is an obstacle which inevitably hinders young painters who seek the correct path to painting. He thus showed with incontrovertible arguments that he who concerns himself with the chief excellence of the art, namely that which is solid, will acquire in good time and without undue effort a sufficiently beautiful way of painting.

8 Louis Gabriel Blanchard (1630–1704) 'Conference on the Merits of Colour'

With his 'Conference on the Merits of Colour', delivered on 7 November 1671, Louis Gabriel Blanchard took the arguments of the colourists into the very heart of the Royal Academy. As the text of the conference makes clear, he was stung into action by the criticisms of Titian which had been made by Philippe de Champaigne a few months before (see IC7). With remarkable courage and tenacity, Blanchard undertook not only to defend the Venetian artist's work, but to present the case for the importance of colour to painting in general. Although he repeatedly affirms his admiration for the merits of design as well as of colour, he will have been aware that to challenge the priority of design was to question

the theoretical principles on which the authority of the Academy was based. The source of his claim that the different arts are distinguished by the different means of imitation they employ is the *Poetics* of Aristotle, and the lecture as a whole is characterized by a systematic and scholarly style of presentation which was no doubt intended to add persuasion to his case. Amongst the artists who have achieved excellence in colour, Blanchard lists Titian, Giorgione, Tintoretto and Veronese, and, for the first time in the conferences of the Academy, Peter Paul Rubens. Before long, the names of Poussin and Rubens would be used as a convenient shorthand to identify the supporters of each of the opposing camps. Louis Gabriel was the son of a painter, Jacques Blanchard, known as the 'French Titian'. He was elected to the Royal Academy in 1663 with an *Allegory of the Birth of Louis XIV* (Versailles), which was strongly influenced by the work of Le Brun. He went on to pursue a successful career and in 1684 was sent by Louis XIV to acquire pictures in recently conquered French Flanders. The text of the conference was first published by André Fontaine in *Conférences inédites de l'Académie royale de Peinture et de Sculpture*, Paris: Minerva, 1903, pp. 14–26. It has been translated for the present volume by Katerina Deligiorgi.

Gentlemen, the conferences of the Academy were established to help us to discover the truth and to throw light on matters that appear uncertain. I hope that you will find my thoughts on the merits of colour to be in accordance with this general purpose.

I have long been debating with myself whether I should raise this issue again. I have decided to do so after long deliberation on account of the importance of the subject and because, in my opinion, the matter has not so far been adequately examined or thoroughly debated. This is what I venture to do now, relying on your goodwill and hoping that, without judging my efforts too harshly, you will encourage me, and assist me with your own views.

You see, then, gentlemen, that I wish to present a case for the merits of colour. I shall endeavour to do so in a few words, so that each of you may have the opportunity to speak in turn and to express your thoughts on the subject.

1. Before I begin, however, I want to assure you that the spirit which animates this discourse is not one of contradiction. Nor is my intention to diminish the importance of design. On the contrary, it is a skill I esteem highly since it is a part of painting that is all the more precious for being difficult to acquire. In fact, I need not say a word more on this subject: the remnants of sculpture which survive from Antiquity constitute by themselves sufficient praise for the merits of design.

2. In submitting my arguments to your judgement, therefore, I have no other motive than that of discovering whether you consider them good or bad. Indeed, I find it all the more necessary to seek advice from you in this way since the task I am about to undertake is beyond my capacities and I am a young man with but little knowledge of painting. I am greatly honoured that you have entrusted me with giving this lecture and with proposing the subject.

3. As you know, gentlemen, colour was only recently the subject of a discourse. I confess that I listened with growing impatience to what was said before one of Titian's beautiful paintings. For this incomparable painting does not in the least accord with the testimony of those who showed their total indifference to the beauty

of its colours, when all the while the entire assembly was charmed by it. I for one was among its admirers and it is with great pleasure that I seek to defend that part of the painting which represents its greatest worth and value.

4. I shall have nothing to say regarding the effects of colours. The great M. Le Brun, who plans to discuss all the different parts of painting and who has already treated of some so admirably, will surely fulfil this task consummately and comprehensively as usual.

5. It is necessary to begin by explaining not only what we understand by colour, but also what painting is.

6. We may, I believe, define painting as an art which by means of form and colour imitates on a flat surface all manner of objects which come before our eyes. This definition is, it seems to me, the correct one because it is perfectly fitted to painting alone and so serves to distinguish it from all the other arts.

7. Painting has three parts: Invention, Design, and Colour. The first part invents the objects and disposes them on the canvas in the most advantageous and appropriate manner; the second gives them their correct proportions; and the third distributes upon the canvas the colours which are best able to captivate and to deceive the eyes.

I intend to speak of this last part of painting, whose merits were recently disparaged in one of our conferences where it was decided that colour was of little consequence and that we ought to apply ourselves to design alone.

In my view, this decision was arrived at too hastily and without having sufficiently considered the reasons which support a different opinion which is more widely held and which is closer to the truth.

8. It seems to me, gentlemen, that we can reasonably establish three things in defence of colour:

9. First, that colour is just as necessary to the art of painting as design.

10. Secondly, that if we diminish the worth of colour, we thereby also diminish the worth of painters.

11. And thirdly, that colour merited the praise of the ancients, and that it merits it again in our own age.

12. The first truth is not difficult to establish. Consider simply this. Every art is what it is by virtue of the different parts which compose it. Were we to remove one of its elements, even the slightest, we would be taking away something of its beauty and perfection. If now there is one part which may be considered more important than any other and which is indispensable to a particular art, this is because it makes a vital contribution to the aim of that art.

In the art of eloquence, for instance, the aim is to persuade. It is clear, then, that if there is a part of eloquence which is more important than any other, it must be that which most contributes to persuasion.

13. We must now examine two things: first, what general aim does the painter pursue in his work, and secondly, is design or colour more efficacious in achieving that end?

14. Is it enough to say in answer to the first question that the aim of the painter is to imitate nature? No, because all the fine arts do this. Could we then say that he aims to deceive our eyes? Again, No! For in many instances sculpture can do the same.

15. What, then, is the aim of the painter? It is, of course, both to deceive the eyes and to imitate nature. But we should add that this is done through the medium of colour, and herein lies the difference that distinguishes painting from all the other arts and which gives painting its own specific end. A painter is a painter only because he uses colours which are capable both of seducing the eyes and of imitating nature. Colour, therefore, should guide the painter, for it is colour that serves this goal.

16. That colour best serves the painter's purposes as we have sought to establish is, I believe, something that no one can doubt. I would be abusing your patience if I sought to establish such an obvious truth with mere words.

17. We should turn instead to consider some possible objections to my argument.

18. It could be argued that the purpose of painting is to represent on a flat surface the volume of bodies and that this can easily be done in black and white through drawing.

19. It could also be argued that single-colour paintings, or 'camaïeux', have often been produced by expert painters whose sole purpose was the imitation of nature, and that, for this reason, it is not colour but drawing that best serves this purpose.

20. It is easy to respond to both objections by saying that a single-colour painting can scarcely be considered a true work of art. Rather, it captures an idea for a work that the painter plans to execute, a work which the painter will realize fully using to that end whatever colours are required. Had the painter no intention to proceed in this way, we should conclude that he had misunderstood his aim, which is the imitation of nature. For natural objects are not monochrome – God bestowed different colours on them which serve to distinguish them from one another. It would therefore be best to say that the painter who uses only a single colour for his paintings does not seek to imitate nature but sculpture.

21. There are still others who suggest that the end of painting is only to delight and pleasingly to deceive the eye. They argue that design is better suited to that end, assuming that figures are drawn correctly and in accordance with the rules, because colour, even in nature, is extremely changeable. They add, too, that many wise painters, whose example it is always good to follow, did not rate colour highly and devoted their lives to design.

22. Again, the answer to this objection is simple. Even if we concede that the purpose of painting is merely to please, it would surely be preferable to please all rather than a few. The truly correct design is properly understood only by a few; it is savoured by the finest of connoisseurs and the most able of painters. Colour, by contrast, when harmoniously and skilfully applied, delights and enchants everybody. To please only the ignorant is a deficiency. To please the experts alone is excessive. But to please everybody alike is perfection itself.

23. Now, I am not in the least surprised that there are some who devote themselves to design, whilst neglecting colour, for design has its own beauty and charm. Moreover, as you know, design is valued all the more because it requires time, effort and application – a lifetime does not suffice to perfect this skill. I do not find it at all difficult to believe, therefore, that learned painters who made design their chief pursuit and dedicated themselves to it avidly pursued their study, always discovering something new to add to their knowledge. Perhaps, while seeking after beauty and

knowledge, they were surprised by death and were granted no time even to think about acquiring knowledge of colours.

24. It is, of course, possible that they neglected this knowledge simply because they thought it easy to acquire, believing that they could master it whenever they wished. Experience shows, however, that they would have been deluding themselves. Many a painter has searched hard for this knowledge but, having mistaken it for something it was not, was never able to acquire it. Others, having found it by accident, failed to recognize it and let it escape them.

25. It is certainly a matter of some importance to acquire knowledge of colour at the outset so as not to be deceived later on. For having thus accustomed ourselves to its charms we are less likely to let them dazzle us or lull us into forgetting the other parts of painting. It is not my intention here to promote colour to the detriment of design. Rather, I wish to unify them so that they can serve the same end together. In this way we can avoid replicating the errors of the Roman and the Lombard schools, which find fault with each other for having neglected one or the other part of painting. Let us rather combine these two beautiful parts, and if one is less well represented let us not regard it with indifference, or, we should rather say, contempt.

26. As to what best captivates and deceives the eye, clearly a painting with a mediocre design but with bright and harmonious colours will have a greater effect and better deceive the eyes than one in which excellence of design contains mediocre colours. This is because masterfully applied colour always represents the truth, whereas design represents only a reasonable possibility. We see very few bodies which possess the proportions which our rules teach us and yet we do not trouble ourselves as to whether bodies are really as exquisitely proportioned and as beautiful as we draw them. For such beauty is at least possible. By contrast, the eyes are accustomed to observe different colours and even take delight in such diversity.

27. My second point is proven by the very definition of painting through which I sought to show that it is colour which makes the painter and which distinguishes him from all other artists.

28. Man has in common with plants that he grows and with animals that he senses. He is man only through reason, and we may well add that the better he uses his reason the more human he becomes. The painter imitates nature in common with all those who pursue the fine arts, and, like sculptors and engravers, he draws. He is, however, a painter only through colour, so that we may reasonably assert that the better he possesses and uses the part of painting which we call colour, the wiser he is as a painter.

29. If, then, it is colour that distinguishes us from other artists and it is colour that makes the special quality of the painter, would we not, if we were to neglect it, also neglect ourselves? Could we diminish its merit without diminishing our own?

30. It remains now for me to convince you that the ancients held colour in high esteem and that it still deserves esteem in our own century.

31. Anyone who has read about the time when the fine arts were in their prime in Greece will know that Zeuxis was highly praised for his knowledge of colour and Apelles for the correctness of his design. Colour and design were thus equally admired at a time when design had reached a level of achievement that is superior to ours today, whereas colour was by comparison less advanced. Yet in our own age,

even though colour has progressed since the invention of oil painting, achieving a high degree of force and beauty, we seem inclined to deny it its due merit. Why is this? Have our eyes suddenly become more discerning? Have we come upon some new fact that was hidden from the ancients and which entitles us to put colour on trial when it was held in such high esteem in the age of Alexander? Very well, gentlemen, let us place colour in the court of judgement. But then let us also try Zeuxis and Titian, who were both as favoured by princes as they were by painting herself. Let us further add Giorgione, Tintoretto, Veronese and all the Venetians, and also Rubens and his school. The only crime these great men can be supposed to have committed is to have been sensitive to the beauty of colour. If this is so, gentlemen, then I doubt whether anyone in this company would not find himself guilty of the same crime when considering attentively these miracles of art, these admirable works where no effort has been spared in order to allow colour to appear with all its charms. Therefore, gentlemen, since we ourselves succumb to the charms of colour, and since you too would be found guilty were you to indict these great men whose works enchant you and make you forget what might be missing in them, I suggest that you cherish this beautiful enchantress and work to perfect this beautiful part that makes us painters, allowing us to excel in a domain that is well regarded and admired by those who have a discerning taste.

32. In conclusion, gentlemen, I hope you will agree that colour is an essential part of painting which contributes more than any other to the attainment of the painter's aim and to the perfection of his work; that it distinguishes our art from all the others; that therefore it is as necessary as design; that we cannot diminish it without diminishing the merit of painters; and finally, that it merits our admiration as it has merited in the past the admiration of the ancients.

9 Charles Le Brun (1619–1690) 'Thoughts on M. Blanchard's Discourse on the Merits of Colour'

Blanchard's 'Conference on the Merits of Colour' (see IC8) was met by a swift and powerful response from within the Academy itself. On 9 January 1672 two conferences were given, challenging his arguments. The first was by Jean-Baptiste de Champaigne, a cousin of Philippe de Champaigne, whose conference on Titian had initiated the conflict the previous year (see IC7). Here we reproduce the second and more cogently argued of the two, given by the director of the Academy himself, Charles Le Brun. Le Brun had been ill and unable to attend the Academy's monthly assembly on the occasion of Blanchard's lecture. However, he sought to answer the issues which his younger colleague had raised with a degree of finality. Where Blanchard had argued that colour is the 'specific difference' which distinguishes painting from all the other imitative arts, Le Brun contends that design retains its primacy, for colour cannot exist without design: were it not for design, 'colour by itself could not depict even the slightest fold of drapery.' He repeats the familiar charge against colour that it is variable and inconstant, changing in response to conditions of light and atmosphere. Colour belongs to mere matter or substance, whilst the more noble quality of design is proper to the intellect or mind. Finally, against Blanchard's claim that colour was held in high esteem by the ancients, Le Brun makes recourse to the famous story of the origin of painting, pointing out that the shepherdess of the story is said to have traced her

lover's outline on the wall without the use of colour. In the last part of the lecture, Le Brun uses the occasion of the recent opening of the French Royal Academy of Architecture to suggest that the three major arts of painting, sculpture and architecture should all be united under the authority of design. The text of the conference was first published by André Fontaine in *Conférences inédites de l'Académie royale de Peinture et de Sculpture*, Paris: Minerva, 1903, pp. 35–43. It has been translated for the present volume by Katerina Deligiorgi.

To speak well of the merit of something, one must first have an idea of the nature of the thing. Now, true merit is that which stands on its own and does not require anything extraneous. Therefore to discover the respective merits of design and of colour, and to distinguish between them, we must consider which of the two things is the more self-sufficient and independent than the other.

I propose the following theses:

That design consists of two parts, one that is intellectual or theoretical, and one that is practical.

That the intellectual or theoretical part depends on imagination alone, that it can be expressed with words, and that it extends through to all the other products of the mind.

That the practical part of design, insofar as it presupposes the intellectual part, depends on the imagination as well as the hand; it too can be expressed with words.

It is this latter, practical side of design that with the help of a pencil gives form and proportion and which imitates all visible things, even expressing the passions of the soul without the need for colour except for showing blushing and pallor.

We may add here that design imitates everything that is real whereas colour only represents what is accidental.

For we are all agreed that colour is itself but an accident produced by the reflection of light and that it varies according to circumstances. By night and under the illumination of a torch, green will look blue, and yellow will look white. So it is that colour changes depending on the light that falls on it.

We should also note that the colour we see in paintings depends on the pigments that are used to produce it: its tint and hue cannot vary unless this material base itself is altered. We cannot produce, for instance, green from red nor blue from yellow. We may thus say that colour is wholly dependent on matter and thus that it is less noble than design, which pertains to the intellect alone.

We could add here that colour also depends on design inasmuch as colour alone could not represent any figure whatsoever were it not for the guidance of design.

Design is indeed utterly necessary for colouring: if it were not for design which gives it form, colour by itself could not depict even the slightest fold of drapery. Without design it would be impossible to organize the distribution of colours upon the canvas. If design were of no account, then colour-grinders would be of equal rank with painters, for they too use colours and have almost as much knowledge in the practical application of colours as painters do.

Thus we see that it is design and not colour that establishes the merit of painting.

If, as we have said, the merit of something is proportionally greater the less it depends on extraneous causes, then it would follow that the merit of design is infinitely greater than that of colour, which owes all its lustre to design. We should desist, therefore, from elevating colour too high and we should not pretend that we owe our paintings to it, or that without colour there would be neither painters nor painting. As we have just seen, design precedes and guides colour, endowing it with its brilliance and splendour. If we remind ourselves of the ancient story about the origin of painting, we can see that colour had no part in it. We are told that the shepherdess who drew the portrait of her beloved had neither colours nor brushes at her disposal, but an awl, or at best a pencil, with which to trace the image of her lover. Despite the fact that no colours were used in its making, it is this first portrait that the ancients unanimously regarded as the origin of painting.

It is thus easy for us to conclude that it is not colour that makes the painter or the painting. Nonetheless, I agree that it does contribute to the ultimate perfection of painting, in the same way that a lovely complexion contributes to the perfection of a face with beautiful features.

Certainly a painter cannot reach perfection if he cannot apply colour properly, and likewise a painting cannot be considered accomplished in every respect if it lacks colours that are expertly and sparingly applied. But I would also say that such expertise and prudence are acquired through design and that, in a word, the role of colour is exclusively to satisfy the eye, unlike design, which satisfies the intellect.

Since paintings aim to please both the senses and the intellect, colour has its own part to play, as I have just said, in the perfection of the work.

Therefore we should not neglect it, nor should we hold it in low esteem. On the contrary, we should apply ourselves to its study with care. We should, however, let design be our guide, leading and directing our study like a compass so that we do not become submerged in the ocean of colour in which many drown who seek refuge there.

In order to avoid those dangers, we must apply ourselves with assiduity to the study of design. To encourage you in this study, gentlemen, I would like to draw your attention to the eloquent discourse in praise of architecture which was delivered at the opening of the Academy of Architecture, in which design was given the highest praise for enabling architecture to create its most beautiful ideas.

It is design that enables the architect to trace the plans for the great edifices, the bridges, the elevations, the fortifications, the public squares and all the splendid structures that architects create. For a proof that it is design which perfects the architect's art we need look no further than the teachings of Vitruvius. Vitruvius argues that it is necessary for the architect to master design and to know not only how to draw buildings but also the human body, because it is on the proportions of the body that he models the proportions and even the parts of his great structures.

Vitruvius teaches us also that columns are drawn from nature's most magnificent creation, for their proportions correspond to those of the human form, some being modelled on the male body, others on the female, and still others on the figure of young girls.

He shows us, therefore, that the architect must have a thorough knowledge of proportions and that he must be able to draw correctly everything that he sees in

nature, for without this he would be unable to devise the ornaments which adorn buildings. How could an architect create pyramids and obelisks laden with hieroglyphs without design?

How else could architecture bring to the light of day superb mausoleums, marking the greatness of those who are buried there, or again magnificent triumphal arches, those splendid pedestals invented by design to carry the statues of conquerors and images made of marble, representing the feats of battle and the triumphs of the victors.

It is design that gives form and proportion to the marble and bronze statues raised to honour virtuous men. Indeed, the wisest and most celebrated of sculptors owe the beautiful shape and correct proportion of their figures to design.

In short, architecture and design are the same thing insofar as it is design that enables both the painter and the sculptor to become architects. [...]

In our own times, Pietro da Cortona, Andrea Sàcchi, Alessandro Algardi, and the Cavalier Bernini, who is still alive, demonstrate through their achievements that a painter and a sculptor can, if he is a good draughtsman, also be a good architect.

And if one day our monarch were to learn of the union and harmony existing between painting and architecture, he would no longer wish to keep them apart, but would form a single school instead of the two separate ones he has established.

I am further convinced that if the pressing affairs of our protector, the Superintendent of the Royal Buildings, allowed him a pause for reflection, he would join painting and architecture together in a single school, as they are joined in the works they produce. Then, gentlemen, you will recognize the value of design and will have no difficulty in discerning its superiority and in granting it a place infinitely higher than that of colour.

It will be design, gentlemen, that will allow you to work for the renown of the French School, for it will enable you to create works rich in allegory as well as in ornament which fittingly celebrate the glorious state of France today under the reign of Louis XIV, the greatest and most victorious monarch France has ever known.

10 Roger de Piles (1635–1709) from *Dialogue upon Colouring*

With the publication of the *Dialogue upon Colouring* in 1673, Roger de Piles once again raised a challenge to the authority of the Academy, assuming the role of the leading theorist of the partisans of colour. Svetlana Alpers has suggested that he employed the dialogue form in order to advance conversation as an appropriate form of response before a painting and that this intimate dialogue between amateurs is his alternative to the public conferences instituted at the Academy (Alpers, 1991). The figure of Damon presents the arguments for design, whilst Pamphilus seeks to persuade him of the merits of colour. Through Pamphilus, De Piles makes a crucial distinction between colour (*couleur*), the physical property of objects that renders them visible, and colouring (*coloris*), the part of painting by which the artist imitates the appearance of objects. By breaking with the idea that there is any direct correlation between the 'colouring' employed by the artist and the 'colours' which he imitates, he shows that the correct use of colour is as much the work of the mind as is design. Like Blanchard (see IC8), he maintains that it is colour which differentiates painting from the other arts. But he also refutes Le Brun's counter-argument

that colour is dependent upon design because it cannot imitate objects on its own (see IC9). Reversing the traditional equations of colour with matter and design with the intellect, he likens design to the body and colour to the mind or soul. Just as the body attains its true perfection only once it is animated by the soul, so painting attains its true excellence only when it is perfected by colour. Colour has hitherto been neglected because it cannot easily be formulated in rules and precepts, escaping the doctrinaire approach of the Academy. De Piles voices cautious criticism of Poussin's relative neglect of colour, whilst praising the *beau fard* (beautiful artifice) of Rubens. The positive connotations which he gives to this term are obscured by the English translator's choice of 'speciousness'. For this reason, we have occasionally given the original French term in square brackets in the text. De Piles turns the traditional criticism of colour's deceptive qualities into praise for its capacity to charm and deceive the eye. The 'colouring' by the painter does not serve merely to imitate the colours we see in the world but creates autonomous effects whose harmonious arrangement on the canvas is one of the principal sources of our pleasure in painting. *Dialogue sur le coloris* was first published in Paris, by Nicolas Langlois, in 1673. The following excerpts are taken from the translation by John Ozell, *Dialogue upon Colouring*, London: Daniel Brown, 1711, pp. 3–10, 16–19, 28–31, 36–8.

Pamphilus and Damon, some time since, after the breaking up of the *Academy* of Painting, not knowing how to dispose of themselves the remainder of the Day, thought fit to give me a visit. And as they are Men of Good Merit, and not only Lovers, hut very good Judges of Art, I thought I cou'd no way better acknowledge their Civility, than by shewing them some Pictures and other Curiosities I had receiv'd the Day before from Rome. The first I shew'd them were five or six Pictures of a middling size, which they were mightily pleas'd with; and afterwards, upon my pointing to a large *Bacchanal* (a Picture representing the Feasts of Bacchus) which an ingenious man had copied for me after Titian; behold (cried Damon) abruptly, the Subject of our Quarrel! and turning towards Pamphilus, this I hope will please you, said he, since you are such a Lover of fine Colouring.

It is true, said Pamphilus, I am sensibly touch'd with the Beauties I see in that Picture, and am heartly vex'd that the generality of Painters will not so much as endeavour to discover them, in order to practise them.

May I be the judge of your difference, interrupted I, pray what is your Quarrel?

We just now left the Academy, reply'd Pamphilus, and in our way hither, Damon and I entertain'd our selves with what had pass'd at the Conference.

I presently thought, since my Picture of Titian was the occasion of reviving the Dispute, that the Academy had been treating of *Colouring*. I desir'd 'em to impart to me what they had heard in that Conference (which they readily granted) and to engage 'em to it the more, I kept them to Sup with me; in the mean while we went through all the Curiosities that had been sent me. At Table we talk'd of nothing but News, but drawing afterwards nearer the Fire, I put 'em in mind of their Promise; Damon said, that in order to let me into the whole thing, and to give me the more Pleasure, he wou'd take it from the beginning and wou'd do it by way of Dialogue; that Pamphilus, if he pleas'd, shou'd be the Respondent; and he himself wou'd make what Objections he cou'd think of against the Merit of *Colouring*, which had been the Subject of the Conference in the Academy (for Pamphilus you must know was an

extreme Lover of that part of Painting). I signify'd my Thoughts that it would be the best way in the World and Pamphilus yielding to it, Damon with his Eye on him began thus.

Pray, says he, let me first of all ask you, what it is you call *Colouring*?

It is, answers Pamphilus, a part of Painting by which the Painter knows how to imitate the Colour of all natural Objects, and to give to artificial ones that Colour which is the most advantageous to 'em for deceiving the Sight.

And pray what do you call *Colour*? proceeds Damon.

To answer you like a Painter, says Pamphilus, and to let alone any Philosophical Disputes, namely, whether it be any thing real, or whether it be only the Refraction of Light with the Modification of the Body coloured: I say, *Colour* is what renders the Object sensible to Sight. Now as painters are to consider two sorts of Objects, the Natural or that which is true, and the Artificial or that which is painted; they ought likewise to consider two sorts of Colours, the Natural and the Artificial. The Natural Colour is that which renders actually visible to us all the Objects which are in Nature; and the Artificial is the Materials which Painters make use of to imitate those Objects: And in this sense we may call those artificial Colours which are on the Painter's Palette, since it is only by the Artifice of their Mixture, that the Colour of Natural Objects can be imitated. A Painter ought to have a perfect Knowledge of these two sorts of Colours; the Natural, that he may know what he is to imitate; and the Artificial to make a Composition and a Teint capable of perfectly representing the natural Colour. He shou'd likewise know that in the Natural Colour there is the true Colour of the Object, the reflected Colour, and the Colour of the Light: And among the artificial Colours he ought to know those which have a Friendship together (if I may so say) and those which have an Antipathy; he shou'd know the value of 'em separately, as also comparatively with each other.

But what signifies it to know this Friendship and this Antipathy of Colours, reply'd Damon, since all that is to be done, is, by the mixture of artificial Colours, to imitate those that are natural to the Object before us.

Nature, replied Pamphilus, is not always fit to imitate; a Painter must chuse her according to the Rules of his Art, and if he does not find her such as he expects, he must correct what is before him. And as the (*Designer* or *Drawer*) does not imitate all he sees in a faulty Model, but on the contrary, in the Proportions and the Colours where he finds it most convenient, he alters the Faults he meets with: So the *Painter* should not imitate all the Colours that present themselves indifferently; he ought only to chuse those he likes, to which (if he thinks fit) he adds others that may produce such an effect as he fancies, for the Beauty of his Work; he not only endeavours to render every particular Object Beautiful, Natural and True, but he likewise studies the Union of all together; sometimes he takes from the Vivacity of Nature, and at other time she adds to the Lustre and Strength of the Colours he meets with.

But what will you say, cried Pamphilus, if I shall prove, that this Strength and Vivacity you speak of, tend only to the more perfect imitating of Nature? and that the Pieces where this is wanting, are weak and penurious. To be satisfied therefore of this, you must consider, that a Picture is a flat Superficies, That the Colours cease to have their first Freshness some time after they are laid on; and lastly, That the Distance of the Picture causes it to lose some of its Lustre and Strength; and that

therefore it is impossible to supply these three things without Artifice. A good *Painter* ought not to be a Slave to Nature; he ought to be her Arbiter and judicious Imitator; and provided a Picture has its Effect and imposes agreeably on the Eye, it is all that can be expected of it.

I see, said Damon, you wou'd have a *Painter* let nothing escape him that is for the farther Advantage of his Art.

Most certainly, replied Pamphilus, and you are very sensible a Picture cannot be perfect if one of the parts of a Painting be wanting; and that a Painter is not a Master of his Art if he is ignorant of any one of the Parts which compose it, I should therefore as soon blame a Painter for neglecting the *Colouring*, as for not *Disposing* his Figures so advantageously as he might have done, or for *Drawing* them ill.

It is certain, replied Damon, that a Work is never perfect, so long as there is any thing wanting; but you will have the *Colouring* to be as necessary a part of Painting as the *Drawing*?

Why not, says Pamphilus, do you not know that you destroy the whole if you take away a part, especially a part that is so essential to its Whole, as is that of *Colouring* to the Art of Painting?

If I apprehend you right, replied Damon, you mean that all Objects falling under the Sight no otherwise than by the Colour, and being distinguish'd from each other only by that, they ought to be imitated in their Colour as well as in their exterior form: and I grant you that. But what will you say when I shall show you some Pictures of Polydore de Caravage, which are reckoned some very excellent Pieces of Painting, though they are only painted in one and the same Colour, in *claro-obscuro*? (black and white.)

It is true, said Pamphilus, those are very fine Pieces; but it is as true, that they are no true Works of Painting, and are very far from deceiving the Sight: For you your self grant, that to imitate Nature, we ought to imitate her as she appears to us, and that she appears to us no otherwise than under the semblances of Colour.

But, proceeds Damon, though a Piece be but of one and the same Colour, yet if the Lights and Shades are so well manag'd as to look like a piece of Sculpture, what will you say then?

I shall say then that there is nothing wanting, reply'd Pamphilus, but it is a true Piece of Painting; since in the Design and Colour it will imitate a work of Sculpture which you suppose. The Beauty of *Colouring* does not consist in a multiplicity of different Colours, but in their just distribution, so that the painted Objects have the same colour as the true; a painted Stone for example to resemble a natural one; Carnation to appear true Flesh; and in a word, that not only each particular Object do perfectly present the Colour of those it imitates; but that they altogether make an agreeable Union throughout the whole Piece.

Since we are upon Works of *Claro-obscuro*, interrupted Damon, pray tell me under what part of Painting do you comprehend the knowledge of Light and Shades?

Under *Colouring*, reply'd Pamphilus, since in Nature, Light and Colour are inseparable; since whenever there is Light there is Colour; and wherever you find Colour, you will likewise there find Light. Thus *Colouring* comprehends two things; the local *Colour*, and the *Claro-obscuro*. The local *Colour* is that which is natural to each Object, and which the Painter ought to improve by comparison; and the

knowledge of this comprehends likewise the knowledge of the Nature of Colours; that is to say, their Union and their Antipathy.

The *Claro-obscuro* is the Art of distributing, to advantage, the Lights and Shades, not only upon the particular Objects, but likewise upon the general Picture. This Artifice, which but few Painters have been Masters of, is the most powerful means of setting off the local Colours, and the whole Composition of a Picture.

* * *

I imagin'd, proceeds Damon, that the *Colouring* was in Painting no more than an *Integrating* part, (as the Philosophers speak) which renders the whole more entire and perfect: Just as we consider an Arm or a Leg, or any other Part, without which a Man is still a Man, tho' less entire and less perfect, and thus, without the *Colouring* a Picture does not cease to be a Work of Painting, though a less perfect one.

I see, says Pamphilus, you have never consider'd what Painting is, and are ignorant of its Definition. *An Art, which by the means of exterior Form and Colours imitates upon a flat Superficies, all the Objects that fall under the Sense of Seeing.* This, in my Opinion, is a just Definition, since it gives a perfect Idea of Painting, and distinguishes it from all other Arts.

I confess, said Damon, I never well consider'd it.

Now if you mind, said Pamphilus, you will see that the *Colouring* is not only an essential part of Painting, but is likewise its *Difference*; and consequently the part that makes the Painter; as *Reason*, which is the difference of Man, is what makes Man.

And what will become of *Drawing*, reply'd Damon?

Drawing, answers Pamphilus, still holds its Place, since it is an essential part of Painting, without which Painting cannot subsist, any more than *Colouring*.

In short, says Damon, you would have *Drawing* to be the *Genus* of Painting, and *Colouring* to be its *Difference*?

Right, said Pamphilus; for the *Genus*, you know, communicates itself to several Species, and for that Reason is less noble than the *Difference*, which is a prerogative proper to its single Species; and thus the Degree of *Animal*, which is the genus of Man, communicates it self indifferently to Man and Beast, and the Degree of *Rational*, which is the *Difference* of Man, is communicated to Man only.

To what other arts, reply'd Damon, would you have *Drawing*, to communicate itself?

To Carving, replies Pamphilus, to Graving, to Architecture, and to other Arts which give Measure and Proportion.

But the *Design* of a Sculptor, reply'd Damon is not the same as that of a Painter; for the one is *Geometrical* and the other *Perspective*.

I answer you first, said Pamphilus, that the different manner of Communication does not hinder the thing from communicating. Secondly, it is certain, that the Design of the Sculptor and Painter is the same essentially; that both are founded on certain Proportions; and what is in Perspective may be measur'd like what is Geometrical: And lastly, it is manifest, that Sculptors make use of Perspective in their *Basso relievos* as Painters do in their Pictures.

I agree, said Damon, that Designing is communicated to several sorts of Arts but may it not be said, that Colour likewise communicates itself in the same manner, and that Tapestry-makers and Dyers use it as well as Painters?

As for Tapistry work, reply'd Pamphilus, I don't think it differs from that of Painting; Tapistry-makers, like Painters, represent the Colours and Forms, which are in Nature. Their Colours are fix'd in the Wooll, as the Painters Colours are in the Clay or Minerals, which they make use of; and this Difference of Materials, you know, is never essential. As for the Objection of Dyers, you might have spar'd that, and not have brought Dyers into the same Question with Painters; however, you shall be answer'd. Dyers, it is true, understand something of *Colours*, but not of *Colouring*, which is now under debate. That part of Painting which is call'd *Colouring*, goes often by the name of *Colour*; 'tis commonly us'd so; and this Ambiguity occasion'd your making the Objection concerning the Dyers; and yet there is a great deal of difference between *Colour* and *Colouring*; and I have shewn you, that *Colouring* is not, either White, or Black, or Yellow or Blue, or any such like Colour; but the *understanding* of these same Colours, which the Painter makes use of, to imitate natural Objects, and this Understanding the Dyers have not.

However, reply'd Damon, you must grant me, that *Drawing* is the Foundation of *Colouring*; that it supports it, that *Colouring* depends upon it; whereas it does not depend upon *Colouring*, since *Drawing* may subsist without *Colouring*, but *Colouring* cannot without *Drawing*.

Supposing all this to be so, says, Pamphilus, what would you infer from it?

That *Drawing*, reply'd Damon, is more necessary, more considerable, and more noble than *Colouring*?

You are not aware, continued Pamphilus, that whatever you think you have been saying in Favour of Drawing, concludes nothing to its Advantage, in prejudice of *Colouring*. On the contrary, you thereby shew, that *Drawing* alone is something imperfect with respect to *Painting*, for though Drawing is the Foundation of *Colouring* and subsists before it; yet it does so, only that it may receive its whole Perfection from it: Nor is it surprizing, that the *Receiver* should have its Being and subsist before what is *Received*. It is the same with all *Matter*, which is to be Dispos'd, before it receives its Perfection from substantial Forms. The Body of Man, for Example, ought to be entirely form'd and organiz'd before the Soul be receiv'd into it. And in this Method it was that God make the first Man; He took Earth, he form'd a Body of it, he endu'd it with all the necessary Dispositions, then he created the Soul, which he infus'd therein for the perfecting of it and with it MAN.

* * *

But pray, continu'd I, what do you take to be the reason for the Indifference the Generality of Painters have for fine *Colouring*?

It proceeds in my Opinion from several Causes, said Pamphilus. I have already told you that it is not common for Men to esteem a thing or to have it at Heart, when they do not understand it, and there are but few Painters who understand this Part of Painting. One wou'd think to hear you talk, cry'd I, that *Colouring* was a very difficult thing.

More difficult than you imagine, said he to me; and all I have to say to you on this Subject is, that for near three Hundred Years since Painting was reviv'd, we can hardly reckon six Painters that have been good Colourists; whereas as we may reckon up at least thirty who have been very good Draughtsmen. The Reason is, because Drawing has Rules founded upon proportion, upon Anatomy, and upon a continual

Experience of the same thing; whereas Colouring has not yet any well known Rules: and the *Experience* that is made in it, being almost always different, because of the different Subjects that are handled, cou'd never yet be able to establish any very certain and precise Rules for it.

What, replies Damon, has Colouring no Rules?

I do not say so, answers Pamphilus, but only that they are not very much known.

Do you think, continued Damon, that Titian and other good Colourists did not understand these Rules?

I believe, said Pamphilus, that they knew the best part of them; but Giorgion, Titian, Rubens and Vandike, more than the others.

Nay, said Damon, what they have left us are so many publick Books, which may serve for the Instruction of all Painters, who need do no more than examine their Works well, copy them for some considerable Time, and make such Remarks there-upon, as may be thought necessary for their own Improvement.

That is not all, replied Pamphilus; a great many Painters have done what you speak of without any success.

Pray then, reply'd Damon, let us know which way wou'd you have them go to Work?

In the manner you prescribe, said Pamphilus: But besides that, they must have a Turn of Mind to make Advantage of every thing, to observe nothing but what is worth Observation, and to penetrate into the true Causes of those Effects that are admir'd. You said very well, that those great Mens Works were Books which contain'd the Precepts of Colouring. But do you not know, that all sorts of Persons are not capable of understanding all Books and improving by them, especially such difficult Books as those are? There are Painters who have copied Titian for many Years together, who have examin'd him with Care, and made all the Reflections they were capable of; and yet, not having made those they shou'd have done, they have never comprehended him, and therefore it is that the Copies which they made with all the Care that was possible, and which they fancy'd to be with very great Exactness, are still very short of the Conduct that is visible in the Originals.

Was not Poussin, said I, such a one? Speak ingeniously; for tho' he copied the Works of Titian, so much as he did, his own have not much of him.

Now you mention a Man, replied Pamphilus, whose memory will ever be dear to Posterity. He was so Perfect a Master of Draught; he handled his Subjects so learnedly; in short, he knew so many other necessary parts of Painting, that he may be well forgiven if the Pains he took in searching after fine Colouring did not succeed with him.

You own then, reply'd Damon, he did not comprehend the Artifice which is in Titian's Pieces?

Most certainly, said Pamphilus, and the greatest part of his Works confirm it.

It is very certain, that after he had copyed Titian's Works, his own had something of 'em, but then it was only superficial and if he had really comprehended the Maxims, the Finesses and Delicacies of Titian, he would have made Advantage of them; he had too much good Sense not to have done it. The same Spirit which made

him conceive the Beauties of Titian's Works, in so much as to bend himself strenuously to copy them for the sake of the *Colouring*, I say, this same Spirit, far from making him depart from it, wou'd have caused him diligently to have cultivated it, had he penetrated into that part; and his last Pieces, which are the weakest in point of Colour, wou'd have been the strongest.

* * *

You abandon your Friend Rubens, I see, interrupted Damon. Are you fallen out with him since I heard you so much extol his Works?

I was just going to speak of him when you interrupted me, said Pamphilus, tho' I have nothing to add to what I have said of him heretofore. I shall only say, since we are fallen upon the Subject, that the best Counsel I can give a Painter (if I were capable of giving him any) shou'd be once a Week for the Space of a Year to visit the Gallery of the Luxembourg, to lay all things else aside, and to spare nothing for that purpose. That day wou'd be undoubtedly the best spent of any in the Week. Rubens is methinks the Man of all Painters who has made the Road to Colouring more easy and clear of Incumbrances; and the Work I speak of, is the *friendly hand* to deliver the Painter from the Shipwreck wherein he may be innocently engag'd.

And ought to be added to the *Regimen*, said Damon smiling. I know well enough, continued he, that Rubens is one of your Hero's in Painting, and that you have always esteem'd the Gallery of Luxembourg as one of the finest Things in *Europe*, if we except (you'll say) the Manner of the Design, in many Places. But every body has not your Palate, and those who are of a contrary Opinion, say that there is but little Truth in Rubens's Works when narrowly examin'd, that the Colours and Lights are exaggerated, that they are only Specious [*que ce n'est qu'un fard*], and in short that it is not as Nature is commonly seen.

Specious! [*O le beau fard!*] cry'd Pamphilus, wou'd to God, Friend Damon, the Pictures that are drawn now-a-days were *So Specious!* Are you ignorant that Painting is nothing but *Speciousness* [*que la Peinture n'est qu'un fard*], that it is its Essence to deceive, and the greatest Deceiver in that Art is the greatest Painter. Nature is of herself ungrateful, and he that aims at copying her simply as she is, and without Artifice, shall always produce something poor and of a very mean manner. What you call Exaggeration in the Colours and Lights, is an Act of wonderful Ingenuity which represents the painted Objects truer (if one may so say) than the true ones themselves. And thus the Pictures of *Rubens* are more beautiful than Nature herself, who seems to be nothing but a Copy of that great Man's Works. And tho' the things after a narrow Examination shou'd not be as exact, as you suppose, what matters it, provided they *appear* so; since the End of Painting is not so much to convince the mind as to cheat the Eye [*tromper les yeux*].

This Artifice, says Damon, I think marvellous in great Works.

And in those too, reply'd Pamphilus; wherein it is apparent *Rubens* has made it more sensible to such as have a Capacity to attend to it and examine it; for to Persons who have but little Skill therein, nothing is more hidden to them than Artifice.

11 Jusepe Martinez (1600–1682) from *Practical Discourse on the Most Noble Art of Painting*

Martinez was a Spanish painter and engraver whose father had been an artist before him. In his twenties he spent time in Italy, visiting Rome and Naples, meeting contemporary artists, studying the Antique, and generally assimilating the classical values of harmony, balance and strong pictorial structure. From the 1630s he was based in Madrid, where he was on friendly terms with Velázquez, and also made the acquaintance of Francisco Pacheco (see IA3). In 1643 he was appointed a court painter and tutor to the king's son. Martinez's surviving works are almost exclusively of religious subjects. In the last decade of his life he seems to have abandoned painting and turned to writing. His *Discursos practicables del nobilísimo arte de la pintura* was complete by the mid-1670s, but remained unpublished until 1866. The text combines theoretical reflections on painting with an account of the artist's travels in Italy and Spain. In the following extracts Martinez discusses the need for an overarching pictorial unity, and the need to control colour so that it does not disrupt this fundamental unity. He then goes on to discuss what is required for a proper understanding of art, making the case that pictorial art requires more than either abstract knowledge or craft skill. The book's claim on our attention resides in its unique status as a synthesis of the work of mind and hand alike. The extracts from Martinez's Chapters VI 'Concerning Unison', VII 'Concerning Colour', and XIV 'Concerning the Science and Wisdom of the Painter', were translated by Nicholas Walker from J. Gallego ed., *Discursos practicables del nobilísimo arte de la pintura*, Barcelona: Selecciones Bibliófilas, 1950, pp. 86–91, 134–8.

Chapter VI. Concerning Unison

Unison is a necessary requirement without which the work will be lacking in harmony and will not look well. This definition is accepted in music where several voices, no matter how excellent they are, will prove dissonant if they are lacking in harmony and fail to submit to the direction of the choir master. By disposing everyone in his proper place, he will obtain a harmony so sweet and delicate that it will leave the ear in suspense and will produce a unison in which each voice can be distinguished. From this we may conclude that without submitting to the master everything would fall into outrageous confusion. The careful painter will proceed in precisely the same manner in his sketches and models and, in order to find such unison and effect it properly, he will do it first of all in black and white. Thus, in light and dark, the artist will clearly and distinctly perceive the unison which his pictorial subject possesses. For if he uses colour even in his preliminary sketches, he will easily fall into confusion. It may transpire that the artist, enamoured of the beauty of the colours, will fail to distribute light and shade with absolute sureness. I have seen how this can happen to the most experienced masters when they have to produce a work of great importance and difficulty.

As an example of this doctrine, the student is well advised to study the engraving of the finest masters. These will provide sufficient instruction, although certain visionaries and conceited people, ignoring all truth, have condemned this way of studying. It is quite clear that the example set by the ancients has been a cause of the

progress of the moderns. Thus, without beholding the works of the ancients, the moderns would remain in complete ignorance. Therefore every student should be prepared to submit to his teacher, and one who fails to do so can never prove a good pupil. But through obeying this rule, he will avoid disappointment and will quickly benefit from the instruction received.

Chapter VII. Concerning Colour

The colours of a painting are to the eye what the strings of a musical instrument are to the ear. Therefore unison or unity, through which a design becomes harmonious, must be accomplished with moderation as far as colours are concerned lest their vivacity cause them to clash one with another. The student must therefore be warned that there is only one given perfect light and colour for a religious or historical painting. This light and colour will only be found in the principal figures or in the foreground since the other figures, insofar as they recede into the background, according to the space they occupy, will have less and less thereof. Many artists in the desire to enrich and ennoble their works have simply made them ostentatious in colour rather than producing fine examples of art and study, and caused the various figures to clash against one another. Even if the latter were properly disposed and in correct proportion, the painting will win small praise if the artist neglects this harmony in the colours.

The proper choice of colour is an extremely difficult task and is not easily accomplished, even under the instruction of a master, unless the student's natural talent assists him. It is nonetheless true that study and practice go to make up half the talent. All the best masters have attempted in their works to follow what is most beautiful. As I have remarked before, we can see this, for example, in Titian, from whose school all the other colourists have hailed. I mention this example by way of introduction. Many artists have proceeded according to different methods and have produced very splendid works as long as they followed their own natural talents and always fixed their eyes on beauty. But the student should specifically be warned against changing his style lest he fall into confusion. This can happen even with great talents, merely leaving them indecisive and only multiplying their labours. He is fortunate indeed who finds a practical and direct master, handling the brush naturally and without constraint. Such a simple and direct approach will encourage a certain dexterity which is not merely agreeable to behold in itself but also conceals the toil involved and renders the paintings beautiful. But the student should always try and follow his natural inclination so that talent and art may succour one another.

Let us now discuss the question of the appropriate location for a painting. It is necessary to find a place of sufficient illumination in which the vigour and force of the relief will be revealed to advantage. I have seen far too many paintings prove unsuccessful here for failure to heed this warning and to consider the distances required. On the other hand, fresco paintings generally achieve the required perfection precisely because they are executed in their actual location. The student should keep this warning in mind lest he share the experience of many experienced masters whose paintings, though perfect in themselves, did not possess or at least reveal the third part of their intrinsic quality once they had been put in place. It follows that it is

necessary to employ scaffolding as a convenient means of overcoming lack of familiarity with the destined location of the work. If painters were better acquainted with this important consideration, they would not object to this procedure, whatever amount of work may be involved thereby. Scaffolds deserve much credit though it is very seldom given.

In conclusion allow me to cite an incident which occurred with a most prudent master. He was commissioned to produce a number of oil paintings for a very ostentatious chapel and set about the work with much study and care. After producing the paintings to the satisfaction of connoisseurs he brought the works to the church where the chapel was located. His patron arrived and looked at the pictures very briefly. The painter, who was there at the time, asked him how he liked the paintings and received the answer: 'Sir, I never expected from your hands such poor and unfinished work since these are nothing but crude sketches. Please bring them to that degree of perfection that I had expected.' To this the ingenious painter replied: 'The work is not finished, and I cannot be accused until the paintings stand in place. If you would kindly give me the key to the chapel, I shall finish these paintings by myself to the perfection you demand.' He had a wooden enclosure constructed with its own key and door, without any aperture through which he might be observed. After a month, and once the paintings were in place, he invited his patron to visit. When the latter entered and saw the excellent paintings in place he was much amazed to behold such great improvements in so short a space of time. The master's pupils laughed very much because they knew full well that he had not performed the slightest retouching of the pictures. This may teach the student not to show his works or declare them finished until he has seen them in their proper place.

Regarding the application of colour, there are many ways of proceeding. Some artists paint their work in a single approach, finishing them all at once, while others apply a heavy impasto and finish the work with very careful retouching afterwards. Others again make very sure of their design right from the first sketch on the canvas, then apply the pigment very delicately and retouch the work where necessary. This last method is the one that is observed by most masters. It is a matter of no less importance for the student to possess the spirit and desire to bestow impressive greatness upon his works, for there are some ignorant minds who have held the small and delicate aspects of painting in much higher esteem than this. But those so minded will never succeed in accomplishing great works executed in the proper manner. And I have a perfect example of this principle in mind; a great lord commissioned two pictures of the same kind which he then had brought to his palace. He placed both pictures in a position with good light. One picture was twelve hands in height and nine in width, whereas the other was not even a quarter of the size. The great lord was very knowledgeable and experienced in the field of art, having beheld an abundance of works by the more important artists. Three other nobles were present on this occasion and, being eager to learn which was the most excellent and skilful of the two pictures, they asked the lord for his opinion. The latter replied with his customary sagacity: 'They have both been deftly executed, but with this difference – that the great nevertheless always remains great.'

This example may inspire the learner artist to accomplish his works with great esteem, hoping that they may indeed occupy very public sites, like the sumptuous

temples and palaces adorned with terraces and objects of great size, with great pictures that can be appreciated and enjoyed from some considerable distance. The smaller objects placed alongside these greater ones strike us as poor and mean by contrast, even if they have been executed with the same skill and boldness as the former. Thus it is that the prudent master keeps these latter things for his smaller rooms and chambers, his chapels and his lesser sites and places. But let it not be thought that what I have said about such small things here implies little regard for this kind of work, for I do indeed value and venerate the same as is only right. I say simply that the great is always great.

Chapter XIV. Concerning the Science and Wisdom of the Painter

[...] There are three ways of comprehending art. The first involves the concrete knowledge of art, the second involves the techniques and practices of art, and the third involves the foundation of art, the very root and origin of all our other knowledge and understanding of the subject. A general knowledge of art is possessed by many who feel a natural inclination towards this profession and, enchanted by the beauty of the same, acquire further knowledge through practice under the guidance of learned masters, having sought them out and studied with them precisely on account of the difficulties that arise in such fields. In this way they obtain a certain knowledge which could indeed be perfected by understanding if they continued in regular instruction, but which remains merely a worthy desire as long as the substance of that knowledge is not actually put to work. Their own judgement thus remains a matter of fantasy that is lacking in firm foundations, that is incapable of properly distinguishing between a good thing and something better or quite unique and evaluating it accordingly. Such judgement involves nothing more than the recognition of what is good or bad in general and, lacking any deeper reflection, remains content with the simple knowledge it already possesses. The second way of comprehending art, the practical one, is more advanced than the former. It is acquired in the actual production of art in the following way. The practitioner learns this art mechanically, as one might almost say. They proceed by copying and imitating what they see without any greater understanding than is required by the exercise of memory. Let us supply an example: a great orator delivers an excellent speech with all the fundamental means of admirable rhetoric. Now let it be repeated by someone else who fails to understand the content of the speech: he will never be able to perform it with the like degree of vivacity or intelligence as the orator who first delivered the speech. For to read is not the same as to feel what one reads.

The third kind of understanding, which constitutes the very foundation of art, consists in making oneself fully conversant with the nature of symmetry, of anatomy, of the outline and contours of the body. To proceed surely and confidently with regard to perspective, to secure the appropriate disposition of figures and ensure that each occupies its proper place and setting, to realize the particulars of the story depicted in a wholly unified fashion, lending them the requisite degree of illumination and paying careful attention to the intended location of the painting and the point from which it will be viewed: all of this constitutes the perfect understanding and proper foundation that is required in order to exercise sound judgement with

respect to a given work, however complex and difficult the latter may be, and to set about its practical realization on the basis of this knowledge.

I have been prompted to supply these indications by observing the vanity of many who have attempted to produce art and promulgate precepts on the basis of their own imaginings. But it is a manifest and most pernicious deceit to violate the truth in such a fashion, to turn art into a manual skill, to measure without the use of the compass, to look without seeing, to judge and labour without the exercise of reason. All corporeal things that live were fashioned by God with due foresight and proper measure, so that one may neither add nor omit anything that would disfigure the same. We have many examples close to hand. Simply consider a horse, a man, a bull, a lion, or any of the other animals: if they did not possess different forms, symmetries and features, they could never be distinguished one from another. In order to represent these forms with perfection art must enter the lists, and must provide the proper measure that the depiction may be perfect and he who beholds it satisfied. By working with imagination alone, on the other hand, the artist would produce a horse instead of a man, and devoid of the proper parts and features required. In saying this it is by no means my intention to encourage the artist to prepare himself for painting by literally taking up the compass and so forth, for that is a tiresome and tedious approach injurious to the matter. The artist must simply ensure that when he sets to work, the results will appear free and spontaneous instead of forced.

Turning now to those who have no desire to undertake such work themselves, but rather wish to recognize the equality, the artistic character and the perfection of a picture when they behold it, we shall now enumerate, in order to assist them, the parts that are most essential to such perfection. A perfect picture or story, then, must exhibit a certain majestic fullness together with various effects of light and shade that should not disturb our gaze. The principal figures should display the requisite gravity, respect and decorum, each performing his particular function with no suggestion of ambiguity as regards the significance of the action. One should also be able to recognize the figures distinctly set off one from another, all of which should occupy their proper places in accordance with the overall disposition so that even if a multitude is involved the figures neither obstruct nor distract from one another. One must ensure that everything is uniformly combined with respect to colour and artistic finish, presenting thus a unity in which no single part predominates over another. For nothing is more conspicuous than when the various parts of a picture fail to cohere with one another, than where some things stand out over against others and disrupt the overall unity, however excellent these things may be in themselves. If this counsel is heeded, then the general harmonious effect will be esteemed more highly than any dissonance, even if certain things in the painting have been depicted with greater attention and accomplished perfection than others. For this is what unity consists in. It can easily be seen even from good paintings which have committed and continue to commit this fault that our eyes naturally delight in the contemplation of things depicted with the greatest fidelity and fail to take notice the other ones that are also good in themselves. Many artists have availed themselves of the forms of brocade, books, drinking glasses, grasses and flowers of one kind or another, as observed in their natural state of stillness. These give the painter the time he desires and requires since they neither change nor move. Thus the artist succeeds here with

greater patience and productivity and produces works of greater perfection as a result. It is quite another matter with living things which cannot long remain unchanged in state. For the latter a very different kind of study and facility is required.

12 Felix da Costa (1639–1712) from *The Antiquity of the Art of Painting*

Felix da Costa was a Portuguese painter, one of a family of painters, whose father was also an artist. The history of Portuguese art in the period is relatively little known in the English-speaking world, indeed none of da Costa's paintings appears to have survived. Nonetheless, it seems likely that the father had published a Portuguese edition of Dürer's theory of art, that one of his artist sons worked in Paris, and that Felix was in England in the early 1660s (in connection with the marriage of Catherine of Braganza to Charles II). The second half of the seventeenth century was a time of economic depression in Portugal, and the arts languished as a consequence. One of the principal motivations for da Costa's text was to right this situation through the institution of a Royal Academy. He was working on the *Antiguidade da arte da pintura* in the late 1680s, and directed his report to the Portuguese Council of State in 1696 via his patron, the Count of Villarmajor. Da Costa's first line of argument was to establish the credentials of painting as a liberal art, and the painter as a multi-talented intellectual. To this end he began at the top, with the claim that the first artist was God himself. He went on to draw on many sources, notably classical, biblical and Italian sixteenth-century theorists, for a division of art into three 'parts': invention, design and colour. He also took a considerable amount from Vicente Carducho's *Dialogos de la Pintura* which were published in Madrid in 1633. Da Costa's argument was far from merely academic however, including as it did a criticism of the continuing artisanal status of painting in Portugal and an enumeration of the benefits that would accrue to national commerce from the thriving practice of art. But the plea fell on deaf ears. A Portuguese Academy did not materialize until the nineteenth century, and, apart from some fragments which appeared in 1823, Da Costa's report remained unpublished until the 1960s when it was revived by art historians at Yale University. Our selections highlight Da Costa's claim for art's elevated status as well as its practical benefits. They are taken from *The Antiquity of the Art of Painting*, researched and introduced by George Kubler, translated into English by Kubler, George L. Hersey, Robert F. Thompson, Nancy G. Thompson and Catherine Wilkinson, New Haven and London: Yale University Press, 1967, pp. 379–82, 392, 426–30.

In order to set forth the excellence of painting it is fitting to tell of its beginnings and early development. Its Author was the Lord our God Himself, who in the act of creating the first man performed a most outstanding work of divine omnipotence with his own hands.

There are three principal parts to painting: invention, design, and color. Invention includes all considerations of placing the work in the mind by means of representation: such as the adjustment of the perspective plane to fit the subject, the placement of the figures, the posture of each body, and the concordance of the whole. Design includes the execution of all this when it has been thought out in the mind. It also includes the correctness of outlines, the proper anatomy and symmetry of hodies, the proportioning of every part to the whole, and the rules of architecture and

perspective with its diminutions. Color consists of the various hues and their shadow tones in chiaroscuro, their arrangement, and their relative brightness. When these three parts are all put together they reveal the intellectual intent, as well as the skill of the painter.

Painting is the likeness and image of all that is seen, as we see it. It is composed of lines and colors on a flat plane, imitating depth by the disposition of lines and shadows. And it is called painting whether it be executed with pencil, charcoal, wash, or any other medium that represents objects in relief.

This is Socrates' definition: *pictura est imitatio, et representatio eorum quae videntur*. ['Painting is the imitation and representation of that which is seen']. The Greeks called it Zoography, from *graphi* which means to write, and *zoy*, life. Thus it means living writing. Sculpture is included under painting because the rules and preparation are the same. Thus artists should learn one another's methods: the painter, when he paints, ought to consider the sculptor's relief; and the sculptor, when he models, should consider the finish of the painter. The two are actually equivalent when it is a question of sculpture in low relief.

The Lord God created the first man with a body and a soul. Its form and proportion come from clay. The muscles and bones come from blood, choler, phlegm, and melancholy; and He filled his creature with life by making him a soul, a memory, an understanding, and a will.

The painter is the imitator of this divine omnipotence, since when he paints the human figure he creates a body and then instills life into it. He must, however, portray it as mute, giving a soul to his figure by showing its actions. He provides it with flesh by making blood, out of vermilion; with choler, by adding a pale color; with phlegm, by adding white; and with melancholy, by blackening the shadows. When these four colors have been blended, the figure becomes lifelike, and earthly matter has been inspired to life by art.

Thus the Sovereign Artificer taught men how to paint. [1] *Faciamus hominem ad imaginem et similitudinem nostram*, [2] *praesit piscibus maris, et volatilibus coeli, et bestiis terrae, universaeque creaturae terrae, omnique reptili quod movetur in terra*. [Genesis 1]

[1] 'Let us therefore make men in our Likeness.' Thus our Lord wished the painter to make use of intelligence by conceiving in his mind the form the human figure must have, in all its postures, at all ages, with the coldness or warmth appropriate to its years, strong or weak, timid or angry, just or unjust, selfish or loving, happy or sad, proud or humble, as well as other characteristics – for example the kind of clothing, or lack of it, required by different climates, rites, and customs.

These aspects are those of which the portrayal most fatigues the mind, and with which the artist's skill is most concerned. Both sacred and profane subjects come to realization by means of geometry, perspective, anatomy, symmetry, physiognomy, architecture, and philosophy. The last requires the most thought. It is first of all concerned with the Idea, that is, internal intellectual drawing. From this proceeds external drawing, which is the actual execution adjusted to the imagination, set in order for discourse, and refined by the artist's skill.

[2] 'And he had dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth.'

The human body is the most important subject to which the artist can devote his skill, and he must be well aware of the character of muscles and bones, and of their movements, making every other object subordinate to the rule of the human body. This is also the most important kind of drawing. Once it is understood, all other kinds become easy. Here, and here alone, is the perfection of painting to be found. Here the artist must command drawing to represent everything by the interplay of feelings, and by varying the play of muscles to accord with the movements of the bodies.

'So God created man in his own image.' By the baser image we may approach the greater archetype, the Divine Painter. For this reason the painter always seeks perfection. It contains the justest and most accurate proportion and symmetry; from it come beauty, delicacy, grace, and the exact proportions of bodily members: in sum, proportion and grace. These qualities, in turn, help the artist to express the mode of movement, the adjustment of the parts, the liveliness of the action and the play of muscles, the axis of the body, the stance of the feet, and the lights and shadows. So that the figures, though mute, may speak of their actions, and though not really alive, may seem to breathe and, at last, resemble their models.

Formavit igitur dominus deus hominem de limo terrae, et inspiravit in faciem eius spiraculum vitae, et factus est homo in animam viventem. [Genesis 2]

'The Lord God made man from the dust of the earth, and breathed into his face the breath of life, endowed him with a living soul.' The painter imitates his Creator with his colors made of earth, and human creatures are therefore derived from the same principle as the artist's figures. Also the painter models the relief of his subject upon a plane surface. In the same way God utilized the surface of the earth to form Adam. And God took these earth colors and substances, and by means of artistic skill created Adam, and filled him with life. Adam's body being formed of earth, received lights and shadows from its colors, and living spirit from its [Divine] Painter.

Plantaverat autem dominus paradisium voluntatis a principio. [Genesis 2] 'In the beginning the Lord God planted a delightful Paradise.' He made a forest or landscape, before He made man. The painter works in the same way, first creating the effect of receding space with the laws of perspective, and then placing man within its confines. Having made the field and forest of Eden He placed man within them: *in quo posuit hominem.* God created the earth and the sky, and trees, water, fish, birds, four-footed animals, and the greater part of the creatures on earth; and only after this did He create man and place him in Paradise. And when God had finished this, His handiwork, He made Adam. *Apellavit que Adam nominibus suis cuncta animantia.* 'And he called Adam by his name before all the animals,' and made him lord over them. This is what the painter intends and what he imitates. Having made the landscape he does not regard it as finished until its figures are all in place, having already studied by means of geometry and perspective, the diminution of distances, planes, and the foreshortening of bodies; and also the distribution of forms and colors. By means of anatomy he has studied the correctness of contours; by means of history he has studied appropriate expression, and through philosophy he knows about motives, while physiognomy tells him of the emotions. This latter quality is what gives soul to a picture and makes for figures that truly speak, and take precedence over all others.

* * *

The more the arts belong to intellect and understanding, the more decent and noble they are. What art can compete with the noble and spiritual one of painting, to which all branches of knowledge contribute? Without painting's discipline the other arts would be in extreme difficulties peculiar to them alone and found in no other field. Both kinds of philosophy are of use to painting: natural philosophy is altogether its proper subject, and philosophy no less, for knowledge of the affections, virtues, vices, and their expression in the appearances of the physiognomy, as the face is altered successively by joy, pain, effort, anger, fear, madness, and so on. And the study of anatomy is more proper to the artist than even to the doctor, for [the former] does not merely explain the subject, but must account for all its variations in the movement of the members and their actions, and everything that affects each subject according to age, sex, and estate, and according to its passions; whence the variations of drawing have no limits, and lie beyond understanding. Anatomy is accompanied by symmetry, or adjusted proportion, not only of human bodies, but also of beasts, and hence in every visible object, however its particular form or beauty be constituted.

To this added geometry, perspective, and architecture with all its skill, as equally necessary to the painter. Also all sacred and profane history belongs to him, not only to describe them as needed but also to explain with decorum the costumes, buildings, ornaments, customs, usages, and rites of all ages, kingdoms, and nations. Viewed thus, no knowledge is too recondite for at least some occasional use in painting. In painting no work is ever without perspective in the diminution of objects and their parts and members, which create foreshortening; and also in the quantity of the bodies, and in the strength of colors and the diminution of distances. A body of knowledge as immense and unusual as this need be learned only by the painter; and for this reason alone, the other arts must give painting precedence, and conclude that its results are truly miraculous.

* * *

The Most Christian King of France Louis XIV is devoted to painting as the whole world knows him to be. Witness his charter passed in the year 1663 for the purpose of establishing and fomenting the rents granted to the Royal Academy of painting in Paris. Among other things it says:

We have considered that in order to make our Kingdom flourish more and the better to demonstrate the abundance and felicity of [the land] we cannot do anything better or more convenient than to cultivate the sciences and liberal arts, in keeping with the example set by the great kings who came before us: to honor those subjects whose [talents] surpass those of other men, with gifts, prizes, and public honors, so that these [awards] may incite others to emulation, by exerting themselves to become deserving of like honors. Among the fine arts there are none that are nobler than painting and sculpture. Both have always been held in great respect in our kingdom. To those who profess them we should like to bestow tokens of our special esteem. To this end in the year 1648 we established in our fair city of Paris a Royal Academy of painting and sculpture, to which we award special decrees and privileges augmented in the 21st year of our reign. LOUIS.

[...] To encourage art [the King] gave 4,000 pounds to the Royal Academy, as a public [institution] open to any person wishing to practice the art of drawing. The Prime Minister honors [this Academy] with his care, his protection, and with his visits always. The First Painter is rewarded most handsomely for his works, in addition to more than 12,000 pounds he receives annually as salary, as well as a house at the Gobelins factory where everything for the embellishment of the royal palace is kept, such as paintings, sculptures, wood carvings, tapestries, jewelry, and embroidery. There he designs, composes, and corrects everything that is done, all according to the invention and execution he chooses.

In Rome the same King has an Academy which sustains and gives [stipends] to thirteen French members, who study painting in the hope of future fame, at the font from which knowledge of the art of painting forever has flowed. At the beginning of their study, they practice diligently by copying the good works by excellent masters that are to be found in Rome, looking towards the double enrichment of their country by endowing it both with good pictures and good citizens. Some, already advanced in learning, return to their country, with others taking their places. Thus they receive for their art what it deserves in merit and honor for the hard work which its study requires.

This is why foreign nations possess greater advantage – not because of superior genius but rather because they are possessed of higher studies, finer honors, and greater rewards. These circumstances stimulate men to take on difficulties. One detects wisdom in man (as Aristotle points out) when he teaches himself fine works which stem from high custom. Many talents are squandered in Portugal for lack of that study, which alone can lead to due perfection.

[...] Many persons have a fine genius for painting and a large talent for invention; they can perform according to their natural gifts. But when [the painter's] judgment lacks acquaintance with the rules of art, he will fashion only its parts, but he will not achieve their happy unity, in the concordance between the part and the whole that produces them, [so that] all rests upon an equal level of perfection. And since he lacks this kind of awareness he lacks the knowledge to follow his natural gifts, and this is not acquired without a good deal of exercise. In addition [he should have] good intellect and a natural inclination towards an art founded upon [mastery] of the elements demanded in painting. Quintilian asserts that the arts have their origin in nature. What one needs to do is to search for the means by which to enable [art's] continuation, according to precepts and rules, in keeping with the saying of Apelles: *Null[us]a dies sine linea* ['No day without a line']. Thus drawing and more drawing is the proper exercise of academies, whence come many remarkable and skillful men who, as draftsmen, are outstanding in all professions. Drawing is exceedingly necessary for painters, sculptors, and architects, for all three arts require much of it. It is a convenience to engineers, who use it to place figures in perspective, to show planes to foreshorten, to show fortresses as they appear to the eye, [as well as] mountains and adjoining valleys, and any town or city and whatever else the eyes can perceive. For only by means of the geometric plane can [one] comprehend the surface, which is made up of lines without relief or appearance of bodily substance. The plane remains hidden but it serves together with the view of a body when it is drawn, to show the object from within and without.

To gold- and silversmiths [drawing] is quite necessary, for it is a pity that jewelers are blinded by ignorance, admiring any sort of dross and subject that they see from the North. Drawing is like a light leading them obediently [out of] their ignorance. They imagine one cannot progress further for they do not know how to invent anything but cheap and tawdry things. Lacking an understanding of architecture, which they leave to the cabinetmaker's devices, they cast their silver without knowledge of what is being made for them. [Drawing] is essential to wood-carvers, for carving properly in relief, and so that they may invent altarpieces and other works with grace and skill. For they confuse the principle[s] of architecture, which are its order, with the members, such as moldings, Atlantios, seraphim, and children, lost in leaves and branches; which cover up [the wood-carver's] ignorance. Yet his ignorance remains apparent to those who understand [architecture], who strive for the essential and abhor the unnecessary.

[Drawing] is necessary for embroiderers also to gain true knowledge and to make embroideries [like those] of the ancients. [Otherwise], when they attempt figural designs they make them so formlessly that the work is more a discredit than an enhancement. Because they are ignorant of drawing, they need to consult painters for the realization and perfection of the work in designs they can follow.

For navigation, drawing is needed to make sea charts and maps of the earth. It is also useful to engravers for cutting the plate with the burin, as well as for the text figures and the frontispieces of books, as for coats of arms and emblems, poems, and initials and arabesques as well. It is intolerable to say that in this kingdom there is not one engraver whose work is not too deformed, ignorant, and clumsy to show abroad. Our engravers exert themselves only in marking the copper plate with the burin, wasting time, and taking money for monstrous things without form or art, and lacking, not talent, but drawing and instruction.

[Drawing helps] those who wish to be expert in penmanship, in calligraphy, and in the dexterous fashioning of letters. [Drawing aids] those who paint tiles and pottery so that they know what they are doing; for without drawing, no one can make [patterns], being unworthy of the name of painter of pottery. Those who design tapestries without a knowledge of painting can only imitate fault[s] not to look like repairs, which comes to the same thing. Those who enamel need drawing in order to color in light and dark with a sense of what they are about, and to paint what we see on watches and copperplates.

Cabinetmakers [need drawing] to make beds, buffets, counters and other well designed pieces. They should also be able to work out the designs and sketches by others, as well as to make good inventions and renderings of their own. Metalworkers in brass and tin also need drawing to make models and to repair gently with skill and care whatever comes to them. Lacemakers and seamstresses too [need drawing] to sew with imagination and grace by adapting and inventing clothes, and putting them right when they are shapeless, and making neat lace edgings on underwear, all evenly done and durable. There is no art or craft which in whole or in part does not depend upon the art of drawing. For it is impossible to preserve the commonwealth without it and a painter is always of service to any civilized court, as Pliny exactly said: *Pictorque res communis terrarum* ['The matter of painting is the whole world'].

The most useful and necessary kind of drawing represents the symmetry and anatomy of the human body. From this kind of drawing, as from a fountain, many streams arise and flow from high places to a variety of lower ones. The opposite case occurs in the imitation of leaves, which lack proportion, because no defect arises from their being higher or lower, shorter or longer, larger or smaller. Such is not the case with human figures which possess exact dimension in all their parts and varying degrees of grace in their movements.

Since the study [of drawing] is the same for everyone, like its instruction, as well, all who [profess it] will follow truth and will always be guided by good principles. Hence the possession of true understanding. The most inglorious and spirited students will gain sound knowledge and will become consummate [artists]. Even those who are not so active, nor possessed of such lively wit, if at least they labor, can learn how to imitate truth, though of course in an inferior way, not for the want of rules but because they lack genius, which, like grace, is a gift of nature. It is not acquired, but possessed only by those to whom Heaven imparted it at birth. Like courage, it is inborn, and not acquired.

With the establishment of an Academy we shall witness the spread of the art of drawing in this kingdom, [we shall] gain great repute for the [aforementioned] arts. Portuguese talent will be made famous, and [Portuguese] works will shine forth, to be known in foreign countries, and to enjoy applause.

ID

The 'je ne sais quoi'

1 Baltasar Gracián (1601–1658) from *The Hero*

According to the German philosopher Hans-Georg Gadamer, the concept of taste has always extended beyond aesthetics, describing an 'ideal of genuine humanity' (Gadamer, 1975). Indeed, the origins of its modern use are to be found not in discussions of art and beauty, but in the domain of ethics and politics. Central to the new meaning and prominence given to the term in the seventeenth century were the writings of the Spanish Jesuit, Baltasar Gracián. His first publication, *El Héroe* of 1637, somewhat like Machiavelli's *The Prince*, is a handbook for the ideal leader. In describing the qualities or attributes required to act well in courtly and political life, Gracián identifies a domain of judgement which cannot be reduced to rules. Since right action is grounded in consideration of individuals and particular things, an important role is played by the exercise of *gusto*, or taste, and by the *je ne sais quoi* which eludes rational comprehension. Gracián's writings form part of a powerful counter-current to the dominance of rationalism, bringing to the fore subtle modes of perception and judgement which were ignored or marginalized by an exclusive focus on reason. *El Héroe* was first published in Spain in 1637. Our selections are taken from the anonymous English translation by 'a gentleman of Oxford', *The Hero, from the Spanish of Balthasar Gracián, with Remarks Moral, Political and Historical of the Learned Father J. de Courbeville*, London: T. Cox, 1726, pp. 45–7, 141–5. We have omitted the remarks of the learned father. An earlier English translation was made in 1652 by John Skeffington.

Chap. V

That he should have an exquisite Taste.

It is not enough for this great Man, this Hero we are now treating of, to have a good Share of Wit and Ingenuity, and the Gifts of Nature accomplish'd by Art; he must likewise be born with an Elegancy of Taste, and have it perfected by Erudition. Wit and Taste are like two Brothers of the same Origin, and their Qualities are of near Proportion to each other. An elevated Wit is never allied to a mean Taste; the Taste must have an Equality, or otherwise it is degenerate; or rather the Wit itself was but

mean at first: For there are Perfections of different kinds, according as the Sense is more or less noble from whence they spring. A young Eagle can amuse itself with looking upon the Sun, while an old Butterfly is dazzled, and loses the Sight of its weak Eye by doing it; and in like manner, the Strength and Compass of any Man's Parts is known by the Taste that is observable in him. It is a very valuable thing, no doubt, to have a good Taste; but in a great Man this is not much: His Taste must be excellent. And tho' it be one of those Talents, that may be communicated to others, and consequently acquir'd where there is an apt Disposition; yet where shall we find any that have done it? This is an Happiness that accrues to very few.

It may not be amiss to take notice by the by, that a great many People are perpetually applauding their own particular Taste, and, with a good deal of Arbitrariness, condemning that of others; but others are generally even with them: For they too, in their turn, admiring their own Taste, look upon their Adversaries with Scorn and Contempt. Thus has one part of the World been always bickering with the other; and tho' on one side there may be more Folly, on both sides there is enough. But to return. An excellent Taste is a formidable Qualification, and the Terror of every thing that is bad or indifferent in its kind; nay more, the best things dread it, and the most acknowledg'd Perfections are not secure of the Sentence of its Tribunal; for since it is the Rule of the just Worth of things, it examines them to the bottom, and makes as it were a Dissection of them before it gives in its Valuation. As Esteem is a very desirable Good, 'tis a Part of Wisdom and Justice to covet it; and the natural Punishment of such as are too prodigal of it, ought to be a Contempt of their Suffrage. Admiration is generally the Cry of Ignorance, and arises not so much from the Perfection of the Object, as from the Imperfections of our Understanding: Qualities of the first Rank only deserve our Admiration, and herein we ought to be very reserv'd.

* * *

Chap. XIII.

That he should have the *Je ne sais quoi* in him.

This certain something, which the *French* call *le Je ne sais quoi*, that is the Soul of all the other good Qualities requir'd in an Hero, that gives Ornament to his Actions, Grace to his Words, and an unavoidable Charm to every thing that comes from him, is as far above our Thoughts as it is our Expressions; for no Man ever yet did, or ever will be able to comprehend it. 'Tis the Lustre of Brightness, which does not strike us without it; and the Agreeableness of Beauty, which does not please us without it; for it only can give the Cast and Fashion, as I may call it, to all the good Qualities that do adorn us. In a word, 'tis the Perfection of Perfection itself, and what communicates a Flavour to every thing that is good or beautiful in us.

It discovers itself to us under certain Charms, that we cannot explain tho' we are sensible of them: 'Tis a Collection of Parts, the whole of which is very affecting and engaging, whether the Person be speaking or acting; and to examine it a little nearer, it seems to be the Gift of Nature, independent on Art, and what no Rules have hitherto taught us to acquire.

The Desire however of defining it, and the Impossibility of succeeding therein, has put Men upon inventing different Names, according to the different Impression it makes on them. 'Tis at one time, *a certain something*, so majestick and great; at another, *something* so lovely and genteel; in this case, 'tis *a certain something* so bold or so gracious; in that, *something* so lively or so soft; and every one in short gives it an Appellation, according to the different Views it represents. 'Tis a farther Property of this *Je ne sais quoi*, that some perceive it where others do not; for it does not strike all alike, but therein differs, according to the Measure of their Knowledge or Manner of their Sensibility.

What I have hitherto said relates to the *Je ne sais quoi* of what is *fine* and *delicate*, and usually so imperceptible, that it escapes most Men's Observation. What is more gross is universally understood, and makes an Impression upon the Sentiment of the Vulgar, who are touch'd and affected with it, tho' they seldom consider the Reason why.

Some, I know, are of Opinion, that this *Je ne sais quoi* is nothing else, but the Easiness and Freedom of a Person's outward Behaviour; but to make the Definition just, they should add a *Je ne sais quoi* of Easiness, of Freedom, &c. and then they tell us nothing new, but leave the Thing as obscure and undefin'd as it was before: Besides, that this is bounding its Character, which extends to every thing, in like manner as the Sun sheds its Influence upon all the Works of Nature. If the Sun were to refuse its kindly Warmth to the Earth, it would produce no Fruits; and if a Man chances to want this *Je ne sais quoi*, all his fine Qualities are dead and insipid; so that it is not so much a Circumstance, or any outward Property, as it is in the Being and Essence of the Thing itself.

If indeed it is the Agreeableness of Beauty, as I said before, 'tis as much the Flegm that is proper to Prudence, as it is the Martial Fire that suits with Valour; for it goes along with them both. Thus, for instance, we perceive in a Captain a *Je ne sais quoi* of lively Intrepidity, that inspires his Soldiers with Courage and Assurance. In like manner, we perceive in a Monarch, seated on his Throne, a *Je ne sais quoi* of august Appearance, that strikes us with an awful Respect: The one is sprightly, the other majestick; but both inseparable from the Perfection they are intended to signify; in the one case, the Dignity proper for a King upon his Throne; and in the other, the Valour fit for a Warrior in the Field of Battle.

[...]

In a word, this *Je ne sais quoi*, this certain something, without wanting any thing itself, enters into every thing to give it Worth and Value. It enters into Politicks, into Learning, into Eloquence, into Poetry, into Trade, and is equally found in the Conditions of both high and low.

2 Baltasar Gracián (1601–1658) from *The Art of Worldly Wisdom*

Gracián's *The Art of Worldly Wisdom* forms a sort of compendium or summary of his previous writings, expressing in condensed and aphoristic form his key teachings on how to get on in the world. He had already encountered the disapproval of his Jesuit superiors for his book *El Discreto* (The Man of Discretion), a handbook of courtly manners in the

tradition of Castiglione's *The Courtier*. After the publication of his three-part allegorical novel, *El Criticon* (The Critic), completed between 1651 and 1657, his teaching privileges were removed and he was exiled to Tarazona where he died in disgrace. *The Art of Worldly Wisdom* remains the best-known of Gracián's works and it was widely translated into other European languages. Though primarily concerned with the exercise of prudence or correct judgement in the social, political and ethical domains, Gracián's investigation of the nuances of social interaction helped to give rise to a new aesthetic of *délicatesse*, or sensitivity, which relies upon the individual's own capacity for experience and reflection rather than fixed general concepts. It was originally published in Spain as *Oráculo Manual y Arte de Prudencia* in 1647. As late as 1861, Arthur Schopenhauer undertook to produce the twelfth translation into German. Many of its key ideas, however, had long since been disseminated into European thinking. The first of several English translations appeared in 1694 under the title *The Courtiers Manual Oracle or the Art of Prudence*. The following excerpts are taken from the translation by Joseph Jacobs, *The Art of Worldly Wisdom*, London and New York: Macmillan, 1892, pp. 1, 3–4, 7, 14–15, 16–17, 23, 29, 30, 35, 37–8, 51–3, 57, 74, 86, 107, 170–1.

Character and Intellect: The two poles of our capacity; one without the other is but halfway to happiness. Intellect sufficeth not, character is also needed. On the other hand, it is the fool's misfortune to fail in obtaining the position, the employment, the neighbourhood, and the circle of friends that suit him.

A Man at his Highest Point. We are not born perfect: every day we develop in our personality and in our calling till we reach the highest point of our completed being, to the full round of our accomplishments, of our excellences. This is known by the purity of our taste, the clearness of our thought, the maturity of our judgment, and the firmness of our will. Some never arrive at being complete: somewhat is always awaiting; others ripen late. The complete man, wise in speech, prudent in act, is admitted to the familiar intimacy of discreet persons, is even sought for by them.

Nature and Art: material and workmanship. There is no beauty unadorned and no excellence that would not become barbaric if it were not supported by artifice: this remedies the evil and improves the good. Nature scarcely ever gives us the very best; for that we must have recourse to art. Without this the best of natural dispositions is uncultured, and half is lacking to any excellence if training is absent. Every one has something unpolished without artificial training, and every kind of excellence needs some polish.

Keep the Imagination under Control; sometimes correcting, sometimes assisting it. For it is all-important for our happiness, and even sets the reason right. It can tyrannise, and is not content with looking on, but influences and even often dominates life, causing it to be happy or burdensome according to the folly to which it leads. For it makes us either contented or discontented with ourselves. Before some it continually holds up the penalties of action, and becomes the mortifying lash of these fools. To others it promises happiness and adventure with blissful delusion. It can do all this unless the most prudent self-control keeps it in subjection.

Common in Nothing. First, not in taste. O great and wise, to be ill at ease when your deeds please the mob! The excesses of popular applause never satisfy the sensible. Some there are such chameleons of popularity that they find enjoyment not in the sweet savours of Apollo but in the breath of the mob. Secondly, not in intelligence. Take no pleasure in the wonder of the mob, for ignorance never gets beyond wonder. While vulgar folly wonders wisdom watches for the trick.

Recognise when Things are ripe, and then enjoy them. The works of nature all reach a certain point of maturity; up to that they improve, after that they degenerate. Few works of art reach such a point that they cannot be improved. It is an especial privilege of good taste to enjoy everything at its ripest. Not all can do this, nor do all who can know this. There is a ripening point too for fruits of intellect; it is well to know this both for their value in use and for their value in exchange.

Observation and Judgment. A man with these rules things, not they him. He sounds at once the profoundest depths; he is a phrenologist by means of physiognomy. On seeing a person he understands him and judges of his inmost nature. From a few observations he deciphers the most hidden recesses of his nature. Keen observation, subtle insight, judicious inference: with these he discovers, notices, grasps, and comprehends everything.

Know how to Choose well. Most of life depends thereon. It needs good taste and correct judgment, for which neither intellect nor study suffices. To be choice, you must choose, and for this two things are needed: to be able to choose at all, and then to choose the best. There are many men of fecund and subtle mind, of keen judgment, of much learning, and of great observation who yet are at a loss when they come to choose. They always take the worst as if they had tried to go wrong. Thus this is one of the greatest gifts from above.

A Sound Judgment. Some are born wise, and with this natural advantage enter upon their studies, with a moiety already mastered. With age and experience their reason ripens, and thus they attain a sound judgment. They abhor everything whimsical as leading prudence astray, especially in matters of state, where certainty is so necessary, owing to the importance of the affairs involved. Such men deserve to stand by the helm of state either as pilots or as men at the wheel.

Elevated Taste. You can train it like the intellect. Full knowledge whets desire and increases enjoyment. You may know a noble spirit by the elevation of his taste: it must be a great thing that can satisfy a great mind. Big bites for big mouths, lofty things for lofty spirits. Before their judgment the bravest tremble, the most perfect lose confidence. Things of the first importance are few; let appreciation be rare. Taste can be imparted by intercourse: great good luck to associate with the highest taste. But do not affect to be dissatisfied with everything: 'tis the extreme of folly, and more odious if from affectation than if from Quixotry. Some would have God create another world and other ideals to satisfy their fantastic imagination.

Culture and Elegance. Man is born a barbarian, and only raises himself above the beast by culture. Culture therefore makes the man; the more a man, the higher. Thanks to it, Greece could call the rest of the world barbarians. Ignorance is very raw; nothing contributes so much to culture as knowledge. But even knowledge is coarse if without elegance. Not alone must our intelligence be elegant, but our desires, and above all our conversation. Some men are naturally elegant in internal and external qualities, in their thoughts, in their address, in their dress, which is the rind of the soul, and in their talents, which is its fruit. There are others, on the other hand, so *gauche* that everything about them, even their very excellences, is tarnished by an intolerable and barbaric want of neatness.

Know Yourself – in talents and capacity, in judgment and inclination. You cannot master yourself unless you know yourself. There are mirrors for the face but none for the mind. Let careful thought about yourself serve as a substitute. When the outer image is forgotten, keep the inner one to improve and perfect. Learn the force of your intellect and capacity for affairs, test the force of your courage in order to apply it, and keep your foundations secure and your head clear for everything.

Reality and Appearance. Things pass for what they seem, not for what they are. Few see inside; many take to the outside. It is not enough to be right, if right seem false and ill.

Grace in Everything. 'Tis the life of talents, the breath of speech, the soul of action, and the ornament of ornament. Perfections are the adornment of our nature, but this is the adornment of perfection itself. It shows itself even in the thoughts. 'Tis most a gift of nature and owes least to education; it even triumphs over training. It is more than ease, approaches the free and easy, gets over embarrassment, and adds the finishing touch to perfection. Without it beauty is lifeless, graciousness ungraceful: it surpasses valour, discretion, prudence, even majesty itself. 'Tis a short way to dispatch and an easy escape from embarrassment.

Look into the Interior of Things. Things are generally other than they seem, and ignorance that never looks beneath the rind becomes disabused when you show the kernel. Lies always come first, dragging fools along by their irreparable vulgarity. Truth always lags last, limping along on the arm of Time. The wise therefore reserve for it the other half of that power which the common mother has wisely given in duplicate. Deceit is very superficial, and the superficial therefore easily fall into it. Prudence lives retired within its recesses, visited only by sages and wise men.

Trust your Heart, especially when it has been proved. Never deny it a hearing. It is a kind of house oracle that often foretells the most important. Many have perished because they feared their own heart, but of what use is it to fear it without finding a better remedy? Many are endowed by Nature with a heart so true that it always warns them of misfortune and wards off its effects. It is unwise to seek evils, unless you seek to conquer them.

Have the Gift of Discovery. It is a proof of the highest genius, yet when was genius without a touch of madness? If discovery be a gift of genius, choice of means is a mark of sound sense. Discovery comes by special grace and very seldom. For many can follow up a thing when found, but to find it first is the gift of the few, and those the first in excellence and in age. Novelty flatters, and if successful gives the possessor double credit. In matters of judgment novelties are dangerous because leading to paradox, in matters of genius they deserve all praise. Yet both equally deserve applause if successful.

3 Thomas Hobbes (1588–1679) from 'Answer to Davenant's Preface to *Gondibert*'

Sir William Davenant (1606–68) was a poet, playwright and theatre owner who subscribed to the Royalist cause during the English civil war. His long chivalric poem *Gondibert* was written in exile in France in 1650. It was here that he encountered Hobbes, the foremost political philosopher of his time, also in retreat from the war in England. Hobbes was a classical scholar, though his literary work forms only a minor part of his legacy. Nonetheless his comments on Davenant provide a cogent statement of the new attitude to art which was emerging in England in the mid-seventeenth century. This involved an emphasis on the psychological dimension. Not just the unity or harmony of the poem (or painting) is at issue, but the imaginative work required to produce it. In Hobbes' philosophy the mind is conceived as a *tabula rasa* on which the world inscribes itself. He draws upon this wider philosophy to provide a brief account of how the world is got into the poem: how judgement on the one hand, and imagination (or Fancy) on the other, complement each other in the realization of the work of art. Our short extract is taken from *The English Works of Thomas Hobbes*, ed. Sir William Molesworth, vol. IV, London: John Bohn, 1840, pp. 449–50.

Time and education beget experience; experience begets memory; memory begets judgment and fancy; judgment begets the strength and structure, and fancy begets the ornaments of a poem. The ancients therefore fabled not absurdly, in making Memory the mother of the Muses. For memory is the world, though not really, yet so as in a looking-glass, in which the judgment, the severer sister, busieth herself in a grave and rigid examination of all the parts of nature, and in registering by letters their order, causes, uses, differences, and resemblances; whereby the fancy, when any work of art is to be performed, finds her materials at hand and prepared for use, and needs no more than a swift motion over them, that what she wants, and is there to be had, may not lie too long unespied. So that when she seemeth to fly from one Indies to the other, and from heaven to earth, and to penetrate into the hardest matter and obscurest places, into the future, and into herself, and all this in a point of time, the voyage is not very great, herself being all she seeks. And her wonderful celerity, consisteth not so much in motion, as in copious imagery discreetly ordered, and perfectly registered in the memory; which most men under the name of philosophy have a glimpse of, and is pretended to by many, that grossly mistaking her, embrace contention in her place. But so far forth as the fancy of man has traced the ways of

true philosophy, so far it hath produced very marvellous effects to the benefit of mankind. All that is beautiful or defensible in building; or marvellous in engines and instruments of motion; whatsoever commodity men receive from the observations of the heavens, from the description of the earth, from the account of time, from walking on the seas; and whatsoever distinguisheth the civility of Europe, from the barbarity of the American savages; is the workmanship of fancy, but guided by the precepts of true philosophy. But where these precepts fail, as they have hitherto failed in the doctrine of moral virtue, there the architect Fancy must take the philosopher's part upon herself. He, therefore, who undertakes an heroic poem, which is to exhibit a venerable and amiable image of heroic virtue, must not only be the poet, to place and connect, but also the philosopher, to furnish and square his matter; that is, to make both body and soul, colour and shadow of his poem out of his own store [...]

4 Gerrard Winstanley (c.1609–1676?) from *Fire in the Bush* and *The Law of Freedom in a Platform*

During the civil war period Winstanley became the leading figure and principal theoretician of the radical wing of the English revolution. In practical terms he is best known for his involvement with the Diggers, or True Levellers, and their project to cultivate common land at St George's Hill in Surrey. His intellectual production consisted of a series of pamphlets sketching the philosophy of an agrarian communist society. Winstanley did not write on art as such, but in the climate of the Reformation and the religious wars which followed it throughout Europe, the status of art, and of images in general, was of great moment on both sides of the Protestant/Catholic divide (see, for example, Pacheco IA3). In the first extract, from *Fire in the Bush* of 1650, Winstanley draws an absolute distinction between 'true knowledge' and the work of the 'imagination'. For Winstanley 'imagination' stands for all that departs from the knowledge of God, all that is potentially false, idle and misleading in human consciousness. Although his conception is specific to its time, Winstanley's argument stands as an early instance of the conflict between individual consciousness and social conscience which has continued to haunt so many programmes of emancipation. Throughout the modern period, and in a variety of forms, the imagination and the aesthetic dimension have frequently been treated as more of a threat than a promise by social improvers. (For a transatlantic echo of Winstanley's radical protestantism, see ID8; for later manifestations of unease with the independence of art, see *Art in Theory 1815–1900* IIA1 and IIIB9, and *Art in Theory 1900–2000* IIA3 and VC9.) The second extract from Winstanley's writings is from his best-known statement of the future communist society, *The Law of Freedom in a Platform* of 1652. Here the point concerns, not the place allocated to art in the future commonwealth, but its total absence. Various manufactures and handcrafts are allocated their place in social production and education; even music has a role (for girls). Practical knowledge is enthusiastically advocated, while contemplation and book-learning are disparaged. The visual arts are simply not mentioned, a silence which is significant in itself. Both extracts are taken from Gerrard Winstanley, *The Law of Freedom and other Writings*, ed. Christopher Hill, Harmondsworth: Pelican Classics 1973, pp. 220–1 and 362–5.

Fire In The Bush

[...] when all things were produced, and appeared very good in the liking and content of the creating spirit, the word of command was to whole mankind (not to one or a few single branches of mankind), 'Do thou take possession over the fish, fowl, beast; and do thou till the earth; and do thou multiply and fill the earth.' And no part or branch of mankind is shut out by him from this employment.

For as the great earth and the inferior creatures therein are as the commons, forests and delights of God in the out-coasts of the creation: even so mankind, the living earth, is the very garden of Eden, wherein that spirit of love did walk and delight himself principally, as being the head and lord of all the rest.

In this garden are five rivers: hearing, seeing, tasting, smelling, feeling; which we in our age of the world call five senses. And these five water springs do refresh and preserve the whole creation, both of the out-coasts and of the garden.

In this garden, mankind, and in every branch of him, there is a tree of knowledge of good and evil, called imagination; and the tree of life, called universal love or pure knowledge in the power.

When mankind, or the living soul, feeds upon or delights himself in the fruit of that tree of good and evil, which is selfish, unwarranted and unexperienced imagination which is his weakness and disease: then he loses his honour and strength and falls from his dominion, lordship, and becomes like the beasts of the field, void of understanding. For the lord of so great and vast a body as the creation is must know all things clearly, as they be, and not by blind imagination, that leads mankind sometimes astray, as well as sometimes in the right way.

When mankind is guided by imagination, he runs a great hazard upon life and death. This power is he that calls good evil, and evil good, this knows not the creating spirit in inward feeling, but does fancy him to be sometimes one thing, sometimes another; and still dwells in the dark chamber of uncertainty.

And while mankind eats of this tree and delights himself here, he is driven out of the garden, that is, out of himself; he enjoys not himself, he knows not himself; he lives without the true God or ruler, and is like the beasts of the field, who live upon objects without them; and does not enjoy the kingdom within himself, but seeks after a kingdom and peace without him, as the beasts do.

This imagination is he that fills you with fears, doubts, troubles, evil surmisings and grudges; he it is that stirs up wars and divisions; he makes you lust after every thing you see or hear of, and promises delight to you in the enjoyment, as in riches, places of government, pleasures, society of strange women: and when you have all these which you think or imagine to have content in, presently troubles follow the heels thereof; and you see your self naked and are ashamed.

So that the selfish imaginary power within you is the power of darkness, the father of lies, the deceiver, the destroyer, and the serpent that twists about everything within your self, and so leads you astray from the right way of life and peace. And the whole world of mankind generally at this day, through all the nations of the world, is eating of this tree of knowledge of good and evil and are cast out of themselves, and know not the power that rules in them: and so are ignorant of their God. This is the

fulness of the Beast's time, it is his last period; all places, persons and things stink with his imaginary power of darkness in teaching and ruling. Therefore it is that fulness of time in which the restorer of all things will come, to deliver the creation from that bondage and curse, and draw up all things to live in him, who is the true life, rest and light of all things.

The Law Of Freedom

What trades should mankind be brought up in?

In every trade, art and science, whereby they may find out the secrets of the creation, and that they may know how to govern the earth in right order.

There are five fountains from whence all arts and sciences have their influences: he that is an actor in any or in all the five parts is a profitable son of mankind; he that only contemplates and talks of what he reads and hears, and doth not employ his talent in some bodily action for the increase of fruitfulness, freedom and peace in the earth, is an unprofitable son.

The first foundation is the right planting of the earth to make it fruitful, and this is called husbandry. And there are two branches of it:

As first, planting, digging, dunging, liming, burning, grubbing and right ordering of land, to make it fit to receive seed, that it may bring forth a plentiful crop. And under this head all millers, maltsters, bakers, harness-makers for ploughs and carts, rope-makers, spinners and weavers of linen and such like, are all but good husbandry.

The second branch of husbandry is gardening, how to plant, graft and set all sort of fruit trees, and how to order the ground for flowers, herbs and roots for pleasure, food or medicinal. And here all physicians, chirurgeons,¹ distillers of all sorts of waters, gatherers of drugs, makers of wines and oil, and preservers of fruits and such like, may learn by observation what is good for all bodies, both man and beasts.

The second fountain is mineral employment, and that is to search into the earth to find out mines of gold and silver, brass, iron, tin, lead, cannel,² coal and stone of all sorts, saltpetre, salt and alum-springs and such like. And here all chemists, gunpowder-makers, masons, smiths and such like, as would find out the strength and power of the earth, may learn how to order these for the use and profit of mankind.

The third fountain is the right ordering of cattle, whether by shepherds or herdsmen; and such may learn here how to breed and train up cows for the dairies, bulls and horses for the saddle or yoke. And here all tanners, hatters, shoemakers, glovers, spinners of wool, clothiers, tailors, dyers and such like, may learn how to order and look to these.

The fourth fountain is the right ordering of woods and timber trees, for planting, dressing, felling, framing of timber for all uses, for building houses or ships. And here all carpenters, joiners, throsters,³ plough-makers, instrument-makers for music, and all who work in wood and timber, may find out the secret[s] of nature, to make trees more plentiful and thriving in their growth and profitable for use.

The fifth fountain, from whence reason is exercised to find out the secrets of nature, is [to] observe the rising and setting of the sun, moon and the powers of the

heavens above; and the motion of the tides and seas, and their several effects, powers and operations upon the bodies of man and beast. And here may be learned astrology, astronomy and navigation, and the motions of the winds and the causes of several appearances of the face of heaven, either in storms or in fairness.

And in all these five fountains here is knowledge in the practice, and it is good.

But there is traditional knowledge, which is attained by reading or by the instruction of others, and not practical but leads to an idle life; and this is not good.

The first is a laborious knowledge, and a preserver of common peace, which we find God himself acting; for he put forth his own wisdom in practice when he set his strength to work to make the creation: for God is an active power, not an imaginary fancy.

The latter is an idle, lazy contemplation the scholars would call knowledge; but it is no knowledge but a show of knowledge, like a parrot who speaks words but he knows not what he saith. This same show of knowledge rests in reading or contemplating or hearing others speak, and speaks so too, but will not set his hand to work. And from this traditional knowledge and learning rise up both clergy and lawyer, who by their cunning insinuations live merely upon the labour of other men, and teach laws which they themselves will not do, and lays burdens upon others which they themselves will not touch with the least of their fingers. And from hence arises all oppressions, wars and troubles in the world; the one is the son of contention, the other the son of darkness, but both the supporters of bondage, which the creation groans under.

Therefore to prevent idleness and the danger of Machiavellian cheats, it is profitable for the commonwealth that children be trained up in trades and some bodily employment, as well as in learning languages or the histories of former ages.

And as boys are trained up in learning and in trades, so all maids shall be trained up in reading, sewing, knitting, spinning of linen and woollen, music, and all other easy neat works, either for to furnish store-houses with linen and woollen cloth, or for the ornament of particular houses with needle-work.

And if this course were taken, there would be no idle person nor beggars in the land, and much work would be done by that now lazy generation for the enlarging of the common treasuries.

¹ Surgeons.

² 'Cannel' is a bituminous coal.

³ Turners (probably).

5 Blaise Pascal (1623–1662) from *Pensées*

After an early career as a scientist and mathematician, during which he invented the first digital calculator and the syringe, and laid the basis for the modern theory of probability, Pascal was increasingly drawn to the religious austerity of Jansenism. One of the key principles of Jansenism was that the way to salvation lay not through good works but through acceptance of, and immersion in, divine grace. After an intense mystical experience on the night of 23 November 1654, the testament of which he kept sewn into his clothes, Pascal withdrew to the former convent of Port Royal where the Jansenists were

based. Although not a permanent resident there, Pascal thereafter wrote only in service of the Jansenist faith. His *Pensées* represent the surviving fragments of an unfinished work of Christian apologetics. They have remained influential to the present day as a counter to materialism and dogma, not least within the existentialist tendency of modern philosophy. Our extracts concern the power of the imagination in human existence on the one hand, and on the other a sense of the limitedness of that existence in the infinity of the cosmos, and, for Pascal, of God's grace. The selections are taken from Blaise Pascal, *Pensées*, translated with an introduction by A. J. Krailsheimer, Harmondsworth: Penguin Classics 1966, pp. 38–41, 89–91, 93–5.

Imagination. It is the dominant faculty in man, master of error and falsehood, all the more deceptive for not being invariably so; for it would be an infallible criterion of truth if it were infallibly that of lies. Since, however, it is usually false, it gives no indication of its quality, setting the same mark on true and false alike.

I am not speaking of fools, but of the wisest men, amongst whom imagination is best entitled to persuade. Reason may object in vain, it cannot fix the price of things.

This arrogant force, which checks and dominates its enemy, reason, for the pleasure of showing off the power it has in every sphere, has established a second nature in man. Imagination has its happy and unhappy men, its sick and well, its rich and poor; it makes us believe, doubt, deny reason; it deadens the senses, it arouses them; it has its fools and sages, and nothing annoys us more than to see it satisfy its guests more fully and completely than reason ever could. Those who are clever in imagination are far more pleased with themselves than prudent men could reasonably be. They look down on people with a lofty air; they are bold and confident in argument, where others are timid and unsure, and their cheerful demeanour often wins the verdict of their listeners, for those whose wisdom is imaginary enjoy the favour of judges similarly qualified. Imagination cannot make fools wise, but it makes them happy, as against reason, which only makes its friends wretched: one covers them with glory, the other with shame.

Who dispenses reputation? Who makes us respect and revere persons, works, laws, the great? Who but this faculty of imagination? All the riches of the earth are inadequate without its approval. Would you not say that this magistrate, whose venerable age commands universal respect, is ruled by pure, sublime reason, and judges things as they really are, without paying heed to the trivial circumstances which offend only the imagination of weaker men? See him go to hear a sermon in a spirit of pious zeal, the soundness of his judgement strengthened by the ardour of his charity, ready to listen with exemplary respect. If, when the preacher appears, it turns out that nature has given him a hoarse voice and an odd sort of face, that his barber has shaved him badly and he happens not to be too clean either, then, whatever great truths he may announce, I wager that our senator will not be able to keep a straight face.

Put the world's greatest philosopher on a plank that is wider than need be: if there is a precipice below, although his reason may convince him that he is safe, his imagination will prevail. Many could not even stand the thought of it without going pale and breaking into sweat.

I do not intend to list all the effects of imagination. Everyone knows that the sight of cats, or rats, the crunching of a coal, etc., is enough to unhinge reason. The tone of voice influences the wisest of us and alters the force of a speech or a poem.

Love or hate alters the face of justice. An advocate who has been well paid in advance will find the cause he is pleading all the more just. The boldness of his bearing will make it seem all the better to the judges, taken in by appearances. How absurd is reason, the sport of every wind! I should list almost all the actions of men, who hardly stir except when jolted by imagination. For reason has had to yield, and at its wisest adopts those principles which human imagination has rashly introduced at every turn. Anyone who chose to follow reason alone would have proved himself a fool. We must, since reason so pleases, work all day for benefits recognized as imaginary, and, when sleep has refreshed us from the toils of our reason, we must at once jump up to pursue the phantoms and endure the impressions created by this ruler of the world. Here is one of the principles of error, but not the only one.

Man has been quite right to make these two powers into allies, although in this peace imagination enjoys an extensive advantage; for in conflict its advantage is more complete. Reason never wholly overcomes imagination, while the contrary is quite common. [...]

Imagination decides everything: it creates beauty, justice and happiness, which is the world's supreme good.

* * *

Let man then contemplate the whole of nature in her full and lofty majesty, let him turn his gaze away from the lowly objects around him; let him behold the dazzling light set like an eternal lamp to light up the universe, let him see the earth as a mere speck compared to the vast orbit described by this star, and let him marvel at finding this vast orbit itself to be no more than the tiniest point compared to that described by the stars revolving in the firmament. But if our eyes stop there, let our imagination proceed further; it will grow weary of conceiving things before nature tires of producing them. The whole visible world is only an imperceptible dot in nature's ample bosom. No idea comes near it; it is no good inflating our conceptions beyond imaginable space, we only bring forth atoms compared to the reality of things. Nature is an infinite sphere whose centre is everywhere and circumference nowhere. In short it is the greatest perceptible mark of God's omnipotence that our imagination should lose itself in that thought.

Let man, returning to himself, consider what he is in comparison with what exists; let him regard himself as lost, and from this little dungeon, in which he finds himself lodged, I mean the universe, let him learn to take the earth, its realms, its cities, its houses and himself at their proper value.

What is a man in the infinite?

But, to offer him another prodigy equally astounding, let him look into the tiniest things he knows. Let a mite show him in its minute body incomparably more minute parts, legs with joints, veins in its legs, blood in the veins, humours in the blood, drops in the humours, vapours in the drops: let him divide these things still further until he has exhausted his powers of imagination, and let the last thing he comes down to now be the subject of our discourse. He will perhaps think that this is the ultimate of minuteness in nature.

I want to show him a new abyss. I want to depict to him not only the visible universe, but all the conceivable immensity of nature enclosed in this miniature atom. Let him see there an infinity of universes, each with its firmament, its planets, its earth, in the same proportions as in the visible world, and on that earth animals, and finally mites, in which he will find again the same results as in the first; and finding the same thing yet again in the others without end or respite, he will be lost in such wonders, as astounding in their minuteness as the others in their amplitude. For who will not marvel that our body, a moment ago imperceptible in a universe, itself imperceptible in the bosom of the whole, should now be a colossus, a world, or rather a whole, compared to the nothingness beyond our reach? Anyone who considers himself in this way will be terrified at himself, and, seeing his mass, as given him by nature, supporting him between these two abysses of infinity and nothingness, will tremble at these marvels. I believe that with his curiosity changing into wonder he will be more disposed to contemplate them in silence than investigate them with presumption.

For, after all, what is man in nature? A nothing compared to the infinite, a whole compared to the nothing, a middle point between all and nothing, infinitely remote from an understanding of the extremes; the end of things and their principles are unattainably hidden from him in impenetrable secrecy.

Equally incapable of seeing the nothingness from which he emerges and the infinity in which he is engulfed.

What else can he do, then, but perceive some semblance of the middle of things, eternally hopeless of knowing either their principles or their end? All things have come out of nothingness and are carried onwards to infinity. Who can follow these astonishing processes? The author of these wonders understands them: no one else can.

Because they failed to contemplate these infinities, men have rashly undertaken to probe into nature as if there were some proportion between themselves and her.

Strangely enough they wanted to know the principles of things and go on from there to know everything, inspired by a presumption as infinite as their object. For there can be no doubt that such a plan could not be conceived without infinite presumption or a capacity as infinite as that of nature. [...]

In the perspective of these infinities, all finities are equal and I see no reason to settle our imagination on one rather than another. Merely comparing ourselves with the finite is painful.

If man studied himself, he would see how incapable he is of going further. How could a part possibly know the whole? But perhaps he will aspire to know at least the parts to which he bears some proportion. But the parts of the world are all so related and linked together that I think it is impossible to know one without the other and without the whole.

There is, for example, a relationship between man and all he knows. He needs space to contain him, time to exist in, motion to be alive, elements to constitute him, warmth and food for nourishment, air to breathe. He sees light, he feels bodies, everything in short is related to him. To understand man therefore one must know why he needs air to live, and to understand air one must know how it comes to be thus related to the life of man, etc.

Flame cannot exist without air, so, to know one, one must know the other.

Thus, since all things are both caused or causing, assisted and assisting, mediate and immediate, providing mutual support in a chain linking together naturally and imperceptibly the most distant and different things, I consider it as impossible to know the parts without knowing the whole as to know the whole without knowing the individual parts.

The eternity of things in themselves or in God must still amaze our brief span of life.

The fixed and constant immobility of nature, compared to the continual changes going on in us, must produce the same effect.

And what makes our inability to know things absolute is that they are simple in themselves, while we are composed of two opposing natures of different kinds, soul and body. For it is impossible for the part of us which reasons to be anything but spiritual, and even if it were claimed that we are simply corporeal, that would still more preclude us from knowing things, since there is nothing so inconceivable as the idea that matter knows itself. We cannot possibly know how it could know itself.

Thus, if we are simply material, we can know nothing at all, and, if we are composed of mind and matter, we cannot have perfect knowledge of things which are simply spiritual or corporeal.

That is why nearly all philosophers confuse their ideas of things, and speak spiritually of corporeal things and corporeally of spiritual ones, for they boldly assert that bodies tend to fall, that they aspire towards their centre, that they flee from destruction, that they fear a void, that they have inclinations, sympathies, antipathies, all things pertaining only to things spiritual. And when they speak of minds, they consider them as being in a place, and attribute to them movement from one place to another, which are things pertaining only to bodies.

Instead of receiving ideas of these things in their purity, we colour them with our qualities and stamp our own composite being on all the simple things we contemplate.

Who would not think, to see us compounding everything of mind and matter, that such a mixture is perfectly intelligible to us? Yet this is the thing we understand least; man is to himself the greatest prodigy in nature, for he cannot conceive what body is, and still less what mind is, and least of all how a body can be joined to a mind. This is his supreme difficulty, and yet it is his very being. *The way in which minds are attached to bodies is beyond man's understanding, and yet this is what man is* [St Augustine, *City of God*, XXI.10.].

Man is only a reed, the weakest in nature, but he is a thinking reed. There is no need for the whole universe to take up arms to crush him: a vapour, a drop of water is enough to kill him. But even if the universe were to crush him, man would still be nobler than his slayer, because he knows that he is dying and the advantage the universe has over him. The universe knows none of this.

Thus all our dignity consists in thought. It is on thought that we must depend for our recovery, not on space and time, which we could never fill. Let us then strive to think well; that is the basic principle of morality.

The eternal silence of these infinite spaces fills me with dread.

Be comforted; it is not from yourself that you must expect it, but on the contrary you must expect it by expecting nothing from yourself.

6 André Félibien (1619–1695) on grace and beauty from *Conversations on the Lives and Works of the Most Excellent Ancient and Modern Painters*

Although Félibien des Avaux occupied an important position at the court of Louis XIV as historiographer of the Royal Buildings and honorary counsellor to the Royal Academy (see IB9), his own writings are marked by an independence of judgement and breadth of taste which goes beyond the orthodox opinion promoted by figures such as Jean-Baptiste Colbert and Charles Le Brun. This is revealed both in his preference for discursive means of presentation which could accommodate differences of opinion and in his admiration for artists such as Rembrandt, who fell outside the classicist framework. In the following excerpt, taken from one of the theoretical excursions to the first of his monumental series of *Entretiens*, Félibien addresses the distinction between grace and beauty. Grace is distinguished from beauty insofar as it escapes definition and, like the *je ne sais quoi*, does not obey any rule. It is what distinguishes a living representation from a wax model, expressing the inner movements of the soul. This excerpt has been translated for the present volume by Jonathan Murphy from André Félibien, *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes*, Trévoux, 1725 (facsimile reprint, Farnborough: Gregg Press, 1967), pp. 82–8.

Pymander began again: ‘What difference is there then between grace and beauty, and how can they be distinguished from each other? For if beauty is the result of the proportion of the parts, can one find grace in subjects which are neither beautiful nor well proportioned?’

I replied that I could address the issue of distinguishing these two charming qualities quite easily. Beauty is a result of the proportion and symmetry between corporeal and material parts. Grace is the result of the uniformity of inner movements, caused by emotions and feelings within the soul.

So that when there is merely symmetry between the different corporeal parts, the beauty that results from this is a beauty without grace. But when in addition to beautiful proportions one divines the unity and harmony of all interior movements, which not only unite all parts of the body, but also animate them and cause them to act together with the correct cadence in a uniformly balanced manner, then the sort of grace that we admire in the most accomplished persons is also engendered, without which even the most beautiful proportion in the various parts is somehow lacking in perfection. When this uniformity of movement appears on a less beautiful face, whose features are imperfect, we still admire it as what we detect is precisely this quality of grace. As spiritual beauties are more excellent than corporeal ones, we will always prefer a person whose body is but imperfectly beautiful but who possesses this quality of grace to a more beautiful person lacking this supplementary quality. Thus, in Tibullus, although Quintia was more beautiful than Lesbia, it was the latter

who was blessed with this *je ne sais quoi* that rendered her more agreeable than the former.

To demonstrate that grace is a movement of the soul one need only think of a beautiful woman. Her beauty we can easily judge by a simple examination of the proportions of the different parts of her body, but her grace we can judge only through her speech, through her laughter, or through some movement that she might make.

The same principles apply in sculpture and painting, where grace will be lacking unless the artist can join some sort of movement fitting to the beauty of the figures and the actions in which they are engaged. For that reason it occasionally comes to pass that our admiration is aroused by works that do not have the normal proportions necessary for beauty, but where movement is happily expressed. When we see figures drawn by the hand of the most excellent Masters, where the proportions of all the different parts of the bodies are perfect and there is also a beautiful uniformity of movement concerted to a single purpose, then we admire the manner in which beauty and grace concord in a perfect work of art.

This *je ne sais quoi* to which we so often refer yet which we describe so poorly is like the secret knot that binds together these two parts of the body and soul. It is the natural result of the beautiful symmetry of parts and the concerted movement; but as this mixture results from a highly subtle, hidden process, no matter how much we examine it or attempt to describe it, we can neither represent it nor express it in the manner that we would desire. But we can say that it may be noted in a face, with the same freshness and novelty that we find in a rose that begins to open its petals early in the morning; the shape and beauty of the colours are an incarnation of the iridescent freshness of spiritual beauty. For the *je ne sais quoi* is a truly divine splendour, born out of beauty and grace.

This observation of beauty and grace has led me to understand why I have never appreciated the strong resemblance that so many admire in those wax faces that are modelled from life.

At this point I noticed that Pymander was staring at me quite closely. I remarked upon this, and he replied that I seemed to be speaking in nonsensical paradoxes: how could a resemblance be any closer than one based on a wax moulding from life?

I replied that although my opinion may at first have appeared a little strange, I was nonetheless prepared to defend it. A wax model does have exactly the same features as the person it is intended to portray, and often the colour mixing is of such subtlety and precision that one may see all the different flesh tints, with the veins and muscles and even the pores, and that on occasion the eyes capture exactly the sparkle and crystalline humour that makes them so clear, and yet despite such mastery, the resemblance is surprising to the eye more than it is convincing to the spirit, and as such it is not in fact a true likeness of the person that it is intended to represent. The reason for this is that during the moulding process the subject is obliged to remain immobile throughout, and the material used is such that the natural function of the features is thus neglected. It forces the subject into such stasis that all the interior movements which give life to our features are placed in suspension, and the resulting portrayal is a true portrait of total immobility, and as such is a lifeless and insensible resemblance. It is infinitely less perfect than a resemblance achieved by a painter or

sculptor, with brush or chisel. Through their work the painter and sculptor strive to breathe life into their work and to instil it with beauty and grace, imitating to the best of their capacities the object that they have before them; in wax the mould alone is the artisan, and it can only imitate what it finds, and that which it is possible to imprint upon it.

For that reason, in wax figures moulded from life, grace and the quality of *je ne sais quoi* are both lacking, as grace is the portrayal of interior movements of the soul, together with the beauty of proportion as I explained above. The wax model can never convey or reflect the inner movements of the soul, and they are the true source of grace.

There is then a great deal of difference, not between an excellent painter or an artful sculptor and those who mould wax from life, whose art I count for nothing, but between a face modelled from life and a portrait painted by a great man, such as one finds on a beautiful medallion, like those of the king and queen which are produced with such skill at the Louvre.

7 Dominique Bouhours (1623–1662) From *The Conversations of Aristo and Eugene*

Dominique Bouhours, a Jesuit teacher of classical studies in Paris, published two influential works of literary criticism, *Les Entretiens d'Ariste et d'Eugène* in 1671 and *La Manière de bien penser dans les ouvrages d'esprit* in 1687. The former is composed of six separate sections in the form of dialogues, of which two are represented here. Contrary to the predominant intellectual rationalism of the time, Bouhours uses the dialogue form to explore the nature of those indefinable critical qualities that are perceived instantaneously through the workings of intuition, rather than gradually through the operations of reason. The 'bel esprit' of the first excerpt is conceived as a person who acts decisively on the basis of individual but justifiable intuition. The *je ne sais quoi* of the second excerpt may be thought of as that which the 'bel esprit' or the 'true artist' uniquely generates. As these suggestions imply, the tendency represented in Bouhours' speculations is more familiar from its later development in Romantic and Modernist writing on the arts: the isolation of an ineffable critical virtue from the wider category of aesthetic production, and of the 'artist' from the 'illustrator', the 'designer' or the 'entertainer'. Though both Bouhours' books were widely read outside France, only the second was translated into English before the twentieth century (in 1705 as *The Art of Criticism* and in 1728 as *The Arts of Logick and Rhetorick*). The present excerpts from *The Conversations of Aristo and Eugene* are taken from Scott Elledge and Donald Schier eds., *The Continental Model: Selected French Critical Essays of the Seventeenth Century, in English Translation* (1960), revised edition, Ithaca: Cornell University Press, 1970, pp. 160–6 and 182–92.

The bel esprit

Eugene and Aristo began their walk with the reading of a work containing both prose and verse which one of their friends had recently composed. They read it attentively, as new things are always read; and after examining it at leisure they were both of the

opinion that for a long time nothing had appeared which was wittier or more reasonable.

A man must be very intelligent, said Eugene, to write the kinds of works in which witticisms glitter everywhere and in which there are no paste jewels.

Intelligence alone is not enough, replied Aristo; a special kind is needed. Only the keenest wit produces masterpieces, for it is the quality which gives to excellent pieces of writing the special shape which distinguishes them from ordinary ones, and that characteristic of perfection by which new charms are always to be found in them. But everybody does not have this keen wit I am speaking of, he added, and he who counterfeits the clever man has it perhaps less than another. For there is much difference between being professionally clever and having a keen wit of a certain beauty which I can imagine.

If that beauty of wit which you imagine is a very rare thing, said Eugene, the reputation for cleverness is fairly common; it is the compliment most frequently paid in society. It even seems to me there is no quality more easily acquired. One need only be able to tell a story agreeably or turn a line of verse: a trifle gracefully said, a madrigal, a couplet for a song can often be the basis for a reputation as a wit; and you must agree that it is of these clever talkers and makers of pretty things that we are accustomed to say, *He is a bel esprit*.

I admit, answered Aristo, that this title has been as freely and unjustly usurped in our time as that of gentleman or marquis; and if the usurpers in the realm of letters were punished as severely as these other usurpers have been in France many people would be degraded from that rank as many have been from the nobility. Those clever gentlemen would have a hard time commanding respect for their madrigals, their jingles, and their impromptus and thus maintaining themselves in their present status; I am sure they would not find in their papers grounds for clinging to the eminence they claim. Their titles are no better than those of false nobles; the name they bear is a name floating in the air unsupported by anything substantial; they have a reputation for wit but without deserving it and without exemplifying it.

The witty man is a foolish type, said Eugene, and I don't know whether I wouldn't rather be a little stupid than to pass as what is ordinarily called clever.

All reasonable men are of your opinion, answered Aristo. Wit has been so much disparaged since its profanation through being made too common that the wittiest men object to the name and avoid being accused of it as though it were a crime. Those who are still proud of the name are not the decent people in society; indeed, they are far from being what they think they are; they are nothing less than beaux esprits, for true beauty of wit consists in a just and delicate discernment which those gentlemen do not have. That discernment shows things to be what they are in themselves, not stopping too soon, as do the common people who do not go below the surface, and not going too far like those refined intelligences which, through an excess of subtlety, evaporate in vain and chimerical imaginings.

It seems to me, interrupted Eugene, that this exquisite discernment is more closely related to common sense than to *bel esprit*.

True wit, answered Aristo, is inseparable from common sense, and it is a mistake to confuse it with that sort of vivacity which has nothing solid in it. One might say that judgment is the foundation for beauty of wit; or rather *bel esprit* is of the nature

of those precious stones which are not less solid than brilliant. There is nothing more beautiful than a well-cut and well-polished diamond; it shines on every side and on every facet.

Quanta sodezza, tanto ha splendore. [Its splendour is proportionate to its solidity.] It is solid but brilliant matter, it dazzles but has consistency and body. The union, the mixture, the proportion of the brilliant with the solid give it all its charm and all its value. There is a symbol for bel esprit as I conceive it. It is equally brilliant and solid: it might well be defined as common sense which sparkles. For there is a kind of gloomy, bleak common sense which is hardly less the contrary of wit than is a false brilliance. The common sense I am speaking of is entirely different; it is gay, lively, full of fire, like that which is seen in the *Essays* of Montaigne . . . it proceeds from a straight and luminous intelligence and from a clear and pleasant imagination.

The just apportionment of vivacity to common sense renders the mind subtle but not vapid, brilliant but not too brilliant, quick to conceive an idea, and sound in all its judgments. With that kind of wit one thinks of things properly and expresses them as well as they have been thought. Much meaning is gathered into few words, everything is said that need be said and only that is said which must be said. The bel esprit is concerned more with things than with words; yet he does not scorn the ornaments of language, neither does he seek them out; the polish of his style does not lessen its strength, and he might be compared to those soldiers under Caesar who, for all they were clean and perfumed, were nonetheless valiant men who fought well.

On the basis of what you are saying, remarked Eugene, there is not much difference between a bel esprit and a rationalist (*esprit fort*).

There is none at all, replied Aristo, if we take the latter expression in its literal meaning, a strong mind. The beauty of wit is a masculine and gallant beauty which has in it nothing soft or effeminate. [. . .]

But do not imagine that the bel esprit, because he is very strong, is for that reason lacking in delicacy: he resembles Achilles in Homer and Rinaldo in Tasso whose nerves and muscles were extremely strong under a white and tender skin. His solidity and profundity do not keep him from conceiving things with finesse, nor from giving refined expression to all that he thinks. The images by which he expresses his thoughts are like those paintings which have all the technique of art and in addition what must be called a tender and graceful air which charms the connoisseur.

There are excellent minds which have no delicacy and who are proud of having none, as if delicacy were incompatible with strength. Their way of thinking and saying things has no sweetness and no attractiveness. With all their learning and all their subtlety their imaginations are in some way sombre and crude, like that Spanish painter who could make only coarse strokes and who proudly replied one day to those who criticized him for this that he preferred to be *primero en aquella grosseria que secundo en delicadeza* [first in that coarseness rather than second in delicacy].

But men of this turn of mind, however good they may be, are not so felicitous in their works as that painter was in his. The most learned writings and even the most ingenious are judged unfavorably in our day if they are not delicately handled. Besides their solidity and their strength they must have what I shall call an agreeable and flowery quality in order to please people of good taste, and that is what gives

individuality to beautiful things. To understand what I mean, remember what Plato says, that beauty is like the flower of goodness. According to that philosopher good things which do not have that flower are only good, and those which have it are really beautiful.

That is to say, added Eugene, that the *bel esprit*, if we define him Platonically, is a good mind in flower, like those trees which bear fruit and flowers at the same time and in which we see the maturity of autumn allied to the beauty of spring . . .

Those fruits and flowers, Aristo went on, indicate also that happy fecundity which is so fitting in a gifted man. For myself I consider there is not less difference between sterile minds and those which are not than there is between handsome orange trees and mean growths which produce no fruit.

I doubt, interrupted Eugene, whether fertility is a sound indication of beauty of mind. It seems to me that the most fecund minds are not always the most reasonable or the most acute. Great fecundity most often degenerates into an undesirable abundance, into a profusion of false and useless thoughts; and if you examine the question carefully you will see that what you are calling a property of the *bel esprit* is usually no more than the effect of an unbridled imagination.

I am well aware, replied Aristo, that there is a fertility of mind similar to that of trees which, because they are too heavy-laden with fruit, bear little that is good. The fecundity I am speaking of is not of that kind. It is what I have called a happy fecundity, not only a stock of good things but one which is controlled by common sense. A real *bel esprit* is like those rich and wise people who live magnificently in every way, yet who nevertheless are not extravagant. [. . .]

. . . a *bel esprit* is rich in his own resources; he finds in his own understanding what ordinary people find only in books. He studies himself and educates himself, as a learned man said of one of the greatest geniuses France has ever produced. Above all he does not take over the thoughts of others; he does not steal from the ancients or from foreigners the works he gives to the public.

Yet, said Eugene, that is what most of our clever men do. They continually pillage the Greeks and the Romans, the Italians and the Spaniards; and if anyone were willing to examine their works carefully he would discover that the land of Belles Lettres is full of robbers and that Mercury, who presides over the arts and sciences, is also, and not without cause, the god of thieves . . .

While forbidding larceny to the *bel esprit*, Aristo went on, I do not intend to forbid him to read good books; I do not even claim that his reading ought to be useless to him. I am willing for him to imitate the great models of antiquity if only he tries to surpass them in his imitation; but I cannot allow him to do like those minor painters who limit themselves to copying the originals and who would produce nothing beautiful if the masters of the art had not done so before them. [. . .]

But do not suppose that all of the beauty of wit can be reduced to this. Besides what I have just mentioned, it demands a nature able to acquire all the artistic skills, a lofty and broad intelligence, unlimited and unsurpassed. For beauty of wit is like that of the body: little men, however well formed, are not handsome, in Aristotle's opinion; at best they are only agreeable, because to have the advantage of stature is an essential part of beauty. Thus the little genius who is limited to a single thing, the maker of pretty verses who can do only that with whatever charm and decorum, is

not a bel esprit, say what you will; he is really only a wit and it would be enough for him to be accepted on that footing in society.

Moreover, to be a bel esprit it is not enough to have a solid, profound, delicate, fertile, just, and universal intelligence; the mind must have besides a certain clarity which all great geniuses do not have. For some of them are naturally obscure and even affect obscurity; a large proportion of their ideas are so many enigmas and mysteries; their language is a kind of cipher which can be understood only through divination. Among modern Spaniards Gracián is one of these incomprehensible geniuses; he can rise very high, he has subtlety, strength, and common sense; but most of the time the reader doesn't know what he means as perhaps he doesn't know himself; some of his works seem made to defy understanding.

However, there ought to be neither obscurity nor confusion in what comes from a bel esprit; his thoughts and expressions must be so noble and so clear that the most intelligent of his readers admire him and the least intelligent understand him.

* * *

The je ne sais quoi

When Aristo and Eugene had reached the place of their walk, they first gave expression to the joy they felt at passing such pleasant hours in each other's company. Eugene said: Though we may be solitary, yet I am not envious of the most agreeable society in the world.

Aristo thereupon said to his friend all those things which a warm friendship can suggest at such meetings; then, allowing his mind to rove wherever his heart might lead it, he said: It must be admitted, my dear Eugene, that there are few friendships like our own, for we can be always together and never tire of each other. Private conversations in which love plays no part are almost always tiresome when they are too frequent or when they are rather long. No matter what the esteem or the affection one may have for any gentleman, one gradually wearies of seeing only him and of speaking only to him; one even feels, in some inexplicable way, that this brings about a diminution in the feelings which his merits have caused, whether because one gradually becomes used to what at first appeared extraordinary in his person or whether through familiarity one discovers in him hidden defects which make his good qualities less estimable. Hence, for us daily to find new pleasures in our conversations, as we do, our friendship must necessarily be much stronger than ordinary ones, because, although it is virtuous, it arouses in us what love arouses in others.

In other words, added Eugene, we must be meant for each other, and there must be a rare sympathy between our minds.

What you say is very true, answered Aristo, and for myself I feel it deeply. The boredom which seizes upon me as soon as we are separated, the joy which our longest conversations give me, the slight attention I pay to learning new things and my lack of care in cultivating my old habits are apparently the effects of the great liking and those hidden inclinations which make us feel for one person an indefinable something which we do not feel for another.

From the way you speak, replied Eugene, you appear to know pretty well the nature of that indefinable something whose effects you feel.

It is something much easier to feel than to know, rejoined Aristo. It would not be indefinable if it were understood; its nature is to be incomprehensible and inexplicable.

But can we not say, Eugene responded, that it is an influence from the stars and an invisible effect of the planet which was in the ascendant when we were born?

Naturally we can say that, answered Aristo, or even that it is the tendency and instinct of the heart, that it is the most exquisite feeling of the soul for whatever makes an impression upon it, a marvelous liking and what might be called a kinship of the heart, to use the words of a Spanish wit: *un parentesco de los corazones*.

But to say that and a thousand other things is to say nothing. These feelings, these tendencies, these instincts, these likings, these kinships, are fine words which scholars have invented to delude their ignorance and to deceive others after they have been taken in themselves. One of our poets has described it better than all the philosophers; he settles the matter in a word:

There are strong bonds of hidden, tender liking,
Through whose sweet pow'r each lover finds his own;
Each to each is join'd at glances' striking
By something hidden, never to be known.

Even if that were true of the mysterious something one feels for people deep in one's heart, said Eugene, it might not be true of whatever it is that makes people pleasing, a quality which shows in their faces and which is obvious at first sight.

I assure you, said Aristo, that this latter something is as hidden and indescribable as the other. Because it is visible it is not better known or easier to define. For it is not really beauty, or a prepossessing appearance, or charming manners, or the gaiety of good humor, or brilliance of wit, because every day we meet people who have all these qualities without the faculty of being pleasing, and we see others who are very pleasant without having any agreeable qualities except the mysterious something.

Hence, the most reasonable and the most certain thing that can be said is that the greatest merit achieves nothing without it, and that it is sufficient in itself to create a very great effect. There is no advantage in being handsome, witty, gay, or what you will, if that mysterious something is lacking; all your fine qualities are as it were dead: there is nothing striking or touching about them. They are hooks without bait, pointless arrows and dull witticisms. Yet whatever defects may be found in body or soul, with this single advantage one is always pleasing, nor can one do anything wrong: the mysterious something makes everything right.

It follows from that, said Eugene, that it is a grace which brightens beauty and other natural perfections, which corrects ugliness and other natural defects, that it is a charm and an air which informs every action and every word, which has its part in the way one walks and laughs, in the tone of the voice, and even in the slightest gesture of the socially acceptable person.

But what is that grace, that charm, that air? asked Aristo. When one examines all those terms closely one ends by not making head nor tail of them, and one is forced

back upon the mysterious something. One of our clever gentlemen has said of a very likable young man:

But most of all he had a grace
A 'something' by which to surpass
The sweetest charms of love's young face,
A smile whose pow'r all words doth pass,
An air distinctive and unique
Whose secret others vainly seek.

This grace, this charm, this air are like the light which embellishes all of nature and which is seen by everybody though we do not know what it is, and so we cannot say anything more about it, to my way of thinking, except that it can neither be explained nor understood. Indeed, it is so delicate and imperceptible that it escapes the most penetrating and subtle intelligence; the human mind, which recognizes the most highly spiritual quality of the angels and the most divine quality in God, so to speak, does not recognize what is charming in a phenomenon which is both perceptible to the senses and capable of touching the heart.

If that is true, said Eugene, we must give the lie to philosophers who have always maintained that knowledge precedes love; that the will can love nothing which is unknown to the rational faculty.

They were right in their argument, said Aristo. Love is impossible without knowledge, and one always knows the loved person; that is, we may know that she is lovable, but not always know why we love her.

But if you please, interrupted Eugene, is that knowledge sufficient by which we know the person and recognize that she is lovable? Is it possible to love her and at the same time not to know what it is that makes her the object of love?

Yes, answered Aristo, and the mystery of the 'certain something' consists of exactly that. Nature, like art, is careful to hide the cause of unusual impulses: we see the machine, and with pleasure, but we do not see the spring which makes it work. A woman may be pleasing to us, or inspire love at first sight without our knowing why she has this effect. You will say that in these circumstances nature sets traps for our heart so as to catch it unawares, or rather that since she knows it to be as proud and as sensitive as it is in fact, she spares it and treats it gently by hiding the dart which is to wound it.

I am inclined to think, said Eugene, that if the soul does not perceive the quality by which it is touched in such encounters the reason is that the quality acts so fast as to be imperceptible to the soul. For, as you may have noticed, anything which moves very fast is invisible. Thus arrows, bullets, cannon balls, bolts of lightning all pass before our eyes without being seen. These things are visible in themselves but the speed with which they move hides them from our sight.

That reminds me, said Aristo, of the simple-mindedness of that savage who, having been shot and not being able to understand what had wounded him, said that it was either the flame he had seen or the noise he had heard.

If stone, fire, lead, and wood, Eugene continued, become invisible through the speed with which they fly through the air, should we be amazed that the quality

which at first sight makes an impression on the soul can pass unnoticed? For of all the things which move fast the fastest is the dart which wounds the heart, and the shortest of all moments, as I may say, is that in which the 'mysterious something' makes its effect.

However that may be, said Aristo, it is certain that this mysterious something belongs to that class of things which are known only by the effects they produce. Our eyes witness the wonderful movements which a magnet induces in iron filings; hut who can say what the power of that marvelous stone really is? The wind which shakes mountains and rocky cliffs, which destroys towns and troubles all the elements is something unseen and which has not yet been well defined. Neither have the influences which fall from the heavens and which form minerals in the depths of the earth. Let us say the same of that charm and of that peculiar fascination we are discussing: it attracts the hardest hearts, it sometimes excites violent passions in the soul, it sometimes causes very noble sentiments; but it is never known except in that way. Its importance and its advantage lie in its being hidden; it is like the source of that Egyptian river, the more famous for not having yet been discovered, or like the unknown goddess of the ancients who was adored only because she was not known.

Might one dare say, Eugene added, that it is like God Himself and that there is nothing better known nor more unknown in the world?

One can at least say this with certainty, Aristo continued, that it is one of the greatest marvels and one of the greatest mysteries of nature.

Is that not the reason, said Eugene laughing, that the most mysterious nations give it a place in everything they say? The Italians, who make a mystery of everything, use their expression *non sò che* right and left. Nothing is more usual in their poets.

Un certo non sò che
Sentesi al petto.

[An indescribable sensation is felt in the heart.]

[...] I should never finish if I tried to mention all the examples of *non sò che* which I remember. The Spaniards also have their *no sé que* which they use at all times and in all contexts, besides their *donaire* (grace) their *brio* (vigor) and their *despejo* (facility) which Gracián calls *alma de toda prenda, realce de los mismos reales, perfección de la misma perfección* (the object of all desire, splendor of all splendors, the perfection of perfection itself), and which is, according to the same author, above our thoughts and our words, *lisonjea la inteligencia, y estraña la explicación* (it deceives the intelligence and bemuses attempts at explanation).

If you took the trouble to read our books with as much care as you have read the Italians and Spaniards, said Aristo, you would find that the *je ne sais quoi* is very popular among us, and that in this we are as mysterious as our neighbors.

But to come back to what we were saying, the *je ne sais quoi* is like those beauties covered with a veil, which are the more highly prized for being less exposed to view, and to which the imagination always adds something. Hence, if by chance we were to see clearly the nature of this mysterious something which astonishes and overwhelms the heart at first glance, we should perhaps be less charmed and touched than we are;

but it has not yet been unveiled and perhaps never will be since, as I have already said, once unveiled it would cease to be what it is.

Moreover, since it cannot be explained, it cannot be described either, and this is perhaps the reason why showing a person's portrait is not enough to cause her to be loved by the beholder, any more than does singing her praises, whatever romances and fables may say. The most favorable description and the most flattering portrait can produce esteem for a person and a desire to see her, but neither the one nor the other ever causes a real affection because neither the brush nor the tongue can express that mysterious something which is all-powerful.

* * *

At least, Eugene added, the *je ne sais quoi* is restricted to natural phenomena for, as far as works of art are concerned, all their beauties are evident and their capacity to please is perfectly understandable.

I cannot agree, answered Aristo. The *je ne sais quoi* belongs to art as well as to nature. For, without mentioning the different manners of painters, what charms us in those excellent paintings, in those statues so nearly alive that they lack only the gift of speech, or who do not even lack that if we are to believe our eyes . . . what charms us, I say, in such paintings and statues is an inexplicable quality. Therefore the great masters, who have discovered that only that is pleasing in nature whose attraction cannot be explained, have always tried to give charm to their works by hiding their art with great care and skill. [. . .]

Let us go further, my dear Eugene, and let us say in addition that when we examine carefully those things in this world which we most admire we see that what makes us admire them is the mysterious something which surprises us, which dazzles us, which charms us. We shall even come to see that this mysterious quality is, if it is rightly understood, the focal point of most of our passions. Besides love and hatred, which give the impetus to all the impulses of the heart, desire and hope, which fill up the whole of man's life, have practically no other foundation. For we are always desiring and hoping, because beyond the goal we have set for ourselves there is always something else to which we unceasingly aspire and which we never attain; that is why we are never satisfied with the enjoyment even of those things we have most ardently desired.

But to speak in a Christian fashion of the *je ne sais quoi*, is there not a mysterious something in us which makes us feel, despite all the weaknesses and disorders of corrupt nature, that our souls are immortal, that the grandeurs of the earth cannot satisfy us, that there is something beyond ourselves which is the goal of our desires and the centre of that felicity which we everywhere seek and never find? Do not really faithful souls recognize, as one of the Fathers of the Church says, that we were made Christians not for the goods of this life but for something of an entirely different order, which God promises to us in this life but which man cannot yet imagine?

Then, Eugene interrupted, this mysterious quality partakes of the essence of grace as well as of nature and art.

Yes, answered Aristo. Grace itself, that divine grace which has caused so much uproar in the schools and which produces such wonderful effects upon souls, that grace both strong and gentle which triumphs over hardness of heart without limiting the freedom of the will, which subjects nature by adjusting itself to her, which makes

itself master of the will while leaving the will its own master, that grace, I say, what is it but a mysterious quality of a supernatural order which can be neither explained nor understood?

The Fathers of the Church have tried to define it, and they have called it 'a deep and secret calling,' 'an impression of the spirit of God,' 'a divine unction,' 'an all-powerful gentleness,' 'a victorious pleasure,' 'a holy lust,' 'a covetousness for the true good'; that is to say that it is a *je ne sais quoi* which indeed makes itself felt but which cannot be explained and of which it would be better not to speak.

It is true, Aristo went on, that the *je ne sais quoi* is almost the only subject about which no books have been written and which the learned have never taken the trouble to elucidate. Lectures, dissertations and treatises have been composed on very odd subjects, but no author, as far as I know, has worked on this one.

I remember, said Eugene, reading in the *History of the French Academy* that one of the most illustrious academicians gave a speech in the Academy on the subject of the *je ne sais quoi*. However, since this speech has not been published, the world was no more illumined by it than it was before, and perhaps even if this academic discourse were to see the light we should not be much more informed than we are, the subject being one of those which have an impenetrable core and which cannot be explained other than by admiration and silence.

I am very glad, said Aristo laughing, that at last you have come to the proper conclusion and that you are satisfied to admire what at first you wanted to understand. Take my advice, he added, and let us stop here without saying anything further about a thing which continues to exist only because no one can say what it is. Besides it is time to bring our walk to an end; the sky is darkening all around us, it is starting to rain, and if we do not go in soon we shall be liable to feel the fury of the coming storm.

8 Samuel Willard (1640–1707) from *A Compleat Body of Divinity*

Samuel Willard was pastor of the Old South Church in Boston, Massachusetts, from 1678 until his death. For the last few years of his life he was Vice-Chancellor of Harvard College. While sophisticated European Christians such as Bouhours were interpreting the experience of art by reference to traditional concepts of divine grace (see ID7), a puritan distaste for the celebration of art ruled throughout most of North America well into the nineteenth century. As demonstrated in the following excerpts from Willard's published sermons, this distaste was given its clearest practical form in the proscription of religious images. It was a consequence of this proscription that domestic portraiture and the recording of local landscape provided the only generally tolerated means of practice for the aspiring American painter until at least the late eighteenth century (see IVA5). The more ambitious forms of history painting generally failed to take root, associated as they were with European traditions of religious painting. As the contrast with Bouhours serves to make clear, however, Willard and his fellow New England Protestants were driven by something more fundamental than the mere disapproval of pictures. What concerned them was that those who established their highest values by reference to the experience of art were, in effect, worshipping a false God; and that they thus threatened those values by which the community was bound together. (For an earlier but comparable English text see ID4.) The voice of

Protestant iconoclasm was to be heard with increasing rarity as the aesthetic discourse of modernism developed. An evolving opposition to that discourse was to keep pace, however, articulating in one form or another the continuing concerns of those who regarded the aesthetic as a value indifferent to human unhappiness and injustice, and who believed that they themselves spoke on behalf of threatened communities. Samuel Willard published several volumes of his collected sermons. The following passages are taken from his *A Compleat Body of Divinity in Two Hundred and Fifty Expository Lectures on the Assembly's Shorter Catechism*, Boston, 1726, Sermon XVII, April 23th 1689, p. 54 and Sermon LI, January 13th 1701, pp. 621–2, in the form reprinted in John McCoubrey, *American Art 1700–1960*, Englewood Cliffs, New Jersey: Prentice-Hall, 1972, pp. 3–5.

Enquiry into the Divine Attributes, 1689

...how very unsuitable is it to represent the Divine Nature by any Corporeal similitude. I mean in Pictures or Images, of any visible and bodily substance, and that whether it be for civility or devotion, i.e., either merely as Ornamental, or as some pretend, to increase devout Affections in any; how is it possible rightly to shadow a Spirit? Whoever was able rightly to decipher the form or shape of a being which is invisible! It is folly to pretend to afford us the Portraiture of an Angel, but it is a madness and wickedness to offer at any Image or Representation of God: How many solemn cautions did God give His people against this by Moses, besides the express forbidding of it in the second Command; and God declares it to be a thing Idolatrous. For any to entertain or fancy any other Image of God, but those reverend impressions of His glorious Perfections that are engraven upon his heart, is highly to dishonour Him, and provoke Him to Jealousy.

What Is Forbidden in the Second Commandment, 1701

First, this Command forbids the Worshipping of God by Images. This is expressly mentioned; and that in two Particulars.

1. The Making of them is prohibited. *Thou shalt not make.* And under a graven Image and Similitude is comprehended, every manner of Representation of God, whether in Statues or Pictures: For this general Prohibition doth not respect things merely Civil, but only a Representation of the Deity, as we may gather from Deut. 4.15, 16. *Take ye therefore good heed unto yourselves (for ye saw no manner of similitude on the day that the Lord Spake unto you in Horeb, out of the midst of the fire). Lest ye corrupt yourselves, and make you a graven image, the similitude of any figure, the likeness of male or female.* Isai. 40.18, 19. *To whom then will ye liken God, or what likeness will ye compare unto him? The workman melteth a graven image,...*

2. The offering of Divine Worship to them or before them. *Thou shalt not bow,...* And the latter is *exegetical* to the former. God reckons any religious bowing to an Image or Representation, to be a worshipping it. For although Idolaters have been so brutish, as to direct their Worship nextly and immediately to the Image, yea, the wise Heathens themselves were not so gross, as to acknowledge that they looked upon their Idols, to be real Deities in themselves, or terminate their Worship on

them; but they conceived of a God, whom they represented by the image, through which they supposed him to communicate himself to them, and in which they adored him, hoping for a better Acceptance. The Egyptians, when they found good or benefit by any Creature, they worshipped God in it, not supposing that the thing itself was God, but that God communicated himself to them, by and through the Creature, and that they ought to worship him in it, and the Creature no further, then they supposed God to be in it. For this End also they made Images, or Portraitures of these and those Creatures, before which they paid their Devotions, and on which they imposed the Name of their God. And this is represented as sinful and superstitious, Rom. 1.21, 22, 23. *Because when they knew God, they glorified him not as God, neither were they thankful, but became vain in their imaginations, and their foolish heart was darkened. Professing themselves to be wise, they became fools: And changed the glory of the uncorruptible God, into an image made like to corruptible man, and to birds, and four-footed beasts, and creeping things.* Of this Nature was the Golden Calf, which Israel made in the Wilderness, in Imitation of the Egyptians, among whom they had lived and conversed. Nor did they suppose it to be God himself, but a Representation of him, and put his Name upon it, as we do of a Person on his Statue or Picture. Hence they kept the Feast to Jehovah, Exod. 32.5. *Tomorrow is a feast to the Lord.* Of the same Nature was Jereboam's Calves, which were erected at Dan and Bethel, to facilitate the People's Worship, and was surrogated in the room of the Ark, at the Temple in Jerusalem. Hence that Reason is given of the making of them, I Kin. 12.28. *Whereupon the king took counsel, and made two calves of gold, and said unto them, It is too much for you to go up to Jerusalem.* It is true, those are called Gods, in the Word of God, and the worshiping of them is called Idolatry, yea, they are named Devils and their Service Devil-Worship. See, II Chron. 11.15. *And he ordained him priests for the high places, and for the devils, and for the calves which he had made.* Psal. 106.36, 37. *And they served their idols which were a snare unto them. Yea, they sacrificed their sons and their daughters unto devils.* Partly because the ignorant among them, were become so brutish in their Imaginations, as to terminate their Service on the Idol. Hence that Complaint, Isai. 44.19, 20. *And none considereth in his heart, neither is their knowledge nor understanding to say, I have burnt part of it in the fire, yea also I have baked bread upon the coals thereof: I have roasted flesh and eaten it, and shall I make the residue thereof an abomination?* Partly also, because God doth not account himself to be acknowledged as God, if his Laws of Worship be neglected, and other Rules be invented in the room thereof, Acts 17.24, 25. And by this, the horrible Idolatry of the Church of Rome is manifested. Nor will all their Evasions, and copious Distinctions, excuse them from the Guilt of it. False Worship is supposed to be paid to a God that will accept of it, which must be a false God, for the true God abhors it.

9 Gottfried Wilhelm Leibniz (1646–1716) on art and beauty

The German philosopher and mathematician Leibniz was born in the university town of Leipzig. His range of work and interests was remarkable and he made original contributions to optics, mechanics, logic, linguistics, geology and physics, as well as philosophy. Although most of his writings remained unpublished at his death in 1716, his ideas were

known and appreciated by his contemporaries through his extensive correspondence. His only work published in his lifetime, *The Theodicy* of 1710, initiated a widespread debate on optimism and the limits of Enlightenment ideas of progress and reason. It was satirized by Voltaire in *Candide* (1758). Leibniz's importance for art theory lies in his re-evaluation of the significance of the 'confused perceptions' of the senses. Cartesian rationalism had been taken up and assimilated into classicist poetics and art theory in the seventeenth century. Fundamental to it was the insistence that only clear and distinct ideas could possess the status of necessity; knowledge gained through the senses was to be profoundly mistrusted. By contrast, Leibniz recognized the virtues of those forms of knowing which were grounded in confused ideas or representations. Such knowledge requires the exercise of 'taste', a form of discriminative activity which involves both reason and experience. Lower and vaguer perceptions implicitly contain their own rational explanation, and though such knowledge might start out as a *je ne sais quoi* it could be brought to a higher level of rational demonstration. The following selections, drawn from a wide variety of Leibniz's writings, were selected by Milton C. Nahm for his book, *Readings in Philosophy of Art and Aesthetics*, Englewood Cliffs, New Jersey: Prentice-Hall, 1975, pp. 315–19.

The 'I know not what' and 'sympathy'¹

Joy is a pleasure which the soul feels in itself. *Pleasure* is the feeling of a perfection or an excellence, whether in ourselves or in something else. For the perfection of other beings also is agreeable, such as understanding, courage, and especially beauty in another human being, or in an animal or even in a lifeless creation, a painting or a work of craftsmanship, as well. For the image of such perfection in others, impressed upon us, causes some of this perfection to be implanted and aroused within ourselves. [...]

We do not always observe wherein the perfection of pleasing things consists, or what kind of perfection within ourselves they serve, yet our feelings (*Gemüth*) perceive it, even though our understanding does not. We commonly say, 'There is something, I know not what, that pleases me in the matter.' This we call 'sympathy.' But those who seek the causes of things will usually find a ground for this and understand that there is something at the bottom of the matter which, though unnoticed, really appeals to us. [...]

Music is a beautiful example of this. Everything that emits a sound contains a vibration or a transverse motion such as we see in strings, thus everything that emits sounds gives off invisible impulses. When these are not confused, but proceed together in order but with a certain variation, they are pleasing; in the same way, we also notice certain changes from long to short syllables, and a coincidence of rhymes in poetry, which contain a silent music, as it were, and when correctly constructed are pleasant even without being sung. Drum beats, the beat and cadence of the dance, and other motions of this kind in measure and rule derive their pleasureableness from their order, for all order is an aid to the emotions. And a regular though invisible order is found also in the artfully created beats and motions of vibrating strings, pipes, bells, and, indeed, even of the air itself, which these bring into uniform motion. Through our hearing, this creates a sympathetic echo in us, to which our animal spirits respond. This is why music is so well adapted to move our minds. [...]

There can be no doubt that, even in touch, taste, and smell, sweetness consists in a definite though insensible order and perfection or a fitness, which nature has put there to stimulate us and the animals to that which is otherwise needed. [. . .]

I call any elevation of being a perfection . . . perfection shows itself in great freedom and power of action, since all being consists in a kind of power. [. . .]

The greater any power is, moreover, the more there is found in it the many revealed through the one and in the one. . . . Now unity in plurality is nothing but harmony [*Uebereinstimmung*], and, since any particular being agrees with one rather than another being, there flows from this harmony the order from which beauty arises, and beauty awakens love.

Taste consists of confused perceptions²

Taste as distinguished from understanding consists of confused perceptions for which one cannot give an adequate reason. It is something like an instinct. Tastes are formed by nature and by habits. To have good taste, one must practice enjoying the good things which reason and experience have already authorized.

Confused knowledge and the 'something, I know not what'³

Knowledge is *clear*, therefore, when it makes it possible for me to recognize the thing represented. Clear knowledge, in turn, is either confused or distinct. It is *confused* when I cannot enumerate one by one the marks which are sufficient to distinguish the thing from others, even though the thing may in truth have such marks and constituents into which its concept can be resolved. Thus we know colors, odors, flavors, and other particular objects of the senses clearly enough and discern them from each other but only by the simple evidence of the senses and not by marks that can be expressed. So we cannot explain to a blind man what red is, nor can we explain such a quality to others except by bringing them into the presence of the thing and making them see, smell, or taste it, or at least by reminding them of some similar perception they have had in the past. Yet it is certain that the concepts of these qualities are composite and can be resolved, for they certainly have their causes. Likewise we sometimes see painters and other artists correctly judge what has been done well or badly; yet they are often unable to give a reason for their judgment but tell the inquirer that the work which displeases them lacks 'something, I know not what.'

Contemplation of beautiful things is pleasant in itself⁴

Thus the contemplation of beautiful things is itself pleasant, and a painting of Raphael affects him who understands it, even if it offers no material gains, so that he keeps it in his sight and takes delight in it, in a kind of image of love. But when the beautiful object is at the same time itself capable of happiness, this affection passes over into true love.

Reason, imagination and the precepts of art⁵

Music is subordinate to Arithmetic and when we know a few fundamental experiments with harmonies and dissonances, all the remaining general precepts depend on numbers; I recall once drawing a harmonic line divided in such a fashion that one could determine with the compass the different compositions and properties of all musical intervals. Besides, we can show a man who does not know anything about music, the way to compose without mistakes. But as it is not enough to know Grammar and Prosody to compose a beautiful epigram, and since a schoolboy who is taught to avoid mistakes in his writing does not for that purpose have to compose a speech having the power of Cicero's eloquence, so in music what a man needs to compose successfully are practice as well as genius and vivid imagination in things of the ear. And as the making of beautiful verses requires a prior reading of good poets, noticing turns and expressions which gradually tinge one's own style, 'as they who walk in the sun take on another tint,' in the same way a Musician, after noticing in the compositions of talented men a thousand and one beautiful cadences and, so to speak, phrases of Music, will be able to give flight to his own imagination furnished with these fine materials. There are even those who are naturally musicians and who compose beautiful melodies just as there are natural poets who with a little aid and reading perform wonders, for there are things, especially those dependent on the senses, in which we do better by letting ourselves go automatically by imitation and practice than by sticking to dry precepts. And as playing the clavichord requires a habit which the fingers themselves have to acquire, so imagining a beautiful melody, making a good poem, promptly sketching architectural ornaments or the plan of a creative painting require that our imagination itself acquire a habit after which it can be given the freedom to go its own way without consulting reason, in the manner of an inspired Enthusiasm. The imagination will not fail to succeed in proportion to the genius and experience of the person, and we ourselves sometimes have the experience in dreams of shaping images which we should have great difficulty in creating while awake. But reason must afterwards examine and correct and polish the work of the imagination; that is where the precepts of art are needed to produce something finished and excellent . . . we have said all these things only in order to forestall incidentally the false notions of those who might abuse what we have just said about the easy means of learning the sciences by some few precepts or principles of discovery.

Whole and part⁶

. . . Look at the most lovely picture, and then cover it up, leaving uncovered only a tiny scrap of it. What else will you see there, even if you look as closely as possible, and the more so as you look from nearer and nearer at hand, but a kind of confused medley of colours, without selection, without art! And yet when you remove the covering, and look upon the whole picture from the proper place, you will see that what previously seemed to you to have been aimlessly smeared on the canvas was in fact accomplished with the highest art by the author of the work. What happens to

the eyes in painting is equally experienced by the ears in music. The great composers frequently mingle discords with harmonious chords so that the listener may be stimulated and pricked as it were, and may become eager to know what is going to happen; presently when all is restored to order he feels so much the more content. In the same way we may take pleasure in small dangers, or in the experience of ills, from the very sense or proof they give us of our own power or felicity. Or again at the spectacle of rope-walking or sword-dancing we are delighted by the very element of fear that is involved, and we ourselves in play with children hold them as if we were going to throw them out of the window, and half let them go – in very much the same way as the ape carried Christian, King of Denmark, when he was still an infant wrapped in long clothes, to the edge of the roof, and then, when everybody was in terror, turned it into jest and put him back into his cradle safe and sound. On the same principle it has an insipid effect if we always eat sweet things; sharp, acid, and even bitter things should be mixed in to stimulate the taste. He who has not tasted what is bitter has not earned what is sweet, nor will he appreciate it. This is the very law of enjoyment, that positive pleasure does not come from an even course; such things produce weariness, and make men dull, not joyful.

What I have said, however, about the possibility of a part being disturbed without upsetting the harmony of the whole must not be interpreted to mean that no account is taken of the parts; or that it is sufficient for the whole world to be completed at all points, even though it should turn out that the human race was wretched, and that there was in the universe no care for justice and no account was taken of us – as is maintained by some people whose judgment about the sum of things is ill-grounded. For the truth is that, just as in a well regulated commonwealth care is taken that as far as possible things shall be to the interest of the individual, in the same way the universe would not be sufficiently perfect unless, as far as can be done without upsetting the universal harmony, the good of individual people is considered. Of this there could be established no better measure than the very law of justice itself, which dictates that each should have a part in the perfection of the universe and in his own happiness in proportion to his own virtue and to the extent to which his will is directed towards the common good; by which is fulfilled what we call the charity and love of God, in which alone, according to the judgment of wise theologians also, stands the whole force and power of the Christian religion. Nor ought it to seem remarkable that all this deference should be paid to minds in the universe, since they bear the closest resemblance to the image of the supreme Author, and their relation to Him is not that of machines to their artificer (like the rest of the world) but rather that of citizens to their prince; moreover they will endure as long as the universe itself, and they, in some manner, express and concentrate the whole in themselves; so that it might be said that minds are whole parts. [...]

God and the artisan contrasted⁷

... The reason why God is to be preferred above another mechanician is not only because He makes the whole, whereas the artisan has to seek for his material. This superiority would arise from power only. But there is another reason for the excellence of God, which arises from wisdom. This reason is that His machine also

lasts longer and goes more correctly than that of any other mechanician whatever. The buyer of the watch does not trouble himself whether the workman made the whole of it, or whether he had the pieces of it made by other workmen and merely adjusted them himself, provided that it goes properly. And if the workman had received from God the gift of creating as well the material for the wheels, the buyer would not be satisfied if he had not also received the gift of adjusting them properly. And in the same way the man who wants to be satisfied with God's handiwork will not become so merely for the reason alleged here.

Thus it is needful that God's invention should not be inferior to that of a workman; it must even go infinitely beyond it. The mere production of everything would indeed exemplify the power of God, but it would not sufficiently show His wisdom. Those who maintain the opposite fall exactly into the error of the Materialists and of Spinoza, from whom they protest they differ. They recognize power, but not sufficient wisdom in the principle of things. [. . .]

IE

Practical Resources

1 Edward Norgate (1580–1650) from *Miniatura; or The Art of Limning*

The impoverished son of a successful father who died young, Norgate seems to have shown early talent as a calligrapher and limner or illuminator, which, in seventeenth-century England, was esteemed the most respectable of occupations for a painter. Evidence suggests that he spent some time in the studio of Nicholas Hilliard in London. His first recorded appointments were as tuner (in 1611) and keeper of the king's musical instruments, and he was to earn his living as a cultured civil servant, not primarily as an artist. In the course of his working life, however, he was to acquire as good a practical knowledge of recent developments in art as anyone in England at the time. Appointments as Pursuivant and subsequently as Windsor Herald in the College of Arms came through the patronage of Thomas Howard, Earl of Arundel, whose collection of art was rivalled only by the king's. In 1630 Norgate was granted a monopoly by Charles I himself to 'write and limn' those official letters that would require an impressive presentation. In effect, he served as a general adviser to the king on artistic matters. In that role, and as an agent buying on Arundel's behalf, he made various journeys to the Low Countries and to Italy between 1618 and 1646. His treatise on the art of limning was dedicated to the third Earl of Arundel, who was a former pupil. It was left in manuscript form at Norgate's death. Muller and Murrell have argued persuasively that the first draft of the work was written in 1627–8, and that it was substantially revised in 1648 (Norgate, ed. Muller and Murrell, 1997). As they observe, not only is it 'the most important source for the study of Tudor and Stuart miniature painting', it also 'contains fundamental information and ideas about Netherlandish landscape, drawing in pastel, the naturalization of foreign critical terms into English, and the work of such artists as Rubens, Van Dyck, Holbein, Paul Bril, Orazio Gentileschi, and Hendrik Goltzius' (p. xi). Several of the artists named were acquaintances of Norgate's. Though the first version of the treatise was heavily plagiarized in William Sanderson's *Graphice* of 1658, no complete printed edition of either version was issued until 1919 (Norgate, ed. M. Hardie, Oxford). In the twenty years after Norgate's death a gradually enlarging number of manuscript copies circulated among a close network of gentleman-artists and royalist amateurs,

who regarded them as repositories of technical secrets. The Arundel family copy of the second version was given to the Royal Society in 1678 at the urging of John Evelyn. The opening sections of the treatise are concerned with the physical composition and manufacture of colours. We have selected Norgate's central instruction on the painting of portrait miniatures, with its considerable technical detail on such matters as the picturing of jewellery, together with a shorter passage from his account of the relatively novel art of landscape painting. Our text is taken from the first edition to compare different surviving manuscripts of the second version: Jeffrey M. Muller and Jim Murrell eds., *Edward Norgate: Miniatura or the Art of Limning*, New Haven and London: Yale University Press for the Paul Mellon Centre for British Art, 1997, pp. 71–81 and 82–4.

On portraiture

The first sitting Let the partie whose picture you intend to draw sit before you at a convenient distance, then draw the Lines or porfile of the face with white and lake mingled very faint, to the end that in case you mistake the distance or faile in your designe, You may with a touch of stronger and deeper Colour, amend what you finde amisse without hurt to your worke. The first draught being faintly made, will never be discernable where stronger touches appeare. The lines being truly drawne (where in above all things you ought to be exact and sure), observe the deeper and more remarkable shadowes, and with the same faint crimson Colour of lake and White, give some slight touches or markes somewhat roughly of those shadowes for your better memory and help, when you are againe to goe over them more exactly.

The Lines of the Face being drawne some what sharpc and near you may if You please line out the posture and proportions of the Body, (which in common pictures is not much lower then the shoulders) where in you are to be carefull to observe the Life, as near as possibly you may. This posture is ordinarily drawne with some other darke colours, for as in this you neede not be soe exact, as in the lines of the Face, soe in case you mistake it you may easily deface alter or amend it without trouble to your selfe, or hurt to the picture. [...]

The Order to be observed in a picture by the life is upon the matter the same with oyle Painters, in their ordinary Pictures, which is the first sitting to dead colour the face onely, not troubling Your selfe with the Contorni [garnishes] or things about it, as ground, apparell, &c. And this first sitting comonly takes up two howres in time or if you list to be exact two or three or fower.

The second sitting ordinarily takes up three or fower howres, or more, for in that time you are to goe over the face, very curiously, observing what soever may conduce to the likenes (which is the principall) or to the judicious and fleshly colouring, and observation of the severall graces, beauties or deformities as they appeare in the Life, or else in the close, sharp, and neat workmanship, which is the least considerable, and is indeed but *Opus Laboris*, rather then Ingenii [a work of drudgery rather than native wit]. Yet with some much in estimation.

The third and last sitting is comonly of two howres, or three, according to the patience of the sitter, or skill of the Lymner, and this time is spent in closing what in the former sittings was left imperfect and rough, but principally, in giving to every deepe shadow their strong touches, and deepnings, as well in the shadowes as in the eyes, eye browes, haire, eares &c. For you must remember that though Lymning

when finished, is of all kinds of painting the most close, smooth, and even, yet the best way to make it soe, and to drive the shadowes with that softnes, and airie tendernes, which the Italians call *La maniera fumata*, is to begin rough, with free, and bold hatches, strokes, and dashes, (which they call *Colpo Di Maestro*) with the sharp point of a reasonable bigg pencill, And after in the working to close it by degrees, filling, and stopping all those whitish bare, and unfinisht places with the point of a smaller pencill. Yet these touches and Observations, are ever the last part of this busines, and never to be done, till all the apparell haire and ground be finished. And this being done with Judgement and discretion, adds exceedingly to the life, likenes and roundnes of the picture, and is like good Musick, best heard and tasted at the close.

To returne to the dead colour description, too sutable to the name, your worke must bee done, or rather begun, the rudest, roughest and boldest of all. Having drawne your face, with lake and white, as I said before, you may adde a little Min or red lead to those Colours, tempering them to the red and crimson of the Cheekes, lipps, &c. but gently and faintly, because it is observable, that in all Colours of Lymning, you can adde as often as you please, but be sure never to lay them too deepe which if you doe, it wilbe hardly helpt without spoiling, or defacing your peece, because as I said before, there is noe heightning of a face in Lymning (the white touches for the light of the eyes, and haire excepted).

The first colours you are to begin the Face with all, is the Redds which are different according to the Life, some more towards a Crimson, others of a more sanguine or blushing redd, here and there disperst, mingled, and towards the shadow pleasingly obscured, with the *Mezzo tinto* or middle faint shadow, principally the lipps, cheekes, nose, bottome of the Chinne, and over and about the Eye Browes, and eyes, you will perceave a delicate faint rednes, and underneath the Eyes inclining to a blewish and purple colour (above the power of a pen to describe).

These in faire and beautifull faces are ordinary; and must be dilligently observed. The Eare is comonly reddish or inclineing to a darke Crimson, but comonly in a picture it is lost in shadow, or hid most part in the haire.

These severall reds you may worke with the point of the pencill, but after the manner of washing, or hatching, drawing your pencill along with easy, faint, or gentle stroakes, washing and wiping it rather, then with stips, points, or pricks, to pincke or punch it, as some affect to doe. Certainly the true manner of working, must bee the fruit of your owne Industry and practice, and as you finde the Cast and dexterity of your hand, where in it is impossible to give or prescribe a law above that of *Nature* and *Custome*.

The summe of all is, that in your dead colourings, you must wash over and colour your ground and complexion, with this red, and the following shadowes, not caring in this first sitting to be exact, and curious, but rather bold and juditious. For I have seene pictures begun by a good hand, that though being beheld neere, they appeared exceeding rough, uneven, and unpleasant, yet at a little Distance from the eye, they appeared smooth, neat, and round. Which way of painting is called *La gran Maniera*, and is indeed the very best.

Therefore I would perswade you (specially the first sitting), to affect this bold, stout, and judicious manner of expressing what soever you see in the Life which

(though rude at first) you will finde in the working and finishinge, to be in your owne power to bring it to that close neatness, and curiositie, as you please.

The Redds thus done, the next is the blewes, and other broken blewish and grayish shadowes, that comonly are seene betweene the light and darke, specially about the balls of the eyes, Temples, about the forehead, rootes of the haire and other places, where the vaines appeare. These must be wrought in as the other faintly at first, and by degrees, sweetning, the shadowes, or deepning, according as your light falls harder or gentler, and in goeing over the face, be sure to strike in the hard and strong shadowes, under the nose, Chin, Eyebrowes, &c: and with some what more bold touches then before, bring up your worke together, visiting with your pencill the whole round, and uttermost extent of your worke, never givinge perfection to any one part, hut to bring up all together, in an equall roundness. By which meanes you wilbe able better to observe the likenes, and the Musick and harmony of lights, and shadowes, wilbe the more full and compleate, when all parts appeare with an equality of perfection, yet as it were at randome, in a Cursory manner.

The fainter and sleighter shadowes, being thus put in, and smoothed, and wrought into the Red, you may then proceed to the hayre, disposing it into such Folds and Tramells, as may best become the Picture.

You must first draw them with Colours neere the life of browne *umber*, and soe of the rest, washing the colour with a bold hand, because the hayre you may heighthen or alter at your pleasure, without danger, or defacing the picture. Remember to cast the haire into a middle colour, not soe high as the heighthing, nor soe deepe as the deeping, but soe as you may worke in the one and the other at pleasure.

This done peruse your worke, and be carefull to fill up the void and empty places, (if any such you have left) that none be bare and uncovered with Colour, and for a parting blow, deepen it yet more strongly, then yet you did in the darkest shadowes, still carefully observing the life, which must bee your Loadstarr and director, and remembring by degrees, to bring up the fainter shadowes, to attend and follow those deeper you toucht last, and soe we have done our first sitting, wherein is exprest the face alone, and that in dead colour onely.

The Second Sitting Wilbe longer in time, but I hope not soe long in the Description, for this will take up three fower or more howres, according as you will bestowe more or lesse time or paines, as your owne and your freinds patience will hold out. And now the party being set in his former posture, you are more exactly to observe, and more curiously to expresse the severall Lineaments of the Face, and varieties of Nature in the Colouring, which as you did with a rude bold, and hasty pencill before, soe now you are after a second, and more leasurly reviewe, to examine your worke, and with the same Colours and some what more then the same Industry to revisite, the severall parts, and the most remarkables of the face, working, driving, and sweetning, the same Colours, one into another, to the end, that nothing bee left with a hard edge (which the Italians hate calling it, *La maniera tagliente or scorticata* [the hard-edged or flayed style]) or on heapes, or uneven patches, but all soe wrought one into an other, with the point of a sharper pencill then you used at first, as that your shadowes may lie soft and smooth, being disposed, and gently extended, into, and towards the lighter parts of the face Like ayre or breath.

Now after you have wrought an hower or two, and made a reasonable progresse over the face, and reduct your observables to a laudable improvement, and perfection it will bee time to lay your ground behind the Picture, to Dead colour the apparrell band, ruffe, or what other linnen you please. For the Fonde, or ground behinde pictures, they are made of all Colours as please Mr. Painter most commonly of blew, sometimes of Crimson like sattin or velvet Curtaines (much in request with Mr Hilliard), but most it is laid with darke and sad colour, to sett off the Picture, indeed nothing comes amisse, if the ground be different enough from the Picture. [...]

And now that your ground is laid you will find the Picture you began some what strangely changed from what it was, for the beauty of the ground will soe dim and darken the Beauty of your picture as at first will seeme strange. Therefore you must worke up your Linnen, and apparrell, to or neere to that height it must be. Soe deale with the haire, or any other ornament about the body, which done worke over your face againe, giving more perfection to every part, and now the strongest, and deepest touches in all the *Face* would be brought in, to give it that roundnes and strong colouring as may bring forward and advance the face above the ground, and make it appeare in the due lustre and Life it should have, which cannot be done, but by retouching and revisiting with your strongest shadowes, the Eyes, Eyebrowes, the bottome of the Nose, the Dimples of the Chin, and mouth, and other shadowie places easier for you to find and doe, then me to write.

In this worke it wilbe necessary you make use of the best and sharpest pencill you have, where with all you may fill all those blanke places, which are bare and unfilled, whereby Your peece will (ere you are aware) become round and even.

To particularize every thing would be thought a plot upon your patience. Therefore I will here end this second sitting onely wishing you not to leave Your ground. To rest hard upon the porfile of the face with an edge, but with your pencill, soe to sweeten and drive in the ground, with the out line of the face, that when your worke is done, the ground may seeme a great way off, removed behinde the face which must appeare as embost and standing off from the ground, by shadowing it above, on the light side of the Picture, and below on the dark. Then goe over your haire heightning and deepning it as you shall see cause, and making the out most extremities of the loose, and scattered haire to fly and play over the ground which will give a grace to your worke, and ever is observed by all that are verst in this Art. [...]

If when you have done, and the party gone or weary with sitting (as comonly they are), and that your work appeares not altogether soe closed up as it should be, you must to bring it to perfection, spend some time in filling up the void and empty places which you may doe alone, sweetning the shadowes and supplyeing those defects which may have escaped your view (I meane for the face). But for the apparrell, Linnen Jewells, pearle and such like, you are to lay them before you in the same posture as your designe is, and when you are alone, you may take your owne time, to finish them, with as much neatnes and perfection as you please, or can.

And for Linnen it is best made by laying a *Mezzo tinto*, or middle colour, whereon to heighthen with the purest white, and to deepen with black broken with a little brownish and lesse blewish colour.

For black as satin or the like, you may observe the same order, for a middle colour, deepning with Ivory black, and for the heighthning, or light reflexions you may breake

your black with a little Indico, and white, you will find your blacks to render a very excellent reflexion, specially if your lights be strong and hard, where of, if you please to see almost inimitable expressions, you will find abundantly to your content, in the Gallery of my most noble Lord that *Maecenas of Vertue*, and patron of Arts, the Earle of *Arundell* and *Surrey Earle Marshall* of England, and done by the incomparable *Hans Holbein*, who in all his different and various manner of painting, either in Oyle, Distemper, Lymning, or Crayon, was it seems soe rare generall, and absolute an Artist, as never to imitate any man, nor ever was worthily imitated by any.

The third Sitting Wilbe wholly spent in repetition of your former order, for the strong touches, and deepe shadowes, where in it is odds [*sic*], but you ever find some thing to doe, and for the roundnes you wilbe better able to see your way before you, now the *Contorni*, the apparrell Linnen, ground &c, are laid in and finished, Then otherwise you could be.

In this sitting you shall doe well to bend your observations upon what conduces most to the Likenes, which all good workmen comonly make their principall, but yet their last care and to this purpose the party sitting is by occasion of Discourse to be sometimes in motion, and to regard you with a freindly merry and Joviall aspect, where in you must bee ready and suddaine, to catch at and steale Your observations, and to expresse them with an assured quick and constant hand, which is the last and best note I can give you, for this last and third sitting.

If you have occasion for Armour, gold workes Jewells pearles, or such like, For Armour lay a ground of fine shell silver, hound with Gum (that which comes from Holland is the best for this purpose, and soe is the shell gold), being dry and burnisht with the small tooth of a weasell fastned into a stick. Then temper a shadowe for your Armour, with silver, Indico and a little Litmus, or dash of Lake, and worke your shadowes upon, and over your silver, according to the Life, which must bee Laid before you, the beighthnings are to bee Left, not made, being the bright burnisht silver, the deepning, the deepest of your shadow, the thinner parte where of with some silver must be sweetly and neatly wrought into the ground of silver Laid at first.

And for gold you may lay a flat ground with English Oker tempered with liquid Gold. Yet there is a stone growing in the gall of an *Oxe*, that being ground and tempered with Gold, is excellent for all Gold workes, and gives a very good lustre, the deepning being made with *Lake* and burnt Umber, the heighthning of pure Gold the manner of the working I shall tell You witbin a few Leaves as I bad it from Old Mr Hilliard.

If in your Gold works, there be any carving or embost Imagery (which must be done with strong, and bright reflexions) you may very fitly expresse them, by raying in those high and eminent places a little heape of Gallstone, or *English Oker*, well gumd. These roundnesses or little heapes are made with your pencill full of Colour resting the point of it, in one and the same place for the Colour to flow out, till these heapes or touches bee raised above your other worke.

That done cover your raised worke with gold, which burnisht gently, will shew exceeding faire, and bright. The like you may doe with silver, to expresse the roundnes and lustre of pearles, the shadow and ground whereof must be *White*, *Indico*, *black* and a little *Pincke*.

Diamonds are exprest with Liquid silver, Laid flat, and high, the deepning Cherristone black, and Ivory. The silver dry, and burnisht is left for the heighthning, the stronger and darker your deepe shadowes are made, the fairer and brighter your *Diamonds* will appeare.

To make *Rubies* was delivered mee as a great secret in Cypher. In plaine English it is that on a ground of burnisht silver, of the fashion and size of your Rubie, You take Turpentine of the best and Purest, temper it with Indian or Florence Lake, then take a needle or such like small iron Instrument, heated in a Candle, and laid upon the ground of silver, fashioning the stone round, square, ovall, or how you please, with the point of your Instrument. This must rest a day or two to dry and you will find it faire, and transparant. If it be long in drying, adde to it a little Powder of clarified Masticke.

For an *Emerald*, adde to Turpentine, *Verdigreece*, and a little *Turmericke* root scrapt, with *Vineger*. Let it dry, grind it into fine powder, and temper it with *Turpentine*, as you did for the *Rubie*.

Saphires are made with the same *Turpentine* tempered with *Ultramarine*, a costly colour, made of *Lapis Lazuli*. The manner to make this rich and beautifull colour you will finde here after, as I had it from that knowne *Antiquary Sig^f Verstegan of Antwerpe*. [...]

On Landscape

An Art soe new in England, and soe Lately come a shore, as all the Language within our fower Seas cannot find it a Name, but a borrowed one, and that from a People, that are noe great Lenders, but upon good Securitie (the Dutch) perhaps they will name their owne Child. For to say truth the Art is theirs, and the best in that kind, that ever I saw spake *Dutch*, viz *Paulo Brill*, a very rare Master in that Art, Liveing in *Trinita del Monte* in *Rome*, and his Contemporary *Adam Elshamer* [Elsheimer] termed by the Italians *Diavolo per gli cose piccole* [a devil for little things], *Momper*, *Bruegel*, *Coningslo*, and last but not least Sir *Peter Rubens*, a Gentleman of great parts, and abilities (over and above his Pencill) and Knighted by the best of Kings or Men.

Now *Landscape*, or shape of Land, is but the same with the Latine *Rus Regiones Regiunculae*, The French *Paisage*, or *Italian Paese*: and is nothing but a picture of *Gli belle Vedute*, or beautifull prospect of *Feilds*, *Cities*, *Rivers*, *Castles*, *Mountaines*, *Trees* or what soever delightfull view the Eye takes pleasure in. Nothing more in Art or *Nature* affording soe great variety and beautie as beholding the farre distant Mountaines and strange scituation of ancient Castles mounted on almost inaccessible *Rocks* whereof in *Savoy* and *Piedmont* after you have past *La Tour du Pin* many are to bee seene and in all probability built by the ancient *Romans*, and in some places with *precipices*, desperately falling into the *Lezere* [Isère], and other torrents, about the *Alpes* that with a roaring noise make hast to breake their necks from those fearfull *Rocks* into the Sea. Of these many strange yet very beautifull views are to be seene, from about *Mont Senis*, *Launebourg Novalaise*, and about *Mont Godardo* in *Germany*, and many other places about *Provence*, most of which have bene very well designed after the Life by Peter *Brugell* of *Antwerp*, and remaine in stampe [engravings] to his great Comendation.

Those, that write the Histories of *Plants* as *Mathiolus*, *Gerard*, and others begin ever with the name *Nature*, and vertues of the herbes and *Plants* they describe. Give me leave therefore to follow their method, and I owe much to this harmless and honest Reerecreation, of all kinds of painting the most innocent, and which the *Divill* him selfe could never acuse of or infect with Idolatry. Soe I meane for your sake, and my owne, a little to retard your expectation with some circumstantiall observations concerning the Originall of *Landscape* and by what occasion it hath got soe much credit, and is in soe much request as now it is. For it doth not appeare that the antients made any other Accompt or use of it, but as a servant to their other peeces, to illustrate, or sett off their *Historicall* painting, by filling up the empty Corners, or void places of Figures, and story, with some fragment of *Landscape*, in reference to their Histories, they made as may be seene in those incomparable *Cartoni*, of the *Acts* of the *Apostles*, and miracles of our Saviour, the figures some what bigger then the Life, soe rarely invented by the Divine *Raphael d' Urbino*, and done in water colours by him and *Julio Romano* [i.e. Raphael's tapestry cartoons, now in the Victoria and Albert Museum, London].

But to reduce this part of painting to an absolute and intire Art, and to confine a mans industry for the tearme of Life to this onely, is as I conceive an Invention of these later times, and though a *Noveltie*, yet a good one, that to the Inventors and Professors hath brought both honour and profit.

The first occasion as I have bene told abroad was thus

A Gentleman of Antwerpe being a great *Liefhebber* [Virtuoso or Lover of Art] returning from a long Journey, he had made about the Countrey of *Liege*, and *Forrest* of *Ardenna*, comes to visit his old friend, an ingenious Painter of that Citie, whose House and Company he useually frequented. The Painter he finds at his Easill – at worke – which he very dilligently intends, while his newcome friend walking by, recountes the adventures of his long Journey, and with all, what Cities he saw, what Beautifull prospects he beheld in a Countrey of a strange Scituation, full of *Alpine Rocks*, old Castles, and extrordinary buildings &c. With which relation (growing long) the prompt and ready Painter, was soe delighted, as (unregarded by his walking freind), he layes by his worke, and on a new Table, begins to paint, what the other spake, describing his description in a more legible and lasting Character, then the others words. In short, by that time the Gentleman had ended his long Discourse, the Painter had brought his worke to that perfection, as the Gentleman at parting by chance casting his eye that way, was astonisht with wonder, to see those places and that Countrey soe Lively exprest by the Painter as if hee had seene with his owne eyes, or bene his Companion in the Journey.

This first Essay at Landscape it seemes got the Painter Crownes, and Credit. This began others to imitate, and now the Art is growne to that perfection, that it is as much as twenty or thirty yeares practice can doe, to produce a good Painter, at this one *species* of painting onely. Wherewithall Sir Peter *Rubens* of Antwerp was soe delighted in his Later time, as hee quitte all his other practice in Picture, and Story, whereby he got a vast estate, to studie this, whereof he hath left the world the best, that are to bee seene . . .

2 Constantijn Huygens the Elder (1596–1687) on Rembrandt and Jan Lievens

Huygens had become private secretary to the Stadholder Prince Frederik Hendrik in 1625. He was himself the son of the secretary to the first Stadholder, William of Orange, and had undergone a thorough education in the classics as well as being taught music and drawing. By the age of 30 he was not only one of the most prominent intellectuals in the United Provinces, but also one of the most politically influential. Part of his work was to keep an eye open for talented young painters who could potentially contribute to the image of the Dutch court in ways that might parallel the work of artists in Paris, Rome and elsewhere. It was thus that two young painters who had emerged in Leiden were brought to his attention. Jan Lievens (1607–74) worked closely with Rembrandt in the late 1620s, the two possibly sharing a studio. Later, Lievens worked in England, and then in Antwerp, increasingly influenced by the Flemish Baroque style of Van Dyck and Rubens. From 1644 Lievens pursued his career in Amsterdam where he painted political allegories of the Dutch Republic as well as portraits of many of its leading citizens. The son of a prosperous miller, Rembrandt (1606–69) had a Latin school education before spending an apparently fruitless time at Leiden University round about 1620–2. He then spent three years in the studio of Jacob van Swanenburg, an artist who had lived and worked for many years in Italy. After that he studied with Pieter Lastmann, a Raphaelesque painter, in Amsterdam, before returning to Leiden to set up his own practice. By 1630 both young painters had accrued a considerable reputation in history painting as well as portraiture, which evidently extended to Amsterdam and to the upper echelons of the Stadholder's court. Indeed the Stadholder himself had already acquired pictures by Lievens, whose reputation at this time was, if anything, the more advanced of the two. Huygens was writing an autobiography (*The Youth of Constantijn Huygens, written by himself*) between c.1629 and 1631, and it is from there that the present appreciation of the two emerging artists is taken. It is interesting both for what it has to say about class and career opportunities in independent Holland, and for Huygens' informed comments about the stylistic inclinations of the two painters. Also significant, given the way northern painting is conventionally distinguished from the classical tradition, is Huygens' emphasis on the benefits that would accrue to the young artists from an exposure to the Italian Renaissance. Our extracts are taken from the English text as translated from Huygens' Latin in Walter L. Strauss and Marjon van der Meulen, *The Rembrandt Documents*, New York: Abaris Books, 1979, pp. 69–72.

In Triarii, I have purposely singled out a noble pair of Leiden youths. If I said they alone were equal to those prodigies I have pointed out among so many great mortals, I would judge even this something less than what these two deserved. If I said they will shortly surpass them, I would leave nothing more to hope for than what certain sage observers have anticipated from their astonishing beginnings.

When I consider the parentage of each, I think no stronger argument can be given against nobility being a matter of blood. [. . .] The father of one of these young men [Lievens] is an embroiderer and a commoner; the other's [Rembrandt's father] is a miller and surely not of the same grain. Who could help but marvel that two prodigies of talent and creativity could emerge from these farmers. When I look at the teachers these boys had, I discover that these men are barely above the good

repute of common people. They were the sort that were available for a low fee; namely within the slender means of their parents. Should they come into sight of their pupils today, they would be confounded with the same shame as I imagine were those teachers who first brought Virgil to poetry, Cicero to oratory, and Archimedes to mathematics. To give each his due and yet do no harm to another (for what do I care?), they owe nothing to their instructors and everything to their natural gifts. [. . .]

The name of the first is Jan Lievens whom I called the son of an embroiderer. The other is Rembrandt, whose lineage I derived from a miller. Both are beardless, and, if you note their appearance in body and face, are closer to boyhood than to youth.

It is not appropriate for my talents or this biography to review the works and activity of individuals. What I hoped for regarding Rubens, I would also like to see used by these two, especially: that they compose a list of their works, a table of their paintings. If each made this modest reference to his works, it would show the marvel of every age, and in brief encompass by what plan and what judgment they constructed, ordered, and worked out each item. I will dare to pronounce perfunctorily on each man as follows. Rembrandt is superior to Lievens in judgment and in the liveliness of emotion. Lievens surpasses him in inventiveness and the loftiness of his daring themes and forms. From his youthful spirit Lievens breathes forth nothing except what is great and magnificent and he equals the size of the objects of his painted forms not as willingly as he exceeds it. Rembrandt, completely wrapped up in his activity, loves to work on a small canvas and present an effect by condensation, something you may search for in vain in the very spurious [efforts] of others.

I want to say that Rembrandt's finest painting is one of the penitent Judas, returning the silver coins – the price of the innocent Lord – to the high priest. All of Italy and whatever of beauty or deserving admiration that has survived from furthest antiquity may approach it [but will not surpass it]. The gesture of this one Judas in despair – not to speak of the many [other] fascinating figures in this one work – Judas, maddened, howling, begging forgiveness, yet not hoping for it, or reflecting any hope in his countenance, his expression frightening, his hair tangled, his clothes torn, his limbs twisted, his hands clenched to the point of blood, prostrate on his knees on a random impulse, his body twisted by every pitiful hideousness – this bearing I contrast to all the elegance of the centuries and one I want the most unaware mortals to know. This latter group asserts, and we have reproached them at other times, that nothing today is either accomplished or spoken that antiquity did not see accomplished or said long ago. But I say that it did not occur to Protogenes, Apelles, or Parthasius nor could it occur were they to return, how this adolescent (I am amazed just reporting it), this Dutchman, this miller without a beard has summed up individual elements in one human being and expressed what is universal. Blessed are you, my Rembrandt! Ilium and all of Asia were not carried to Italy for as much as the highest praise of Greece and Italy has been brought to Holland by this Dutchman, who till now has seldom left the confines of his city.

In the transition above, I prefaced something about Lievens. I think I have made a sufficient judgment of what sort of character he is. He is a young man of great spirit, and if he lives, nothing but the greatest is to be anticipated from him. In any matter you please, he is powerful in judgment which is sharp, deep and mature, beyond that

of a grown man. Among what should be discovered, I used to reprehend that one fault of his – a danger risked not just once – namely, that he either flatly rejected every criticism or took it once admitted with a bad spirit because of a certain rigidity based on too much confidence in himself. This is a vice quite harmful to a person of any age but is truly pernicious in youth so that ‘a little leaven leavens the whole dough’ [1 Cor. 5:6], and those who indulge in a vice close to this one are said in Scripture ‘to delude themselves’ [Gal. 6:3]. He abridges the wisdom of the great who think that God has given to each man ‘with a chary hand what is sufficient’ [Horace, *Carmina* 3:16, 44] and who is convinced that no one has emerged in control of everything by submitting a gentle spirit and docile nature to anyone nor could he be taught anything by anyone. An immense harvest of works by the outstanding is there for the ages, nor could you easily imagine, if you compared the painter with so many paintings, that such plentiful fruit came from so slender a trunk.

He has approached the miraculous in doing the expressions on faces and if the great and untamed power of his nature could be restrained, which now embraces all of nature in its daring and expectation, it would not be unjust to convince him to be a painter who devotes himself to this part especially, a wondrous compendium, as it were, of the whole person, body, I say, and spirit. For on historical subjects, as we say publicly, this certainly great and admirable artist will not easily attain the vivid invention of Rembrandt.

I can scarcely tear myself away from talk of such outstanding young men without turning again to that one fault for which I already censured Lievens – they are carelessly content with themselves and till now have not thought Italy of such great importance, though they need to spend a few months traveling there. In such talented natures there is a certain mixture of madness which one who will destroy young spirits has abundantly bestowed, indeed, this alone is lacking the two for the perfection of art. Oh, if only they were acquainted with Raphael and Michelangelo. They would eagerly visually devour so many monuments of these great souls. How quickly they would surpass them all and, as men born for the consummation of art (did they only realize it), they would summon Italians to their own Holland. But I will not be silent about the pretext by which they usually hide how much it is a matter of apathy, and excuse themselves. They say that in the bloom of their youth, when especially an account of themselves must be given, there is not leisure time to waste in travel. Besides, as there is today an eager delight in and choice of painting by kings and princes on this side of the Alps, they have seen Italian paintings especially outside Italy, which there you track down with great inconvenience scattered about, while here they are displayed *en masse* and one can have his fill.

3 Rembrandt van Rijn (1606–1669) Letters to Constantijn Huygens

Rembrandt wrote very little. The only correspondence to have survived is a late letter of 1662 to his Sicilian patron Don Antonio Ruffo, and the present series of seven letters to Constantijn Huygens the Elder, written relatively early in Rembrandt’s career in 1636 and 1639. The Huygens letters are included here in recognition of Rembrandt’s importance to the period covered by this volume. Around 1633 Rembrandt painted two panels, *The*

Elevation of the Cross and *Descent from the Cross* (now in the Alte Pinakothek, Munich). Both pictures entered the collection of the Stadholder Frederik Hendrik. Rembrandt was then commissioned to paint three further pictures on the theme of the Passion. His biographer has argued that this commission was 'both the most and least desirable of his career' (Schama, p. 1999, 433), and that even the first letters from 1636 contain a note of procrastination, as well as demanding twice the rate he had been paid for the *Descent* and the *Elevation*. In the event it was another three years before *The Ascension of Christ*, the *Entombment* and the *Resurrection* (all now also in the Alte Pinakothek, Munich) were finished. The letters from 1639 concern the completion of the work and the subsequent problems over payment, with Rembrandt having to settle for a lower price than he had wished. Even in the Dutch Republic it seems that the artist/patron relationship was not far removed from servant/master, though it must be said that Rembrandt did not take his rebuff lying down. Likewise in 1662, when Ruffo complained about the condition of a picture sent to him, Rembrandt responded: 'I am most astounded by what has been written about the *Alexander*, which is so well done that I must, suppose there are not many lovers of art at Messina,' going on, 'If your Lordship likes the *Alexander* as is, very well. If he does not want to keep it, six hundred florins remain outstanding' (cited by Schama, pp. 592–3). In the end the point is subtle. Rembrandt has to do as he is told if he wants to sell at all. But at the same time he is the sole provider of a commodity in short supply. In the end it all depends on who wants what, in the grey area where taste meets fashion meets power. Claims for its status as a liberal art notwithstanding, painting remains an emphatically material practice in a world of material exchange. The third letter to Huygens, dated 12 January 1639, is particularly significant for the rare statement it contains of Rembrandt's feelings about his own painting. However, even here there is room for doubt as the Dutch phrase *naetuerelste beweeghelijkheid* is ambiguous between 'motion' and 'emotion'. The editors of the *Rembrandt Documents* conclude that, rather than a single clear-cut meaning, what is implied is 'an animated interplay of motion and emotion of artist, subject and spectator' (p. 162). The letters are reprinted in full from the English translations in Strauss and Van Der Meulen op. cit., pp. 129, 133, 161, 165, 167, 171, 173.

I February 1636

My [dear] Sir and most gracious Mr. Huygens: I hope your lordship will be so kind as to advise His Excellency that I am very diligently engaged in proficiently completing the three Passion pictures which His Excellency has personally commissioned me [to do]: an Entombment, a Resurrection, and an Ascension of Christ. These are companion pictures to Christ's Elevation and His Descent from the Cross. Of these above three, one has been completed, namely Christ's Ascension to Heaven, and the other two are more than half-finished. Please, Sir, let me know whether it would please His Excellency to have the finished piece first, or all three together, so that I may best serve His Excellency the Prince, according to his desires.

As a token of my readiness to serve you with my favor, I cannot refrain from presenting you, [dear] Sir, my latest work. I trust that you will most graciously accept it¹ in addition to my greetings. I command your lordship [and] all [of yours] all to God to health.

Your obliging and affectionate servant
Rembrandt

¹ This probably refers to one or more etchings.

II 1636

My [dear] Sir: Let me first offer my kind regards. I agree that I should come soon to see how the picture accords with the rest. As regards the price, I certainly deserve 200 pounds for it, but shall be content with whatever His Excellency pays me. And if you, Sir, do not deem it presumptuous, I shall not neglect to requite the favor.

Your humble and devoted servant
Rembrandt

It will show to [the] best advantage in His Excellency's gallery, since there it will be [displayed] in bright light.

III 12 January 1639

My [dear] Sir:

Because of the great pleasure [I have had] and interest I have taken in the proper execution of the two pieces His Highness has commissioned me to do, i.e. the one of Christ's Entombment, and the other of His Resurrection – to the great consternation of His guards – and as a result of my diligent zeal, these two pieces have now been completed as well, and therefore I am now ready to deliver them and thus afford pleasure to His Highness, for in these two pictures the deepest and most lifelike emotion has been observed [and rendered]. That is also the main reason why they have been so long in my hands.

I ask you therefore, my [dear] Sir, whether you wish to inform His Highness of this, and [also] whether it would please you Sir, if the two pictures were first delivered to your house, as was done previously. In this regard, I shall first await a short note [from you] in reply.

And because you have become involved in these matters for a second time, I shall send along, as a token of gratitude, a piece measuring ten feet in length and eight feet in height which you will prize in your house.¹ Wishing you all happiness and the blessing of salvation, Amen.

Your obliging and devoted servant
Rembrandt

¹ Thought to be *The Blinding of Samson*, 1636 (now in the collection of the Stadelches Kunstinstitut, Frankfurt).

IV January 1639

My [dear] Sir:

With your permission, I am now sending you these two pieces, which I think will be considered fine enough to warrant His Highness paying me no less than a thousand guilders for each of them. But should His Highness not deem them worth that, let him pay me less, according to his pleasure. I rely on His Highness' knowledge and

discretion. I shall gratefully content myself therewith. And in addition to my regards, I remain his

obliging and devoted servant
Rembrandt

The sum I have advanced for frames and the crate is 44 guilders.

V 27 January 1639

My [dear] Sir:

I have read your pleasant letter of the 14th with singular pleasure. I discern your kind inclination and affection which I feel deeply obliged to requite [you] with service and friendship. Because of [my] inclination to do this, [and] in spite of your wish, [I] am sending [you] along [with this letter] a canvas, hoping that you will accept it, because it is the first memento which I offer you, Sir.

Wtenbogaert, the tax collector, paid me a visit just when I was busy packing the two pieces and desired to see them once more before [they were crated]. He mentioned that if it pleased His Highness, he was prepared to make payments to me from his office here. Therefore, may I ask you, my [dear] Sir, that the money which His Highness allows me for these two pieces be paid here [in Amsterdam] as soon as possible, because I could use it well particularly at the present time. Awaiting your gracious reply, and wishing you and all of your family happiness and blessings besides my regards,

your obliging and affectionate
servant
Rembrandt

[Postscript]

My [dear] Sir: hang this picture in a bright light and in such a manner that it can be viewed from a distance. It will then sparkle at its best.

VI 13 February 1639

Worthy Sir:

I have full faith in you, particularly as regards the [matter of my] remuneration for the last two pieces. If things had gone according to your wishes and to propriety, no objection would have been raised to the asking price. As for the pieces [which were] delivered previously, no more than 600 k. guilders were paid for each of them, and if His Highness cannot be persuaded in the face of valid arguments to pay a higher price, even if they are obviously worth it, I shall be content with 600 k. guilders each, with the provision that reimbursement shall be authorized for my [cash] outlay of 44 guilders altogether for the two ebony frames and the crate. Therefore, I ask you, Sir, kindly [to intercede] that I might as soon as possible receive payments here in Amsterdam, and I trust that with [your] kind help on my behalf I shall soon be able to enjoy my pennies, and I shall remain grateful for all your acts of friendship.

And with my greetings to you, Sir, and to all your close friends, [I] commend you to God, [may he grant you] long-lasting health.

Your obliging and affectionate servant
Rembrandt

VII February 1639

My [dear] Sir:

I hesitate to trouble you with this letter, but I am doing so because of what Wtenbogaert, the [tax] collector, told me after I complained to him about the delay in my payment. Volbergen, the treasurer, denied that dues were claimed annually. Last Wednesday, Wtenbogaert, the collector, replied to this that Volbergen had thus far laid claim to these dues every six months, so that more than 4000 k. guilders had been deposited again at his office. And because of this true state of affairs, I beg you, kind Sir, to have my payment order prepared promptly, so that I will now finally receive my well-earned 1244 guilders. I shall forever seek to requite you, Sir, for this with reverence, service, and evidence of friendship. With this, I give you, Sir, my heart-felt regards and wish that God [grant] you long-lasting good health and gives you His blessings,

Your obliging and affectionate
servant
Rembrandt

4 Philips Angel (c.1618–after 1664) from *In Praise of Painting*

Formerly confused with a contemporary painter of the same name who worked in Haarlem and Middelburg, Philips Angel worked in Leiden until 1645, when he joined the Dutch East India Company, travelling on the company's business to Batavia (now Jakarta). He was to remain there until his death, apart from a period of some five years in Persia, during which he served for a while as court painter to Shah 'Abbas II. Almost nothing survives of his work as an artist. 'In Praise of Painting' was originally delivered as a lecture to the painters' guild of Leiden on 18 October 1641, when Angel's audience probably included the artists Gerrit (or Gerard) Dou, David Bailly and Pieter van Steenwijk. It was first published as *Lof der schilder-konst*, Leiden: Willem Christiaens, 1642. There are two particular reasons for interest in the treatise. The first is the importance Angel places on naturalistic observation and upon the achievement of plausible illusions. This emphasis is consistent with his support for the kinds of detailed techniques then being developed by Dou and other Leiden painters, and for the Dutch painters' development of such relatively novel genres as battle-pieces, seascapes and guardroom group portraits. It is this emphasis that gives Angel's relatively standard account of the requisite skills a measure both of modernization and of specificity to the work of his Dutch contemporaries. Unlike his French and Italian contemporaries, he is little concerned with the edifying or didactic functions of art. Rather, he treats of painting as a respectable craft, leading to the production of things that delight the eye. The second reason for interest in Angel's treatise is the evidence it offers of his proximity to Rembrandt, who was also born in Leiden, and who returned to work there between 1626 and 1631. The approximate date of 1618 normally accepted for Angel's

birth would make him a surprisingly young authority to lecture to the guild of artists in 1641 on the name day of St Luke, their patron saint, or indeed to compose a substantial treatise on painting. It seems more likely that between 1626 and 1631 he would have been old enough to profit directly from Rembrandt's presence in Leiden. In any case, the form of attention that Angel devotes to history painting in general, and to Rembrandt's *Samson's Wedding Feast* (Dresden, Gemäldegalerie) in particular, suggests that his ideas on the subject were formed under the influence of the older painter and of his circle. Our text is taken from the facsimile reprint of the original Leiden edition of 1642, pp. 33–41, 43–4, 46–8, 51–8. The excerpts have been edited and translated for this edition by Hester Ysseling.

Let us conclude by examining what qualities a painter must have if he is to be counted amongst the number of praiseworthy artists without being subject to ridicule. For surely not all those who call themselves painters can be considered amongst them. Many incite themselves to mirth, thinking 'If our art is to be considered so excellent, then I should think rather highly of myself, since I am one of its citizens.' They are like peacocks who stick out their chests with pride and take pleasure in the beautiful plumes of their tails, but on looking down and seeing the dull colour of their feet, drop their tails and shuffle away backwards. This is the fate of those who, upon hearing such great things about the excellence of painters, conclude from the fact that they too bear the same name that they are like them. But when they compare their own work to that produced by these illustrious artists, then, like the peacock, they are obliged to slink away with their heads bowed, filled with shame and remorse. To learn what qualities you must have in order to be ranked among the illustrious, pay attention while I depict with my pen the figure of someone who deserves to be ranked their equal without being mocked. First of all, he has a healthy judgement, a steady and confident hand for drawing, a fluent mind to compose in accordance with nature, ingenious invention of pleasing abundance, correct arrangement of light and shadow together with a just observation of actual things in nature, a well-trained knowledge of perspective and no less a knowledge of history, accompanied by profound and natural reflections which arise from plentiful reading and enquiry. He also has a grasp of mathematics and a thorough understanding of anatomy. He seeks to imitate nature rather than the manner of painting employed by other masters. He knows how to mix lifelike [*vleysich*] colours and how to express the differences of woollen, worsted, linen, and silk fabrics. He has a brisk yet smoothly flowing brush. If to all these things he adds the mellifluous eloquence of Apelles, the virtue of Michelangelo, and the passion and diligence of Domenico Ghirlandaio, we are justified in saying of him that he should be honoured with an eternally enduring crown of honour. [...]

To appreciate the usefulness of the virtues which we have given as the requirements of a painter, we shall analyse each of them separately.

First, we observed that the first and foremost requirement of a painter is right judgement. I emphasize the usefulness this brings for the benefit of our art and the furtherance of its honour because whoever possesses good judgement without the ability to act on his judgement will rather make his impotence known by abstention than bring shame on himself through his deeds. To make this better understood I will give an example. Someone who has a sound understanding of a painting when it is

shown to him and who judges it to be pleasing and unsurpassable as far as he is concerned, knowing that he would not be able to imitate it, would not make the same careless mistakes which are all too common today. When he copies the work he will do no more than he is asked and refrain from wanting, as many do these days, to play the hypocrite and pretend that, having added something of his own composition, the whole piece was an object of his own invention. This is ridiculous, and no more respected by connoisseurs of art than a monkey who covers its naked behind by crouching under a mantelpiece, but who reveals his nakedness as soon as he dares to climb upwards. So it is with these people as long as they hide under the compositions of great masters. But even if their idiocy does not become visible, their nakedness is revealed as soon as they dare to climb up by their own invention. A healthy mind with sound judgement would avoid this, knowing that stealing someone else's good name is only to the disadvantage of art. But someone might ask: is it not allowed, then, to borrow from other masters? This I do allow, for otherwise I would be contradicting the teaching of Karel van Mander in his *Grontleggingen van de Schilder-Konst* [Outlines of the Art of Painting], chap. I v. 46, where reasons are given as to why this is permitted.

It is quite a different thing, however, to borrow something in order to elevate one's own imperfection to a higher degree of perfection than it is to add something defective to something which is already good. The one pays homage to the master from which it was taken, whereas the other, a careless addition, does him nothing but harm. Therefore we should distinguish between taking something and adding something. [...]

Second, a painter also needs a steady hand for drawing, which is of the utmost importance, since it will help to avoid gross mistakes, such as are made only too often by bands of good-for-nothings. When they produce a head, one finds that one eye is higher than the other, or that the ears are too small, the nose too short or too long, the mouth too thin and so forth. Alternatively, they will place heads on bodies which are either too small or too large, or of which the arms and legs are too short. In sum, many awkward things come to light, and such mistakes could be avoided by possession of a steady hand for drawing. [...]

Third, the artist requires a mind which can combine things in a fluid and natural manner. That this is indeed the case can be concluded from the fact that the artist who is fluent in composing will never be embarrassed by a difficult composition. When he concentrates his thoughts and makes them play around a single idea, his fertile mind produces thousands of changeable devices. When this fluency is accompanied by naturalness [*eyghentlijckheyt*], and when the two work together like sisters, this brings such a pleasing and graceful lustre to the art that it can better be understood from the example of master painters than it can be explained in words. This quality is also required of a painter because it allows him to represent the histories which he depicts in a way which makes it easier for enthusiasts and others to understand them.

Fourth, besides this smoothly flowing naturalness, no lesser radiance is added to the art by an abundance that pleasingly embellishes it. That a painter should be mindful of this can be seen from the warm affection which it arouses in the art lover's heart. This we see every day in those who embellish their works with abundance so

that they delight the eyes of enthusiasts and fill them with a wishful desire for things represented. Through this their paintings will sell readily. In view of the profit it brings us, we should pay the strictest attention to the representation of elegant abundance.

Fifth, on account of the gracefulness [*welstandigheyt*] it lends to our art, the proper arrangement of light and shadow is one of the most important laurels with which a good painter ought to be adorned. For shadows, if arranged well and put in the right place, render magical force and marvellous grace. Many things whose colours are barely imitable by any brush are made to appear highly realistic. For the force that living and real things have remains even if their shadows are scattered and confused, and the whole still retains grace. Because of the imperfections remaining in us, we cannot lend to our works such grace and such force as real things appear to us to have. We can bring this about only if we properly arrange shadow and light together. [. . .]

Sixth, it may sound strange to some of you if at this point I add to this chain of the art of painting a link which is the observation of actual things in nature. However, the ideas that I will present here in order to show the reason why will undoubtedly satisfy you, my lords, and you will agree that it is useful. Oh lovers of art! I have often noticed a serious mistake which is made not only by the lowliest, but also (I mention it respectfully) by the greatest and most esteemed masters. This mistake follows from nothing other than a failure to pay close attention to the observation of actual things in nature. This is particularly noticeable when artists paint a wagon. They make it seem as if the horses were in full gallop, whilst the wheels of the carriage remain standing still.

This is something I have seen not only in battle painters, but also in history painters. [. . .] If they had paid strict attention to the proper observation of actual things in nature, they would have avoided these mistakes by closely observing the natural movements and conceiving the form which appears the most adequate. When a wagon-wheel or a spinning-wheel moves at full speed we see that because of the fast turning no spoke is actually visible but only a vague shimmer. Even though I have seen many pictures with wagon-wheels in them, I have never seen this phenomenon properly represented. Rather, every spoke is drawn or painted as if the wagon did not move them, so that there is no difference between a wagon standing still and one that has the appearance of moving. Many may be of the opinion that adequacy is much harder to achieve in this than in other subjects, but since we are the imitators of life, we should not give up when confronted with a little more difficulty if this brings us closer to natural things.

* * *

Seventh, a well-practised understanding of perspective is required for the art of painting. I will show that this is the case in seven or eight words (to be brief). Through her rules, this art reveals to us that what is below our eyes should be seen as if we were looking down on it, whereas what is above our eyes should be seen as if we were looking up at it. Many people think that this is a trivial matter and say that this can be seen without any knowledge of perspective. But it is not true. They themselves reveal it in their work, where it is constantly shown up. Knowledge of perspective also helps in choosing the appropriate horizon for our works, such as

in landscapes, temples, houses, tables and the like. This gives the appearance of a fixed position to things, whereas in the work of inexperienced artists the things which are depicted usually seem to be toppling. To avoid these mistakes, a painter needs a well-practised understanding of this art.

Eighth, a no less experienced understanding and knowledge of histories is needed in order to avoid those misunderstandings in their representation which the inexperienced often make as a consequence of their negligence with respect to reading.

* * *

To avoid these mistakes, I strongly advise that we do as our predecessors did and adhere to the practice that is still pursued by many contemporary masters, that is, we should occupy ourselves with assiduously sniffing through [*doorsnuffelen*] old musty books in order to obtain knowledge of histories. If we wish to express this knowledge in drawings, prints or paintings, we should add our own elevated reflections and let the freedom which is allowed us merge in such a way that it does not violate the spirit of the histories but adds lustre to our work. This is what old masters did and what many of today's illustrious spirits still do. Here we may include the renowned Rembrandt, the illustrious Jan Lievens, the highly esteemed [Jacob] Backer, the good Bliccker and many others I will not mention for the sake of brevity. [. . .]

Among other things, I once saw a *Samson's Wedding* depicted by Rembrandt. If we read the story in Judges 14:10, we can see how that clever artist perceived it and what elevated reflections he brought to it, in this case regarding the naturalness of the guests sitting, or rather lying, at table. For the ancients used beds to lie upon, and they did not sit at table in the way we do now, but lay on their elbows, in the way that is still customary among the Turks. This he showed very pleasingly. In order to distinguish this wedding from other weddings, he put Samson in the foreground with long hair to make it clear that no razor had ever touched his head. Moreover, Samson is shown posing his riddle to a few attentive listeners, as can be told from his hands, for with his right thumb and middle finger he had grasped the left middle finger, a common but very natural act for someone who wishes to present something to others by means of speech. Since not all the guests were disposed towards the same thing, he painted others who were merry and not listening to the riddle, but holding up a flute of wine and laughing. Others are shown busy kissing – in sum, it was a lively wedding. And even though the movements are similar to those that can be found at our contemporary banquets, he had still added sufficient contrast to allow the observer to distinguish it from the wedding banquets of our day. You can see that this appropriate and natural representation is the fruit of his having read the histories well and considered them fully, with lofty and profound reflections.

* * *

Now let us see why it is necessary for a painter to have some knowledge of mathematics, the usefulness of which I will point out in one or two words. The reason is that it allows him to judge competently the features of a face and its proportions, which is of great importance for a painter. But I will elaborate on this on another occasion: I shall avoid starting on this road for it will inevitably lead us too far afield.

Further, I will consider to what end a profound knowledge of anatomy is useful. A good grasp of anatomy gives us the advantage that we learn from it the knowledge of

muscles, where they originate and where they end, how they move and how they change in their movements, how they recede and protrude again, and how a body should be divided so as to be well proportioned. Knowledge of anatomy shows us the difference between the bodies of a man and of a woman, and the difference in proportion between children and adults. Moreover, we learn from it how always to find a straight perpendicular or plumb line in the figure of a human being, and also an isosceles triangle, a square, a perfect circle, and many other useful things. To acquire this knowledge, Michelangelo and many other excellent men dissected several bodies, and split muscles apart to learn about them. I often regret that in this city the artists are not given so much freedom, and that they do not have at their disposal a freely accessible dissecting room which could further this useful science. By contrast, all the other arts, even including the school for martial arts, maintain their position. But our art, which gives to Leyden (the birthplace of all great minds) greater renown than any other art, is not given any freedom for further expansion. Nevertheless, dear brothers, in the absence of such accommodation (hoping that it will some day be provided, together with other things useful to us), I recommend to you the anatomy by Master Heynderick and Master Cornelis van Haerlem, who have bequeathed flayed plaster models to you, by which you may reach a certain degree of knowledge regarding the nude, which is highly to our benefit. [. . .]

Leaving the subject of anatomy behind us, I will now show that it is much more laudable to follow nature than to follow the manner of painting of other masters. It is contemptible to imitate the manner of painting of other masters, whereas it is advisable to follow nature. Let us, then, prefer what is advisable to what is contemptible, and follow life conscientiously. But how are we to go about this? Should we paint in such a way that every one can see that the work is by this or that master because of the manner in which it was painted? No, on the contrary, for as long as this can be known and identified the master is still adding too much of himself. But if he knows how to follow life to such an extent that we are in a position to judge whether his work adequately approaches life without being able to trace the manner of the master who made it – such an artist deserves praise and credit, and will be esteemed above others. [. . .]

Let us leave this behind, and choose that which will bring us the most praise, seeking out nature, which is so full of variety that if someone follows it truly it will be impossible ever to decide who made their work. Or it may be the case that someone comes so close to life that we would have to agree that it was the work of some particular master because it was at the same time so true and nevertheless so varied, and because no one had ever heard of such truthfulness to life except in his work. This we would not conclude from his manner of painting, but from its uncommon correspondence to life. Let us aspire in this way to the highest perfection, since it is open to all of us. And if no such artist has been found as yet, fellow art-lovers, strive diligently to come as close to him as possible. If you should ever achieve your aim, you will deservedly be adorned with a new crown of honour to cover your laudable head, since this is one of the excellent recommendable things to which sacrifice is made at the altar of eternal remembrance.

Having added this link of the imitation of nature to the chain of the art of painting, let us now swiftly forge the next link and see what lustre can be brought to our art by

the flesh-like [*vleysighe*] blending of colours. First, it takes away the dull sallowness; second, the green unnaturalness; third, the harsh stone-like quality, and instead of these despicable qualities it brings the highly esteemed naturalness of a fleshy, skin-like colour, which makes our art pleasant to the eye of art-loving enthusiasts. This virtue is so great that we have no further need to prove its necessity or to enlarge upon it in any more detail. Keeping to the terms we set ourselves, we proceed to the next necessity that is required of a painter, to wit, that he must know how to distinguish between silk, velvet, woollen and linen-worsted.

Velvet clothes which actually appear to have the lustre of velvet are rarely seen, and the difference between woollen and linen-worsted, with respect to the way it creases and folds, often escapes the attention of the painter. Neither does he observe the shine which is more brilliant in silk than in satin. He also neglects the fine delicacy [*dunne eellicheyf*] which should be imitated in fine linen and chiffon velvet. A praiseworthy painter should be able to represent these differences in a manner most pleasing to the eye (by means of his brush-work), distinguishing the roughness of worsted and the smoothness of satin. This is something in which that brilliant German [i.e. Dürer] exceeds other painters and for which he is still famous.

How necessary this requirement is in a painter I leave to the judgement of all just persons, and proceed to prove my last point, that as well as all the aforementioned necessary virtues, a painter should have at his command a brisk, bold and yet smoothly flowing brush, because without it all the virtues mentioned could not be put into practice. For alas, what good is a work of painting, even if one sits and sweats over it for months, seeking most conscientiously to figure it out, if a sweet disposition [*houdinge*] cannot be found there. However, this is not the case with every painter. Nor does neatness amount to much without a certain ease [*lossicheyf*], because the flaw of rigidity degrades the virtue (if it may be called a virtue) of neatness. Whoever chooses to privilege neatness in his studies should also practise that virtue which is constantly observed by Gerard Dou, who is never sufficiently praised. His is a curious ease, guided by a steady and confident drawing-hand. Whoever proceeds in any other manner will receive more ridicule than praise. And whoever does not know how to achieve such neatness should exert himself to acquire a loose, brisk, smoothly flowing brush, rather than suffocate in rigid, tidy unpleasantness. Oh distinguished brothers, now you have learned what qualities a painter must have in order to be ranked among the most illustrious men without being an object of ridicule.

If, besides these virtues of the painter, you also seek to promote your own person, then try to acquire the mellifluous eloquence of Apelles, which was so sweet that Alexander was much taken by it and visited him regularly to speak with him. On one such occasion it happened that King Alexander expressed a judgement on art which, to put it mildly, was inappropriate. In response, Apelles dared to demand that the king be silent, saying that His Majesty would much rather hold his tongue than utter such talk, since the apprentices at the back were laughing at him. He managed to convey this with such kind and courteous pleasantness that the mighty Alexander accepted it with grace. Behold how much influence sweet eloquence had on the feelings of this great monarch, whereas, on the contrary, gruff obstinacy leads to nothing but disadvantage and ridicule. [...]

Besides this virtue of courteous eloquence, noble minds, try to emulate the virtue of Michelangelo and to govern your earthly frame with discipline and decency. This will make you esteemed among men and loved by God, and these two things will serve to establish your name for ever. If, to conclude, you also devote yourself with the passion and diligence which once distinguished Domenico Ghirlandaio, then I have nothing more to say to you than that you rightly deserve that the crown of honour be seated on your head. To conclude, let us learn to exploit our time profitably and to spend it so well that there is 'no day without a line'.

This was the frequent saying of the renowned Apelles: let it not only be our proverb, but our daily reflection, because through work we extract fire from the stone, and the gods sell everything for sweat. If we follow this, we will be sacrificed on the altar of immortality along with all great artists, and our names will be held up to our successors for all eternity. Should it happen that someone asks how it has come about that we have achieved such excellence above others, let them be referred to the proverb of the philosopher Demosthenes which will be written for us in golden lettering: 'by having used more oil than wine', which means to say that we have added more nights to our days to improve on our studies than we have squandered on revelling and intoxication. If we take this into consideration conscientiously, through the strength of our art we will struggle free of the devouring jaws of death, and in spite of the grim reaper [*de breeckneck aller dinghen*] we will survive and blossom without withering from century to century.

* * *

5 Francisco Pacheco (1564–1644) from *The Art of Painting, its Antiquity and Greatness*

Pacheco's *Arte de la pintura* embraced two very different aspects of art. On the one hand, for the Catholic artist, committed to the ideals of the Counter-Reformation as spelt out by the Council of Trent, art was first and foremost a means to Christian salvation. The painter was to use the skills and knowledge at his disposal to bring images of the divine before the human consciousness, and thus to act as a kind of supplement to, or enhancement of, the teachings of the Church. This aspect of Pacheco's treatise is shown above, in IA3. There remained a very different side to painting. For all the emphasis on its intellectual or spiritual aspects, the actual making of a painting remained a laborious, physical affair, requiring mastery of a wide range of craft skills and any number of tricks of the trade. This dimension of art is treated in the third volume of Pacheco's book. The following selections begin with instructions about preliminary drawing. Pacheco then describes how to make an oil painting, from the preparation of the canvas, through the underdrawing, to the selection and application of colour. In the final two extracts Pacheco moves on from the *cuisine* of painting and offers suggestions about how to make, respectively, a landscape and a portrait. Our excerpts are taken from *Artists' Techniques in Golden Age Spain. Six Treatises in Translation*, edited and translated by Zahira Veliz, Cambridge and London: Cambridge University Press 1986, pp. 35, 36, 42 (sketches); pp. 68–70, 72–4 (oil painting); pp. 93–5 (landscapes); pp. 99–101, 103–5 (portraits). We have retained some of Veliz's explanatory footnotes.

Oh, illustrious *Artifice*, honor of the Spanish nation! We have discoursed to this point with appropriate care and attention on the art of painting in general, which your genius needs not, but which opens the door to the superior light of your doctrine; now, with your permission, we will familiarize those humble men who need some instruction in the ways to execute their works, and with your authority we will give substance to this third book about the practice of art, which I begin by discussing the ideas and sketches to be prepared for the execution of the painting. [...]

It is certain that the activity of making sketches, drawings, and cartoons directly belongs to painters who have achieved the third and final grade of their art; they are more obliged to invent new things, keeping away as much as possible from anything that has been done already, not only by others, but also by themselves, and this they do in various ways. When they are asked for an antique or modern figure or history, they prepare themselves to paint either by counsel from learned persons or by reading books, and thus forming their ideas, they fabricate a whole from parts. Then with charcoal, pencil, or pen, on paper, they draw the first rough ideas for the movements, expressions, and actions required for the lively expression of the subject to be painted. From three or four studies, they choose one to be used (either by their own taste or by the judgment of learned men), and then draw it cleanly with black pencil as did Becerra [1520–1570], adopting the method of the great Michelangelo; or with black and red, as did Federico Zuccaro [1542/3–1609]... or in soft washes with highlights, making use of paper tinted any color that serves as the middle tint for the lead white in gum used for the bright highlights, as you see in many things by worthy men and which our Vargas [Luis de Vargas, 1502–1568] and Maese Pedro [Pedro Campaña, 1503–1580] used. [...]

I paint in oil on primed paper or canvas the heads that I study from life for a history or figure, choosing the most beautiful and pleasant, whether they be of children, youths, dignified or aged men, or of women, in the postures required to express my idea; I draw hands, arms, feet, and nudes on tinted papers with charcoal, black and red pencils, highlighting with white chalk crayons and dry white lead because they are ready-prepared and blend well with the drawing. The draperies, plain cloth or silk, I make by dressing the live models with tunics or capes, and drawing the parts that are necessary for my history or figure, which I complete by drawing in its entirety on a large panel or canvas of the size I want, without squaring, as I have a certain facility in this.

* * *

PREPARATION OF CANVASES. The invention of oil painting was very useful because of the risk of panels splitting, and because of the light weight of canvas and the convenience of being able to carry a painting to distant places. Very large canvases are protected from humidity by stretching and nailing them over thick panels where they last many years.

Painters are accustomed to using various methods for preparing their linens, depending on where they are working. We will point out some to be avoided, as well as others, so that their advantages are known according to what we have experienced over many years.

Some prepare the canvas with *gacha*¹ of flour or of mill dust, cooking it with oil and a little honey (you could almost eat this, even without appetite). One layer of this

is spread over the well-stretched canvas so that the pores are filled. After it dries, the pumice stone is passed over and then it is primed with one or two layers of oil priming. Others prepare canvases with size from gloves' scraps, and when it dries, they go over it again with the same size tempered with sifted gesso. When the brushed layer is finished, the gesso is spread with a knife so it covers the threads. After drying it in the open air, the pumice stone is passed over the surface again and then it is primed one or two times with a brush. Others prepare linens with glue size and use sifted ashes in place of gesso, making an even mixture, and applying it with a brush and knife. When it is dry and gone over with the pumice stone, it is primed only with common red earth ground in linseed oil; they use this in Madrid. Others use a priming of white lead, red lead, and charcoal black, all ground in linseed oil and used over the gesso preparation.

THE BEST PREPARATION FOR CANVAS. But experience has taught me that all preparations of gesso, flour, or ash get moist and rot the linen in time, and what was painted there flakes off. Therefore, I consider it better to use weak size that is cooled and jelled and put on the linen with a knife, and this serves to fill the open pores of the canvas; do not load it on too heavily; and go over it with the pumice stone after it is dry and then prime on top. I do not object to going over the well-stretched linen with the pumice stone to remove knots before putting on the size. The best and smoothest priming is the clay used here in Sevilla, which is ground to a powder and tempered on the *losa*² with linseed oil. Put on a very even layer with a knife, and after the canvas is well dried, go along with the pumice stone to remove all the rough and uneven places so that it is ready to receive the second layer, leaving it more evenly covered. After [the canvas] is dry, finish up with the pumice stone for receiving the third layer for which (if you wish) a little white lead may be added to the clay. These three layers have to be put on with a knife. I also say that linens can be prepared very well even without the size, if these three layers of priming are used as we have described, although adding the thin size makes it smoother. [. . .]

Having all the things to be painted prepared and ready, we will be able to explain how to draw that which will be painted and how to begin with the *bosquexo*,³ and then go on to painting, in the order that we will say.

HOW TO DRAW THAT WHICH WILL BE PAINTED IN OIL. That which you must observe in making your cartoons and drawings we have said at the beginning of this third book. Cartoons for pictures to be painted in oil are rarely made the same size, so the figures or histories must be drawn onto the wall, panels, canvases, copper plates, or stones from a small preparatory drawing [done] by eye or by using a grid of squares. The only difference in drawing onto the various surfaces to be painted is in the kind of crayon that is used. If the things to be painted are life-size or larger, then long, slender-pointed pieces of hard *yeso mate* will be made. A cane tube of three-quarters or a full *vara* in length is prepared by firmly fastening a piece of chalk of the appropriate size into the hole of the piece of cane, and this serves as a long drawing stick [*toca lápiz*]. Another cane of the same size is prepared by fastening a bunch of hen's feathers into the hole of the cane, and this serves to erase and clean away anything that is badly drawn and exceeds the limits of reason in art. From an appropriate distance, use the first cane to block out all of the figure or history, stepping back to look at it often and erasing and redrawing until it agrees with the design of the

cartoon. The sure and good grace of the entire work lies in the proper delineation of the figure or history, because it is certain that all the difficulty of painting consists in achieving the contours. After the entire picture is well-proportioned and outlined, the various figures are refined using smaller points in the cane. Thus the flesh tones as well as the draperies and all the other details to be painted are perfected.

HOW TO MAKE THE *BOSQUEXO*. Let us assume that everything to be painted has been drawn correctly with accurate profiles and that we wish to begin the *bosquexo*. This is done in various ways. Some paint it with black and white, or with white mixed with carmine and Italian umber. This is an easy and comfortable way for those who lack great resolve and certainty, and who wish to vary and depart from the drawings, freely altering one thing and another until it is to their taste. Some worthy men have used this method, but if everything to be worked is already clearly indicated, it is best to begin the *bosquexo* in colors for the heads and flesh of the figures, and especially if they are taken from life. For fair flesh, use white and vermilion and a little light ochre; for flesh that is not so fair, use red earth of Levante and ochre, adding more or less according to the variations of the shadows. The appropriate tints are made with bone black, Italian umber, lamp black, spalt, and red earth, and carmine is used as well for some darks. For rosy flesh, use vermilion and carmine, and for those that are less rosy, mix the vermilion with red earth.

THE BEST *BOSQUEXO*. Some make the *bosquexo* very complete and leave it as finished; others just paint it with blotches of colors and leave it confused. I agree with the first of these, and believe in doing as much as possible in the *bosquexo*, because with retouching and repainting, many things become cruder. [. . .]

Thus, the flesh colors are the first to be painted in the *bosquexo* and the last to be retouched and finished. After the *bosquexo* is completed and washed with a sponge and water, the skies should be finished first, then the distances, the buildings and fields, and all that serves as ornament to the figures. Then the figures should be dressed in their various appropriate colors, according to what we shall say, and the finishing of the faces and flesh waits until last.

HOW TO TEMPER COLORS FOR DRAPERIES. Next we shall speak of the colors for particular draperies, but before we go on, be advised that some of the colors we shall name must be ground first with water, and that all of them are tempered and ground with linseed or walnut oil.

ABOUT THE COLOR WHITE. We will begin with white, which has to be painted in oil and which is mixed with the other colors. It has to be the best lead white to be found and that is, above all, the one from Venice. It should be hard, and should break cleanly into pieces when it is cut with a knife. Some prepare it by crumbling it by hand in a good quantity of water, and when the bulk and residue of the white have settled, the liquid is poured off into another vessel. If the lead white is washed like this two or three times, it is not necessary to grind it in water. The sediment serves for priming. The usual manner of preparing it is to grind it very well in water and then make it into little loaves which are placed in the sun to dry. Afterwards grind it with fresh linseed oil or walnut oil that does not separate, and cover the paint with a thin, clean cloth to keep dust out. Store it covered in a glazed earthenware tub full of sweet, clean water that is replaced every eight days. [. . .]

ABOUT YELLOW COLORS. Some customarily use *jalde*⁴ or orpiment for fine yellows in oil. Look for the strongest color and grind it well in water and set it aside to dry. A drier is needed, whether it is tempered with linseed oil on the wooden block [*el tablón*] or whether [the pigment and oil] are ground together. Some add glass that has been finely ground with water; others use linseed oil mixed with powdered red lead, letting the powder stand in the oil for several days, and this is the best drier. Also some use copperas, taking a sufficient quantity of it. Keep away from verdigris like the plague, because it is your worst enemy. Make it a custom to darken with the same *jalde* burned on a little palette over embers until it becomes runny and the color of honey, which shows that it is burned. This is also ground first in water and it serves as the second tint. Make the darkest tints with dark ochre or with umber and red earth. For those that are still darker, use carmine and splat. This same *jalde* is burned to obtain an orange color, or it may be mixed with red lead of the earth, or with vermilion. The second tints are made with the colors already mentioned. Do not keep the *jalde* in water: it has a bad odor, it is harmful to the head, and enough of it is poisonous, so keep away from it.

For grinding and tempering a yellow in linseed oil, massicot is safer to use, if it is good. Admit light and dark ochres for the second tints and add red lead and vermilion tempered with oil. *Ancorza* and ochre may also be used to darken the yellow, and for the darkest parts, Italian umber is used. Massicot may be mixed with white if a lighter golden-yellow tint is desired. One cannot do without massicot in any way for landscapes. Fortunately, the massicot I use exceeds the best *jalde* in color and beauty, and surpasses it in safety. Keep it in water like the white and it is a good drier.

ABOUT GREENS AND THEIR VARIETY. Some make green by working first with white and black in oil and then glazing with verdigris ground in linseed oil. To purify the verdigris for this, it is usually first ground in water with vinegar and some leaves or shoots of rue. Then it is strained through a hair sieve, and after drying, it is ground in oil, as has been said. After glazing the first time, it is customary to glaze it one or two times more, adding a little varnish to it, and in this way it stays very brilliant. Other times green is worked with verdigris and white and glazed with the same verdigris. Others add a little massicot that is not too yellow to the white, and work this together with the verdigris, returning to glaze it later. Other times green is worked with mountain green⁵ ground in oil, lightened with white and darkened with lamp black. It is glazed twice and stays a very pretty color. I do not use verdigris except with light and brilliant *cenizas de azul*.⁶ With good yellow ochre I make a dark green that pleases me, strengthening the darkest tints with black, and for the lights I use good massicot with a little white, [which] makes a very pretty green. Iridescent tones may be desired in light greens, and these can be blended very nicely. The light tones may be massicot and white or various other light colors.

For painting in oil, carmine from Florence is better than that from the Indies, and it is more sure and durable, although the one from Honduras is not bad. If some rose-colored drapery must be worked, it is more permanent if the *bosquexo* is painted with vermilion. Then work the drapery with carmine and white and it can be glazed or left unglazed. If a crimson (*carmesi*) cloth is intended, or one of *grana*,⁷ or one of velvet, the vermilion and carmine must be tempered together to make an even, bright color. Mix the light tones from this by adding more or less lead white, according to what is

desired. If pure carmine is not enough to darken it, help it out with a little black. When this color is dry, it can be glazed once or twice with good Florentine carmine and a little thickened linseed or walnut oil. The carmine should always have its bit of drier, either of glass or of litharge powder mixed into hot linseed oil recently taken from the fire. The oil shows that it is properly heated when a piece of bread dipped into it comes out toasted. This is an ordinary drier that does not kill the carmine. Fat-oil of minium is also a good drier. This is added to *jalde* and copperas powder ground or tempered in oil.

With this carmine color I have made some very convincing velvets, but all lag behind those of my friend Alonso Vázquez, who was unequaled in this.

Others work red draperies with pure vermilion and shade with carmine. Black is added for the half-tints of carmine and vermilion. Some are also accustomed to working curtains or cloth with red earth of Levante or with haematite (*albin*) and white before shading and glazing with carmine. But I am of the opinion that even those things that will be glazed should be worked with good colors because in that way the paint is permanent and more durable. [...]

BLUE AND HOW IT IS WORKED IN OIL. Blue (we mean the blue of Santo Domingo and not that of ultramarine, which is neither used in Spain nor have the painters enough wealth to use it) is the most difficult color to use and it dies on many very good painters. We will describe how it should be used cleanly in oil so that it stays bright. Most say that the blue, which is of a pretty color, thin, well refined, and clean, should be tempered on the wooden block with walnut oil. A quantity of white freshly ground with walnut oil is prepared and put aside. Then you take enough of this white and mix it with blue to make light blue and then to make the half-tints.

A NEW OPINION. It is my opinion that the blues should be worked light, and the dark parts be made with pure blue. For the darkest shadows, add no black to the blue, nor should purple carmine be added, and even less should you add indigo; instead, add a little good, fine smalt of a pretty color to the pure blue, with which it mixes very well. The reason I wish to counsel that the blues be light is that the blue darkens with time and turns black. This is seen in landscapes; and in my experience I have seen many draperies that were blue turn into a black blotch, so that the folds of the cloth no longer can be distinguished. But if the blue is painted light, it stays blue always, and its highlights and shadows can be seen. I have observed this in the painting of Mohedano, who followed this method.

* * *

LANDSCAPE PAINTING. Landscape painting is much used nowadays, and many have been pleased to work with it. The Flemings especially have been much inclined to this, using tempera and oil for the disposition of the sky and the land, with its fields, gardens, and rivers. [...]

HOW TO COMPOSE A LANDSCAPE. This is the order to follow when painting a landscape, assuming that the canvas is ready: The landscape is drawn by dividing the space into three or four distances or grounds. In the first distance, where the figure or saint is to be placed, the largest trees and rocks are made, keeping them in proportion to the figure. In the second distance, the trees and houses are made smaller, and in the third distance they are still smaller. In the fourth distance, where the ridges of land join the sky, everything is carried to the greatest degree of diminution. The drawing is

followed by the *bosquexo*, either with colors, or according to the habit of some who prefer to make it in black and white; but I consider it better to paint in colors at once, because the smalt stays brighter. Tempering the necessary quantity [of smalt], and preferably a little more, with linseed or walnut oil, and putting in enough white, a pleasant mixture will be made; it should not be dark, but rather inclining toward the light, because time darkens it. From this main mixture, two other lighter ones will be made by adding more white, making one lighter than the other, so that they may be differentiated. Then a rose color will be tempered with carmine and white, and it should be lighter than the blues. If the sun is shown rising or setting, a mixture of white and ochre should be made, lighter still than the ones we have described. After the colors are mixed, the sky should be divided in this way: the ochre and white mixture [should be applied] in the area of the horizon near the mountains; moving up from there, an equal amount of the rose color will be applied and blended toward the ochre and white. The blues follow this, finishing the highest part with the darkest mixture and keeping in mind that the colors must be blended together with great smoothness. Pleasing clouds can be made in the sky by adding a little carmine to the smalt mixture and a little black to the others, highlighting them with the same rose tone and adding some of the white and ochre in the parts near the glowing horizon from which they take their light. When the sky, which occupies the upper half of the canvas, has been applied, the painting of the land begins. This is done with the lightest mixture of smalt and white, which comes out somewhat darker than the horizon because the earth is always darker than the sky, and even more so where it is near the sun. These ridges of land closest to the horizon should have lights and darks because later, in finishing the painting, it is usual to form small cities or trees on the lower slopes. Then, moving down the canvas, larger houses or cities or trees will follow, and these are made with *azul fino* because it is more fitting for this distance. This blue has to be tempered with white, and to differentiate some parts, a very little massicot may be added, which will turn it a little green where it is used. If houses are made in this distance, a little black or red earth will be added to vary the tints from those painted above, and thus the proper color for this part is made. Approaching the first distance, the trees and houses have to be made larger – if it is desired, they may rise above the horizon line. These trees should be of a green color made with [blue] ashes or *costras*, and they should have some darks to make them stand out from what is behind; then some light touches of *ancorca* and massicot can be laid over the darks to brighten the trees. Should there be water at the foot of the trees, it ought to reflect them as if it were a looking glass. Likewise, if there are houses, grasses, or rocks, their reflections must be seen upside down; the rocks will have light parts whose exact reflection must appear within the water. Should there be figures in this part, they have to be in proportion, so that a figure stands convincingly next to a tree or a house. They need not be too exactly delineated, nor do the trees need to be painted with as many exact strokes, nor do the colors have to be as dark as in the first distance, but more so than those behind.

The foreground where the figure is placed is the first thing to be drawn and the last to be completed in the *bosquexo* and finishing, because the principal part of superior grandeur should conclude the work. The trees that are painted here must rise from the ground across all the height of the sky, so that all the other distances will

be made subject to this, as it is the first seen. The *bosquexo* [of the trees] may be made with brush strokes of black and umber and a little verdigris and *ancorca*. Do not form leaves with the lights because they will be made later with strokes overlapping the limits of the painted *bosquexo*; use a practical method for thus detailing the leaves, and mix some dry leaves among the green. If they look like natural leaves of known trees, it will be much better, and the trunks should be treated in the same way because they are in the main part of the picture, occupying space near the figure. If the grasses on the ground appear to be as they are in nature, the work will be worthy of greater praise, since this area is near the viewer. The landscapes must be finished with the same colors, at the same time forming some little clefts or peaks in the mountains with the lightest mixture of smalt and white, painting in some little trees or cities with the same color lightened or darkened, with some rose highlights, and in parts, with white and ochre highlights; do this in the mountains as well, as though the light of the horizon were retouching the peaks. Farther down the slopes there are more clearly formed highlights of blue and white. Then the stronger green highlights will follow, and the houses will be more finished, defining the buildings to a certain point, always keeping in mind that retouching must begin from the highest and most distant parts, descending through the distances to what lies nearest. This is done with intention that the light and dark colors be laid pleasingly one over the other. Do not forget that the skies and mountains have to be applied with great neatness the first time so that they may be finished with one retouching, because smalt turns green if it is applied two times, as we have noted before.

* * *

THE INGENIOUS INVENTION OF PORTRAITS AND HOW THEY ARE MADE. Now that we have disposed of many subjects, it is time for us to treat of portraiture, a part of painting so pleasant and worthy that the *buenos ingenios* readily embrace it. The first thing is to determine whether it is essential for the good painter to make portraits.

If we are to speak scientifically and accurately, it is certain that the grandeur of art does not depend on portraiture, as we have seen throughout these discourses. The great drawing studies made in many academies; the grandeur of imagination and fine ideas; the knowledge of the anatomy of the human body, of symmetry and the proportion of the parts to the whole, of perspective for the diminution of things; the knowledge of architecture, and the abundance of precepts in drawing and *colorido* – all these aspire to greater and more difficult things than painting a head from life. Indeed, there have been made very worthy painters to whom the name of portraitist has meant nothing and they have achieved great renown for their inventiveness in sacred and profane histories; this sufficed for the great Michelangelo, who embraced the greatest difficulties of painting and architecture, soaring like a supreme angel over the things most difficult to master, such as the beauty of the human form, with its musculature, contours and profiles, and difficult foreshortenings. [. . .] portraiture is not an essential requirement for a great painter if he is proficient and skilled in the rest, although there are those who would be displeased to hear such a thing and would say that such painters avoided painting portraits because they did not know how – but this seems a harsh opinion to me.

My opinion is thus because the name and fame achieved by Apelles in antiquity, and by Raphael of Urbino and the great Titian in their time, did not proceed from their portraits (although these were marvelous), but rather from the invention, skill, and grandeur of their histories. But truly, we cannot deny that the portraitist was born like the poet, and as long as he does not default on the other great obligations of painting, then such skill heightens and enriches his art and gives him access to the greatest sovereigns in the world – and those who are accomplished in portraiture are not excluded from the merits of great painters. [...]

TWO OBLIGATIONS OF PORTRAITURE. We approach, then, the working method for portraits. He who paints portraits is obliged to do two things – if I am not mistaken – and if he fulfills both, he is deserving of praise. The first is that the portrait appear very much like the sitter, and this is the principal end for which portraits are made, and that which satisfies the patron. Both good and bad painters are obliged to do this, and if it is not achieved, their work is for naught. The second obligation is that the portrait be well drawn, and painted in a good manner of *colorido*, with strength and relief. This second obligation is valued and credited among those who have appreciation of art because even if the sitter is unknown, he will yet be esteemed in regard to good painting. It sometimes happens that an ignorant and simple painter makes very good likenesses of his patrons and then they are recognized at a glance, as they achieve a rigid likeness as if cut from paper, are crudely made with such lack of art that in regard to painting, they have no value at all; and those who painted them usually are so puffed up with pride seeing their vulgar works celebrated, that they seem to lose their reason, while to those who knew, these same works only give cause for laughter and amusement. [...]

HOW TO PAINT PORTRAITS. With these preparations and precepts, and the canvas primed and ready, we arrive at how to begin the portrait. If it is to be full-length, and if the subject tires of standing, the canvas may be lowered a certain distance on the stretcher so both the artist and the person being portrayed may be seated, and the excess linen can be rolled at the bottom of the stretcher. North or northerly light will be more constant and temperate, and the other three directions should be avoided because of the harshness of their sunlight. Some like to paint in the afternoon because the flesh is in perfect color then. But my disposition is better accommodated in the morning, when no other occupation has yet distracted my concentration and understanding. From nine until twelve, it will be possible to draw and *bosquexar* the head, and if some parts remain unfinished, they can be completed another day at the same hour. First, the length of the face must be taken with a compass with the light falling from high above, but without making the shadows too strong. The painter should place himself at an appropriate distance, neither too close nor too far, from which he can turn easily to see both the subject and the canvas. The head should be studied carefully, to see whether it tends to be long or round, and the form of the whole in relation to its parts. The outlines will be made with a long pointed *yeso mate*, exercising dexterity and propriety as if you were going to leave the portrait thus. The painter should not move on until he is satisfied that in the contours he has captured a very good likeness of his patron, and if possible, that the patron himself [should] examine it before the colors are prepared. I do not consider it wise to leave the likeness to hrushwork, preferring to achieve it little by little with the *bosquexo* and

the finishing touches. It happens that in my drawings, the subject can be recognized by the lines alone; but how can this ever be done by someone who does not lift a pencil to draw in a full year? I have observed, with all respect, that those who follow only the *oficio* of portraiture and do not study it thoroughly, never make the parts of the portrait accurately, but only approximate its totality (that is to say, the 'air' of the sitter), and all their portraits are made with one method of drawing and coloring, and therefore all the persons portrayed give the impression of being kin; in some parts, such as the ears, which rarely are studied and painted with care, there often is no difference at all from one head to the next. Yet those artists who are *valiente* reflect all the variety and difference found in their living subjects, even in the smallest details, because they have the advantage of knowledge and practice in drawing.

The painter should temper his colors somewhat lighter than life, because they almost always darken; he should take care that there always be more than enough of the colors for the light *encarnaciones*⁸ and appropriate half-tints. The painting is begun by applying these tints in the forehead and eyes, and once this is accomplished, the rest is not so difficult; and if the eyes, which are the mirror of the soul, are well portrayed, the painter will be much credited. In the *bosquexo* the shadows must be left soft and round and not very dark.

To some very scrupulous painters it seems that for drawing large portraits a system of squares should be used, or a net (which we have recommended before), and for small ones, lenses that reduce the drawing to smaller than life-size. But habitual use of these devices implies a lack of freedom and mastery of drawing. It is therefore better that the *artifice* draw by looking and by learning quickness and dexterity, since assurance comes from a good eye, as I heard from the great Alonso Sánchez [Coello, 1531/2–1588] whom I once saw paint a portrait. Even after the portrait head is finished, it may be retouched many times in the absence of the sitter, as long as the contours are not altered.

When the head is finished to the satisfaction of all, if the figure is standing, then the body must be drawn with the proportion and gesture of the living subject. The same formula must not be used always, but rather a variety of different postures. I caution this because some artists seem to trace all their figures from a single pattern, and the heads portrayed from life contradict the movement suggested by the body, like someone taking dancing lessons, unmindful that many figures would fall to the ground were they to assume the postures given them in paint. It has been said already that there are differences in the stance and arrangement of men, women, and children. Some dispense altogether with the painting of women, thereby avoiding certain acts against beauty which, although one must promise them, are unjust to act out: any work that fails in the imitation of nature forfeits the good opinion it might have earned. [...]

¹ *Gacha* is a kind of gruel made of flour and honey, mixed with water and cooked over high heat.

² *Losa*. A stone slab, sometimes of porphyry, for grinding artists' colors.

³ *Bosquexo*. Underpainting.

⁴ Orpiment, the yellow sulphide of arsenic.

⁵ This is presumably malachite.

⁶ Blue carbonate of copper.

⁷ Precise translation of *carmin*, *carmesi*, and *grana* is difficult because of their overlapping seventeenth-century meanings. *Carmin* identified a red lake pigment made from kermes insects. [...] The word *carmesi* . . . describes the color of a silk or other cloth tinted with *grana*, a fine purple derived from the kermes insects that grow within the fruit of the kermes oak (*coscoja*).

⁸ *Encarnaciones*. Painted flesh tones.

6 Jean Dubreuil (1602–1670) Preface to *Perspective Practical*

Dubreuil is not a well-documented figure. In the seventeenth century, religious orders performed many of the functions now associated with university communities, and Dubreuil was one of several French members of the Jesuit order who concerned themselves in the seventeenth century with the theory, criticism and teaching of the arts. His treatise *La Perspective pratique* was published in Paris and was in its second edition by 1651. It was reissued in 1663. The first printed treatise on perspective had appeared in France in 1505 (Jean Pélerin's *De artificiali perspectiva*, with text in both Latin and French). By the middle of the seventeenth century a working knowledge of perspective was a condition of competence for any ambitious professional painter, and handbooks on perspective became relatively numerous (see also IE8). Dubreuil's is representative rather than exceptional. (His claim to have consulted all the previous authorities he cites is somewhat undermined in the English text by the listing of the important Dutch designer Hans Vredeman de Vries (1527–1606) as two separate authors, 'Uredement' and 'Uriesse'). In England, however, *La Perspective pratique* was to remain current through various editions and translations until the end of the eighteenth century. It seems likely that this success was due to two principal factors. The first was the care that Dubreuil had taken to make clear the extensive practical application of perspective for the representation of all things from palaces to footstools. The second was the quality of the 150 engraved illustrations to Robert Pricke's first English edition of 1672. We reproduce Dubreuil's preface in Pricke's translation. Our text is taken from *Perspective Practical, or a Plain and Easie Method Of true and lively Representing all Things to the Eye at a distance, by the Exact Rules of Art . . . by a Religious Person of the Society of Jesus a Parisian . . . set forth in English by Robert Pricke*, London: Robert Pricke, 1672. (The preface is unpaginated.)

The Art of Perspective, which hath the eye for its Principle, to whom Nature hath given more vivacity and more Perfections then to the other senses, and which holdeth amongst them the Rank, and the Advantages that the Soul hath above the Body, is likewise the fairest and most delightful of all the Parts, that the Science of the Mathematicks hath put forth into light. This Science may well boast it self to be the soul and the life of Painting, seeing that it is it which giveth unto Painters the Perfection of their Art, which in its ordering the heights and the measures of the Figures, the Moveables, the Architectures, and other Ornaments of a Picture: It instructeth what colours he should use, lively or sad, in what place he ought to apply the one and the other, what he ought to finish, and what ought not so to be: where one is to give a light, and where there is no need of it: in a word, it is this that ought to begin and finish, seeing that it ought to go throughout all. Without help, the best Master will make as many faults as draughts, principally in Architectures, wherewith they would enrich their Works, as I have seen in Pieces well esteemed, where they have failed so foully, that this in part hath been the motive of my design, for to cause

them to know their errors without naming them, and to teach the young ones to avoid them. How excellent a Painter soever one is, he must observe all these Rules, or he shall content none but ignorants, and a Reasonable Painter that shall know and use these well, shall do wonders to every ones content.

The Engraver in Copper ought not to be more ignorant of it then the Painter, seeing that he doth that with his Graver, which the other doth with his Pencil: It will make him to know that which he ought to touch toughly, and that which he ought to make faint. The need that he hath of this Science is so much the more necessary, as his Pieces are far more in number, then those of the Painter: the which if they be skilfully made, his praise is increased: if on the contrary, his defects are thereby the more known, and every Piece is a Mouth which decrieth its Workman.

The Carver in Boss shall learn the height which he must give to his Statues, as well for below as for the midst, and in proportion to that which is higher, what Projector he must give to Buildings, and to other Bodies that have Mouldings or demi-Boss, the Angle for the point of the sight, for to take the heights and abridgements of all the Objects near and far off.

The Architect by this Science, may be able to give the understanding of his designs in a small space, he may also elevate one part, and leave the other in Plane, for to make his whole work appear; and seeing that we are upon Architecture, there needeth that the Perspective, (or he that professeth this,) be learned therein, at least in the Practice of the Hand, by reason that the fairest Pieces of Perspective are made in rich and sumptuous Buildings, framed according to the Orders of Columns, the Beauty of which dependeth on Proportions and Measures, which ought to be observed therein, otherwise they will offend the eye; wherefore they ought to be well studied, and whosoever knoweth them not when he ought to know them, is worthy of blame, seeing the easiness that he hath to learn them, having *Vitruvius*, *Vignola*, *Scamozzii*, and many other which have written thereof so pertinently.

It is not enough that he knows the Orders of Columns, he must understand all the Measures which are ordinarily given to Buildings, and to each particular things, Gates, Windows, Chimneys, &c. and to place them well, and to take days fit for the purpose, that he make not any thing like one eye or maimed, to take great care that every thing be right, nothing faulty, and that the symmetry and proportion be kept, as much as one is able, otherwise the Perspective, which is made for to content the sight, would offend it by its defects.

Goldsmiths, Embroiderers, Makers of Tapistry, Painters, workers in Silver, in Silk, and in Wool; Joyners, and all others that busie themselves in making designs, and with Painting, cannot let pass this Science, of Perspective, if they would do any thing that may be commendable.

The most part of those I have known to affect this Science, have assured me, that they have been beaten off by the great number of lines, that some Authors have set for to frame and finde the place of their Objects, Bodies, or Figures; others, by having met with too much obscurity in their Orders and Explications, and particularly, for that they have not set the Instructions over against the Figures, and that whilst that they turn over leaves to finde them, they forgat that which they desired to know. All these Complaints oblige me to be more clear, and more Methodical in the Instructions which I have set before every figure, that they might have before them the

Manner to set into Practice that which they desire, applying my self to their capacity, without giving such Demonstrations as would obstruct or hinder them rather than clear them, using words which all may be able to understand, even in the Definitions, . . . Having also given to certain things qualities which the common sort give to them, though that in effect they have them not. As for example, . . . where I discourse of the distance or removal far off, I have been constrained to say, against my thought, that it is the Apple of the eye which receiveth the Rays of the Objects, as if they were bounded there, by reason that I have experimented that when I say that the Vision is made upon the Retine, or fifth thin Membrane, at the bottom of the eye, that the Rays do but pass by the Apple, and that the representation, or species of that which we behold are turned back; it seemeth to me that I speak a new language, and that they cannot conceive that. Wherefore having considered that this knowledge did little import for the Practice of this Art: I gave to the Apple that which appertaineth to the bottom of the eye, which is the true place of the vision or sight, where the species of the Objects are framed although others say that it is in the Cristalline: Those which would be resolved in this, may look into *Aquilton Scheiner* and *des Cartes*, which have very well discoursed thereof.

Although I have used all diligence possible, for to render this Science very easie, yet I doubt not but many may finde trouble therein at the beginning; but he which shall be able to surmount the difficulties, which he shall finde at the first; there is nothing which he may not understand and practice, so that he be careful to understand well, and retain one Order, before that he turn over the leaf: because that they are, as it were linked together, and dependent the one of the other: this little pains will give the satisfaction, by the easiness which one shall have afterwards, in making all whatsoever he would.

It shall be known by the Table following, that this Book sufficeth for to make all sorts of Perspectives, by using the orders, which the Figures and Letters shall shew, the which one may bring together to have that which one desireth, in which he that would make some fair Perspective, shall be delighted to find presently that which he shall conceive will content his minde: and then he shall have far more delight then if he copied a Piece wholly made by another; and if one be constrained to imitate any one, this shall be done with facility, seeing that there are here orders, of all that possibly he can meet with. I confess freely that I have an incredible delight in making of new designs, and in inventing of new pieces which I would have published, as others have done, had it not been that my desire is, that every one should be partaker of this Recreation which he may take in composing them, & making them himself, having given him all the means, and the orders for to bring the same to pass. But if any one will not take this as pains, he shall find many of them all made already in *Marolois*, *Uredeman*, *Uriesse*, and others, which have taken delight to make their ingenuity appear therein.

So many, so fair, and excellent works have served to make some Painters lazy, that they will not learn to make that which they found already made; they are content only to design those the best that they are able, and as far as they understand them, the which would be tolerable, if they did imitate them well; but counterfeiting them without understanding, they make nothing that is good, giving ordinarily so many points in a Picture, as they shall meet with objects therein, lines and returns, they will

make you see the under part of a thing, which as a certain one hath very well said, steal from particulars that which they give to the publick, to draw glory to themselves from the labour of others.

I had rather say freely, that I intending to make this little Treatise of Perspective; I would see, as far as I could, those which had written thereof, and take from one and others, that which might serve for my subject, afterwards to make a General Restitution, with which I have mingled a little of mine own, for to bind them together, and to follow an Order, which they had forgot to keep. The first that I found to have given some light to this Science, is *George Reich*, an *High Germane*, in the tenth Book of his Works: After him *Viator*, a Cannon of Toul, which hath given store of good Figures, but too little Instructions. After him came *Albert Durer*, an excellent man, which hath left some Rules and Principles amongst his Works in the fourth Book of his Geometry: *John Cousin* also hath made a Book thereof, wherein there are many good things. After those came *Daniel Barbaro*, *Vignola*, *Serlio*, *du Cerean*, *Sirigary*, *Salomon de Caus*, *Maroleis*, *Uredement*, *Uriesse*, *Guidus Ubaldus*, *Pietro*, *Acolti*, *le Sieur de Vaulizad*, *le Sieur Desargues*, and lately the Reverend *P. Niceron a Minime*, whom I have seen all, the one after the other, admiring their study and pains, for to serve the Publick, esteeming my self much honoured to imitate that which they done, and to be the unknown Copier of their Works, besides those which I have named; there are many other brave spirits, which have written thereon, which I have not had the happiness to see, because I could not attain to it. This Multitude of Authors causeth sufficiently to understand, that this Science hath been in all times cherished and esteemed by the most curious spirits, and more in that age that we are in, then in any other pass'd, the which maketh me to hope, that this little work will not displease many, seeing that it bringeth Instructions, which have not been seen for setting into Perspective, that which falleth ordinarily under the senses, and by consequence giveth the manner of making all sorts of Perspectives which any one can imagine.

I desire to proceed to cause it to be seen, and to teach to set into Perspective all that may be set into it, not only in Pieces level, and upon an united Plane, but also the bending, round and oblique, as for to paint within Roofs, frettings or rais'd Works, Corners and Turnings again, making to appear square, or round, that which it shall not be. In one word, all the Rarities and Deceits of Perspective, whereof these ought to come forth first, being the foundations and principles of those which must follow. If I shall know that they may be pleasing, and that they are look'd upon with a courteous eye, it shall be such a contentment and satisfaction to me, as I hope not for, and which shall easily compel me to acquit my self of my Promise.

7 Samuel van Hoogstraten (1627–1678) from *Introduction to the Academy of Painting; or, The Visible World*

Samuel van Hoogstraten was born in Dordrecht in Holland, and underwent his earliest training with his father, who was a silversmith and a painter. After his father's death he went to Amsterdam, entering Rembrandt's studio at the age of 14 or 15. In 1648 he returned to

his native Dordrecht, where he was appointed provost of the city's mint. He developed a particular interest in the art of *trompe l'oeil* in the course of travels to Germany, Italy and Vienna between 1651 and 1655. His skill in this respect was rewarded by the Habsburg Emperor Ferdinand III. On his return to Dordrecht he opened a painting studio, where he gave practical demonstrations of his understanding of illusion. An ingenious *Perspective Box of a Dutch Interior* dates from this period (now in the National Gallery, London). In 1662 he travelled to England, where he fulfilled a number of commissions over the next four years, including a *trompe l'oeil* view down a corridor for Dyrham Park (Avon). After a few years in The Hague, he returned to Dordrecht in 1671, remaining there for the rest of his life. His major theoretical work was published shortly before he died: the substantial treatise *Inleyding tot de hooge schoole der schilderkonst, anders de zichtbaere werelt*, Rotterdam, 1678. The text is subdivided into nine books, each of which is overseen by one of the muses. The major Dutch precedents for this work were the *Schilder-boeck* of Karel van Mander (Haarlem 1603–4) and Franciscus Junius' *Painting of the Ancients* (see IA1). Hoogstraten drew heavily on both, though his work is distinguished from theirs, both generally by its practical and empirical character, and more particularly by its concern with techniques of description and illusion. In this respect at least his text represents what was distinctive in the Dutch art of the time, which otherwise received very much less literary and theoretical support than was given to art in France and Italy. The treatise was published near the end of what has been seen as the golden age of Dutch painting, when there was a tendency to reaffirm the authority of the classical tradition. Hoogstraten's submission to this tendency is revealed in his references to classical Antiquity and to the Italian Renaissance and in his insistence on the precedence of history painting over still life and landscape. Our text is taken from the original Dutch edition of 1678, pp. 10–12, 24, 35–6, 216–18, 231–7. The excerpts have been specially edited and translated for this edition by Hester Ysseling.

Book I, Chapter 1 – *How some have come to the art in very strange ways, and what sort of persons are suited to it*

* * *

I consider it a most difficult task to identify whether young people are naturally suited to the art of painting. Some already draw figures and images while still at school, instead of writing, and this leads us to suspect that they may have a natural propensity for painting. But this is too uncertain a ground to build on and cannot permit us to conclude that they really are well suited to it, as if they were born for it. Although they may show an inclination towards the art, a more particular test is required if we are genuinely to know their minds: namely whether they will be able to see it through to the end and face adversity with perseverance. For I am certain that those who do not follow it with heart and soul are unsuitable for it, even if, for a time, they have tasted its sweetness. [. . .]

Fabritius, a fellow student of mine, once put the following question to me: What are the certain distinguishing marks and fruits of the mind in a young student which justify the hope that he will grow up to be a good painter? I answered, according to the degree of understanding which I possessed at that age, that such a student should not only appear to care for the art, but that he should actually be in love with the representation of the pleasing features of nature. He should not only concern himself with the dead body of art and follow the trend of the day and do as others do, but he

should be infatuated with the soul of art: that is to say, he should seek to investigate the actual qualities of nature. He should be jealous when someone else knows something which is unknown to him and ashamed to learn something from someone else indirectly, seeking rather to figure it out by his own effort. This was my answer at the time.

* * *

Book I, Chapter 4 – *On the aim of the art of painting, what it is and what it brings about*

The art of painting is a science which allows us to represent all the ideas or notions the entire visible world can provide and to deceive the eye with outline and colour. [...] For a perfect painting is like a mirror of nature which makes things which are not appear to be and which deceives us in an admissible, diverting and laudable way. [...] It is a memorial for things past, a miraculous presentation of what is far off, a prophetic imagination of what is still to come, and the greatest of all arts. For this reason it is also called the book for laymen, since it works on the eyes of all sorts of people with persuasive force.

* * *

Book I, Chapter 7 – *How visible nature manifests itself*

[...] The specific qualities of all things present themselves to us first and foremost in their form and appearance, not as natural philosophers [physicists] describe them, but only to such an extent as determines their outward shape, like the shell around the egg, separating the bodies they contain from all other things, as if by a boundary. Just as wine contained in a bottle assumes the form of the bottle, so the shape of the bottle becomes the painter's object of contemplation such that he comprehends all natural things and each thing in particular. The determinations of a thing consist of length, breadth, height and depth, concavity and roundness, straightness and curvature, bias and obliqueness, and in such a variety of ways as can be drawn from lines and points to make out any kind of shape. It is by means of lines, then, that we should learn to reproduce things in nature as they appear to us. This is where the art of perspective comes into play, because the eye does not comprehend things in their entirety but only the faces which are turned toward us. What the eye sees ends at the boundary set by the outline, which is made by the limits [*zichteinden*] of the rays which are cast by our eyes.

Book I, Chapter 8 – *The usefulness of frequent drawing from observation*

... One should make a habit of always drawing attentively. It is necessary to devote oneself to this habit to such an extent that it would become a mortal sin ever to let it slacken. For if it slackens on one occasion, it may happen more often. But whoever avoids this slackening, as if it were a destructive wild beast, will steadily increase the alertness with which he perceives things. [...] The habit of close looking makes the judgement sound and lends a certain measure to the eye. And surely the eye must

first acquire accuracy and certitude before we can entrust it with judgement [...]. Thus, in time the eye will come to provide a compass. Although the prescription of the rules and principles of art to an ingenious enthusiast may supply him with enough understanding to talk about art, this does not mean that he will have acquired the habit of practice. He will still make great mistakes and will be surpassed by a less erudite person who has acquired the compass of the eye through much exercise. The habit of observation will be of great service to the eye and to the hand of a young pupil. Whoever diligently acquires the habit of drawing much from life through close looking will frequently be able to embarrass a great master and will come closer to the natural features of things than his intellect will ever be able to grasp even at a much later stage. Therefore it is very useful and highly necessary to begin drawing often from life at an early age. And even if it is true that there are still no schools available for studying from the nude, material for observation will not be lacking. For almost every part of nature suffices to feed this close attention and to whet the sharpness of the eye. To be sure, he who constantly needs a ruler and a pair of compasses goes about on crutches, whereas the eye, strengthened through exercise, can itself serve as a compass. Base idleness discourages many from hunting this quarry which cannot be gained except through sustained exercise, strengthened by the fiery hope of being able to enjoy the fruit of this laudable labour and of gaining honours such as even the great masters have had to do without. [...]

This will be the most useful course of study for the young, who must acquire the habit of imitating things just as they are, so that in time they will be able to choose the most beautiful things with justification. But, oh painting youths, do not pride yourself on too much at too early a stage, nor assume that you have grasped the art of drawing as soon as you can produce an acceptable head or portrait.

* * *

Book VI, Chapter 2 – *On painting and of flat surfaces*

* * *

The subject of painting, as we have said before, is the imitation of all things: its subject is the entirety of visible nature in which nothing shows itself to our eyes without its own form and appearance. Even these appearances, however, only become visible through the colours of things, which consist in simple, unmixed and mixed colours. The simple colours are not difficult for the artist to imitate with similar unmixed paints, unless the colours exceed in force the reach of our paints. Here we may sometimes find ourselves at a loss. But many careful artists have found paints that improve significantly over the common ones. [...] Some colours are used in coats of arms, but we shall pass over this since it is too common and will only speak of what belongs to the pictorial [*schilderachtich*]. For example, it is not difficult to put a smooth wall space or a knotted wainscot into your work, but this is a beneficial practice and an appropriate step towards gaining artistry. Playful young painters often start to produce ordinary things coloured from life which they cut out around the edges, or they paint letters and combs and develop their skill in representing flat things on a flat surface. Such skills may also be a source of honour since kings and queens have been deceived by it. Parrhasius' curtain gave him victory over the brave

Zeuxis, and the Malthese [Francesco Maltese, c.1610–60] is still praised to this day for his painted tapestries.

Book VI, Chapter 6 – *On the coloration of the human nude. Curvature. Hair, etc.*

[...] According to Nazianzenus, only those painters are to be esteemed the best artists who give to the things created through their paintings true naturalness, whereas others, foolishly mixing a diversity of amusing colours, show nothing but coarseness [*wiltzang*]. Not only do they deviate from true artistry, but they do not even deserve the name of painter. This is an important point since there are some who claim to be masters of the art even though their nudes seem to be flayed or smeared with red paint or the juice of berries. [...] Even though redness is very natural in a sunburnt fisherman, this feature which is required in skin and flesh should not be exaggerated. In painting the nude it is not enough to mix beautiful colours; rather the artist should seek out true naturalness. For neither marble nor alabaster nor shiny ivory is comparable to soft skin. The whiteness of snow does not attract us, but delicate nudity enthral, indeed ravishes. Whether the artist paints nudes of children, youths, massive wrestlers, scrawny, emaciated bodies, bathing nymphs, or indeed, heavenly goddesses – he should see to it that the colours are refracted in such a way that the flesh glows and chalky whiteness is avoided. [...]

After likeness to flesh comes roundness. The ancients esteemed Nicias in this skill above all others, because his objects stood as if they were raised up and half round. Some think that they can bring about this effect by using hard black shadows and glaring lights which they call highlights [*hoogselen*], but their nudes seem to be made of metal rather than soft flesh – or at least to be shows of candlelight. The best painters have achieved roundness through delicate gentleness rather than by violence, because the nude body in nature curves just as well in ordinary light as in an all too forced shaft of light. It does so better when the light comes from the front rather than too much from the side, for roundness is nothing but a gradual recession on all sides [*omwijkende vermindering*].

Book VI, Chapter 7 – *On hair and clothes*

It produces an elegant effect to paint hair well and naturally. Holbein is said to have often painted the skin of the brow and the chin first, later painting the hairs over it, stroke by stroke. I will leave this great master his well-deserved esteem, but I care more for the unconstrained imitation of the colour that skin and hair produce together, with their gleam and reflection cast in their right place without pointing out every single hair. [...]

Alongside well-painted nudes belong pleasantly coloured clothes, so that your images may enjoy more grace. If you portray a queen, then let her shine in a silk robe with pearls and precious stones, but see to it that what befell Apelles' pupil does not befall you. This pupil painted Helen with such excessive finery that on seeing the work Apelles said, 'Surely you have painted this princess rich instead of beautiful.' This is the reason why this work was afterwards called the prosperous instead of the beautiful Helen. Do you wish to depict the Turkish sultan in all his splendour? Then

paint him in white satin or silver worsted mingled with green and decorated with large flowers. Place a large turban with colourful feathers on his head.

You can also gain honour with wall hangings and tapestries, as is said of Parhasius, who deceived and conquered his challenger Zeuxis simply by painting a curtain hanging over his work, as the well-known story tells. Giovanni da Udine painted a tapestry or a wall hanging at the end of a gallery in the Vatican, and when the Pope came to see the paintings, a member of staff tried to lift it up as is customary but found himself deceived. In these things the ability to render the colours well is of the highest importance; perfection can be reached in this ability to the extent that what we seek to imitate lies within the reach of our paints.

* * *

Book VI, Chapter 9 – *On landscape*

The most pleasant colours, Plutarch says, strengthen and delight the eye by their liveliness and joy. To be sure, these colours do not have a special name, but I believe that we catch sight of them in the general impression of a landscape with its thousand refracted colours, when sweet spring renews the meadows and the fields, and the wood raises its newly budding crowns.

When the orchard, white with blossom, is overflowing with fruit, then, oh painting youths, do not let lazy sleep steal this inestimable time from you, but start with things which have never been seen before. Paint for me from life vegetables, dripping with dew, and fresh flowers. You will find colours that no painter ever put to work. Do not spare the beauty of nature from your labours but be confident that what is so delightful in nature will also make your work well-loved. Having depicted ordinary things for long enough, whoever then feels the sting of ambition can take on something more precious and he will easily invent something rare and new. [...]

It is a common flaw among artists to acquire a manner of colouring, as if things were bound to their manner of painting rather than their manner of painting being bound to the nature of things. Many, however, being drawn towards nature, have acquired a manner of colouring which seems highly appropriate to that part of the art to which they were most attracted. Thus Hercules Seghers was principally concerned with mountains, whilst Lijfring painted inspired rockwork. Precious stones also possess miraculous colours, and the peculiarities of marine plants and shells have their own particular enthusiasts. [...] Augustine says that the sea at one time puts on blue, at another crimson, like so many different robes.

Book VI, Chapter 10 – *On the manner of painting*

[...] Poetry may well be called the speaking art of painting, but just as the doing is more difficult than the saying, so painting is much more difficult than verse-writing. For when the poet has finished his poem in his mind, the pen flows on without labour, whereas the painter loses practically everything he has comprehended before he knows how to express it in paint. However diligently they exerted themselves, Protogenes and Neacles were at a loss to represent the froth, first of a dog and then of a horse. Indeed, they lost their patience at such a difficult task and in desperation

threw their sponges at their work. And even though the dirty sponges brought about the desired effect and made their animals froth at the mouth quite naturally, this only brought to light that their judgement was sound enough but their hands too slow. [...]

It is necessary, then, to acquire a method that can easily obey our reason. To this end it is highly advisable to acquire a brisk brushstroke which confidently points out the places that differ from the others, giving the drawing its proper features and, where appropriate, a playful flourish to the colours. This should be done without ever lapsing into wiping or erasing, however, because this would wipe away the good quality and leave nothing but a dream-like rigidity [*droomige stijvicheyt*] at the expense of the honest refraction of colours [*oprechte breekinge der verwen*]. It is better to seek gentleness with a full brush, lustily swabbing away, as Jordaens used to call it, without paying much attention to smooth blending, since the latter will emerge by itself in the course of the painting, however boldly you may set to work. The early work of Titian is well blended, even if it is painted with a full brush, but in his later work, when his eyesight began to falter, he left broad flat strokes untouched which, seen at arm's length, possess all the more force.

It is not as remarkable to render something attractive with a loose stroke as to execute it with the utmost intelligent labour. A good beginning ought to encourage us, but the greatest task is to make a good end. When our perception of a thing is fresh it is penetrating, but such close looking is needed even more when the work is at an advanced stage. One often sees it happen that someone starts their work enthusiastically, but as their capacity to look attentively slackens they bring nothing to it but a slick rigidity or neatness. Unfortunately this often still pleases unthinking enthusiasts to such an extent that with untimely words of praise they lull the budding pupil to sleep and miserably spoil him. In this way, many a noble mind is kept from the ladder he was about to climb and art itself is wronged. [...]

I earnestly recommend, therefore, that you set to work energetically and keep your senses alert to the end. Always keep the following thoughts in mind: exceed nature in force and gentleness; give light and shadow their proper place; bind the whole together well, never changing your method at the end from that with which you began; and never allow your close looking to slacken. In this way your reason will generally become sharper, your manner of treatment inimitable, and your work equal to nature in all parts of the art. Do not bother yourself with learning a method or a manner of painting, but concentrate on steadily becoming more certain in your observations, discerning the parts of art well and pursuing them diligently. Thus the hand will become the servant of the eye and will methodically be able to represent in the most elegant way the diversity of things, each in accordance with its own nature. [...]

A different kind of manner is required for light hair, quivering leaves and things of this sort. And yet another way of handling the brush is required for the beautiful nude and for shiny marble. But you will find your way in all these matters if your hand has become used to obeying your eye and your judgement. [...]

You will also have to change your method in accordance with the place where the work is to be hung. You will regret it dearly if you have wasted a great deal of time on subtleties in painting a piece which is to be hung up high on a wall and will be viewed

from afar. In this case you may use brushes that fill your hand and let each stroke be one and put the colours down practically unmixed in many places, because the height and the thickness of the air will give many things the appearance of merging even if they stand apart. [...]

A good artist, Seneca says, handles his tools dexterously, or with remarkable ease. A painter, having placed around him many different colours to make an image, skilfully chooses those which are of use to him, and his hand and eye quickly move hack and forth between his oils and his work. Plutarch compares the paintings of Nicomachus with the writings of Homer and says that, beside other pleasant things and perfections which are found in both, they also share the following feature, that it can be seen that they were made with ease and without much labour. By contrast, the paintings of Dionysus and the poems of Antimachus, although full of force and meaning, seem sombre, as though they have been made with much worry. They say that what is done with difficulty is difficult to look at. And this is what befell the paintings of Baccio Bandinelli, who thought he could master the art without exercise. The skill of making things with ease comes with sustained exercise and much practice. Then it may come to pass that reason acquires the ability immediately to form the desired conception; or that the eye picks out certain forms in rough sketches of pleasant objects, the way we see shapes in the fire while sitting by the hearth; or that the hand, through habit, forms something more or less in the way we do when we write. Because a good writer forms good letters without even thinking about it, and his eye and his reason seem to be located in his hand.

* * *

8 Bernard Lamy (1640–1715) ‘The Excellency of Painting’ from *A Treatise of Perspective*

Like Dubreuil (IE6), Bernard Lamy pursued his studies as a member of a religious order, in his case the Oratory (a society of priests without vows, founded in Rome). His *Traité de perspective où sont contenus les fondements de la peinture* was published in Paris in 1684. In previous publications he had addressed the fields of rhetoric, mechanics, mathematics and geometry, and his discussion of perspective gains force and depth from his interest in the study of optics. Lamy conceives of optics as dependent on the practices alike of the scientist, the mathematician and the painter. His readiness to accord equal significance to the skills of each is one of the distinguishing features of his work. It might seem that his belief that mathematics is the ‘foundation of painting’ was not one to which all contemporary styles of painting could have been made to conform. Lamy’s sophisticated argument, however, is that *any* representation will fail if its effect is not in some way equivalent to the experience of its object. His concern is not simply with the accuracy of pictures, but with value in the psychological experience that paintings provide. (It is significant that Abraham Bosse, who taught perspective at the Académie Royale, had been ejected in 1661 for too rigid an insistence on perspective as a rule-governed system.) The *Traité de perspective* was translated into English at the beginning of the eighteenth century, in an edition dedicated to the ‘Commissioners of His Majesty’s Ordnance’. We are reminded that the working-out of perspective projections was not simply a matter for artists and philosophers; it was also an issue of practical and theoretical interest to those

concerned with military planning. Our text is taken from *A Treatise of Perspective or The Art of Representing all manner of Objects as they appear to the Eye in all Situations, containing The Elements of Designing and Painting*, translated by 'an Officer of His Majesties Ordnance' (A. Forbes), London (publisher unspecified), 1702, chapter I, 'The Excellency of Painting; Perspective is its Foundation', pp. 1–18.

To represent upon Cloath, what is not there, as Cavities and Eminences, where all is Flat; and Distances when every thing is Near; is a Performance that merits Admiration. 'Tis an Effect, and at the same time, a Proof of what the Eye (to speak Philosophically) doth not see, but only the Soul which forms to it self different Images of Objects, according to the different Impressions of the reflected Light on the Eyes. Nothing is more difficult to be expressed, than the Nature of these Images; whither it be that the Soul forms them out of its own Substance, and so sees it self, as it were, transform'd into all things; or if it sees these Images in a Substance above it, which being the Principle of all Beings, can represent all.

By this Advance, I mean only to discover a Difficulty, on which it would be requisite to make serious Reflections; for it concerns not the Subject I intend to treat of, and therefore it's sufficient at present to consider, that the Operations of Nature being Simple and Constant, the like Impressions in the Organs of Sense, ought to be followed with the same Sentiments; so that as often as the Eyes are struck after the same manner, the Soul must have in its view the same Images, whatever be their Nature and Origine. If (I say) the Rayes, by which we see a Picture, pierce the Eye in the same order as if they came from the Objects themselves, tho' we see but the Painting; and if the small luminous Bodies which compose these Rayes, shake and move after the same manner the *Retina*, that is, the small strings of the Optick Nerve, which line the bottom of the Eye, then the Picture must have the same Effect as the Objects themselves: For the Optick Nerve furnishes the bottom of the Eye with a vast number of small Filaments into which it divides it self, and makes what we call the *Retina*: 'Tis there that the Rayes do in some measure paint the Features of the Objects from which they are reflected; as when a Chamber is shut so close, that there is no passage left for the Light, but through a Perspective-glass, the Rayes paint the Objects that are without, on a piece of white Paper, if it be opposed to the Glass. This Chamber represents the Eye, and the Paper the *Retina*.

The new Philosophy supposes the World full of small Bodies, and that it is their Action or Pressure, that makes us sensible of the Light. These small Bodies, in removing themselves from that which causes their Reflection, press those that oppose their Motion, and these in like manner press those that follow, by a Communication of Motion made in a direct Line from the Object to the Eye. 'Tis this Motion (according to our Philosophers) that informs the Soul of the Figure of the Object, as the Staff does a Blind-man of the Nature of things, by the Impression it makes in his Hand, as it is thrust forward or pulled back. So the Impression of the Luminous Bodies on the *Retina*, occasions the Soul's having the Idea of the Object, that caused the Impression. For, we must know, that the Picture made by the Rayes, is only the Motion they impart to the small Strings of the Optick Nerve: Now, since the Pressure of the Matter which rests on the Optick Nerve, is the Natural Cause of the Sense of Light and Colours, because Red appears still Red, both with a stronger

and weaker Light; we may conclude the different Celerity of Shakings or Vibrations of the Matter which presses the Eye, to be the only cause of the Variety of Colours; different Colours are in the same case as different Sounds, for the Sounds change not because of the variety of the force whereby the Air is agitated in the Motion, (for instance) of the Strings of a Lute, but because of the diversity of Readiness and Celerity in the Vibrations, the Parallel holds in all Points, bating that the Action of the Air conveys the Sound, and that of a Matter yet more Subtile, the Colours.

Thus 'tis the difference of the Shakings or Vibrations of the Matter which presseth the Eye, that adds the Colour of the Objects, to the Features of the Image, which the Rayes paint in the bottom of the Eye; that is to say, that 'tis the difference of the Motions, that this matter takes on the Surface of the Objects, from which it reflects it self, that causes different Sensations; or 'tis the occasion of these Sentiments that we call Colours; Just as the Soul is sensible of different Tasts, according to the Variety of the Food that affects the Fibres of the Tongue.

However it be in this New Philosophy, it is agreed upon, that a Picture, when seen from a certain Point, reflecting the Light in the same manner as the Object it self would do; ought to have the same Effect as the Object whose Features and Colours it represents. That is to say, When it sends back the Luminous Rays in the same Order and Disposition, and with those very Motions that give the true Sentiments of each Colour, the same will the Effect be. This is what's taught by that part of the Mathematicks call'd *Perspective*, which I design to treat of.

A *Picture* may be consider'd as an open Window or transparent Glass, through which the Eye which is supposed to be at a certain Point, may see the Objects represented by the Picture. Now by the help of the *Mathematicks*, the passage of the Rayes which render the Object Visible, may be trac'd in the Picture or transparent Glass. This passage being marked with suitable Colours, the Picture represents the Features of these Objects, their Form, their Colour, and in a word, all their Appearances. And since it makes the same Impression, the Soul must have the same Images in its view, and be thought to see the same things.

Mathematicians draw only Lines, they cannot finish a Picture; And on the other hand, Painters cannot begin it, without a regard to the Rules taught by the Mathematicians. Every *Picture* is a *Perspective*, so that what is taught in this part of the *Mathematicks*, is the Foundation of *Painting*, which ought to be well adjusted, for all Painters do not agree to it.

The Design of *Painting*, is to represent on a flat Body, as Paper, Cloath, or a Wall, whatever is desired. This can never be done, if the view of the *Picture* makes not the same Impression on the Eyes, as if they saw the things themselves. And this is what *Perspective* does exactly. Painters that are ignorant of this, can never succeed but by chance; for in *Painting* by the Eye in Imitation of Nature, as they do, 'tis impossible to form their Features so just, or range them so exactly in their true places, as the Rays of things supposed beyond the *Picture*, would do other Features in piercing the *Picture* if it were transparent.

For a clearer Conception of these things, Let us consider, that there is a great difference between *Carving* and *Painting*. A Statue that stands by it self may be seen on all sides, it shews all its parts. As for Example, the Statue of *Hercules* in the Palace of *Farnese*, represents the Body of *Hercules* intire; it may be seen all round, and

viewed from different parts; it is not the same with a Painted Picture, which is terminated by a single Stroke, representing only and precisely the Circumference in which the thing that is Painted appeared to the Painter that design'd it, and in which he designs it shall appear. So that this Circumference is different according to the different points of sight; and cannot be proper for representing the same Object seen from another side. This is the reason why all the Draughts of the *Hercules* of the Palace of *Farnese* are not alike, because this Statue was designed by different Persons, who did not all behold it from the same side.

Let us here consider, that Stones and other Inanimate Matters, can keep the same Situation a long time, whereas all that hath Life, is continually changing, and in a perpetual Motion. The most ingenious Painter cannot represent these Changes; all he can do, is to paint the Moment of an Action; that is to say, the Situation of every thing, the Motions, the Postures proper to every Actor, and the Character of the Passion with which he was animated in the Moment of the represented Action. Nor can he thus Paint several Actions in one Picture.

In Drawing the Picture of a Person supposed to be alone, it suffices to observe in his Visage, and in his Countenance, the Character of his Genius, and of his ordinary Inclinations, his Physiognomy, or the Strokes of his Face, which are peculiar to himself; but in representing an Action of Consequence, to which many contribute as Actors, or Witness, every one, according to the part he undertakes, should make appear by his Eyes, and by his Posture, what he is thinking that Moment. This is the Moment a Painter can represent; this is the Point where all his Work tends; his nicest Point, I say, is, that having placed at a certain Station, him that is to consider his Picture, he sees the same thing as if the Cloath becoming in that Moment Transparent, he saw the Action it self, which is the subject of the Picture.

This being well considered, it is easie to establish the Necessity of Mathematical *Perspective*. It is impossible to see precisely the same things, from two different Stations or Points of Sight: The Eye being placed in a certain Point, from whence it sees at once a whole Action, perceives nothing but what is opposite to it. If it see the Front of a Person, his Back is hid; it cannot at the same time see above and below the same thing. The Line which terminates what the Eye discovers, is so peculiar to what it sees in the Situation it is in, that there would be a necessity of drawing a new the out-lines of a Figure, if the Eye were moved to another place; for it is evident, that the Figures of things alter, as they are seen sloping, sidewise, or in Front; they become likewise smaller or bigger, as they are more or less distant from the base of the Picture; so that a Picture can be only made for one single Point or Station.

'Tis impossible to find exactly by chance, all the out-lines of a Figure, and the bigness suitable to it in the place where it is designed to be: This cannot be done true by Just and Infallible Rules, without the Mathematicks: But after all, one cannot err in these things without mistaking grosly; for, once more, can a Figure be seen behind and before at the same time? What is seen at a distance, hath it the same Appearance as if it were near? Is it reasonable to give a Figure almost the whole height of a Column, which, in the Object represented, is 30 or 40 Feet, when at the same time the Natural Heighth of this Figure is not above 5 or 6? These are nevertheless Faults very ordinary to Painters, particularly to those who Copy the Works of some great Masters, not taking notice that the Painter, whose Works they steal, hath given a

Circumference to his Picture, which will not be convenient for it, in the place whither he carries it.

Many imagine *Perspective* to be useful only in representing Walks, Trees, or Architecture, because they distinguish it only by a Concourse of Lines to one single Point. But since a Picture cannot have its Effect, if the Rayes, which it reflects, come not to the Eye, in the same order as if the Cloath let the Light pass through, or that by the opening of the Picture, the things themselves were seen: 'Tis the passage of the Rayes that is searched for in the *Painting*, as well as in the *Perspective*, that ought not to be so distinguished. To inable us to judge the better, let us see what *Painting* is essentially.

We may say of *Painting* as of *Eloquence*: There are general Rules for Writing and Speaking Judiciously and Nobly; but as being Master of these Rules, is not sufficient for Speaking and Writing on all sorts of Subjects, on *Philosophy*, on the *Mathematics*, or on *Theology*; and what Eloquence soever one may have, he can never speak reasonably on a Subject he knows little of. So a *Painter* cannot represent but what he knows, tho' he search to the bottom of his Art. For Example, He cannot represent a Battel well, if he is ignorant of the Method of Drawing up an Army; nor a Sea-fight, if he be no Seaman. But this does not imply, that a good Painter ought to be both Soldier and Sailer. 'Tis true, there are some Subjects that Painters so commonly treat of, that it seems essential to their Art, not to be ignorant of them. Could a Painter be Excellent, if he knew not a Man? I mean the outside of a Humane Body, and what may appear on that outside; the Veins, the Muscles, and the Tendons; he ought therefore to be perfectly well acquainted with the Anatomy of the outside of a Humane Body. Those who apply themselves to the Painting of Beasts, ought to make the same Inquiry. To paint a Horse well, 'tis convenient to know the Anatomy, and most esteemed Proportion of his parts.

In fine, *Painting* is not essentially limited to represent any particular Subject. It is in general the Art of Imitating; and its Perfection is, that the Imitation is so Natural, that the Picture makes the same Impression, as the Object it self that the Painter would imitate. There lies the Beauty of his Art: 'tis the Address with which he imitates what he would represent, that makes him esteemed; for we are sometimes charm'd to see that in a Picture, which would be frightful if we saw it really. A Serpent causes Fear, but its Picture, if well done, is charming: So that 'tis the Skill of the painter that pleases.

Now the Imitation is not perfect, if it have not the same Effect as the thing it self; that so the Eyes may be agreeably deceived. Therefore since a Picture can have only one point of sight, and since each Figure expos'd to view, hath a certain Circumference peculiar to it self, in relation to the point from whence 'tis supposed to be seen; and a certain bigness, which depends on the distance in which it is represented, we must of necessity have recourse to the *Mathematicks*, without which it cannot be done to the utmost Preciseness. It may be said, there are Pictures that please without that Nicety. I own it; but whom do they please? None but such as do not compare them with the things the Painter would have them represent. 'Tis the Resemblance of Truth that pleases in *Painting*, as hath been said. How can this Resemblance exist in a Picture, when every thing confutes it, when the Ground he represents is too large or too small for the Actions that are supposed to be done there? When what ought to be

separate, are huddled together; and what should be joynd, are remote? When all is too great, or too little, and nothing hath its just Measure? Painters, after having made their Figures, do generally adorn the bottom of their Picture with a piece of Architecture, rich and fine in appearance, for if we examine the Plan in order to find, for Example, the foot of a Column, we shall find it rests on the head of some Figure. Can such Pictures please indifferently? We shall now examine its Perfection, and the Enquiry is neither Vain nor Useless; for the Rules of *Perspective* are as easie as they are sure.

Let us then conclude *Perspective* and *Painting* to be the same thing; save only that *Perspective* is made to consist, in finding Geometrically, (as I do in this Treatise) the Points, at least the *Principal*, through which the Rayes pass, that would shew the Object that is painted, if the Picture were Transparent. I say, the *Principal* Points, for it would be too tedious to search for all with Rule and Compass. The Eye alone hath an infinite Number of Features proper to it self; and besides that, two Men have not their Eyes intirely alike, the same Eye can change as many ways, as the Soul can have different Motions. Only they who have study'd Nature, and by a search after all its Characters, have acquired that Facility of imitating what they see, or what they conceive; these can represent things as they are. All a Geometrician can do, is to determine the Greatness and Situation of Figures in a Picture. That's what belongs to *Perspective*, the rest is the Work of the Painter, or of one who is wont to imitate or design what is seen; especially to mark well the Outlines. 'Tis in this they exercise themselves in Academies, who design after a Copy, or in particular, after a *Relief-work*.

A Skilful Painter having once, by the help of *Perspective*, found the Position of some Points in the Circumference, which he endeavours to compass, finishes it easily; which is impossible to those that cannot design. There are a thousand fine Strokes, of which one may find several Points, and yet not be able to finish them. Every Motion hath a proper Posture; every Passion hath a Character in the Visage; every Age, every Sex, and every Condition, a certain Air, which he must be a Judge of, and know how to express; otherwise, what is done, represents nothing that hath Life, all is dead; for the Air and Features of a Body full of Life, are very different from these of a dead Body. However it may resemble something that had once Life, there are still the same Features but much changed. Nothing but a long Exercise, and an extraordinary Genius, a Curiosity and a Nicety more than ordinary, can make one sensible of the difference.

Let us add, that tho' the Art of Painting consists in Imitating, yet a Painter that can only Imitate what he sees, is no Artist. What he represents should be Beautiful and Fine, and there is no Beauty but what is Imperfect. He must therefore imagine what is not, and form a Resemblance finer than the finest things can be found; for when he forms to himself an Idea, it may happen that nothing can be found intirely resembling it. He ought therefore to dive into what things may happen, in all the Conditions in which they can be apprehended. To represent the Posture of a Body that one sees before him, 'tis not requisite to be an Anatomist; but without the Knowledge of Anatomy, 'tis impossible to represent correctly a Posture, which he conceives but does not see.

* * *

... The Mathematicks make Abstraction of the sensible Qualities. *Perspective* then, which is but a part, can be no other than an Application of *Geometry*, to find the passage of the Luminous Rayes, that will make the things themselves appear, which are supposed to be behind the Picture, and are to be there represented. *Perspective*, I say, is the Foundation of *Painting*, but it is not sufficient to make an accomplish'd Painter, I am far from pretending it: The Idea which I have given of *Painting*, shews that I have other thoughts; but after all, what I have said, will serve to prove, that *Perspective* is useful to a Painter, that 'tis that which regulates his Designs; that without it he works but at random, and cannot keep up to the nicety of just Measures. . . .

9 José Garcia Hidalgo (c. 1645–1717) from *Principles for Studying the Sovereign and Most Noble Art of Painting*

During his lifetime Garcia Hidalgo was better known as a painter than as a writer on art. In his youth he visited Italy, where he encountered the Baroque of Pietro da Cortona and Carlo Maratti. On his return to Spain he based himself in Madrid and built a successful career, mostly as a painter of religious pictures. He was a painter to successive Spanish monarchs in the late seventeenth and early eighteenth centuries, claiming later to have spent twenty-seven years in the service of the Crown. He also acted as a censor for the Holy Office of the Inquisition. From about 1680 Hidalgo worked on a treatise on painting. Published in 1693, the *Principios para estudiar el nobilísimo y real Arte de la Pintura* was intended, as its title suggests, as a practical handbook rather than a theoretical disquisition. The text of only eleven pages was accompanied by upwards of 130 etchings which Hidalgo made to assist the teaching of beginners, to help them follow technically difficult suggestions about foreshortening, posture, etc. Approximately half the text concerns oil painting, and Hidalgo's suggestions bear comparison with those of Pacheco (see IE5). For the present extracts, in order not to duplicate Pacheco, Hidalgo's descriptions of fresco painting technique and of engraving have been chosen, as well as some more general remarks about composition and about the need for artists to attend to the conditions under which their work will be seen. The selections have been made from *Artists' Techniques in Golden Age Spain*, edited and translated by Zahira Veliz, Cambridge and London: Cambridge University Press 1986, pp. 136–9. We have retained some of Veliz's explanatory footnotes.

In fresco painting, the preparation is made over a dry wall without any saltpeter. The lime and sand are applied with a trowel, making a layer as thick as a coin of eight *neales*: mix together equal parts of each, or two of sand, three of lime, and the sand should be sifted; neither the lime nor the water for painting or dampening should have any saltiness, and no more should be prepared than can be painted in one day; if too much has been prepared, it must be undone and scraped away, and prepared again on another day. Artificial colors are not used, but rather good slaked plaster for the white, and ochre, red earth, *pabonazo*,¹ *hornaza*² (for gold and yellow); for the highlights, in place of massicot, red *lápiz*³ and calcined Roman vitriol, and natural vermilion for the reds. Haematite and eggshell white for *veladuras*, shafts of light, and transparent things; smalt and ultramarine for blues, and for purples, smalt and

pabonazo, which takes the place of carmine. For the greens, green earth or dark verdaccio from Verona, and mountain green. For browns, umber and red earth, black and ochre. For blacks, black earth, charcoal black, and ground coal. All the colors are reinforced in fresco; if you wish, the darks may be made with charcoal black or black earth. Make a sufficient amount of the tints to last for everything, because it is difficult to make adjustments later, and the tints can be tested on a new brick to see how much they will lighten [when they dry]. If it is to be legitimate fresco, neither the darks nor the lights may be retouched; it is customary to give some things a touch of gold over a mordant of glue and honey. For this kind of painting, everything that must be represented is drawn on paper and traced onto the wall, or pricked and transferred to the wall, which stands ready with its lime and sand preparation. Imitate the design and harmony of the drawing, or wash drawing, or color study, which you should have before you. There are few whose work comes out perfectly without these preparations. So you see that in this kind of painting, as in all, he who is the better draftsman, and has assurance and knowledge of architectural and optical perspective, will do everything better, even if it is only something executed in light and dark tones or black and white. Because although colors re-create sight, without good contours true to the original, and well-placed darks and lights, they are only blotches of good color and are of interest only to those who are ignorant and lack understanding of art. [...]

If anyone wishes to apply himself to engraving or etching with *agua fuerte*,⁴ either to practice drawing, or to execute some works, I will present the best recipes that have come to my knowledge, although I myself have not used them with great delicacy or care. The first is from Callot [Jacques Callot, 1592–1635], for a soft varnish, and it is made in this way: Take two ounces of virgin wax or *engrumo*,⁵ one of asphaltum, and one of colophony. Liquify all of this and then place it in cold water, and wetting your hands, form little balls or pellets of the mixture, and wrap them in taffeta and keep them to rub over the metal plate when it is to be etched. This plate, being quite clean and polished, is placed on a charcoal fire and rubbed with the little ball or pellet, coating it evenly and thinly. Then the plate is treated with the smoke of a tallow candle, and when it is evenly black, allow it to cool. The drawing is traced onto the plate and graven with slender needles with sharp or oval points used to make fine or heavy marks. After everything is graven, little balls of wax and turpentine as thick as a finger are made [to surround the plate] and *agua fuerte* is poured on, either pure, or diluted to some proportion with water. Where you do not wish it to go too deep, as in the distances, stop the open metal with a putty made of oil and tallow. The parts that must have more bite are stopped later, and the principal or foremost parts are not stopped, so they will come out stronger. These stages must be observed always, so that what is distant will separate from what is near, and so that the figures will have some outlines and shadows that are hard, and others that are soft. In everything, experience will teach you what the pen cannot: good judgment, patience, and knowledge together usually achieve their end.

The drawings are rubbed on the reverse with red ochre, or white lead or vermilion, rubbing and cleaning them well with the finger so that no more sticks to the metal than what is pressed through from the front of the drawing or script with the needle. All of the outlines transferred by the needle will be visible on the plate.

There is another recipe, for a so-called hard varnish, which is used for etching metal plates with *agua fuerte*: Take five ounces of colophony, and another five of pine resin, one ounce of mastic, and one of asphaltum, and four ounces of walnut oil. Cook it all together until it forms strings like sugar syrup. When it is like this, strain it and put it into a glazed or copper container and cover it against dust.

Then it is ready for use, and it will last a good twenty years or more. It is applied to the plate by hand, spreading it very thinly [as it is] heated over a fire and darkened with the smoke of a tallow candle. Turn it until it is evenly coated and when the smoke lessens, and a little stick touched to the surface does not scratch it, take the plate from the fire and let it cool; then transfer the drawing and engrave it, as was said for the other varnish, except in this case, if you have no *agua fuerte*, use the following vinegar: Distilled or very strong white vinegar, sal-ammoniac, common salt, and verdigris. For three *azumbres*⁶ of vinegar, use six ounces of common salt and six of sal-ammoniac and four of verdigris, all powdered; place everything in a glazed vessel large enough so that these ingredients fill half of it. The rest remains empty so that the liquid will not overflow when it boils, because it bubbles a lot, and will lose its strength [if it overflows]. After boiling it three times, take it from the fire and cool it, then strain it and keep it well-stoppered in a double-glazed vessel. If the mixture seems strong when it is taken out [and applied to the plate], temper it with more vinegar. When the plate is sufficiently bitten, remove its coating with a soft and well-burned charcoal of pine wood, going over it until it is clean and the etched lines are clearly seen for printing. If there is any fault in the proof print, correct and retouch with the burin. Be warned that everything comes out the reverse of what was drawn or written on the plate, so the left comes out right, and the writing must be made in reverse, or copied, drawn, and written from the reverse [of a paper], by rubbing it with oil, or holding it up to the light or to a mirror.

The following knowledge is also important for those who wish their works to be well-directed; this is based on observations of great men, and it is advice of total and certain truth. The first thing is that you do not place figures in actions that are too violent because they will not be convincing and will become discomposed in their gestures. Do not have the head and the body facing in the same direction. Nor should the plumb of the neck be lost in a standing figure. Nor should both the arms and legs follow the same movement. Nor should the grace and contours of the nude be covered with drapery. Nor should the figure be doubled over so that the shoulders are lower than the navel. In kneeling figures, do not put the knees together. In laboring figures, work all of the muscles and parts. In the figures of standing, seated, or kneeling women, neither legs nor feet are to be separated, for this is indecent and indecorous. In striding figures only one foot needs to be seen clearly. In a figure carrying a load, the leg bearing the weight – that is, the perpendicular – should not try to indicate movement; rather the freer limb should be the one to express the movement. For every figure, represent the movements and functions required by the age of the figure. In a running figure, all the limbs should indicate lightness and agility. Do not show women in movements as vigorous as those of men, since generally they are to be represented with proper calm in any role they take. In histories, the figures or groups or crowds must be distinct, some near and some far, some seated, others standing, and in various appropriate activities and actions

pertaining to the history. They should be shown with distinct ages and costumes, so that they are lighter in the distance, and so the figures are not confused one with the other, nor draperies of one color with those of another, nor should there be many figures of like physiognomy and age. The principal figure of the history should be the most easily recognized, and the figure which gives greatest pleasure to the viewer. Half-figures should not be used, unless a stair or wall or slope is called for. Do not fill the canvas with figures if they are not required by the history and subject, because perspective and landscape give depth and art and beauty [to the work]. The figures of the history that are closer and more important are to have more beautiful colors and stronger lights and darks; those in the following distance have softer darks and less brilliant lights; in the third distance, still less bright; and so on in the fourth and fifth, with a diminution of the figures that is barely perceptible; all should be soft and mellow, and do not glaze the draperies except in the foreground; in some places, if the [colors] come out too strongly, they must be given a *veladura* with white and ultramarine or smalt, in landscapes just as in figures and architecture. In other bright places, you have to sully and tint the colors to temper their brightness with asphaltum or blue, or whatever is best for the color and distance of the thing. The distances or landscapes are always tempered and tinted so that details stand out properly, in the darks as much as in the lights. And thus, the painting will have coherence, since the diminution will be consistent in the tints as well as in the proportion and diminution of the figures, according to good perspective.

It is also very important that the painter see or know the light in which his painting will be seen, and the height and distance from which it will be seen, because for filtered light, the highlights should be strong and untempered, and the darks as well; for bright light, or a place made bright [artificially], everything must be soft and well-tempered in the colors and adjusted and soft in the execution; in works that will be seen from a distance, large figures should be used, and the strokes of light and dark should appear proportionate and strong, because they are tempered and lost with distance and height.

This seems enough for those discreet persons who know how to follow and apply information with good judgment. I have printed this work for the reasons I gave above and because it could be of some use to those who cannot participate in any other, better way, and so, without tiring anybody, they can still have some knowledge. Sometimes a poor traveler, ignorant of such a thing as a bright torch, contentedly lights his way through the darkness with a taper, being happy thus not to stumble and fall in obvious ignorance. Thus he can accompany other curious and virtuous travelers who journey through study and discourse on Art, and together they overtake those who move through [total] darkness with slow, uncertain steps. And all of this I give as a way of employing my time, as benefits all creatures, to the honor and glory of God and the Most Holy Mother.

¹ *Pabonazo*. Red mineral pigment used in fresco painting.

² *Hornaza*. Dark yellow pigment prepared in glass-makers' furnaces.

³ A kind of red ochre.

⁴ Nitric acid.

⁵ A form of solidified animal fat, possibly a by-product of the process for extracting glue from animals.

⁶ One *azumbre* is slightly more than a gallon.

Part II

The Profession of Art

II

Introduction

The first third of the eighteenth century saw few substantial developments in the styles of painting or sculpture, but considerable increase and intensification in the claims made for art in general. These rested on a series of interconnected theoretical advances: the assertion of the priority of sensory experience, made in John Locke's philosophical work (IIB1); the recognition of the eye as the prime organ for the receipt of sensation and of information about the world, made explicit in the writing of Joseph Addison (IIB4); and the work done by Roger de Piles (IIA2) and the Abbé du Bos (IIB6), which served to distinguish art's specific formal and technical concerns from those of literature.

To the advocates of painting, some of whom were themselves practitioners, the urgent task now was to demonstrate to a wider audience that it was no mere craft, but an intellectual pursuit with a respectable pedigree, fully deserving the thoughtful attention – and investment – of cultivated individuals. This imperative was driven by wider social and economic processes at work in the modern capitals of Europe. These were such as to produce substantial growth in the educated middle class, an increase in the availability of leisure for the members of this class, and a concomitant self-consciousness about the acquisition of culture. As Jonathan Richardson was concerned to affirm (II A6), even the painter of portraits was now required to 'think as a Gentleman, and a Man of Sense' (if only to conceal the true material conditions of his profession as one whose class position was actually far from secure). The success of Chambers' *Cyclopaedia* (IIA10) provides powerful evidence of the rising constituency it supplied: a constituency not of practitioners in search of instruction but of bourgeois self-improvers in pursuit of knowledge and consumers in pursuit of culture.

The growth of this constituency gradually affected the very character of art theory, leading to a broadening of its address and a loosening of its dependence upon classical authority. It is against this background that we should interpret the suggestion of Du Bos, made in 1719, that judgement in matters of painting should be exercised by the educated public rather than the professional painter, bearing in mind that in France the paradigm of professional painter belonged to a *royal* academy (see IIB6). We should not assume, however, that what had been the more or less exclusive concerns

of a minority were now transformed through a simple process of liberalization. There is plenty of evidence to suggest that those who already saw themselves as connoisseurs were far from eager to open their conversation to the world at large. For all Shaftesbury's assertion of the need for a 'public voice' to raise 'a true ambition in the artist', his patrician deliberation on an imagined painting could hardly be called a popular text (II B3). In England as subsequently in France, an enlargement of the public could be countenanced only to the extent that the 'public' was 'polite'. A large question was now raised in the minds of any who deliberated about art's effect upon its audience: was 'taste' the innate property of the already cultured, or could it be acquired? If it was even possible that the 'vulgar' might *become* 'polite', then it would be increasingly difficult to prevent questions regarding the value of art from being implicated in political debates about the spread of education and of economic opportunity (see II A7).

Together with these circumstantial changes came a degree of practical cosmopolitanism, encouraged by the relaxation of restrictive laws. In the late seventeenth century it had been illegal to import foreign works of art into England. In the early eighteenth there was a booming market in antiquities, paintings and prints from abroad. Throughout Europe there was an exponential increase in the amount of newly published literature on the arts, while translations were often made and printed with a rapidity that today's authors might envy. Shaftesbury's 'Judgement of Hercules' was published first in French and then in English, and was later translated into German; Richardson was translated into French by a Dutchman; the Dutch treatise of Gérard de Lairesse was translated into English, French and German; and so on. (There was also a high degree of recycling of antecedent publications, often unacknowledged in purportedly original texts.) In England this increase in publication was greatly encouraged after 1695 by the lapse of the Licensing Act, leading as this did to the ending of pre-publication censorship and of monopoly over the presses. Addison's important 'Pleasures of the Imagination' (II B4) was published serially in a medium that could not have existed twenty years before, and it was addressed to a constituency that could not have been envisaged at that time, by a man occupying a profession that could not formerly have supported him. As a sustained piece of writing on aesthetic matters, it was also novel in the very nature of its concerns. Two years later, in 1714, Jean-Pierre de Crousaz published his *Treatise on Beauty*, marking the moment at which a specifically aesthetic discourse was initiated in France also (see II B5).

It would be some while, however, before this swelling literature could confidently establish its values with regard to the work of contemporary or even recent artists. In fact, the more aesthetics developed into a distinct discipline, the more resolutely its concerns were distanced from the contingencies of current practice. Meanwhile, with poetry's ancient pedigree always in view, the prevailing tendency of art theory and criticism was still to affirm the authority of classical antecedents and of the later Italian Renaissance masters, Raphael foremost among them. This generalization applies with a surprising consistency across the different national cultures of Europe, even though the respective native schools varied greatly in the length and depth of their establishment. For instance, while the Italians could refer to an unbroken tradition of pictorial art stretching back over centuries, and while the Académie

Royale and later the Salons provided French writers with a common point of reference, it was the need to ground an English school in the first place that impelled Jonathan Richardson's *Essay on the Theory of Painting* in 1715. Yet in each case, the litany of authorities tended to be much the same. In fact, there may have been some advantage in the relative novelty of painting so far as much of its educated English audience was concerned. Richardson's address to potential connoisseurs (IIA7) was well timed to coincide with the spread of empiricist theories, arguing as these did for the primacy of learning through direct sensory experience (IIB1, 4, 7). It was during this period that much of the early work was done to connect the evaluation of art to philosophical theories of mind and of perception.

In France, the Académie Royale continued to act as a regulator of competence and as a forum for elevated debate, tied irrevocably to the conditions of its royal patronage. Coypel's invocation of the grand manner testifies to the high aspirations that the Académie maintained and to their association with the work of Raphael, still the normal model for the 'perfect painter' (IIA8). In fact, however, the period produced no French artists whose careers could match those that had ended in the later seventeenth century: Nicolas Poussin (d. 1665), Philippe de Champaigne (d. 1672), Claude Lorrain (d. 1682) and Charles Le Brun (d. 1690). The reign of Louis XIV had been associated with a period of remarkable French cultural ascendancy, but that ascendancy was already effectively over by the turn of the century. The final decade and a half before the king's death in 1715 was vexed by the ravages of warfare and by divisive religious conflicts. Louis XV came of age in 1723 and lived for a further fifty years, but where comparisons with the earlier period were made explicit, they were rarely such as to favour the achievements of his reign. The clearest indication of its artistic character was the spread of rococo decoration throughout the interiors of the wealthy. (The term rococo is compounded from the French for rocks and shells: *rocailles* and *coquilles*.) Enlarged to the scale of history painting, rococo work tended to appear overblown, while the more ambitious compositions of the academic painters were significantly lacking in animation. That some quantity of large-scale painting was guaranteed royal patronage in France – indeed, was virtually commanded – seems not generally to have assured large paintings of abiding critical value during the first half of the eighteenth century. The most attractive French paintings of the time were relatively modest enterprises. Not until the 1780s would the high ideals of French classical painting again be matched in practice, and then the source of their reinvigoration was a burgeoning republicanism.

In Holland in the early eighteenth century a well-established bourgeois market was kept supplied by a host of specialists working in a number of separate centres. From the perspective of the present, it is clear that the golden age of Dutch painting, like the golden age of classical art in France, was by then already over. Yet no such considerations seem to have troubled Gérard de Lairesse as he composed his massive and widely distributed treatise (IIA1). Following the prevailing tendency, he looked back through France and Italy to the classics for his models, paying relatively little regard to the recent achievements of his own countrymen. Lairesse's priorities seem to have been representative of the literate Dutch culture he addressed. If there were late seventeenth-century writers who responded sympathetically to the contemporary 'realism' of Jan Steen, Isaac Ostade, Adrian Brouwer and others, their texts have not

survived. The best testimony we have to the force of these painters' work is that the early eighteenth-century writers who aimed to promote the status of painting generally took pains to disparage it en bloc. It seems entirely appropriate that the 'Beau Idcal' promoted by ten Kate in 1732 should have been attached to Richardson's writing on the sublime, since it owes little enough to the Dutch painting of the previous century (IIB9, 10).

In Italy, the legacy of classical, Renaissance and Baroque civilizations could still be counted on during the first half of the eighteenth century to attract dealers, collectors and cultural tourists from the rest of Europe. It is clear from Richardson's testimony that current Italian painting was also maintaining its prestige at the time, at least as far as the English market was concerned (IIA6, 7). And with some justice. With the maturity of Giambattista Tiepolo (1696–1770), the long history of Italian monumental art came to a last late flourish, while the demand for topographical paintings was serviced at a high level, first by Antonio Canaletto (1697–1768) and later by his pupil Francesco Guardi (1712–93), both of them working principally in Venice. Canaletto's nephew Bernardo Bellotto (1720–80) was also to produce some remarkable views, many of them painted in Central European cities. We look in vain, however, for other than merely biographical texts by contemporary writers that we might put beside the Italian paintings in question. This was apparently not art of a kind that either required theoretical defence or generated significant interpretative comment. To those whose interests it satisfied, its merits must have seemed transparent and uncontroversial.

In fact, it is true of the early eighteenth century as a whole that its major painters tended neither to generate written theory themselves nor to attract any considered reflection on their work from others. As we have suggested, this latter deficiency may have been the result of a lingering lack of maturity in art theory as a whole, its pursuit of conservative ideals often disconnected both from the emerging concerns of aesthetics and from the contingent conditions of practice. Another factor may have been the absence of significant change in artistic style. During the first third of the century there was a perceived need both to advertise the value of art and to demonstrate the potentially elevated character of its accompanying theory. What was lacking was any strong external motivation to revise such protocols as art criticism had managed to establish. Watteau is perhaps the most original artist of the period, but he was not to live long, and even his exceptional achievement can be cited to prove the rule of relative stability. From the unconsidered materials of character sketches and theatrical decorations, he was able to distil an art of sustained pathos and complexity. Yet if the most ambitious of his compositions made reference to the protocols of history painting, it was only to dissolve history itself into a play of manners and gestures and moods. And this left little to discourse about, at least as discourse about art was conceived in France in the eighteenth century. Insofar as we have evidence of contemporary thought about Watteau and his work, it survives in the anecdotal materials of obituary accounts (see IIA2). This is not to imply that that work was unconsidered. Evidence of another kind survives in the great number of engravings that were made from his paintings and drawings.

There is a general lesson to be learned here – or rather to be reiterated in the face of this specific example. Developments in the theory of art do not necessarily proceed

in step with developments in practice, nor can the priorities of theoretical argument necessarily be matched in any systematic fashion against the conclusions of retrospective critical evaluation. At no period in the long history of the modern is this lack of symmetry so clearly demonstrated as it is during the first half of the eighteenth century.

IIA

Painting as a Liberal Art

1 Gérard de Lairesse (1640–1711) from *The Great Book on Painting*

From the mid-1660s until his death, Gérard de Lairesse worked principally in Amsterdam. A generation younger than Jan de Bisschop (IA4) and Samuel van Hoogstraten (IE7), he was a determined advocate of classical principles. These he implemented in his own painting in multi-figure compositions, allegories and decorative schemes produced for the benefit of a cultivated bourgeois audience with a taste for French art. Poussin was the dominant model for his work. In 1690, at the height of a highly successful career, he became blind. Thereafter he turned to lecturing on art. A first volume of his lectures was published by his sons in 1701 as *Grondlegginge der teekenkunst* (Principles of Design). *Het groote schilderboek* (The Great Book on Painting) followed in 1707, published in two volumes in Amsterdam. This work ran to numerous editions and was translated into several languages. Its contents are generally consistent with neo-classical and academic theory, in the sense that de Lairesse affirms the values of the antique and directs the artist's ambition towards those historical and allegorical compositions that are proper to the highest genres. The treatise nevertheless retains a distinctively Dutch flavour. This emerges in de Lairesse's fascination with the imaginary construction of emblematic pictures and allegories – a tendency which his blindness may have encouraged. It is also noticeable in those vivid passages where he discusses the interest of 'mode' or 'modern' painters in the depiction of everyday and urban subjects, and where he discourses on the decorum of still-life painting. De Lairesse's inclination is to disparage the endeavours of such painters as Bamboccio (Pieter van Laer), Brouwer, Ostade and (Anton?) Moller. Through the very vehemence of his opposition, however, he provides testimony to the strength of genre painting in the Low Countries, and to the kinds of 'kitchen' still life that accompanied it. Our excerpts are taken from the English translation of the *Groote schilderboek* made by John Frederick Fritsch and published as *The Art of Painting in All its Branches*, London: J. F. Fritsch, 1738, pp. 88–90, 126–36 and 547–50.

Book II. Of Ordonnance, or Composition.

Chap XV. Of the four Sorts of Tables, or Ordonnances, and what they are.

[...] I shall now treat of the Nature, Force and Quality of Tables or Ordonnances (as necessary for Landskip as History-painters) and therein consider 1. Their Kinds. 2. Their Names. 3. Which of them have double Uses, and which have single.

I suppose four Kinds, *viz. Historical, Poetic, Moral and Hieroglyphic*; the first is a simple and true Fact. The second, a double Fiction, exhibiting fabulous Stories, or a Mixture of Deities and Mortals: The third has a threefold Moral; teaching our Duty to God, our Neighbour and ourselves: And the last is fourfold, as couching, under a short and mysterious Sense, the three before going; handling Virtue and Vice for the Benefit of Soul and Body, and shewing the Happiness and Immortality of the one, and the Corruption of the other.

In *History*, the Poet or Painter, ought intirely to confine himself to *Truth*, without Addition or Abatement; his Ornaments, tho' borrowed from Poesy, must be so restrained, that nothing, serving for Illustration, create Improbability; for Instance, not to represent Day-break by the poetic Figure of *Aurora*; or the Night, by *Diana*; or the Sea, by *Neptune*; which is needless, and an Error, because those Things can be naturally expressed by Colours; as Day-break, by its Appearance, of Yellow, Red and Blue, or by the Sun-rays appearing on the Horizon; the Night, by it's Darkness, and by the Moon and Stars; the Sea by its Waves and Billows, Rocks, Monsters and Shells on the Shore; also the *Nile*, by it's Crocodiles, &c. or any Thing proper to the Sea or Rivers.

The *Poetic* Tables differ from the historical in this; that, instead of true Story, they consider *Fictions only*, intermixing Deities with Mortals, as we have said; and thereby signifying nothing else, but the Course of the World thro' the four Elements, as Air, Earth, Fire and Water; and tho' historically handled, yet each is a simple Figure, having a mystic Meaning, either in *Name or Shape*, and often in *both*; as *Scylla*, *Atlas*, *Leda*, *Cyclops*, and many others: And thus the Fable, being both philosophic and moral, in one and the same Manner prescribes Virtue and decries Vice; as we gather from *Ovid*, *Virgil*, and others. It is necessary therefore, in designing such an Ordonnance, to *keep intirely to the Fable*, as before is said, without any Addition of hieroglyphic Figures, as Temperance, Prudence, Anger, Jealousy, &c. which are so improper here, as hereafter shall be shewn, that they destroy the very Intent of it; for there are others, which (tho' in a different Manner) will express the same Passions; as *Cupid*, instead of *Love*; *Pallas*, instead of *Wisdom*, and many others; as we collect from the Poets.

The *Moral* Ordonnances are *true Facts, or Histories*, proposed only for Edification or Instruction; exhibiting either the gallant Acts, or Crimes, of human Nature; and these explained by some additional emblematic Figures, which express the Passions by which they were moved, or misled; for Instance, with *Alexander* we may place Ambition; next *Marcus Aurelius*, Humanity; next *Augustus*, Piety; next *Scipio Africanus*, Moderation, in restoring the young captive Bride to her Spouse, and many others, as *Horace* in his Emblems artfully exhibits. In this Sort of Ordonnances we are no ways confined to Time, the Sun's Place, or the Quality of the Country; for we may intermix Summer with Winter, even all the Elements may appear; the Subject may be in the Front of the Picture in *Africa*; and in the Offskip, at *Rome*, or elsewhere; even in Hell itself another Scene may be acting; so great a Latitude has a Moralist: But he must take Care to avoid Superfluity, and Things improper to the main Action, which, as in Plays, spoil the Beauty of the Representation.

The *Hieroglyphic* Ordonnances are quite different from the three former in their Nature and Quality, having no other Affinity with them than an Intention to *exalt Virtue, and debase Vice*, by the Rewards of the one and the Punishment of the other:

They are as well Christian as Heathen; the Christian affect the Soul, and the Heathen the Body: The former demonstrate the Immortality of the Soul, and the latter shew the Vicissitude and Vanity of the World. These Tables consist in assembling several emblematic Figures of different Passions, which all together are to express a single Meaning; as Piety, Peace, War, Love, &c. And such Tables are called Emblems, by their Application and emblematic Use, and by being made up of Objects which have their proper Meaning and Relation, or else Derivatives from them; as the Palm-tree, Laurel, Myrtle, Cypress, or the Sun, Moon, and Stars, or an Hour-glass, a Dart, Flame, &c. Which signify any Power, Virtue or extraordinary Effect. These Tables, like the preceding, admit not of the least Superfluity to obscure their Significations; because, having neither History nor Fable to build on, they consist only of a single Passion, proceeding from the Subject (which may be at our own Choice) explained and made intelligible by the other emblematic Figures, which must not be improperly introduced, lest the Sense of the whole Scene be altered: But here we must observe to make a Distinction between *Heathen* and *Christian* Representations; the *Heathen* admit of *Venus*, *Cupid* or *Anteros*, for Love; the *Christian* shews Charity, or a Woman with Children about her, and a Flame on her Head; the former has *Hercules*, for Fortitude, and the latter St. *Michael*; the one takes *Jupiter* with his Thunder, and the other, Justice; the former expresses Piety by a Woman with an Oblation-bowl in her Hand, and near her an Altar with a Crane, and the latter chuses a Cross instead of the Bowl: But all this is uncertain, and not confined to Time or Climate.

Book III. Of Things Antique and Modern.

Chap I. *The Difference between what is Antique and Modern.*

We are now obliged, to put in Execution our Purpose of making a proper Distinction between Things Antique and Modern; since the Difference between them is so great, that they cannot unite, without causing excessive Deformity; *for Things Antique are always the same, but the Mode continually changing*; its very Name implies its Mutability; since nothing is more unconstant than what depends on Fashion; which alters not only annually, but even daily in those who mimic the Court. These Contraries, which are so confounding, and cause such a Variance between what is *antique* and *modern*, we see chiefly in the Composition of Histories, Fables, Emblems, and such like; in which both (yet the *Modern* most) are blended together.

* * *

I think I can't better describe the Difference between what is *Antique and Modern*, than by a Windball and an Egg, thus; the Ball, by being tossed to and fro, and at last bursting, represents *short Duration*, affording nothing but Wind; but the Egg hatched and opened, produces a living Creature; not only *a Something*, but *something good*; the former, a mere Nothing; or, if it have a Name, 'tis Vanity, and therefore rather bad than good.

Painting was, by the ancient *Romans*, so highly esteemed, that none but Noblemen durst learn it: As we may also gather from the Painters, several of whom have been of noble Extraction: And the Reason of it is very evident, since 'tis not only probable, but reasonable, that such ingenious Spirits should have a distinguishing Inclination

for Arts, suitable to their Quality, above the Vulgar. Their Meditations, Actions, and Perceptions were fixed on great and sublime Things: They inquired into, and consulted many excellent Authors of History, Fables and Emblems, as well sacred as profane, and the Accounts of ancient Medals; from whence they have drawn plentiful and ingenious Matter for their Studies: What excellent Paintings have they not oblig'd the World with! How many Temples, Palaces, and other rare Structures have they enriched with elegant Devices inciting to Virtue; whereby they have bequeathed a lasting Name to Posterity! How did Architecture (never enough to be praised) flourish in their Times. But what Alterations do we see now? How are the Beauties and profitable Uses of Painting either sunk, obscured or slighted, since the *Bambocciades*¹ are multiplied in these Countries; at present we can scarce see one Virtue appear, but ten, nay an hundred Vices will rise counter to it; thus has sprung up a second *Hydra* like that of *Lerna*; so that we want a valiant *Hercules* to lop off those Dragons Heads which are always sprouting. Thus Architecture itself, how excellent soever, is, with the right Practice of Painting, brought into Disgrace, and slighted by other Nations; since we scarce see a beautiful Hall or fine Apartment of any Cost, that is not set out with Pictures of Beggars, Obscenities, a *Geneva*-Stall, Tobacco-smokers, Fiddlers, nasty Children easing Nature, and other Things more filthy. Who can entertain his Friend or a Person of Repute in an Apartment lying thus in litter, or where a Child is bawling, or wiping clean? We grant, that these Things are only represented in Picture: But is not the Art of Painting an Imitation of the Life; which can either *please or loath*? If then we make such Things like the Life, they must needs raise an Aversion. They are therefore too low and unbecoming Subjects for Ornament, especially for People of Fashion, whose Conceptions ought to surpass the Vulgar. We admit indeed that all this is Art, or at least called so, when the Life is thereby naturally exprest; but how much the beautiful Life, skilfully handled, differs from the defective Life of modern Painters, let the Curious determine. It's certain that Men (and Beasts too) have each a particular and different Inclination to particular Things; whereby they love what's agreeable to their Natures, the one good, the other bad, because (as some pretend) they are governed and influenced by certain Constellations happening at their Births: This at least we know, that one Man inclines to Hunting, and a Country-life; another, to War, Strife and Contention; another to Merchandise and Deceit; this, to Politicks and great Things; that, to Pleasures, &c. So that in each we discover what his Nature and Passion is prone to.

But let us reflect on the two Arts, Noble and Ignoble; or *Antique and Modern*, and see how much they differ both in Objects and Execution. *The Antique is unlimited*, that is, it can handle *History*, sacred as well as profane, *Fables and Emblems* both moral and spiritual; under which three Heads it comprehends, *all that ever was, is, and shall be*; the *past, present and to come*; and that, *after an excellent Manner, which never alters, but remains always the same*: *The modern, contrarily, is so far from being free, that it is limited within certain narrow Bounds; and is of small Power; for it may or can represent no more than what is present, and that too in a Manner which is always changing: What is past and to come is without its Power; as also Histories, Fables and Emblems, as well poetical and philosophic as moral*. Hence we may judge what the *modern Art of Painting* is, and why it cannot be called *noble*; much less have any Harmony with the *antique*. I could assign more Causes for this Disunion, but shall at

present omit them for two Reasons; first, because Men's Judgments are so various; and each argues according to his Passions and Inclinations, in Proportion as he likes or dislikes a Thing: Secondly (which is the principal) that I may not be thought to raise any Suspicions of Partiality or Prepossession. But why should I restrain my Thoughts? Let me speak plain in Spite of others; I say then, that altho' *modern Things* seem to have some Prettiness, yet they are only to be esteemed as *Diversions of the Art*. I moreover maintain, that such Painters, as never produce more than one Choice of Subjects, may truly be ranked among Tradesmen; since such Representations cannot be called an Exercise of the Mind, but an handycraft Trade.

By such Remarks as these, we may sufficiently perceive, that from *Apprehension, Knowledge* and *Judgment* spring the Lustre and Elevation of the *antique Art* of Painting; and contrarily that *Ignorance, Negligence* and *Self-will* debase and subject *the modern*: So that the Ancients have not improperly placed *Minerva* by the one, and *Midas* by the other; intimating by the former, *Skill in the Art, Practice, Carefulness* and *an heavenly Talent*; and by the latter, *Imprudence, blind Zeal, worldly Defects* and *Hindrances*.

But if any one would perhaps examine, whether there be not a Means to make the *Modern noble*, as well as the *Antique*, that they might both march together, they would find it to be Labour in vain; since Defects once got footing are not easily remedied: But further, we often hear with Wonder, that Painters persuade one another that, in handling a Subject, 'tis enough to follow Nature, tho' she be defective; as crooked, lame, squint-ey'd, or blind; and that when she is imitated with a delicate Pencil, that is sufficient; and such is their Zeal and extraordinary Pains, that one paints for that end the Air of his Wife, tho' ever so ugly, with all her Freckles and Pimples very exactly, whereby the Agreeableness of a beautiful Woman's Face is quite lost: Another chuses his clownish unmannerly Maid-servant for his Model, and makes her a Lady in a Saloon: Another will put a Lord's Dress on a School-boy, or his own Son, tho' continually stroaking his Hair behind his Ears, scratching his Head, or having a down-look; thinking it sufficient to have followed Nature, *without Regard to Grace*, which ought to be represented; or having recourse to fine Plaister-faces, which are to be had in Abundance.

The beautiful and well-composed Airs in a Picture of many or few Figures, have a great Effect on the Minds of the Knowing; of which the Ancients were thoroughly sensible; for in the most perfect Bodies they made the Face chiefly to excel in Beauty and Agreeableness. No one of Judgment will deny, that a beautiful and well-carriaged Woman has such an Ascendant as most effectually to move her Beholders in two different Manners, and by two contrary Passions; under Misfortune or in raging Pain, she will pierce a Man's Heart, and move him to Compassion; and when she entertains us on any joyful Occasion, with Singing or Laughing, she will at once delight us: A clownish Woman contrarily, will not produce any such Effects; for her Beholders, thro' her Unmannerliness and simple Behaviour, despise her Mirth, and mock her ridiculous Sorrow.

What great Defect do we not still find in *modern Painters*, when they use, or rather abuse, the Life; not doing like those, who being accustomed to a *nobler Manner*, view the Life with Knowledge and Judgment, that is, *not as it ordinarily appears, but as it ought to be, in its greatest Perfection*: Whereas the others, blinded by Custom, have no

such Nicety; because they imitate the Life just as they see it, without any Difference: We even see them make it more deformed than Nature ever produces; for the more mis-shapen Faces *Bamboccio, Ostade, Brouwer, Moller*, and many others made, the more they were esteem'd by Ignorants: By which *low Choices* we can easily judge, that they were Strangers to Beauty, and Admirers of Deformity: However 'tis an infallible Rule, that daily Custom and Converse with People like ourselves, contribute much to it. Thus Deformity and Vice are preferred to Virtue, and what should be shunn'd sought; whereas he who is sensible of Virtue will always endeavour to escape Error.

Chap. II. *Method for representing what is City-like, or elegant Modern.*

The continual Changes in worldly Things afford us plentiful Matter for *modern Manner*, without recourse to History, Fables or Emblems; even so much as to be endless; as may be gathered from the Assemblies for publick Worship, Pleadings in Courts, Plays, Family-occurrences, and the like: All which we perceive to be either majestic, amorous, sorrowful, or otherwise. *Those Things, how different soever, can be represented in the antique Manner as well as in the modern, provided each keep its Quality*; as I have already intimated, and shall further insist in the subsequent Examples; which can be handled in *both Manners alike natural and proper, without either's borrowing any thing from the other, but the Subject*. This I think worthy of Remark; and the rather, since, to my Knowledge, no Author, treating of *Things Antique and Modern*, has said any thing touching it.

Fra. Mieris has not only curiously followed his Master *Gerard Dou*, in the elegant *modern Manner*, but is, in some Things, his Superior; and the rare *Poussin*, and *Raphael*, Prince of the *Italian Painters*, excell'd in the *Antique*: Let us then follow their Examples in what is most agreeable to our *Gusto's*; and tho' the latter far exceed the former in Nobleness, it's however more commendable, to be like a *good Mieris in the modern Manner, than a bad Raphael in the antique*. Tho' I remember to have seen a Picture of old *Mieris*, which, as often as I think of it, surprises me; it was an half-length Figure, about the Bigness of the Palm of the Hand, representing the Art of Painting, holding a Vizer in her Hand; its Air, Head-attire, Dress and Furniture so very beautiful and truly *antique*, that I never saw the like done by any other *modern Master*, how skilful soever. Whence it appears, how rare it is for a *modern Master* to give into the *Antique*.

Let us now represent the Case of *Parents permitting their Children to take some Diversions in Bathing*: A Design which can be *as well executed in the Antique as the modern Manner*. The *Bagnio* comes forward in the Piece, having a Descent into it of two Steps: The Boys, from 12 to 15 Years old, about the Water and in it, are naked: A Daughter, of 20 Years of Age, is seen with a fine white Linnen Cloth over her Body, in order to cover what Modesty conceals, and as is customary on such Occasions; nevertheless her Arms and Part of her Legs are bare; she is coming up the Steps on the left Side: One of the aforesaid Boys holds her fast by a Flappet of the wet Cloth, in order to prevent her going up: Further behind, near a Bed, the eldest Daughter, about 25 Years old, appears almost unshifted; and near her, a Maid-servant to put the Cloth about her: The Father we represent, drest either in his Cloaths, or a *Japan Night-gown*, standing on the Brink of the *Bagnio*, and laughing at the Boys who are

in it, and playing their Tricks: One of them is standing with his left Leg on the Steps, and with the other Foot just touches the Water; the youngest Boy lies on his Belly extended on the lowermost Step, plashing with his Hands in the Water; the Cloth of the Daughter, who is stepping out of the Bagnio, dropping wet, sticks so close to her Body, that the Nakedness of the Members appear transparently through it: The Mother all this while is busy in serving some Sweet-meats on a Table covered with a Napkin, near which, a Child, of 2 or 3 Years of Age, is sitting in a Chair in his Shirt; to whom she offers a Macaroon. Somewhat further are seen silk Gowns, Petticoats, velvet Scarves, Hoods, &c. hanging on Pins: On a Table are lying pearl Neck-laces, Bracelets and other Trinkets: In fine, the whole Disposition is most orderly, natural and beautiful. As for the Boys Cloaths, to wit, Coats, Hats, Breeches, Stockings, Shoes, &c. they lie on the Brink of the Bagnio.

Now I refer it to the judicious Reader, whether the Daughter, who, on the left Side, is stepping out of the Bagnio, ought not, notwithstanding her being covered with the Cloth, to be represented beautiful and shapeable in her Arms, Legs, Hands and Feet, nay, even her Body also, so far as the Nakedness appears thro' the wet Cloth? Her Modesty appears evidently by her bashful Look: What a Carriage shew the Feet and whole Body, while she endeavours to cover the Parts which Modesty conceals! And how modestly does she step up, instead of exposing those Parts by a wanton Gate! I ask further, whether the Boy, who is stopping her by the Flappet of the Cloth, ought to be less beautiful and well-made than the Father in the flowered *Japan* Gown? The Boy the same, who lies extended on his Belly; in whom must appear Innocence and Childishness: The eldest Daughter in her Bloom, well descended and virtuously educated. To whom shall we liken her? Whence must we fetch her Beauty? And whom must we use for a Model? A vulgar Person, or one of a better Appearance: Even this latter would be insufficient for the Purpose, if not well educated and fine-carriaged; because Beauty without Grace looks mishapen and stiff: This Virgin then, who is, except in her Feet, quite naked, ought principally to be painted as beautiful and agreeable as a *Grecian Venus*; I mean not, a wanton one, but an Heavenly one,² *i. e.* a virtuous one; for as much as the Soul differs from the Body, and the Body from the Dress, does Nobility from Commonalty, Virtue from Defect. If any one ask, where he shall find those Beauties; I refer him in the first Place, to the Books which treat of perfect Proportion; wherein true Grace consists: Whilst he is studious in those, he ought to have the best Plaister-figures before him, in order to exercise his Understanding, and thereby acquire a solid Judgment. If it be again objected, that the Plaister is not equal to living Nature, I own it; for I mean not, that the Artist should paint Flesh-colour after them, but get a perfect Idea of their Beauty, Grace and Agreeableness,³ both general and particular; whence Perfection springs; for the Colouring is evident, and easy enough to be found in the Life, as I could prove in several Instances of some ordinary Painters who coloured well; who, before they had made much Progress in the Art, were cried up for great Men, and yet, having any Thing extraordinary to do, were not able to sketch well an Head, Hand or Foot.

The *modern Painting* can therefore not be accounted *Art*, when Nature is simply followed; which is a meer imperfect Imitation or defective aping her. Even, were a Thing represented ever so natural, well-designed and properly ordered; the

Condition, Manners and Custom of the Country well observed, and the Colouring most exact, yet the Knowing will not think it artful: But when Nature is *corrected and improved* by a judicious Master, and the aforesaid Qualities joined to it, the Painting must then be noble and perfect.

I say therefore, with respect to the Naked, whether of Man, Woman or Child, that when 'tis not exhibited most beautifully, or in its *due Proportion*, the *modern Painting* cannot deserve the Name of *Art*; and with good Reason, since this is the only Method whereby to make those two unlike Sisters accord.

Van Dyk, never enough to be commended, gained Excellence in the *antique* as well as the *modern* Manner, by strictly following the aforesaid three Graces in both; and he thereby acquired the Epithet of *Matchless*: Let us therefore follow his noble Example in what made him so famous; since he is the first who carried the *modern* Manner so high as to gain it the Name of *Art*. Whence we may easily conclude, what great Difference there must be, between a Painter who makes the *modern or defective Life*, his *Study and Excellence*, and one who follows the *Antique*, or makes a *thorough Inquiry into every thing that's beautiful and perfect*: The Difference is even so great in every respect, that I cannot but wonder at it; especially, when I consider how much greater the Number of the former Sort is, and how they daily increase. . . . The Reason of so great a Difference can be attributed to nothing else, but the different Inclinations of Painters, to Objects agreeing with their Tempers.

They, who content themselves with following *defective Life*, will never produce any thing *perfect*, or deserve the Name of artful Masters; because *not knowing, or not caring to know, what is best*, they cannot so much as strive at it: To which add, another Mischief; *they more easily judge of what is bad than good*; as I shall explain myself in the following Example.

A *young Man* as a Painter with Pallet and Pencils, attended by *Zeal*, is led, by a blind *Cupid*, to the Figure of *Nature*, whose Face is covered by *Vulcan* with a Veil. The *Sun* behind the young Man enlightens the aforesaid whole Figure. *Mercury*, on a Cloud, with his *Caduceus* in one Hand, holds a Star over the Artist's Head in the other. The Meaning is this.

Nature is the Painter's Object; the *Sun* represents *Knowledge*; *Vulcan*, the *gross Part of the Air, or Earthiness*; and *Mercury*, *inevitable Fate*. The rest explains itself. Thus much touching a *modern* Painter.

* * *

Book XI. of Still-Life.

Emblem, touching Still-life.

Judgment and *Prudence* sit here at a Table; by whom are seen some *Cupids* taking, out of a large *Horn of Plenty*, all Sorts of Things, as a Scepter, Crown, Necklaces, Books, a Shepherd's-staff, Musical Instruments, Garlands, Flowers, Fruit, &c. serving for Still-life, and presenting them to *Judgment*, who, by the Help of *Prudence*, lays them in Heaps on the Table, disposing them orderly for representing ingenious Ordonances in that Part of Art.

Chap. I. *Of Still-life in general*

Having thus far treated of the Power and Dignity of the noble Art of Painting, together with the Lustre and Advantage accruing to those who thoroughly consider and put it in Execution; we shall now, for the sake of weak Capacities, proceed to *Still-life*, or, *immoveable and inanimate Things; such as Flowers, Fruits, Gold, Silver, Stone, Musical Instruments, dead Fish, &c.* and shew which are the best and of most Advantage. These may, in their Turns, in different Manners, serve for Materials for a natural Composition, wherewith to please all Sorts of Men, the Great as well as the Little, the Learned as Ignorant. Wherefore, out of many, we shall fix on the following Objects, as the most beautiful, elegant, and agreeable.

1. *Flowers.*
2. *Fruit.*
3. *Gold, Silver, and other rich Things.*
4. *Musical Instruments.*

These four Sorts, artfully order'd and perform'd, may serve for the Ornament of Halls and Cabinets as well as the best Paintings, provided they have a *proper Light, and hang together*. But we must know, in the first Place, what constitutes a good Still-life-piece, since, tho' it be naturally handled, nothing but a *good Choice* can charm the Senses, and bring Fame to the Master. 'Tis Weakness to think that faded Flowers should please, much less in a Picture: Or who would hang a Piece of ordinary, unripe, or rotten Fruit in his best Room, and among a Cabinet-collection, seeing the Life itself is so disagreeable? Such Rubbish I did formerly admire; but as they only shew the Deformities of Nature, I have no Appetite to view them any more. But, to return to the Subject.

My Opinion is, that the Beauty and Goodness of a Still-life consists only in the most choice Objects: I say, *the most choice*; as, among Flowers, the most rare and beautiful, and the same in Fruits and other Things. These will gain a Master Credit, especially with the Addition of some *particular Significations proper to them*. It is not probable that wealthy People should be delighted with old-fashion'd Plate and Furniture, when they can have every Thing more beautiful and elegant; and as improbable, that judicious Lovers of Musick should be pleased with the modern Lyre, Dulcimer, or Bag-pipe. As for Cabbages, Carrots, and Turnips, as likewise Codfish, Salmon, Herrings, Smelts, and such-like (which are poor and mean Ornaments, and not worthy of any Apartment) he who is pleased with them may seek them in the Markets. I as little approve of Horse-furniture and hunting Equipage; tho' these latter, with wild Boars, Stags, Hares, Pheasants, Partridges, and other Fowls, depending on Princes and Noblemens Fancies, are more tolerable.

Having thus in general touched on Still-life, let the Judicious determine which Sort is best and most advantageous either to the Painter or Purchaser.

As for me, I think Eloquence very charming to the Ear; but *Goodness* alone makes Beauty amiable. What is a fine Flower, Apple, Gold Cup, or well-tun'd Violin, without good Smell, delicate Taste, proper Use, and agreeable Sound? *Goodness*, I

say, ought to be perfectly apparent: The Smell, Taste, Hearing, or Sound cannot be painted; but may be, in some Measure, express by occult Significations, either in Bass-relief by Fables, Hieroglyphicks, or emblematick Figures, or by many other Things, if the Will be not wanting.

As to the Nature and *Property of the Places* for Still-life, they are two-fold, close and open; the one representing it as if *hanging against a Wall* or Wainscot, and the other, as *lying on a Bench or Table, or on the Ground*.

We also suppose, that no Objects used in Still-life ought to be represented *less than the Life*.

'Tis likewise improper, and against the Nature of Still-life, to introduce, in any of the before-mention'd Choices, *colour'd Back-works*, or *Vistos*, either close or open, that is, Landskip, Architecture, or any Kind of living Creatures; which would spoil the very Name of a Still-life: Moreover, it is difficult, if not impossible, for such a Painter to hit every Thing; and granting he can, I yet question, whether he would be pleas'd with the Title of a Still-life Painter. I say then, that the *Depth* of the Picture is only to be represented by an hanging Curtain, or a Bass-relief of Wood or Stone, of such a Colour and Tint, as best suits the general *Decorum*; the one darkish, and the other somewhat lighter. With *Flowers*, a dark-grey Back-ground suits better than a white, yellow, or red one. With *Fruit*, white and grey Marble, but not yellow or red. Yet, as a fine Bass-relief requires more Skill than Flower or Fruit, and such like, you may, instead thereof, introduce a Niche, with a God or Goddess's Bust therein, proper to the Subject, as a *Flora, Pomona, Bacchus, Apollo, Diana*, or others, according to the Intent of your Design, and as you would have it bear either a *particular* or *general Meaning*, which each of those Figures will supply in Abundance. Flowers are various, and, like Fruits, may be divided into three Sorts, to wit, the Spring, Summer and Autumn; and, having different Qualities, are fit for many fine and uncommon Designs, in Conjunction with Bass-reliefs or Busts, as I have said; with this Caution, that *with Flowers* suit *no Fruit*, but Ears of Corn, as being airy and pliable; but among Fruits may be some Flowers, especially such as allude to *Rest* and *Mirth*, as Poppies and Roses. And yet these agree best with Grapes, either in Garlands or Festoons.

Let us now, for Exercise and Improvement in this Point, observe what the Learned say. The *white Lilly* is sacred to *Juno*; *Turnsol* to *Apollo*; the *Rose* to *Venus*; *Diana* and *Somnus* claim the *Poppies*; *Ceres*, the *Corn-Flowers*; *Juno*, the *Pomegranates*; *Bacchus*, the *Fig-tree* and *Vine*; *Ceres*, or, *Isis*, the *Peaches* and *Ears of Corn*; *Venus* and *Apollo*, the *Apples*; *Ops*, or Mother Earth, *every Thing she produces throughout the Year*. Of Instruments, the *Lyre* is dedicated to *Apollo, Mercury*, and the *Muses*; the *Flute*, to *Pan* and *Venus*; the *Trumpet*, to *Mars*, &c.

¹ The followers of *Bamboccio*, a celebrated Painter of mean Subject [Pieter van der Laer].

² *Venus Urania*.

³ The *Three Graces*.

2 Roger de Piles (1635–1709) from *The Principles of Painting*

With the appointment of Jules Hardouin-Mansart as the new protector of the Royal Academy in 1699, Roger de Piles was invited to join the Academy as an *amateur honoraire* and as its chief theoretician. After so many years in opposition, the victory of the principal spokesman of the partisans of colour was now complete. The last decade of his life was spent in producing a summation of his ideas on art, published a year before his death as the *Cours de peinture par principes*. Whereas earlier theorists within the Academy had sought to establish painting's status as a liberal art by stressing its affinity with poetry and by emphasizing its intellectual character, De Piles insists on the difference of painting from the other arts, elaborating its specifically *visual* interest. A successful painting must call to the spectator, obliging the viewer to approach the canvas 'as if he intended to converse with the figures'. This leads him to address problems of perception as well as of cognition: to examine the way in which paintings appeal to the eye as well as to the mind. With his conception of the *tout-ensemble*, or the effect of the 'whole together', he shows that pictorial unity is achieved through the balanced and harmonious relation between the constituent elements of the composition. It is through such effects that painting is able to astonish and delight the viewer, who takes pleasure in the very artifice itself. The *Cours de peinture par principes* was first published in Paris by J. Estienne in 1708. The following excerpts are taken from the anonymous translation by 'a painter', *The Principles of Painting*, London: J. Osborn, 1743, pp. 1–8, 10–12, 59–60, 64–6, 68–70.

Preface, on the Idea of Painting

The prize of a race is not to be won, if we have not the goal in our eye; nor is the perfect knowledge of any art or science to be acquired, without having a *true idea* of it. This idea is our goal or mark, and directs us unerringly to the end of our career; that is, to the possession of the science we desire.

But though there is nothing which does not include in itself and discover its true idea; yet we must not from hence infer, that this idea is so obvious, as not to be mistaken; or that the false idea does not often pass for the true and perfect. There are several ideas of painting, as well as of other arts: The difficulty lies in discovering which of them is the *true one*. For this purpose, it is necessary to observe, that, in painting, there are *two sorts of ideas; a general idea, which is common to all men, and a particular idea, peculiar to painters.*

The surest way to know infallibly the *true idea* of things is, to derive it from the very *basis* of their *essence and definition*; for definition was invented for no other purpose than preventing equivocation and ambiguity in ideas, banishing those that are false, and informing the mind of the true end and principal effects of things. Whence it follows, that the more an *idea* leads us directly and rapidly to the end which its essence points out, the more certain we ought to be, that such an idea is a *true one*.

The essence and definition of painting is, the *imitation of visible objects, by means of form and colours*: Wherefore the more *forcibly and faithfully painting imitates nature*, the more directly and rapidly does it lead us to its *end*; which is, *to deceive the eye*; and the surer proofs does it give us of its *true idea*.

The *general idea* above-mentioned strikes and attracts every one, the ignorant, the lovers of painting, judges, and even painters themselves. A picture, that bears this character, permits no one to pass by it with indifference; but never fails to surprise us, and to detain us for a while to enjoy the pleasure of our surprize. True painting, therefore, is such as not only surprises, but, as it were, calls to us; and has so powerful an effect, that we cannot help coming near it, as if it had something to tell us. And we no sooner approach it, but we are entertained, not only with *fine choice*, with the *novelty* of the things it represents, with the history or fable it puts us in mind of, with ingenious inventions, and with allegories, to give us the pleasure of employing our parts, either in discovering the meaning, or criticising the obscurity of them; but also with that *true and faithful imitation*, which attracted us at first sight, and afterwards lets us into all the particulars of the piece; and *which*, according to *Aristotle*, never fails to divert us, how horrible soever those natural objects may be which it represents.

The other *idea*, which, as we said, is *peculiar to painters*, and to which they ought to be perfectly habituated, concerns, in particular, the *whole theory of painting*; and should be so much at command, that it may seem to cost them no reflection to execute their thoughts: So that after having studied correct design, fine colouring, and all their dependencies, they ought to have those ideas always present and ready, which answer to the several branches of their art.

On the whole, *true painting*, by the force and great truth of its imitation, ought, as I have observed, to *call the spectator*, to surprise him, and oblige him to approach it, as if he intended to converse with the figures: In effect, when the piece bears the character of *truth*, it seems to have drawn us to it, for no other purpose, than to *entertain and instruct* us.

But here we must observe, that the *ideas* of painting in general are as different as the *manners of the several schools*. Not that painters are without those particular ideas, which they ought to possess: But the use they make of them not being at all times just, the *habits* which this use brings upon them, their attachment to *one part* more than another, and the affection they preserve for the *manner* of those masters whom they have imitated, prejudice their choice, and bias them to some favourite branch of the art; though they are under the strictest obligation to make themselves masters of every part of it, in order to contribute to the *general idea* above-mentioned: For most painters are always divided in their inclinations; some following *Raphael*, others *Michael-Angelo*, others the *Caracchis*, and others the scholars of these masters: Some prefer *the whole*; others *the abundance of thoughts*; others the *graces*; others *the expression of the passions of the soul*; and there are some who give themselves wholly up to the *heat* and transport of their genius, tho' but little improved, either by study or reflection.

But what can be done with all these vague and *uncertain ideas*? 'Tis certainly dangerous to reject them; we must therefore resolve to prefer to all other things that *truth*, which we have supposed in the *general idea*: For, to all *painted objects*, the appearance of *truth* is more necessary, than the manner of any master whatever; because truth in painting is the basis of all the parts which heighten the excellence of this art; as the *sciences and virtues* are the foundation of all those accomplishments, which can either exalt or adorn human nature. For which reason we must suppose

truth on the one hand, and virtue and science on the other, to be in perfection, when we talk of those finishings; or accomplishments, of which either painting or human nature is susceptible, and which, without resting upon such a basis, can have no good effect. In short, the spectator is not obliged to seek for *truth* in a painting; but *truth*, by its effect, must *call to the spectator*, and force his attention.

'Tis in vain to adorn a stately palace with the greatest rarities, if we have forgot to make doors to it, or if the entrance be not proportionable to the beauty of the building; so as to raise the passenger's desire to walk in, and gratify his curiosity. All *visible objects* enter the understanding by the faculty of *seeing*, as *musical sounds* do by that of *hearing*. The *eyes* and *ears* are the *doors*, which admit us to judge of *painting* and *musick*: The first care therefore both of the painter and the musician should be, to make these entrances *free* and *agreeable*, by the force of their harmony; the one in his *colouring* conducted by the *claro-obscuro*, and the other in his *accords*. The spectator being thus attracted by the force of the performance, his eye discovers in it those particular beauties which are capable of instructing and pleasing; the curious finds in it what suits his taste; and the painter there observes the different branches of his art, in order to improve himself by what is good, and to reject whatever may be vicious. Every thing in a picture is not equally perfect. Some paintings there are, which, with several faults, when minutely consider'd, do not fail, nevertheless, to catch the eye; because of the artist's excellent management in his *colouring*, and the *claro-obscuro*.

Rembrant, for instance, diverted himself one day with drawing his maid's picture, in order to set it at his window, and deceive passengers: His project succeeded; for the fallacy was not discover'd till some days after. And yet, as we may justly imagine of *Rembrant*, this effect was not owing to the beauty of the design, nor to the nobleness of the expression. When I was in *Holland*, I had the curiosity to see this picture; and, finding it to be well pencil'd, and of great force, I bought it, and it has at this time a considerable place in my cabinet.

Other painters, on the contrary, have shewn in their works a good many perfections in the several parts of the art; yet have not been so happy as *Rembrant*, to gain, at first sight, such favourable regards: I say, not happy; because, if they have sometimes succeeded, 'twas owing to a chance disposition of objects, which, in the places they filled, required an advantageous *claro-obscuro*; a perfection which cannot be denied them, but wherein the skill of the painter had very little share; since, if it had been the effect of science, it would have appeared in all his other productions.

Thus nothing is more common, than to see paintings set off a room, purely by the richness of their borderings, whilst the insipidity and coldness of those paintings is such, that people pass unconcernedly by them, without being attracted by that truth which calls to us. Now, to make this point clearer, I must explain it by the example of some skilful painters, who yet have not been masters enough to strike the eye, at first sight, by a faithful imitation, and a truth which ought to deceive, as even excelling nature itself. The most remarkable example I can quote is *Raphael*, because of his great reputation, and because there was never any painter who possessed so many parts of the art, or possessed them in so high a degree of perfection.

'Tis very certain, by the confession of many, that men of knowledge have often sought for *Raphael's* works in the midst of them; that is, in the halls of the *Vatican*,

where are his best performances; and have asked their guides to shew them the works of *Raphael*, without giving the least indication of being struck with them at the first glance of the eye, as they expected to be, from that painter's reputation. The paintings of *Raphael* did not answer the idea they had conceived of so great a genius, because they measured them by that idea which one ought naturally to have of perfect works. They could not imagine, that the imitation of nature would not, in the works of so wonderful an artist, appear in all its vigour, and all its perfection. This shews, that without the knowledge of the *claro-obscuro*, and of whatever depends on colouring, the other parts of painting lose much of their merit, even when they are in that degree of perfection to which *Raphael* carried them.

* * *

It is certain, that the number of pictures which call the spectator is but few: But that is not the fault of the art; the essential effect of which is to surprise, and deceive the eye: We must only blame the painter's negligence, or rather impute it to his genius, as not being exalted enough, or not sufficiently furnish'd with the principles necessary for compelling, as it were, those who pass by, to stop, and give attention to his pieces.

But further; it argues more genius to make a good use of lights and shades, harmony of colours, and their suitableness to each particular object, than to design a single figure correctly.

Design, which requires much time to learn perfectly, consists of little more than an habit, which is often repeated, of giving measures and outlines; but the *claro-obscuro*, and harmony of colours, is a continual subject of reasoning, which employs the genius in ways that are as different as the compositions themselves. A moderate genius may, through perseverance, attain correct designing; but the *claro-obscuro* requires, besides the rules, such a compass of genius, as may incorporate with, and, as it were, diffuse itself through, all the other parts of painting.

'Tis well known, that the works of *Titian*, and of all the painters of his school, have scarce any other merit than their *claro-obscuro*, and colouring; and yet they bear a great price, are in great repute, and maintain their posts in the cabinets of the curious, as first-rate pictures.

When I speak of design, I must be understood to mean only that material part, which, by just measures, forms all objects in a regular manner; for I am not ignorant, that in design there is a genius capable to season all sorts of forms by the assistance of taste and elegance; yet it is easy to observe, that the effect, which calls to the spectator, arises principally from the colouring of all the parts; by which we are to understand the *claro-obscuro*, and the general harmony of colours, as also such as we call *local*, or colours which faithfully imitate those of any particular object. But all this hinders not the other parts of art from being necessary to help forward the whole work, and from mutually assisting each other; some to form, others to adorn the objects painted, in order to give them a taste and grace that may instruct, respectively, both lovers and painters, and, in a word, may please every one.

Thus, as it is the duty of painting, both to call and please; when it has called the spectator, it must necessarily entertain him with all the various beauties of which it is capable.

* * *

Of Disposition

* * *

In *composition*, the painter ought to contrive, as much as he possibly can, that the spectator may, at first sight, be struck with the character of the subject, or at least may, after some moments of reflection, take the principal scope of it. It will greatly contribute to this end, that he place the hero, and the principal figures, in the most conspicuous places; yet this must be done without affectation, and in such a manner as the subject and probability require; for œconomy, or management, depends upon the nature of the subject, which may be either pathetick or gay, heroick or popular, tender or terrible; in short, the picture must have more or less motion, as its subject is more or less stirring or still. As the subject points out to the artist the proper œconomy in the disposition of objects, so distribution, in its turn, wonderfully contributes to the expression of the subject, gives both force and grace to what is invented, prevents confusion in the figures, and makes every thing in the picture more clear, more apparent, and more capable to produce the effect above-mentioned, *of calling to and detaining the spectator.*

* * *

Of the Whole together.

The last point depending on disposition is, *the whole together*, which is the result of the parts that compose the piece; but the whole, arising from the combination of several objects, must not be like a number made up of several unities, independent and equal among themselves, but like one poetical whole, where the great have need of the lower people, and these have need of the great. All the objects, lines, colours, lights and shades, of a picture, are great or small, strong or weak, only by comparison; but, let their natures, qualities, or conditions, be what they will, they have such a relation to one another in their combination, as no one in particular can supersede; For the effect of the whole consists in a general subordination, where the darks heighten the lights, and the lights set off the darks, and where the merit of each part is founded on a mutual dependence. So that we may define *the whole together* to be, *Such a general subordination of objects one to another, as makes them all concur to constitute but one.*

Now this subordination, by which several objects concur to make but one, is founded on two principles, *viz. The satisfaction of the eye, and the effect of vision.* And this I shall explain.

The eye has this in common with the other organs of sense, that it cares not to be obstructed in its office; and it must be agreed, that a great many people, met in one place, and talking together at the same time, and with the same tone of voice, so as that no one in particular could be distinguished, would give pain to those who heard them: It is just so in a picture, where many objects, painted with equal force, and illuminated by the same light, would divide and perplex the sight, which, being drawn to several parts at once, would be at a loss where to fix; or else, being desirous to take in the whole at one view, must needs do it imperfectly.

Now, to hinder the eye from being dissipated, we must endeavour to fix it agreeably, by a combination of lights and shades, by an union of colours, and by oppositions wide enough to support the groups, and give them repose. But where the picture has several groups, one of them must predominate in force and colour, and besides, detached objects must be so united with their ground, as to make but one mass, that may serve as a repose to the principal objects: The satisfaction of the eye is therefore one of the foundations upon which the unity of objects in painting depends.

The other foundation of this same unity is, the effect of vision, and the manner of its operation. Now the eye is at liberty to see all the objects about it, by fixing successively on each of them; but, when 'tis once fix'd, of all those objects, there is but one which appears in the centre of vision, that can be clearly and distinctly seen; the rest, because seen by oblique rays, become obscure and confused, in proportion as they are out of the direct ray. [...]

It remains that we now speak of a wonderful effect, which the *whole together* produces, and it is that of putting all the objects into harmony. For harmony, wherever it appears, proceeds from arrangement and good order. There is a harmony in moral as well as in natural philosophy; in the conduct of human life, as well as in the proportions of the human body; and, in short, in every thing that consists of parts, which, however different from one another, yet agree to make but one *whole*, more or less general. Now, as this order must be supposed to exist in all parts of painting separately, we must infer, that each part has its particular harmony. But it is not enough, that each part has its particular arrangement and propriety; they must all agree together in the picture, and make but one harmonious whole; in the same manner as it is not enough, in a concert of musick, that each part be heard distinctly, and follow the particular arrangement of its notes; they must all agree together in a harmony which unites them, and which, out of several particular *wholes*, makes but one *whole* that is general. This is what painting does, by the subordination of objects, groups, colours, and lights, in the general, of a picture.

There are in painting several sorts of harmony; the sweet and the temperate, as usually practised by *Correggio*, and *Guido Reni*; and the strong and great, as that of *Giorgione*, *Titian*, and *Caravaggio*. And these may be in different degrees, according to *places*, *times*, *light*, and *the hours of the day*. Great light, in a close place, produces strong shades; the same, in an open country, requires broken colouring, and sweet shadowing. In short, the skilful painter knows what use he ought to make, not only of the seasons of the year, but of the times of the day, and of the accidents that happen, either in the skies, or on the earth, in order to bring all, as we have said, into one harmonious whole.

This is the idea I have conceived of what is called, in painting, *the whole together*: And I have endeavoured to make it understood as a machine, whose wheels give each other mutual assistance, as a body, whose members have a mutual dependence; and, in short, as an harmonious œconomy, which stops and entertains the spectator, and invites him to please himself with contemplating the particular beauties of the picture.

3 Rosalba Carriera (1675–1757) on feminine studies

Rosalba Carriera was born in the parish of San Basilio in Venice, where she is recorded as a pupil of Giuseppe Diamantini (1621–1705). Her first works appear to have been painted snuff-boxes. By the early years of the century, however, she was already producing the pastels and miniature portraits for which she was to become famous across Europe. In 1705 she was admitted to the Accademia di San Luca in Rome, with a miniature as her reception piece. Her first commissions were largely from German princes, but her work found favour in courts throughout Europe. Between April 1720 and March 1721 she visited Paris, meeting several of the leading painters, including Antoine Coypel (see IIA8 and 9) and Antoine Watteau (see IIA12). Her success in Paris was confirmed by her reception into the Académie Royale de Peinture et de Sculpture just four months after her arrival. Her portraits are marked by great delicacy and freshness, and her innovative exploration of the pastel medium had a significant influence on artists such as Maurice de La Tour and Jean-Etienne Liotard (see IVA12). The following fragment was found among the letters and papers pertaining to Carriera contained in the Biblioteca Laurenziana in Florence. These are bound in five volumes and carry the signature Ashburnham, 1781. The editors of her literary remains have given it the descriptive title 'A Proposito degli Studi Femminili'. The addressee of the piece and its date of composition remain unknown. It has been translated for the present volume by Katerina Deligiorgi from *Rosalba Carriera: Lettere, Diari, Frammenti*, ed. Bernardi Sani, Florence: Leo S. Olschki, 1985, vol. 2, pp. 738–9.

Dear Madam, since our recent conversation I have become more aware of how unreasonable it was of you to ask me to tell you something about a subject on which I have a lot to learn from you. The strong judgement, vivid imagination and admirable ease you showed on that occasion are clear evidence of how perfectly you have mastered this topic – and also, I am sure, any other you care to discuss. Anyone who would like to speak or write well on this would need first to be your student. Nonetheless, if only to show you how absolutely I am at your command, I would rather be your echo than stay silent when you ask me to speak and would rather beg forgiveness for my mistakes than fail to comply with your wishes. If you understand that I do not pretend to offer you my thoughts as a gift, but merely to pay the interest on my debt, I know that you will not accuse me if I do not give back what I received from you. Nor can you reproach me with vanity – it is inappropriate, and only another person who is less loved and esteemed by me would be capable of drawing out so much from me. This thought does not leave me in any doubt that you will tolerate my defects and correct the errors with your usual candour, for they are the result of my effort to oblige you, even if doing so will show my weakness. The defence of our sex against the many great minds who have attacked it with such force can indeed appear to be a task that is too difficult for a woman to undertake. I do not say this because I can or must concede that we are by nature less able in such undertakings than men – at least, before I finish I hope to give some plausible reasons for this.

Rather, I say so because men, especially in England, have expropriated us and because there are only a few women who have an educated mind and

knowledge of letters, who are thus sufficiently equipped for such things. For my part, I readily admit that though there are only a few, there may be many more who in their conversation show themselves more able than myself in defending our cause. It saddens me that because they pursue their own affairs or because of other distractions, or out of sheer indulgence, they fail to do public justice to their sex.

Whether because of interest or inclination, men are generally against us and one should not expect a man to show such generosity of spirit as to champion the cause of our sex against the injuries and oppressions they visit on us. The chivalrous times are gone and not even a Don Quixote is left to succour damsels in distress.

It is true that an apology of a similar nature was made three or four years ago by a man. I think though that even if he obliged his Eugenia thereby, the rest of his sex was much less obliged. For as you well know, Madam, he was more concerned to make his satire sharp than his apology powerful. He fared badly and received more blows than he gave, and like a renegade he fought under our own standard only to betray us. But what can you expect from a Ganymede? He is a creature who cannot truly praise the spirit of a woman over that of a man and who compliments us only to show his own good manners and education. He raises a scandal about our entire sex and believes us to be sufficiently strong because in a history of 2,000 years he manages to find a few examples of women distinguished for their intelligence, wisdom and virtue, and many of notorious men. I think that even the fiercest of our opponents would have saved him all this trouble by telling him that in all times we find famous and infamous people of both sexes – or else, we might as well abandon any pretence to modesty or reason.

I don't have any theories, and have no inclination or true desire to start now with the commonplaces of the book of M. N. and I will leave to the pedants and other scholars the study of Antiquity for the purpose of discovering sufficient heroes and heroines to stuff a herring or to fill some miserable proclamation with insistence rather than argument. I will not enter into a dispute about whether men or women are more intelligent or more gifted: what gives men the advantage over us is their education, the freedom to converse, and the variety of their affairs and acquaintances. Whatever the difference in gift and intellect, the greatest disparity is in these latter circumstances. Nor shall I debate whether we are more virtuous. I know that there are many villains and hope that there is also a good number of virtuous people from both sexes. I can only add that whoever of our sex makes a bad choice does so on account of her origin and her upbringing.

The question I am considering at present is whether or not an intelligent gentleman who spends his time in the company of women can be said to waste it.

I put this question in general terms.

4 Mary Chudleigh (1656–1710) ‘To the Reader’ from *Essays upon Several Subjects in Prose and Verse*

The poet and essayist Mary Chudleigh was born in Winslade, Devon. She was strongly influenced by the feminist views of Mary Astell (1666–1731) with whom she maintained a correspondence. Her best-known work is the poem *The Ladies’ Defence* (1701) in which she responded to a sermon by John Sprint advocating the total subordination of women to their husbands. The *Essays upon Several Subjects in Prose and Verse* were published in the last year of her life. They form a miscellany of religious and moral writings on subjects such as Knowledge, Pride, Humility, Death and Fear. Although not directly concerned with the visual arts, her address ‘To the Reader’ casts light upon the very real obstacles which hindered the participation of women in the public culture of the arts. For Chudleigh, the development of an interior intellectual and imaginative life offered a form of compensation for the relative isolation of her existence in the country. She is acutely aware of her exclusion from ‘ingenious Company’ and of the effect this must have on her ability to express her ideas in the appropriate way. Indeed, she addresses her writings only to those of her own sex, declining to pretend that they ‘deserve the Notice of the Men’. The unpaginated address ‘To the Reader’ is taken from *Essays upon Several Subjects in Prose and Verse*, London: R. Bonwick, 1710.

That the Pleasures of the Mind are infinitely preferable to those of Sense, intellectual Delights, the Joys of Thought, and the Complacencies arising from a bright and inlarg’d Understanding, transcendently greater and more satisfactory than those of the Body, than those that owe their Original to the Animal Life, has, through all Ages, been an acknowledg’d Truth, a Truth that comes attended with all the convincing Evidences that can be desired, and will soon be found to be undeniably so by all such as will be at the Pains of making the Experiment.

Such as have been so happy as to have had a Taste of these Delights, a pleasing Relish of these internal Joys, have always been blest with an inward Satisfaction, an unexpressible Felicity; their Minds have been calm, easy, and intrepid, amidst the greatest Storms, the most deafning Hurricanes of Life, never ruffled by Passions, nor disturbed by the most threatenng, the melancholiest Circumstances of Fortune. They have long been the dear, the favourite Companions of my solitary Hours, and while they are mine, I cannot only be contentedly, but even chearfully alone; they fill up all the Spaces, all the Intervals of Time, and make my Days slide joyfully along.

O what Pleasures, what transporting Joys do rational instructive Thoughts afford! What rich Treasures do they yield to the Mind! What unexhausted Stores of Knowledge may be drawn from them! They leave no Vacancies, no room for dull insipid Trifles, debasing Impertinencies, nor any of those troublesome Reflexions which generally proceed from narrow groveling Souls, from Souls that have not learn’d to use their Faculties aright. Though I cannot boast of having mine improv’d, and must with Blushes own my Thoughts are infinitely inferior to multitudes of others; yet, mean as they are, to Me they prove delightful, are always welcome, they present me with new and useful Hints, with something that agreeably, as well as advantageously, entertains my Mind; the Notices they give me, I strive to improve by Writing; that firmly fixes what I know, deeply imprints the Truths I’ve learned.

The following *Essays* were the Products of my Retirement, some of the pleasing Opiates I made use of to lull my Mind to a delightful Rest, the ravishing Amusements of my leisure Hours, of my lonely Moments.

'Tis only to the *Ladies* I presume to present them; I am not so vain as to believe any thing of mine deserves the Notice of the *Men*; but perhaps some of my own Sex may have occasion for such Considerations as these; to them they may prove beneficial; they'll in 'em be perswaded to cultivate their Minds, to brighten and refine their Reason, and to render all their Passions subservient to its Dictates; they'll there be instructed by great Examples, read of several Men, and some Ladies, that have struggled with Pain, Poverty, Infamy, Death, and whatsoever else has been accounted dreadful among the Suffering incident to Humanity, without being overcome, without losing their Resolution, or lessening their Patience; see them cheerful and smiling amidst Misfortunes, submitting themselves with a decent Contentedness, with a becoming Resignation to the All-wise Disposal of their merciful Creator; they will there learn to be easy and Mistresses of themselves, amidst Sickness, the Loss of Friends, Indignities, Calumnies, and all the other Accidents that attend Mortality; will there be told, that the greater the Difficulties are which they encounter, the greater will be the Glory of the Conquest; and that when Death has put an end to their Conflicts, Virtue will remain victorious, and the Rewards of a Future-state abundantly compensate for all the Miseries of this.

I hope they will pardon the Incorrectness of my Stile: The Subjects of which I write are worthy of their Attention; 'tis those I recommend to them: Truth is valuable though she appears in a plain Dress; and I hope they will not slight her because she wants the Ornaments of Language: Politeness is not my Talent; it ought not to be expected from a Person who has liv'd almost wholly to her self, who has but seldom had the Opportunity of conversing with ingenious Company, which I remember Mr. *Dryden*, in the Preface to one of his *Miscellanies*, thinks to be necessary toward the gaining of Fineness of Stile; this being a Qualification I want, it cannot be suppos'd I should understand the Delicacies of Language, the Niceties of good writing; those things I leave to happier, more accurate Pens: My whole Design is to recommend Virtue, to perswade my Sex to improve their Understandings, to prefer Wisdom before Beauty, good Sense before Wealth, and the Sovereignty of their Passions before the Empire of the World: I beg them to do me the Favour to believe one that speaks it from a long Experience, That a greater Delight, a more transporting Satisfaction, results from a pure well-regulated Soul, from a Consciousness of having done Things agreeable to Reason, suitable to the Dignity of ones Nature, than from the highest Gratifications of Sense, the most entertaining Gayeties of an unthinking Life.

5 Antonio Palomino y Velasco (1655–1726) from *The Pictorial Museum and Optical Scale*

Palomino received a humanistic education in his native Cordoba, intended to prepare him for a career in the Church. However, he was encouraged by a friendship with the painter Valdés Leal (1622–90) to change his plans and to study art, which he did first in Cordoba

then, from 1678, in Madrid. Ten years after his arrival, he became an honorary *Pintor del Rey*, a post which was subsequently paid. Palomino produced many altarpieces, as well as major fresco commissions for municipal buildings and a wide range of theatrical decorations for royal entertainments. The encyclopaedic *El museo pictórico y escala óptica* was his major contribution to the theory and history of art. It was published in three volumes in the last decade of his life. The first part, the *Theory of Painting*, appeared in 1715, and ran to over 300 pages. There was then a long gap until 1724, when the second and third volumes were published together in a 500-page book. The second volume, on the *Practice of Painting*, was intended as a companion to the first. Its extensive descriptions of the preparation of canvases and brushes, and of a variety of artistic techniques, are comparable to those of Pacheco and Hidalgo (see IE5 and 9). The third volume was a relatively free-standing history of Spanish art, containing biographies of over 200 painters and sculptors. These proved popular, and were translated into French, German and English during the eighteenth century. The present selections are drawn from the first and second volumes. Extracts from Book II, chapter 1 come first, because there Palomino discusses general questions of the relationship between art and science, and between the liberal and mechanical arts (for a comparable discussion, see IIA10). Pacheco is unusually explicit about the class implications of the liberal/mechanical distinction, stretching back to Antiquity. In common with other Iberian authors of the time, Palomino is eager to enlist the visual arts thus defined in the service of the Christian religion (cf. IA3, IC11, 12). In the extracts from Book I, the *Theory of Painting*, Palomino discusses his version of the 'Parts' of art, which differ from the more usual breakdown into Idea, Design, Colour, Chiaroscuro, Expression, etc. Instead he offers an elaborate exposition of different types of metaphor said to animate the work of art. The extracts have been edited and translated for the present volume by Nicholas Walker from *El Museo Pictórico, y escala óptica*, Madrid: Da Sancha, 1715, vol. 2, pp. 82–3, 86–7; vol. 1, pp. 56–64.

Book II. Chapter I. That Painting must be Esteemed a Liberal Art

§3 Before proceeding to the demonstration of my conclusion, it is imperative first of all to indicate the nature of science and of art, and to define what it is that distinguishes the liberal from the mechanical arts. Science is a habit of understanding acquired by demonstration, whereas Art is a secure and proper approach to the producing of works. Science is therefore essentially concerned with theoretical and contemplative activities, and does not depend on practical or manual operations of any kind. Art does not exclude such speculative activities, hut it essentially involves practical and manual operations wrought upon external and perceptible matter in order to construct a specific product according to appropriate rules and infallible teachings.

The domain of art is divided into the liberal and the mechanical arts. In liberal art, defined in accordance with its intrinsic essence, theoretical and contemplative activities prevail over practical and bodily operations. In mechanical art it is the latter which prevail over the former. Therefore the difference between the two kinds of art is merely that in liberal art there is more contemplation than toil, and in mechanical art there is more toil than contemplation. And to leave no doubt in the matter, we may also be permitted to mention the base art [*la arte sórdida*] which is commonly held to be such a contemptible occupation [*oficio vil*]: this is an art learned without reference to further theoretical activity but one that is executed exclusively through

the repetition of simple material practice and bodily exercise in humble, lowly and rather unworthy operations. It is regarded as contemptible or sordid because it stains, lowers and defiles the excellence of an individual's rank and person, although it is quite fitting for those who don the clothes of labour. Such an occupation, therefore, is not an art in the proper sense but only in the loose and extremely broad sense of the word. There are some who confuse the mechanical with the sordid arts without drawing the distinction that should properly be made here.

There are also other definitions that may be applied to the liberal arts. Although they are, in my own view, rather descriptive than intrinsic, they are worthy of mention because of the weighty authorities who formulated them. The first such definition is that of St Augustine who says: 'Liberal arts are those which are worthy of a Christian and which show us the way to true wisdom.' The second definition is that of Seneca, who says in Letter 88: 'Liberal studies are those which are worthy of being pursued by free men.'

In this connection one should know that the Romans distinguished between the free or free-born and slaves or servants. The latter alone were permitted to exercise the sordid or mechanical arts which were therefore known as servile arts. The noble and so-called liberal arts were reserved for the free or the noble and prohibited to slaves, a distinction of classes which corresponds in Spain to that between noblemen and commoners. [. . .]

§5 . . . If the liberal arts, as St Augustine claims, are those which are 'worthy of a Christian and which show us the way to true wisdom', then I ask: is there then any art that is superior to that of those mute but eloquent lessons with which the early Church was wont to show the faithful the way of truth in the open books of sacred scripture, and the lives and martyrdoms of the saints that were depicted with the silent eloquence of the brush? Is there any art superior to that which has worked such miraculous effects in converting the most hardened souls to the delicious yoke of our religion and to the fear of God? Is there any art superior to that whose sacred shafts penetrate the most powerful of the senses? Such miraculous effects are obtained not only through the reverent depiction of sacred images, but also through the hidden, potent force of art in portraits or purely human and profane images, as it was with the image of the philosopher Polemon according to the reports of the Council of Nicea: the venerable expression of the face served of itself to reprimand a licentious woman led astray by a dishonourable youth, whereby she venerated the merely painted image as if it were a living man – a circumstance much pondered upon and extolled repeatedly by the Holy Fathers of the Council. Is there any art superior to that where the artist, in representing the highest and most profound mysteries of our faith and our salvation, must ineluctably meditate thereby upon the very things he is depicting, thus transforming a pleasurable diversion of the body into the delicious food of the soul? Will not the most indifferent mind begin to soar heavenward when exposed repeatedly to such opportunities for pursuing the path to true wisdom. This is amply proven by the praiseworthy Christian diligence with which so many artists proceed: when they are to represent a sacred subject, and most especially before the depiction of Christ our Lord or His most Holy Mother, they prepare themselves through prayer, mortification, self-castigation and the taking of the sacraments. Since

some of these are yet living, I shall refrain from naming them. Let it be sufficient here to remember the exemplary life and praiseworthy deeds of that venerable gentleman Geronimo Benet, who professed this liberal art and died but lately in Valladolid in the sacred habit of the Society of Jesus. Since painting is an art worthy of a Christian man, and since the definition of St Augustine properly confirms the same, we also affirm, in accordance with that definition, that painting is a liberal art.

* * *

Book I, Chapter VII: On the Integral Composition of a Painting

§I – In accordance with our method of real division, we come now to consider painting in relation to the various parts that make up an integral whole. This is how Seneca, in his philosophy, deemed it proper to proceed, dividing up the mysteries of the entire body of knowledge into its component parts the better to arrive at an understanding of the whole. It is the same with man himself: after considering the latter as a rational animal, determining his metaphysical properties in accordance with generic and specific differences, after considering him as a physical entity, as a substantial unity of matter and form, body and soul (as we did with painting in our previous chapters), the philosophers proceed to consider him in relation to his various component physical parts, like the head, the hands, the feet, and so forth, none of which can properly be understood without reference to all the other parts. Painting, therefore, from this point of view, is composed of, and can be divided into, seven aspects or parts which are: *argument, economy, action, symmetry, perspective, light and grace, and good style* . . .

§II *The Historical Argument* – The first thing, then, *the argument or theme, is the event, happening, story or idea that is to be expressed*. And this in two distinct ways, the first of which depends entirely on the wit [*ingenio*] of the fabricator, and the second of which depends upon the details of the story in question: this latter we shall call the historical argument, the former the metaphoric argument. The historical argument thus comprises everything that possesses the character of a story: *sacred, human or fabulous*. Although fables are not, strictly considered, historical in nature, they are ultimately founded upon historical events, albeit ones that have been confused and obscured by the blind superstitions of the pagan mind . . .

§III The said historical argument divides therefore into the following types: *the rational, the sensitive, the vegetative, the inanimate and the mixed*. (When considered, with all its latitude, in pictorial terms.) The *rational* type concerns the unfolding of action and the human figures involved – Raphael of Urbino, Domenichino, Lanfranco and many other artists have excelled marvellously in this respect. The *sensitive* type involves animals of one or more species, like birds, fish and wild beasts – and here Peter and Martin de Vos and Azneira, all of them pupils of Rubens, have proved outstanding, in the context of hunting scenes, watering places, inns and other such things. The *vegetative* type involves trees, fruits, flowers, in which the Jesuit Artoes, Mario and Ruo Polo have distinguished themselves. The *inanimate* type involves the disposition of various inanimate objects, like buildings, armour and harness, work-

shops, instruments and devices, costumes and garments, other rich accoutrements and similar precious things of greater or lesser value. There have been many celebrated masters in this domain, including our own outstanding Don Antonio Pareda. The *mixed* type involves all or some of the features described above. This is indeed the most pleasing and delightful type by virtue of its variety, and that which most clearly reveals the rich fecundity of the maker's inspiration. It must be said that the very practical approach adopted in Italy favours the collaboration of several hands in a single painting precisely because of the many differences involved in these various types of theme. This approach has not been pursued in Spain, either because the ardent spirit of her artists does not care to share the prize of glory, or because, in a more vulgar sense, an artist can no longer support himself in his work simply by painting flowers or landscape, as some formerly succeeded in doing. From the present point of view, therefore, when we behold a picture, whether it depicts the countryside, flowers, fruit or whatever, we declare it well or poorly composed historically insofar as it properly observes the precepts of history with respect to its overall arrangement, its progressive disposition of volume, and the treatment of light.

§IV *The Metaphoric Argument* – The metaphoric argument is that which reveals the idea [concepto] of the artist through the use of ingenious metaphor. For metaphor is the mother of all intellectual subtlety. It is the most ingenious, versatile, penetrating and wonderful part of our human understanding (according to Count Emanuel Tesauro), a precious treasure trove in which the skilled artist is able to discover a rich and fertile material with which to enrich the mind along the paths of erudition. I shall not expand further upon this matter here, lest I exceed the bounds imposed upon me by the present theme. I shall merely say something concerning the various kinds of metaphorical argument that most frequently present themselves in the art of painting. Of the latter, some of them specifically concern the painter, while others concern humanist scholars. Those that directly concern the painter are five in number: the metaphor is either *natural*, *moral*, *facial*, *instrumental* or *iconological*.

§V *The Natural Metaphor* – The natural metaphor is that which reveals the idea of the painter by means of some natural sign. This is what the ingenious artist Nealces did: after depicting a sea battle between the Persians and the Egyptians, and desiring to indicate that it transpired upon the Nile, whose waters are no different from any other river, he inserted a little donkey drinking at the banks with a crocodile lying in wait for it, such animals being peculiar to that celebrated river. The ingenious Temantes showed similar judgement when he wished to convey the huge dimensions of the giant Polyphemus within the confines of a rather small panel: having depicted the principal figure in foreshortened perspective, he placed some little satyrs of differing sizes alongside the vast bulk of the giant, measuring one toe against the size of four trees: a device enabling us to infer that the monstrous brute himself was forty-nine yards in height. For the foot is a seventh part in proportion to the body, and the big toe a seventh part in proportion to the foot, and multiplying seven with itself we arrive at the aforementioned forty-nine yards. A modern painter has proceeded with similar insight: in depicting the distress of Hagar thirsting in the desert, he has not failed to include the empty water-flask she had taken from the

home of Abraham. And likewise another painter in depicting the mysterious bush before which Moses stood, which burned and yet was not consumed: he showed neither ashes nor smoke, these being the two extremes into which every combustible substance divides. Since smoke and ashes are the natural signs of anything that can be consumed by fire, the very absence of these two extremes, on the other hand, is a natural sign for that which can never be so consumed. And all ideas which are thus expressed through such natural signs belong in this class of natural metaphor.

§VI *The Moral Metaphor* – The moral metaphor, or the metaphor of custom, is *that which reveals the idea of the artist by means of some sign which, through custom or the free interpretation of men, has assumed the right to a certain signification*. This it has accomplished through observing the habits of dress, the rituals and the customs that belong to different individuals, countries and times. And to proceed otherwise were indeed the greatest absurdity: as if one were to paint a Roman senator in a great cloak, or a Greek dressed in a toga, the latter without a beard, and the former with one; or a Visigoth sporting a ruff, and a Spaniard of that period with buttoned hose, and so forth; all of which is contrary to what was practised in former times. [...]

As far as the metaphor of custom is concerned, Centensis, known as Guarcino, furnished an admirable example in depicting the death of Amon at the hands of his brother Absalom, and the terrible violence inflicted upon his sister Tamara. Since this had all transpired at the end of a banquet, a circumstance which the artist wished to indicate, he painted aniseed upon the table, spilt and scattered from the dish in the sudden commotion of the deed. No less accomplished was the moral and ritual precision of another painter who depicted an act committed on a holy day within a temple and took care to reproduce the proper hues of the ceremonial vestments decreed by the Church for just such an occasion. All the arguments which express such things as depend upon the free interpretation, customs and usages of men belong in this class of moral metaphor.

§VII *The Facial Metaphor* – The facial metaphor is *that which reveals, through the expression of the human countenance, the work of those passions which hold concealed sway within individuals*. For the countenance is like the clock-face that indicates all the hidden stirrings that lie within ourselves. It reveals the *sex, the age, the thinking mind and the perturbations of the soul*: the sex because the visage of a man is quite distinct from that of a woman, and the age because the vigour of youth is quite different from the weariness of old age. But these are the simpler things to accomplish, whereas it is the other two which are intimately connected with the most precious and refined accomplishment of painting; as for the mind, we must look to see how far it reveals its workings in the face: the look of the reticent or the bold, the wise or the foolish, the expression of the sensualist, that of the hardy and the industrious, of the feeble and the slothful, and so forth. We must also look to see how the perturbations of the soul inflect the authentic and natural appearance of the face. For the countenance of an angry man is one thing, that of one possessed by lewdness another, and similarly that of one who is dolorous in contrast to one who feels happy, and so forth.

Aristides Thebanus was distinguished for his acuteness in this regard, being the first (according to Pliny) to depict the soul itself, its perturbations and customary expressions, and the Greeks indeed called him *Ethe*. And thus Aristotle also bestowed the title of *Ethics* upon his moral philosophy, since it concerned itself with the customs of men. This too is the reason why properly observed customary behaviour is called *etiquette*. But although the kind of argument under discussion here includes the expression of human custom, it does not for that reason properly belong amongst the former class of argument. For in that case, one merely infers an inner idea from some observance or universally shared custom expressed in external terms, whereas in the present case one deduces some internal and personal form of behaviour from external indications. And this is what it means to paint the expression of the soul, without which indeed the painting would appear lifeless, as if it were sculpture; for in living beings the soul alone reveals itself in such signs and expressions. Thus when we see the latter presented through painting, we are ready to excuse him who takes the image for life itself.

Zeuxis was no less excellent on this score since in his painting of Penelope he is said to have portrayed her accustomed manner of behaviour too. And Polygnotus proceeded in a similar fashion (according to Aristotle) in the images and portraits of men that he produced. Apelles indeed was so precise in his depictions that the astrologers prophesied what would later befall the subjects in question on the basis of their facial expression in the pictures. But it was the ingenious Timantes who excelled in such effects, for much more was gathered from his pictures than he actually painted there; and for all his excellence in the field of art, his intellectual ingenuity was greater still. His heroic brush was responsible for the celebrated picture of the sacrifice of Iphigenia, so often recounted by tongue and pen alike, which brought before our eyes the unhappy maiden stretched out upon the altar as the imminent victim of the wild Goddess of wild beasts [i.e. Artemis], and every detail of the figure depicted with an air of sadness that epitomized the expressive image of grief itself. And needing now to provide an even greater image of grief in the figure of Iphigenia's father, but reluctant to identify the same too explicitly, the artist presented the latter with his face covered, suggesting both the uncanny character of the deed and the sudden dispatch with which it must be performed: the image is thus a most convincing expression of paternal love, either because he could not bear to look upon such a tragic sight directly or in order to wipe away the pitiful tears from his own eyes. The artist thus leaves the precise imagination of the father's countenance to the better exercise of our own discretion, and thereby achieves with the eloquent colours of rhetoric what the mute speech of painting could never accomplish alone.

Nor is the kind of discretion shown here by Timantes without significance for sacred matters. For when the sacred historian of scripture recounts the mournful spectacle of the death of Christ our Lord, and thereby speaks of our Most Holy Mother, he tells us only that she stood close by the cross. For to be a mother and to stand close by the cross is of itself nothing but an expression of grief. Thus the writer did not wish to describe precisely what she suffered, leaving this rather to the thoughts of those who meditate upon the scene and reflect upon the events in question.

§VIII *The Instrumental Metaphor* – The fourth of the said metaphors available to the ingenious painter is the *instrumental metaphor*: namely that through which some instrument or other determines the individual representation of the figure in a painting. This is the case, for example, with the Holy Apostles, other martyred saints, and preachers of one kind or another, where we find a certain attribute, device or instrument associated with the martyrdom in question, or some particular and outstanding feature through which the individual concerned can be recognized: like the keys of St Peter, the sword of St Paul, the crucifix of St Andrew, the wounds of St Francis, and so forth; and it is the same with the gods of the pagans: the thunderbolt of Jupiter, the sickle of Saturn, the lyre of Apollo, the keys of Janus, and so forth, with every other figure possessing some instrument or device peculiar to himself as an individual. The instrument serves as a sign through which we may recognize what is signified, the precise hero who is here represented. There are many illustrious examples of this metaphor to be found amongst the ancients and the moderns since it is the one most commonly employed by practitioners of the painting profession.

§IX *The Iconological Argument* – The fifth and last metaphor of the painter is the iconological, that which represents some abstract or invisible matter by means of the human figure. Thus we have the Virtues, the Vices, the Sciences, the Arts, Day and Night, which serve to represent these things which are not themselves real physical entities as if there were indeed such; for the expression of such things many other metaphors are also employed: like the crane for Vigilance, the ostrich for Gluttony, the sword for Justice, the olive for Mercy. One must not neglect here the apt expression of feelings, the proper representation of colours, and all the other expressive signs for the underlying idea, whether sacred, prophetic or comic, that one wishes to communicate.

Nor was this iconological argument unknown to the ancients, for the great Apelles employed it when he essayed to show how Alexander not only conquered Persia by war, but also conquered that selfsame war by peace. He depicted the fury of war in the form of a raging and wrathful youth, his eyes darting fire, his mouth foaming and bloody, his body covered in wounds and bound with fetters; now disarmed, his hands tied behind his back, the youth is chained to the triumphal chariot of Alexander. It was from this original image that Virgil, replacing the head of Alexander with that of Augustus, drew his picture of the fury of war chained in the Temple of Janus:

Furor impius intus.
Saeva sedens super arma, et centum vintus aënis;
Post tergum nodis, fremet horridus ore cruento.

[‘Within, impious Rage, sitting on savage arms, his hands fast behind with a hundred brazen knots, shall roar in the ghastliness of blood-stained lips.’]

... And when Apelles desired to expose the utterly inconstant nature of the Athenians, moved as they were by the most contrary of sentiments, he painted a kind of demon both wild and tranquil, constant and vacillating, bold and timid, warlike and pacific in what was surely a most ingenious painting! Pliny fails to tell us, however,

precisely how the picture was formed and fashioned, although Manuel Tesauro says with his accustomed boldness: I imagine that it was a demon with two heads, one that of a man, the other that of a wild beast, and two legs, one like a column, the other like a serpent, habited partly in lion skin and partly in a lamb's pelt, brandishing a sword in one hand and an olive-branch in the other; and who could put their faith in such a monster (he says) whose virtues are so closely entwined with its vices, who though it does not lack for pity, can never pluck the vileness from its breast? All of the ancient and modern artists recounted in the previous chapter have embellished their heroic frescoes with this kind of argument.

§X *The Emblem* – The various kinds of metaphorical argument that offer themselves to painting and strictly belong to the domain of the humanists are the following: *the emblem, the hieroglyph, and the imprint*. If the painter were himself a humanist, he would presumably never need to seek assistance from other wise and learned men. *The emblem, then, is a metaphor signifying some moral matter by means of iconological, ideal or fantastical figures, or of some other learned and ingenious representation like a motto, or a precise, penetrating and ingenious poem*. This kind of erudite allusion is much favoured in the apartments of Lords and Princes for the decoration of vaults, domes and friezes, and can be left, subject to the wishes of the institution commissioning the work, to the discretion of the artist.

§XI *The Hieroglyph* – The hieroglyph is *a metaphor that encompasses some doctrinal idea by means of a symbol, or a device without reference to a human figure, with a Latin motto from a classical author, or some poetic verse in the vernacular*. Such things are much used on occasion of the funeral ceremonies of heroes or mighty warriors, the coronations of Princes, for the official entrance of the Queen or other high officials. And similarly on occasion of the solemn feasts of the holy saints and the Immaculate Conception, of the canonization of saints and other such festivals, where the various figures and symbols of sacred Scripture, along with other theological, arcane and mystical conceits, are all put to use.

§XII *The Imprint* – The imprint is *a metaphor signifying a particular and heroic concept by means of a strange figure or attribute, enhanced by some clever motto, riddle or specimen of classical poetry*. These things are much used with shields, crests, insignia, armour and standards where the significance is not immediately obvious. The concept in question is intended precisely to be something concealed and enigmatic, presented without reference to the human figure. In fact it is the first of these three respective approaches, the emblem, that allows the greatest latitude with regard to the theme, figure or inscription, to the universality of reference, the free choice of images, and the decoration with an appropriate epigram. The hieroglyph, on the other hand, is much more limited in scope since its reference is not so general in character and it makes do without the addition of human figures or Latin verse. But the imprint is even more limited than this since the most important thing about a motto is the proper application of its ambiguous, enigmatic and hidden sense rather than its original inventiveness. The concept here signifies what it extols and extols what it signifies. . . .

This kind of pictorial argument is reserved for elevated minds. And for this reason the ancients were wont to set the image of the sphinx, enigmatic in its form and significance alike, upon the portals of their temples. Plutarch interpreted this as a demonstration that divine wisdom reveals itself to the wise through symbols and hidden signs. This species of language is therefore not vouchsafed to the ignorant who, even if guided by the light, are ever wont to tarry in their darkness. As the great tragedian Sophocles has uttered in his wisdom:

Mysteria numen tecta sapientis docet Fatuus Magister prorsus est inutilis.

[‘Secrets taught to the wise are absolutely useless to fools.’]

And as Our Lord said unto the disciples: You are sharers in the knowledge of the mysteries of the Kingdom of God; and parables must suffice for the others who seeing fail to see, and hearing fail to hear.

One must properly understand the full significance that attaches to this single metaphorical task of the painting art where no demonstration of true learning is excessive. For it encompasses the whole field of history, sacred and profane, and a great part of natural philosophy, as well as holy theology and the mysteries of the faith and of the sacraments, which themselves find daily expression in elaborate symbols and sacred metaphors. It also encompasses rhetoric in the expression of the effects, physiognomy in the various manifestations of face and mind, ethnological considerations in the representation of customs and practices, questions of character in the appropriate depiction of states of mind, poetry in the fashioning of its conceits and symbolic subtleties, mythology in recounting the fables and gods of the pagans, and finally the realm of law and right in respect of divine and human matters, ensuring to each the right that belongs to him according to his particular sphere. It would appear that no one capacity of human life is properly sufficient for such a universal task of understanding! Yet it behoves us to observe that painting, amongst all these arts and sciences, and those that shall concern us later, is fabricated as it were from all without assuming the specific task of any. The painter, therefore, without having to learn them, may never remain entirely ignorant of the latter. So that whatever the subject he may have to depict, he will know where to discover it – for the proper prosecution of which some counsel will be provided in the proper place.

6 Jonathan Richardson (1665–1745) from *Essay on the Theory of Painting*

Richardson was a prominent painter and collector of art as well as a writer, though it was as a writer that he made his greatest mark. Nonetheless he had a successful career as a society portraitist, and was arguably the leading London portrait painter in the 1720s and 1730s. It was enough to make him wealthy, and to fund a collection of drawings which included examples by Raphael, Michelangelo, Rubens, Van Dyck and Rembrandt. But it was as a writer that Richardson made a lasting impression. He is conventionally regarded as the first English author to have composed an original and comprehensive work on the

theory of art. Joshua Reynolds acknowledged his writings as the formative influence on his career, and indeed Reynolds' own *Discourses* (IVA7) can be viewed as the culmination of a tradition inaugurated by Richardson. His work was admired by figures as different as William Hogarth and Samuel Johnson. Richardson's *Essay on the Theory of Painting* first appeared in 1715. A second edition appeared in 1725, with a new chapter on the Sublime, and a three-volume French translation of this and other writings appeared in 1728. The bulk of Richardson's first book consists of an exploration of the 'Parts' of art (cf. IA1, IB6, IB8, IC4), now expanded to seven. These are, in the order in which Richardson treats of them: Invention; Expression; Composition; Drawing; Colouring; Handling; and Grace and Greatness. By this last, Richardson alludes to something of the *je ne sais quoi* (see *ID passim* and IIB10), as well as initiating discussion of the Sublime – which was to become a staple of later eighteenth-century aesthetic debate (see his own discussion in IIB9 and Edmund Burke in IIIB6). The selections here are all taken from the long general introduction to the *Essay on the Theory of Painting*, in which Richardson establishes the elevated status of his subject. There is no longer the slightest hint of defensiveness about this claim. Richardson begins by discussing painting as a source of pleasure before going on to claim for it a higher status as a stimulus to the mind. For him the artist, whether a history painter or a portraitist, is a learned figure, versed in a variety of intellectual disciplines as well as possessing psychological insight into the human character. For Richardson, and for those who came after him, painting has nothing left to prove: it is, in effect, *the primus inter pares* of the liberal arts. The extracts are taken from the second edition, London: 'A. C.', 1725, pp. 1–8, 12–13, 17–28, 33.

Because Pictures are universally Delightful, and accordingly made one part of our Ornamental Furniture, many, I believe, consider the Art of Painting but as a pleasing Superfluity; at best, that it holds but a low Rank with respect to its Usefulness to Mankind.

If there were in reality no more in it than an Innocent Amusement; if it were only one of those Sweets that the Divine Providence has bestow'd on us, to render the Good of our present Being superior to the Evil of it, it ought to be consider'd as a Bounty from Heaven, and to hold a Place in our Esteem accordingly. Pleasure, however it be depreciated, is what we all eagerly and incessantly pursue; and when Innocent, and consequently a Divine Benefaction, 'tis to be consider'd in That View, and as an Ingredient in Humane Life, which the Supreme Wisdom has judg'd necessary.

Painting is that Pleasant, Innocent Amusement. But 'tis More; 'tis of great use, as being one of the means whereby we convey our Ideas to each other, and which in some respects has the Advantage of all the rest. And thus it must be rank'd with These, and accordingly esteem'd not only as an Enjoyment, but as another Language, which completes the whole Art of communicating our Thoughts; one of those particulars which raises the Dignity of Human Nature so much above the Brutes; and which is the more considerable, as being a Gift bestowed but upon a Few even of our own Species.

Words paint to the Imagination, but every Man forms the thing to himself in his Own way: Language is very Imperfect: There are innumerable Colours, and Figures for which we have no name, and an infinity of other Ideas which have no certain Words universally agreed upon as denoting them; whereas the Painter can convey his

Ideas of these Things Clearly, and without Ambiguity; and what he says every one understands in the Sense he intends it.

And this is a Language that is Universal; Men of all Nations hear the Poet, Moralist, Historian, Divine, or whatever other Character the Painter assumes, speaking to them in their own Mother Tongue.

Painting has another Advantage over Words, and that is, it Pours Ideas into our Minds, Words only Drop 'em. The whole Scene opens at one View, whereas the other way lifts up the Curtain by little, and little: We see (for Example) the fine Prospect at Constantinople, an Eruption of Mount Ætna, the Death of Socrates, the Battel of Blenheim, the Person of King Charles the First, &c. in an instant.

The Theatre gives us Representations of Things different from both these, and a kind of Composition of both: There we see a sort of moving, speaking Pictures, but these are Transient; whereas Painting remains, and is always at hand. And what is more considerable, the Stage never represents things Truly, especially if the Scene be Remote, and the Story Ancient. A Man that is acquainted with the Habits, and Customs of Antiquity, comes to revive or improve his Ideas relating to the Misfortune of Œdipus, or the Death of Julius Cæsar, and finds a sort of Fantastical Creatures, the like of which he never met with in any Statue, Bas-Relief, or Medal; his just Notions of these Things are all contradicted and disturb'd. But Painting shews us these brave People as they were in their own genuine Greatness, and noble Simplicity.

The Pleasure that Painting, as a Dumb Art, gives us, is like what we have from Musick; its beautiful Forms, Colours and Harmony, are to the Eye what Sounds, and the Harmony of that kind are to the Ear; and in both we are delighted in observing the Skill of the Artist in proportion to It, and our own Judgment to discover it. 'Tis this Beauty and Harmony which gives us so much Pleasure at the Sight of Natural Pictures, a Prospect, a fine Sky, a Garden, &c. and the Copies of these, which renew the Ideas of 'em, are consequently Pleasant: Thus we see Spring, Summer and Autumn, in the depth of Winter; and Frost and Snow, if we please, when the Dog-Star rages. By the help of this Art we have the Pleasure of seeing a vast Variety of Things and Actions, of travelling by Land or Water, of knowing the Humours of Low Life without mixing with it, of viewing Tempests, Battels, Inundations; and, in short, of all Real or Imagin'd Appearances in Heaven, Earth, or Hell; and this as we sit at our Ease, and cast our Eye round a Room: We may ramble with Delight from one Idea to another, or fix upon Any as we please. Nor do we barely see this Variety of Natural Objects, but in Good Pictures we always see Nature Improv'd, or at least the best Choice of it. We thus have nobler and finer Ideas of Men, Animals, Landscapes, &c. than we should perhaps have ever had; We see particular Accidents, and Beauties which are rarely, or never seen by us; And all this is no inconsiderable Addition to the Pleasure. [...]

But when we come to consider this Art as it informs the Mind, its Merit is rais'd; it still gives Pleasure, but 'tis not Merely such; The Painter Now is not only what a wise Orator who is a beautiful Person, and has a graceful Action is to a deaf Man, but what such a one is to an understanding Audience.

And thus Painting not only shews us how Things Appear, but tells us what they Are; We are inform'd of Countries, Habits, Manners, Arms, Buildings Civil, and

Military, Animals, Plants, Minerals; and in fine, of all kinds of Bodies whatsoever. [...]

And if my Ideas are raised, the Sentiments excited in my Mind will be proportionably improved. So that supposing two Men perfectly Equal in all other respects, only one is conversant with the Works of the best Masters (well chosen as to their Subjects) and the other not; the former shall necessarily gain the Ascendant, and have nobler Ideas, more Love to his Country, more moral Virtue, more Faith, more Piety and Devotion than the other; he shall be a more Ingenious, and a Better Man. [...]

But (by the way) 'tis not every Picture-Maker that ought to be called a Painter, as every Rhymer, or Grubstreet Tale Writer is not a Poet, or Historian: A Painter ought to be a Title of Dignity, and understood to imply a Person endued with such Excellencies of Mind, and Body, as have ever been the Foundations of Honour amongst Men.

He that Paints a History well, must be able to Write it; he must be thoroughly inform'd of all things relating to it, and conceive it clearly, and nobly in his Mind, or he can never express it upon the Canvas: He must have a solid Judgment, with a lively Imagination, and know what Figures, and what Incidents ought to be brought in, and what every one should Say, and Think. A Painter therefore of this Class must possess all the good Qualities requisite to an Historian; unless it be Language (which however seldom fails of being Beautiful, when the thing is clearly, and well conceiv'd). But this is not sufficient to him, he must moreover know the Forms of the Arms, the Habits, Customs, Buildings, &c. of the Age, and Countrey, in which the thing was transacted, more exactly than the other needs to know 'em. And as his Business is not to write the History of a few Years, or of One Age, or Countrey, but of All Ages, and All Nations, as occasion offers, he must have a proportionable Fund of Ancient, and Modern Learning of all kinds.

As to Paint a History, a Man ought to have the main Qualities of a good Historian, and something more; he must yet go higher, and have the Talents requisite to a good Poet; the Rules for the Conduct of a Picture being much the same with those to be observed in writing a Poem; and Painting, as well as Poetry, requiring an Elevation of Genius beyond what pure Historical Narration does; the Painter must imagine his Figures to Think, Speak, and Act, as a Poet should do in a Tragedy, or Epick Poem; especially if his Subject be a Fable, or an Allegory. If a Poet has moreover the Care of the Diction, and Versification, the Painter has a Task perhaps at least Equivalent to That, after he has well conceived the thing (over and above what is merely Mechanical, and other particulars, which shall be spoken to presently) and that is the Knowledge of the Nature, and Effects of Colours, Lights, Shadows, Reflections, &c. And as his Business is not to compose *One Iliad*, or *One Æneid* only, but perhaps Many, he must be furnish'd with a Vast Stock of Poetical, as well as Historical Learning.

Besides all this, 'tis absolutely necessary to a History-Painter that he understands Anatomy, Osteology, Geometry, Perspective, Architecture, and many other Sciences which the Historian, or Poet, has little occasion to know.

He must moreover not only See, but thoroughly Study the Works of the most excellent Masters in Painting, and Sculpture, Ancient, and Modern. [...]

To be a good Face-Painter, a degree of the Historical, and Poetical Genius is requisite, and a great Measure of the other Talents, and Advantages which a good History-Painter must possess: Nay some of them, particularly Colouring, he ought to have in greater Perfection than is absolutely necessary for a History-Painter. [...]

A Portrait-Painter must understand Mankind, and enter into their Characters, and express their Minds as well as their Faces: And as his Business is chiefly with People of Condition, he must Think as a Gentleman, and a Man of Sense, or 'twill be impossible to give Such their True, and Proper Resemblances.

But if a Painter of this kind is not oblig'd to take in such a compass of Knowledge as he that paints History, and that the Latter upon Some accounts is the nobler Employment, upon Others the Preference is due to Face-Painting; and the peculiar Difficulties such a one has to encounter will perhaps balance what he is excused from. He is chiefly concerned with the Noblest, and most Beautiful part of Humane Nature, the Face; and is obliged to the utmost Exactness. A History-Painter has vast Liberties; if he is to give Life, and Greatness, and Grace to his Figures, and the Airs of his Heads, he may chuse what Faces, and Figures he pleases; but the Other must give all that (in some degree at least) to Subjects where 'tis not always to be found, and must Find, or Make Variety in much narrower Bounds than the History-Painter has to Range in. [...]

A Painter must not only be a Poet, an Historian, a Mathematician, &c. he must be a Mechanick, his Hand, and Eye, must be as Expert as his Head is Clear, and Lively, and well stored with Science: He must not only write a History, a Poem, a Description, but in a fine Character; his Brain, his Eye, his Hand, must be busied at the same time. He must not only have a nice Judgment to distinguish betwixt things nearly Resembling one another, but not the same, (which he must have in common with those of the noblest Professions;) but he must moreover have the same Delicacy in his Eyes to judge of the Tincts of Colours which are of infinite Variety; and to distinguish whether a Line be streight, or curv'd a little; whether This is exactly parallel to That, or oblique, and in what degree; how This curv'd Line differs from That, if it differs at all, of which he must also judge; whether what he has drawn is of the same Magnitude with what he pretends to imitate, and the like; and must have a Hand exact enough to form these in his Work, answerable to the Ideas he has taken of them.

An Author must Think, but 'tis no matter how he Writes, he has no Care about that, 'tis sufficient if what he writes be Legible: A curious Mechanick's Hand must be exquisite, but his Thoughts are commonly pretty much at liberty, but a Painter is engaged in Both respects. When the Matter is well Thought and Digested in the Mind, (a Work common to Painters and Writers) the Former has still behind a vastly greater Task than the other, and which to perform Well, would alone be a sufficient recommendation to any Man who should employ a whole Life in attaining it.

And here I must take leave to endeavour to do Justice to my Profession as a Liberal Art.

'Twas never thought unworthy of a Gentleman to be Master of the Theory of Painting. On the contrary, if such a one has but a superficial Skill that way, he values himself upon it, and is the more esteem'd by others, as one who has attain'd an Excellency of Mind beyond those that are Ignorant in that particular. 'Tis strange if the same Gentleman should forfeit his Character, and commence Mechanick, if he

added a Bodily Excellence, and was capable of Making, as well as of Judging, of a Picture. How comes it to pass, that one that Thinks as well as any Man, but has moreover a curious Hand, should therefore be esteem'd to be in a Class of Men at all inferior? An Animal that has Use of Hands, and Speech, and Reason, is the Definition of a Man: The Painter has a Language in common with the rest of his Species, and one superadded peculiar to himself, and exercises his Hands, and Rational Faculties to the utmost Stretch of Humane Nature; certainly he is not less Honourable for excelling in All the Qualities of a Man as distinguish'd from a Brute. Those Employments are Servile, and Mechanical, in which Bodily Strength, or Ability, is Only, or Chiefly required, and that because in such cases the Man approaches more to the Brute, or has fewer of those Qualities that exalt Mankind above other Animals; but this Consideration turns to the Painter's Advantage: Here is indeed a sort of Labour, but what is purely Humane, and for the Conduct of which the greatest Force of Mind is necessary. [...]

To conclude: To be an Accomplish'd Painter, a Man must possess more than One Liberal Art, which puts him upon the Level with those that do so, and makes him Superior to those that possess but One in an Equal Degree: He must be also a Curious Artificer, whereby he becomes Superior to one who equally possesses the other Talents, but wants That. A Rafaëlle therefore is not only Equal, but Superior to a Virgil, or a Livy, a Thucydides, or a Homer.

7 Jonathan Richardson (1665–1745) from *The Science of a Connoisseur*

Richardson's second publication took up where his first one left off. The *Essay on the Theory of Painting* (IIA6) had established the status of painting as a liberal art, and analysed it part by part. Now it was time to look at what people did with art, what it was for, how it could benefit the lives of those who devoted attention to it. Richardson published *Two Discourses* in one binding in 1719. The first was an *Essay on the Whole Art of Criticism as it Relates to Painting*. The second, a *Discourse on... the Science of a Connoisseur*, sought to redress the comparative neglect of the arts in England, which in Richardson's time was not yet the Great Power of the later eighteenth century, though the English ruling bloc was gaining in confidence. Raising the level of culture, not only of the 'Gentleman', but also of the 'Common People', was beginning to be seen partly as a desirable end in itself, but also as conducive to an increase in the mercantile and economic capacity of the nation. Indeed, Richardson's remarks about the future prospects of an English school of painting seem to have been inspirational for the young Joshua Reynolds. As such, they may be seen to stand in the prehistory of the Royal Academy itself, the institution par excellence of the arts in England until well into the nineteenth century, if not later. Our extracts are taken from *A Discourse on the Dignity, Certainty, Pleasure and Advantage of the Science of a Connoisseur*, London: W. Churchill, 1719, pp. 3–5, 6–9, 10, 12–13, 41–52.

'Tis remarkable that in a Countrey as Ours, Rich, and abounding with Gentlemen of a Just, and Delicate Taste, in Musick, Poetry, and all kinds of Literature; Such fine Writers! Such Solid Reasoners! Such Able Statesmen! Gallant Soldiers! Excellent

Divines, Lawyers, Physicians, Mathematicians, and Mechanicks! and yet so few! so very few Lovers, and *Connoisseurs* in Painting!

In Most of these particulars there is no Nation under Heaven which we do not excel; In Some of the Principal most of them are Barbarous compar'd with us; Since the Best times of the ancient Greeks and Romans when this Art was in its greatest Esteem, and Perfection, such a National Magnanimity as seems to be the Characteristic of our Nation has been lost in the World; And yet the Love, and Knowledge of Painting, and what has Relation to it bears no proportion to what is to be found not only in Italy, where they are all Lovers, and Almost all *Connoisseurs*, but in France, Holland, and Flanders.

Every Event in the Natural, and Moral World has its Causes, which are caus'd by other Causes, and so on up to the first Cause, the Immutable, and Unerring Will, without which not so Inconsiderable an Accident (as it will be call'd) as the falling of a Sparrow, or the change of the Colour of a Single Hair can happen [. . .] That so Few here in England have consider'd that to be a Good *Connoisseur* is fit to be part of the Education of a Gentleman, That there are so Few Lovers of Painting; not merely for Furniture, or for Ostentation, or as it Represents their Friends, or Themselves; but as it is an Art capable of Entertaining, and Adorning their Minds As much as, nay perhaps More than Any other whatsoever; This Event also has its Causes, To remove which, and consequently their Effects, and to procure the contrary Good is what I am about to Endeavour, and hope in some measure to Accomplish.

Nor is this a Trivial Undertaking; I have already been giving the Principles of it, and Here I recommend a NEW SCIENCE to the World, Or one at least little known, or consider'd as such: So New, or so little Known that 'tis yet without a Name; it may have one in time, till then I must be excus'd when I call it, as I do, *The Science of a Connoisseur* for want of a Better way of expressing my self: I open to Gentlemen a New Scene of Pleasure, a New Innocent Amusement; and an Accomplishment which they have yet scarce heard of, but no less worthy of their Attention than most of those they have been accustomed to acquire. I offer to my Countrey a Scheme by which its Reputation, Riches, Virtue, and Power may be increased. [. . .]

My present business then in short is to endeavour to persuade our Nobility, and Gentry to become Lovers of Painting, and *Connoisseurs*; Which I crave leave to do (with all Humility) by shewing the Dignity, Certainty, Pleasure, and Advantages of that Science.

One of the principal Causes of the General neglect of the Science I am treating of I take to be, that very few Gentlemen have a Just Idea of Painting; 'Tis commonly taken to be an Art whereby Nature is to be represented; a fine piece of Workmanship, and Difficult to be perform'd, but produces only pleasant Ornaments, mere Superfluities.

This being all they expect from it no wonder they look no farther; and not having apply'd themselves to things of this nature, overlook Beauties which they do not hope to find [. . .]

Painting is indeed a Difficult Art, productive of Curious pieces of Workmanship, and greatly Ornamental; and its Business is to represent Nature. Thus far the Common Idea is just; Only that 'tis More Difficult, More Curious, and More Beautifull than is Commonly Imagin'd. [. . .]

The Great, and Chief Ends of Painting are to Raise, and Improve Nature; and to Communicate Ideas; not only Those which we may receive Otherwise, but Such as without this Art could not possibly be Communicated; whereby Mankind is advanced higher in the Rational State, and made Better; and that in a Way, Easy, Expeditious, and Delightful.

The business of Painting is not only to represent Nature, but to make the Best Choice of it; Nay to Raise, and Improve it from what is Commonly, or even Rarely Seen, to what never Was, or Will be in Fact, tho' we may easily conceive it Might be.

* * *

The Dignity of the Science I am recommending will farther appear if it be consider'd, that if Gentlemen were Lovers of Painting, and Connoisseurs, it would be of great Advantage to the Publick, in

1. The Reformation of our Manners.
2. The Improvement of our People.
3. The Increase of our Wealth, and with all these of our Honour, and Power.

[1.] Anatomists tell us there are several Parts in the Bodies of Animals that serve to several Purposes, Any of which would justify the Wisdom, and Goodness of Providence in the making of them; but that they are Equally Useful, and Necessary to All, and serve the End of Each as effectually as if they were apply'd to One only: This is also true of Painting; It serves for Ornament, and Use; It Pleases our Eyes, and moreover Informs our Understandings, Excites our Passions, and Instructs us how to Manage them.

Things Ornamental, and things Useful are commonly distinguish'd, but the Truth is Ornaments are also of Use, the Distinction lies only in the Ends to which they are subservient. The wise Creator in the Great Fabrick of the World has abundantly provided for These, as well as for Those that are called the Necessaries of Life: Let us imagine our Selves always inhabiting between Bare Walls, wearing nothing but only to cover our Bodies, and protect them from the Inclemencies of the Weather, no Distinction of Quality, or Office, Seeing nothing to Delight, but merely what serves for the Maintenance of our Being; how Savage, and Uncomfortable must This be! Ornaments raise, and exhilarate our Spirits, and help to excite more Useful Sentiments than is commonly imagin'd; And if Any have this Effect, Pictures (consider'd only as Such) will, as being one of the Principal of This kind.

But Pictures are not merely Ornamental, they are also Instructive; and Thus our Houses are not only unlike the Caves of Wild Beasts, or the Hutts of Savages, but distinguish'd from those of Mahometans, which are Adorn'd indeed, but with what affords no Instruction to the Mind: Our Walls like the Trees of Dodona's Grove speak to us, and teach us History, Morality, Divinity; excite in us Joy, Love, Pity, Devotion, &c. If Pictures have not this good Effect, 'tis our Own Fault in not Chusing well, or not applying our Selves to make a Right Use of them. But I have spoken of This sufficiently already, and will only take leave to add Here, That if not only our Houses, but our Churches were Adorn'd with proper Histories, or Allegories well Painted, the People being now so well Instructed as to be out of Danger of Superstitious Abuses, their Minds would be more Sensibly affected than

they can possibly be without This Efficacious means of Improvement, and Edification. . . .

If Gentlemen were Lovers of Painting, and Connoisseurs, this would help to Reform Them, as their Example, and Influence would have the like Effect upon the Common People. All Animated Beings naturally covet Pleasure, and eagerly pursue it as their Chiefest Good; the great Affair is to chuse those that are Worthy of Rational Beings, Such as are not only Innocent, but Noble, and Excellent: Men of Easy, and Plentiful Fortunes have commonly a great part of their time at their Own Disposal, and the want of knowing how to pass those Hours away in Virtuous Amusements contributes perhaps as much to the Mischievous Effects of Vice, as Covetousness, Pride, Lust, Love of Wine, or any other Passion whatsoever. If Gentlemen therefore found Pleasure in Pictures, Drawings, Prints, Statues, Intaglias, and the like Curious Works of Art; in discovering their Beauties, and Defects; in making proper Observations thereupon; and in all the other parts of the business of a Connoisseur, how many Hours of Leisure would Here be profitably employ'd, instead of what is Criminal, Scandalous, and Mischievous! [. . .]

2. Our Common People have been exceedingly Improv'd within an Age, or two, by being Taught to Read, and Write; they have also made great Advances in Mechanicks, and in several Other Arts, and Sciences; And our Gentry, and Clergy are more Learned, and better Reasoners than in times past; a farther Improvement might yet be made, and particularly in the Arts of Design, if as Children are taught Other things they, together with These learnt to Draw; they would not only be qualify'd to become better Painters, Carvers, Gravers, and to attain the like Arts immediately, and evidently depending on Design, but they would thus become better Mechanicks of all kinds.

And if to learn to Draw, and to understand Pictures, and Drawings were made a part of the Education of a Gentleman, as Their Example would Excite the Others to do the like, it cannot be deny'd but that This would be a farther Improvement even of This part of our People: The whole Nation would by This means be removed some Degrees higher into the Rational State, and make a more considerable Figure amongst the Polite Nations of the World.

3. If Gentlemen were Lovers of Painting, and Connoisseurs, many Summs of Money which are now lavish'd away, and consum'd in Luxury would be laid up in Pictures, Drawings, and Antiques, which would be, not as Plate, or Jewels, but an Improving Estate; Since as Time, and Accidents must continually waste, and diminish the Number of these Curiosities, and no New Supply (Equal in Goodness to those we have) is to be hop'd for, as the appearances of things at present are, the Value of such as are preserv'd with Care must necessarily encrease more and more: Especially if there is a greater Demand for them, as there Certainly will be if the Taste of Gentlemen takes This Turn: Nay 'tis not Improbable that Money laid out This way, with Judgment, and Prudence, (and if Gentlemen are good Connoisseurs they will not be impos'd upon as they too often are) may turn to Better Account than almost in Any other.

We know the Advantages *Italy* receives from her Possession of so many fine Pictures, Statues, and other curious Works of Art: If our Country becomes famous in That way, as her Riches will enable her to be if our Nobility, and Gentry are

Lovers and Connoisseurs, and the Sooner if an Expedient be found (as it may Easily be) to Facilitate their Importation, We shall share with Italy in the Profits arising from the Concourse of Foreigners for the Pleasure, and Improvement that is to be had from the Seeing, and Considering such Rarities.

If our People were Improved in the Arts of Designing, not only our Paintings, Carvings, and Prints, but the Works of all our other Artificers would also be proportionably Improved, and consequently coveted by Other Nations, and their Price advanced, which therefore would be no small Improvement of our Trade, and with that of our Wealth.

I have observ'd heretofore, that there is no Artist whatsoever, that produces a piece of work of a value so vastly above that of the Materials of Natures furnishing as the Painter does; nor consequently that can Enrich a Countrey in any Degree like Him: Now if Painting were only consider'd as upon the Level with Other Manufactures, the Employment of More Hands, and the Work being Better done would certainly tend to the Increase of our Wealth; but This Consideration over and above adds a great Weight to the Argument in favour of the Art as Instrumental to This End.

Instead of Importing vast Quantities of Pictures, and the like Curiosities for Ordinary Use, we might fetch from Abroad only the Best, and supply other Nations with Better than Now we commonly take off their Hands: For as much a Superfluity as these things are thought to be, they are such as no Body will be without, not the meanest Cottager in the Kingdom, that is not in the extremest Poverty, but he will have something of Picture in his Sight. The same is the Custom in Other Nations, in Some to a Greater, in Others to a Less Degree: These Ornaments People will have as well as what is absolutely Necessary to Life, and as sure a Demand will be for them as for Food, and Cloaths; as it is in some Other Instances thought at first to be Equally Superfluous, but which are Now become considerable Branches of Trade, and consequently of great Advantage to the Publick.

Thus a thing as yet unheard of, and whose very Name (to our Dishonour) has at present an Uncouth Sound may come to be Eminent in the World, I mean the English School of Painting; and whenever This happens who knows to what heights it may rise; for the English Nation is not accusom'd to do things by Halves.

8 Antoine Coypel (1661–1722) on the grand manner, from 'On the Aesthetic of the Painter'

Antoine Coypel was the eldest son of the painter Noël Coypel, director of the Académie de France in Rome from 1672, and the father of Charles-Antoine Coypel (see IIA11). Having accompanied his father to Italy, he was immersed at an early age in the art of those widely regarded as the classics of the modern manner – Raphael, the Carracci, Domenichino and latterly Correggio – though his admiration for the Venetian painters and for Rubens was to put him on common ground with the 'colourists'. In the eight years after his return to Paris in 1676 he progressed through the hierarchies of the Académie Royale from student, to member, to assistant professor. He was made director of the Academy in 1714 and First Painter to the King the next year. Voiced in a lecture at the Academy, his advocacy of the grand manner represented some recapitulation of his own early commitments, at a time

when he saw himself as bearing a responsibility for the conduct of French painting. The 'perfect painter' as Coypel conceives him is first and foremost the ideal history painter in the classical mould, equipped at every technical point and in every moral aspect with an entirely faultless decorum. 'Sur l'esthétique du peintre' was originally published in Antoine Coypel, *Discours prononcés dans les conférences de l'Académie Royale de peinture et de sculpture*, Paris, 1721. It was reprinted in Henry Jouin ed., *Conférences de l'Académie Royale de peinture et de sculpture*, Paris: A. Quantin, 1883. The following translation has been made for the present volume by Jonathan Murphy, from pp. 277–86 of the 1883 edition. (See also IIA9.)

The mind of the perfect painter must be filled with divers sorts of knowledge. Not only should there be a strong foundation in the humanities, but also a considerable competence in rhetoric, so that he may abide by the same rules as an orator, and like him may instruct, please, and touch the heart. For it is these three elements which contribute most to the force of painting, and hence they must be sought above all else; yet they are often the most neglected.

The great painter must also be a poet. I do not mean that he should necessarily write verse, as one can versify without being a poet; but he should be filled with the same spirit that animates poetry, and he should be familiar with its rules and conventions, for... these are the same as those which govern painting. Painting and poetry are sister arts, which resemble each other so closely in all things that they constantly lend each other mutual support. Painting should do for the eyes what poetry does for the ear; both have the same principles, the same ideas, the same object and the same enthusiasm.

A great painter should be familiar with all types of history, from the Bible as well as from profane or fabulous sources. Geography, geometry and perspective are also requirements. Architecture is indispensable, and must be greatly cultivated, and the painter should know nature as a natural philosopher [physicist] does: how otherwise could the causes and effects of things be represented with certainty? A profound knowledge of the passions is essential, so that he may trace every fine distinction in the movements of the soul. His task will be to portray joy, sadness, pleasure, pain, love, hate, fear, and all the other passions which trouble and agitate the human heart. He must know not only the exterior man, in his correct anatomical proportions, but with the help of philosophy he must delve into the depths of his soul. Character cannot be portrayed without a substantial knowledge of the rules of physiognomy. He must also be familiar with the general rules of musical composition. Harmony, the product of the division of sounds, is founded on the same principles as those which govern the proportions of physical bodies, the gradations of light, and nuances of colour.

The rules of declamation are necessary in painting so that gesture and facial expression should be in good concord. The painter, who unfortunately cannot breathe speech into his paintings, must compensate for this by the use of lively expression and gesture, which should function in a similar manner to the sign language of the deaf.

Painters should also have some knowledge of the art of dance, not simply for the noble and gracious choice of posture, but also in order to imitate the celebrated

pantomimes of the ancient Greeks, where the story was communicated through carefully regulated movements: hands and feet spoke a language of gesture, and such was the art of their posture and the liveliness of their gestures that the spectators could easily decipher even the most mysterious of the actions of their gods.

In truth a tremendous variety of knowledge is required for a great painter. However, all this knowledge will be quite useless unless it is combined in the correct proportions with order and economy throughout the work. Great art must combine beauty and sublime thought, a noble and majestic treatment of the subject, and must faithfully transmit the truth of the story and the customs and costumes of the country. Expression should be lively and noble, execution freely handled, and the entire work should breathe an air of abundance and variety, all combined with exquisite judgement,¹ equally capable of bringing pleasure or displeasure, interest or disappointment.

The idea of the perfect painter, such as I am creating here, may appear slightly exaggerated, but it must be agreed that nowhere do I overstate the case, nor overstep the bounds of plausibility; indeed many other desirable elements could be added to this list. Such a painter would indeed be filled with great qualities, but it should be remembered that my task here is to lay out the necessary requirements for a truly great painter. It may be objected that few have ever achieved such a high degree of perfection, even amongst those painters whom we consider to be the most noteworthy; to which I would reply that indeed no painter has ever been beyond reproach. This should be noted in particular by a number of our contemporaries, who claim aloud that their own work is beyond correction, and that they have nothing left to learn. Painters of the calibre of Leonardo, Raphael, Michelangelo, Dürer, Domenichino, Rubens and Poussin, who were immensely learned men in many fields, never presumed themselves to be omniscient. The ancients, when they signed their work, would often use an imperfect tense to convey that such was their manner, rather than the boastful 'fecit'. They were rarely satisfied with their work, and mindful to demonstrate as much to subsequent generations.

* * *

The grand manner, or that which we have come to know as such, has its origin in a natural elevation of the spirit that we feel within us: as such it is more a gift from the heavens than a quality that we may obtain from the grandeur of our ideas or the beauty of imagination. But as the grand is also to be found in various aspects of painting, we shall examine these in turn, in an attempt to isolate a number of rules that might help painters to achieve greatness.

The grand resides both in the choice of subject-matter and in the manner in which it is treated: in disposition, in expression and in the execution of the drawing.

The painter is free to choose his own subject, and he should cherish this right: and should be mindful of choosing great, celebrated or singular events, where the action is both lively and easily characterized.

When in the choice of a subject the pathetic can be joined to the great, this will often lead to a successful outcome. Although the grand rejoices both the spirit and the faculty of judgement, not all can appreciate its beauty, but when the passions are joined together and manipulated with force, this cannot fail to move all who cast their eyes upon it. The pathetic leads more swiftly to the heart than the great does to the

spirit. And moreover one may touch the spirit without touching the heart, but one cannot move the heart without affecting the spirit.

As there is no action without circumstance, the grand may always be achieved if one chooses the most considerable set of circumstances, linking them together in a beautiful whole. A great painter should always ensure that no action extraneous to the central focus of his theme should intrude in the composition, so that all elements agree to augment its force and character. All that is added to the subject should increase and embellish the painting: the grand must contain nothing that is superfluous in any way.

Above all, where religious painting is concerned, it must be ensured that no base or childish circumstances liable to disfigure its character should be introduced. All must inspire respect and holiness.

* * *

When some sort of base circumstances are absolutely necessary for the subject, they should be positioned in the most inconsequential areas of the picture, so that they bring out the beauty of the action, which should always be in the middle of the scene and the brightest part of the picture. How ridiculous it would be in a nativity scene to give the animals pride of place, where the subject is so grand and holy, and demands that the Saviour be placed at the centre of the picture! When such base circumstances must unavoidably be introduced, it is a tremendous fault to introduce them in an inapt manner and afford them centre stage in the work, when they are the complete opposite of the seriousness of the subject in question. Nonetheless, whatever rules one draws up to govern such matters, they will count for nothing if they are not applied with delicacy and fine judgement by the painter.

All extraneous episodes should be avoided, and those intrinsic to the subject must be chosen with great care. Herein lies the art of disposition, or composition.

The composition of a painting is the correct distribution of the different parts, which when positioned correctly form an agreeable unity, lending each other mutual support so that no one element stands out excessively. The most vivid inspiration, the most sublime idea counts for nothing if the composition is lacking and each part is not in its rightful place. Without order, a painting is no more than a confused mass of figures which tire the eyes and the mind. But the order must not be an affected arrangement; objects should be placed so ingeniously that it appears that their positioning is nothing more than the result of a happy chance. True art should aim to hide art itself. The grand appears easy: but that which appears easy is in reality the most difficult thing to achieve, and can only be attained through a rigorous application of rules and prescriptions. If occasionally a sublime spirit appears to break free and overstep the boundaries, carried away by enthusiasm or by the verve of his execution, this is perhaps an indication of our imperfect understanding of art itself, but it ultimately serves to reinforce the rules that we have developed. [...] One cannot expect the rules to produce the enthusiasm necessary for the grand style: but the rules must justify that enthusiasm.

Variety and abundance are pleasing in composition, but here one should be neither mean nor prodigal, and the character and seamliness of the subject must always be preserved. The grand manner must always avoid complexity wherever possible, so that it is always better to leave something to the imagination rather than fatigue the

eyes with superfluous detail. Correction and judgement are all, and a wise and artful choice of elements to enter the subject is always paramount. The most interesting and evocative details must be chosen and placed with skill: all that is irrelevant, childish or insipid must be discarded.

Certain subjects are simple by their very nature. The majesty of a prince often consists in the choice of a few succinct words, and in similar fashion a small number of characters will create as much grandeur as is created by a wide variety of characters in a larger work.

When the subject is deeply serious, for instance, in the representation of a ceremony, a certain air of arrangement is necessary, and it is often here the grandeur or majesty lies, but this arrangement should always be accompanied by a softness, forming an almost imperceptible sort of contrast. The divine Raphael is a master in such situations, as demonstrated by paintings like *The Disputation over the Sacrament*, *The School of Athens*, *Pentecost* and *The Acts of the Apostles*. What unity of action! What knowing simplicity, what grandeur, what nobility, what majesty!

For those reasons that great man was ever distant from all that we so wrongly term the picturesque, and hence became the greatest painter in the world.

In battle scenes and other pictures filled with tumultuous action, abandon, variety and disorder are the keys. There a knowing sort of disorder is a vital feature of art; but that disorder must always be a result of art. Together with this apparent air of confusion, which sets in motion the spirit and the imagination, there must also be repose for the eyes, to be found in quieter groups, in the chiaroscuro blocks, and in the harmony and contrast of the colours. The grand is always a result of these, and the whole must be kept in mind when composition is being considered.

Grandeur is also a question of representing multiplicity, of suggesting far more than can ever be represented on one canvas. The spectator must be afforded an opportunity to exercise his own imagination. Thus is his self-esteem flattered, and accordingly he will admire the work all the more. His greatest pleasure perhaps is to believe himself to be the author of that which has merely been sketched out. There are few more important qualities than the ability to encourage this exercise in others.

Perhaps the greatest quality in expression is to ensure that the character of the subject treated can be divined at first glance. Clothing, the choice of location, proportion, expression, gesture, all are in concord to increase or diminish the grandeur of the subject. The painter must be sublime when divinities are to be represented. All must be magnificent and full of pomp when the actions of kings or heroes are to be represented; and a similar procedure should be used even when commonplace or ordinary subjects are to be represented. The greatest, most singular and most noble effects of nature should always be chosen, for therein lies all that is truly picturesque. Even the lowest style should have its own nobility. But verisimilitude should never be abandoned in pursuit of the extraordinary or grand. Each subject should have the character most fitting, in expression, physiognomy or gesture. The poses of old men should differ from those of impetuous youths. The actions of women should be more gracious than those of men, and those of children should have the naivety and tenderness that characterizes them, as in the painting of the great Correggio.

Regardless of the diversity of actions or attitudes, some form of unity must always be maintained. Nothing is further from the grand style than the unnecessary introduction of violent actions into a serious subject, where all should be in concord for a common end. An excess of movement in one figure juxtaposed with an overly immobile figure forms an unpleasant contrast, displeasing to the eye and the mind. Raphael is the great model to follow here.

Greatness in drawing is quite different from correctness. One may be exact and faithful, and draw with no taste at all. Examples are Lucas van Leyden, Albert Dürer, and many others besides. One may also draw with great taste but quite without correctness, as is often the case in Correggio's drawing. The great character of drawing is in the genius of the painter, and is often hard to determine. But we may say that it often consists in the ability to bring out large areas with big blocks, and in avoiding all that is dry, trenchant, harsh, and abrupt. Angles in contours are hard and mean. Contours should be animated by undulating forms, by all that resembles the flame and brings greatness, elegance and truth; such is the true spirit of the arabesque, and here it is impossible to imitate Correggio too closely. All that is opposed to this style is barbarous and ephemeral, and goes against nature and the tastes of the great masters. When one examines the work of Michelangelo, Leonardo da Vinci, Raphael and the Carracci, one finds the antidote to Lucas van Leyden, Dürer and Piero Testa.

The grand style is also a product of great attention to drapery, so much so that often the grandeur and nobility of a figure depend on the choice of a particular fold, or on the choice of the material disposed in one manner or other. On occasion the grandeur will result from a certain chance disorder in the drapery, as in the work of Correggio. On other occasions it is the result of order in the folds, which evoke all that is noble and majestic, and such was the taste of the ancients. Raphael has the admirable ability to combine the two together. His language speaks only to the painter. Many believe that the drapery is left to another hand, as they believe that in music the harmonics and the parts are the work of students, all of which serves to demonstrate that in all of the arts there are mysteries known only to the practitioners themselves.

¹ In the original French, *goût*. In the seventeenth century, the word *goût* – which in modern French simply means taste – referred much more narrowly to the intellectual faculty of judgement than it did to individual choices regarding personal preference [translator's note].

9 Antoine Coyvel (1661–1722) from 'On the Excellence of Painting'

As in the previous text, here Coyvel is concerned to advance the case for painting as not simply a civilized but also a civilizing art. His transparent aim is to ensure honour and recognition for those who practise it. 'L'Excellence de la peinture' was originally published in Antoine Coyvel, *Discours prononcés dans les conférences de l'Académie Royale de peinture et de sculpture*, Paris, 1721. It was reprinted in Henry Jouin ed., *Conférences de l'Académie Royale de peinture et de sculpture*, Paris: A. Quantin, 1883. The following

excerpt has been translated for the present volume by Jonathan Murphy from pp. 220 and 224–5 of the 1883 edition. (See also IIA8.)

I recently overheard a man well regarded in both the sciences and the arts make the following remark, while studying a painting quite closely: 'That must be truly beautiful, for it lulls me into a state of most agreeable reverie.' I know full well that not all men are capable of such reflection, but they do appreciate that painting both embellishes and brings life to the area that surrounds it; and if it fails to occupy their spirit, it does at least amuse and please their eyes, although they may fail to understand the reasons for this. And indeed, even in the saddest and most forsaken place, a painting seems to keep one company, and one is never alone in one's cabinet except when the pictures have been moved. This is a fact universally recognized, for all men are touched by the objects that they behold. The conversation that follows is generally mute, but the language of the eyes is no less real for that. It is truly a pleasure to be able to entertain oneself while being spared the travails of frivolous discourse and spared the necessity of replying. Often it is the most pleasurable form of entertainment. Painting is a means of conversing with absent friends, relations and all those we hold most dear; not only those with whom we live, but also with those who lived in times now far distant; while pleasing our spirit and our eyes, it teaches us their customs and habits, their military valour, their arms, their clothing, their building, their ceremonies and their religion, and thus serves to instruct us in the most painless fashion; even, we might say, while bringing great pleasure all the while. While we believe ourselves to be involved in some quite different endeavour, it increases our knowledge and opens new vistas without our even being aware that this is being brought about. What a pleasure it is, to those who can think and cogitate upon it, those who can set its charms to work in tranquillity, thought being the only true and reliable pleasure to which we can aspire; so often we flee it, while thinking to call it hither. Such is the goal of all wisdom; the ancients so sought this happy tranquillity that they constructed temples and altars in its honour.

* * *

It must be acknowledged that painting so agreeably occupies the eyes, the spirit and the imagination that often, through a sort of enchantment, it softens the memory of past suffering, and even on occasion present pain. Not only does this beautiful art bring infinite pleasure to those who know and love it, but it also brings inexpressible happiness to all those who exercise it with distinction. What secret delight it is to see a tiny creation born beneath our fingers, solely through imagination, a few simple lines and the intelligence of light and shadow. Bodies and objects quite unreal come to life, agreeably deceiving our own eyes, and deceiving those of others as well. What delight it brings, as our genius reveals itself, and our spirit is filled with lofty ideas and all that nature herself can contain! The pleasure of such work is so sweet: I remember hearing one time in Rome that when Bernini's family or students would drag him away unwillingly from his tireless work, in architecture, sculpture or painting, he often remarked 'Ah! Why must you drag me away from my true mistress?' What a great privilege it is for great painters to see palaces and temples of great magnificence arise in their work, to charm the eyes and the heart not only of educated men, but even of ignorant and stupid people! What satisfaction it must bring to ornament one's

homeland, and attract admiration even from abroad! Gold and azure have their precious sparkle, but to see one's work outshine matter, and live on for posterity! Do we not still talk of Apelles, the worthy favourite of Alexander the Great? The course may not always run smooth, and the pleasure is often interrupted or allied with suffering; by an infinite amount of work and the ingratitude of the people, by the erroneous decisions of the high-handed and inconsiderate, or by unthinking scorn. A man who is a stranger to art is incapable of admiring an artist, as Cicero remarked: but the truly great man, who must always have glory in his sights, must think of doing well rather than of being recompensed. He should expect the arrows of envy and injustice, and remind himself that the bitterness of work might one day be softened by the honour it brings. For great paintings, and great painters, have ever been honoured down the ages.

10 Ephraim Chambers (1680–1740) from *Cyclopaedia*

Chambers was the son of a farmer in Kendal, then in the county of Westmoreland in the English Lake District. After education at Kendal grammar school, he was apprenticed in London to a maker of globes, maps and mathematical instruments. The resulting interest in science and geography stimulated him to conceive the idea of an all-encompassing survey of the contemporary state of knowledge, going beyond the only existing work of the kind, John Harris's *Lexicon Technicum* (1704). (The term 'encyclopaedia' is derived from Latin translations of Greek phrases found in Pliny and others, connoting 'the circle of the arts and sciences'; 'cyclopaedia' is an etymologically meaningless contraction which may have been intended to imply 'the circle – or cycle – of education'.) The late seventeenth century had given rise, in both France and England, to several attempts to measure the achievement of the new learning against that of the ancients (see IA7 and 8). Chambers' aspiration was to produce a distillation of the entire field, compiled, as he put it in his frontispiece, 'from the best Authors, Dictionaries, Journals, Memoirs, Transactions, Ephemerides &c. in several Languages'. The interest of Chambers' work today lies not in the originality of any particular definition, but rather in the opposite: its status as a distillation of contemporary received wisdom. In the early eighteenth century, England had achieved a measure of political stability and seemed poised for expansion. In his dedication to the new King, George II, Chambers spoke openly of the coming eminence of England, making direct comparison with the Greece of Alexander and the Rome of Augustus. In this perspective, knowledge played a crucial role. It was thanks to the Arts and Sciences, Chambers wrote, that 'the mind is reclaim'd from its native Wildness, and enrich'd with Sentiments which lead to Virtue and Glory. 'Tis these, in fine, that make the Difference between your Majesty's Subjects and the Savages of Canada or the Cape of Good Hope.' Subsequently, it was a proposal to translate Chambers' monumental achievement into French that led Diderot and D'Alembert to the still greater project of the *Encyclopédie* (see IIC7, 8 and 9). These extracts on art are taken from Chambers' *Cyclopaedia: or an Universal Dictionary of Arts and Sciences*, 2 volumes, London: James and John Knapton et al., 1728, vol. 1, pp. 12–13, 144, 191–2, 230–1, 262, 370–1, 735, 794; vol. 2: pp. 36–7, 125. For the purposes of the present anthology, we have elected to replace Chambers' alphabetical organization with an order made in terms of generality. Thus: 'Art', followed by 'Painting', followed by the various 'Parts' of art, such as 'Design', 'Colour', etc.

ART is principally used for a certain System or Collection of Rules, Precepts, and Inventions or Experiments, which being duly observ'd, make the Things a Man undertakes succeed, and render them advantageous and agreeable. In this sense *Art* is opposed to *Science*, which is a Collection of speculative Principles and Conclusions. *Arts* in this Sense, may be divided, with respect to their Scope and Object, into *human*, as *Medicine*; and *divine*, as *Theology*. *Human*, again, may be subdivided into *Civil*; as *Law*, *Politics*, &c. *Military*, as *Fortification*, &c. *Physical*, as *Agriculture*, *Chymistry*, *Anatomy*, &c. *Metaphysical*, as *Logicks*, *pure Mathematicks*, &c. *Philological*, as *Grammar*, *Criticism* &c. *Mercantile*, to which belong the *Mechanical Arts* and *Manufactures*.

ARTS are more popularly divided into *Liberal* and *Mechanical*. The *liberal Arts* are those that are noble, and ingenuous; or which are worthy of being cultivated without any regard to *Lucre* arising therefrom. – Such are *Poetry*, *Musick*, *Painting*, *Grammar*, *Rhetoric*, the *military Art*, *Architecture* and *Navigation*. *Mechanical Arts* are those wherein the *Hand*, and *Body* are more concern'd than the *Mind*; and which are chiefly cultivated for the sake of the *Profit* they bring with them. – Of which kind are most of those which furnish us with the *Necessaries of Life*, and are popularly known by the Name of *Trades*. – Such are *Weaving*, *Turnery*, *Brewing*, *Masonry*, *Clock-making*, *Carpentry*, *Joinery*, *Foundery*, *Printing*, &c. The *mechanical Arts* take their Denomination from $\mu\eta\chi\alpha\nu\eta$ [mekhane] 'Machine'; as being all practised by means of some *Machine* or *Instrument*. With the *liberal Arts* it is otherwise; there being several of them which may be learnt and practised without any *Instrument* at all: as *Logic*, *Eloquence*, *Medicine* properly so called &c. The *Arts* which relate to the *Sight* and *Hearing*, My Lord *Bacon* observes, are reputed liberal beyond those which regard the other *Senses*, which are chiefly employed in *Matters of Luxury*.

It has well been noted by some *Philosophers*, that during the *Rise* and *Growth* of *States*, the *military Arts* chiefly flourish; when arrived at their *Height*, the *liberal Arts*, and when on the declining hand, the *voluptuary Arts*.

PAINTING, the Art of representing natural Bodies, and giving 'em a Kind of Life, by the Turn of Lines, and the Degrees of Colours.

Painting is said to have had its *Rise* among the *Egyptians*; And the *Greeks*, who learnt it of 'em, carried it to its *Perfection*; if we may believe the *Stories* related of their *Apelles* and *Zeuxis*. The *Romans* were not without considerable *Masters* in this *Art*, in the later *Times* of the *Republic*, and under the first *Emperors*; but the *Inundation* of *Barbarians*, who ruin'd *Italy*, proved fatal to *Painting*, and almost reduced it to its first *Elements*. It was in *Italy*, however, that the *Art* returned to its ancient *Honour*, and in the beginning of the *XVth* century; when *Cimabue*, betaking himself to the *Pencil*, translated the poor *Remains* of the *Art*, from a *Greek Painter* or two, into his own *Country*. He was seconded by some *Florentines*: The first who got any *Reputation* was *Ghirlandaio*, *Michel Angelo's* Master; *Pietro Perugino*, *Raphael Urbin's* Master; and *Andrea Verrocchio*, *Leonardo da Vinci's* Master. But the *Scholars* far surpassed the *Masters*; they not only effaced all that had been done before 'em, but carried *Painting* to a *Pitch* from which it has ever since been declining.

'Twas not by their own noble Works alone that they advanc'd Painting; but by the Number of Pupils they bred up, and the Schools they form'd. *Angelo* in particular, founded the School of *Florence*; *Raphael* the School of *Rome*; and *Leonardo* the School of *Milan*; to which must be added, the *Lumbard* School, establish'd about the same time, and which became very considerable under *Georgian* and *Titian*. Besides the *Italian* Masters, there were others on this Side the Alps, who had no communication with those of *Italy*; such were *Albert Durer*, in *Germany*; *Holbens* in *Switzerland*; *Lucas* in *Holland*; and others in *France* and *Flanders*: but *Italy*, and particularly *Rome*, was the Place where the Art was practic'd with the greatest Success; and where, from Time to Time, the greatest Masters were produc'd. To *Raphael's* School, succeeded that of the *Caraches*, which has lasted, in its Scholars, almost to the present Time; wherein the *French* Painters, by the Munificence of the late *Louis XIV* seem almost in Condition to vie with those of *Greece* or *Italy*. In *Paris* they have two considerable Bodies of Painters, the one, the *Royal Academy of Painting and Sculpture*, the other the *Community of Masters in Painting, Sculpture, &c.*

The Art of *Painting* is divided, by *Fresnoy*, into three principal Parts, *Invention*, *Design*, and *Colouring*, to which some add a fourth, *viz. Disposition*. *Felibien* divides *Painting* into the *Composition*, the *Design*, and *Colouring*. *Mons. Testling*, Painter to the late King, divides it, somewhat more accurately, into the *Design* or *Draught*, the *Proportion*, the *Expression*, the *Clair-obscur*, the *Ordonnance*, and the *Colouring*; to which his *English* Translator adds the *Perspective*.

DESIGN, or *Draught*, with regard to the Arts and Sciences, signifies the Thought, Plan, Geometrical Representation, Distribution, and Construction of a *Painting*, *Poem*, *Book* or *Building*: 'This Painter has shewn the first *Design* of his *Picce*, in which the *Figures* are well disposed'. 'The *Design* of that *Poem* or *Book* is artfully laid'. '*Claudian* never sees his whole *Design* together: When he composes a Part, he thinks of nothing else; and works up every Member, as if it were separate from all the rest'. [...]

DESIGN in the *Manufactories*, the *Figures* wherewith the *Workman* enriches his *Stuff*, or *Silk*; and which he copies after some *Painter*. In undertaking such *Kinds* of figured *Stuffs*, 'tis necessary that before the first *Stroak* of the *Shuttle*, the whole *Design* be represented on the *Threads* of the *Warp*; we don't mean in *Colours*, but with an infinite number of little *Pack-Threads*, which being disposed so as to raise the *Threads* of the *Warp*, let the *Painter* see from Time to Time what *Kind* of *Silk* is to be put in the *Eye* of the *Shuttle*, for *Woof*. This *Method* of preparing the *Work*, is call'd *reading the Design*, or *reading the Figure*. [...]

DESIGN is particularly used in *Painting*, for the first *Idea* of a large *Work* drawn roughly, and in little; with *Intention* to be executed, and finish'd in large. In this simple *Sense*, the *Design* is the simple *Contour*, or *Outline* of the *Figures* or *Things* intended to be represented; or the *Lines* that terminate, and circumscribe them.

Such *Design* is sometimes drawn in *Crayons*, or *Ink*, without any *Shadows* at all: Sometimes it is *hatch'd*, that is, the *Shadows* are expressed by sensible *Lines*, usually

drawn a-cross each other with the Pen, Crayon or Graver. Sometimes again, the Shadows are done with the Crayon rubb'd so as there does not appear any Lines: Sometimes the Grain, or Strokes of the Crayon appear, as not being rubb'd: Sometimes the *Design* is *wash'd*, that is, the Shadows are done with a Pencil, in *Indian* ink, or some other Liquor: And sometimes the *Design* is *colour'd*, that is, Colours are laid on, much like those intended for the Grand Work.

The Qualities, or Parts required in a *Design*, are *Correctness*, *Good Taste*, *Elegance*, *Character*, *Diversity*, *Expression*, and *Perspective*. *Correctness* depends principally on the Justness of the Proportions, and a knowledge of Anatomy. *Taste* is an Idea, or Manner of *Designing*, which arises either from the Complexion and natural Disposition, or from Education, the Masters, Studies &c. *Elegance* gives the Figures a Kind of Delicacy, which strikes People of Judgment, and a certain Agreeableness, which pleases everybody. The *Character* is what is peculiar to each Thing; In which there must be a *Diversity*; in as much as every Thing has its particular Character to distinguish it. The *Expression* is the Representation of an Object according to its Character, and the several Circumstances it is supposed to be in. The *Perspective* is the Representation of the Parts of a Painting, or Figure, according to the Situation they are in, with respect to the Point of Sight.

The *Design*, or *Draught*, is a Part of the greatest Import, and Extent in Painting. 'Tis acquired chiefly by Habit, and Application; Rules being of less Avail here than in any of the other Branches of the Art, as *Colouring*, *Clair-Obscure*, *Expression*, &c. [. . .] The rest relates to *Perspective*: As, that those Objects are seen at one View, whose Rays meet in a point: That the Eye and Object be always conceiv'd as immoveable: That the Space, or *Medium* between them be conceiv'd transparent: And that the Eye, Object and Picture, be at a just Distance; which is usually double the Bigness of the Subject, or Picture.

EXPRESSION, in Painting, the natural and lively Representation of the Subject, or of the several Objects intended to be shewn. The *Expression* consists principally in representing the human Body, and all its Parts, in the Action suitable to it; in exhibiting in the Face, the several Passions proper to the Figures; and observing the Motions they impress on the other external Parts. The Term *Expression*, is ordinarily confounded with that of *Passion*: But they differ in this, that *Expression* is a general Term, implying a Representation of an Object. Agreeably to its Nature and Character, and the Use or Office it is to have in the Work; and *Passion*, in Painting, is a Motion of the Body, accompanied with certain Dispositions, or Airs of the Face, which mark an Agitation in the Soul. So that every *Passion* is an *Expression*; but not every *Expression* a *Passion*.

The *Laws* or *Rules* of *Expression* in *painting*. *Expression*, we have said, is a Representation of Things according to their Character; and may be consider'd either with respect to the *Subject* in general; or to the *Passions* peculiar therein.

I. With regard to the *Subject*, 'tis to be observed,

1 That all the Parts of the Composition are to be transform'd, or reduced, to the Character of the Subject; so as they may conspire to impress the same Sentiment,

Passion, or Idea: Thus *e.g.* In a Representation of Joy and Peace, every Thing is to appear calm and agreeable; of War, turbulent, and full of Terror &c.

2 In Order to this, any Circumstance occur in History, or Description, that would invert, or take from the Idea; it must be suppressed; unless essential to the Subject.

3 To this End, the History, or Fable, is to be well studied in the Authors who describe it, in Order to conceive its Nature and Character truly, and impress it strongly on the Imagination; that it may be diffused and carried thro' all the Parts of the Subject.

4 A Liberty to be taken of chusing favourable Incidents, in order to diversifie the *Expression*; provided they be not contrary to the principal Image of the Subject, or the Truth of History.

5 The Harmony of the *tout Ensemble* to be particularly regarded, both with regard to the Actions, and the Light and Colour.

6 The Modes and Customs to be observed; and every Thing made conformable to Time, Place, and Quality.

7 The three Unities of Time, Place and Action, to be observed: That is, nothing to be represented in the same Picture, but what passes at the same Time, and may be seen at the same View.

II. With regard to the particular *Passions* and *Affections* of the Subject; the Rules are,

1 That the Passions of Brutes are few and simple, and have almost all an immediate Respect, either to Self-Preservation, or the Propagation of the Kind: But in Men, there is more Variety; and accordingly, more Marks and *Expressions* thereof. Hence, Man can move his Eye-brows, which, in Brutes are immovable: And can likewise move the Pupil every way, which Brutes cannot.

2 Children, not having the Use of Reason, act much on the footing of Brutes; and *express* the Motions of their Passions directly, and without Fear or Disguise.

3 Tho' the Passions of the Soul may be *express'd* by the Actions of the Body; 'tis in the Face they are principally shewn; and particularly in the Turn of the Eye, and the motion of the Eye-brows.

4 There are two Ways of lifting up the Eye-brows; the one at the middle, which likewise draws up the Corners of the Mouth, and argues pleasant Motions: The other, at the Point next the Nose, which draws up the middle of the Mouth, and is the Effect of Grief and Sadness.

5 The Passions are all reducible to Joy and Sadness; each of which is either simple, or mix'd and passionate.

6 Simple Joy causes a Dilation of all the Parts: The Eye-brows rise in the middle, the Eyes half open, and smiling, the Pupil sparkling and moist, the Nostrils a little open, the Cheeks full, the Corners of the Mouth drawn a little upwards, the Lips red, the Complexion lively, the Forehead serene.

7 Passionate Joy proceeding from Love, shews the Forehead smooth and even, the Eye-brows a little elevated on the Side the Pupil is turn'd to, the Eyes sparkling and open, the Head inclined towards the Object, the Air of the Face smiling, and the Complexion ruddy: – That proceeding from Desire, shews itself by the Body, the Arms extended towards the Object, in uncertain and unquiet Motions.

8 Simple Sadness, is *Express'd* by the Body being cast down, the Head carelessly hanging aside, the Forehead wrinkled, the Eye-brows rais'd to the midst of the Forehead, the Eyes half shut, the Mouth a little open, the Corners downwards, the under-Lip pointing and drawn back, the Nostrils swell'd, and drawn downwards. – That mix'd with *Fear*, causes the Parts to contract and palpitate, the Members to tremble and fold up, the Visage to be pale and livid, the point of the Nostrils elevated, the Pupil in the middle of the Eye, the Mouth openest at the sides, and the under-Lip drawn back. – In that mix'd with *Anger*, the Motions are more violent, the Parts all agitated, the Muscles swell'd, the Pupil wild and sparkling, the Point of the Eye-brows fix'd towards the Nose, the Nostrils open, the Lips big and press'd down, the Corners of the Mouth a little open and foaming, the Veins swell'd, and the Hair erect. – That with *Despair*, resembles the last, only more excessive and disorder'd.

9 The Hand has a great Share in the *Expression* of our Sentiments and Passions: The raising of the Hands conjoin'd – towards Heaven, *expresses* Devotion: Wringing the Hands, Grief: Throwing them towards Heaven, Admiration: Fainting, and dejected Hands, Amazement and Despair: Holding the Hands, Idleness: Holding the Fingers indented, musing: Holding forth the Hands together, Yielding and Submission: Lifting up the Hand and Eye to Heaven, calling God to Witness: Waving the Hand from us, Prohibition: Extending the right Hand to anyone, Pity, Peace and Safety: Scratching the Head, Thoughtfulness and Care: Laying the Hand on the Heart, solemn Affirmation: Holding up the Thumb, Approbation: Laying the Fore-finger on the Mouth, bidding Silence: Giving with the Finger and Thumb, *parce dare*: And the Fore-finger put forth, the rest contracted *Monstrari & dicier hic est*.

10 The *Sex* of the Figure to be regarded; and Man, as he is of a more vigorous and resolute Nature, to appear in all his Actions freer and bolder than Women, who are to be more reserved and tender.

11 So also the *Age*, the different Stages whereof incline to different Motions both of Body and Mind.

12 The *Condition*, or Honours, a Person is invested withal, renders their Actions more reserved, and their Motions more grave; contrary to the Populace, who observe little Conduct and Restraint; giving themselves, for the most part, up to their Passions; whence their external Motions become rude and disorderly.

Lastly, in *Spirits* we must retrench all those corruptible Things, which serve only for the Preservation of Life, as Veins, Arteries &c. only retaining what may serve for the Form and Beauty of the Body. In *Angels*, particularly, as being symbolical Figures, we are to mark out their Offices and Virtues, without any Draught of sensual Passions; only appropriating their Characters to their Functions of Power, Activity and Contemplation.

CLAIR-OBSCURE, or CHIARO SCURO, in Painting, the Art of distributing, to advantage, the Lights and Shadows of a Piece, both with regard to the easing of the Eye, and the Effect of the whole Piece. Thus, when a Painter gives his Figures a strong Relievo, loosens 'em from the Ground, and sets 'em free from each other, by

the Management of his Lights and Shadows, he is said to understand the *Clair-obscur*.

The *Clair-obscur* makes one of the great Divisions, or Branches of Painting, the whole of a Picture being resolvable into *Light* and *Shadow*. The Doctrine of the *Clair-obscur* will come under the following Rules.

Light may be either consider'd with regard to itself; to its Effects; the Place where 'tis diffus'd; or its Use.

For the 1st, Light is either *Natural* or *Artificial*. *Natural*, either comes immediately from the Sun, which is brisk, and its Colour various according to the Time of the Day; or 'tis that of a clear Air thro' which Light is spread, and whose Colour is a little bluish; or a cloudy Air, which is darker, yet represents Objects in their genuine Colours with more ease to the Eye. *Artificial* proceeds from Fire, or Flame, and tinges the Object with its own Colour: but the Light it projects is very narrow and confin'd.

For the 2nd, the *Effects* of Light are either *Principal*, as when the Rays fall perpendicularly on the Top of a Body, without any Interruption; or *Glancing*, as when it slides along Bodies; or *Secondary*, which is for things at a distance.

3 For the *Place*, 'tis either the open Campaign, which makes Objects appear with great Softness; or an inclos'd Place, where the Brightness is more vivid, its Diminution more hasty, and its Extremes more abrupt.

4 For the *Use*, or Application: The Light of the Sun is always to be suppos'd without, and over against the Picture; that it may heighten the foremost Figures: the Luminaries themselves never appearing, in regard the best Colours can't express 'em. The chief Light to meet on the chief Group, and as much as possible on the chief Figure of the Subject. The Light to be pursu'd over the great Parts without being cross'd or interrupted with little Shadows. The full Force of the principal Light to be only one Part of the Piece: taking care never to make two contrary Lights. Not to be scrupulously confin'd to one universal Light; but to suppose other accessory ones, as the opening of Clouds &c. to loosen some Things, and produce other agreeable Effects. Lastly, the Light to be different, according to the Quality of Things whence it proceeds, and the Nature of the Subjects which receive it.

For *Shadows*; they are distinguish'd, 1st into those form'd on the Bodies themselves, by their proper Relievs. 2nd Those made by adjacent Bodies; those that make the Parts of any whole; and the different Effects, according to the difference of Places.

For the first, since the different Effects of Light only appear by Shadows, their Degrees must be well manag'd. The Place which admits no Light, and where the Colours are lost, must be darker than any Part that has Relievo, and dispos'd in the Front. The Reflex, or return of the Light, brings with it a Colour borrow'd from the Subject that reflects it; and flies off at a greater or less Angle according to the Situation of the reflecting Body, with regard to the luminous one: Hence, its Effects must be different in Colour, and in Force; according to the Dispositions of Bodies. Deepenings, which admit not of any Light, or Reflex, must never meet on the Relievo of any Member of any great elevated Part; but in the Cavities or Joints of Bodies, the Folds of Draperies &c. And to find Occasions for introducing great

Shadows, to serve for the Repose of the Sight, and the Loosening of Things; instead of many little Shadows, which have a pittiful Effect.

For the 2nd, the Shadows made by Bodies, are either in plain and smooth Places, or on the Earth; wherein they are deeper than the Bodies that occasion 'em, as receiving less reflex Light; yet still diminish as they depart further from their Cause; or on the neighbouring Bodies, where they are to follow the form of the said Bodies, according to its Magnitude and its Position, with regard to the Light.

For the 3rd, In Shadows that have Parts, the Painter must observe to take for a Light in a shadow'd Place, the Teint, or Lustre of the light Part; and, on the contrary, for the Shadow in the lighten'd Part, the Teint or Lustre in the Shadow: To make an Assemblage of Colour, Shadow, and Reflex in the shadow'd Part; but without interrupting the great Masses of Shadows: To avoid forming little Things in the Shadow; as not being perceiv'd, unless closely look'd at; and to work, as it were, in the general, and at one sight: Never to set the strong Shadows against the Lights, without softening the harsh Contrast by the help of some intermediate Colour: tho the Mass of Light may be plac'd either before or behind that of the Shadow; yet ought to be so dispos'd as to illuminate the principal Parts of the Subject.

For the 4th, The Effects of Shadows are different, as the Place is either wide and spacious; as in those coming immediately from the Sun, which are very sensible, and their Extremes pretty abrupt; and from the serene Air, which are fainter and more sweet; from the dark Air, which appear more diffus'd, and almost imperceptible; and those from an artificial Light, which makes the Shadow deep, and their Edges abrupt: or as it is more narrow and confin'd, where the Lights coming from the same Place make the Shadow more strong, and the reflex less sensible.

COLOURING, in Painting, the manner of applying and conducting the *Colours* of a Picture: Or, it is the Mixture of Lights and Shadows form'd by the various *Colours* employ'd in a Painting. The *Colouring* is one of the principal Branches of Painting.

M. Félibien divides the Painter's Art into three Parts; the Design, the Composition, and the *Colouring*. The *Colouring* strikes the most; but among Masters it always gives place to the Exactness of the Design. De Piles observes that the Word *Colouring*, in its confin'd Sense, is chiefly applicable to a History-piece; scarce at all to a Landskip. [. .]

The *Colouring*, in its general Sense, takes in what relates to the Nature and Union of *Colours*; their Agreement, or Antipathy; how to use them to advantage in Light and Shadow, so as to show a Relievo in the Figures, and a sinking of the Ground: What relates to the aerial Perspective, *i.e.* the Diminution of *Colours* by means of the Interposition of Air; the various Accidents and Circumstances of the Luminary and the Medium; the different Lights, both of the Bodies illuminating and illuminated; their Reflections, Shadows, different Views, with regard either to the Position of the Eye, or the Object: What produces the Strength, Fierceness, Sweetness &c. in Paintings well *colour'd*: The various Manners of *colouring*, both in Figures, Landskips &c.

The Doctrine of Colouring is compris'd under the following Rules.

Colours are consider'd, either in respect of their Use, or their Oeconomy and Disposition.

1st With regard to their *Use*. They are either in Oil, or Water: Those in Oil, again, are either consider'd with a View to their Preparation or Application. *In the Preparation of Oil Colours*, care must be taken that they be ground fine; that in putting them on the Pallet, those which won't dry of themselves, be mix'd with Oil, or other Dryers; and that ting'd *Colours* be mix'd in as small Quantities as possible. For their *Application*, it is consider'd either with regard to the Kinds of Painting in Works of various *Colours*, or in those of one single *Colour*.

For the *first*: in the larger Pieces, the *Colours* are either laid on full, so as they may be *impasted*, or incorporated together, which makes them hold more firmly. Or else we mix those more agreeable ones, which dry too hard, and too hastily, with a little *Colour*, and the clearest of the Oil: But in both Cases, the *Colours* are to be laid on strong at first; it heing easy to weaken those that are to be thrust hack, and to heighten the others: The Touches to be bold, by the Conduct of a free and steady Pencil; that the work may appear the most finish'd at a proper distancee, and the Figures animated with Life and Spirit. [. . .]

For the 2nd Part of *Colouring*, or the *Oeconomy* and dispensing thereof in Paintings; regard is either had, first, to the Qualities of the *Colours*, to appropriate them according to their Value and Agreement: or secondly, to their Effect, in the Union and Oeconomy of the Work. For the first, it must be observ'd that *white* represents Light, and gives the briskness and heightening; *black*, on the contrary, like Darkness, obscures and effaces the Objects: again, black sets off the light Parts; and by that they serve each other to loosen the Objects. A proper Choice to be made of *Colours*, and the too much charg'd manner to be avoided [. . .]

For the *Effects of Colours*, they either regard the Union, or the Oeconomy: With respect to the first, care must be taken that they be laid so as to be sweetly united under the briskness of some principal one; that they participate of the prevailing Light of the Piece; and that they partake of each other by the communication of Light, and the help of Reflection. For the Oeconomy in managing their degrees, regard is to be had to the *Contrast*, or Opposition intervening in the Union of *Colours*; that by a sweet Interruption, the briskness, which otherwise fades and palls, may be rais'd to the Harmony which makes the Variety of *Colours* agree; supplying and sustaining the Weakness of some by the Strength of others; neglecting some Places on purpose to serve as a Basis or Repose to the Sight, and to enhance those which are to prevail thro' the Piece. [. . .]

PERSPECTIVE, the Art of Delineating visible Objects on a plane Surface, such as they appear at a given Distance or Height, upon a transparent Plane, placed perpendicular to the Horizon, between the Eye and the Object.

This, we particularly call *linear Perspective*, as regarding the Position, Magnitude, Form &c. of the several Lines, or Contours of Objects; and expressing their Diminution: In opposition to the *Aerial Perspective*, which regards the Colour, Lustre,

Strength, Boldness &c. of distant Objects consider'd as seen thro' a Column of Air; and expresses the Diminutions thereof. The former is a Branch of Mathematicks: Some make it a member of Opticks; others a rivulet therefrom; and its Operations are all geometrical. The latter is a Part of Painting, and consists wholly in the Conduct of the Colours, their different Teints, or Degrees, Force, Weakness &c.

SCULPTURE, the Art of Cutting or Carving Wood, Stone, or other Matter, to form various Figures for Representations; as also of fashioning Wax, Earth, Plaister &c. to serve as Models, or Moulds for the Casting of Metal Figures. *Sculpture*, in its Latitude, includes both the art of working in Creux, properly called *Engraving*, and of working in Relievo, which is what we strictly call *Sculpture*.

The Antiquity of this Art is past Doubt; as the Sacred Writings, the most ancient and authentic Monuments we have of the earliest Ages, mention it in several Places: Witness Laban's Idols stolen away by Rachel, and the Golden Calf which the Israelites set up in the Desart, &c. But 'tis very difficult to fix the Original of the Art, and the first Artists, from prophane Authors; what we read thereof, being intermixed with Fables, after the Manner and Taste of those Ages. Some make a Porter of *Sicyon* named *Dibutades* the first Sculptor. Others say the Art had its Origin in the Isle of *Samos*, where one *Ideocus* and *Theodorus* perform'd Works of this Kind, long before *Dibutades*' Time. 'Tis added that *Demuratus*, Father of *Tarquin the Elder*, first brought it into *Italy* upon his retiring thither; and that by Means of *Enciropus* and *Entygramma*, two excellent Workmen herein, who communicated it chiefly to the *Tuscans*; among whom it was afterwards cultivated with great Success. They add, That *Tarquin* sent for *Tauranus*, one of the most eminent among them, to *Rome*, to make a statue of *Jupiter* &c. of baked Earth, for the Frontispiece of the Temple of that Deity. About this Time, there were many *Sculptors*, both in *Greece* and *Italy*, who wrought altogether in Earth. Some of the most noted are, *Calisthenes*, an *Athenian*, who made himself and his House famous, by the great number of Earthen Figures he adorned it withal. *Demophilus* and *Gorsanus*, two Painters, who enrich'd the Temple of *Ceres* with great Variety of Painting and Earthen Images. In effect, all the first Statues of the Heathen Deities were either of Earth or Wood; and 'twas not so much any Frailty of the Matter, or Unfitness for the Purpose, as the Riches and Luxury of the People, that first induc'd them to make them of Marble, and other more precious Stones. Indeed, how rich soever the Matter were whereon they wrought, yet they still used Earth to form Models thereof. And to this day, whether they be for cutting Marble Statues with the Chissel, or for casting them in Metal, they never undertake the one or the other without first making a perfect Model thereof in Earth. Whence, doubtless, arose the Observation of *Praxiteles*, That the Art of Moulding Earthen Figures was the natural Mother of that of making Marble and Metal Figures; which last never appeared in Perfection till about 300 Years after the building of *Rome*, though the first was at its Height long before.

Phidias of *Athens*, who came next, surpass'd all his Predecessors, both in Marble, in Ivory and in Metals: And about the same Time appeared several others who carried *Sculpture* to the highest Perfection it ever arrived at; particularly *Polyclites* at *Sicyon*; then *Myron*; *Lysippus*, who alone was allowed the Honour of casting *Alexander's* image in Brass. *Praxiteles* and *Scopas*, who made those excellent Figures now before

the Pope's Palace at *Montecavallo*; *Briaxis*, *Timotheus*, and *Leochares*, who with *Scopas* wrought at the famous Tomb of *Mausolus* King of *Caria*; *Cesisodorus*, *Cana-chus*, *Dedalus*, *Buthious*, *Nyceratus*, *Euphanor*, *Theodorus*, *Xenocrates*, *Phiromachus*, *Stratonicus*, *Antigonus*, who wrote on the Subject of his Art; the famous Authors of the *Laocoön*, vis. *Agesander*, *Polydore*, and *Athenodorus*, and infinite others, the Names of some whereof have passed to Posterity; those of others have perished with their Works. For though the Number of Statues in *Asia*, *Greece* and *Italy* were so immense, that in *Rome* alone, as we are informed, there were more than there were living Persons, yet we have but very few now left, at least very few of the finest. When *Marcus Scaurus* was *Ædile*, his Office obliging him to provide what was requisite towards the Publick Rejoycings, he adorned the stately Theatre, which he erected, with 3000 Brazen Statues; and though *L. Mummius* and *Lucullus* brought away a great number out of *Asia* and *Greece*, yet there were still above 3000 remaining in *Rhodes*, as many at *Athens*, and more at *Delphi*: but what is most extraordinary is the Bigness of the Figures which those ancient Artists had the Courage to undertake. Amongst those *Lucullus* brought to *Rome*, there was one of *Apollo* 30 cubits high; the *Colossus* of *Rhodes*, made by *Cares* of *Lyndos*, the Disciple of *Lysippus*, far exceeded it; *Nero's* Statue, made by *Xenodorus* after that of *Mercury*, was also of an extraordinary Size, being 110 feet high. *Sculpture*, however, did not continue above 150 years, after *Phidias's* Time till it began insensibly to decline; not but that there were still some fine Pieces of Workmanship both in *Greece* and *Italy*, though not performed with so good a Fancy, and such exquisite Beauty. [. . .]

STATUARY, a Branch of Sculpture, employ'd in the making of Statues. Statuary is one of those Arts where the Ancients surpass'd the Moderns. Indeed 'twas much more popular, and more cultivated, among the former than the latter.

'Tis disputed between *Statuary* and *Painting* which of the two is the most difficult and most artful. The Invention of *Statuary* was at first very coarse. *Leon Battist Alberti*, who has an express Treatise on *Statues*, imagines that it took its Rise from something casually observed in the Productions of Nature, that, with a little Help, might seem disposed to represent the Figure of some Animal. The common Story is that a maid, full of the Idea of her Lover, made the first Essay, by the Assistance of her Father's Implements, who was a Potter. This, at least, is pretty certain, that Earth is the first Matter *Statuary* was practised upon.

STATUARY is also used for the Artificer, who makes *Statues*. In this Sense we say, *Phidias* was the greatest *Statuary* among the Ancients, and *Michael Angelo* among the Moderns.

11 Anne-Claude-Philippe de Tubières, Comte de Caylus (1692–1765) 'On Drawings'

Anne-Claude-Philippe de Tubières de Grimoard de Pestels de Lévis, Comte de Caylus – to give him his full name – was a wealthy antiquary, collector, amateur of art, engraver and writer. He devoted considerable energy to the acquisition of first-hand knowledge of the

arts, travelling as a young man to see classical sites in Turkey, Greece and Italy. He formed an extensive collections of coins and archaeological fragments, and made numerous engravings after Old Master drawings. Between 1752 and 1767 he published a seven-volume work on Egyptian, Etruscan, Greek, Roman and Gaulish antiquities, which was among the earliest art-historical studies to accord serious attention to pre-classical cultures. He was appointed an honorary amateur member of the Académie Royale in 1731 and became increasingly influential in its activities. Caylus' lecture on drawing was delivered to the Académie Royale on 7 June 1732. Among his qualifications to speak on the subject was his close acquaintance with drawings in the French royal collections and in the vast private collection of Pierre Crozat, hundreds of which he had himself reproduced, following tuition in etching and engraving from Charles-Antoine Coypel (son of Antoine Coypel; see IIA8). Through the study of drawings, he believed, practitioners and connoisseurs alike may gain special insight into processes of composition and into the artist's creative character and integrity. Caylus conceives of drawing essentially as a means of expression for the painter, rather than as an end in itself, criticizing the French artist Raymond La Fage (1656–84) and the Italian Parmigianino (1503–40, Caylus' 'Parmesan') for neglecting painting at the expense of drawing. (In the latter case this criticism was certainly misdirected.) The lecture was published as 'Discours du Comte de Caylus sur les dessins' in *Revue Universelle des Arts*, vol. 9, 1859, pp. 316–23. Our version is taken from the translation of this text in Elizabeth Gilmore Holt ed., *A Documentary History of Art*, vol. II (1947), Princeton: Princeton University Press, 1958, pp. 322–6.

Since the part of the inquiry which concerns drawings is naturally included in the scheme of your lectures, I thought I might communicate to you some reflections I have made not about drawing in particular, which I regard as the basis of an art in which I can only receive lessons here, but about drawings in general, their attraction, their usefulness and the knowledge of them. Such is my project and the subject I shall discuss with you.

All that great men bring to light is with reason to be recommended to their contemporaries but still more to those who succeed them. This general reflection pertains perhaps more to the arts and to painting in particular than to all the other products of the mind. Thus we observe that for a long time the drawings of the great masters have been esteemed and sought after and we are indeed fortunate that since the very infancy of painting there have been lovers of the arts zealous enough to have preserved them for us. Our obligation to them is all the greater to my mind because drawings are one of the most attractive things for a painter or for an amateur of the arts and it is certain that one is well advanced in connoisseurship of the arts when one knows how to read them well.

What is more agreeable than to follow an artist of the first rank in the need he had to produce, or in the first idea which struck him for a production, whose final execution one can compare, to delve into the different changes his reflections caused him to make before arresting his work, to seek to appraise them, to see oneself finally in his very studio and to be able to form one's taste by examining the reasons that prompted him to make changes. After having examined these first thoughts, with what pleasure does one not see studies correctly made from Nature, the nude parts of a draped figure, the details of this same drapery? Finally, all the parts that have contributed to the perfection of the painting or of the work which the Universe

admires. It also seems to me that the great artists make us experience impressions similar to those they themselves have felt. Poetry warms us in their first conceptions, Wisdom and Truth strike us in the finished things.

It seems to me that a simple stroke often determines a passion and proves how much at that time the mind of the author felt the force and the truth of the expression. The inquisitive eye and the animated imagination are pleased and flattered to finish what often is only sketched. The difference found in my opinion between a beautiful drawing and a beautiful painting is that in one, one may read in proportion to his ability all that the greater painter has wanted to represent and in the other, one has himself finished the object offered you. Consequently one is often more stimulated by the sight of one than by that of the other, for, the reasons for satisfaction and for the preference men accord to something must always be looked for in self-esteem. The only drawback to be found in this charming section of the art you practice, gentlemen, is the way in which several painters have let themselves be carried away by the pleasure of drawing. They have neglected painting to attach themselves solely to drawing. They have yielded entirely to the pleasing attraction of quickly tossing their ideas on paper, as well as to that of imitating nature in landscapes and in the other beauties with which she so well knows how to pique the taste of her admirers.

However well these persons whom I have just mentioned have drawn, one must recognize that it is always a kind of licentiousness which should be censured. It is an ill consequence into which one must always prevent especially the young from falling with even more severity as this lazy process increases each day one's aversion to painting. On this subject, gentlemen, I will bring you the example furnished me by a Frenchman and an Italian, both eminent; one is the Parmesan and the other La Fage, and their works are an obvious proof of what I have just set forth. The first did very few pictures, the second none at all, and even the drawings that he wished to finish have constantly lost therefrom, their initial fire being extinguished. Without going into details of their styles, I will only tell you that it seems to me that one of them took up the graceful side of Raphael, or, to express it better, he was so possessed by this aspect of the works of that great man, that through the desire to make it perceptible to himself, he fell into the error of those who exaggerate. As for the other artist, he produced with an almost supernatural ardor the way of delineating muscles and his emphasized contours sometimes recall the conception of Michelangelo. Be that as it may, they both drew well, their pen was charming, and La Fage knew, so to speak, how to represent torrents of figures. But it seems to me that in recognizing the pleasure given by this sort of drawing, one must admit after all that they lack the solidity one finds in the great painters. The latter have as foundation the indication of color and that Economy, wise and majestic, which must rule in the compositions of pictures. So, strictly speaking, one could refuse to the Parmesan and La Fage the name of Painter, for in an examination of their drawings one finds neither that primal idea nor that reflection which proves that the work was composed in the mind before being put on paper. Harmony, this gift from heaven, the understanding of *chiaro-scuro*, and perhaps the habit of using color are therefore alone able to contribute to the beauty of the work I am discussing with you. These reflections prove to me the necessity to study these aspects and of never setting them aside. I

flatter myself to have proved to you, gentlemen, how much they are to be recommended to a painter, since they make themselves felt with pleasure when perceived and wished for when they are not found in those very drawings which appear at first sight not to need them in order to please.

Harmony and the understanding of *chiaro-scuro*, which emanate solely from a greater profundity in art, seem to me lacking therefore not only in the sketches of those I have just named but in those of artists who only draw. One will see in their works a beautiful outline they will have given to a figure. They will make a beautiful grouping of nudes but true taste will not be fully satisfied by the study of their works.

This would be the place to speak of the abuse of sketches without straying too far from my subject, but it is not for me to teach. I have only resolved to test a few reflections. I am but an amateur and the amateur and the master must speak differently. The one may reflect, the other must give lessons, and I await them from you, Gentlemen.

I believe I have shown you in general what produces the attraction in the study and the knowledge of drawings. Now I will consult you on the usefulness that I believe they may have for the painter or for the amateur.

I am convinced that the great man is formed only by the gifts of nature; but this nature, beautiful as she may be, needs cultivation and adornments and the sight of beautiful drawings is one of the means that should be all the more employed for this purpose, as it smooths away a great number of the difficulties present at each step in the practice of an art so extensive as that of painting. Nothing so excites the genius of a Painter or gives him that inner fire so necessary to composition as the examination of a fine drawing. Here is already a useful purpose of considerable worth. In drawings one sees exposed and without any deception the manner in which the painter has known how to read nature and the manner in which he has sometimes known how to take a pleasing liberty [with it].

This reflection again makes the study of drawings commendable for me, but one of the most considerable arguments to my mind is that affectation reveals itself completely in drawings. Consequently they can prevent one from falling into this capital fault and they can correct a bad education as well as a false taste to which one has yielded. Color can sometimes make one excuse the fault of affectation in a picture, while a drawing with, so to speak, no covering, can invite and convince him who studies it to recognize the full extent of this drawback, even more so as the comparison one can make with similar works easily makes one sensitive to the true and to the beautiful imitation of Nature.

When I criticize affectation here, I do not mean to speak of the style and of the technique by which one distinguishes works of one man from those of another. I only wish to speak to you of the abuse of that manner which makes one draw from memory even though after nature. An abuse one has seen only too much at all times in the works of those who neglect Nature, or who submit her to habit; of those finally who sacrifice [her] to the imagination.

Moreover, the study of drawings uncovers the different routes that so many able persons have taken to arrive at the same goal. These routes are infinite and prove that when Nature has endowed a man with feelings he only has to give free rein to his

inspiration and to the lessons that Nature alone can give. Thereafter he will deserve admirers in one domain or another of all those which compose this art.

All these reasons would lead me to counsel a Painter to possess drawings and to study them. Rubens often did so and his example is particularly good to follow since there are moments when the more dormant genius needs to be awakened. One can study without becoming a slave and the criticism one can make of the weakest part of a drawing is often a marvellous lesson. I said that a Painter should abandon himself to the talent given him by nature. I am far from denying this, but at the same time I believe that an artist whose aim is the perfection of his art should not scorn or ignore the works of others. If he wishes to owe absolutely nothing to anyone but himself, he walks a road that is bound to lead him astray. [. . .]

12 Anne-Claude-Philippe de Tubières, Comte de Caylus (1692–1765) ‘The Life of Antoine Watteau’

As an honorary member of the Académie Royale (see IIA11), Caylus had a hand in reviving the programme of ‘Conferences’ that had fallen into abeyance, and he became prominent among those advocating a return to a more expressive and elevated form of history painting along authentically classical lines (see IIC4). It is in the light of this advocacy that we should understand the reservations he offers in writing of a painter whom he claims as a former close friend. Antoine Watteau (c.1684–1721; ‘Wateau’ is a variant spelling now rarely used) had been among the most successful French painters of the early eighteenth century. The types of composition in which he excelled had their origins in theatrical scenery and iconography and in rococo decoration, and were thus disqualified from the highest status in the eyes of the Academy. It was a testimony to Watteau’s exceptional drawing skills and to the elusive emotional content with which he invested his work that the Academy accepted the *Pilgrimage to the Isle of Cythera* (now in the Louvre) as the *morceau de réception* (reception piece) finally confirming his membership in 1717. In doing so they were implicitly recognizing the genre of *fêtes galantes* that he had made his own. Watteau left no statement of his own concerning his work, but several accounts of his career were written after his early death, while engravings of his paintings and drawings were issued in considerable numbers. Caylus’ text was read at the Academy on 3 February 1748. It was published by Edmund and Jules de Goncourt in *L’Art du dix-huitième siècle*, Paris, 1860. Our version is taken from the translation of this work by Robin Ironside, *French XVIII Century Painters*, London: Phaidon Press, 1948, pp. 10–26.

Antoine Wateau was born at Valenciennes in 1684. He was the son of a tiler. Birth is of no consequence in the eyes of philosophers and artists except in so far as it may facilitate education, but when it is of this humble kind it affords a convincing proof of talent and genius bestowed by Nature.

This proof is reinforced in the present instance by the severity which was the dominant characteristic of Wateau’s father. It was with great reluctance that he was persuaded to place his son, whom Nature was already inspiring with the desire to imitate her, as apprentice to a painter working in his own town. What he did while with this painter is unknown to us and we need not regret our ignorance; for I seem to recall that this master was one who disposed of his pictures according to their

measurements, or at least that his standards were similar, and the point is not worth our discussion.

However that may be, the father was unwilling to provide the expenses of this education for any length of time. Not that he was in a position to judge how unprofitable it might be from the artistic point of view, but he wished to force his son to embrace his own profession. Wateau had more exalted ideas, or, at any rate, Painting had already destined him for her own; and so, rather than settle down in his father's profession, he left him and travelled to Paris, by what rustic means of transport one may imagine, in order to devote himself there to the Muse whom he already loved but scarcely knew.

Ill-informed and helpless, the Pont Notre-Dame was a resource he was only too happy to discover. This miserable factory of hundredth-hand copies made with stiff colours applied flat, even more hostile to the development of taste than illumination which at least preserves the forms of an engraving, was hardly suited to the sentiments that he had received in germ from nature. But to what depths are we not reduced by necessity? [. . .]

Instead of being discouraged by this pitiable occupation, he redoubled his efforts to rise above it. Such moments of freedom as he enjoyed – public holidays, even the nights – were devoted to drawing from nature. He set an example whose value to the young could hardly be over-emphasized – an example which is all very well on paper, the idlers will reply, but of which we may certainly say that only the love of art could ever inspire it. However that may be, continual study is never fruitless, or without some strengthening effect upon natural disposition. Nor, indeed, could we cite many instances of the same passionate industry that had not been followed by pronounced success.

With this grounding of study and these excessive powers of application, he prepared himself to leave the dismal employment to which necessity had reduced him. He made the acquaintance of Gillot who, at about the same time, had just become a member of this Academy. Gillot was an artist who was known as a painter of bacchanals, of other fanciful or even historical subjects, and had also concerned himself with decoration and fashion: he was now, however, largely confining himself to the representation of themes from the Italian Comedy. For Wateau, this meeting was to prove a stroke of fortune. It was, indeed, this type of subject which determined once and for all the direction of his taste, and the pictures of his new master opened his eyes to various aspects of the art of painting whose existence he had hitherto merely suspected. [. . .]

Wateau's talent was now unmistakably, though still faintly, evident; and he was still in need of further enlightenment. This he found; on leaving Gillot, he was received as a pupil by Claude Audran, concierge of the Luxembourg, an estimable character and a skilful decorator who, in this latter capacity, worthily upheld the reputation of the family which has provided your Academy with so many gifted members.

He was, moreover, a man of natural taste. Ornamentation had been his principal study, ornamentation of the kind that was used by Raphael at the Vatican and elsewhere by his pupils, of the kind also that Primaticcio employed at Fontainebleau. Audran revived the fashion of the latter's compositions, and it was due to his

activities that the heavy and oppressive taste of his own predecessors was forgotten. His works were designed, by the reservation of blank spaces, for the reception of figure or other subjects in accordance with the wishes of the various patrons whom he had inspired with a desire to have their walls and ceilings decorated in this manner; it was thus that artists in differing genres found employment in his studio.

And it was there that Wateau's taste for decoration was formed and that he developed that lightness of brushwork required by the white or gilded backgrounds on which Audran's designs were carried out. Skilful examples of his work can be seen at the Ménagerie at Versailles, and there are fine ceilings after his designs at the Château of Mcudon.

But I must confess that it is with some regret that I speak with a kind of admiration of his work; for it resulted not only in the demolition of ceilings that had been painted by some of the most gifted artists, but the change of fashion involved, which has now been succeeded by the taste for plaster decoration, deprived you, as you are still deprived, of an opportunity of exercising your talents in a branch of art that encourages the expression of what is noble and heroic.

But let me return to Wateau. It was while he was living in the Luxembourg that he studied and copied, with avidity, some of the finest works of Rubens, that he drew, unremittingly, the trees of that beautiful garden which, less strictly planned, as it is, than those of the other royal houses, provided him with innumerable viewpoints, with that infinity of motives which only landscape painters are able to extract. [. . .]

So far, we have observed simply a young man intent, without any special advantages, on perfecting his talent, a young man who is assiduous and who is at once his own tutor and the architect of his own reputation. In what follows we shall examine this talent in its developed form; but we shall see it in the coils of a life agitated by inconstance and by the artist's disgust with himself and with humanity.

He left Audran when he had mastered those aspects of the art of painting which I have indicated in the foregoing account of his studies. He was so thoroughly versed in their practice that he was able to depart entirely from the manner of Gillot. He carried out a group of pictures, representing soldiers on the march or resting, in a style entirely opposed to that of his master; and these early works are perhaps equal in quality to the finest productions of his maturity. They are full of harmony and colour, the heads are subtly and intelligently perceived, and the brushwork preserves the particular quality of his drawing even in the extremities and the draperies and, generally, in his conception of the subject.

I cannot make up my mind to attribute the separation from Audran to his inconstant temper. Wateau was aware of his own powers. He had intelligence and he was not the dupe of his master's, who was no better endowed with this quality than he was with a knowledge of the world and who, moreover, finding it very convenient to retain Wateau's services for his own profit, was anxious to subvert his taste for any kind of work except that with which he entrusted him. . . .

A desire to visit Rome and to benefit there from the excellent academy established by Louis XIV alike for the general advancement of art and the instruction of students, enrolled him, for a period, among the competitors for the prize offered by your school. He won the second prize in 1709, but he was not entitled to make the

journey to Italy; he had to be content, therefore, with continuing his studies in Paris, but he pursued these without renouncing his project of a visit to Rome.

With this object in mind, he submitted to you, in 1712, a group of pictures executed in his more personal style and much superior to the earlier prize-winning composition. A mature and distinguished talent and the inexpedience of the journey he wished to make were the motives that induced the Academy to receive him as a member. His reception was signaled by the support of M. de la Fosse, a man esteemed both for excellence of character and for achievement in various branches of painting; he asserted Wateau's merits and, though knowing him only by his works, took an active interest in his candidature.

It is thus that truth should prevail in the deliberations of the Academy; personal preferences are not a ground for the admission or exclusion of applicants. Prejudices for or against particular persons, based on their connexions, constitute a grave defect. Talent alone should influence our decisions, and shed lustre upon our choices. It was shortly after the Academy had conferred this merited honour upon Wateau that I made his acquaintance.

But the honour you did him and the originality and novelty of his style attracted more commissions than he was willing or able to deal with. It was not long before he also began to suffer from those importunities that distinguished talents tend to draw upon themselves in large towns where semi-connoisseurs abound, all too eager to inflict their presence in studios and private collections. And to what purpose? Merely to talk continual nonsense, to disturb and interrupt those meditations and researches that are so essential to the production of fine work. The best they can do is to utter false praise; flattery, indeed, is their main function. How wearisome and tormenting for an artist to have such people call upon him and establish themselves in his house and to be unable to get rid of them! For they are a tenacious species as impatient to make their appearance as they are difficult to dismiss.

Their multitude is usually followed by those dealers in second-hand goods, self-styled virtuosi of the art, who know how to take advantage of a practice which is common in society and weighs heavily upon painters with any facility of execution.

These persons take possession of sketches and present themselves with studies; and, what is worse, solicit the retouching of the mere leavings of the studio which they amass in heaps; and their whole object is to procure a complete painting by a master which should cost them little or nothing. There is no trick to which they will not stoop to achieve this end.

Wateau was persecuted by them; he distinguished easily these two types of importunates, understood them admirably, and being by nature caustic, he revenged himself in general by depicting in his work the personalities and intrigues of those by whom he was most sorely beset. In particular instances, however, he was none the less their dupe. Moreover, satirical caricature was no consolation for the tedium which in the end overpowered him. I have often seen him distracted to the point of wishing to abandon his vocation.

It might be thought that his brilliant success with the public would have flattered his self-esteem sufficiently to save him from such trifling annoyances. But his temperament was such that he was continually sickened by what he was doing. I believe that one of the strongest reasons for this disgust had, as its motivating

principle, the elevated views he entertained on the art of painting. I am in a position to affirm that he conceived the art more nobly than he practised it, an attitude of mind that was unlikely to prejudice him in favour of his own productions. The prices they fetched left him equally unaffected, and were, indeed, much smaller than those he could have obtained. Money he neither loved nor desired, and was thus deprived of that powerful support that so many have found in the mere passion for gain. . . .

Wateau was by temperament not only caustic but also timid, two characteristics that Nature rarely combines in the same personality. He had a quick intelligence, and though he had received no education, he was an acute, even a fastidious, judge of music and the arts. Reading was his great recreation. He knew how to take advantage of what he had read; but, though, in general, he discerned and was able to represent with remarkable insight the absurdities of those importunates who came to disturb his labours, he had not, as I have said, a strong character and was easily defrauded, imposed upon and deceived.

Possessed of an agreeable reputation, he had no enemies but himself, and a certain spirit of instability which dominated him. No sooner had he established his residence anywhere than he took an aversion to the place. Time after time, he changed his abode, and always on some specious pretext that he was moved to devise by a sense of shame at his behaviour. He was apt to stay longest in some rooms of mine in various quarters of Paris which we used only for painting, drawing and posing the model. In these retreats, consecrated exclusively to art, free from all importunities, he and I, together with a third friend impelled by the same tastes, experienced the joys of youth combined with the vivid pleasures of the imagination, a happiness which was perpetually enhanced by the charms of the art of painting. I may say that Wateau, so morose, so splenetic, so timid, so caustic everywhere else, was there purely the Wateau of his pictures, an artist, that is to say, such as they evoke, tender, agreeable, faintly bucolic.

It was in this seclusion that I recognized, to my advantage, how deeply Wateau thought about painting, and how inferior was his execution to his ideas. Indeed, since he had no knowledge of anatomy and had never drawn from the nude, he was unable either to comprehend or express it; so much so that the complete rendering of an academy study was for him an exacting and consequently a disagreeable exercise. The female body, requiring less articulation, was somewhat easier for him. Such difficulties illustrate my earlier observation that the dislike for his own work which so often affected him arose from his being in the situation of a man who thinks better than he acts.

A particular result of this deficiency of draughtsmanship was an inability to paint or to compose anything in the heroic or allegorical vein, or to render the human figure on a large scale. The *Four Seasons* that he painted for the dining-room of M. Crozat are a proof of this assertion. The figures here are almost half life-size, and though they were executed after sketches by M. de la Fosse, they display so much mannerism and aridity that one can find nothing to say in their favour. The style of these paintings differs only from that of his small-scale works in the treatment of the nude and in the draperies; but that light and subtle touch which is so effective in small pictures loses its value and becomes intolerable when employed over a large area such as, in this instance, was unavoidable.

Fundamentally, it must be agreed, Wateau was an infinitely mannered artist. Though he was endowed with certain graces and is captivating in his favourite subjects, his hands, his heads, even his landscape, all suffer from this defect of mannerism. Taste and general effect are his best qualities and these produce, it is true, very charming illusions, more especially as his colour is good, and very exact in the rendering of stuffs which he drew in a peculiarly delightful way. It should be added that he hardly ever painted other stuffs than silk, which falls always in small folds. But his draperies were well disposed and the pattern of the folds was correct because he always drew from nature and never made use of a lay-figure. His choice of local colour was good and was never out of harmony with his tonality. Finally, his delicate touch infused a life and piquancy into everything he painted.

M. Crozat, who was fond of artists, offered Wateau board and lodging at his house. The offer was accepted. This fine establishment, which at that time housed a greater number of valuable paintings and curios than perhaps any private owner had hitherto brought together, provided the artist with a thousand new incentives. Of these the most exciting to his taste was the large and admirable collection of drawings by the great masters. He was affected by those of Jacopo Bassano; and still more so by the studies of Rubens and Van Dyck. He was charmed by the fine inventions, the exquisite landscape backgrounds, the foliage, revealing so much taste and understanding, of Titian and Campagnola, whose secrets he was able to explore in these drawings. And, since it is natural to consider things in relation to their possible usefulness, it was to these last qualities that he most readily gave attention, rather than to those other qualities of arrangement, composition and expression in the works of the great history painters whose talents and purposes were so remote from his own. These he was content to admire without seeking to adapt himself to them by any special course of study, from which, indeed, he would have derived scant advantage.

It was here that I and M. Henin, the friend to whom I have referred, were able to assist him by preparing copies of drawings by the best Flemish masters and by those two great Italian landscape painters, copies which we carried just sufficiently far for him to capture the finished effect himself by the addition of a few touches. This was to serve him as he would have wished; in everything he required rapidity. And I shall always maintain that, in painting, it was to effects of rapidity that he was most sensitive.

The painting of small pictures facilitates the achievement of such effects. The most trifling adjustment makes or mars their expressive quality. Indeed, there are instances when the principal credit for their success should be assigned to chance. Wateau, in order to stimulate rapidity both of effect and execution, liked to apply his paint thickly. This device has always been widely employed, and the greatest masters have had recourse to it. But to practise it successfully, elaborate and adroit preparations are required, and Wateau hardly ever made them. As some sort of remedy for this omission, he had the habit, when wishing to correct a picture, of heedlessly rubbing it with thick oil and then repainting. The momentary advantage he gained in this way subsequently caused considerable damage to his pictures, damage to which a certain untidiness in his procedure, that must have injured his colour, also greatly contributed. It was very rarely that he cleaned his palette, and he sometimes went for several days without doing so. The pot of thick oil, of which he made so much use, was full

of dirt and dust and mixed with all sorts of colours which adhered to his brushes when he dipped them into it. How remote was this method of procedure from the exceptional precautions that certain Dutch painters used to take in order to work cleanly! In this respect, Gerard Dow, among others, has often been quoted; and it has been observed how he ground his colours on a mirror, that he took infinite precautions to prevent their corruption by a single atom of dust, and that he always cleaned his palette himself and even the handles of his brushes . . .

I do not suppose that you, however, would look upon these details as mere trifles. It seemed to me necessary to record them as a recommendation of that care and cleanliness in the use of colour which is a too essential condition of the preservation and survival of pictures for me to refrain from emphasizing the consequences of its neglect for the benefit of any who may have so utterly disregarded it as Wateau. It was listlessness and laziness that prompted this disregard, even more than that vivacity which may be inspired by an eager need to transfer at once to the canvas some effect conceived in the imagination. It was a need that seized him at times, but it was less compelling than his pleasure in drawing. The exercise of drawing had infinite charms for him and although sometimes the figure on which he happened to be at work was not a study undertaken with any particular purpose in view, he had the greatest imaginable difficulty in tearing himself away from it.

I must insist that in general he drew without a purpose. For he never made an oil sketch nor noted down the idea, in however slight or summary a form, for any of his pictures. It was his habit to do his drawings in a bound book, so that he always had a large number that were readily available. He possessed cavalier's and comedian's costumes in which he dressed up such persons as he could find, of either sex, who were capable of posing adequately, and whom he drew in such attitudes as nature dictated and with a ready preference for those that were the most simple. When it took his fancy to paint a picture, he resorted to his collection of studies, choosing such figures as suited him for the moment. These he usually grouped so as to accord with a landscape background that he had already conceived or prepared. He rarely made use of them in any other way.

This method of composing, which is certainly not one to be followed, is the real reason for that uniformity with which Wateau's pictures may be reproached. Without being aware of it, he repeated, on many occasions, the same figure; and it is this also which gives engravings after his work a kind of monotony, a kind of general similarity which prohibits the production of any quantity of them. In a word, with the exception of one or two of his pictures, such as 'L'Accordée de village' (or 'La Noce de village') ['The Village Betrothal' or 'The Village Marriage'], 'Le Bal' ['The Ball'], the trade sign painted for the sieur Gersaint, and 'L'Embarquement de Cythère' ['The Embarkation for Cythera'], which he painted for his reception into our Academy and which he has repeated, his compositions have no precise object. They do not express the activity of any passion, and are thus deprived of one of the most affecting aspects of the art of painting, that is, of action. Action alone, as you are aware, gentlemen, may animate your compositions, particularly in the heroic vein, with that sublime fire which speaks to the spirit, takes possession of it, transports it and fills it with wonder and admiration.

I should not forget to observe here that Wateau was not received as a member of your Academy until five years after his candidature had been approved; that is to say, on 28 August 1717. His dilatoriness in executing and supplying the picture required by the conditions of membership was the only cause of this delay. It even proved necessary to issue two summonses before he complied with this rule.

IIB

Imagination and Understanding

1 John Locke (1632–1704) ‘Of the Association of Ideas’ from *An Essay Concerning Human Understanding*

John Locke was a formative influence on the development of British empiricism. His *Essay Concerning Human Understanding* brought about a profound change towards subjectivism, giving priority to sensation as the basic or most fundamental unit of human knowledge. In opposition to the rationalism of Descartes, with its emphasis on innate ideas and the deductive power of reason, Locke placed a new emphasis on the data of the senses. His starting-point was not general truths of reason, but the information given through sensation. This new approach had an enormous impact on the subsequent development of aesthetics, though Locke himself did not write directly on the subject. The influence of his ideas can be seen in the work of figures such as Du Bos (IIB6), Hutcheson (IIB7), Hume (IIIB5) and Burke (IIIB6). His writings also contributed to awakening a new interest in psychology and the workings of the mind. The first edition of *An Essay Concerning Human Understanding* was published in 1690. In a chapter added to the fourth edition of the book in 1700, Locke addressed the phenomenon of the association of ideas, arguing that through sufficiently powerful or repeated experiences we can develop likings or aversions which are ‘accidental’ and bear no necessary connection to the objects themselves. Later theorists such as Archibald Alison (VA11) subsequently developed this idea in relation to questions of art and beauty. For these ‘Associationists’, beauty is not a quality of objects but a feeling in the perceiver’s mind, the origin of which is to be traced to the connection between ideas which arises on the basis of experience. The following excerpt is taken from the edition of Locke’s *Essay Concerning Human Understanding* edited by Peter H. Nidditch, Oxford: Clarendon Press, 1975, chapter XXXIII, ‘Of the Association of Ideas’, pp. 395–400.

§5. Some of our *Ideas* have a natural Correspondence and Connexion one with another: It is the Office and Excellency of our Reason to trace these, and hold them together in that Union and Correspondence which is founded in their peculiar Beings. Besides this there is another Connexion of *Ideas* wholly owing to Chance or Custom; *Ideas* that in themselves are not at all of kin, come to be so united in some Mens Minds, that ’tis very hard to separate them, they always keep in company, and

the one no sooner at any time comes into the Understanding but its Associate appears with it; and if they are more than two which are thus united, the whole gang always inseparable shew themselves together.

§6. This strong Combination of *Ideas*, not ally'd by Nature, the Mind makes in it self either voluntarily, or by chance, and hence it comes in different Men to be very different, according to their different Inclinations, Educations, Interests, *etc.* Custom settles habits of Thinking in the Understanding, as well as of Determining in the Will, and of Motions in the Body; all which seems to be but Trains of Motion in the Animal Spirits, which once set a going continue on in the same steps they have been used to, which by often treading are worn into a smooth path, and the Motion in it becomes easy and as it were Natural. As far as we can comprehend Thinking, thus *Ideas* seem to be produced in our Minds; or if they are not, this may serve to explain their following one another in an habitual train, when once they are put into that tract, as well as it does to explain such Motions of the Body. A Musician used to any Tune will find that let it but once begin in his Head, the *Ideas* of the several Notes of it will follow one another orderly in his Understanding without any care or attention, as regularly as his Fingers move orderly over the Keys of the Organ to play out the Tune he has begun, though his unattentive Thoughts he elsewhere a wandering. Whether the natural cause of these *Ideas*, as well as of that regular Dancing of his Fingers be the Motion of his Animal Spirits, I will not determine, how probable soever by this Instance it appears to be so: But this may help us a little to conceive of Intellectual Habits, and of the tying together of *Ideas*.

§7. That there are such Associations of them made by Custom in the Minds of most Men, I think no Body will question who has well consider'd himself or others; and to this, perhaps, might be justly attributed most of the Sympathies and Antipathies observable in Men, which work as strongly, and produce as regular Effects as if they were Natural, and are therefore called so, though they at first had no other Original but the accidental Connexion of two *Ideas*, which either the strength of the first Impression, or future Indulgence so united, that they always afterwards kept company together in that Man's Mind, as if they were but one *Idea*. I say most of the Antipathies, I do not say all, for some of them are truly Natural, depend upon our original Constitution, and are born with us; but a great part of those which are counted Natural, would have been known to be from unheeded, though, perhaps, early Impressions, or wanton Phancies at first, which would have been acknowledged the Original of them if they had been warily observed. A grown Person surfeiting with Honey, no sooner hears the Name of it, but his Phancy immediately carries Sickness and Qualms to his Stomach, and he cannot bear the very *Idea* of it; other *Ideas* of Dislike and Sickness, and Vomiting presently accompany it, and he is disturb'd, but he knows from whence to date this Weakness, and can tell how he got this Indisposition: Had this happen'd to him, by an over dose of Honey, when a Child, all the same Effects would have followed, but the Cause would have been mistaken, and the Antipathy counted Natural. [...]

§9. This wrong Connexion in our Minds of *Ideas* in themselves, loose and independent one of another, has such an influence, and is of so great force to set us awry in our Actions, as well Moral as Natural, Passions, Reasonings, and Notions

themselves, that, perhaps, there is not any one thing that deserves more to be looked after.

§10. The *Ideas* of *Goblins* and *Sprights* have really no more to do with Darkness than Light; yet let but a foolish Maid inculcate these often on the Mind of a Child, and raise them there together, possibly he shall never be able to separate them again so long as he lives, but Darkness shall ever afterwards bring with it those frightful *Ideas*, and they shall be so joined that he can no more bear the one than the other.

§11. A Man receives a sensible Injury from another, thinks on the Man and that Action over and over, and by ruminating on them strongly, or much in his Mind, so cements those two *Ideas* together, that he makes them almost one; never thinks on the Man, but the Pain and Displeasure he suffered comes into his Mind with it, so that he scarce distinguishes them, but has as much an aversion for the one as the other. Thus Hatreds are often begotten from slight and almost innocent Occasions, and Quarrels propagated and continued in the World.

§12. A Man has suffered Pain or Sickness in any Place, he saw his Friend die in such a Room; though these have in Nature nothing to do one with another, yet when the *Idea* of the Place occurs to his Mind, it brings (the Impression being once made) that of the Pain and Displeasure with it, he confounds them in his Mind, and can as little bear the one as the other.

§13. When this Combination is settled and whilst it lasts, it is not in the power of Reason to help us, and relieve us from the Effects of it. *Ideas* in our Minds, when they are there, will operate according to their Natures and Circumstances; and here we see the cause why Time cures certain Affections, which Reason, though in the right, and allow'd to be so, has not power over, nor is able against them to prevail with those who are apt to hearken to it in other cases. The Death of a Child, that was the daily delight of his Mother's Eyes, and joy of her Soul, rends from her Heart the whole comfort of her Life, and gives her all the torment imaginable; use the Consolations of Reason in this case, and you were as good preach Ease to one on the Rack, and hope to allay, by rational Discourses, the Pain of his Joints tearing asunder. Till time has by disuse separated the sense of that Enjoyment and its loss from the *Idea* of the Child returning to her Memory, all Representations, though never so reasonable, are in vain; and therefore some in whom the union between these *Ideas* is never dissolved, spend their Lives in Mourning, and carry an incurable Sorrow to their Graves.

§14. A Friend of mine knew one perfectly cured of Madness by a very harsh and offensive Operation. The Gentleman, who was thus recovered, with great sense of Gratitude and Acknowledgment, owned the Cure all his Life after, as the greatest Obligation he could have received; but whatever Gratitude and Reason suggested to him, he could never bear the sight of the Operator: That Image brought back with it the *Idea* of that Agony which he suffer'd from his Hands, which was too mighty and intolerable for him to endure. [...]

§16. Instances of this kind are so plentiful every where, that if I add one more, it is only for the pleasant oddness of it. It is of a young Gentleman, who having learnt to Dance, and that to great Perfection, there happened to stand an old Trunk in the Room where he learnt. The *Idea* of this remarkable piece of Household-stuff, had so mixed it self with the turns and steps of all his Dances, that though in that Chamber

he could Dance excellently well, yet it was only whilst that Trunk was there, nor could he perform well in any other place, unless that, or some such other Trunk had its due position in the Room. If this Story shall be suspected to be dressed up with some comical Circumstances, a little beyond precise Nature; I answer for my self, that I had it some Years since from a very sober and worthy Man, upon his own knowledge, as I report it; and I dare say, there are very few inquisitive Persons, who read this, who have not met with Accounts, if not Examples of this Nature, that may parallel, or at least justify this.

§17. Intellectual Habits and Defects this way contracted are not less frequent and powerful, though less observed. Let the *Ideas* of Being and Matter be strongly joined either by Education or much Thought, whilst these are still combined in the Mind, what Notions, what Reasonings, will there be about separate Spirits? Let custom from the very Childhood have join'd Figure and Shape to the *Idea* of God, and what Absurdities will that Mind be liable to about the Deity?

2 Anthony Ashley Cooper, third Earl of Shaftesbury (1671–1713) from 'The Moralists, a Philosophical Rhapsody'

The early education of Anthony Ashley Cooper, third Earl of Shaftesbury, was carried out by the philosopher John Locke (see IIB1) who was a member of the household of his grandfather, the first Earl of Shaftesbury. Although Shaftesbury, like his grandfather, initially entered into politics, ill-health obliged him to retire from active life. From 1702 he pursued the interests of an intellectual and a connoisseur. His most important contributions were in the domain of moral philosophy. He was one of the first to propound that we have a 'moral sense', an innate capacity to distinguish virtue from vice. His philosophy owes as much to Neoplatonism as to Locke's empiricism, and much of its complexity arises from his attempt to combine these two seemingly incompatible approaches. Shaftesbury himself describes his treatise 'The Moralists' as a 'philosophical rhapsody'. It is subtitled a 'recital of conversations on natural and moral subjects'. In the excerpt reproduced here, Theocles seeks to awaken in Philocles admiration and awe for the works of nature. Theocles' celebrated hymn to the natural world is informed both by a pantheistic admiration for nature's divine order and harmony and by a recognition of the terror which its more 'sublime' aspects can induce. (For Burke on the sublime, see IIB6.) Significantly, Theocles maintains that the enjoyment of beauty is quite distinct from any desire to possess the thing which we admire. Passages such as these have encouraged later thinkers to recognize Shaftesbury as the founder of the modern notion of disinterested pleasure. However, it is important to note that Shaftesbury does not distinguish between beauty and goodness; moral and aesthetic pleasure are seen to arise from the same basic source. 'The Moralists' was first published in 1709. It was reprinted in 1711 in Shaftesbury's own collection of his writings entitled *Characteristics of Men, Manners, Opinions and Times*. We have used the edition edited by John M. Robertson, Indianapolis: Bobbs-Merrill, 1964, pp. 97–9, 110–12, 122–4, 125–8.

Here, Philocles, we shall find our sovereign genius, if we can charm the genius of the place (more chaste and sober than your Silenus) to inspire us with a truer song of Nature, teach us some celestial hymn, and make us feel divinity present in these solemn places of retreat.

Haste then, I conjure you, said I, good Theocles, and stop not one moment for any ceremony or rite. For well I see, methinks, that without any such preparation some divinity has approached us and already moves in you. We are come to the sacred groves of the Hamadryads, which formerly were said to render oracles. We are on the most beautiful part of the hill, and the sun, now ready to rise, draws off the curtain of night and shows us the open scene of Nature in the plains below. Begin: for now I know you are full of those divine thoughts which meet you ever in this solitude. Give them but voice and accents; you may be still as much alone as you are used, and take no more notice of me than if I were absent.

Just as I had said this, he turned away his eyes from me, musing awhile by himself; and soon afterwards, stretching out his hand, as pointing to the objects round him, he began:—

'Ye fields and woods, my refuge from the toilsome world of business, receive me in your quiet sanctuaries, and favour my retreat and thoughtful solitude. Ye verdant plains, how gladly I salute ye! Hail all ye blissful mansions! known seats! delightful prospects! majestic beauties of this earth, and all ye rural powers and graces! Blessed be ye chaste abodes of happiest mortals, who here in peaceful innocence enjoy a life unenvied, though divine; whilst with its blessed tranquillity it affords a happy leisure and retreat for man, who, made for contemplation, and to search his own and other natures, may here best meditate the cause of things, and, placed amidst the various scenes of Nature, may nearer view her works.

'O glorious nature! supremely fair and sovereignly good! all-loving and all-lovely, all-divine! whose looks are so becoming and of such infinite grace; whose study brings such wisdom, and whose contemplation such delight; whose every single work affords an ampler scene, and is a nobler spectacle than all which ever art presented! O mighty Nature! wise substitute of Providence! impowered creatress! Or thou empowering Deity, supreme creator! Thee I invoke and thee alone adore. To thee this solitude, this place, these rural meditations are sacred; whilst thus inspired with harmony of thought, though unconfined by words, and in loose numbers, I sing of Nature's order in created beings, and celebrate the beauties which resolve in thee, the source and principle of all beauty and perfection.

'Thy being is boundless, unsearchable, impenetrable. In thy immensity all thought is lost, fancy gives over its flight, and wearied imagination spends itself in vain, finding no coast nor limit of this ocean, nor, in the widest tract through which it soars, one point yet nearer the circumference than the first centre whence it parted. Thus having oft essayed, thus sallied forth into the wide expanse, when I return again within myself, struck with the sense of this so narrow being and of the fulness of that immense one, I dare no more behold the amazing depths nor sound the abyss of Deity.

'Yet since by thee, O sovereign mind, I have been formed such as I am, intelligent and rational, since the peculiar dignity of my nature is to know and contemplate thee, permit that with due freedom I exert those faculties with which thou hast adorned

me. Bear with my venturous and bold approach. And since nor vain curiosity, nor fond conceit, nor love of aught save thee alone inspires me with such thoughts as these, be thou my assistant and guide me in this pursuit, whilst I venture thus to tread the labyrinth of wide Nature and endeavour to trace thee in thy works.'

Here he stopped short, and starting as out of a dream: now, Philocles, said he, inform me, how have I appeared to you in my fit? Seemed it a sensible kind of madness, like those transports which are permitted to our poets? or was it down-right raving?

I only wish, said I, that you had been a little stronger in your transport, to have proceeded as you began, without ever minding me. For I was beginning to see wonders in that Nature you taught me, and was coming to know the hand of your divine Artificer. But if you stop here I shall lose the enjoyment of the pleasing vision. And already I begin to find a thousand difficulties in fancying such a universal genius as you describe.

* * *

Thus I continue then, said Theocles, addressing myself as you would have me, to that guardian deity and inspirer whom we are to imagine present here, but not here only. For, 'O mighty Genius! sole animating and inspiring power! author and subject of these thoughts! thy influence is universal, and in all things thou art inmost. From thee depend their secret springs of action. Thou movest them with an irresistible unwearied force, by sacred and inviolable laws, framed for the good of each particular being, as best may suit with the perfection, life, and vigour of the whole. The vital principle is widely shared and infinitely varied, dispersed throughout, nowhere extinct. All lives, and by succession still revives. The temporary beings quit their borrowed forms and yield their elementary substance to new-comers. Called in their several turns to life, they view the light, and viewing pass, that others too may be spectators of the goodly scene, and greater numbers still enjoy the privilege of Nature. Munificent and great, she imparts herself to most and makes the subjects of her bounty infinite. Nought stays her hastening hand. No time nor substance is lost or unimproved. New forms arise, and when the old dissolve, the matter whence they were composed is not left useless, but wrought with equal management and art, even in corruption, Nature's seeming waste and vile abhorrence. The abject state appears merely as the way or passage to some better. But could we nearly view it, and with indifference, remote from the antipathy of sense, we then perhaps should highest raise our admiration, convinced that even the way itself was equal to the end. Nor can we judge less favourably of that consummate art exhibited through all the works of Nature, since our weak eyes, helped by mechanic art, discover in these works a hidden scene of wonders, worlds within worlds of infinite minuteness, though as to art still equal to the greatest, and pregnant with more wonders than the most discerning sense, joined with the greatest art or the acutest reason, can penetrate or unfold.

'But 'tis in vain for us to search the bulky mass of matter, seeking to know its nature; how great the whole itself, or even how small its parts.

'If, knowing only some of the rules of motion, we seek to trace it further, 'tis in vain we follow it into the bodies it has reached. Our tardy apprehensions fail us, and can reach nothing beyond the body itself, through which it is diffused. Wonderful

being (if we may call it so), which bodies never receive except from others which lose it, nor ever lose, unless by imparting it to others. Even without change of place it has its force, and bodies big with motion labour to move, yet stir not, whilst they express an energy beyond our comprehension.

'In vain, too, we pursue that phantom time, too small, and yet too mighty for our grasp, when, shrinking to a narrow point, it escapes our hold, or mocks our scanty thought by swelling to eternity, an object unproportioned to our capacity, as is thy being, O thou ancient cause! older than time, yet young with fresh eternity.

'In vain we try to fathom the abyss of space, the seat of thy extensive being, of which no place is empty, no void which is not full.

'In vain we labour to understand that principle of sense and thought, which seeming in us to depend so much on motion, yet differs so much from it and from matter itself as not to suffer us to conceive how thought can more result from this than this arise from thought. But thought we own pre-eminent, and confess the realest of beings, the only existence of which we are made sure by being conscious. All else may be only dream and shadow. All which even sense suggests may be deceitful. The sense itself remains still; reason subsists, and thought maintains its eldership of being. Thus are we in a manner conscious of that original and eternally existent thought whence we derive our own. And thus the assurance we have of the existence of beings above our sense and of thee (the great exemplar of thy works) comes from thee, the all true and perfect, who hast thus communicated thyself more immediately to us, so as in some manner to inhabit within our souls, thou who art original soul, diffusive, vital in all, inspiriting the whole.

'All Nature's wonders serve to excite and perfect this idea of their author. 'Tis here he suffers us to see, and even converse with him in a manner suitable to our frailty. How glorious is it to contemplate him in this noblest of his works apparent to us, the system of the bigger world!

* * *

... The wildness pleases. We seem to live alone with Nature. We view her in her inmost recesses, and contemplate her with more delight in these original wilds than in the artificial labyrinths and feigned wildernesses of the palace. The objects of the place, the scaly serpents, the savage beasts, and poisonous insects, how terrible soever, or how contrary to human nature, are beautiful in themselves, and fit to raise our thoughts in admiration of that divine wisdom, so far superior to our short views. Unable to declare the use or service of all things in this universe, we are yet assured of the perfection of all, and of the justice of that economy to which all things are subservient, and in respect of which things seemingly deformed are amiable, disorder becomes regular, corruption wholesome, and poisons (such as these we have seen) prove healing and beneficial.

'But behold! through a vast tract of sky before us, the mighty Atlas rears his lofty head covered with snow above the clouds. Beneath the mountain's foot the rocky country rises into hills, a proper basis of the ponderous mass above, where huge embodied rocks lie piled on one another, and seem to prop the high arch of heaven. . . . See! with what trembling steps poor mankind tread the narrow brink of the deep precipices, from whence with giddy horror they look down, mistrusting even the ground which bears them, whilst they hear the hollow sound of torrents

underneath, and see the ruin of the impending rock, with falling trees which hang with their roots upwards and seem to draw more ruin after them. Here thoughtless men, seized with the newness of such objects, become thoughtful, and willingly contemplate the incessant changes of this earth's surface. They see, as in one instant, the revolutions of past ages, the fleeting forms of things, and the decay even of this our globe, whose youth and first formation they consider, whilst the apparent spoil and irreparable breaches of the wasted mountain show them the world itself only as a noble ruin, and make them think of its approaching period. . . . But here, mid-way the mountain, a spacious border of thick wood harbours our wearied travellers, who now are come among the ever green and lofty pines, the firs, and noble cedars, whose towering heads seem endless in the sky, the rest of the trees appearing only as shrubs beside them. And here a different horror seizes our sheltered travellers when they see the day diminished by the deep shades of the vast wood, which, closing thick above, spreads darkness and eternal night below. The faint and gloomy light looks horrid as the shade itself; and the profound stillness of these places imposes silence upon men, struck with the hoarse echoings of every sound within the spacious caverns of the wood. Here space astonishes; silence itself seems pregnant, whilst an unknown force works on the mind, and dubious objects move the wakeful sense. Mysterious voices are either heard or fancied, and various forms of deity seem to present themselves and appear more manifest in these sacred silvan scenes, such as of old gave rise to temples, and favoured the religion of the ancient world. Even we ourselves, who in plain characters may read divinity from so many bright parts of earth, choose rather these obscurer places to spell out that mysterious being, which to our weak eyes appears at best under a veil of cloud. . . .'

Here he paused a while and began to cast about his eyes, which before seemed fixed. He looked more calmly, with an open countenance and free air, by which, and other tokens, I could easily find we were come to an end of our descriptions, and that whether I would or no, Theocles was now resolved to take his leave of the sublime, the morning being spent and the forenoon by this time well advanced.

* * *

'Tis true, said I, Theocles, I own it. Your genius, the genius of the place, and the Great Genius have at last prevailed. I shall no longer resist the passion growing in me for things of a natural kind, where neither art nor the conceit or caprice of man has spoiled their genuine order by breaking in upon that primitive state. Even the rude rocks, the mossy caverns, the irregular unwrought grottos and broken falls of waters, with all the horrid graces of the wilderness itself, as representing Nature more, will be the more engaging, and appear with a magnificence beyond the formal mockery of princely gardens. . . . But tell me, I entreat you, how comes it that, excepting a few philosophers of your sort, the only people who are enamoured in this way, and seek the woods, the rivers, or seashores, are your poor vulgar lovers?

Say not this, replied he, of lovers only. For is it not the same with poets, and all those other students in nature and the arts which copy after her? In short, is not this the real case of all who are lovers either of the Muses or the Graces?

However, said I, all those who are deep in this romantic way are looked upon, you know, as a people either plainly out of their wits, or overrun with melancholy and enthusiasm. We always endeavour to recall them from these solitary places. And I

must own that often when I have found my fancy run this way, I have checked myself, not knowing what it was possessed me, when I was passionately struck with objects of this kind.

No wonder, replied he, if we are at a loss when we pursue the shadow for the substance. For if we may trust to what our reasoning has taught us, whatever in Nature is beautiful or charming is only the faint shadow of that first beauty. So that every real love depending on the mind, and being only the contemplation of beauty either as it really is in itself or as it appears imperfectly in the objects which strike the sense, how can the rational mind rest here, or be satisfied with the absurd enjoyment which reaches the sense alone?

From this time forward then, said I, I shall no more have reason to fear those beauties which strike a sort of melancholy, like the places we have named, or like these solemn groves. No more shall I avoid the moving accents of soft music, or fly from the enchanting features of the fairest human face.

If you are already, replied he, such a proficient in this new love that you are sure never to admire the representative beauty except for the sake of the original, nor aim at other enjoyment than of the rational kind, you may then be confident. I am so, and presume accordingly to answer for myself. However, I should not be ill satisfied if you explained yourself a little better as to this mistake of mine you seem to fear. Would it be any help to tell you, 'That the absurdity lay in seeking the enjoyment elsewhere than in the subject loved?' The matter, I must confess, is still mysterious. Imagine then, good Philocles, if being taken with the beauty of the ocean, which you see yonder at a distance, it should come into your head to seek how to command it, and, like some mighty admiral, ride master of the sea, would not the fancy be a little absurd?

Absurd enough, in conscience. The next thing I should do, 'tis likely, upon this frenzy, would be to hire some bark and go in nuptial ceremony, Venetian-like, to wed the gulf, which I might call perhaps as properly my own.

Let who will call it theirs, replied Theocles, you will own the enjoyment of this kind to be very different from that which should naturally follow from the contemplation of the ocean's beauty. The bridegroom-Doge, who in his stately Bucentaur floats on the bosom of his Thetis, has less possession than the poor shepherd, who from a hanging rock or point of some high promontory, stretched at his ease, forgets his feeding flocks, while he admires her beauty. But to come nearer home, and make the question still more familiar. Suppose (my Philocles) that, viewing such a tract of country as this delicious vale we see beneath us, you should, for the enjoyment of the prospect, require the property or possession of the land.

The covetous fancy, replied I, would be as absurd altogether as that other ambitious one.

O Philocles! said he, may I bring this yet a little nearer, and will you follow me once more? Suppose that, being charmed as you seem to be with the beauty of those trees under whose shade we rest, you should long for nothing so much as to taste some delicious fruit of theirs; and having obtained of Nature some certain relish by which these acorns or berries of the wood became as palatable as the figs or peaches of the garden, you should afterwards, as oft as you revisited these groves, seek hence the enjoyment of them by satiating yourself in these new delights.

The fancy of this kind, replied I, would be sordidly luxurious, and as absurd, in my opinion, as either of the former.

Can you not then, on this occasion, said he, call to mind some other forms of a fair kind among us, where the admiration of beauty is apt to lead to as irregular a consequence?

I feared, said I, indeed, where this would end, and was apprehensive you would force me at last to think of certain powerful forms in human kind which draw after them a set of eager desires, wishes, and hopes; no way suitable, I must confess, to your rational and refined contemplation of beauty. The proportions of this living architecture, as wonderful as they are, inspire nothing of a studious or contemplative kind. The more they are viewed, the further they are from satisfying by mere view. Let that which satisfies be ever so disproportionable an effect, or ever so foreign to its cause, censure it as you please, you must allow, however, that it is natural. So that you, Theocles, for aught I see, are become the accuser of Nature by condemning a natural enjoyment.

Far be it from us both, said he, to condemn a joy which is from Nature. But when we spoke of the enjoyment of these woods and prospects, we understood by it a far different kind from that of the inferior creatures, who, rifling in these places, find here their choicest food. Yet we too live by tasteful food, and feel those other joys of sense in common with them. But 'twas not here (my Philocles) that we had agreed to place our good, nor consequently our enjoyment. We who were rational, and had minds, methought, should place it rather in those minds which were indeed abused, and cheated of their real good, when drawn to seek absurdly the enjoyment of it in the objects of sense, and not in those objects they might properly call their own, in which kind, as I remember, we comprehended all which was truly fair, generous, or good.

So that beauty, said I, and good with you, Theocles, I perceive, are still one and the same.

'Tis so, said he. And thus are we returned again to the subject of our yesterday's morning conversation. Whether I have made good my promise to you in showing the true good, I know not. But so, doubtless, I should have done with good success had I been able in my poetic ecstasies, or by any other efforts, to have led you into some deep view of Nature and the sovereign genius. We then had proved the force of divine beauty, and formed in ourselves an object capable and worthy of real enjoyment.

3 Anthony Ashley Cooper, third Earl of Shaftesbury (1671–1713) 'A Notion of the Historical Draught of the Tablature of the Judgement of Hercules'

Shaftesbury's notional sketch of an exemplary history painting sets virtue and pleasure in competition, in a context sanctioned by classical authority. The theme is the young Hercules, faced at the crossroads of his life with the choice between 'Virtus' (Virtue) and 'Voluptas' (Pleasure or Vice), each represented by a woman of appropriate aspect who

invites him to follow the path she indicates. (Shaftesbury's text is taken from the Sophist Prodicus as represented in Xenophon's *Memorabilia*. We have omitted the lengthy footnote in which Prodicus' account is given.) Shaftesbury writes as though engaged in the thorough imagination of an appropriate painted composition or 'tablature' – somewhat disingenuously, since his 'invention' follows closely on the precedent of Annibale Carracci's painting on the theme made for the Farnese Palace in Florence (1596–7, now Naples, Capodimonte Museum), which was engraved in a widely circulated set by Petrus Aquila. The subject was also treated by Poussin in a painting owned in the early eighteenth century by James Brydges, later Duke of Chandos (now National Trust, Stourhead). In fact, Shaftesbury's aim seems to have been less to achieve the 'invention' of a painting than to discourse upon the proper conditions and functions of elevated history painting in general, supported by the authority of various previous writers whom he cites in quotations. He did give his treatise practical effect, however, making it the basis for a commission from the Italian painter Paolo de Matteis (1662–1728), who painted three versions of *Hercules at the Crossroads between Virtue and Vice* (now Leeds, Temple Newsam House, dated 1712; Munich, Alte Pinakothek; and Oxford, Ashmolean Museum). We have included Shaftesbury's introduction and chapter I, which is concerned with matters of consistency and priority in the interpretation of the chosen theme, together with chapter V, on such stylistic matters as drapery and scene-setting. Chapters II, III and IV, omitted here, are concerned with the manners in which the three principal figures should be represented. Shaftesbury's treatise was the product of conversation with French *littérateurs* and painters. It was originally written in French and was published in the *Journal des Sçavans* in November 1712. An English version was printed the following year, and a German translation in 1759. Shaftesbury also intended the treatise for inclusion in a collection under the title *Second Characters, or the Language of Forms*, which remained unpublished at the time of his death. This volume was finally edited by Benjamin Rand and published by Cambridge University Press in 1914. Our text is taken from the reprint of this edition, New York: Greenwood Press, 1969, pp. 30–8 and 49–56.

Introduction

(1) Before we enter on the examination of our historical sketch, it may be proper to remark, that by the word *Tablature* (for which we have yet no name in English, besides the general one of picture) we denote, according to the original word *Tabula*, a work not only distinct from a mere portraiture, but from all those wilder sorts of painting which are in a manner absolute, and independent; such as the paintings in fresco upon the walls, the ceilings, the staircases, the cupola's, and other remarkable places either of churches or palaces.

(2) Accordingly we are to understand, that it is not merely the shape or dimension of a cloth, or board, which denominates the piece or *tablature*; since a work of this kind may be composed of any coloured substance, as it may of any form; whether square, oval or round. But it is then that in painting we may give to any particular work the name of *Tablature*, when the work is in reality 'a single piece, comprehended in one view, and formed according to one single intelligence, meaning, or design; which constitutes a real whole, by a mutual and necessary relation of its parts, the same as of the members in a natural body.' So that one may say of a picture composed of any number of figures differently ranged, and without any regard to this correspondency or union described, that it is no more a real piece or *tablature* than a

picture would be a man's picture, or proper portraiture, which represented on the same cloth, in different places, the legs, arms, nose, and eyes of such a person, without adjusting them according to the true proportion, air, and character which belonged to him.

(3) This regulation has place even in the inferior degrees of painting; since the mere flower-painter is, we see, obliged to study the form of festoons and to make use of a peculiar order, or architecture of vases, jars, cannisters, pedestals, and other inventions, which serve as machines, to frame a certain proportionate assemblage, or united mass, according to the rules of perspective; and with regard as well to the different shapes and sizes of his several flowers, as to the harmony of colours resulting from the whole: this being the only thing capable of rendering his work worthy the name of a composition or real piece.

(4) So much the more, therefore, is this regulation applicable to history-painting, where not only men, but manners, and human passions are represented. Here the unity of design must with more particular exactness be preserved, according to the just rules of poetic art; that in the representation of any event, or remarkable fact, the probability, or seeming truth (which is the real truth of art) may with the highest advantage be supported and advanced: as we shall better understand in the argument which follows on the historical tablature of the Judgment of Hercules; who being young, and retired to a solitary place in order to deliberate on the choice he was to make of the different ways of life, was accosted (as our historian relates) by the two goddesses, Virtue and Pleasure. It is on the issue of the controversy between these two, that the character of Hercules depends. So that we may naturally give to this piece and history, as well the title of The Education, as the Choice or Judgment of Hercules.

Chapter I

Of the general constitution or ordinance of the tablature

(1) THIS fable or history may be variously represented, according to the order of time:

Either in the instant when the two goddesses (Virtue and Pleasure) accost Hercules;

Or when they are entered on their dispute;

Or when their dispute is already far advanced, and Virtue seems to gain her cause.

(2) According to the first notion, Hercules must of necessity seem surprized on the first appearance of such miraculous forms. He admires, he contemplates; but is not yet engaged or interested. According to the second notion, he is interested, divided, and in doubt. According to the third, he is wrought, agitated, and torn by contrary passions. It is the last effort of the virtuous one, striving for possession over him. He agonizes, and with all his strength of reason endeavours to overcome himself:

Et premitur ratione animus, vincique laborat.

[‘And the first thing to be considered is the work that surrounds me.’]

(3) Of these different periods of time, the latter has been chosen; as being the only one of the three, which can well serve to express the grand event, or consequent resolution of Hercules, and the choice he actually made of a life full of toil and hardship, under the conduct of Virtue, for the deliverance of mankind from tyranny and oppression. And it is to such a piece, or tablature, as represents this issue of the balance, in our pondering hero, that we may justly give the title of the Decision or Judgment of Hercules.

(4) The same history may be represented yet according to a fourth date or period: as at the time when Hercules is entirely won by Virtue. But then the signs of this resolute determination reigning absolutely in the attitude, and air of our young hero; there would be no room left to represent his agony, or inward conflict, which indeed makes the principal action here; as it would do in a poem, were this subject to be treated by a good poet. Nor would there be any more room left in this case, either for the persuasive rhetoric of Virtue (who must have already ended her discourse) or for the insinuating address of Pleasure, who having lost her cause, must necessarily appear displeas'd, or out of humour: a circumstance which would no way suit her character.

(5) In the original story or fable of this adventure of our young Hercules, it is particularly noted, that Pleasure, advancing hastily before Virtue, began her plea, and was heard with prevention; as being first in turn. And as this fable is wholly philosophical and moral, this circumstance in particular is to be considered as essential.

(6) In this third period therefore of our history (dividing it, as we have done, into four successive dates or points of time) Hercules being auditor, and attentive, speaks not. Pleasure has spoken. Virtue is still speaking. She is about the middle, or towards the end of her discourse; in the place where, according to just rhetoric, the highest tone of voice and strongest action are employed.

(7) It is evident, that every master in painting, when he has made choice of the determinate date or point of time, according to which he would represent his history, is afterwards debarred the taking advantage from any other action than what is immediately present, and belonging to that single instant he describes. For if he passes the present only for a moment, he may as well pass it for many years. And by this reckoning he may with as good right repeat the same figure several times over, and in one and the same picture represent Hercules in his cradle, struggling with the serpents; and the same Hercules of full age, fighting with the Hydra, with Anteus, and with Cerberus: which would prove a mere confused heap, or knot of pieces, and not a single entire piece, or tablature, of the historical kind.

(8) It may however be allowable, on some occasions, to make use of certain enigmatical or emblematical devices, to represent a future time: as when Hercules, yet a mere boy, is seen holding a small club, or wearing the skin of a young lion. For so we often find him in the best antiques. And though history had never related of Hercules, that being yet very young, he killed a lion with his own hand; this representation of him would nevertheless be entirely conformable to poetic truth; which not only admits, but necessarily presupposes prophecy or prognostication, with regard to the actions, and lives of heroes and great men. Besides that as to our subject, in particular, the natural genius of Hercules, even in his tenderest youth,

might alone answer for his handling such arms as these, and bearing, as it were in play, these early tokens of the future hero.

(9) To preserve therefore a just conformity with historical truth, and with the unity of time and action, there remains no other way by which we can possibly give a hint of any thing future, or call to mind any thing past, than by setting in view such passages or events as have actually subsisted, or according to nature might well subsist, or happen together in one and the same instant. And this is what we may properly call the rule of consistency.

(10) How is it therefore possible, says one, to express a change of passion in any subject, since this change is made by succession; and that in this case the passion which is understood as present, will require a disposition of body and features wholly different from the passion which is over, and past? To this we answer, That notwithstanding the ascendancy or reign of the principal and immediate passion, the artist has power to leave still in his subject the tracts or footsteps of its predecessor: so as to let us behold not only a rising passion together with a declining one: but, what is more, a strong and determinate passion, with its contrary already discharged and banished. As for instance, when the plain tracts of tears new fallen, with other fresh tokens of mourning and dejection, remain still in a person newly transported with joy at the sight of a relation or friend, who the moment before had been lamented as one deceased or lost.

(11) Again, by the same means which are employed to call to mind the past, we may anticipate the future: as would be seen in the case of an able painter, who should undertake to paint this history of Hercules according to the third date or period of time proposed for our historical tabature. For in this momentary turn of action, Hercules remaining still in a situation expressive of suspense and doubt, would discover nevertheless that the strength of this inward conflict was over, and that victory began now to declare herself in favour of virtue. This transition, which seems at first so mysterious a performance, will be easily comprehended, if one considers, that the body, which moves much slower than the mind, is easily outstripped by this latter; and that the mind on a sudden turning itself some new way, the nearer situated and more sprightly parts of the body (such as the eyes, and muscles about the mouth and forehead) taking the alarm, and moving in an instant, may leave the heavier and more distant parts to adjust themselves, and change their attitude some moments after.

(12) This different operation may be distinguished by the names of anticipation and repeal.

(13) If by any other method an artist should pretend to introduce into this piece any portion of time, future or past, he must either sin directly against the law of truth and credibility, in representing things contrary and incompatible; or against that law of unity and simplicity of design, which constitutes the very being of his work. This particularly shews itself in a picture, when one is necessarily left in doubt, and unable to determine readily, which of the distinct successive parts of the history or action is that very one represented in the design. For even here the case is the same as in the other circumstances of poetry and painting: 'That what is principal or chief, should immediately shew itself, without leaving the mind in any uncertainty.'

(14) According to this rule of the unity of time, if one should ask an artist, who had painted this history of the Judgment of Hercules, 'Which of these four periods or dates of time above proposed he intended in his picture to represent?' and it should happen that he could not readily answer, It was this, or that: it would appear plainly he had never formed a real notion of his workmanship, or of the history he intended to represent. So that when he had executed even to a miracle all those other beauties requisite in a piece, and had failed in this single one, he would from hence alone be proved to be in truth no history-painter, or artist in the kind, who understood not so much as how to form the real design of a historical piece.

* * *

Chapter V

Of the ornaments of the piece; and chiefly of the drapery, and perspective

(1) It is sufficiently known, how great a liberty painters are used to take, in the colouring of their habits, and of other draperies belonging to their historical pieces. If they are to paint a Roman people, they represent them in different dresses; though it be certain the common people among them were habited very near alike, and much after the same colour. In like manner, the Egyptians, Jews, and other ancient nations, as we may well suppose, bore in this particular their respective likeness or resemblance one to another, as at present the Spaniards, Italians, and several other people of Europe. But such a resemblance as this would, in the way of painting, produce a very untoward effect; as may easily be conceived. For this reason the painter makes no scruple to introduce philosophers, and even apostles, in various colours, after a very extraordinary manner. It is here that the historical truth must of necessity indeed give way to that which we call poetical, as being governed not so much by reality, as by probability, or plausible appearance. So that a painter, who uses his privilege or prerogative in this respect, ought however to do it cautiously, and with discretion. And when occasion requires that he should present us his philosophers or apostles thus variously coloured, he must take care at least so to mortify his colours, that these plain poor men may not appear, in his piece, adorned like so many lords or princes of the modern garb.

(2) If, on the other hand, the painter should happen to take for his subject some solemn entry or triumph, where, according to the truth of fact, all manner of magnificence had without doubt been actually displayed, and all sorts of bright and dazzling colours heaped together and advanced, in emulation, one against another; he ought on this occasion, in breach of the historical truth, or truth of fact, to do his utmost to diminish and reduce the excessive gaiety and splendour of those objects, which would otherwise raise such a confusion, oppugnancy, and riot of colours, as would to any judicious eye appear absolutely intolerable.

(3) It becomes therefore an able painter in this, as well as in the other parts of his workmanship, to have regard principally, and above all, to the agreement or correspondency of things. And to that end it is necessary he should form in his mind a certain note or character of unity, which being happily taken, would, out of the many colours of his piece, produce (if one may say so) a particular distinct species of an

original kind: like those compositions in music, where among the different airs (such as sonatas, entries, or sarabands) there are different and distinct species, of which we may say in particular, as to each, 'that it has its own proper character or genius, peculiar to itself.'

(4) Thus the harmony of painting requires, 'that in whatever key the painter begins his piece, he should be sure to finish it in the same.'

(5) This regulation turns on the principal figure, or on the two or three which are eminent, in a tablature composed of many. For if the painter happens to give a certain height or richness of colouring to his principal figure; the rest must in proportion necessarily partake this genius. But if, on the contrary, the painter should have chanced to give a softer air, with more gentleness and simplicity of colouring, to his principal figure; the rest must bear a character proportionable, and appear in an extraordinary simplicity; that one and the same spirit may, without contest, reign through the whole of his design.

(6) Our historical draught of Hercules will afford us a very clear example in the case. For considering that the hero is to appear on this occasion retired and gloomy; being withal in a manner naked, and without any other covering than a lion's skin, which is itself of a yellow and dusky colour; it would be really impracticable for a painter to represent this principal figure in any extraordinary brightness or lustre. From whence it follows, that in the other inferior figures or subordinate parts of the work, the painter must necessarily make use of such still quiet colours, as may give to the whole piece a character of solemnity and simplicity, agreeable with itself. Now should our painter honestly go about to follow his historian, according to the literal sense of the history, which represents Virtue to us in a resplendent robe of the purest and most glossy white, it is evident he must after this manner destroy his piece. The good painter in this, as in all other occasions of like nature, must do as the good poet; who undertaking to treat some common and known subject, refuses however to follow strictly, like a mere copyist or translator, any preceding poet or historian; but so orders it, that his work in itself becomes really new and original . . .

(7) As for what relates to the perspective or scene of our historical piece, it ought so to present itself, as to make us instantly conceive that it is in the country, and in a place of retirement, near some wood or forest, that this whole action passes. For it would be impertinent to bring architecture or buildings of whatever kind in view, as tokens of company, diversion, or affairs, in a place purposely chosen to denote solitude, thoughtfulness, and premeditated retreat. Besides, that according to the poets (our guides and masters in this art) neither the goddesses, nor other divine forms of whatever kind, cared ever to present themselves to human sight, elsewhere than in these deep recesses . . .

(8) As to the fortress, temple, or palace, of Virtue, situated on a mountain, after the emblematical way, as we see represented in some pieces formed upon this subject; there is nothing of this kind expressed by our historian. And should this or any thing of a like nature present itself in our design, it would fill the mind with foreign fancies, and mysterious views, no way agreeable to the taste and genius of this piece. Nor is there any thing, at the same time, on Pleasure's side, to answer, by way of opposition, to this palace of Virtue; which, if expressed, would on this account destroy the just simplicity and correspondency of our work.

(9) Another reason against the perspective part, the architecture, or other studied ornaments of the landscape kind, in this particular piece of ours, is, that in reality there being no occasion for these appearances, they would prove a mere incumbrance to the eye, and would of necessity disturb the sight, by diverting it from that which is principal, the history and fact. Whatsoever appears in a historical design, which is not essential to the action, serves only to confound the representation, and perplex the mind: more particularly, if these episodic parts are so lively wrought, as to vie with the principal subject, and contend for precedency with the figures and human life. A just design, or tablature, should, at first view, discover, what nature it is designed to imitate; what life, whether of the higher or lower kind, it aims chiefly to represent. The piece must by no means be equivocal or dubious; but must with ease distinguish itself, either as historical and moral, or as perspective and merely natural. If it be the latter of these beauties, which we desire to see delineated according to its perfection, then the former must give place. The higher life must be allayed, and in a manner discountenanced and obscured; whilst the lower displays itself, and is exhibited as principal. Even that which according to a term of art we commonly call still-life, and is in reality of the last and lowest degree of painting, must have its superiority and just preference in a tablature of its own species. It is the same in animal pieces, where beasts or fowl are represented. In landscape, inanimates are principal: it is the earth, the water, the stones and rocks which live. All other life becomes subordinate. Humanity, sense, manners, must in this place yield, and become inferior. It would be a fault even to aim at the expression of any real beauty in this kind, or go about to animate or heighten in any considerable degree the accompanying figures of men, or deities which are accidentally introduced, as appendices, or ornaments, in such a piece. But if, on the contrary, the human species be that which first presents itself in a picture; if it be the intelligent life, which is set to view; it is the other species, the other life, which must then surrender and become subservient. The merely natural must pay homage to the historical or moral. Every beauty, every grace must be sacrificed to the real beauty of this first and highest order. For nothing can be more deformed than a confusion of many beauties: and the confusion becomes inevitable, where the subjection is not complete.

(10) By the word moral are understood, in this place, all sorts of judicious representations of the human passions; as we see even in battle pieces; excepting those of distant figures, and the diminutive kind; which may rather be considered as a sort of landscape. In all other martial pieces, we see expressed in lively action, the several degrees of valour, magnanimity, cowardice, terror, anger, according to the several characters of nations, and particular men. It is here that we may see heroes and chiefs (such as the Alexanders or Constantines) appear, even in the hottest of the action, with a tranquillity and sedateness of mind peculiar to themselves: which is, indeed, in a direct and proper sense, profoundly moral.

(11) But as the moral part is differently treated in a poem, from what it is in history, or in a philosophical work; so must it, of right, in painting be far differently treated, from what it naturally is, either in the history, or poem. For want of a right understanding of this maxim, it often happens that by endeavouring to render a piece highly moral and learned, it becomes thoroughly ridiculous and impertinent.

(12) For the ordinary works of sculpture, such as the low-relieves, and ornaments of columns and edifices, great allowance is made. The very rules of perspective are here wholly reversed, as necessity requires, and are accommodated to the circumstance and genius of the place or building, according to a certain oeconomy or order of a particular and distinct kind . . . But for the completely imitative and illusive art of painting, whose character it is to employ in her works the united force of different colours; and, who surpassing by so many degrees, and in so many privileges, all other human fiction, or imitative art, aspires in a directer manner towards deceit, and a command over our very sense; she must of necessity abandon whatever is over-learned, humorous, or witty; to maintain herself in what is natural, credible, and winning of our assent: that she may thus acquit herself of what is her chief province, the specious appearance of the object she represents . . .

(13) We are therefore to consider this as a sure maxim or observation in painting, 'that a historical and moral piece must of necessity lose much of its natural simplicity and grace, if any thing of the emblematical or enigmatic kind be visibly and directly intermixed.' As if, for instance, the circle of the Zodiac, with its twelve signs, were introduced. Now this being an appearance which carries not any matter of similitude or colourable resemblance to any thing extant in real nature; it cannot possibly pretend to win the sense, or gain belief, by the help of any poetical enthusiasm, religious history, or faith. For by means of these, indeed, we are easily induced to contemplate as realities those divine personages and miraculous forms, which the leading painters, ancient and modern, have speciously designed, according to the particular doctrine or theology of their several religious and national beliefs. But for our tablature in particular, it carries nothing with it of the mere emblematical or enigmatic kind: since for what relates to the double way of the vale and mountain, this may naturally and with colourable appearance be represented at the mountain's foot. But if on the summit or highest point of it, we should place the fortress, or palace of virtue, rising above the clouds, this would immediately give the enigmatical mysterious air to our picture, and of necessity destroy its persuasive simplicity, and natural appearance.

(14) In short, we are to carry this remembrance still along with us, 'that the fewer the objects are, besides those which are absolutely necessary in a piece, the easier it is for the eye, by one simple act and in one view, to comprehend the sum or whole.' The multiplication of subjects, though subaltern, renders the subordination more difficult to execute in the ordinance or composition of a work. And if the subordination be not perfect, the order (which makes the beauty) remains imperfect. Now the subordination can never be perfect, except 'when the ordinance is such, that the eye not only runs over with ease the several parts of the design (reducing still its view each moment on the principal subject on which all turns), but when the same eye, without the least detainment in any of the particular parts, and resting, as it were, immovable in the middle, or centre of the tablature, may see at once, in an agreeable and perfect correspondency, all which is there exhibited to the sight.'

4 Joseph Addison (1672–1719) ‘On the Pleasures of the Imagination’

Playwright, poet, politician and journalist, Addison was one of the figures of his age. After a classical education at Charterhouse and Oxford, he travelled in Europe for four years from 1699 to 1703. The resulting book, *Remarks upon Several Parts of Italy* (1705) became the standard guide for English gentlemen undertaking the Grand Tour. Together with Richard Steele, Addison produced and wrote two magazines, *The Tatler* (1709–11), and *The Spectator* (1711–12 and 1714) which did much to establish modern periodical journalism. In effect, Addison became the premier arbiter of taste in England on issues ranging from gardening and manners to literature and art. ‘The Pleasures of the Imagination’ was his most influential piece of cultural journalism. Addison begins by claiming that sight is our most important sense, and the greatest stimulus to the imagination. He then distinguishes the pleasures of the imagination from those of understanding. For Addison, the imagination occupies a mid-point between the relatively crude pleasures of the senses, and the higher pleasures of rational understanding. But for all that it is in that sense inferior, the imagination can dominate the understanding, since its pleasures are more vivid and easier to acquire. Addison’s third main point is to divide the pleasures of the imagination into two kinds, ‘primary’ and ‘secondary’: the former derived from objects before our sight, the latter from things or kinds of things we have seen and are then able to summon up in our memories. ‘The Pleasures of the Imagination’ appeared in eleven instalments in daily issues of *The Spectator*, in 1712. Our extracts are taken from Papers I (no. 411, Saturday 21 June); II (no. 412, Monday 23); IV (no. 414, Wednesday 25); and VI (no. 416, Friday 27). Our source was *The Spectator with a Biographical, Historical and Critical Preface by the Rev. Rob. Lynham in Six Volumes*, London: Cowie, Low and Co., 1826, vol. 4, pp. 377–84, and vol. 5, pp. 5–15.

Paper I.

Our sight is the most perfect and most delightful of all our senses. It fills the mind with the largest variety of ideas, converses with its objects at the greatest distance, and continues the longest in action without being tired or satiated with its proper enjoyments. The sense of feeling can indeed give us a notion of extension, shape, and all other ideas that enter at the eye, except colours; but at the same time it is very much straitened, and confined in its operations to the number, bulk, and distance of its particular objects. Our sight seems designed to supply all these defects, and may be considered as a more delicate and diffusive kind of touch, that spreads itself over an infinite multitude of bodies, comprehends the largest figures, and brings into our reach some of the most remote parts of the universe.

It is this sense which furnishes the imagination with its ideas; so that by ‘the pleasures of the imagination,’ or ‘fancy’ (which I shall use promiscuously), I here mean such as arise from visible objects, either when we have them actually in our view, or when we call up their ideas into our minds by painting, statues, descriptions, or any the like occasion. We cannot indeed have a single image in the fancy that did not make its first entrance through the sight; but we have the power of retaining, altering, and compounding those images which we have once received, into all the varieties of picture and vision that are most agreeable to the imagination: for by this

faculty, a man in a dungeon is capable of entertaining himself with scenes and landscapes more beautiful than any that can be found in the whole compass of nature.

There are few words in the English language which are employed in a more loose and uncircumscribed sense than those of the fancy and the imagination. I therefore thought it necessary to fix and determine the notion of these two words, as I intend to make use of them in the thread of my following speculations, that the reader may conceive rightly what is the subject which I proceed upon. I must therefore desire him to remember, that by 'the pleasures of the imagination,' I mean only such pleasures as arise originally from sight, and that I divide these pleasures into two kinds: my design being first of all to discourse of those primary pleasures of the imagination, which entirely proceed from such objects as are before our eyes; and in the next place to speak of those secondary pleasures of the imagination which flow from the ideas of visible objects, when the objects are not actually before the eye, but are called up into our memories, or formed into agreeable visions of things that are either absent or fictitious.

The pleasures of the imagination, taken in their full extent, are not so gross as those of sense, nor so refined as those of the understanding. The last are indeed more preferable, because they are founded on some new knowledge or improvement in the mind of man; yet it must be confessed, that those of the imagination are as great and as transporting as the other. A beautiful prospect delights the soul as much as a demonstration; and a description in Homer has charmed more readers than a chapter in Aristotle. Besides, the pleasures of the imagination have this advantage above those of the understanding, that they are more obvious, and more easy to be acquired. It is but opening the eye, and the scene enters. The colours paint themselves on the fancy, with very little attention of thought or application of mind in the beholder. We are struck, we know not how, with the symmetry of any thing we see, and immediately assent to the beauty of an object, without inquiring into the particular causes and occasions of it.

A man of a polite imagination is let into a great many pleasures that the vulgar are not capable of receiving. He can converse with a picture, and find an agreeable companion in a statue. He meets with a secret refreshment in a description, and often feels a greater satisfaction in the prospect of fields and meadows, than another does in the possession. It gives him, indeed, a kind of property in every thing he sees, and makes the most rude uncultivated parts of nature administer to his pleasures; so that he looks upon the world as it were in another light, and discovers in it a multitude of charms, that conceal themselves from the generality of mankind.

There are indeed but very few who know how to be idle and innocent, or have a relish of any pleasures that are not criminal; every diversion they take is at the expense of some one virtue or another, and their very first step out of business is into vice or folly. A man should endeavour, therefore, to make the sphere of his innocent pleasures as wide as possible, that he may retire into them with safety, and find in them such a satisfaction as a wise man would not blush to take. Of this nature are those of the imagination, which do not require such a bent of thought as is necessary to our more serious employments, nor, at the same time, suffer the mind to sink into that negligence and remissness, which are apt to accompany our more sensual delights, but, like a gentle exercise to the faculties, awaken them from sloth and idleness, without putting them upon any labour or difficulty. [...]

Paper II.

I shall first consider those pleasures of the imagination which arise from the actual view and survey of outward objects: and these, I think, all proceed from the sight of what is great, uncommon, or beautiful. There may, indeed, be something so terrible or offensive, that the horror or loathsomeness of an object may overbear the pleasure which results from its greatness, novelty, or beauty; but still there will be such a mixture of delight in the very disgust it gives us, as any of these three qualifications are most conspicuous and prevailing.

By greatness, I do not only mean the bulk of any single object, but the largeness of a whole view, considered as one entire piece. Such are the prospects of an open champaign country, a vast uncultivated desert, of huge heaps of mountains, high rocks and precipices, or a wide expanse of waters, where we are not struck with the novelty or beauty of the sight, but with that rude kind of magnificence which appears in many of these stupendous works of nature. Our imagination loves to be filled with an object, or to grasp at any thing that is too big for its capacity. We are flung into a pleasing astonishment at such unbounded views, and feel a delightful stillness and amazement in the soul at the apprehension of them. The mind of man naturally hates every thing that looks like a restraint upon it, and is apt to fancy itself under a sort of confinement, when the sight is pent up in a narrow compass, and shortened on every side by the neighbourhood of walls or mountains. On the contrary, a spacious horizon is an image of liberty, where the eye has room to range abroad, to expatiate at large on the immensity of its views, and to lose itself amidst the variety of objects that offer themselves to its observation. Such wide and undetermined prospects are as pleasing to the fancy as the speculations of eternity or infinitude are to the understanding. But if there be a beauty or uncommonness joined with this grandeur, as in a troubled ocean, a heaven adorned with stars and meteors, or a spacious landscape cut out into rivers, woods, rocks, and meadows, the pleasure still grows upon us, as it arises from more than a single principle.

Every thing that is new or uncommon raises a pleasure in the imagination, because it fills the soul with an agreeable surprise, gratifies its curiosity, and gives it an idea of which it was not before possessed. We are indeed so often conversant with one set of objects, and tired out with so many repeated shows of the same things, that whatever is new or uncommon contributes a little to vary human life, and to divert our minds for a while with the strangeness of its appearance. It serves us for a kind of refreshment, and takes off from that satiety we are apt to complain of, in our usual and ordinary entertainments. It is this that bestows charms on a monster, and makes even the imperfections of nature please us. It is this that recommends variety, where the mind is every instant called off to something new, and the attention not suffered to dwell too long, and waste itself on any particular object. It is this, likewise, that improves what is great or beautiful, and makes it afford the mind a double entertainment. Groves, fields, and meadows, are at any season of the year pleasant to look upon, but never so much as in the opening of the spring, when they are all new and fresh, with their first gloss upon them, and not yet too much accustomed and familiar to the eye. For this reason, there is nothing that more enlivens a prospect than rivers,

jetteaus, or falls of water, where the scene is perpetually shifting, and entertaining the sight every moment with something that is new. We are quickly tired with looking upon hills and valleys, where every thing continues fixed and settled in the same place and posture, but find our thoughts a little agitated and relieved at the sight of such objects as are ever in motion, and sliding away from beneath the eye of the beholder.

But there is nothing that makes its way more directly to the soul than beauty, which immediately diffuses a secret satisfaction and complacency through the imagination, and gives a finishing to any thing that is great or uncommon. The very first discovery of it strikes the mind with an inward joy, and spreads a cheerfulness and delight through all its faculties. There is not perhaps any real beauty or deformity more in one piece of matter than another, because we might have been so made, that whatsoever now appears loathsome to us might have shewn itself agreeable; but we find by experience that there are several modifications of matter, which the mind, without any previous consideration, pronounces at first sight beautiful or deformed. Thus we see that every different species of sensible creatures has its different notions of beauty, and that each of them is most affected with the beauties of its own kind. This is no where more remarkable than in birds of the same shape and proportion, where we often see the male determined in his courtship by the single grain or tincture of a feather, and never discovering any charms but in the colour of its species. [...]

There is a second kind of beauty that we find in the several products of art and nature, which does not work in the imagination with that warmth and violence as the beauty that appears in our proper species, but is apt however to raise in us a secret delight, and a kind of fondness for the places or objects in which we discover it. This consists either in the gaiety or variety of colours, in the symmetry and proportion of parts, in the arrangement and disposition of bodies, or in a just mixture and concurrence of all together. Among these several kinds of beauty the eye takes most delight in colours. We no where meet with a more glorious or pleasing show in nature, than what appears in the heavens at the rising and setting of the sun, which is wholly made up of those different stains of light that shew themselves in clouds of a different situation. For this reason we find the poets, who are always addressing themselves to the imagination, borrowing more of their epithets from colours, than from any other topic.

As the fancy delights in every thing that is great, strange, or beautiful, and is still more pleased the more it finds of these perfections in the same object, so it is capable of receiving a new satisfaction by the assistance of another sense. Thus, any continued sound, as the music of birds, or a fall of water, awakens every moment the mind of the beholder, and makes him more attentive to the several beauties of the place that lie before him. Thus, if there arises a fragrancy of smells or perfumes, they heighten the pleasures of the imagination, and make even the colours and verdure of the landscape appear more agreeable; for the ideas of both senses recommend each other, and are pleasanter together than when they enter the mind separately: as the different colours of a picture, when they are well disposed, set off one another, and receive an additional beauty from the advantage of their situation.

Paper IV.

If we consider the works of nature and art as they are qualified to entertain the imagination, we shall find the last very defective, in comparison of the former; for though they may sometimes appear as beautiful or strange, they can have nothing in them of that vastness and immensity, which afford so great an entertainment to the mind of the beholder. The one may be as polite and delicate as the other, but can never shew herself so august and magnificent in the design. There is something more bold and masterly in the rough careless strokes of nature, than in the nice touches and embellishments of art. The beauties [of] the most stately garden or palace lie in a narrow compass; the imagination immediately runs them over, and requires something else to gratify her; but in the wide fields of nature, the sight wanders up and down without confinement, and is fed with an infinite variety of images, without any certain stint or number. For this reason we always find the poet in love with the country life, where nature appears in the greatest perfection, and furnishes out all those scenes that are most apt to delight the imagination. [...]

But though there are several of those wild scenes, that are more delightful than any artificial shows, yet we find the works of nature still more pleasant, the more they resemble those of art: for in this case our pleasure rises from a double principle; from the agreeableness of the objects to the eye, and from their similitude to other objects. We are pleased as well with comparing their beauties, as with surveying them, and can represent them to our minds, either as copies or originals. Hence it is that we take delight in a prospect which is well laid out, and diversified with fields and meadows, woods and rivers; in those accidental landscapes of trees, clouds, and cities, that are sometimes found in the veins of marble; in the curious fret-work of rocks and grottos; and, in a word, in any thing that hath such a variety or regularity as may seem the effect of design in what we call the works of chance.

If the products of nature rise in value according as they more or less resemble those of art, we may be sure that artificial works receive a greater advantage from their resemblance of such as are natural; because here the similitude is not only pleasant, but the pattern more perfect. [...]

We have before observed, that there is generally in nature something more grand and august than what we meet with in the curiosities of art. When, therefore, we see this imitated in any measure, it gives us a nobler and more exalted kind of pleasure than what we receive from the nicer and more accurate productions of art. On this account our English gardens are not so entertaining to the fancy as those in France and Italy, where we see a large extent of ground covered over with an agreeable mixture of garden and forest, which represent every where an artificial rudeness, much more charming than that neatness and elegancy which we meet with in those of our own country. It might indeed be of ill consequence to the public, as well as unprofitable to private persons, to alienate so much ground from pasturage and the plough, in many parts of a country that is so well peopled, and cultivated to a far greater advantage. But why may not a whole estate be thrown into a kind of garden by frequent plantations, that may turn as much to the profit as the pleasure of the owner? A marsh overgrown with willows, or a mountain shaded with oaks, are not

only more beautiful, but more beneficial, than when they lie bare and unadorned. Fields of corn make a pleasant prospect; and if the walks were a little taken care of that lie between them, if the natural embroidery of the meadows were helped and improved by some small additions of art, and the several rows of edges set off by trees and flowers that the soil was capable of receiving, a man might make a pretty landscape of his own possessions.

Writers who have given us an account of China, tell us the inhabitants of that country laugh at the plantations of our Europeans, which are laid out by the rule and line; because, they say, any person may place trees in equal rows and uniform figures. They choose rather to shew a genius in works of this nature, and therefore always conceal the art by which they direct themselves. They have a word, it seems, in their language, by which they express the particular beauty of a plantation that thus strikes the imagination at first sight, without discovering what it is that has so agreeable an effect. Our British gardeners, on the contrary, instead of humouring nature, love to deviate from it as much as possible. Our trees rise in cones, globes, and pyramids. We see the marks of the scissars upon every plant and bush. I do not know whether I am singular in my opinion, but for my own part, I would rather look upon a tree in all its luxuriance and diffusion of boughs and branches, than when it is thus cut and trimmed into a mathematical figure; and cannot but fancy that an orchard in flower looks infinitely more delightful than all the little labyrinths of the most finished parterre. But, as our great modellers of gardens have their magazines of plants to dispose of, it is very natural for them to tear up all the beautiful plantations of fruit-trees, and contrive a plan that may most turn to their own profit, in taking off their evergreens, and the like moveable plants, with which their shops are plentifully stocked.

Paper VI.

I at first divided the pleasures of the imagination into such as arise from objects that are actually before our eyes, or that once entered in at our eyes, and are afterward called up into the mind either barely by its own operations, or on occasion of something without us, as statues or descriptions. We have already considered the first division, and shall therefore enter on the other, which, for distinction sake, I have called 'The Secondary Pleasures of the Imagination.' When I say the ideas we receive from statues, descriptions, or such-like occasions, are the same that were once actually in our view, it must not be understood that we had once seen the very place, action, or person, that are carved or described. It is sufficient that we have seen places, persons, or actions in general, which bear a resemblance, or at least some remote analogy, with what we find represented; since it is in the power of the imagination, when it is once stocked with particular ideas, to enlarge, compound, and vary them at her own pleasure.

Among the different kinds of representation, statuary is the most natural, and shews us something *likest* the object that is represented. To make use of a common instance: let one who is born blind take an image in his hands, and trace out with his fingers the different furrows and impressions of the chisel, and he will easily conceive how the shape of a man, or beast, may be represented by it; but should he draw his

hand over a picture, where all is smooth and uniform, he would never be able to imagine how the several prominences and depressions of a human body should be shewn on a plain piece of canvas, that has in it no unevenness or irregularity. Description runs yet farther from the things it represents than painting; for a picture bears a real resemblance to its original, which letters and syllables are wholly void of. Colours speak all languages, but words are understood only by such a people or nation. For this reason, though men's necessities quickly put them on finding out speech, writing is probably of a later invention than painting; particularly we are told that in America, when the Spaniards first arrived there, expresses were sent to the Emperor of Mexico in paint, and the news of his country delineated by the strokes of a pencil, which was a more natural way than that of writing, though at the same time much more imperfect, because it is impossible to draw the little connexions of speech, or to give the picture of a conjunction or an adverb. It would be yet more strange to represent visible objects by sounds that have no ideas annexed to them, and to make something like description in music. Yet it is certain, there may be confused imperfect notions of this nature raised in the imagination by an artificial composition of notes; and we find that great masters in the art are able, sometimes to set their hearers in the heat and hurry of a battle, to overcast their minds with melancholy scenes and apprehensions of deaths and funerals, or to lull them into pleasing dreams of groves and elysiums.

In all these instances, this secondary pleasure of the imagination proceeds from that action of the mind which compares the ideas arising from the original objects with the ideas we receive from the statue, picture, description, or sound, that represents them. It is impossible for us to give the necessary reason why this operation of the mind is attended with so much pleasure, as I have before observed on the same occasion; but we find a great variety of entertainments derived from this single principle; for it is this that not only gives us a relish of statuary, painting, and description, but makes us delight in all the actions and arts of mimicry. It is this that makes the several kinds of wit pleasant, which consists, as I have formerly shewn, in the affinity of ideas: and we may add, it is this also that raises the little satisfaction we sometimes find in the different sorts of false wit; whether it consists in the affinity of letters, as an anagram, acrostic; or of syllables, as in doggerel rhymes, echoes; or of words, as in puns, quibbles; or of a whole sentence or poem, as wings and altars. The final cause, probably of annexing pleasure to this operation of the mind, was to quicken and encourage us in our searches after truth, since the distinguishing one thing from another, and the right discerning betwixt our ideas, depend wholly upon our comparing them together, and observing the congruity or disagreement that appears among the several works of nature. [. . .]

5 Jean-Pierre de Crousaz (1663–1750) from *Treatise on Beauty*

Jean-Pierre de Crousaz was born in Lausanne in Switzerland, where he was educated in the Calvinist faith. As a minister of the Church he suffered persecution for his enthusiasm for Descartes and for his vigorous pursuit of Enlightenment ideals. As late as 1680, the canton of Bern prohibited the teaching of Descartes' philosophy. Crousaz was the author of a

Logic (1712) as well as a major treatise on Pyrrhonism, and in 1725 he was made an associate member of the Academy of Sciences in Paris. His *Treatise on Beauty* of 1714 is generally considered the earliest French treatise on aesthetics. Although written in the spirit of Cartesian rationalism, much of its interest resides in the new significance which it accords to feeling (*sentiment*). Instead of relying on the authority of the ancients, Crousaz begins with the question 'What is beauty?' He seeks to convince his readers that a proper understanding of beauty is a task which still lies ahead of them. The central problem is that knowledge of beauty is gained through two different faculties, feeling and reason. The first gives rise to pleasure, the second to approbation or approval. But the two are not always in accord: something can please me even though I withhold my approval and vice versa. True to the principles of Cartesian rationalism, Crousaz elects to pursue the path of speculation rather than of sentiment. Although he acknowledges pleasure as a constituent element in the appreciation of beauty, he trusts to the superior authority of reason; the true character of beauty is to be established *independently* of feeling. It is not until the Abbé du Bos (see IIB6) that sentiment is given priority over rational deliberation. The *Traité du Beau* was first published in Paris in 1714. The following excerpt has been taken from the edition published in Amsterdam: Françoise L'Honoré, 1715, pp. 1–11. It has been translated for the present volume by Katerina Deligiorgi.

Aim of the work

I. There are, without doubt, very few words used more often than the word 'beautiful'. Yet nothing is as unclear as its meaning or as vague as its idea. Although we use it all the time, we lack a definition for it and do not agree about the meaning it ought to have.

At various times and in various matters people call things beautiful to which others refuse the name. It seems that we must conclude from this either that all men do not have the same idea of the beautiful or that their senses are far less similar than we suppose and that they perceive things very differently. For if an object makes the same impression upon someone who finds it beautiful and upon someone who does not, then certainly the idea of beauty they have in their heads cannot be the same. And if the idea remains invariable, then the same object must be sensed differently by the person who finds it beautiful and by him who does not recognize it as such.

Whereas for some the beautiful is that which pleases, at least generally speaking, others immediately oppose this definition, claiming that it is contradicted by experience. Every day, they say, we discover people who, though charmed by certain objects, recognize in good faith that these objects lack beauty and that they cannot be called beautiful without exaggeration. On the other hand, there are beauties which are not at all striking and which fail to delight even those who admit that they are beautiful. Sometimes, therefore, we call 'beautiful' that which does not please and we refuse this name to that which does please.

II. Is the idea of the beautiful, then, but a figment of the imagination? Is the use of the word ruled by caprice alone? Do we find beautiful whatever we please? I find it difficult to believe this and the very examples I have just given show the contrary. Sometimes we recognize as particularly beautiful an object which does not touch us sensibly and at other times we love and contemplate with pleasure something of little

or no beauty. Therefore, we have an idea of the beautiful which does not at all depend on feeling alone and which we cannot attach as firmly as we would like to that which most pleases us, while refusing it to that which pleases us less.

It is this idea which we seek to discover. Everybody possesses it, but since it hardly ever appears alone we do not reflect upon it and fail to distinguish it from the tangle of other ideas which appear alongside it. Above all, the attendant feelings seize hold of our attention and prevent us from dwelling sufficiently upon this idea to observe it clearly. Because of this the idea of the beautiful remains vague and in a state of confusion, which generates an infinity of misunderstandings.

III. I will endeavour to write with precision on this vague idea and to establish agreement on a subject that seems to divide people so much.

To this end, I will carefully avoid building upon doubtful principles. I shall proceed with as much order and precaution as is possible. I shall not introduce a subsequent thought without having first appropriately established the previous one. And I would rather burden my discourse with a few superfluous reflections than advance falsehoods that seem true or leave any of my propositions half-proven.

IV. My readers will probably have the same experience as I. Given the vastness of the topic, a great number of ideas will occur to them at once and a thousand difficulties will cross their mind which will at first stop them from seeing the force of my proofs. But I beg my readers to suspend their judgement and to have the patience to read this discourse through to the end. If they give it their attention, I hope that they will not encounter any difficulties which cannot easily be resolved from my principles.

The general idea of the beautiful

I. When we ask what is beautiful, we do not mean to speak of an object which exists outside us and is separate from other objects, as when we ask what is a horse or what is a tree. A tree is a tree and a horse is a horse absolutely and in themselves; there is no need to compare them with any of the other things contained in the universe. This is not the case with beauty. This term is not absolute but expresses a relation between the objects we call beautiful and our ideas, or our feelings, or our understanding, or our heart, or, finally, other objects different from ourselves. To fix the idea of beauty, therefore, it is necessary to determine and to examine in detail the relations we call beautiful.

II. Human language is full of similar terms. Words such as 'truth' and 'probity', for instance, are of a like nature. They are not substances placed who knows where, each with its own rank and discrete existence. A proposition is true on account of the relation between the ideas it contains or the relation between the ideas and the things to which they are applied. A triangle has three corners, wood is flammable, glass is solid and breakable. All these propositions are true because the things of which I speak are in fact such as I conceive and describe them. Both the objects of which I speak and the ideas which I gather are mutually connected with each other.

Similarly, when I say that such an action is just, or that such a conduct shows probity, I mean that the action or the conduct accords with ideas we have of justice and of probity.

In the same way, it is said of a food or of a way of life that they are healthy, meaning that they maintain or restore our health, that they preserve or impart vigour, sustain our forces and prolong our life.

I admit that there is as much controversy and disagreement about these matters as there is about the beautiful. However, this makes these examples better suited to the subject I seek to explain and allows them to throw further light on it. Some consider a falsehood what others hold as an incontestable truth. Some consider unjust what others believe to be entirely legitimate. Some give dietary advice which others find pernicious and some prescribe as a medicine what others claim to be a poison.

Yet no matter how opposed they might be in their use of these terms, all agree on the general idea. When my feeling differs from another's, it is precisely because that person's ideas seem to me not to accord with the things themselves, whereas that person believes that they do. We both, however, take truth to consist in the relation between thought and object. Believing that it is in accordance with the idea of equity, someone may approve of something which I find inequitable and therefore condemn it. We agree, however, that an action is just when it conforms to ideas of rectitude. In a similar manner, we agree that a medicine is health-giving when it helps us recover or conserve our forces and our life, even if some attribute this property to something which, according to others, has quite contrary properties. These three general ideas are the same in all men and are in themselves invariable even if we use them very differently. This is because not everybody has the same ideas and the same knowledge of the things to which they apply these ideas.

Could we then not base on the same principle and determine in a similar way the idea of beauty? Even if it were more vague than the three ideas I have just used in my examples, as long as all could come to an agreement we could discover a principle and use it to go further. All that would be required then would be to take care to apply this principle correctly and precisely.

III. Those who are not content to fall back on habitual usage but who are willing to look inside themselves, to pay attention to what occurs within themselves and to examine what they feel and think when they say 'this is beautiful,' will notice that they use this word to express a certain relation between an object and agreeable feelings or ideas of approbation. They will agree that to say 'this is beautiful' is to say 'I perceive something of which I approve, or something that pleases me.'

We see from this that the idea we attach to the word beautiful is a double one and that this is what renders it equivocal. We become confused because we fail to disentangle the two meanings. This is one of the principal causes of our disagreements about the beautiful.

IV. I shall invoke here a principle I have established elsewhere and which can be accepted without difficulty once it is properly understood. I distinguish between two sorts of perceptions: I call the first 'ideas' and the others 'feelings'. When I think of a circle, a triangle, two decades, three decades, or the numbers five or eight, a bird or a

house, I form ideas in my head. But when I eat, when I sit by the fire, when I raise a flower to my nose, the perceptions of flavour, of warmth and of scent which strike and take possession of me belong to what I call feelings and not to simple ideas.

Ideas occupy the spirit, feelings interest the heart. Ideas amuse us, exercise and sometimes tire our attention, depending on whether or not they are composite and on the degree to which they are combined with each other. Feelings, on the other hand, dominate and take hold of us, determine our predilections and render us happy or sad according to whether they are sweet or vexing, agreeable or disagreeable. Whereas we express ideas easily, it is very difficult to describe feelings. It is moreover impossible to communicate them exactly with words to those who have not experienced anything similar.

We exert a certain control over our ideas and stimulate them ourselves. One idea is born from another and, as long as no feeling holds them fast or pushes them away, our attention stays fixed for as long as we wish and leaves them as soon as we decide. However, feelings depend both on external objects and on certain inner dispositions which are not in our power. This is why we cannot always feel what pleases us, nor can we always avoid that which displeases us.

We are more or less happy with our ideas, depending on how clear, simple, composite or ordered they are, and on whether or not the objects which they represent seem to us worthy of our attention. Our feelings, however, animate or irritate us depending on their intensity or dullness. This, I think, is enough to explain my thoughts on this matter and the distinction which I have drawn.

V. Let us take someone who considers an object, but who seeks only to form an idea about it, aiming to know and to judge the object accurately. It is possible that, on such an occasion, he will perceive nothing which moves him, because he discovers nothing that interests him or disturbs his tranquillity. He will then say that there is nothing in this object that touches and delights him, even though he recognizes the object to be beautiful. From this we can establish that something can be recognized as beautiful even if it fails to please and that for this reason it is wrong to define the beautiful as that which pleases. However, even if the idea of the object is not accompanied by any agreeable feeling, it is possible that we can discover something in it that merits our approbation and that it has attributes to which we could not refuse our favourable opinion. Such an object then both pleases and does not please: it pleases the idea but not the feeling.

By contrast . . . there are objects whose idea contains nothing laudable, but which excite agreeable and enjoyable feelings. We say then that the objects are pleasant without being beautiful. There are, then, different kinds of beauty and different kinds of pleasure and we should not confuse them, or else we shall remain entangled. Let us distinguish that which pleases the spirit from that which pleases the heart, and that which gains our approval simply as an idea from that which gains our approval as a cause of a feeling.

Sometimes ideas and feelings are in agreement with each other and an object merits the qualification 'beautiful' on both counts. Sometimes, however, ideas and feelings are at war with each other and then an object pleases and at the same time it does not: from one perspective it is beautiful, while from another it lacks beauty.

Some speculative thinkers, accustomed to judging objects coolly and from ideas only, count feelings for nothing and consider all that is built upon them and all that follows from them as capricious or wayward. In contrast others, who are more numerous, do not reason at all, or hardly at all, and deliver themselves over entirely to their feelings. Since these latter are unable to trace the origins of their feelings and the causes of their differences with each other, in order to give some account of such differences and have done with it, they attribute them to chance, to some *je ne sais quoi*, or to pure caprice, thus confounding taste with fancy. However, we ought to avoid equally both confusion and excess.

Let us therefore examine first which principles regulate our approbation when we judge something from ideas only and find it beautiful independently of feeling.

VI. It is certain that instances like the following occur. Take someone with knowledge of painting and of mathematics and ask him to look at excellent paintings, or at circles, triangles, polygons, and other figures drawn with perfect regularity. If this person is preoccupied by something else or his heart is swayed by some violent passion, if, for example, he is anxious about the proceedings of a trial and happens to look at all these objects in the waiting-rooms of a judge whose verdict he awaits impatiently, then, it is certain that he will look at them fleetingly, simply out of politeness. He will not be touched by them in any way and every moment they demand of his attention will be painful and unrelieved by any feeling of pleasure. He would, however, be able to agree that all these objects are beautiful and well-wrought. There is, therefore, a beauty that is independent of feeling, and our mind contains the speculative principles which enable us to decide coolly whether an object is beautiful or not.

6 Abbé Jean-Baptiste du Bos (1670–1742) from *Critical Reflections on Poetry and Painting*

Jean-Baptiste du Bos was born in Beauvais, but underwent his theological training in Paris. He travelled widely and was familiar with the intellectual and cultural life of England, Italy and the Netherlands. He was strongly influenced by the empiricist philosophy of Locke (IIB1), whom he met while in England, and, to a lesser extent, by the work of Addison (IIB4) and Shaftesbury (IIB2 and 3). His *Critical Reflections on Poetry and Painting* met with enormous success on its publication in 1719. This was due, at least in part, to the fact that the book is written from the standpoint of the interested amateur rather than that of the philosopher or the practising artist. It found a wide readership amongst the ever growing number of those who took a non-professional interest in the arts. The new concern with the role of feeling and imagination which had surfaced in the work of Bouhours (ID7) and Crousaz (IIB5) is now made into a powerful attack on the authority of reason to judge works of art. Insisting on the primacy of sensation or 'sentiment', Du Bos maintains that it is the individual's subjective response before a work of art which is of central importance. This concern with the effects which art works have upon their audience leads him to consider the different means of representation proper to poetry and painting. In an argument which prefigures that developed by Lessing in the *Laocoön* (IIIA10), he contrasts poetry with

painting, pointing out that whereas poetry can depict a sequence of events, painting is restricted to a single moment in time. The *Réflexions critiques sur la poésie et sur la peinture* was first published in Paris, by J. Mariette, in 1719. We have used the English translation by Thomas Nugent, made from the fifth French edition, which encompasses all the changes and subsequent additions which Du Bos made to the work in his lifetime: *Critical Reflections on Poetry, Painting and Music*, London: John Nourse, 1748, vol. 1, pp. 1-4, 21-5, 43-7, 56-9, 69-72, 74-5.

That a sensible pleasure arises from poems and pictures, is a truth we are convinced of by daily experience; and yet 'tis a difficult matter to explain the nature of this pleasure, which bears so great a resemblance with affliction, and whose symptoms are sometimes as affecting, as those of the deepest sorrow. The arts of poetry and painting are never more applauded, than when they are most successful in moving us to pity.

The pathetic representation of the sacrifice of Jephtha's daughter, set in a frame, is one of the most elegant ornaments of a sumptuous cabinet. The several grotesque figures, and most smiling compositions of painters of the gayest fancies, pass unobserved, to attend to this tragical picture. A poem, the chief subject whereof is the violent death of a young princess, graces the most august solemnity; and the tragedy is marked out for one of the principal amusements of a company assembled for their diversion. 'Tis observable, that we feel in general a greater pleasure in weeping, than in laughing at a theatrical representation.

In short, the more our compassion would have been raised by such actions as are described by poetry and painting, had we really beheld them; the more in proportion the imitations attempted by those arts are capable of affecting us. These actions are universally allowed to be the happiest and noblest subjects. It must be therefore a secret charm that draws our attention to the imitations made by those arts, whilst our nature feels an inward dread and repugnance at the sight of its own pleasure.

I shall venture to undertake to clear up this paradox, and explain the origin of that pleasure, which we receive from poems and paintings. Attempts of a less arduous nature have been frequently charged with temerity. 'Tis an attempt to unfold to man the causes of his approbation and dislike: an attempt to instruct him concerning the nature of his own sentiments, how they rise and are formed within him. I cannot therefore flatter myself with the hopes of my reader's approbation, unless I succeed in endeavouring to lay open to him what passes within himself; that is, in one word, the most inward motions of his heart. 'Tis natural to reject as untrue the glass, wherein we perceive no resemblance of our own features.

Those who write on subjects of a less sensible nature, have it frequently in their power to err with impunity. To detect their mistakes, a great deal of reflection, and sometimes inquiry, is necessary, but the subject which comes under my examination, is most obvious and intelligible. Every man is possessed of a standard rule applicable to my arguments, so as to discover easily the least deviation they may have from truth.

On the other hand, 'tis rendering an important service to those two arts, (arts, that are ranked amongst the most accomplished ornaments of polite society) to inquire philosophically into the nature and manner of the effects arising from their productions. A book which could lay open the heart of man, when moved by a poem, or

affected with a picture, would give our artists a very just and extensive view of the general effect of their works, whereof they seem to have so imperfect an idea. I must beg the indulgence of those gentlemen, for giving them so frequently, in the course of this work, the appellation of artists. The regard which, upon all occasions, I express for their respective arts, will be sufficient to convince them, that my not adding 'illustrious', or some other proper epithet to 'artist', proceeds only from my apprehension of falling into repetition. The desire of rendering them service is one of my inducements to publish these reflections, which I offer as the observations of a plain fellow-citizen, drawn from the examples of past ages, in order to enable their republic to be more upon its guard against future inconveniencies. If at any time I happen to assume a legislative tone, the reader will please to excuse it, as proceeding from inadvertency, rather than from any notion I entertain of my legislative authority.

* * *

That the principal merit of poems and pictures consists in the imitation of such objects as would have excited real passions. The passions which those imitations give rise to, are only superficial.

Since the most pleasing sensations that our real passions can afford us, are balanced by so many unhappy hours that succeed our enjoyments, would it not be a noble attempt of art to endeavour to separate the dismal consequences of our passions from the bewitching pleasure we receive in indulging them? Is it not in the power of art to create, as it were, beings of a new nature? Might not art contrive to produce objects that would excite artificial passions, sufficient to occupy us while we are actually affected by them, and incapable of giving us afterwards any real pain or affliction?

An attempt of so delicate a nature was reserved for poetry and painting. I do not pretend to say, that the first painters and poets, no more than other artists, whose performances may not perhaps be inferior to theirs, had such exalted ideas, or such extensive views, upon their first sitting down to work. The first inventors of bathing never dreamt of its being a remedy proper for the curing of certain distempers; they only made use of it as a kind of refreshment in sultry weather, though afterwards it was discovered to be extremely serviceable to human bodies in several disorders: In like manner, the first poets and painters had nothing more in view perhaps, than to flatter our senses and imagination; and in labouring with that design, they found out the manner of exciting artificial passions. The most useful discoveries in society, have been commonly the effect of hazard: Be that as it will, those imaginary passions which poetry and painting raise artificially within us, by means of their imitations, satisfy that natural want we have of being employed.

Painters and poets raise those artificial passions, within us, by presenting us with the imitations of objects capable of exciting real passions. As the impression made by those imitations is of the same nature with that which the object imitated by the painter or poet would have made; and as the impression of the imitation differs from that of the object imitated only in its being of an inferior force, it ought therefore to raise in our souls a passion resembling that which the object imitated would have excited. In other terms, the copy of the object ought to stir up within us a copy of the passion which the object itself would have excited. But as the impression made by the

imitation is not so deep as that which the object itself would have made; moreover, as the impression of the imitation is not serious, inasmuch as it does not affect our reason, which is superior to the illusory attack of those sensations, as we shall presently explain more at large: Finally, as the impression made by the imitation affects only the sensitive soul, it has consequently no great durability. This superficial impression, made by imitation, is quickly therefore effaced, without leaving any permanent vestiges, such as would have been left by the impression of the object itself, which the painter or poet hath imitated.

The reason of the difference between the impression made by the object, and that made by the imitation, is obvious. The most finished imitation hath only an artificial existence, or a borrowed life; whereas the force and activity of nature meet in the object imitated. We are influenced by the real object, by virtue of the power which it hath received for that end from nature. *In things which we propose for imitation*, says Quintilian, *there is the strength and efficacy of nature, whereas in imitation there is only the weakness of fiction.*

Here then we discover the source of that pleasure which poetry and painting give to man. Here we see the cause of that satisfaction we find in pictures, the merit whereof consists in setting before our eyes such tragical adventures, as would have struck us with horror, had we been spectators of their reality. For as Aristotle in his Poetics says, *Tho' we should be loth to look at monsters, and people in agony, yet we gaze on those very objects with pleasure when copied by painters; and the better they are copied, the more satisfaction we have in beholding them.*

The pleasure we feel in contemplating the imitations made by painters and poets, of objects which would have raised in us passions attended with real pain, is a pleasure free from all impurity of mixture. It is never attended with those disagreeable consequences, which arise from the serious emotions caused by the object itself.

A few examples will illustrate, better than all my arguments, an opinion, which, methinks, I can never set in too clear a light. The massacre of the innocents must have left most gloomy impressions in the imaginations of those, who were real spectators of the barbarity of the soldiers slaughtering the poor infants in the bosom of their mothers, all imbrued with blood. Le Brun's picture, where we see the imitation of this tragical event, moves indeed our humanity, but leaves no troublesome idea in our mind; it excites our compassion, without piercing us with real affliction. A death like that of Phædra, a young princess expiring in the midst of the most frightful convulsions, and accusing herself of the most flagitious crimes, which she has endeavoured to expiate with poison; such a death, I say, as that, would be one of the most frightful and most disagreeable objects. We should be a long time before we could get rid of the black and gloomy ideas which such a spectacle would undoubtedly imprint in our imagination. The tragedy of Racine, wherein the imitation of that event is represented, touches us most sensibly, without leaving any permanent seed of affliction. We are pleased with the enjoyment of our emotion, without being under any apprehension of its too long continuance. This piece of Racine draws tears from us, though we are touched with no real sorrow; for the grief that appears is only, as it were, on the surface of our heart, and we are sensible, that our tears will finish with the representation of the ingenious fiction that gave them birth.

* * *

Of the nature of those subjects which painters and poets treat of. That they cannot chuse for imitation too engaging a subject.

Since the principal charm of poetry and painting, even the very power of moving and pleasing, proceeds from the imitations of objects capable of engaging us; the greatest imprudence a poet or painter can commit, is to chuse for a principal object of imitation, such things as we should look upon with an eye of indifference in nature; or to employ their art in the description of such actions, as would draw only a midling attention, were we really to behold them. How is it possible for us to be touched with the copy of an original, when the original itself is incapable of moving us? How shall our attention be engaged by a picture representing a peasant driving a couple of beasts along the highway, if the very action which this picture imitates, has no power of affecting us? A tale in verse, describing an adventure, which we have seen unconcernedly, will be much less able to give us any concern. *The imitation operates always with less force, as Quintilian observes, than the object imitated.* The imitation therefore is incapable of moving us, when the object imitated can have no effect upon us. The subjects which the Teniers, Wowermans, and other painters of the same rank have chosen for imitation, would have very little engaged our attention. There is nothing in the action of a country feast, or in the amusements of a parcel of soldiers in a guard-house, that is capable of moving us. The imitation therefore of those objects, may possibly amuse us some few moments, may even draw from us an applause of the artist's abilities in imitating, but can never raise any emotion or concern. We commend the painter's art in copying nature so well, but we disapprove of his choice of objects that have so little in them to engage us.

The finest landskip, were it even Titian's or Caraccio's, does not affect us more, than the prospect of a frightful or agreeable spot of land; there is nothing in such a picture that can be called really entertaining, and, as it strikes us but little, so as little it engages us. The most knowing painters have been so thoroughly convinced of this truth, that it is very rare to find any mere landskips of theirs without an intermixture of figures. They have therefore thought proper to people them, as it were, by introducing into their pieces a subject composed of several personages, whereof the action might be capable of moving, and consequently of engaging us. 'Tis thus that Poussin, Rubens, and several other great masters, have employed their art. They are not satisfied with giving a place in their landskips to the picture of a man going along the high road, or of a woman carrying fruit to market; they commonly present us with figures that think, in order to make us think; they paint men hurried with passions, to the end that ours may be also raised, and our attention fixed by this very agitation: In fact, the figures of those pieces are much more talked of than the trees or terrasses. The famous landskip, so often drawn by Poussin, and which is commonly called the *Arcadia*, would not have been so highly esteemed, had it not been embellished with figures.

The fame of those blissful regions is universally known, which were fancied to have been once inhabited by the happiest race of men that ever the earth produced; men engaged in an uninterrupted series of pleasures, and strangers to all disquiets or cares, except such as are attributed in romances to those chimerical shepherds, whose

situation is represented to us as an object worthy of our desires. The picture above-mentioned exhibits a landskip of that delightful country: In the middle thereof you see the monument of a young maid snatched away in the flower of her age; which appears from her statue lying on the tomb, after the manner of the antients. The sepulchral inscription contains those few Latin words, *Et in Arcadia ego: And I was once an inhabitant of Arcadia*. But this short inscription draws the most serious reflections from two youths and two young virgins decked with garlands, who seem to be struck with their having thus accidentally met with so melancholy a scene, in a place where one might naturally suppose they had not been in pursuit of an object of sorrow. One of them points with his finger to the inscription, to make the rest observe it, whilst the remains of an expiring joy may yet be discerned through the gloominess of grief which begins to diffuse itself over their countenances. Here you imagine yourself listening to the reflections of those youthful persons upon death, which spares neither age nor beauty, and against the attacks of which the most happy climates can afford no sanctuary. Your fancy now suggests to you, the affecting speeches they are going to make to each other upon recovering from their first surprize, which you will naturally apply to yourself, and to those whom you have a concern for.

What has been said with regard to painting, is equally applicable to poetry; since the imitations which the latter makes of nature, affect us only in proportion to the impression made by the thing imitated. The best versified tale imaginable, the subject whereof hath nothing in its nature ridiculous, will never be capable of exciting laughter. A satire, which does not set in a clear light some truth, whereof I had already a confused idea, nor contains none of those maxims, whose conciseness of expression, and sublimity of thought, render them worthy of being dignified as proverbs; such a satire perhaps may be commended as a well-written piece, but makes no impression, nor leaves no desire of a second perusal in the mind of the reader. An epigram without any vivacity of thought, or on such a subject as would not bear listening to with pleasure in prose, let the versification and rhyme be ever so well finished, will never fix itself in your memory. A dramatic poet, whose personages appear in characters of so little concernment, as I should not be uneasy to see my most intimate acquaintances acting those very characters in real life; is very far from engaging me in favor of his personages. 'Tis impossible for the copy to affect me, if I cannot be touched with the original.

* * *

Objection drawn from pictures, to prove that the art of imitation is more engaging than the very subject of imitation.

It may be here objected, that some pictures, wherein we only see the imitation of different objects, which would have no way affected us, had we seen them in their real nature, engage notwithstanding our attention a long time. We take much more notice of fruits and animals represented in a picture, than we should of the reality of those very objects. The copy here engages us more than the original.

To this I reply, that when we contemplate curiously any pictures of this kind, our principal attention is not fixt on the object imitated, but upon the art of the imitator.

'Tis not so much the object, as the artist's abilities, that draws our curiosity; we bestow no more attention on the object imitated in the picture, than we should on that same object in real nature. This kind of pictures does not engage our curiosity half so long as those, wherein the merit of the subject is joined with that of the execution. No body stands as long gazing at a basket of flowers done by Baptist, or at a country feast done by Teniers, as he would on one of Poussin's seven sacraments, or some other historical composition executed with as much ability and art, as is displayed by Baptist and Teniers in theirs. An historical piece drawn with as much dexterity, as a guard-house by Teniers, would engage our attention much more than the guard-house.

Here we are always to suppose, as it is reasonable we should, that the painter's art has been equally successful in both; for it is not sufficient that the pictures be drawn by the same hand. For instance, we behold with more pleasure one of Tenier's country feasts, than one of his historical pieces; but this is no argument at all against us. Everybody knows that Teniers miscarried always in his serious compositions, as he generally succeeded in his grotesque ones.

Thus, by distinguishing the attention which is given to the art, from that which is given to the object imitated, the truth of my proposition will appear manifest; that the imitation never makes a greater impression on us, than the object imitated could have made. This is even true in pictures, that are only valuable for the merit of the execution.

The art of painting is so extremely delicate and attacks us by means of a sense, which has so great an empire over our soul, that a picture may be rendered agreeable by the very charms of the execution, independent of the object which it represents: but I have already observed, that our attention and esteem are fixt then upon the art of the imitator, who knows how to please, even without moving us. We admire the pencil that has been so capable of counterfeiting nature. We inquire how it was possible for an artist to deceive our eyes to that degree, as to make us take colors laid on a surface for real fruit. A painter, therefore, may pass for a great artist, considered as an elegant designer, or as so skilled in colors as to rival nature, though he does not even know how to make use of his talents in the representation of affecting objects, or to give his pictures that spirit and resemblance of life that are conspicuous in those of Raphael and Poussin. The pictures of the Lombard school are admired, though the painters thereof have frequently confined themselves to the flattering of the eyes, with the richness and exactness of their colors, without reflecting, perhaps, that their art was capable of moving us: but their most zealous sticklers agree, that there is yet one great beauty wanting in the pictures of this school; and that those of Titian, for instance, would be infinitely more valuable, if he had pitched upon affecting subjects, and if he had joined more frequently the talents of his own school with those of the Roman. The picture of this great painter, which represents Peter Martyr, a Dominican friar, massacred by the Vaudois, is not perhaps the most valuable of his pieces for the richness of local colors, notwithstanding its being so admirable, even in this respect; and yet Cavalier Ridolfi, the historian of the painters of the school of Venice, acknowledges that this, of all his pieces, is the most generally known, and the most universally applauded. The reason thereof is, because the action of this picture is

more engaging, and Titian has treated it with a greater resemblance of truth, and a more elaborate expression of the passions, than any of his other pieces.

* * *

That there are some subjects particularly adapted to poetry, and others specially proper for painting. Of the manner of distinguishing them.

The subject of imitation ought not only to be interesting of its own nature, but moreover should be adapted to painting, if intended for the pencil; and proper for poetry, if designed for verse. There are some subjects that are much more suitable to painters than poets, and others that are fitter for poets than painters. I shall endeavour to explain this more at large; but as I have thought proper to be a little diffused, in order to render myself more intelligible, I am afraid I shall stand in need of the reader's indulgence for the prolixity of this discussion.

A poet can tell us several things, which a painter would find impossible to exhibit. He can express several of our thoughts and sentiments, which a painter cannot represent, by reason of their not being attended with any proper motion, particularly marked in our attitude, or precisely characterised in our countenance. The speech of Cornelia to Cæsar, where she discovers to him the conspiracy, that was just ripe for his destruction,

L'exemple que tu dois periroit avec toi!

[*May Rome the last example see in thee!*]

cannot be expressed by a painter. He may, indeed, by drawing Cornelia's countenance suitable to her situation and character, give us some idea of her sentiments, and make us sensible, that she is speaking with a dignity that becomes her; but the thought of this Roman lady, who desires the death of the oppressor of the republic, as a punishment that may deter others from making any future attempts upon liberty, and not as a detestable crime, cannot be imaged by the pencil. There is no picturesque expression that can articulate, as it were, the words of old Horatius, where he answers the person, who had asked him, what his son was able to do alone against three antagonists? *Qu'il mourût, That he could die.* A painter may indeed let us see, that a man is moved with a particular passion, tho' he does not draw him in the action of venting it, because there is no one passion of the mind, that is not at the same time a passion of the body. But it is extremely rare, that a painter can express, so as to be sufficiently understood, the particular thoughts produced by anger, according to the proper character and circumstances of each person; or the sublime which it throws out in words adapted to the situation of the personage that speaketh.

For example, Poussin could, in his piece of the death of Germanicus, express all the different sorts and degrees of affliction, wherewith his friends and family were penetrated, when they saw him poisoned, and expiring in their arms; but he was incapable of giving us an account of the last sentiments of this prince, which are so extremely moving. This is left for the poet, who can make him say, *If a death so untimely as mine had snatched me away, even through some mistake of nature, I should yet*

have a right to complain of the severity of my destiny; but as I fall a victim to treachery and poison, I must exhort you, my friends, to be the avengers of my death, and not to blush to turn informers, to obtain my injured manes satisfaction: The public pity will certainly join with such accusers. A painter cannot express the greatest part of these thoughts, nor can he exhibit, in a single piece, more than one of such sentiments as he is capable of expressing. 'Tis true, that in order to make us understand the suspicion which Germanicus had of Tiberius's being the author of his death, he can draw Germanicus, shewing to his wife Agrippina, a figure of Tiberius, exhibited in a gesture and air proper for the distinguishing of such a thought; but he is then obliged to employ his whole piece in expressing this single sentiment.

As the picture, which represents an action, shews only an instant of its duration, it is impossible for the painter to express the sublime, which those things, that are previous to its present situation, throw sometimes into an ordinary sentiment. Poetry, on the contrary, describes all the remarkable incidents of the action it treats of, and that which precedes reflects frequently the marvellous upon a very ordinary thing, which is said or done in the sequel. 'Tis thus poetry may employ the marvellous that arises from circumstances, which may be called a relative sublime. [...]

I have oftentimes wondered why painters, who have so great an interest in making those personages known, by whose figures they intend to move us, and who find it so vastly difficult to distinguish them sufficiently by the sole aid of the pencil, why, I say, they do not accompany always their historical pieces with a short inscription. The greatest part of the spectators, who are in other respects capable of doing justice to the work, are not learned enough to guess at the subject of the picture. 'Tis to them sometimes an agreeable person that strikes them, but talks a language they do not understand. People soon grow tired of looking at such pictures, by reason that pleasures, wherein the mind has no share, are of a very short duration.

The Gothic painters, rude and coarse as they were, had sense enough to know the utility of inscriptions, in order to render the subject of their pictures more intelligible. True it is, that they made as barbarous a use of that knowledge as of their pencils. They had the odd precaution to draw their figures with rolls coming out of their mouths, whereon they wrote whatever they would have these heavy inactive figures express; which was really making them speak. Tho' the rolls here mentioned, disappeared together with the Gothic taste; yet sometimes the greatest masters have judged two or three words necessary, in order to render their subjects intelligible: Nay, several have not even scrupled to write them on some part of the plan of their pieces, where they could be of no prejudice to the work. Raphael and Caraccio have acted thus; and Coypel has inscribed even several scraps of verses from Virgil, in the gallery of *Palace Royal*, in order to render those subjects more intelligible, which he had borrowed of the *Æneid*. Painters, whose works are ingraved, begin to grow sensible of the utility of these inscriptions; wherefore they put them at the bottom of such Prints, as are copied from their drawings.

7 Francis Hutcheson (1694–1746) ‘Preface’ to *An Inquiry into the Original of our Ideas of Beauty and Virtue*

Francis Hutcheson was born in Ireland of Scottish descent and was educated in Glasgow. He was licensed to preach by the Presbyterian Church of Ireland and went on to establish a successful private academy in Dublin. In 1729 he was made professor of moral philosophy at Glasgow University, lecturing on natural religion, morals, jurisprudence and government. He is one of the principal representatives of the moral-sense doctrine in ethics, which he inherited from Shaftesbury (see IIB2). However, his account of the role of feelings or sensations in the formation of our ‘ideas’ owes more to the philosophy of Locke (see IIB1). His *Inquiry into the Original of our Ideas of Beauty and Virtue* was published in two volumes in 1725. The first volume, entitled ‘An Inquiry Concerning Beauty, Order, Harmony and Design’, is given over to demonstrating the existence of an ‘inner sense’ of beauty. Just as involuntary feelings of pleasure and pain are ‘caused’ in us by properties of external objects and remain beyond our will, so the idea of beauty arises in direct response to the presence of features such as regularity, order, and harmony. Beauty is to be found in geometrical shapes and mathematical theorems just as much as in works of art or objects of natural beauty. The second volume of the treatise is given over to establishing the existence of a parallel moral sense which responds to virtuous actions with the same causal immediacy. As the ‘Preface’ to the *Inquiry* makes clear, Hutcheson sees both the inner sense of beauty and the moral sense as independent of rational deliberation. They are ‘natural’ attributes which are identical in every human being and which allow us to judge spontaneously and immediately. Hutcheson’s arguments were subjected to vigorous criticism by Berkeley (see IIB8), but his theory of beauty remains important for having inaugurated a shift towards the perceptual and emotional responses of the individual subject. We have used the fourth, corrected edition, *An Inquiry into the Original of our Ideas of Beauty and Virtue in Two Treatises*, London, 1738, pp. ix–xvii.

There is no Part of *Philosophy* of more Importance, than a just *Knowledge of Human Nature*, and its various Powers and Dispositions. Our late Inquiries have been very much employ’d about our *Understanding*, and the several Methods of obtaining *Truth*. We generally acknowledge, that the Importance of any Truth is nothing else than its Moment, or Efficacy to make Men happy, or to give them the greatest and most lasting Pleasure; and *Wisdom* denotes only a Capacity of pursuing this End by the best Means. It must surely then be of the greatest Importance, to have distinct Conceptions of this End itself, as well as of the Means necessary to obtain it; that we may find out which are the greatest and most lasting Pleasures, and not employ our Reason, after all our laborious Improvements of it, in trifling Pursuits. It is to be fear’d indeed, that most of our Studys, without this Inquiry, will be of very little Use to us; for they seem to have scarce any other Tendency than to lead us into *speculative Knowledge* itself. Nor are we distinctly told how it is that *Knowledge* or *Truth* is pleasant to us.

This Consideration put the *Author* of the following Papers upon inquiring into the various Pleasures which *Human Nature* is capable of receiving. We shall generally find in our modern philosophick Writings, nothing farther on this Head, than some bare Division of them into *Sensible*, and *Rational*, and some trite Common-place

Arguments to prove the *latter* more valuable than the *former*. Our *sensible Pleasures* are slightly pass'd over, and explain'd only by some Instances in *Tastes, Smells, Sounds*, or such-like, which Men of any tolerable Reflection generally look upon as very trifling Satisfactions. Our *rational Pleasures* have had much the same kind of Treatment. We are seldom taught any other Notion of rational Pleasure than that which we have upon reflecting on our Possession or Claim to those Objects, which may be Occasions of Pleasure. Such Objects we call *advantageous*; but *Advantage*, or *Interest*, cannot be distinctly conceiv'd, till we know what those Pleasures are which advantageous Objects are apt to excite; and what Senses or Powers of Perception we have with respect to such Objects. We may perhaps find such an Inquiry of more Importance in *Morals*, to prove what we call the *Reality of Virtue*, or that it is the *surest Happiness* of the *Agent*, than one would at first imagine.

In reflecting upon our *external Senses*, we plainly see, that our Perceptions of Pleasure or Pain do not depend directly on our *Will*. Objects do not please us, according as we incline they should. The Presence of some Objects necessarily pleases us, and the Presence of others as necessarily displeases us. Nor can we, by our *Will*, any otherwise procure Pleasure, or avoid Pain, than by procuring the former kind of Objects, and avoiding the latter. By the very *Frame* of our *Nature* the one is made the Occasion of Delight, and the other of Dissatisfaction.

The same Observation will hold in all our other Pleasures and Pains. For there are many other sorts of Objects, which please, or displease us as necessarily, as material Objects do when they operate upon our Organs of Sense. There is scarcely any Object which our Minds are employ'd about, which is not thus constituted the necessary Occasion of some Pleasure or Pain. Thus we find ourselves pleas'd with a *regular Form*, a Piece of *Architecture* or *Painting*, a Composition of *Notes*, a *Theorem*, an *Action*, an *Affection*, a *Character*. And we are conscious that this Pleasure necessarily arises from the Contemplation of the Idea, which is then present to our Minds, with all its Circumstances, altho' some of these Ideas have nothing of what we commonly call sensible Perception in them; and in those which have, the Pleasure arises from some *Uniformity, Order, Arrangement, Imitation*; and not from the simple Ideas of *Colour*, or *Sound*, or Mode of *Extension* separately consider'd.

These *Determinations* to be pleas'd with any Forms, or Ideas which occur to our Observation, the *Author* chooses to call *Senses*; distinguishing them from the Powers which commonly go by that Name, by calling our Power of perceiving the *Beauty of Regularity, Order, Harmony*, an *Internal Sense*; and that *Determination* to approve *Affections, Actions*, or *Characters* of *rational Agents*, which we call *virtuous*, he marks by the Name of a *Moral Sense*.

His principal Design is to shew, 'That *Human Nature* was not left quite indifferent in the Affair of Virtue, to form to itself Observations concerning the *Advantage*, or *Disadvantage* of Actions, and accordingly to regulate its Conduct.' The Weakness of our Reason, and the Avocations arising from the Infirmities and Necessitys of our Nature, are so great, that very few Men could ever have form'd those long Deductions of Reason, which shew some Actions to be in the whole *advantageous* to the *Agent*, and their Contrarys *pernicious*. The *Author* of *Nature* has much better furnish'd us for a virtuous Conduct, than our *Moralists* seem to imagine, by almost as quick and powerful Instructions, as we have for the Preservation of our Bodys. He

has given us *strong Affections* to be the Springs of each virtuous Action; and made Virtue a lovely Form, that we might easily distinguish it from its Contrary, and be made happy by the Pursuit of it.

This *Moral Sense of Beauty* in *Actions* and *Affections*, may appear strange at first View. Some of our Moralists themselves are offended at it in my *Lord Shaftesbury*; so much are they accustomed to deduce every Approbation, or Aversion, from rational Views of private *Interest*, (except it be merely in the Simple Ideas of the external Senses) and have such a Horror at *innate Ideas*, which they imagine this borders upon. But this *moral Sense* has no relation to innate Ideas, as will appear in the second Treatise.

Our Gentlemen of *good Taste*, can tell us of a great many *Senses, Tastes, and Relishes* for *Beauty, Harmony, Imitation* in *Painting* and *Poetry*; and may not we find too in Mankind a *Relish* for a *Beauty* in *Characters, in Manners*? It will perhaps be found, that the greater Part of the Ingenious *Arts* are calculated to please some Natural Powers, pretty different either from what we commonly call *Reason*, or the External Senses.

In the first Treatise, the *Author* perhaps in some Instances has gone too far, in supposing a greater Agreement of Mankind in their *Sense of Beauty*, than Experience will confirm; but all he is solicitous about is to shew, 'That there is some *Sense of Beauty natural* to Men; that we find as great an Agreement of Men in their Relishes of *Forms*, as in their external Senses, which all agree to be *natural*; and that Pleasure or Pain, Delight or Aversion, are *naturally* join'd to their Perceptions.' If the Reader be convinc'd of this, it will be no difficult matter to apprehend another *superior Sense, natural* also to Men, determining them to be pleas'd with *Actions, Characters, Affections*. This is the *moral Sense*, which makes the Subject of the second Treatise.

The proper Occasions of Perception by the external Senses, occur to us as soon as we come into the World; whence perhaps we easily look upon these Senses to be *natural*: but the Objects of the superior Senses of *Beauty* and *Virtue* generally do not. It is probably some little time before Children reflect, or at least let us know that they reflect upon *Proportion* and *Similitude*; upon *Affections, Characters, Tempers*; or come to know the external Actions which are Evidences of them. Hence we imagine that their *Sense of Beauty*, and their *moral Sentiments* of Actions, must be entirely owing to *Instruction* and *Education*; whereas it is as easy to conceive, how a *Character, a Temper*, as soon as they are observ'd, may be constituted by *Nature* the necessary Occasion of Pleasure, or an Object of Approbation, as a *Taste* or a *Sound*; tho' these Objects present themselves to our Observation sooner than the other.

8 George Berkeley, Bishop of Cloyne (1685–1753) 'Third Dialogue' from *Alciphron, or the Minute Philosopher*

Berkeley was born near Kilkenny in Ireland. He was made a Fellow of Trinity College Dublin in 1707 and was ordained in the Anglican Church in 1709. The works upon which his reputation rests were largely written at this time, including his *Essay Towards a New*

Theory of Vision (1709) and *A Treatise concerning the Principles of Human Knowledge* (1710). He vigorously criticized the theories of Locke (see IIB1) and Shaftesbury (see IIB2 and 3), but his own claim that the contents of the material world are 'ideas' that exist only when a mind perceives them was much misunderstood by his contemporaries. The long philosophical dialogue, *Alciphron*, belongs to his later work. It is an attempt to defend the tenets of Anglican orthodoxy against various manifestations of 'free-thinking' and deism. The 'Third Dialogue' contains a sustained criticism of Hutcheson's arguments for the existence of an innate sense of beauty (see IIB7). Hutcheson's claim that we possess a natural and immediate capacity to discern what is beautiful is put into the mouth of Alciphron. As Alciphron's speech makes clear, however, Berkeley's real worry is the use of such arguments in support of claims for the existence of a parallel moral sense which would obviate the need for the precepts and instruction of the established Church. He seeks to counter such views with the figure of Euphranor, who is made the spokesman of his own opinions. Through a strategy of Socratic questioning, Euphranor brings Alciphron to recognize that the perception of beauty also depends upon recognition of the object's fitness or usefulness for its intended end or purpose. Since this involves the use of reason, our response to beauty cannot be sheerly sensuous or immediate. Beauty is thus to be regarded as not only an object of the eye but of the mind. The dialogue was first published in London by J. Tonson in 1732. The following excerpts are taken from the modern reprint edited by David Berman, *Alciphron, or the Minute Philosopher in Focus*, London and New York: Routledge, 1993, pp. 59–61, 65–70.

ALCIPHRON: [...] To go to the bottom of things, to analyse virtue into its first principles, and fix a scheme of duty on its true basis, you must understand that there is an idea of beauty natural to the mind of man. This all men desire, this they are pleased and delighted with for its own sake, purely from an instinct of nature. A man needs no arguments to make him discern and approve what is beautiful; it strikes at first sight, and attracts without a reason. And as this beauty is found in the shape and form of corporeal things; so also is there analogous to it a beauty of another kind, an order, a symmetry, and comeliness, in the moral world. And as the eye perceiveth the one, so the mind doth, by a certain interior sense, perceive the other; which sense, talent, or faculty is ever quickest and purest in the noblest minds. Thus, as by sight I discern the beauty of a plant or an animal, even so the mind apprehends the moral excellence, the beauty, and decorum of justice and temperance. And as we readily pronounce a dress becoming, or an attitude graceful, we can, with the same free untutored judgment, at once declare whether this or that conduct or action be comely and beautiful. To relish this kind of beauty there must be a delicate and fine taste; but, where there is this natural taste, nothing further is wanting, either as a principle to convince, or as a motive to induce men to the love of virtue. And more or less there is of this taste or sense in every creature that hath reason. All rational beings are by nature social. They are drawn one towards another by natural affections. They unite and incorporate into families, clubs, parties, and commonwealths by mutual sympathy. As, by means of the sensitive soul, our several distinct parts and members do consent towards the animal functions, and are connected in one whole; even so, the several parts of these rational systems or bodies politic, by virtue of this moral or interior sense, are held together, have a fellow feeling, do succour and protect each other, and jointly

co-operate towards the same end. Hence that joy in society, that propension towards doing good to our kind, that gratulation and delight in beholding the virtuous deeds of other men, or in reflecting on our own. By contemplation of the fitness and order of the parts of a moral system, regularly operating, and knit together by benevolent affections, the mind of man attaineth to the highest notion of beauty, excellence, and perfection. Seized and rapt with this sublime idea, our philosophers do infinitely despise and pity whoever shall propose or accept any other motive to virtue. Interest is a mean ungenerous thing, destroying the merit of virtue; and falsehood of every kind is inconsistent with the genuine spirit of philosophy.

CRITO: The love therefore that you bear to moral beauty, and your passion for abstracted truth, will not suffer you to think with patience of those fraudulent impositions upon mankind, providence, the immortality of the soul, and a future retribution of rewards and punishments; which, under the notion of promoting, do, it seems, destroy all true virtue, and at the same time contradict and disparage your noble theories, manifestly tending to the perturbation and disquiet of men's minds, and filling them with fruitless hopes and vain terrors.

ALC: Men's first thoughts and natural notions are the best in moral matters. And there is no need that mankind should be preached, or reasoned, or frightened into virtue, a thing so natural and congenial to every human soul. Now, if this be the case, as it certainly is, it follows that all the ends of society are secured without religion, and that an infidel bids fair to be the most virtuous man, in a true, sublime, and heroic sense.

* * *

EUPHRANOR: Pray tell me, Alciphron, are all mankind agreed in the notion of a beautiful face?

ALC: Beauty in humankind seems to be of a mixed and various nature; forasmuch as the passions, sentiments, and qualities of the soul, being seen through and blending with the features, work differently on different minds, as the sympathy is more or less. But with regard to other things is there no steady principle of beauty? Is there upon earth a human mind without the idea of order, harmony, and proportion?

EUPH: O Alciphron, it is my weakness that I am apt to be lost in abstractions and generalities, but a particular thing is better suited to my faculties. I find it easy to consider and keep in view the objects of sense: let us therefore try to discover what their beauty is, or wherein it consists; and so, by the help of these sensible things, as a scale or ladder, ascend to moral and intellectual beauty. Be pleased then to inform me, what is it we call beauty in the objects of sense?

ALC: Everyone knows beauty is that which pleases.

EUPH: There is then beauty in the smell of a rose, or the taste of an apple?

ALC: By no means. Beauty is, to speak properly, perceived only by the eye.

EUPH: It cannot therefore be defined in general [as] that which pleaseth?

ALC: I grant it cannot.

EUPH: How then shall we limit or define it?

Alciphron, after a short pause, said that beauty consisted in a certain symmetry or proportion pleasing to the eye.

EUPH: Is this proportion one and the same in all things, or is it different in different kinds of things?

ALC: Different, doubtless. The proportions of an ox would not be beautiful in a horse. And we may observe also in things inanimate, that the beauty of a table, a chair, a door, consists in different proportions.

EUPH: Doth not this proportion imply the relation of one thing to another?

ALC: It doth.

EUPH: And are not these relations founded in size and shape?

ALC: They are.

EUPH: And, to make the proportions just, must not those mutual relations of size and shape in the parts be such as shall make the whole complete and perfect in its kind?

ALC: I grant they must.

EUPH: Is not a thing said to be perfect in its kind when it answers the end for which it was made?

ALC: It is.

EUPH: The parts, therefore, in true proportions must be so related, and adjusted to one another, as that they may best conspire to the use and operation of the whole?

ALC: It seems so.

EUPH: But the comparing parts one with another, the considering them as belonging to one whole, and the referring this whole to its use or end, should seem the work of reason: should it not?

ALC: It should.

EUPH: Proportions, therefore, are not, strictly speaking, perceived by the sense of sight, but only by reason through the means of sight.

ALC: This I grant.

EUPH: Consequently, beauty, in your sense of it, is an object, not of the eye, but of the mind.

ALC: It is.

EUPH: The eye, therefore, alone cannot see that a chair is handsome, or a door well proportioned.

ALC: It seems to follow; but I am not clear as to this point.

EUPH: Let us see if there be any difficulty in it. Could the chair you sit on, think you, be reckoned well proportioned or handsome, if it had not such a height, breadth, wideness, and was not so far reclined as to afford a convenient seat?

ALC: It could not.

EUPH: The beauty, therefore, or symmetry of a chair cannot be apprehended but by knowing its use, and comparing its figure with that use; which cannot be done by the eye alone, but is the effect of judgment. It is, therefore, one thing to see an object, and another to discern its beauty.

ALC: I admit this to be true.

EUPH: The architects judge a door to be of a beautiful proportion, when its height is double of the breadth. But if you should invert a well-proportioned door, making its breadth become the height, and its height the breadth, the figure would still be the same, but without that beauty in one situation which it had in another. What can be the cause of this, but that, in the forementioned supposition,

the door would not yield convenient entrances to creatures of a human figure? But, if in any other part of the universe there should be supposed rational animals of an inverted stature, they must be supposed to invert the rule for proportion of doors; and to them that would appear beautiful which to us was disagreeable.

ALC: Against this I have no objection.

EUPH: Tell me, Alciphron, is there not something truly decent and beautiful in dress?

ALC: Doubtless, there is.

EUPH: Are any likelier to give us an idea of this beauty in dress than painters and sculptors, whose proper business and study it is to aim at graceful representations?

ALC: I believe not.

EUPH: Let us then examine the draperies of the great masters in these arts: how, for instance, they use to clothe a matron, or a man of rank. Cast an eye on those figures (said he, pointing to some prints after Raphael and Guido, that hung upon the wall): what appearance do you think an English courtier or magistrate, with his Gothic, succinct, plaited garment, and his full-bottomed wig; or one of our ladies in her unnatural dress, pinched and stiffened and enlarged, with hoops and whalebone and buckram, must make, among those figures so decently clad in draperies that fall into such a variety of natural, easy, and ample folds, that cover the body without encumbering it, and adorn without altering the shape?

ALC: Truly I think they must make a very ridiculous appearance.

EUPH: And what do you think this proceeds from? Whence is it that the eastern nations, the Greeks, and the Romans, naturally ran into the most becoming dresses; while our Gothic gentry, after so many centuries racking their inventions, mending, and altering, and improving, and whirling about in a perpetual rotation of fashions, have never yet had the luck to stumble on any that was not absurd and ridiculous? Is it not from hence that, instead of consulting use, reason, and convenience, they abandon themselves to irregular fancy, the unnatural parent of monsters? Whereas the ancients, considering the use and end of dress, made it subservient to the freedom, ease, and convenience of the body; and, having no notion of mending or changing the natural shape, they aimed only at showing it with decency and advantage. And, if this be so, are we not to conclude that the beauty of dress depends on its subserviency to certain ends and uses?

ALC: This appears to be true.

EUPH: This subordinate relative nature of beauty, perhaps, will be yet plainer, if we examine the respective beauties of a horse and a pillar. . . . Now, I would fain know whether the perfections and uses of a horse may not be reduced to these three points: courage, strength, and speed; and whether each of the beauties enumerated doth not occasion or betoken one of these perfections? After the same manner, if we inquire into the parts and proportions of a beautiful pillar, we shall perhaps find them answer to the same idea. Those who have considered the theory of architecture tell us, the proportions of the three Grecian orders were taken from the human body, as the most beautiful and perfect production of nature. Hence were derived those graceful ideas of columns, which had a character of strength without clumsiness, or of delicacy without weakness. Those beautiful proportions were, I say, taken originally from nature, which, in her creatures, as

hath been already observed, referreth them to some end, use, or design. The *gonfiezza* also, or swelling, and the diminution of a pillar, is it not in such proportion as to make it appear strong and light at the same time? In the same manner, must not the whole entablature, with its projections, be so proportioned, as to seem great but not heavy, light but not little; inasmuch as a deviation into either extreme would thwart that reason and use of things wherein their beauty is founded, and to which it is subordinate? The entablature, and all its parts and ornaments, architrave, frieze, cornice, triglyphs, metopes, modiglions, and the rest, have each a use or appearance of use, in giving firmness and union to the building, in protecting it from the weather and casting off the rain, in representing the ends of beams with their intervals, the production of rafters, and so forth. And if we consider the graceful angles in frontispieces, the spaces between the columns, or the ornaments of their capitals, shall we not find, that their beauty riseth from the appearance of use, or the imitation of natural things, whose beauty is originally founded on the same principle? which is, indeed, the grand distinction between Grecian and Gothic architecture; the latter being fantastical, and for the most part founded neither in nature nor in reason, in necessity nor use, the appearance of which accounts for all the beauty, grace, and ornament of the other.

9 Jonathan Richardson (1665–1745) ‘Of the Sublime’

For the second edition of his *Essay on the Theory of Painting*, Richardson added a new final chapter on the Sublime. Taking up some suggestions by the French author Nicolas Boileau, he began to explore a concept which was to achieve wide currency during the eighteenth century, and to become an important influence on the later Romantic movement. Richardson is obviously uncertain of the matter before him, seeming sometimes to think of the Sublime simply as ‘the most excellent of what is excellent’. Indeed, after a lengthy attempt to pin down the nature of the Sublime in literature he confesses that ‘after all it cannot be said with certainty what is and what is not Sublime’. However, when he goes on to the Sublime in Painting, it turns out that something like this is precisely the point: the Sublime cannot be pinned down. Richardson senses that its hallmark is the excessive, the drive to go beyond what is given in the rules. It is as if, from the very centre of the disposition to specify and codify what art was in terms of gentlemanly competence and national profitability, the notion of the Sublime gave a glimpse of what art would become at a later stage. Although he does not quite know what to do with it, the hallmark of transgression is there in Richardson’s language: ‘tempests’, ‘vastness’, ‘*plus ultra*’, and ‘bliss’. Our brief extracts are taken from the second edition of Richardson’s *Essay on the Theory of Painting*, London: ‘A. C.’ 1725, pp. 248–9 and 256–63.

[. . .] [H]ere I take the Sublime to be the Greatest, and most Beautiful Ideas, whether Corporeal, or not, convey’d to us the most Advantageously.

By Beauty I do not mean that of Form, or Colour, Copy’d from what the Painter sees; These being never so well Imitated, I take not to be Sublime, because These require little more than an Eye, and Hand, and Practice. An Exalted Idea of Colour in a Humane Face, or Figure might be judg’d to be Sublime, could That be had, and

convey'd to Us, as I think it cannot, since even Nature has not yet been Equall'd by the Best Colourists; Here she keeps Art at a Distance whatever Courtship it has made to her. In Forms 'tis Otherwise as we find in the Antique Statues, which therefore I allow to have a Sublimity in them: And should do the same in regard to the same Kind, and Degree of Beauty if it were to be found in any Picture, as I believe it is not. Tho' in Pictures is seen a Grace, and Greatness, whether from the Attitude, or Air of the Whole, or the Head only, that may justly be Esteem'd Sublime.

'Tis to these Properties therefore as also to the Invention, Expression and Composition, that I confine the Sublime in Painting, and that as they are found in Histories and Portraits. [...]

When we see the Sublime it Elevates the Soul, gives her a higher Opinion of her Self, and fills her with Joy, and a Noble kind of Pride, as if her self had produc'd what she is Admiring. It Ravishes, it Transports, and creates in us a certain Admiration, mix'd with Astonishment. And like a Tempest drives all before it. [...]

In the foregoing Treatise I have been shewing what I take to be the Rules of Painting, and tho' Any one had understood, and practis'd them all, I must yet say One thing is wanting, Go, and Endeavour to attain the Sublime. For a Painter should not Please only, but Surprize.

Plus ultra was the Motto of the Emperour Charles V. whose Actions were of the Sublime kind, and, as Monsieur St. Evremont finely distinguishes, rather Vast, than Great: And this should be the Motto of all that apply themselves to any Noble Art, particularly of a Painter [...]. He must be perpetually Advancing. And whatever Rules are given as Fundamental of the Art *Plus ultra* like a Golden Thread should be woven in, and run throughout the whole piece. [...]

When we propose only an exact Imitation of Nature we shall certainly fall short of it; So when we aim no higher than what we find in any One, or more Masters, we shall never reach their Excellence: He that would rise to the Sublime must form an Idea of Something beyond all we have yet seen; or which Art, or Nature has yet produc'd. [...]

This is the Great Rule for the Sublime; not to be given however 'till those Fundamental of the Art have been well Known, and Practised; 'tis to be Open'd when a Man has got far on his way, as the Commissions of Admirals, or Generals going on some great Expedition frequently are. The Sublime disdains to be Trammell'd, it knows no Bounds, 'tis the Sally of Great Genius's, and the Perfection of Humane Nature; but like Milton's Paradise *Wild, above Rule, or Art, Enormous Bliss!*

10 Lambert Hermanson ten Kate (1674–1732) 'The Beau Ideal'

Ten Kate was a widely read Dutch scholar with an interest in philology and Antiquity, as well as the contemporary theory of art. In 1728, in company with A. Rutgers, he published in Amsterdam a three-volume French translation of works by Jonathan Richardson under the collective title *Traité de la Peinture*. To the third volume, Ten Kate appended his own short treatise 'Un Discourse Preliminaire sur le Beau Idéal, des Peintres, Sculpteurs et Poètes'. This had apparently been written before he encountered Richardson's writings on painting. Be that as it may, Ten Kate's text complements the chapter on the Sublime which

Richardson added to the second edition of his *Theory of Painting* in 1725 (see IIB9). Although slight, and far from clear, Ten Kate's text helps to underline the link between the earlier concepts of 'grace' and the *je ne sais quoi* (see ID) and a concept of the Sublime as relating to those aspects of art which appear to defy logical judgement and measure. The text was translated into English and published posthumously as a separate pamphlet of 21 pages. Our short extract is taken from pp. 2–3 of the translation by James Christopher Le Blon, London: James Bettenham, 1732.

The most considerable Authors that treat of the sublime Part and Ideal of the Art of Painting, commonly used the Name of Beau; or a thing well proportion'd, natural, sublime, and of an high Taste: Terms that, in my Opinion, might be more illustrated than they have been; I am determin'd upon the Occasion of this Book of Messieurs Richardsons to publish this my Treatise of the Beau Ideal, with a View to enrich the Art, and to facilitate the Undertakings of the best Authors.

The Ideal is properly a judicious Choice only and an ingenious Representation of Objects in order to have every thing excellent in its kind, and so chosen from intire Nature, as to attract the Eyes and captivate the Attention of Connoisseurs; the whole nevertheless different throughout, according to the Exigence of the Case and the Subject. This Ideality is extended through all the principal Parts of Art, not only in the different Choice of Ordonnance, or Disposition of the whole of the Chiaro Oscuro, the Coloritto, the Draperies, the Attitudes, the Characters of Personages; but also through the Subjects of pleasant Landskips, of fine Flowers and of exquisite Fruits, in such a manner that in every Composition a particular Harmony reigns, and a certain Union of the Whole; just as in a fine Piece of Musick, the Key or Tone reigns upon which the Musick is compos'd.

But seeing the different Reflections of Authors have a Respect to the Ideal of the Personages, either of Fables, or of sacred and prophane History, or of Allegories; and seeing, when the most difficult part of any thing is comprehended, the more easy parts are soon comprehended, we may confine ourselves here to the Ideal, with respect to Personages or Figures, especially to one of the most sublime parts of the Ideal, which is more admirably well executed in the finest antique Statues and in the principal Works of Raphael.

The sublime Part that I so much esteem, and of which I have begun to speak, is a real *Je ne sçai quoi*, or an unaccountable Something to most People, and it is the most important part to all the Connoisseurs: I shall call it an harmonious Propriety, which is a touching or moving Unity, or a pathetick Agreement or Concord, not only of each Member to its Body, but also of each Part to the Member of which it is a Part: It is also an infinite Variety of Parts, however conformable, with respect to each different Subject, so that all the Attitude, and all the Adjustment of the Draperies of each Figure ought to answer or correspond to the Subject chosen. Briefly, it is a true Decorum, a *Bienséance* or a congruent Disposition of Ideas, as well for the Face and Stature, as for the Attitudes. A bright Genius, in my Opinion, who aspires to excel in the Ideal, should propose this to himself, as what has been the principal Study of the most famous Artists. 'Tis in this Part that the great Masters cannot be imitated or copied but by themselves, or by those that are advanced in the Knowledge of the Ideal, and who are as knowing as those Masters in the Rules or Laws of the

Pittoresque and Poetical Nature, altho' inferior to the Masters in the high Spirit of Invention.

11 Pierre de Marivaux (1688–1763) from *The Philosopher's Cabinet*

The French dramatist, novelist and essayist Marivaux was born in Paris. His numerous plays reflect the spirit of 'preciosity' which reigned in the Parisian salons where he was most at home. Through the use of disguise and the construction of false situations, Marivaux investigates the disparity between what is said and what is thought in 'the game of love'. His plays have sometimes been compared to the paintings of Watteau (see IIA12), whose *fêtes galantes* are animated by a similar spirit of grace and refinement. In the work of both artists there is a tone of melancholy seriousness beneath the apparent gaiety. Marivaux was also a prolific essayist. In 1722 he founded the *Spectateur Français*, inspired by Addison's journal, *The Spectator* (see IIB4). *Le Cabinet du philosophe* was also published as a weekly journal, although it seems that the work was conceived as a whole prior to the appearance of the first issue in January 1734. In the excerpt reproduced here, Marivaux constructs an ingenious allegory in which he describes the respective abodes of 'beauty' and of the *je ne sais quoi*. Each is identified with a different form of garden design. That of beauty is formal and symmetrical, that of the *je ne sais quoi*, free and informal. Although the personification of beauty commands respect and admiration, she has become mute and inexpressive. By contrast, the *je ne sais quoi* remains elusive, invisible to the gaze but everywhere present as an animating spirit. Marivaux's admiration for disorder, fantasy and irregularity owes much to the work of Addison, but also draws on the writing of earlier figures such as Bouhours (see ID7). *Le Cabinet du philosophe* was first published in Paris, by Prault, in 1734. The following excerpt has been translated for this volume by Katerina Deligiorgi from the facsimile edition, Geneva; Slatkine Reprints, 1970, 'Deuxième feuille', pp. 35–48.

Rarely are beauty and the *je ne sais quoi* found together.

By *je ne sais quoi* I mean the diffuse charm of a face or a figure which renders someone lovely but which is impossible to locate.

I have read somewhere a rather singular story on this subject about a man who thought that he had found the dwelling-place of Beauty and of the *je ne sais quoi*.

And here is more or less what he said. The account is short, for I relate here only the summary of the story.

One day, said the man, I was strolling in the countryside when I came across one of the most beautiful women in the world, a woman I had encountered before over the eight days I had already spent there. The first time I saw her I had looked upon her with admiration, the second time I was less moved, until finally I was able to look at her with indifference even though I still found her beautiful – and indeed so she was. I asked myself why this beauty, so deserving of admiration, seemed now insipid to me, and, in general, why Beauty itself fails to inspire more enduring feelings.

I was still pondering this when I found myself between two gardens, one magnificent, the other gay and cheerful. The doors of the two gardens were facing each other. On the door of the magnificent garden was written with golden letters: 'The Abode of Beauty'. On that of the cheerful garden, painted in many-coloured letters so

that one could not make out for certain the precise hue, was: 'The Abode of the *je ne sais quoi*'.

'The abode of Beauty!' I thought to myself, 'Oh! that is what I want to see! For who says "beauty" says something more important than "*je ne sais quoi*" and certainly more worth seeing.'

As if pulled by the force of the very word 'beauty' I did not hesitate. Choosing the garden of Beauty, I left behind the garden of the *je ne sais quoi* to which I would return later to amuse myself.

Resolved as I was in favour of the former, I nonetheless glanced once more at the other which seemed so cheerful. I wished then it were possible to see them both at once. But in truth there was no comparison to be made and I had to start with the most attractive. This is what I did.

As I entered the garden of beauty I noticed the footsteps of many men who had gone before – though I also noticed that just as many had left.

I stepped forward and the more I discovered, the more I admired.

I will not describe to you all the beautiful things I saw there. An account of these grounds is beyond me, but I was amazed and awe-struck. Imagine all that is grand, superb and magnificent in a single garden, all the astonishing effects that the most exact symmetry and the most intelligent arrangement can create – and you will hardly have formed an image of what I saw.

How, too, can I describe that palace which I discovered after having walked a while? I give up.

I would rather say something about the woman I saw there. She was sitting on a kind of throne around which several men were gathered. From what they told me, they had arrived there only an hour before me. They were all motionless, as if in ecstasy before this woman sitting on the throne.

Judge for yourself whether they were wrong: it was Beauty in person they were looking at. From time to time, she let her gaze fall nonchalantly on each one of us, making us cry: 'Ah! The beautiful eyes!' and the next moment, 'Ah! The beautiful mouth! Ah! The beautiful turn of the face, the beautiful figure!'

Hearing these exclamations, Beauty would smile, lower her eyes a little, and assume a countenance that was modest rather than disconcerted. Without saying a word, she would start again to look at each one of us, as if to confirm in us the feelings of admiration we had for her. After a short while, she would lift her head and assume a haughty stance that seemed to say: 'Join respect to your admiration.' That was her only language.

In the first quarter of an hour the pleasure of contemplating her made us forget her silence. In the end, however, I became aware of it and so did the others.

'What!' we said amongst ourselves, 'Nothing but smiles and airs and not a single word. That is hardly enough. Is it only our eyes that may be contented? Do we live only for the pleasures of seeing?'

Thereupon, one of us stepped forward to present Beauty with a fruit he had picked in the garden. She smiled and picked it with the most beautiful hand of the world but never opened her mouth. She thanked him with a comely gesture and we had to limit ourselves to looking at her.

Each one of us apparently grew weary of this, for, little by little, our gathering diminished. I saw my companions disappear and soon, from all the admirers amongst whom I had found myself, I was the only one remaining and withdrew in my turn.

As I was walking along an alley, retracing my steps, I encountered another woman who looked very proud and noble. I bowed deeply as I crossed her path.

'What did you see?' she asked with a disdainful and vexed air. 'I have just been admiring Beauty,' I said, 'and now I withdraw.' 'And why withdraw?' she replied. 'Should you not be transfixed by Beauty? What else is there to see, once you have seen her?'

'Nothing for sure,' I said, 'but I saw her enough. I know her features by heart. They are always the same. The beautiful face always repeats itself, it says nothing to the spirit, it speaks only to the eyes, telling them always the same thing. I learn nothing new. If Beauty entertained her admirers a little, if the movements of her soul were reflected on her face, rendering it less uniform and more affecting, then her face would please the heart as well as the eyes. But we are only to look at its beauty, without feeling it. Beauty should take the trouble to speak and to show the wit she doubtless possesses.'

'And what does it matter whether she has any or none at all?' the woman said. 'Does she need any, made the way she is? Go away, you understand nothing. If this were an ordinary face, I would agree with you. Then it would gain from being animated by wit and this would do it a great deal of good and would supplement the graces which it lacked. But to wish that wit animated a beautiful face is to wish to alter its charms. Wit improves uneven features, but harms beautiful ones – it disturbs them. A beautiful face is perfectly finished. The best it can do is to remain as it is. The play of wit would trouble its economy because it is precisely as it should be and it cannot leave that state without harming itself. Your criticisms are therefore lacking in judgement. It is I who tell you this, the unmoving Pride of the beautiful and the companion of Beauty. I never leave her side and take great care to keep her spirit cold and tranquil, so that her face stays calm and retains its noble reserve. Fortunately, it is true that I have no great difficulty in tempering her spirit, for it is usually placid and calm. Or, at least, her spirit is well aware of how important it is to remain grave and not to disturb the beautiful face, whose interests concern it far more than its own.'

This is what this woman claimed and her discourse seemed to me so extraordinary that I responded with a bow, after which I left promptly to reach the abode of the *je ne sais quoi* where I found all those who had left me alone in the abode of beauty.

There was nothing eye-catching in this place and, what is more, nothing arranged. All was as if thrown together by chance. Disorder reigned, but a disorder of the best possible taste, producing a charming effect, the cause of which could neither be unravelled nor shown.

We wanted for nothing and yet nothing can have been finished there, or at least, whatever the final design was, it remained incomplete, for every moment we saw something new added.

And despite the fable which allows for only three Graces, there was an infinity of Graces there striding along in the garden, working and transforming everything. I say 'striding' because this is all they did: they came and went, they passed quickly in

front of us, followed by others, without giving us the time to know them well. They were there, we scarcely had a chance to see them, and they were there no more. Others took their place, moving on in their turn to make room for others. In a word, they were everywhere and stood nowhere. We never saw one but a thousand.

'Ah well, Gentlemen,' I said then, to those who were there with me, 'this is a charming garden, and I would gladly spend a lifetime here, but where is its inhabitant, the *je ne sais quoi*? Bring me to him for you must certainly have encountered him.'

'Not yet,' they replied, 'we have been looking for him since we arrived without having succeeded in finding him yet. It is true that our search is agreeable in itself, for even though we have the greatest desire to see him, we are not in the least impatient to find where he is and were we never to find him we would still be determined to search for ever.'

'He must nonetheless be here,' I replied. Hardly had I uttered these words, than we heard a voice declaring 'Here I am.'

We turned around, for we could see nothing before us. We turned in vain, for we saw nothing there either.

'Where are you then, lovely *je ne sais quoi*?' we all asked together.

'Here I am, I say,' replied the same voice.

And we turned again, again expecting to see him and still seeing nothing.

'You tell us "here I am",' I replied, 'and you do not present yourself to us.' 'But you see no one else but me,' he replied. 'In this infinite number of Graces who pass incessantly in front of your eyes, who come and go and are all so different and yet equally lovely, some virile and some tender: take a good look at them, for there I am. I am what you see, I alone. In these paintings that you like so, in these objects of every kind which so delight you, in the entire expanse of the grounds, in all that you perceive, here simple, here untended, irregular even, sometimes ornate, sometimes not, I am there and I show myself. I bestow my charm on everything, I surround you. In the figure of the Graces, I am the *je ne sais quoi* that belongs to both sexes. Here I am the *je ne sais quoi* which pleases in painting, there the *je ne sais quoi* which pleases in architecture, in furniture, in gardens, in everything that makes an object of taste. Do not look for me in any single shape; I have a thousand and not a single one that is fixed. This is why I am seen but not known and why I remain impossible to grasp or to define. I disappear from sight even while being watched; I am perceived but cannot be unravelled. You look at me and for me and you shall never find me in any other way. Thus you shall never tire of me.'

12 Jonathan Edwards (1703–1758) 'The Beauty of the World'

Edwards was born in East Windsor, Connecticut, the son of the village pastor. At the age of 13 he went to Yale College. Having discovered the 'new learning' – principally the work of Locke and Newton – he went on to gain his MA degree, and was appointed as a tutor there in 1724. He had already undergone a profound religious conversion, and shortly followed his father into the Church, being ordained as a pastor in 1727. He was a leading figure in the religious revivalism which swept New England in the middle years of the eighteenth century,

and as a result of controversies which arose in this period, he was dismissed from his living in 1750. Thereafter he spent six years as a missionary to the Housatonic Indians at the frontier outpost of Stockbridge, Massachusetts. It was here, in almost complete isolation, that he produced his best-known works. In 1757 he was invited to take up the presidency of the College of New Jersey, subsequently Princeton University, but died in an epidemic before he could assume the post. He is now regarded as the first American intellectual to have gained an international reputation. His writings display a remarkable tension between acute observation of the natural world, fuelled by his interest in Newtonian science, and an all-pervading mysticism. The present text, long unpublished, was part of a folio of writings to which Edwards added throughout his life, and which drew together these two sides of his intellect. Called *The Images or Shadows of Divine Things*, it consists of over 200 entries, each of which 'reads' the world as the image of a divine truth. *The Beauty of the World* is a self-contained text of the same kind, included within the larger work. For Edwards, it is as if the world itself is an aesthetic totality, yet this is a sense of the aesthetic which is suffused by far more than worldly pleasure. Edwards himself did not write on art. However, many seventeenth- and eighteenth-century attempts to address elusive and ineffable aspects of experience, under rubrics such as the *je ne sais quoi* and 'grace', seem clearly to prefigure a later, modernist sense of the aesthetic. In this connection, it is of some interest that a meditation by Edwards was employed in 1967 as the epigraph to Michael Fried's passionate defence of artistic modernism, 'Art and Objecthood' (see *Art in Theory 1900–1990* VIIA6). Likewise, Fried's famous claim that 'we are all literalists most or all of our lives; presentness is grace,' clearly carries echoes of the eighteenth-century tradition we find at work in Edwards, with its sense of aesthetic experience lifting the sympathetic viewer out of a world of accident and contingency into a realm of immediacy and truth. The text, which is reproduced here in full, is taken from Jonathan Edwards, *Images or Shadows of Divine Things*, ed. Perry Miller, New Haven: Yale University Press, 1948, pp. 135–7.

The beauty of the world consists wholly of sweet mutual consents, either within itself or with the supreme being. As to the corporeal world, though there are many other sorts of consents, yet the sweetest and most charming beauty of it is its resemblance of spiritual beauties. The reason is that spiritual beauties are infinitely the greatest, and bodies being but the shadows of beings, they must be so much the more charming as they shadow forth spiritual beauties. This beauty is peculiar to natural things, it surpassing the art of man.

Thus there is the resemblance of a decent trust, dependence and acknowledgment in the planets continually moving round the sun, receiving his influences by which they are made happy, bright and beautiful: a decent attendance in the secondary planets, an image of majesty, power, glory, and beneficence in the sun in the midst of all, and so in terrestrial things, as I have shown in another place.

It is very probable that that wonderful suitableness of green for the grass and plants, the blues of the skie, the white of the clouds, the colours of flowers, consists in a complicated proportion that these colours make one with another, either in their magnitude of the rays, the number of vibrations that are caused in the atmosphere, or some other way. So there is a great suitableness between the objects of different senses, as between sounds, colours, and smells; as between colours of the woods and flowers and the smells and the singing of birds, which it is probable consist in a certain proportion of the vibrations that are made in the different organs. So there are innumerable other agreeablenesses of motions, figures, etc. The gentle motions of

waves, of [the] lily, etc., as it is agreeable to other things that represent calmness, gentleness, and benevolence, etc. the fields and woods seem to rejoice, and how joyfull do the birds seem to be in it. How much a resemblance is there of every grace in the field covered with plants and flowers when the sun shines serenely and undisturbedly upon them, how a resemblance, I say, of every grace and beautiful disposition of mind, of an inferiour towards a superiour cause, preserver, benevolent benefactor, and a fountain of happiness.

How great a resemblance of a holy and virtuous soul is a calm, serene day. What an infinite number of such like beauties is there in that one thing, the light, and how complicated an harmony and proportion is it probable belongs to it.

There are beauties that are more palpable and explicable, and there are hidden and secret beauties. The former pleases, and we can tell why; we can explain the particular point for the agreement that renders the thing pleasing. Such are all artificial regularities; we can tell wherein the regularity lies that affects us. [The] latter sort are those beauties that delight us and we cannot tell why. Thus, we find ourselves pleased in beholding the colour of the violets, but we know not what secret regularity or harmony it is that creates that pleasure in our minds. These hidden beauties are commonly by far the greatest, because the more complex a beauty is, the more hidden is it. In this latter fact consists principally the beauty of the world, and very much in light and colours. Thus mere light is pleasing to the mind. If it be to the degree of cffulgence, it is very sensible, and mankind have agreed in it: they all represent glory and extraordinary beauty by brightness. The reason of it is either that light or our organ of seeing is so contrived that an harmonious motion is excited in the animal spirits and propagated to the brain. That mixture we call white is a proportionate mixture that is harmonious, as Sir Isaac Newton has shown, to each particular simple colour, and contains in it some harmony or other that is delightfull. And each sort of rays play a distinct tune to the soul, besides those lovely mixtures that are found in nature. Those beauties, how lovely is the green of the face of the earth in all manner of colours, in flowers, the colour of the skies, and lovely tinctures of the morning and evening.

Corollary: Hence the reason why almost all men, and those that seem to be very miserable, love life, because they cannot bear to lose sight of such a beautiful and lovely world. The ideas, that every moment whilst we live have a beauty that we take not distinct notice of, brings a pleasure that, when we come to the trial, we had rather live in much pain and misery than lose.

Part III

Judgement and the Public Sphere

III

Introduction

The next three sections together cover different aspects of the same chronological span: the second half of the eighteenth century. In Western Europe this was experienced at the time as a period of great change. Indeed, momentous change did occur, economically as well as politically, in the leading nation-states of France and England. In a very real sense, the modern world was born in the twin revolutions of the later eighteenth century: the Industrial Revolution in England, and the political revolution in France. We shall postpone discussion of the political crisis of the late century, and of the artistic changes it brought in its wake, until the introduction to Part IV. Here we will concentrate on the period of entrenchment and stabilization which preceded the upheavals of the American and French Revolutions. Despite these different phases and emphases, certain themes pervade the whole period. The principal motif of Parts III and IV is the consolidation of art as a matter for *public* discourse: as something with which the cultivated urban middle class might be expected to concern itself, and no longer the specialized interest of a patrician or intellectual elite.

The second half of the eighteenth century saw Britain established as the dominant nation in world terms. The Spanish and Portuguese empires, founded on the first wave of global exploration in the sixteenth century, and its associated 'primitive accumulation' of exotic wares and sheer plunder, had long been in decline. The Dutch established a trading empire in the seventeenth century, but lost out to British naval strength. The eighteenth century then saw prolonged conflict between Britain and France. These were not only the strongest European states, but the superpowers of the period. The outcome of the Seven Years War (1756–63), in which both were leading protagonists, did much to shape world history for the next 150 years. The outcome of the war was a pointer to the way things would continue to go. Though the English had good generals and admirals and well-trained armies, their ultimate triumph was due not merely to soldierly *élan*, but to the development of a stronger economic base than their adversaries. Global hegemony was underwritten by industrial strength allied with finance capital at its most advanced: the mines and factories of the Midlands and North combined with the City of London and the Bank of England. The only war the British lost in the period was with their colonists in North America in the mid-1770s. But by then, following the defeat of the French in

1760, the North American continent was already decisively Anglicized in cultural and linguistic terms, if not in its political character. Britain also vanquished France in the East, establishing dominance over India at the same time in the early 1760s. The newly discovered southern continent of Australia was British by 1778. And the 1790s saw the British take control of southern Africa from the Dutch and begin to expand their influence across the rest of the continent.

The nineteenth century was to be British as decisively as the twentieth was to become American. But Britain in the eighteenth century was a paradox. Its industrial strength and political liberty were never translated into artistic pre-eminence in quite the way that might have been expected. The question of an English school, and of the pros and cons of an Academy on the French model, dragged on throughout the middle of the century (see below, section IVA). We have already commented (in the introduction to Part II) on the lack of artistic advance in France at the time, with Watteau's work standing out in its intensity against a quantity of run-of-the-mill history painting. Likewise in England, with the exception of Hogarth's work, there was little really interesting art to talk *about*. Portraiture (demeaningly tagged 'face-painting') dominated, along with landscape. These are discussed in the introductions to Parts IV and V. England remained a predominantly literary culture, with a pronounced empiricist bent. And in the field of the visual arts, English-language debate at the mid-century centred less on practice than on the reception of art: on how it was to be judged, and on what the cultivated might expect to derive from it. There seems, in truth, to have been something of a lull in artistic achievement right across Western Europe at this point. Perhaps for this reason, the question of art's relationship to the past continued to dominate art-theoretical discussion – somewhat paradoxically, however, given that this was the moment at which the leading nations were making a decisive leap into modern social and economic forms.

For those who turned once more to discuss the legacy of the ancients, a principal objective was the education of taste (III A1, 6). For George Turnbull in particular, the primary importance of the classics was educative. Art was less something to be studied for its own reward than for the pointers it provided towards conduct and leadership in the here and now. This was the function of the Grand Tour, that system whereby the social leaders of the next generation were to be allowed off the leash while simultaneously getting acquainted with their cultivated heritage. That said, genuine interest in the past continued apace, and increasingly the mere scrutiny of classical quotations gave way to practical archaeology. The excavations at Herculaneum (III A4) proved a mixed blessing, insofar as they showed the Romans to have been rather less than the austere paragons fondly imagined by so many modern Augustans. For whatever reason, the mid-eighteenth century witnessed a shift in the balance of modern attitudes to the past. Since the time of the Renaissance, Rome had symbolized classical virtue. Now, however, its status increasingly came to be seen as a legacy of the true original, Athens. This was a crucial shift in the balance of power where the Antique was concerned. From this point on, for purposes of both intellectual and practical enquiry, Greece became established as the fountain-head of the Western canon (III A5, 7 and 8).

There was a further shift on this terrain of debate about the art of the past, and it was one which was to have even more far-reaching consequences. In 1939–40, the

emerging American critic Clement Greenberg wrote his two ground-breaking essays on avant-garde art (see *Art in Theory 1900–2000* IVD11 and VA1). In these he claimed that the defining element of modernism was its autonomy. The title he chose for the second essay was revealing: ‘Towards a Newer Laocoon’. In the mid-eighteenth century, German-language scholarship was making its first impact on European debate about art. The period from the Renaissance up to the mid-eighteenth century had been dominated by the motif of art’s elevation. *Ut pictura poesis*, the doctrine of the Sister Arts, stood behind everything that was being claimed on behalf of visual art. Painting could do what poetry could do. However, painting’s equivalence to poetry tended to be predicated on the relationship of both to narrative. The claim was that painting, once granted its learned status, could tell the classical stories with as much impact as poetry. But what also became clear was that it told the stories differently; that is, painting’s *effects* were different. And the registration of this pointed to something new: the perception that the visual arts were equal to but distinct from literature. In the early eighteenth century, writers like De Piles and Du Bos had begun to establish the particularity of visual art (cf. IIA2, IIB6). But the *locus classicus* for this perception is Gotthold Lessing’s meditation on the antique Laocoön sculpture, published in 1766 (IIIA10). The theory of the Sister Arts had done its job, so to speak. The visual arts had been elevated from craft status to Liberal Art. Now art could stand on its own feet. By weakening the doctrine of the Sister Arts and emphasizing instead the particularity of the visual, Lessing blazed a trail along which lay forms of artistic independence as yet inconceivable to the eighteenth-century mind.

The notion of an ‘eighteenth-century mind’ is of course an abstraction; but it serves to differentiate a set of intellectual and moral habits from our own. Cultivated social intercourse in the period was largely preoccupied with questions of virtue and decorum and with the maintenance of all kinds of public standards and proprieties. It is this which makes the eighteenth century at once so close to and so remote from our contemporary world. Postmodern theory has decisively located the origins of the modern in the second half of the eighteenth century: in its technological dynamism, its secularization, its discovery of the individual, of reason, of feeling, of alienation even. Yet it was also an age of wigs and cravats, of bowing and scraping, of the most grovelling homilies by artists of every kind to their esteemed patrons, in other words, of the most stultifying obsession with rank and protocol. Mid-eighteenth-century reflection on the arts was dominated by the concept of ‘Taste’. This was a complex notion, responding on the one hand to a democratizing impulse rooted in the development of empiricist philosophy and the pre-eminence of individual judgement; yet on the other hand steeped in connotations of class and social hierarchy. We include several examples from an extensive literature in both Britain and France, composed by lawyers and political figures no less than philosophers and artists themselves (see IIIB4, 5, 7, 8, 9, 13, 15).

It is as if what was at issue in all the circling around the classical heritage was whose canon it provided, and what lessons it might teach. For Turnbull, as we have remarked, the culture of the past was a kind of handbook for his prospective Grand Tourist. In their concern with gentlemanly competence and good sense, authors repeatedly returned to questions about the nature of judgement: whether it was

innate, whether it could be learned, and what were its limits. One of the most intriguing features of this discourse, attracting mention from figures as dissimilar as Joshua Reynolds and Voltaire, was the relation of the classical heritage to non-Western standards of beauty (see IIIB8 and 9). In general, however, 'taste' was associated with the concept of a 'Grand Manner', embodied in the argument of figures such as Reynolds in England and Winckelmann's ally Anton Raphael Mengs on the continent (IIIB13; for Reynolds' mature statement, see below IVA7). We do not mean to imply that the discourse on taste and on canons of beauty represented some kind of a brake on development and innovation in the arts. There was certainly a potential for conservatism, but at the same time the very preoccupation with these questions led to the emergence of modern aesthetics as such. In due course, reflection upon art and its appropriate modes of response came to be considered as a field of study in itself, not only in England and France, but also in Germany, where a distinct range of philosophical concerns gave rise to some of the most challenging forms of art-theoretical reflection (see IIIB1, 2, and below, VA10).

The very concentration on rational standards of beauty and taste, made manifest in a suitably 'grand manner' indebted to the classical ideal, simultaneously gave rise to various divergent interests and counter-tendencies. Hogarth, for example, drew inspiration from the Dutch in his recording of the manners and mores of contemporary English life. The other side of the preoccupation with imitating classical models and the cultivation of public taste was a growing emphasis on the individual response. The mid-eighteenth century saw the emergence of a recognizably modern interest in the linked concepts of originality and genius. 'Genius' had played a role in the theory of art since the Renaissance. In the early sixteenth century Albrecht Dürer recognized that a rapid sketch by an artist possessed of genius would eclipse even the most laborious production of an uninspired hack. But in the period covered by the present section, the notion began to take on a characteristically modern inflection in respect of its relationship to the idea of rule. For Reynolds, Mengs and others, 'genius' in art had essentially come to mean mastery of the rules. Increasingly, however, from the mid-eighteenth century, the individual imagination began to claim its place (see IIIB10), and genius came to be associated with the transgression, or transcendence, of rules.

This sense of art as potentially disruptive of the status quo, rather than continually confirming it, can also be seen at work in formulations of the concept of the sublime. With its roots in seventeenth-century notions of grace and the *je ne sais quoi*, the sublime takes on a central role in eighteenth-century aesthetics (see IIIB6), leading rapidly out of academic decorum to the preoccupations of Romanticism. In Germany, the field of theory was already dominated by a certain systematizing tendency in the work of Baumgarten, and later of Kant, Winckelmann and Lessing. Yet even here, in the almost wilfully eccentric aesthetic writings of Georg Hamann in the early 1760s, an entirely different note can be heard prefiguring Romanticism (IIIB12). In France, Voltaire remained sceptical of overarching claims for a standard of beauty (IIIB14). So an interest in individualism and subjective judgement, in ungovernability and genius, appears in both the practice and theory of the arts in the mid-eighteenth century. Yet the ruling protocols were still, arguably, established on a

different kind of basis: taste as a standard; virtue as incontestable; civic responsibility as the goal of education and cultivation.

The mid-eighteenth century, then, saw the emergence of both what P. O. Kristeller called 'the modern system of the arts' and the modern modes of philosophical reflection upon the arts, namely aesthetics and art history. A fourth and no less important element in the modern constellation of the arts also emerged at this time, in debate about the *public* role of art: that is, the discourse of art criticism. In 1737, after a period of neglect, the Salons were revived in Paris. Beginning in 1747, a debate took place on standards in art, and on the rights and responsibilities attendant upon the maintenance of those standards. The discussion of the 1747 Salon by La Font de St Yenne, and the discussion to which it gave rise, provides a convenient marker for the birth of modern art criticism (see IIIC1, 2, 3).

This critical discourse around the practice of art may be seen as part of the wider climate of intellectual inquiry conventionally known by its own sobriquet of 'Enlightenment'. In the contemporary intellectual world, haunted by the apparent failure of the promise of emancipation, the so-called Enlightenment 'grand narratives' have been subject to relentless questioning. Yet it is worth underlining that Enlightenment thinkers were motivated by a commitment to combat far more confining myths than those of human reason and virtue: in essence, superstition in the form of organized religion, and inherited privilege in the form of the aristocracy. The beginnings of the Enlightenment may be seen in the late seventeenth-century thought of Locke, Newton and others, and its practical apotheosis was reached in the French Revolution of 1789. It was motivated by a belief 'that unassisted human reason, not faith or tradition, was the principal guide to human conduct . . . that science and the conquest of superstition and ignorance provided the prospect for endless improvement and reformation of the human condition' (Kramnick, 1995, pp. xi-xii). However, the Enlightenment was a more complex and internally differentiated movement than has sometimes been recognized. It included, for example, the figure of Jean-Jacques Rousseau, whose critical and polemical writings struck at many of the certainties and practical ideals which were upheld by his fellow *philosophes*. Rousseau's suggestion that the 'progress' of civilization may in fact have led to the corruption of our natural goodness, called into question the early Enlightenment's confidence in the emancipatory power of unaided reason. He also placed a new emphasis on the role of feeling or 'sentiment', and established new ideals of fulfilled human existence which were to have an important impact throughout the second half of the eighteenth century. In fact his ideas continued to influence Romanticism, and may even be seen as standing behind conceptions such as the 'nobility' of 'primitive' life, which pervaded sections of the late nineteenth- and early twentieth-century avant-garde (IIIA2, 3).

The defining intellectual project of the Enlightenment was the French *Encyclopédie*. Growing out of a plan to translate Ephraim Chambers' *Cyclopaedia* (IIA10), the result far outstripped the inspiration. Led by D'Alembert and Diderot, the *Encyclopédie* offered an overview of the entire field of human knowledge, composed in twenty-eight volumes by a small army of scholars, and published in Paris between 1751 and 1765. Here we reprint extracts from several contributions relevant to the practice of art (IIIC7, 8, 9) as well as one by the sculptor Falconet, intended for the

Encyclopédie, but first published separately (IIC11). This French milieu of debate around the Salon and the *Encyclopédie* project gave rise to art criticism's first major figure, Denis Diderot. Diderot's Salon reviews (IIC12, 13, 14) stand at the head of a tradition extending well into the nineteenth century, a tradition which would exert increasing influence on the actual practice of art. In some of its more esoteric reaches, art theory has often seemed detached from the actual practice of art, not least when it takes the form of philosophical aesthetics. Not so criticism. The antagonism to critics felt by so many modern artists is witness to the fact that, from Diderot onwards, the voice of the critic counted for something.

IIIA

Classical and Contemporary

1 George Turnbull (1698–1748) From *A Treatise on Ancient Painting*

Turnbull was one of the earliest representatives of the eighteenth-century Scottish school of philosophers. His *Principles of Moral Philosophy*, which was later to have an influence on Thomas Reid (see IIB15), was published in 1740, the same year as the *Treatise on Ancient Painting* itself. Indeed the hallmark of the *Treatise* is Turnbull's resolutely ethical approach to art. Turnbull is not interested in art as an object of study in itself. As he puts it in his conclusion, he has written about painting because of its potential 'of impressing on the mind some useful rules and maxims for our conduct' (p. 180). The bulk of Turnbull's text consisted of a survey of the arts in Antiquity, and the social and moral roles they played. A hundred years after Junius (IA1), remarkably little seems to have altered. What has changed is less the story itself than the way it is told. Unlike Junius, Turnbull's study of ancient painting is chronological. It concludes with a survey of the modern inheritors of the classical tradition, from Raphael and Michelangelo to Rubens and Poussin. The *Treatise* is illustrated with fifty engravings of classical works of art, drawn by the Italian artist Camillo Paderni. (These were reissued with an extended commentary the following year as *A Curious Collection of Ancient Paintings*, London 1741.) A second important difference concerns the audience. Junius wrote for an elite group of humanist scholars, originally in Latin. Turnbull addressed the parents of well-off young men, the future leaders of eighteenth-century society. The *Treatise* was, in part at least, homework for the potential Grand Tourist. Turnbull's argument is that in the shaping of human nature, and in the inculcation of an ethical sensibility, the work of art can play a role akin to that of an experiment in teaching the natural sciences. Our extracts, which emphasize this educative purport of the *Treatise*, are drawn from the preface, 'Concerning Education, Travelling and the Fine Arts', and from chapter VII, on 'the Usefulness of the Fine Arts in a Liberal Education'. They are taken from *A Treatise on Ancient Painting, containing Observations on the Rise, Progress and Decline of that Art amongst the Greeks and Romans... to which are added some Remarks on the peculiar Genius, Character and Talents of Raphael, Michael Angelo, Nicholas Poussin and other Celebrated Modern Masters*, London: A. Millar 1740, pp. xv–xvi, 144, 145–7, 148.

There are Subjects of a more important Nature than Paintings and Sculptures, in whatever light they are considered, that ought principally to employ the Thoughts of a Traveller, who has it in his View to qualify himself for the Service of his own Country, by visiting foreign ones. But one Point aimed at in this Treatise is to shew

how mean, insipid, and trifling the fine Arts are when they are quite alienated from their better and nobler, genuine Purposes, which, as well as those of their Sister Poetry, are truly philosophical and moral: that is, to convey in an agreeable manner into the Mind the Knowledge of Men and Things; or to instruct us in Morality, Virtue, and human Nature. And it necessarily follows, that the chief Design of travelling must be somewhat of greater moment than barely to learn how to distinguish an original Medal from a counterfeit one, a *Greek* from a *Roman* Statue, or one Painter's Hand from another's; since it is here proved, that even with regard to the Arts of Design that kind of Knowledge is but idle and trivial; and that by it alone one has no better title to the Character of a Person of good Taste in them, than a mere verbal Critick hath to that of a polite Scholar in the Classics.

Let us consider a little the pretended Reasons for sending your Gentlemen to travel: They may be reduced to these two. 'That they may see the Remains of ancient Arts, and the best Productions of modern Sculptors and Painters;' and 'That they may see the World and study Mankind.'

Now as for the first, how it should be offered as a Reason for sending young Gentlemen abroad, is indeed very unaccountable, when one considers upon what footing Education is amongst us at present; unless it could be thought that one may be jolted by an *Italian* Chaise into the Knowledge and Taste that are evidently prerequisite to travelling with advantage, even in that view; or that such Intelligence is the necessary, mechanical Effect of a certain Climate upon the Understanding; and will be instantaneously infused into one at his Arrival on Classick Ground. For in our present Method of educating young Gentlemen either in publick Schools or by private Tutors, what is done that can in any degree prepare them for making proper and useful Reflexions upon the fine Arts, and their Performances? Are not the Arts of Design quite sever'd in modern Education not only from Philosophy, their Connexion with which is not so obvious, or at least so generally acknowledged; but likewise from classical Studies, where not only their Usefulness must be readily owned by all who have the slightest Notion of them, but where the want of proper Helps from ancient Statues, Bas-reliefs and Paintings for understanding ancient Authors, the Poets in particular, is daily felt by Teachers and Students? It is not more ridiculous to dream of one's acquiring a strange Language merely by sucking in foreign Air, than to imagine that those who never have been directed at home into the right manner of considering the fine Arts; those who have no Idea of their true Beauty, Scope, and Excellence (not to mention such as have not the least notion of Drawing) that such should all at once so soon as they tread *Italian* Soil become immediately capable of understanding these Arts, and of making just Reflexions upon their excellent Productions. And yet this is plainly the case with regard to the greater part of our young Travellers. And for that reason I have endeavoured in the following Essay to lead young Gentlemen and those concerned in their Education, into a juster Notion of the Fine Arts than is commonly entertained even by the Plurality of their professed Admirers; by distinguishing the fine Taste of them from the false Learning that too frequently passes for it; and by shewing in what respects alone the Study of them belongs to Gentlemen, whose high Birth and Fortune call them to the most Important of all Studies; that, of Men, Manners and Things, or Virtue and publick Good.

* * *

The Ancients considered Education in a very extensive View, as comprehending all the Arts and Sciences, and employing them all to this one End; to form, at the same time, the Head and the Heart, the Senses, the Imagination, Reason, and the Temper, that the whole Man might be made truly virtuous and rational. And how they managed it, or thought it ought to be managed, to gain this noble Scope, we may learn from their way of Handling any one of the Arts, or of Discoursing on Morals: Whatever is the more immediate Subject of their Enquiries, we find them, as it hath been observed, calling upon all the Arts and Sciences for its Embellishment and Illustration. Let us therefore consider a little the natural Union and close Dependence of the liberal Arts, and enquire how these were explain'd by the Ancients. [. . .]

If Pictures of natural Beauties are exact Copies of some particular Parts of Nature, or done after them, as they really happened in Nature; they are in that case no more than such Appearances more accurately preserved by Copies of them, than they can be by Imagination and Memory, in order to their being contemplated and examined as frequently and as seriously as we please. 'Tis the same as preserving fine Thoughts and Sentiments by Writing, without trusting to Memory, that they may not be lost. This is certainly too evident to be insisted upon. On the other hand, if Landscapes are not copied from any particular Appearances in Nature, but imaginary; yet, if they are conformable to Nature's Appearances and Laws, being composed by combining together such scattered Beauties of Nature as make a beautiful Whole; even in this case, the Study of Pictures is still the Study of Nature itself: For if the Composition be agreeable to Nature's settled Laws and Proportions, it may exist: And all such Representations shew what Nature's Laws would produce in supposed Circumstances. The former Sort may therefore be called a Register of Nature, and the latter a Supplement to Nature, or rather to the Observers and Lovers of Nature. And in both Cases Landscapes are Samples or Experiments in natural Philosophy: Because they serve to fix before our Eyes beautiful Effects of Nature's Laws, till we have fully admired them, and accurately considered the Laws from which such visible Beauties and Harmonies result.

Tho' one be as yet altogether unacquainted with Landscapes (by which I would all along be understood to mean all Views and Prospects of Nature) he may easily comprehend what superior Pleasures one must have, who hath an Eye formed by comparing Landscapes with Nature, in the Contemplation of Nature itself, in his Morning or Evening Walks, to one who is not at all conversant in Painting. Such a one will be more attentive to Nature, he will let nothing escape his Observation; because he will feel a vast Pleasure in observing and chusing picturesque Skies, Scenes, and other Appearances, that would be really beautiful in Pictures. He will delight in observing what is really worthy of being painted; what Circumstances a good Genius would take hold of; what Parts he would leave out, and what he would add, and for what Reasons. The Laws of Light and Colours, which, properly speaking, produce all the various Phænomena of the visible World, would afford to such an inexhaustible Fund of the most agreeable Entertainment; while the ordinary Spectator of Nature can hardly receive any other Satisfaction from his Eye, but what may be justly compared with the ordinary Titillation a common Ear feels, in respect of the

exquisite Joy a refined Piece of Musick gives to a skilful, well-formed one, to a Person instructed in the Principles of true Composition, and inured to good Performance.

Nor is another Pleasure to be passed by unmentioned, that the Eye formed by right Instruction in good Pictures, to the accurate and careful Observance of Nature's Beauties, will have, in recalling to mind, upon seeing certain Appearances in Nature, the Landscapes of great Masters he has seen, and their particular Genius's and Tastes. He will ever be discerning something suited to the particular Turn of one or other of them; something that a Titian, a Pousin, a Salvator Rosa, or a Claud Lorrain, hath already represented, or would not have let go without imitating, and making a good Use of in Landscape. Nature would send such a one to Pictures, and Pictures would send him to Nature: And thus the Satisfaction he would receive from the one or the other would be always double.

In short, Pictures which represent visible Beauties, or the Effects of Nature in the visible World, by the different Modifications of Light and Colours, in Consequence of the Laws which relate to Light, are Samples of what these Laws do or may produce. And therefore they are as proper Samples and Experiments to help and assist us in the Study of those Laws, as any Samples or Experiments are in the Study of the Laws of Gravity, Elasticity, or of any other Quality in the natural World. They are then Samples or Experiments in natural Philosophy. The same Observation may be thus set in another Light: Nature hath given us a Sense of Beauty and Order in visible Objects; and it hath not certainly given us this or any other Sense, for any other Reason, but that it might be improv'd by due Culture and Exercise. Now in what can the Improvement of this Sense and Taste consist, but in being able to chuse from Nature such Parts, as being combined together according to Nature's Laws, would make beautiful Systems? This is certainly its proper Business and Entertainment: And what else is this but Painting, or a Taste of Painting? For Painting aims at visible Harmony, as Musick at Harmony of Sounds. But how else can either the Eye or the Ear, the Sense of visible or audible Harmony, be formed and improved to Perfection, but by Exercise and Instruction about these Harmonies, by means of proper Examples? Pictures, therefore, in whatever Sense they are considered, have a near Relation to Philosophy, and a very close Connexion with Education, if it be any Part of its Design to form our Taste of Nature, and improve our Sense of visible Harmonies and Beauties, or to make us intelligent Spectators and Admirers of the visible World.

But I proceed to consider historical or moral Pictures, which must immediately be acknowledged, in Consequence of the very Definition of them, to be proper Samples and Experiments in teaching human Nature and moral Philosophy. For what are historical Pictures, but Imitations of Parts of human Life, Representations of Characters and Manners? And are not such Representations Samples or Specimens in moral Philosophy, by which any Part of human Nature, or of the moral World, may be brought near to our View, and fixed before us, till it is fully compared with Nature itself, and is found to be a true Image, and consequently to point out some moral Conclusion with complete Force of Evidence? Moral Characters and Actions described by a good Poet, are readily owned to be very proper Subjects for the Philosopher to examine, and compare with the human Heart, and the real Springs and Consequences of Actions. [. . .] But moral Pictures must be for the same Reason

proper Samples in the School of Morals: For what Passions or Actions may not be represented by Pictures; what Degrees, Tones, or Blendings of Affections; what Frailties, what Penances, what Emotions in our Hearts; what Manners, or what Characters, cannot the Pencil exhibit to the Life? Moral Pictures, as well as moral Poems, are indeed Mirrours in which we may view our inward Features and Complexions, our Tempers and Dispositions, and the various Workings of our Affections. 'Tis true, the Painter only represents outward Features, Gestures, Airs, and Attitudes; but do not these, by an universal Language, mark the different Affections and Dispositions of the Mind? What Character, what Passion, what Movement of the Soul, may not be thus most powerfully expressed by a skilful Hand? The Design of moral Pictures is, therefore, by that Means, to shew us to ourselves; to reflect our Image upon us, in order to attract our Attention the more closely to it, and to engage us in Conversation with ourselves, and an accurate Consideration of our Make and Frame.

As it hath been observed, with respect to Landscapes, so in this Case likewise, Pictures may bring Parts of Nature to our View, which could never have been seen or observed by us in real Life; and they must engage our Attention more closely to Nature itself, than mere Lessons upon Nature can do, without such Assistance; nothing being so proper to fix the Mind, as the double Employment of comparing Copies with Originals. And in general, all that hath been said to shew that Landscapes are proper Samples or Experiments in natural Philosophy, as being either Registers or Supplements to Nature, is obviously applicable to moral Pictures, with relation to moral Philosophy. We have already had Occasion to remark, that it is because the Poet and Painter have this Advantage, that whereas the Historian is confined to Fact, they can select such Circumstances in their Representations as are fittest to instruct or move; that it is for this Reason Aristotle recommends these Arts as better Teachers of Morals than the best Histories, and calls them more catholick or universal. I shall only add upon this Head, that as certain delicate Vessels in the human Body cannot be discerned by the naked Eye, but must be magnified, in order to be rendered visible; so, without the Help of Magnifiers, not only several nice Parts of our moral Fabrick would escape our Observation, but no Features, no Characters of whatever kind, would be sufficiently attended to. Now the Imitative Arts become Magnifiers in the moral way, by means of chusing those Circumstances which are properest to exhibit the Workings and Consequences of Affections, in the strongest Light that may be, or to render them most striking and conspicuous. All is Nature that is represented, if all be agreeable to Nature: What is not so, whether in Painting or Poetry, will be rejected, even by every common Beholder. . . . But a Fiction that is consonant to Nature, may convey a moral Lesson more strongly than can be done by any real Story, and is as sure a Foundation to build a Conclusion upon; since from what is conformable to Nature, no erroneous or seducive Rule can be inferred.

Thus, therefore, 'tis evident that Pictures, as well as Poems, have a very near relation to Philosophy, a very close Connexion with moral Instruction and Education. [...] The Conclusion I have now chiefly in View is, that good moral Paintings, whether by Words, or by the Pencil, are proper Samples in moral Philosophy, and ought therefore to be employed in teaching it, for the same Reason that Experiments

are made use of in teaching natural Philosophy. And this is as certain, as that Experiments or Samples of Manners, Affections, Actions, and Characters, must belong to moral Philosophy, and be proper Samples for evincing and enforcing its Doctrines; for such are moral Paintings.

2 Jean-Jacques Rousseau (1712–1778) from ‘Discourse on the Arts and Sciences’

Though Jean-Jacques Rousseau is now known primarily as a political philosopher, he worked for much of his life as a composer, music-copyist and dramatist. His *The Village Soothsayer* (1752) was presented at court and remained in the repertory of the Paris Opera for fifty years. He also published one of the most widely read and influential novels of the eighteenth century, *Julie, or the new Héloïse* (1760), which has been seen as an important source for later Romanticism. He was born in Geneva, where he was brought up by various relations and received little formal education. He was apprenticed to an engraver, but in 1728 he ran away to Italy and Savoy where he lived with Baronne Louise de Warens. In 1741 he moved to Paris, where he was drawn into the circle of Diderot and his collaborators on the project of the *Encyclopédie*. In contrast to the beliefs normally associated with the Enlightenment, however, Rousseau argued that the regulated manners of sophisticated societies lead to the concealment of emotion and the inhibiting of passion, and to an increasing divorce between private and public forms of virtue. He thus associated the possibility of sincere and direct human expression with an ideal ‘state of nature’, measuring the health of society more in terms of its moral vigour than its achievements in the arts or sciences. If art had a defensible function in his eyes, it was not to arouse pleasant emotions, but rather to provide images of right action that its audience might emulate. The more corrupt and inequitable the society, the more likely it would be that the arts would be conscripted in defence of its vices. Rousseau’s was a strong voice in that criticism of *ancien régime* culture that gathered force in the years leading up to the Revolution. His major work of political philosophy was *Le Contrat social* (The Social Contract), published in 1762. This document is widely understood as having furnished a philosophical justification for the politics of the French Revolution, and is the source of the slogan ‘liberty, equality, fraternity’. In the 1790s, when Jacques-Louis David and his followers argued for a morally strenuous form of classicism to replace the culture of the *ancien régime*, Rousseau’s name was frequently invoked in support. In 1794 his ashes were installed next to those of Voltaire in the Pantheon in Paris (see IVB12). The ‘Discourse on the Arts and Sciences’ was originally submitted for a prize announced by the Academy of Dijon in 1749. On his own later account, Rousseau read the announcement while on his way to Vincennes to visit Diderot, then in prison for offending the censor. The question proposed by the Academy was: ‘Has the Restoration of the Arts and Sciences had a purifying Effect upon Morals?’ Rousseau was awarded the prize (which he declined to collect), and the discourse was published as *Discours sur les sciences et les arts* in November 1750, arousing considerable controversy. It was translated by G. D. H. Cole, with the full title ‘A Discourse on the Moral Effects of the Arts and Sciences’, in Jean-Jacques Rousseau, *The Social Contract and the Discourses*, London: Everyman, 1913, pp. 115–42. Our extract is taken from pp. 119–35 of this edition. (See also IIIA3.)

The question before me is: 'Whether the Restoration of the arts and sciences has had the effect of purifying or corrupting morals.' Which side am I to take? That, gentlemen, which becomes an honest man, who is sensible of his own ignorance, and thinks himself none the worse for it.

* * *

The First Part

[. . .] So long as government and law provide for the security and well-being of men in their common life, the arts, literature, and the sciences, less despotic though perhaps more powerful, fling garlands of flowers over the chains which weigh them down. They stifle in men's breasts that sense of original liberty, for which they seem to have been born; cause them to love their own slavery, and so make of them what is called a civilized people.

Necessity raised up thrones; the arts and sciences have made them strong. Powers of the earth, cherish all talents and protect those who cultivate them. Civilized peoples, cultivate such pursuits: to them, happy slaves, you owe that delicacy and exquisiteness of taste, which is so much your boast, that sweetness of disposition and urbanity of manners which make intercourse so easy and agreeable among you – in a word, the appearance of all the virtues, without being in possession of one of them.

It was for this sort of accomplishment, which is by so much the more captivating as it seems less affected, that Athens and Rome were so much distinguished in the boasted times of their splendour and magnificence: and it is doubtless in the same respect that our own age and nation will excel all periods and peoples. An air of philosophy without pedantry; an address at once natural and engaging, distant equally from Teutonic clumsiness and Italian pantomime; these are the effects of a taste acquired by liberal studies and improved by conversation with the world. What happiness would it be for those who live among us, if our external appearance were always a true mirror of our hearts; if decorum were but virtue; if the maxims we professed were the rules of our conduct; and if real philosophy were inseparable from the title of a philosopher! But so many good qualities too seldom go together; virtue rarely appears in so much pomp and state.

Richness of apparel may proclaim the man of fortune, and elegance the man of taste; but true health and manliness are known by different signs. It is under the homespun of the labourer, and not beneath the gilt and tinsel of the courtier, that we should look for strength and vigour of body.

External ornaments are no less foreign to virtue, which is the strength and activity of the mind. The honest man is an athlete, who loves to wrestle stark naked; he scorns all those vile trappings, which prevent the exertion of his strength, and were, for the most part, invented only to conceal some deformity.

Before art had moulded our behaviour, and taught our passions to speak an artificial language, our morals were rude but natural; and the different ways in which we behaved proclaimed at the first glance the difference of our dispositions. Human nature was not at bottom better then than now; but men found their security in the ease with which they could see through one another, and this advantage, of which we no longer feel the value, prevented their having many vices.

In our day, now that more subtle study and a more refined taste have reduced the art of pleasing to a system, there prevails in modern manners a servile and deceptive conformity; so that one would think every mind had been cast in the same mould. Politeness requires this thing; decorum that; ceremony has its forms, and fashion its laws, and these we must always follow, never the promptings of our own nature.

We no longer dare seem what we really are, but lie under a perpetual restraint; in the meantime the herd of men, which we call society, all act under the same circumstances exactly alike, unless very particular and powerful motives prevent them. Thus we never know with whom we have to deal; and even to know our friends we must wait for some critical and pressing occasion; that is, till it is too late; for it is on those very occasions that such knowledge is of use to us.

What a train of vices must attend this uncertainty! Sincere friendship, real esteem, and perfect confidence are banished from among men. Jealousy, suspicion, fear, coldness, reserve, hate, and fraud lie constantly concealed under that uniform and deceitful veil of politeness; that boasted candour and urbanity, for which we are indebted to the light and leading of this age. We shall no longer take in vain by our oaths the name of our Creator; but we shall insult Him with our blasphemies, and our scrupulous ears will take no offence. We have grown too modest to brag of our own deserts; but we do not scruple to decry those of others. We do not grossly outrage even our enemies, but artfully calumniate them. Our hatred of other nations diminishes, but patriotism dies with it. Ignorance is held in contempt; but a dangerous scepticism has succeeded it. Some vices indeed are condemned and others grown dishonourable; but we have still many that are honoured with the names of virtues, and it is become necessary that we should either have, or at least pretend to have them. Let who will extol the moderation of our modern sages, I see nothing in it but a refinement of intemperance as unworthy of my commendation as their artificial simplicity.

Such is the purity to which our morals have attained; this is the virtue we have made our own. Let the arts and sciences claim the share they have had in this salutary work. I shall add but one reflection more; suppose an inhabitant of some distant country should endeavour to form an idea of European morals from the state of the sciences, the perfection of the arts, the propriety of our public entertainments, the politeness of our behaviour, the affability of our conversation, our constant professions of benevolence, and from those tumultuous assemblies of people of all ranks, who seem, from morning till night, to have no other care than to oblige one another. Such a stranger, I maintain, would arrive at a totally false view of our morality.

Where there is no effect, it is idle to look for a cause: but here the effect is certain and the depravity actual; our minds have been corrupted in proportion as the arts and sciences have improved. Will it be said, that this is a misfortune peculiar to the present age? No, gentlemen, the evils resulting from our vain curiosity are as old as the world. The daily ebb and flow of the tides are not more regularly influenced by the moon than the morals of a people by the progress of the arts and sciences. As their light has risen above our horizon, virtue has taken flight, and the same phenomenon has been constantly observed in all times and places.

* * *

It is not through stupidity that the people have preferred other activities to those of the mind. They were not ignorant that in other countries there were men who spent their time in disputing idly about the sovereign good, and about vice and virtue. They knew that these useless thinkers were lavish in their own praises, and stigmatized other nations contemptuously as barbarians. But they noted the morals of these people, and so learnt what to think of their learning.

Can it be forgotten that, in the very heart of Greece, there arose a city as famous for the happy ignorance of its inhabitants, as for the wisdom of its laws; a republic of demi-gods rather than of men, so greatly superior their virtues seemed to those of mere humanity? Sparta, eternal proof of the vanity of science, while the vices, under the conduct of the fine arts, were being introduced into Athens, even while its tyrant was carefully collecting together the works of the prince of poets, was driving from her walls artists and the arts, the learned and their learning!

The difference was seen in the outcome. Athens became the seat of politeness and taste, the country of orators and philosophers. The elegance of its buildings equalled that of its language; on every side might be seen marble and canvas, animated by the hands of the most skilful artists. From Athens we derive those astonishing performances, which will serve as models to every corrupt age. The picture of Lacedaemon is not so highly coloured. There, the neighbouring nations used to say, 'men were born virtuous, their native air seeming to inspire them with virtue.' But its inhabitants have left us nothing but the memory of their heroic actions: monuments that should not count for less in our eyes than the most curious relics of Athenian marble.

It is true that, among the Athenians, there were some few wise men who withstood the general torrent, and preserved their integrity even in the company of the muses. But hear the judgment which the principal, and most unhappy of them, passed on the artists and learned men of his day.

'I have considered the poets,' says he, 'and I look upon them as people whose talents impose both on themselves and on others; they give themselves out for wise men, and are taken for such; but in reality they are anything sooner than that.'

'From the poets,' continues Socrates, 'I turned to the artists. Nobody was more ignorant of the arts than myself; nobody was more fully persuaded that the artists were possessed of amazing knowledge. I soon discovered, however, that they were in as bad a way as the poets, and that both had fallen into the same misconception. Because the most skilful of them excel others in their particular jobs, they think themselves wiser than all the rest of mankind. This arrogance spoils all their skill in my eyes, so that, putting myself in the place of the oracle, and asking myself whether I would rather be what I am or what they are, know what they know, or know that I know nothing, I very readily answered, for myself and the god, that I had rather remain as I am.'

'None of us, neither the sophists, nor the poets, nor the orators, nor the artists, nor I, know what is the nature of the *true*, the *good*, or the *beautiful*. But there is this difference between us; that, though none of these people know anything, they all think they know something; whereas for my part, if I know nothing, I am at least in no doubt of my ignorance. So the superiority of wisdom, imputed to me by the oracle, is reduced merely to my being fully convinced that I am ignorant of what I do not know.'

Thus we find Socrates, the wisest of men in the judgment of the god, and the most learned of all the Athenians in the opinion of all Greece, speaking in praise of ignorance. Were he alive now, there is little reason to think that our modern scholars and artists would induce him to change his mind. No, gentlemen, that honest man would still persist in despising our vain sciences. He would lend no aid to swell the flood of books that flows from every quarter: he would leave to us, as he did to his disciples, only the example and memory of his virtues; that is the noblest method of instructing mankind.

Socrates had begun at Athens, and the elder Cato proceeded at Rome, to inveigh against those seductive and subtle Greeks, who corrupted the virtue and destroyed the courage of their fellow-citizens: culture, however, prevailed. Rome was filled with philosophers and orators, military discipline was neglected, agriculture was held in contempt, men formed sects, and forgot their country. To the sacred names of liberty, disinterestedness, and obedience to law, succeeded those of Epicurus, Zeno, and Arcesilaus. It was even a saying among their own philosophers that since learned men appeared among them, honest men had been in eclipse. Before that time the Romans were satisfied with the practice of virtue; they were undone when they began to study it.

What would the great soul of Fabricius have felt, if it had been his misfortune to be called back to life, when he saw the pomp and magnificence of that Rome, which his arm had saved from ruin, and his honourable name made more illustrious than all its conquests. 'Ye gods!' he would have said, 'what has become of those thatched roofs and rustic hearths, which were formerly the habitations of temperance and virtue? What fatal splendour has succeeded the ancient Roman simplicity? What is this foreign language, this effeminacy of manners? What is the meaning of these statues, paintings, and buildings? Fools, what have you done? You, the lords of the earth, have made yourselves the slaves of the frivolous nations you have subdued. You are governed by rhetoricians, and it has been only to enrich architects, painters, sculptors, and stage-players that you have watered Greece and Asia with your blood. Even the spoils of Carthage are the prize of a flute-player. Romans! Romans! make haste to demolish those amphitheatres, break to pieces those statues, burn those paintings; drive from among you those slaves who keep you in subjection, and whose fatal arts are corrupting your morals. Let other hands make themselves illustrious by such vain talents; the only talent worthy of Rome is that of conquering the world and making virtue its ruler. [...]

Thus it is that luxury, profligacy, and slavery have been, in all ages, the scourge of the efforts of our pride to emerge from that happy state of ignorance, in which the wisdom of providence had placed us. That thick veil with which it has covered all its operations seems to be a sufficient proof that it never designed us for such fruitless researches. But is there, indeed, one lesson it has taught us, by which we have rightly profited, or which we have neglected with impunity? Let men learn for once that nature would have preserved them from science, as a mother snatches a dangerous weapon from the hands of her child. Let them know that all the secrets she hides are so many evils from which she protects them, and that the very difficulty they find in acquiring knowledge is not the least of her bounty towards them. Men are perverse;

but they would have been far worse, if they had had the misfortune to be born learned.

How humiliating are these reflections to humanity, and how mortified by them our pride should be! What! it will be asked, is uprightness the child of ignorance? Is virtue inconsistent with learning? What consequences might not be drawn from such suppositions? But to reconcile these apparent contradictions, we need only examine closely the emptiness and vanity of those pompous titles, which are so liberally bestowed on human knowledge, and which so blind our judgment. Let us consider, therefore, the arts and sciences in themselves. Let us see what must result from their advancement, and let us not hesitate to admit the truth of all those points on which our arguments coincide with the inductions we can make from history.

The Second Part

AN ancient tradition passed out of Egypt into Greece, that some god, who was an enemy to the repose of mankind, was the inventor of the sciences.¹ What must the Egyptians, among whom the sciences first arose, have thought of them? And they beheld, near at hand, the sources from which they sprang. In fact, whether we turn to the annals of the world, or eke out with philosophical investigations the uncertain chronicles of history, we shall not find for human knowledge an origin answering to the idea we are pleased to entertain of it at present. Astronomy was born of superstition, eloquence of ambition, hatred, falsehood, and flattery; geometry of avarice; physics of an idle curiosity; and even moral philosophy of human pride. Thus the arts and sciences owe their birth to our vices; we should be less doubtful of their advantages, if they had sprung from our virtues.

Their evil origin is, indeed, but too plainly reproduced in their objects. What would become of the arts, were they not cherished by luxury? If men were not unjust, of what use were jurisprudence? What would become of history, if there were no tyrants, wars, or conspiracies? In a word, who would pass his life in barren speculations, if everybody, attentive only to the obligations of humanity and the necessities of nature, spent his whole life in serving his country, obliging his friends, and relieving the unhappy? Are we then made to live and die on the brink of that well at the bottom of which Truth lies hid? This reflection alone is, in my opinion, enough to discourage at first setting out every man who seriously endeavours to instruct himself by the study of philosophy.

If our sciences are futile in the objects they propose, they are no less dangerous in the effects they produce. Being the effect of idleness, they generate idleness in their turn; and an irreparable loss of time is the first prejudice which they must necessarily cause to society. To live without doing some good is a great evil as well in the political as in the moral world; and hence every useless citizen should be regarded as a pernicious person. Tell me then, illustrious philosophers, of whom we learn the ratios in which attraction acts *in vacuo*; and in the revolution of the planets, the relations of spaces traversed in equal times; by whom we are taught what curves have conjugate points, points of inflexion, and cusps; how the soul and body correspond, like two clocks, without actual communication; what planets may be inhabited; and what insects reproduce in an extraordinary manner. Answer me, I say, you from

whom we receive all this sublime information, whether we should have been less numerous, worse governed, less formidable, less flourishing, or more perverse, supposing you had taught us none of all these fine things.

Reconsider therefore the importance of your productions; and, since the labours of the most enlightened of our learned men and the best of our citizens are of so little utility, tell us what we ought to think of that numerous herd of obscure writers and useless *littérateurs*, who devour without any return the substance of the State.

Useless, do I say? Would God they were! Society would be more peaceful, and morals less corrupt. But these vain and futile declaimers go forth on all sides, armed with their fatal paradoxes, to sap the foundations of our faith, and nullify virtue. They smile contemptuously at such old names as patriotism and religion, and consecrate their talents and philosophy to the destruction and defamation of all that men hold sacred. Not that they bear any real hatred to virtue or dogma; they are the enemies of public opinion alone; to bring them to the foot of the altar, it would be enough to banish them to a land of atheists. What extravagancies will not the rage of singularity induce men to commit!

The waste of time is certainly a great evil; but still greater evils attend upon literature and the arts. One is luxury, produced like them by indolence and vanity. Luxury is seldom unattended by the arts and sciences; and they are always attended by luxury. I know that our philosophy, fertile in paradoxes, pretends, in contradiction to the experience of all ages, that luxury contributes to the splendour of States. But, without insisting on the necessity of sumptuary laws, can it be denied that rectitude of morals is essential to the duration of empires, and that luxury is diametrically opposed to such rectitude? Let it be admitted that luxury is a certain indication of wealth; that it even serves, if you will, to increase such wealth; what conclusion is to be drawn from this paradox, so worthy of the times? And what will become of virtue if riches are to be acquired at any cost? The politicians of the ancient world were always talking of morals and virtue; ours speak of nothing but commerce and money. One of them will tell you that in such a country a man is worth just as much as he will sell for at Algiers: another, pursuing the same mode of calculation, finds that in some countries a man is worth nothing, and in others still less than nothing; they value men as they do droves of oxen. According to them, a man is worth no more to the State than the amount he consumes; and thus a Sybarite would be worth at least thirty Lacedaemonians. Let these writers tell me, however, which of the two republics, Sybaris or Sparta, was subdued by a handful of peasants, and which became the terror of Asia.

The monarchy of Cyrus was conquered by thirty thousand men, led by a prince poorer than the meanest of Persian Satraps: in like manner the Scythians, the poorest of all nations, were able to resist the most powerful monarchs of the universe. When two famous republics contended for the empire of the world, the one rich and the other poor, the former was subdued by the latter. The Roman empire in its turn, after having engulfed all the riches of the universe, fell a prey to peoples who knew not even what riches were. The Franks conquered the Gauls, and the Saxons England, without any other treasures than their bravery and their poverty. A band of poor mountaineers, whose whole cupidity was confined to the possession of a few sheep-skins, having first given a check to the arrogance of Austria, went on to crush

the opulent and formidable house of Burgundy, which at that time made the potentates of Europe tremble. In short, all the power and wisdom of the heir of Charles the Fifth, backed by all the treasures of the Indies, broke before a few herring-fishers. Let our politicians condescend to lay aside their calculations for a moment, to reflect on these examples; let them learn for once that money, though it buys everything else, cannot buy morals and citizens. What then is the precise point in dispute about luxury? It is to know which is most advantageous to empires, that their existence should be brilliant and momentary, or virtuous and lasting. I say brilliant, but with what lustre? A taste for ostentation never prevails in the same minds as a taste for honesty. No, it is impossible that understandings, degraded by a multitude of futile cares, should ever rise to what is truly great and noble; even if they had the strength, they would want the courage.

Every artist loves applause. The praise of his contemporaries is the most valuable part of his recompense. What then will he do to obtain it, if he have the misfortune to be born among a people, and at a time, when learning is in vogue, and the superficiality of youth is in a position to lead the fashion; when men have sacrificed their taste to those who tyrannize over their liberty, and one sex dare not approve anything but what is proportionate to the pusillanimity of the other;² when the greatest masterpieces of dramatic poetry are condemned, and the noblest of musical productions neglected? This is what he will do. He will lower his genius to the level of the age, and will rather submit to compose mediocre works, that will be admired during his life-time, than labour at sublime achievements which will not be admired till long after he is dead. Let the famous Voltaire tell us how many nervous and masculine beauties he has sacrificed to our false delicacy, and how much that is great and noble, that spirit of gallantry, which delights in what is frivolous and petty, has cost him.

It is thus that the dissolution of morals, the necessary consequence of luxury, brings with it in its turn the corruption of taste. Further, if by chance there be found among men of average ability, an individual with enough strength of mind to refuse to comply with the spirit of the age, and to debase himself by puerile productions, his lot will be hard. He will die in indigence and oblivion. This is not so much a prediction as a fact already confirmed by experience! Yes, Charles and Pierre Vanloo, the time is already come when your pencils, destined to increase the majesty of our temples by sublime and holy images, must fall from your hands, or else be prostituted to adorn the panels of a coach with lascivious paintings. And you, inimitable Pigalle, rival of Phidias and Praxiteles, whose chisel the ancients would have employed to carve them gods, whose images almost excuse their idolatry in our eyes; even your hand must condescend to fashion the belly of an ape, or else remain idle.

We cannot reflect on the morality of mankind without contemplating with pleasure the picture of the simplicity which prevailed in the earliest times. This image may be justly compared to a beautiful coast, adorned only by the hands of nature; towards which our eyes are constantly turned, and which we see receding with regret. While men were innocent and virtuous and loved to have the gods for witnesses of their actions, they dwelt together in the same huts; but when they became vicious, they grew tired of such inconvenient onlookers, and banished

them to magnificent temples. Finally, they expelled their deities even from these, in order to dwell there themselves; or at least the temples of the gods were no longer more magnificent than the palaces of the citizens. This was the height of degeneracy; nor could vice ever be carried to greater lengths than when it was seen, supported, as it were, at the doors of the great, on columns of marble, and graven on Corinthian capitals.

As the conveniences of life increase, as the arts are brought to perfection, and luxury spreads, true courage flags, the virtues disappear; and all this is the effect of the sciences and of those acts which are exercised in the privacy of men's dwellings. When the Goths ravaged Greece, the libraries only escaped the flames owing to an opinion that was set on foot among them, that it was best to leave the enemy with a possession so calculated to divert their attention from military exercises, and keep them engaged in indolent and sedentary occupations.

¹ It is easy to see the allegory in the fable of Prometheus: and it does not appear that the Greeks, who chained him to the Caucasus, had a better opinion of him than the Egyptians had of their god Theutus. The Satyr, says an ancient fable, the first time he saw a fire, was going to kiss and embrace it; but Prometheus cried out to him to forbear, or his beard would rue it. It burns, says he, everything that touches it.

² I am far from thinking that the ascendancy which women have obtained over men is an evil in itself. It is a present which nature has made them for the good of mankind. If better directed, it might be productive of as much good, as it is now of evil. We are not sufficiently sensible of what advantage it would be to society to give a better education to that half of our species which governs the other. Men will always be what women choose to make them. If you wish then that they should be noble and virtuous, let women be taught what greatness of soul and virtue are. The reflections which this subject arouses, and which Plato formerly made, deserve to be more fully developed by a pen worthy of following so great a master, and defending so great a cause.

3 Jean-Jacques Rousseau (1712–1778) from 'Discourse on the Origins of Inequality'

Following the publication of his 'Discourse on the Arts and Sciences' (IIA2) Rousseau turned his attention to the origins of human civilization, and to the question of the role of language in the formation of human societies. On the one hand, it seemed inconceivable that language could have developed without some kind of social organization that required and encouraged it, on the other, language itself seemed a necessary condition for the development of society. Rousseau's solution was to take an evolutionary approach to both language and society: to see humans as developing from solitary animals into basic forms of community, and as gradually increasing their linguistic competence in the process. There was a price to be paid, however. As social forms became increasingly sophisticated, forms of human expression were more liable to be corrupted. Indeed, Rousseau raised a powerful challenge to Enlightenment notions of perfectibility and progress, questioning the relative priority given to established dichotomies between nature and society, and between the natural and the artificial. He contends provocatively that man is by nature good, but that he is corrupted by society and by the effects of civilization. Like the 'Discourse on the Arts and Sciences', Rousseau's 'Discourse on the Origins of Inequality' was written on a subject

proposed by the Academy of Dijon: 'What is the Origin of Inequality among Men, and is it authorized by Natural Law?' It was originally published as *Discours sur l'origine et les fondements de l'inégalité parmi les hommes* in 1755. It was translated by G. D. H. Cole, with the full title 'A Dissertation on the Origin and Foundation of the Inequality in Mankind' in Jean-Jacques Rousseau, *The Social Contract and the Discourses*, London: Everyman, 1913, pp. 143–229. Our extract is taken from pp. 174–80 of this edition.

[...] Let it be considered how many ideas we owe to the use of speech; how far grammar exercises the understanding and facilitates its operations. Let us reflect on the inconceivable pains and the infinite space of time that the first invention of languages must have cost. To these reflections add what preceded, and then judge how many thousand ages must have elapsed in the successive development in the human mind of those operations of which it is capable.

I shall here take the liberty for a moment, of considering the difficulties of the origin of languages, on which subject I might content myself with a simple repetition of the Abbé Condillac's investigations, as they fully confirm my system, and perhaps even first suggested it. But it is plain, from the manner in which this philosopher solves the difficulties he himself raises, concerning the origin of arbitrary signs, that he assumes what I question, viz. that a kind of society must already have existed among the first inventors of language. While I refer, therefore, to his observations on this head, I think it right to give my own, in order to exhibit the same difficulties in a light adapted to my subject. The first which presents itself is to conceive how language can have become necessary; for as there was no communication among men and no need for any, we can neither conceive the necessity of this invention, nor the possibility of it, if it was not somehow indispensable. I might affirm, with many others, that languages arose in the domestic intercourse between parents and their children. But this expedient would not obviate the difficulty, and would besides involve the blunder made by those who, in reasoning on the state of nature, always import into it ideas gathered in a state of society. Thus they constantly consider families as living together under one roof, and the individuals of each as observing among themselves a union as intimate and permanent as that which exists among us, where so many common interests unite them: whereas, in this primitive state, men had neither houses, nor huts, nor any kind of property whatever; every one lived where he could, seldom for more than a single night; the sexes united without design, as accident, opportunity, or inclination brought them together, nor had they any great need of words to communicate their designs to each other; and they parted with the same indifference. The mother gave suck to her children at first for her own sake; and afterwards, when habit had made them dear, for theirs: but as soon as they were strong enough to go in search of their own food, they forsook her of their own accord; and, as they had hardly any other method of not losing one another than that of remaining continually within sight, they soon became quite incapable of recognizing one another when they happened to meet again. It is further to be observed that the child, having all his wants to explain, and of course more to say to his mother than the mother could have to say to him, must have borne the brunt of the task of invention, and the language he used would be of his own device, so that the number of languages would be equal to that of the individuals speaking them, and the variety would be

increased by the vagabond and roving life they led, which would not give time for any idiom to become constant. For to say that the mother dictated to her child the words he was to use in asking her for one thing or another, is an explanation of how languages already formed are taught, but by no means explains how languages were originally formed.

We will suppose, however, that this first difficulty is obviated. Let us for a moment then take ourselves as being on this side of the vast space which must lie between a pure state of nature and that in which languages had become necessary, and, admitting their necessity, let us inquire how they could first be established. Here we have a new and worse difficulty to grapple with; for if men need speech to learn to think, they must have stood in much greater need of the art of thinking, to be able to invent that of speaking. And though we might conceive how the articulate sounds of the voice came to be taken as the conventional interpreters of our ideas, it would still remain for us to inquire what could have been the interpreters of this convention for those ideas, which, answering to no sensible objects, could not be indicated either by gesture or voice; so that we can hardly form any tolerable conjectures about the origin of this art of communicating our thoughts and establishing a correspondence between minds: an art so sublime, that far distant as it is from its origin, philosophers still behold it at such an immeasurable distance from perfection, that there is none rash enough to affirm it will ever reach it, even though the revolutions time necessarily produces were suspended in its favour, though prejudice should be banished from our academies or condemned to silence, and those learned societies should devote themselves uninterruptedly for whole ages to this thorny question.

The first language of mankind, the most universal and vivid, in a word the only language man needed, before he had occasion to exert his eloquence to persuade assembled multitudes, was the simple cry of nature. But as this was excited only by a sort of instinct on urgent occasions, to implore assistance in case of danger, or relief in case of suffering, it could be of little use in the ordinary course of life, in which more moderate feelings prevail. When the ideas of men began to expand and multiply, and closer communication took place among them, they strove to invent more numerous signs and a more copious language. They multiplied the inflexions of the voice, and added gestures, which are in their own nature more expressive; and depend less for their meaning on a prior determination. Visible and movable objects were therefore expressed by gestures, and audible ones by imitative sounds: but, as hardly anything can be indicated by gestures, except objects actually present or easily described, and visible actions; as they are not universally useful – for darkness or the interposition of a material object destroys their efficacy – and as besides they rather request than secure our attention; men at length bethought themselves of substituting for them the articulate sounds of the voice, which, without bearing the same relation to any particular ideas, are better calculated to express them all, as conventional signs. Such an institution could only be made by common consent, and must have been effected in a manner not very easy for men whose gross organs had not been accustomed to any such exercise. It is also in itself still more difficult to conceive, since such a common agreement must have had motives, and speech seems to have been highly necessary to establish the use of it.

It is reasonable to suppose that the words first made use of by mankind had a much more extensive signification than those used in languages already formed, and that ignorant as they were of the division of discourse into its constituent parts, they at first gave every single word the sense of a whole proposition. When they began to distinguish subject and attribute, and noun and verb, which was itself no common effort of genius, substantives were at first only so many proper names; the present infinitive was the only tense of verbs; and the very idea of adjectives must have been developed with great difficulty; for every adjective is an abstract idea, and abstractions are painful and unnatural operations.

Every object at first received a particular name without regard to genus or species, which these primitive originators were not in a position to distinguish; every individual presented itself to their minds in isolation, as they are in the picture of nature. If one oak was called A, another was called B; for the primitive idea of two things is that they are not the same, and it often takes a long time for what they have in common to be seen: so that, the narrower the limits of their knowledge of things, the more copious their dictionary must have been. The difficulty of using such a vocabulary could not be easily removed; for, to arrange beings under common and generic denominations, it became necessary to know their distinguishing properties: the need arose for observation and definition, that is to say, for natural history and metaphysics of a far more developed kind than men can at that time have possessed.

Add to this, that general ideas cannot be introduced into the mind without the assistance of words, nor can the understanding seize them except by means of propositions. This is one of the reasons why animals cannot form such ideas, or ever acquire that capacity for self-improvement which depends on them. When a monkey goes from one nut to another, are we to conceive that he entertains any general idea of that kind of fruit, and compares its archetype with the two individual nuts? Assuredly he does not; but the sight of one of these nuts recalls to his memory the sensations which he received from the other, and his eyes, being modified after a certain manner, give information to the palate of the modification it is about to receive. Every general idea is purely intellectual; if the imagination meddles with it ever so little, the idea immediately becomes particular. If you endeavour to trace in your mind the image of a tree in general, you never attain to your end. In spite of all you can do, you will have to see it as great or little, bare or leafy, light or dark, and were you capable of seeing nothing in it but what is common to all trees, it would no longer be like a tree at all. Purely abstract beings are perceivable in the same manner, or are only conceivable by the help of language. The definition of a triangle alone gives you a true idea of it: the moment you imagine a triangle in your mind, it is some particular triangle and not another, and you cannot avoid giving it sensible lines and a coloured area. We must then make use of propositions and of language in order to form general ideas. For no sooner does the imagination cease to operate than the understanding proceeds only by the help of words. If then the first inventors of speech could give names only to ideas they already had, it follows that the first substantives could be nothing more than proper names.

But when our new grammarians, by means of which I have no conception, began to extend their ideas and generalize their terms, the ignorance of the inventors must have confined this method within very narrow limits; and, as they had at first gone

too far in multiplying the names of individuals, from ignorance of their genus and species, they made afterwards too few of these, from not having considered beings in all their specific differences. It would indeed have needed more knowledge and experience than they could have, and more pains and inquiry than they would have bestowed, to carry these distinctions to their proper length. If, even to-day, we are continually discovering new species, which have hitherto escaped observation, let us reflect how many of them must have escaped men who judged things merely from their first appearance! It is superfluous to add that the primitive classes and the most general notions must necessarily have escaped their notice also. How, for instance, could they have understood or thought of the words matter, spirit, substance, mode, figure, motion, when even our philosophers, who have so long been making use of them, have themselves the greatest difficulty in understanding them; and when, the ideas attached to them being purely metaphysical, there are no models of them to be found in nature?

But I stop at this point, and ask my judges to suspend their reading a while, to consider, after the invention of physical substantives, which is the easiest part of language to invent, that there is still a great way to go, before the thoughts of men will have found perfect expression and constant form, such as would answer the purposes of public speaking, and produce their effect on society. I beg of them to consider how much time must have been spent, and how much knowledge needed, to find out numbers, abstract terms, aorists, and all the tenses of verbs, particles, syntax, the method of connecting propositions, the forms of reasoning, and all the logic of speech. For myself, I am so aghast at the increasing difficulties which present themselves, and so well convinced of the almost demonstrable impossibility that languages should owe their original institution to merely human means, that I leave, to any one who will undertake it, the discussion of the difficult problem, which was most necessary, the existence of society to the invention of language, or the invention of language to the establishment of society. But be the origins of language and society what they may, it may be at least inferred, from the little care which nature has taken to unite mankind by mutual wants, and to facilitate the use of speech, that she has contributed little to make them sociable, and has put little of her own into all they have done to create such bonds of union. It is in fact impossible to conceive why, in a state of nature, one man should stand more in need of the assistance of another, than a monkey or a wolf of the assistance of another of its kind: or, granting that he did, what motives could induce that other to assist him; or, even then, by what means they could agree about the conditions. I know it is incessantly repeated that man would in such a state have been the most miserable of creatures; and indeed, if it be true, as I think I have proved, that he must have lived many ages, before he could have either desire or an opportunity of emerging from it, this would only be an accusation against nature, and not against the being which she had thus unhappily constituted. But as I understand the word 'miserable,' it either has no meaning at all, or else signifies only a painful privation of something, or a state of suffering either in body or soul. I should be glad to have explained to me, what kind of misery a free being, whose heart is at ease and whose body is in health, can possibly suffer. I would ask also, whether a social or a natural life is most likely to become insupportable to those who enjoy it. We see around us hardly a creature in civil society, who does not lament his

existence: we even see many deprive themselves of as much of it as they can, and laws human and divine together can hardly put a stop to the disorder. I ask, if it was ever known that a savage took it into his head, when at liberty, to complain of life or to make away with himself. Let us therefore judge, with less vanity, on which side the real misery is found. On the other hand, nothing could be more unhappy than savage man, dazzled by science, tormented by his passions, and reasoning about a state different from his own. It appears that providence most wisely determined that the faculties, which he potentially possessed, should develop themselves only as occasion offered to exercise them, in order that they might not be superfluous or perplexing to him, by appearing before their time, nor slow and useless when the need for them arose. In instinct alone, he had all he required for living in the state of nature; and with a developed understanding he has only just enough to support life in society.

4 Jérôme-Charles Bellicard (1726–1786) and Charles-Nicolas Cochin fils (1715–1790) from *Observations upon the Antiquities of the Town of Herculaneum*

Despite, or perhaps because of the excessive admiration in which Antiquity had been held for much of the seventeenth and the early eighteenth centuries, the reception awarded to the frescos uncovered by the excavations at Herculaneum and Pompeii was remarkably critical. The *Observations upon the Antiquities of the Town of Herculaneum*, published by Jérôme-Charles Bellicard and Charles-Nicolas Cochin in 1753, did much to establish the unfavourable opinion in which the frescos were held well into the 1780s. Bellicard was a French writer and engraver who became involved with the antiquarian movement in Rome whilst a scholar at the Académie de France. Charles-Nicolas Cochin, the son of a celebrated engraver, pursued the same career as his father. He received a large number of royal commissions and illustrated more than 200 books, including a frontispiece to the 1764 edition of Diderot's *Encyclopédie* (see III C7–9). Both men were invited to accompany the Marquis de Marigny on his official visit to the site of the excavations in 1750–1. The resulting volume was the first illustrated account of the archaeological sites and proved highly popular. Three English-language editions were published in London in 1753, 1756 and 1758. French editions were published in Paris in 1754, 1755 and 1757. The following excerpts are taken from the first English edition, *Observations on the Antiquities of the Town of Herculaneum*, London: D. Wilson and T. Durham, 1753, pp. 60–6, 70–2, 74–5, 78–80, 84–6, 91–3, 101–5.

Historical Pictures

The most important pictures which have been found in the subterranean city of Herculaneum, are upon some historical subjects, and the figures as large, or nearly as large, as the life.

The first picture represents Theseus victorious over the Minotaur. Theseus stands upright, and naked, except on the shoulder and left arm, which are covered with a piece of drapery. Young children of Athens are represented kissing his hands and feet. The Minotaur exhibited under the figure of a man with the head of a bull, appears overthrown at his feet. On a cloud is represented the figure of a woman, who has a quiver at her back, and a great affinity with the usual description of Diana. The composition of this picture is very cold: the principal figures (especially that of Theseus) seem to be copied from statues. The two children who embrace his right and left arm, appear in attitudes which are very common in the basso relievo of the ancients. The others are not so much in this taste, particularly the Minotaur, who appears fore-shortned. Theseus is tolerably drawn, though without art or understanding, yet there is a very good character in the head. Nor are the other figures designed with better taste. – We may nevertheless affirm, that the manner in these pictures is generally grand and the pencil easy. Otherwise this performance is unfinished, and cannot be considered in any other light than that of a forward sketch.

PICTURE II. The figures of this picture are as big as the life: it represents a woman sitting and leaning upon the right arm, and holding a staff in her other hand. She is crowned with flowers and leaves, intermixed with some ears of corn, and at her right side appears a basket of flowers, from which she is supposed to represent the goddess Flora. Behind her is a fawn, holding a flute composed of seven pipes, and a staff bent in form of a crosier. A man standing upright with his back towards the spectator is placed before her, and is supposed to be Hercules, on account of the lion's skin that covers his quiver. He is looking at a child, who in the lower part of the picture, is represented sucking a hind, which caresses him, and lifts up her hind leg that he may suck with more ease. Between Hercules and this child is an eagle with his wings half display'd. On the other side of Hercules, is a lion asleep; and above in a cloud, the figure of a woman representing a divinity. This picture seems to be nothing more than a Camaieu [monochrome picture] of red colour, the draperies of which are nearly of the same tint with the flesh; yet this last has a variety of tones, and seems to approach the true colouring of nature. The picture is poorly designed, and shews very little knowledge in drawing and expression. The heads are middling, the hand ill executed, and the feet altogether as incorrect. The child is lame, opens his thighs to an unnatural width, and his loins are a great deal too large. The woman has great eyes, which are neither fellows, nor opposite to each other: the whites of them are too much sunk and ill-rounded. The head of the fawn is well enough drawn, and has character in it: as for the animals, they are very ill expressed, especially the eagle and the lion. In a word, this picture seems to be painted by the very same hand that produced the other; for it has the same ease, the same boldness of touches, and is altogether as unfinished.

PICTURE III. Represents the centaur Chiron teaching Achilles. The centaur sits upon his buttocks, embracing the young man. He is tuning the lyre, which Achilles touches at the same time, and which is hung round his neck. Behind these figures, in the back ground, is a plan of architecture, the mouldings of the cornishes of which are very ill executed, and painted with red, so as to resemble a piece of stuff. The manner of this picture is pretty much the same with those I have already mentioned, and altogether

as poorly designed. The muscles of the stomach, and legs of the centaur, are neither just, nor well expressed. Besides, the arms are ill drawn, with regard to the outlines, and the hind legs, which are bent under him are ill chosen, consequently have an ill effect. The figure of Achilles has more symmetry, and the outlines are more flowing; because, without doubt, copied from some good statue; for the attitude gives us reason to suppose that was the case. However, the figure is not ill-painted; the semi-tints make a pretty soft gradation from the light to the shade; and though of a very grey tone, have a good deal of truth and nature.

* * *

There is besides, a number of other pictures which I do not recollect, though the figures are pretty much of the same size; but those I have mentioned are the most important, and what the most solid judgment may be founded upon.

Their colouring in general, has neither art, beauty nor variety: the great lights are well enough coloured; but the semi-tints being nearly the same from head to foot, are of a yellowish grey or olive colour, without grace or variety. The red predominates in the shades, the tone of which is of a duskish hue. Nor is there any strength in the shadows of the drapery, an inconvenience that usually attends painting in fresco and distemper. Another fault which is visible in a great number of fresco's, even by the best Italian masters, is, that the colour of the shades is not broken down, but continues nearly the same with that of the lights, there being no other difference than that the colour of the shades, has a little less white in it. — I do not think the weakness of the colouring in those pictures, can be attributed to the effect of time; at least they seem perfectly fresh and well preserved in that respect. The manner of painting is generally by hatchings, and sometimes melted: almost all the pieces are unfinished, and painted pretty much like our decorations of the theatre. The manner is grand enough and the touches easy, but on the whole denote more boldness than skill.

* * *

Pictures Containing Figures of a Middling Size.

There are several pictures composed of figures of half the natural size, or less; the greatest part of which are indifferent: though the heads are generally the best parts of them, and discover something of a greater character, which savours of what we call the antique. The touches in these are bolder, and sustained by a more vivid colouring than that which we find in the rest. The subject of the most and best of these pieces, is a woman seized by a satyr. There is besides, a picture of Ariadne forsaken. The figures, which are about a foot high, are well coloured, correctly drawn, and have a good effect.

* * *

Pictures of Animals.

They have likewise discovered at Herculaneum, a great number of pictures of animals, birds, fishes, fruits, &c. of the natural size. These pieces are the best of any yet found, being executed with taste and ease; yet they are for the most part

unfinished, and have not always the necessary rounding and exactness. I will mention some that seem to be pretty true in colour and effect, though they want strength in both.

One of these represents an earthen bottle, on the neck of which is a glass reversed, of the same form with our goblets, but shorter.

In another appears a glass with two handles half filled with white wine, and a glass bottle holding some water, which cannot be better expressed.

In a third we find a book, composed of two rolls, and another utensil, which appears to be a Portefeuille, resembling those which are now in use. These are three very good pieces.

Some pictures represent game; and among others is a wild duck extremely natural, together with fruits, and a loaf of the same shape with that which was actually found, &c.

There are also small pieces representing animals, and among the rest, elephants; but that which is the most distinguished for the delicacy of execution, is a tyger about five or six inches long.

There is another picture which has nothing worth notice, but the singularity of the subject; representing a bird like a perroquet, yoked to a little car, upon the forepart of which sits a grasshopper, holding the reins in the capacity of driver: this, however, is none of the best executed.

* * *

Paintings of Architecture.

There is a very considerable number of these pictures of architecture or ruins; but they scarce deserve notice: for, they are altogether out of the proportion of the Grecian architecture. Generally speaking, the pillars are double or triple the length of the natural dimensions: the profil of the mouldings of the cornishes, chapters and bases, is of a wretched Gothic taste; and most of the Arabic mixture in the architecture, is as ridiculous as any of the Chinese designs. Nevertheless, we must except two or three pieces which are agreeably coloured, though not true, and in which the landskip is touched with ease: we may allow the same advantage to some other pieces of ornament twined with vine leaves or ivy. In general, what they have taken from nature, is good: but, we cannot say so much for their works of imagination. There is gradation and distance in these pictures, and the architecture is represented in a kind of perspective, which plainly proves, however, that the authors of these compositions did not understand the rules of that art. The receding figures do not tend towards the points, where they ought to unite. Some objects are seen above, and some below; so that several distant horizons are required to arrange them. In a word, we perceive some notion of the diminution of objects, but without any knowledge of the invariable rules, to which it ought to be subject; or a right understanding of the effects of light.

* * *

Marble Statues Found in Herculaneum.

The sculpture found in this subterranean city, is much superior to the painting.

The principal and finest piece hitherto discovered, is the equestrian statue of white marble, representing Nonnius Balbus. This is a young man, armed with a cuirass, which scarce descends to his loins: Under this cuirass, is a sort of shirt without sleeves, that covers his shoulders; then passing under the cuirass, comes down as far as one third of his thighs. A cloak which he wears upon the shoulder and left arm, does not conceal the hand with which he holds the horse's bridle, which is very short. His thighs and legs are naked, except so much as is covered with the buskins, that scarce reach above the instep, over which they are tied with strings.

This figure is extremely beautiful, on account of the simplicity with which it hath been designed; it is not so striking or fair at first sight, as it will appear after an attentive examination. The head is admirable, the figure surprizingly correct, the contour just and delicate, and the composition equally grand and simple. Although the horse be likewise very beautiful, and his head full of fire and spirit, it is nevertheless inferior to the figure of the man, and the work performed in a peculiar manner; indeed that manner is beautiful and grand: yet the canons of the forelegs, together with the hoof and joint of the foot, seem to be too long in proportion. Another equestrian statue of marble was also discovered, but I could not see it, as they were at work in repairing it.

* * *

Reflections upon the State of Painting at Herculaneum.

One would imagine, that such a numerous collection of antique paintings would ascertain the degree of perfection to which the ancients carried the different parts of that art; nevertheless, I do not believe, that they convey a distinct idea of the excellence of ancient painting. And indeed it is probable that these pieces were not painted by the best masters of those days. For how can we suppose, that in such an age, abounding with excellent sculptors, any consideration could be had to painters so weak in point of design. It seems probable therefore, that these are the works of painters belonging to this ancient city, which in itself was but very inconsiderable. They are painted upon the walls of a theatre, and other publick places, and doubtless, were at that time regarded only as simple embellishments, for which they were unwilling to be at such an expense as would attend the choice of abler artists.

Be that as it will, the Theseus and other pictures as big as the life, are too feeble in point of colour and design. There is very little genius in the composition; and all the parts of the art are expressed in an equal degree of poverty and weakness. The colouring has no variety of tones, and shews no knowledge of the clair obscur; that is, the change which the colours undergo from the distance of the objects; the reflection of the contiguous bodies, and the privation of light. In a word, these works display none of the graces of the art of composing the lights and shades; so as that being assembled and aggrouped, they become more grand, and produce a more sensible effect. Every figure has its own light and shade, and I have not observed one overshadowing another; nor is there one that does not look like the first elements of a composition. The shades are either not at all reflected, or they are reflected equally from head to foot. The colours are too glaring, without being broken down, as

they ought to be, by a privation of light: and they do not partake of the reflection of the adjacent objects. In fine, we observe nothing which can prove, that the ancients had carried the knowledge of light to that degree which it hath attained in these latter ages. As to the composition of the figures, it is cold, and seems to be rather treated in the taste of sculpture than with that heat of imagination of which painting is susceptible. Yet as some of the figures are a little fore-shortened, we may suppose that art was carried farther by the able painters of those days. But nothing has been discovered which determines, whether the ancients knew the fine effect which the richness and variety of stuffs have in painting. We can, however, perceive that the manner of painting drapery in small folds, as practised in statuary, was not general among them, and that they had another manner more large and full. Indeed of this circumstance we were already fully assured by several pieces of antique sculpture; the draperies of which were of coarser stuffs, and folded in larger masses.

* * *

5 Johann Joachim Winckelmann (1717–1768) from *Reflections on the Imitation of Greek Works in Painting and Sculpture*

Winckelmann is generally regarded as the father of modern art history. The son of a poor cobbler in a village in Prussia, he nonetheless received a classical education, going on to study theology and medicine at university. He did not encounter classical art as such until after the age of 30, when, in 1748, he took up a research post in the library of Count von Bünau at Nöthnitz near Dresden. In 1754 he moved into Dresden itself and was involved in the intellectual and artistic circle of the court of the Elector of Saxony. His reflections on Greek painting and sculpture were published in 1755. Although originally published in an edition of only fifty copies, they achieved immediate success, and were quickly translated into French, Italian and English. (Henry Fuseli's *Reflections on the Painting and Sculpture of the Greeks with Instructions for the Connoisseur* appeared in London in 1765, with a second edition in 1767. An anonymous translation also appeared in Glasgow in 1766.) Part of the reason for this was, of course, the apparently inexhaustible contemporary interest in the classical heritage, stimulated not least by the new discoveries at Pompeii and Herculaneum. But above all, the book's success can be attributed to the fact that, despite the vast deposit of words that had settled over Antiquity, Winckelmann had something new to say. Until the middle of the eighteenth century, the focus of classical scholarship had been Rome. But Winckelmann's short text was both symptom of and stimulus to a sea-change. Rome, for so long pre-eminent as the centre of Western culture, was now regarded as having inherited the mantle from Athens. Greece was beginning to be perceived as the true original, its achievement captured in Winckelmann's resonant description of its *edle Einfalt und stille Grösse* ('noble simplicity and quiet grandeur'). Winckelmann's essay has seven sections: I. Natural Beauty; II. Contour; III. Drapery; IV. Noble Simplicity and Quiet Grandeur; V. Working Methods; VI. Painting; VII. Allegory. Winckelmann went on to compose the first genuinely art-historical study of ancient art (see IIIA8). The *Reflections*, however, is less a work of history proper than an argument: first, for the priority of Greece over Rome, but also for the emulation of the Greek ideal as the only hope for the Moderns. Our extracts, from sections I and IV, are taken from *Reflections on the Imitation of Greek*

Works in Painting and Sculpture, translated (with the original German in parallel) by Elfriede Heyer and Roger C. Norton, La Salle, Illinois: Open Court, 1987, pp. 3–25 and 33–9.

I. Natural Beauty

Good taste, which is becoming more prevalent throughout the world, had its origins under the skies of Greece. Every invention of foreign nations which was brought to Greece was, as it were, only a first seed that assumed new form and character here. We are told that Minerva chose this land, with its mild seasons, above all others for the Greeks in the knowledge that it would be productive of genius.

The taste which the Greeks exhibited in their works of art was unique and has seldom been taken far from its source without loss. Under more distant skies it found tardy recognition and without a doubt was completely unknown in the northern zones during a time when painting and sculpture, of which the Greeks are the greatest teachers, found few admirers. [. . .]

The only way for us to become great or, if this be possible, inimitable, is to imitate the ancients. What someone once said of Homer – that to understand him well means to admire him – is also true for the art works of the ancients, especially the Greeks. One must become as familiar with them as with a friend in order to find their statue of Laocoon just as inimitable as Homer. In such close acquaintance one learns to judge as Nicomachus judged Zeuxis' Helena: 'Behold her with my eyes,' he said to an ignorant person who found fault with this work of art, 'and she will appear a goddess to you.'

With such eyes did Michelangelo, Raphael, and Poussin see the works of the ancients. They partook of good taste at its source, and Raphael did this in the very land where it had begun. We know that he sent young artists to Greece in order to sketch for him the relics of antiquity.

The relationship between an ancient Roman statue and a Greek original will generally be similar to that seen in Virgil's imitation of Homer's Nausicaa, in which he compares Dido and her followers to Diana in the midst of her Oreads.

Laocoon was for the artist of old Rome just what he is for us – the demonstration of Polyclitus' rules, the perfect rules of art. [. . .]

In the masterpieces of Greek art, connoisseurs and imitators find not only nature at its most beautiful but also something beyond nature, namely certain ideal forms of its beauty, which, as an ancient interpreter of Plato teaches us, come from images created by the mind alone.

The most beautiful body of one of us would probably no more resemble the most beautiful Greek body than Iphicles resembled his brother, Hercules. The first development of the Greeks was influenced by a mild and clear sky; but the practice of physical exercises from an early age gave this development its noble forms. Consider, for example, a young Spartan conceived by a hero and heroine and never confined in swaddling clothes, sleeping on the ground from the seventh year on and trained from infancy in wrestling and swimming. Compare this Spartan with a young Sybarite of our time and then decide which of the two would be chosen by the artist as a model for young Theseus, Achilles, or even Bacchus. Modelled from the latter it would be a Theseus fed on roses, while from the former would come a Theseus fed

on flesh, to borrow the terms used by a Greek painter to characterize two different conceptions of this hero.

The grand games gave every Greek youth a strong incentive for physical exercise, and the laws demanded a ten-month preparation period for the Olympic Games, in Elis, at the very place where they were held. The highest prizes were not always won by adults but often by youths, as told in Pindar's odes. To resemble the god-like Diagoras was the fondest wish of every young man.

Behold the swift Indian who pursues a deer on foot – how briskly his juices must flow, how flexible and quick his nerves and muscles must be, how light the whole structure of his body! Thus did Homer portray his heroes, and his Achilles he chiefly noted as being 'swift of foot'.

These exercises gave the bodies of the Greeks the strong and manly contours which the masters then imparted to their statues without any exaggeration or excess. [...]

Moreover, everything that was instilled and taught from birth to adulthood about the culture of their bodies and the preservation, development, and refinement of this culture through nature and art was done to enhance the natural beauty of the ancient Greeks. Thus we can say that in all probability their physical beauty excelled ours by far.

The most perfect creations of nature would, on the other hand, have become only partially and imperfectly known to the artists in a country where nature was hindered by rigid laws, as in Egypt, the reputed home of the arts and sciences. In Greece, however, where people dedicated themselves to joy and pleasure from childhood on, and where there was no such social decorum as ours to restrict the freedom of their customs, the beauty of nature could reveal itself unveiled as a great teacher of artists.

The schools for artists were the gymnasia, where young people, otherwise clothed for the sake of public modesty, performed their physical exercises in the nude. The philosopher and the artist went there – Socrates to teach Charmides, Autolykus, and Lysias; Phidias to enrich his art by watching these handsome young men. There one could study the movement of the muscles and body as well as the body's outlines or contours from the impressions left by the young wrestlers in the sand. The nude body in its most beautiful form was exhibited there in so many different, natural, and noble positions and poses not attainable today by the hired models of our art schools.

Truth springs from the feelings of the heart, and the modern artist who wants to impart truth to his works cannot preserve even a shadow of it unless he himself is able to replace that which the unmoved and indifferent soul of his model does not feel or is unable to express by actions appropriate to a certain sensation or passion.

Many of Plato's dialogues, beginning in the gymnasia of Athens, portray to us the noble souls of these youths and at the same time suggest a uniformity of action and outward carriage developed in these places and in their physical exercises.

The most beautiful young people danced nude in the theaters, and Sophocles, the great Sophocles, was the first who in his youth presented such dramas for his fellow-citizens. Phryne bathed before the eyes of all the Greeks during the Eleusinian Games, and, as she emerged from the water, became for the artists the prototype of Venus Anadyomene. It is also known that girls from Sparta danced completely

naked before the eyes of the young people at certain festive occasions. What might seem strange to us here becomes more acceptable when considering that the early Christians, both men and women, were totally unclothed when they were submersed in the same baptismal font.

Thus every festival of the Greeks was an opportunity for the artists to become intimately acquainted with the beauty of nature. [. . .]

These frequent opportunities to observe nature prompted Greek artists to go still further. They began to form certain general ideas of the beauty of individual parts of the body as well as of the whole – ideas which were to rise above nature itself; their model was an ideal nature originating in the mind alone.

Thus did Raphael conceive Galatea, as we can see in his letter to Count Baldassare Castiglione: 'Since beauty is so rare among women, I avail myself of an ideal image.'

Following such concepts the Greeks gave their gods and men forms that transcended the common shapes of matter. In their figures of gods and goddesses, the forehead and nose formed nearly a straight line. Similar profiles of famous women can be seen on Greek coins, which were intentionally modelled after idealized concepts. Perhaps this profile was as peculiar to the ancient Greeks as flat noses are to the Kalmucks, and small eyes to the Chinese. The large eyes of the Greek faces on gems and coins tend to support this supposition. The Roman empresses depicted on coins by the Greek artists were similarly conceived; the head of Livia or of Agrippina has exactly the same profile as that of Artemisia or Cleopatra.

We observe, nevertheless, that the law prescribed by the Thebans to their artists – 'To imitate nature as best as you can or suffer penalty' – was also obeyed by artists in other parts of Greece. In cases where the smooth Greek profile could not be used without endangering the resemblance, they followed nature, as can be seen in the beautiful head of Julia, the daughter of Emperor Titus, done by Euodus.

The highest law recognized by Greek artists was 'to create a just resemblance and at the same time a more handsome one'; it assumes of necessity that their goal was a more beautiful and more perfect nature. Polygnotus constantly observed this law.

Thus, when various artists reportedly followed the example of Praxiteles, who modeled his Cnidian Aphrodite after his mistress, Cratina, or of certain painters who took Lais as a model for the Graces, it is to be understood that this was done without neglecting the great and universal laws of art. Sensual beauty provided the artist with all that nature could give; ideal beauty provided him with sublimity – from the one he took the human element, from the other the divine.

A person enlightened enough to penetrate the innermost secrets of art will find beauties hitherto seldom revealed when he compares the total structure of Greek figures with most modern ones, especially those modelled more on nature than on Greek taste.

In most modern figures, where the skin on certain parts of the body is pressed, one can observe small but all too obvious individual wrinkles. In Greek figures, however, there is, in such a case, a gentle curvature of rippling folds coming one from the other in such a way that they appear as a whole and make but one noble impression. These masterpieces never display a skin tensely stretched, but rather, gently drawn over flesh which fills it firmly but without turgid protrusions, harmoniously following the

directions of any flexions of the body. The skin never forms, as in modern bodies, individual small wrinkles distinct from the flesh beneath them.

Modern works are also distinguished from the Greek by their multitude of small indentations and much too visible dimples. In the works of the ancients, these are subtly distributed with sparing sagacity, of a size appropriate to the more perfect and complete nature of the Greeks, and often are discernible only to an educated eye.

The probability is that in the beautiful bodily forms of the Greeks as well as in the works of their masters there was a greater unity of the entire structure, a nobler connection of parts, and a greater fullness of form, without the emaciated tensions and depressions of our bodies.

We can, of course, do no more than establish a probability. But this probability deserves the attention of our artists and connoisseurs – all the more so since the veneration and imitation of Greek monuments of art is, regrettably, often prompted not by their quality but by prejudice attached to their great age.

This point, concerning which there is a difference of opinion among artists, would require a more detailed treatment than is possible in the present study.

It is known that the great Bernini was one of those who refused to grant the Greeks the virtue of portraying either a more perfect nature or an ideal beauty in their figures. He was, furthermore, of the opinion that nature was capable of bestowing on all its parts the necessary amount of beauty, and that the skill of art consisted in finding it. He prided himself in having to overcome his earlier prejudice concerning the charms of the Medicean Venus, since, after painstaking study, he had been able to perceive occasionally these very charms in nature.

It was this Venus therefore that taught him to discover beauties in nature which he had previously seen only in the statue and which, without the Venus, he would not have sought in nature. Does it not follow then that the beauty of Greek statues is easier to discover than beauty in nature and that thus the former is more inspiring, less diffuse and more harmoniously united than the latter? So the study of nature must be at best a longer and more difficult way to gain knowledge of perfect beauty than the study of antiquity, and Bernini, by directing young artists primarily toward the most beautiful in nature, was not showing them the shortest way.

The imitation of beauty in nature either directs itself toward a single object or it gathers observations of various individual objects and makes of them a whole. The first method means making a similar copy, a portrait; this leads to the forms and figures of the Dutch artists. The second, however, is the way to general beauty and to ideal images of it; and this was the way chosen by the Greeks. But the difference between them and us is that the Greeks could arrive at their portrayals, if not from more beautiful bodies, then from a daily opportunity to observe beauty in nature – an opportunity which we do not have every day, and rarely in the manner that an artist would desire.

Our nature will not easily bring forth such a perfect body as that of Antinous Admirandus nor our minds conceive anything beyond the more than human proportions of a beautiful deity such as that of the Vatican Apollo. What nature, genius, and art have been capable of producing is here revealed to us.

I believe that the imitation of the Greeks can teach us to become knowledgeable more quickly, for it shows us on the one hand the essence of what is otherwise dispersed through all of nature, and, on the other, the extent to which the most perfect nature can boldly, yet wisely, rise above itself. Imitation will teach the artist to think and to draw with confidence, since he finds established in it the highest limits of that which is both humanly and divinely beautiful.

If the artist builds upon this groundwork and allows the Greek rules of beauty to guide his hand and mind, he will be on the path which will lead him safely to the imitation of nature. The concepts of unity and completeness in the nature of antiquity will purify and make more meaningful the concepts of those things that are divided in our nature. By discovering their beauties he will be able to bring them into harmony with perfect beauty and, with the help of the noble forms that are constantly in his awareness, he will become a rule unto himself. [...]

Nothing would demonstrate more clearly the advantages of the imitation of antiquity over the imitation of nature than to take two young people of equal talent and to have one of them study antiquity and the other nature alone. The latter would depict nature as he finds her; if he were an Italian he would perhaps paint figures like those of Caravaggio; or if he were Dutch, he might paint like Jacob Jordaens; if a Frenchman, like Stella. The former, however, would depict nature as it should be, and would paint figures like those of Raphael.

IV. Noble Simplicity and Quiet Grandeur

The general and most distinctive characteristics of the Greek masterpieces are, finally, a noble simplicity and quiet grandeur, both in posture and expression. Just as the depths of the sea always remain calm however much the surface may rage, so does the expression of the figures of the Greeks reveal a great and composed soul even in the midst of passion.

Such a soul is reflected in the face of Laocoon – and not in the face alone – despite his violent suffering. The pain is revealed in all the muscles and sinews of his body, and we ourselves can almost feel it as we observe the painful contraction of the abdomen alone without regarding the face and other parts of the body. This pain, however, expresses itself with no sign of rage in his face or in his entire bearing. He emits no terrible screams such as Virgil's Laocoon, for the opening of his mouth does not permit it; it is rather an anxious and troubled sighing as described by Sadoletto. The physical pain and the nobility of soul are distributed with equal strength over the entire body and are, as it were, held in balance with one another. Laocoon suffers, but he suffers like Sophocles' Philoctetes; his pain touches our very souls, but we wish that we could bear misery like this great man.

The expression of such nobility of soul goes far beyond the depiction of beautiful nature. The artist had to feel the strength of this spirit in himself and then impart it to his marble. [...]

All movements and poses of Greek figures not marked by such traits of wisdom, but instead by passion and violence, were the result of an error of conception which the ancient artists called *parenthyrsos*.

The more tranquil the state of the body the more capable it is of portraying the true character of the soul. In all positions too removed from this tranquillity, the soul is not in its most essential condition, but in one that is agitated and forced. A soul is more apparent and distinctive when seen in violent passion, but it is great and noble when seen in a state of unity and calm. The portrayal of suffering alone in Laocöon would have been *parenthyrsos*; therefore the artist, in order to unite the distinctive and the noble qualities of soul, showed him in an action that was closest to a state of tranquillity for one in such pain. But in this tranquillity the soul must be distinguished by traits that are uniquely its own and give it a form that is calm and active at the same time, quiet but not indifferent or sluggish.

The common taste of artists of today, especially the younger ones, is in complete opposition to this. Nothing gains their approbation but contorted postures and actions in which bold passion prevails. This they call art executed with spirit, or *franchezza* [sincerity, frankness]. Their favorite term is *contrapposto*, which represents for them the essence of a perfect work of art. In their figures they demand a soul which shoots like a comet out of their midst; they would like every figure to be an Ajax or a Capaneus.

The arts themselves have their infancy as do human beings, and they begin as do youthful artists with a preference for amazement and bombast. Such was the tragic muse of Aeschylus; his hyperbole makes his Agamemnon in part far more obscure than anything that Heraclitus wrote. Perhaps the first Greek painters painted in the same manner that their first good tragedian wrote.

Rashness and volatility lead the way in all human actions; steadiness and composure follow last. The latter, however, take time to be discovered and are found only in great matters; strong passions can be of advantage to their students. The wise artist knows how difficult these qualities are to imitate.

ut sibi quivis

Speret idem, sudet multum frustra que laboret

Ausus idem.

HORACE

['so that everyone thinks he can do it too; yet however hard he sweats and strives, his attempt is in vain.']

La Fage, the great draughtsman, was unable to match the taste of the ancients. His works are so full of movement that the observer's attention is at the same time attracted and distracted, as at a social gathering where everyone tries to talk at once.

The noble simplicity and quiet grandeur of the Greek statues is also the true hallmark of Greek writings from their best period, the writings of the Socratic school. And these are the best characteristics of Raphael's greatness, which he attained through imitation of the Greeks.

So great a soul in so handsome a body as Raphael's was needed to first feel and to discover in modern times the true character of the ancients.

6 Daniel Webb (1719?–1798) from *An Inquiry into the Beauties of Painting*

By the second half of the eighteenth century it was becoming widely recognized in England that painting was possessed of both a classical heritage and a respectable modern tradition, and thus deserved to be considered alongside poetry as a fit subject of study for the cultivated amateur. Webb's *Inquiry* is one of a number of works written with the declared aim of educating taste. His further intention was to provide a thorough account of the virtues of Greek painting, and by this means to contribute towards an elevation of modern standards in the art. The problem that lay in the way of this enterprise – as of others like it – was the complete absence of any surviving Greek painting. Webb's solution was not original, though he pursued it with some industry and scholarship. He extrapolated an understanding of Greek painting from what were widely if mistakenly seen at the time as surviving examples of classical Greek sculpture (the Apollo Belvedere, the Laocoön group, the Daughter of Niobe, the Medici Venus and the Borghese Gladiator); and he combed Greek and Latin authors for any mention of specific Greek artists and for descriptions of their works, as others had done before him. On this basis he constructed an ideal and gentlemanly prototype for the modern artist to emulate. Beside the imaginary achievements attributed to Apelles, Zeuxis, Polygnotus, Euphranor, Parrhasius, Nicias and Nicophanes, even Raphael and Correggio appear wanting. It is significant of an anticlerical tendency in the enlightened culture of the time that Webb could write disparagingly (in Dialogue VII) of the patronage of the Church, that he could describe the Christian religion as one whose 'characters are borrowed from the lowest spheres of life', and that he could conceive of the 'genius of painting wasting its powers on crucifixions, holy families, last suppers, and the like'. The *Inquiry* is written in dialogue form, and is copiously referenced with quotations from the original Greek, Latin and Italian (omitted in our version). Our excerpts are taken from the first edition, published as *An Inquiry into the Beauties of Painting and into the Merits of the most Celebrated Painters, Ancient and Modern*, London: R. and J. Dodsley, 1760, pp. 39–43, 51–5, 99–108, 144–7.

Dialogue IV. of Design

A: We are told by Pliny, that all the statues before the time of Dædalus, were represented stiff and motionless with winking eyes, closed feet, and arms hanging in right lines to their sides: These were the rude essays of design, Dædalus, and his immediate followers, unfolded these embarrassed figures; they threw motion into the limbs, and life into the countenance. In the progress of the art, and in abler hands, motion was fashioned into grace, and life was heightened into character. Now, too, it was, that beauty of form was no longer confined to mere imitation, which always falls short of the object imitated; to make the copy equal in its effect, it was necessary to give it some advantage over its model. The artist, therefore, observing, that nature was sparing of her perfections, and that her efforts were limited to parts, availed himself of her inequality, and drawing these scattered beauties into a more happy and compleat union, rose from an imperfect imitative,

to a perfect ideal beauty. We are informed, that the painters of Greece pressed in crowds to design the bosom and breasts of Thais: Nor were the elegant proportions of Phryne less the object of their study. By this constant contemplation of the beautiful, they enriched their imagination and confirmed their taste; from this fund they drew their systems of beauty; and though we should consider them but as imitators as to the parts, we must allow them to have been inventors in the compositions. And indeed, when we reflect on the taste and judgment requisite to form these various ideas into such a wonderful agreement, we cannot set too high a value on their productions. The poets and writers of antiquity acknowledge this superiority of invented to real beauty. –

Ovid thus describes Cyllarus the Centaur, –

*A just proportion, and a manly grace,
Spread thro' his limbs, and kindled in his face.
Nature for once assum'd the sculptor's part,
And in a faultless beauty rivall'd art. –*

And Philostratus, speaking of the beauty of Neoptolemus, remarks, that it was as much inferior to that of his father Achilles, as the handsomest men are to the finest statues. Should we still doubt of the truth or justness of the descriptions, let us observe the works which gave occasion to them. Let us contemplate the fine proportions, the style of drawing in the Laocoon and Gladiator. Let us mark the sublime of the art, in the expressive energy, the divine character of the Apollo. Let us dwell on the elegant beauties of the Venus of Medicis. These are the utmost efforts of design: It can reach no farther than a full exertion of grace, character, and beauty.

* * *

A: The design of the ancients is distinguished by an union in the proportions, a simplicity of Contour, and excellence of character. Of the first I have said as much as I might do, without venturing too far into the mechanic of the art: But, as I have only hinted at the others, some more particular remarks may not be improper. There is no one excellence of design, from which we receive such immediate pleasure, as from a gracefulness of action: If we observe the attitudes and movements of the Greek statues, we shall mark that careless decency, and unaffected grace, which ever attend the motions and gestures of men unconscious of observation. There is a prodigious difference, between those movements which flow from nature, and those which are directed by art.

The ancients knew this well; and hence followed that singular simplicity which characterises their works: For, though at times, as in the Venus of Medicis, and daughters of Niobe, they rise to an assumed gracefulness; and even profess a desire to please; yet this is confin'd to so simple a contour; it is so little above the measure of ordinary action, that it appears less the effect of study, than the natural result of a superior character, or an habitual politeness.

B: Raphael has, in this particular, been wonderfully happy in his imitation of the antique. The most courtly imagination cannot represent to itself an image of a

more winning grace, than is to be seen in his *Sta. Cæcilia*: Indeed, an elegant simplicity is the characteristic of his design; we no where meet in him the affected contrasts of *Mic. Angelo*, or the studied attitudes of *Guido*; the true difference between those, may be best conceived, in a supposed comparison of the real characters of the Drama, with the actors who personate them; in *Raphael*, and the antique, we see *Alexander* and *Hamlet*, in *Mic. Angelo* and *Guido* — And, —

A: Though in treating of grace and beauty, character, so far as it is determined by them, has been naturally included; yet there remains still a more essential part; I mean, that expression of a mind, conveyed in the air of the head, and intelligence of the countenance. If, in the other branches of design, the ancients are to be admired; in this they are wonderful. However enlightened we may be by the most elegant observance of nature, or warmed by the most poetic descriptions, the *Belvedere Apollo*, and daughter of *Niobe* still give us new ideas of nobleness, energy, and beauty. The statuaries of Greece, were not mere mechanicks; men of education and literature, they were more the companions than servants of their employers: Their taste was refined by the conversation of courts, and enlarged by the lecture of their poets: Accordingly, the spirit of their studies breathes through their works. We see no such influence in the productions of the moderns; their greatest merit is a servile imitation of the antique; the moment they lose sight of them they are lost. In the elegant, they are little; in the great, charged; character they have none; their beauty is the result of measure, not idea: And if, mistaking extravagance for spirit, they aim at the sublime, it ends in the blusterings of *Bernini*, or caricatures of *Michael Angelo*.

B: From all that you have offered on the design of the ancients, we may define grace to be the most pleasing conceivable action, expressed with the utmost simplicity each occasion will admit of.

A: So far as a definition of Grace can go, yours gives a just idea of it; for, it implies the highest degree of elegance in the choice; of propriety in the application and of ease in the execution.

* * *

Dialogue VI. of the Clear Obscure

A: [...] Now, in treating of the Clear obscure of the ancients, we have neither the works nor writings of their painters to guide us. Happily, their classic authors, men of parts and erudition, were universally admirers of this art. Hence their frequent allusions to it; their metaphors borrowed from it; with the descriptions of particular paintings, and their effects. In these last we cannot be deceived; like effects, in picture, as in nature, must proceed from uniform causes: And when we find these to correspond exactly with our own observations on the works of the moderns, this analogy leads us into a certainty, as to the similitude of the means by which they were produced.

B: Such inferences as these, when they are natural and unforced, are more conclusive than positive assertions; for we are more apt to be deceived by authority, than by the reason of things.

A: Longinus observes, that, 'if we place in parallel lines, on the same plane, a bright and an obscure colour, the former springs forward, and appears much nearer to the eye.' Hence we may remark, that when painters would give a projection to any part of a figure, as the breasts of a virgin, and the like, they throw its extremities into shade; that these retiring from the eye, the intermediate parts may have their just relief. From this simple law of nature, springs all the magic of the Clear obscure; not only parts are distinguished, but intire figures are detached from their fond; seem surrounded by air; and meet the imagination with all the energy of life. Thus Philostratus prettily describes the picture of a Venus, 'The goddess will not seem to be painted, but springs from the canvass as if she would be pursued.' The same writer tells us, that Zeuxis, Polygnotus, and Euphranor, were, above all things, attentive, to shade happily, and animate their figures; by which he insinuates, that animation, or the soul of painting, owes its being to a just conduct of lights and shades: And hence it was, no doubt, that the paintings of Parrhasius were termed realities; they being possessed of such a force of Clear obscure, as to be no longer the imitations of things, but the things themselves: Agreeable to this, is the observation of an ancient writer, 'That in painting, the contour of the illumined part, should be blended with and lost in the shade; for on this, joined to the advantage of colouring, depcnd animation, tenderness, and the similitude to truth.'

B: Ovid thus marks this transition of colours in his description of the rainbow.

*A thousand colours gild the face of day,
With sever'd beauties, and distinguish'd ray;
Whilst in their contact they elude the sight,
And lose distinction in each others light.*

A: A remark made by Petronius Arbiter, on certain paintings of Apelles, points out the happy effects of this delicacy of pencil. 'With such subtilty, such a likeness to nature, were the extremities of the figures blended with their shades, that you must have taken what was before you for real life.' Nicias the Athenian is praised by Pliny, for his knowledge in the Clear obscure; 'He preserved the lights and shades, and was particularly careful, that his paintings should project from the canvass.' But, the greatest effect in this kind, is by the same attributed to the Alexander of Apelles, in the character of Jupiter the thunderer: 'The fingers (says he) seem to shoot forward, and the thunder to be out of the picture.' This passage is too striking to need a comment. Let us compare the idea we receive from this, with the happiest productions of the modern artists; what could we expect more from the magic pencil of Correggio? I mean as to the effect of clear obscure; for, I am at a loss, from whom to expect, the beauty and grace of an Alexander, united to the majesty and splendor of a Jove. If it appears from what I have offered, that the painter can by a nice conduct of light and shade, give to the characters he brings on

the scene a kind of real existence: So can he, by a partial distribution of this advantage, give them an evident preference one to the other; and by adding a degree of splendor to each character, proportioned to its importance in the drama, he becomes master of a beautiful gradation, no less satisfactory to the understanding, than pleasing to the eye.

Since I cannot offer you an example of this in any of the ancient paintings now to be seen, I shall remind you of a piece of poetic painting, in which you will find every circumstance of dignity and beauty, set off with the finest effect of Clear obscure, that, perhaps, ever entered into the imagination of either poet or painter. It is, where Virgil introduces Æneas into the presence of Dido.

*Scarce had he spoke, when lo! the bursting cloud
Melts into air: Confess'd the hero stood,
Mark'd by the form and splendor of a god;
The rays maternal round his temples play,
And gild his beauties with a brighter day;
These the fond mother studious to improve,
Breath'd on his person all the powers of love;
Thro' his long winding locks the magic flows,
Beams from his eyes, and in each feature glows.*

There is something in this description so truly picturesque, it breaks upon the imagination with such a sudden energy of Clear obscure, that I am persuaded, the poet must have had in his eye, some celebrated picture in this style. It is easy to distinguish, when the arts borrow their ideas one from another, and the lights which they so communicate and receive, reverberate, and prove reciprocally their beauties.

B: I could never read the passage you have just quoted, without being struck with the beauty of this image; but you have supplied me with an adventitious pleasure: The correspondence of these sister arts, acts, in some degree, like the harmony of consenting voices; the idea, which they express, is the same, but the effect is doubled in their agreement. When warmed by the description of Virgil's Laocoon, we gaze on that at the Vatican, his cries are more piercing, his pains more exquisite, and the ideas of the poet are as unisons to those of the statuary. [...]

Dialogue VII. of Composition

B: ... let us proceed to what you call the drama of painting.

A: It was with great propriety so termed by the ancients; because, like a dramatic poem, it contains, first, a subject, or fable: secondly, its order, or contrivance; thirdly, characters, or the manners: Fourthly, the various passions which spring from those characters. Philostratus, speaking of the composition of a picture, calls it in express terms the drama of the painter: Pliny has the same idea, in his commendation of Nichophanes. But, we shall be better satisfied of the justness of this application, by examples, than by authorities. It was the opinion of Nicias,

one of the greatest of the Greek painters, that the subject was of no less consequence in painting, than the fable in poetry; and, of course, that great and noble actions tended to elevate and enlarge, as the contrary must humble and contract the genius of the painter. The ancients had great advantages in this particular; they had, not only their profane history, rich in the most glorious and interesting events; but their sacred, whilst it furnished them with new ideas of the sublime, gave no check to the pathetic. Their gods, superior in grace, majesty and beauty, were yet subject to all the feelings and passions of humanity. How unequal is the lot of the modern artists? employed by priests, or princes who thought like priests, their subjects are, for the most part, taken from a religion, which professes to banish, or subdue the passions: Their characters are borrowed from the lowest spheres of life: Men, in whom, meanness of birth, and simplicity of manners, were the best titles to their election. Even their divine master, is no where, in painting, attended with a great idea; his long strait hair, Jewish beard, and poor apparel, would undignify the most exalted nature, humility and resignation, his characteristics, are qualities extremely edifying, but by no means picturesque. Let us, for example, compare (I must be understood to mean only as subjects for painting) a Christ armed with a scourge, driving the money-changers out of the temple, to an Alexander, the thunder in his hand, ready to dart it on the rebellious nations. It is not in the sublime alone, that their subjects are deficient; they are equally so in the pathetic: The sufferings, which they mostly represent, are in obedience to prophecies and the will of heaven; they are often the choice of the sufferers; and a ten-fold premium is at hand. When St. Andrew falls down to worship the cross, on which he is soon after to be nailed; we may be improved by such an example of piety and zeal; but we cannot feel for one, who is not concerned for himself. We are not so calm at the sacrifice of Iphigenia; beautiful, innocent, and unhappy; we look upon her as the victim of an unjust decree; she might live the object of universal love; she dies the object of universal pity. This defect in the subject, and of habitude in the painters, accounts for the coldness, with which, we look in general on their works in the galleries and churches; the genius of painting wasting its powers on crucifixions, holy families, last suppers, and the like, wants nerves, if at any time the subject calls for the pathetic or sublime. [...]

7 James Stuart (1713–1788) and Nicholas Revett (1720–1804) from *The Antiquities of Athens*

Stuart and Revett met each other in Rome in the 1740s, having travelled there independently from England in 1742. Both were young architects attracted to the centre of Western civilization, and, in particular, of its architectural heritage. Whilst in Rome, they conceived the idea that the hitherto relatively overlooked Greeks were the true source from which Rome had derived its position. While travelling in Italy they met the British Resident in Venice, Sir James Grey. Grey was a prominent member of the Society of Dilettanti, of which his brother was secretary. In 1748 the society in London published Stuart and Revett's 'Proposals for publishing an accurate Description of the Antiquities of Athens'. Members of the society then funded an expedition to Greece. The authors were in Athens

for over two years, from early 1751 to the autumn of 1753, during which time they carefully measured and recorded all the surviving works of classical architecture. After their return to England in 1755, they began the publication of their findings in the form of large albums of meticulous engravings. However, delays in publication allowed the French architect Julien-David Le Roy to pre-empt their efforts with his *Les Ruines des plus beaux monuments de la Grèce*, published in Paris in 1758. Le Roy's work was both less extensive and less accurate than Stuart and Revett's, being based on no more than three months' work. But partly because of Le Roy's enterprise, and partly also because they had chosen to survey the Greek architectural orders by illustrating a series of relatively minor constructions, Stuart and Revett's first volume, which appeared in 1762, was initially regarded as something of a disappointment. The second volume, however, dealt with the Acropolis, and the complete four-volume work is now regarded as second only to Winckelmann (see IIIA5 and 8) in establishing the priority of Greece as the fountain-head of the Western classical tradition. Our selection is taken from the preface to the first volume of *The Antiquities of Athens measured and delineated by James Stuart FRS and FSA and Nicholas Revett, painters and architects*, London 1762, pp. i-iv. Punctuation and spelling have been slightly modified.

The ruined edifices of Rome have for many years engaged the attention of those who apply themselves to the study of architecture, and have generally been considered as the Models and Standard of regular and ornamental building. Many representations of them drawn and engraved by skilful artists have been published, by which means the study of the art has been everywhere greatly facilitated, and the general practice of it improved and promoted; insomuch that what is now esteemed the most elegant manner of decorating buildings was originally formed, and has been since established, on examples which the antiquities of Rome have furnished.

But although the world is enriched with collections of this sort already published, we thought it would be a work not unacceptable to the lovers of Architecture if we added to those collections some examples drawn from the antiquities of Greece; and we were confirmed in our opinion by this consideration principally, that as Greece was the great Mistress of the Arts, and Rome in this respect no more than her disciple, it may be presumed all the most admired buildings which adorned that imperial city were but imitations of Graecian originals.

Hence it seemed probable that if accurate representations of these Originals were published, the world would be enabled to form not only more extensive but juster ideas than have hitherto been obtained concerning Architecture, and the state in which it existed during the best ages of Antiquity. It even seemed that a performance of this kind might contribute to an improvement of the Art itself, which at present appears to be founded on too partial and too scanty a system of ancient examples.

For during those ages of violence and barbarism, which began with the declension and continued long after the destruction of the Roman empire, the beautiful edifices which had been erected in Italy with such labour and expense, were neglected or destroyed; so that, to use a very common expression, it may truly be said that Architecture lay for ages buried in its own ruins; and although from these ruins it has Phoenix-like received a second birth, we may nevertheless conclude that many of the beauties and elegancies which enhanced its ancient splendour are still wanting, and that it has not yet by any means recovered all its former perfection.

This conclusion becomes sufficiently obvious when we consider that the great Artists by whose industry this noble art has been revived, were obliged to shape its present Form after those Ideas only which the casual remains of Italy suggested to them; and these remains are so far from furnishing all the materials necessary for a complete restoration of Architecture in all its parts that the best collections of them, those published by Palladio and Desgodetz, cannot be said to afford a sufficient variety of examples for restoring even the three Orders of columns, for they are deficient in what relates to the Doric and Ionic, the two most ancient of these Orders.

If from what has been said it should appear that Architecture is reduced and restrained within narrower limits than could be wished, for want of a greater number of Ancient examples than have hitherto been published, it must then be granted that every such example of beautiful Form or Proportion, wherever it may be found, is a valuable addition to the former stock, and does, when published, become a material acquisition to the Art.

But of all the countries which were embellished by the Ancients with magnificent buildings, Greece appears principally to merit our attention; since if we believe the Ancients themselves, the most beautiful Orders and Dispositions of columns were invented in that country, and the most celebrated works of Architecture were erected there; to which may be added that the most excellent Treatises on the Art appear to have been written by Grecian architects.

The city of Greece most renowned for stately edifices, for the Genius of its inhabitants, and for the culture of every art, was Athens. We therefore resolved to examine that spot rather than any other, flattering ourselves that the remains we might find there would excel in true Taste and Elegance every thing hitherto published. How far indeed these expectations have been answered must now be submitted to the opinion of the Public.

Yet since the authorities and reasons which engaged us to conceive so highly of the Athenian buildings may serve likewise to guard them in some measure from the over-hasty opinions and unadvised censures of the inconsiderate, it may not be amiss to produce some of them in this place. And we the rather wish to say something a little more at large on this subject, as it will be at the same time an apology for ourselves and perhaps the best justification for our undertaking.

After the defeat of Xerxes, the Grecians, secure from invaders and in full possession of their Liberty, arrived at the height of their Prosperity. It was then they applied themselves with the greatest assiduity and success to the culture of the Arts. They maintained their Independency and their Power for a considerable space of time and distinguished themselves by a pre-eminence and universality of Genius unknown to other Ages and Nations.

During this happy period their most renowned Artists were produced. Sculpture and Architecture attained their highest degree of excellence at Athens in the time of Pericles, when Phidias distinguished himself with such superior ability that his works were considered as wonders by the Ancients, so long as any knowledge or taste remained among them. His statue of Jupiter Olympus, we are told, was never equalled; and it was under his inspection that many of the most celebrated buildings of Athens were erected. Several Artists of most distinguished talents were his contemporaries, among whom we may reckon Callimachus, an Athenian, the

inventor of the Corinthian capital. After this, a succession of excellent Painters, Sculptors and Architects appeared, and these arts continued in Greece at their highest perfection till after the death of Alexander the Great.

Painting, Sculpture and Architecture, it should be observed, remained all that time in a very rude and imperfect state among the Italians.

But when the Romans had subdued Greece, they soon became enamoured of these delightful Arts. They adorned their City with Statues and Pictures, the spoils of that conquered Country; and adopting the Grecian style of Architecture they now first began to erect Buildings of great Elegance and Magnificence. They seem not however to have equalled the Originals from whence they had borrowed their Taste, either for Purity of Design or delicacy of Execution.

For although these Roman edifices were most probably designed and executed by Grecians, as Rome never produced many extraordinary Artists of her own, yet Greece herself was at that time greatly degenerated from her former excellence, and had long since ceased to display that superiority of Genius which distinguished her in the Age of Pericles and of Alexander. To this a long series of misfortunes had reduced her, for having been oppressed by the Macedonians first, and afterwards subdued by the Romans, with the loss of her Liberty, that love of glory likewise and that sublimity of Spirit which had animated her artists, as well as her warriors, her statesmen and her philosophers and which had formed her peculiar character, were now extinguished, and all her exquisite Arts languished and were near expiring.

They were indeed at length assiduously cherished and cultivated at Rome. That City being now Mistress of the World, and possessed of unbounded Wealth and Power, became ambitious also of the utmost embellishments which these Arts could bestow. They could not however, though assisted by Roman munificence, reascend to that height of Perfection which they had attained in Greece during the happy period we have already mentioned. And it is particularly remarkable that when the Roman authors themselves celebrate any exquisite production of Art, it is the work of Phidias, Praxiteles, Myron, Lysippus, Zeuxis, Apelles, or in brief of some Artist who adorned that happy period, and not of those who had worked at Rome, or had lived nearer to their own times than the age of Alexander.

It seemed therefore evident that Greece is the place where the most beautiful edifices were erected, and where the purest and most elegant examples of ancient architecture are to be discovered.

But whether or no it be allowed that these edifices deserved the encomiums which have been bestowed on them, it will certainly be a study of some delight and curiosity to observe wherein the Grecian and Roman style of building differ; for differ they certainly do; and to decide, by a judicious examination, which is the best. It is as useful to attend to the progress of an Art while it is improving as to trace it back towards its first perfection, when it has declined. In one of these lights therefore, the performance which we now offer to the public will, it is hoped, be well received.

8 Johann Joachim Winckelmann (1717–1768) from *A History of Ancient Art*

Winckelmann moved from Dresden to Rome in 1755. The earliest plans for what was to be his major work, the *Geschichte der Kunst des Alterthums*, date from the following year. The manuscript was complete by 1761 and the book appeared in 1764, less than a decade after his initial, ground-breaking foray into classical art (see IIIA5). It is on the *History of Ancient Art* that Winckelmann's reputation rests as the initiator of the modern tradition of art history. He was able to synthesize existing treatments of classical art, such as those of Junius (IA1) and Turnbull (IIIA1), with a chronologically based history informed by recent developments in archaeology and his own highly individual responses to particular works. The result was an account of ancient art based not on subject-matter or the rehearsal of classical quotations, but on the development of a sequence of period styles. These followed a model of birth, maturity and decay, moving from an archaic period, through to a high or classical phase in the fifth and fourth centuries BC, exemplified by artists such as Phidias and Apelles, and then declining in the Hellenistic and Roman periods. In his preface, Winckelmann made much of the fact that, unlike his predecessors, he had actually seen the works he was writing about. For the most part these were later Greek works, or even Roman copies, but it still marked an advance over the earlier, predominantly literary approaches to writing about the art of the past. Winckelmann accordingly enriched his overarching historical schema with insightful responses to particularly significant works; responses which, in sharp contrast to much of the subsequent art-historical academicism he legitimated, are marked by a passionate and even erotic feeling for the art he described. Among the most interesting features of Winckelmann's *History* for the contemporary reader is the way in which, even here, in the founding text of objective, stylistic analysis, figures of race and sex hover in the margins. The *History of Ancient Art* is an extensive book, moving by turns from detailed meditations on particular works to historical generalizations and wide-ranging philosophical reflections on the place of art in human existence. The selections here are therefore restricted to a small number of key issues: Winckelmann's systematic aims, and the practical difficulties he faced; his speculations about the reasons for Greece's artistic eminence, particularly its climate and its political freedom; and his analysis of ideal beauty and artistic expression. The extracts are taken from the *History of Ancient Art*, translated by G. Henry Lodge (4 vols. 1849–72), New York: Frederick Ungar, 1968, pp. 3–4, 10–11, 176–9, 198–203, 210–11, 215, 227–8, 245–6, 250–1.

Preface

The History of Ancient Art which I have undertaken to write is not a mere chronicle of epochs, and of the changes which occurred within them. I use the term History in the more extended signification which it has in the Greek language; and it is my intention to attempt to present a system. [. . .]

The History of Art is intended to show the origin, progress, change, and downfall of art, together with the different styles of nations, periods, and artists, and to prove the whole, as far as it is possible, from the ancient monuments now in existence.

A few works have been published under the title of a *History of Art*. Art, however, had but a small share in them, for their authors were not sufficiently familiar with it, and therefore could communicate nothing more than what they had learned from

books or hearsay. There is scarcely one who guides us to the essential of art, and into its interior; and those who treat of antiquities either touch only on those points in which they can exhibit their learning, or, if they speak of art, they do so either in general terms of commendation, or their opinion is based on strange and false grounds. [...]

In this *History of Art* I have exerted myself to discover the truth, and, as I have had every desirable opportunity of leisurely investigating the works of the ancients, and have spared no pains to obtain the requisite kinds of knowledge, I believed myself competent to undertake it. From youth upward, a love for art has been my strongest passion; and though education and circumstances led me in quite another direction, still my natural inclination was constantly manifesting itself. All the pictures and statues, as well as engraved gems and coins, which I have adduced as proofs, I have myself seen, and seen frequently, and been able to study; but for the purpose of aiding the reader's conception, I have cited, besides these, both gems and coins from books, whenever the engravings of them were tolerably good.

It must not occasion surprise that I have omitted to notice some few works of ancient art bearing the name of the artist, and some which have become remarkable from other circumstances. Those which I have silently passed by are objects which either afford no help in determining a style or a period in art, or else they are no longer in Rome, or are entirely destroyed; for, in modern times, this misfortune has befallen very many glorious pieces, – as I have remarked in several places. I would have described the torso of a statue with the name Apollonius of Athens, son of Nestor, upon it, which was formerly in the Massimi palace; but it is lost. A painting of the goddess Roma, – not the known one in the Barberini palace, – which is adduced by [Jacob] Spon, is also no longer in Rome. The Nymphæum described by Holstein has gone to decay, through negligence, it is asserted, and is no longer shown. The relievo on which Painting was making a portrait of Varro, which belonged to the celebrated Ciampini, is likewise no longer in Rome, lost without the slightest further information in regard to it. The Hermæ of the head of Speusippus, the head of Xenocrates, and several others, bearing either the name of the person or of the artist, have had a similar fate. It is impossible to read, without sorrow, notices of so many antique monuments of art, which were destroyed, both in Rome and elsewhere, in the days of our forefathers; and of many no information even has been preserved. [...]

Who could believe that in our day, from the torso of a statue of which the head is in existence, two other statues were made? Yet this has been the case at Parma, in the very year in which I write, with the colossal trunk of a Jupiter, the beautiful head of which is in the Academy of Painting in that city. The two new figures cut out of the antique one, of a sort that can easily be imagined, stand in the ducal garden. A nose has been affixed to the head in the most bungling manner; and the modern sculptor, intending to improve the forms which the ancient master gave to the forehead, cheeks, and beard, has removed what seemed to him superfluous. I forgot to state that this Jupiter was found in the buried city of Velleia, in the Parmesan territory, of which the discovery has recently been made. Moreover, within the memory of man, indeed since my residence in Rome, many celebrated pieces have been carried to England, where, as Pliny expresses it, they are exiled to remote country-seats.

* * *

Book IV

The superiority which art acquired among the Greeks is to be ascribed partly to the influence of climate, partly to their constitution and government, and the habits of thinking which originated therefrom, and, in an equal degree also, to respect for the artist, and the use and application of art.

The influence of climate must vivify the seed from which art is to be produced; and for this seed Greece was the chosen soil. The talent for philosophy was believed by Epicurus to be exclusively Greek; but this preëminence might be claimed more correctly for art. The Greeks acknowledged and prized the happy clime under which they lived, though it did not extend to them the enjoyment of a perennial spring; for, on the night when the revolt against the Spartan government broke out in Thebes, it snowed so violently as to confine every one to the house. Moderateness of temperature constituted its superiority, and is to be regarded as one of the more remote causes of that excellence which art attained among the Greeks. The climate gave birth to a joyousness of disposition; this, in its turn, invented games and festivals; and both together fostered art, which had already reached its highest pinnacle at a period when that which we call Learning was utterly unknown to the Greeks. At this time they attached a peculiar signification to the honorable title of Author, who was regarded with a certain degree of contempt; and Plato makes Socrates say, that distinguished men, in Greek cities, had not drawn up or left behind them any writings, for fear of being numbered among the Sophists.

Much that might seem ideal to us was natural among them. Nature, after having passed step by step through cold and heat, established herself in Greece. Here, where a temperature prevails which is balanced between winter and summer, she chose her central point; and the nigher she approaches it, the more genial and joyous does she become, and the more general is her influence in producing conformations full of spirit and wit, and features strongly marked and rich in promise. Where clouds and heavy mists rarely prevail, but Nature acts in a serene and gladsome atmosphere, such as Euripides describes the Athenian, she imparts an earlier maturity to the body; she is distinguished for vigorous development, especially of the female form; and it is reasonable to suppose that in Greece she perfected man to the highest degree . . .

The Greeks were conscious of this, and, as Polybius says, of their superiority generally to other nations; and among no people has beauty been prized so highly as among them. [. . .]

To the same influence, in an equal degree, which the atmosphere and climate exercised upon the physical conformation, – which, according to the testimony of all travellers, is of superior excellence even among the Greeks of the present day, and could inspire their artists in former times, – are to be ascribed their kindly natures, their gentle hearts, and joyous dispositions, – qualities that contributed fully as much to the beautiful and lovely images which they designed, as nature did to the production of the form. History convinces us that this was their character. The humanity of the Athenians is as well known as their reputation in the arts. Hence a poet says, that Athens alone knows the feeling of pity; for it appears that, from the times of the oldest wars of the Argives and Thebans, the oppressed and persecuted always found

refuge and received help there. This same genial disposition was the origin of theatrical representations, and other games, – for the purpose, as Pericles says, of chasing sadness from life.

This is more easily understood by contrasting the Greeks with the Romans. The inhuman, sanguinary games, and the agonizing and dying gladiators, in the amphitheatres of the latter, even during the period of their greatest refinement, were the most gratifying sources of amusement to the whole people. The former, on the contrary, abhorred such cruelty; and, when similar fearful games were about to be introduced at Corinth, some one observed, that they must throw down the altar of Mercy and Pity, before they could resolve to look upon such horrors. [. . .]

The independence of Greece is to be regarded as the most prominent of the causes, originating in its constitution and government, of its superiority in art. Liberty had always held her seat in this country, even near the throne of kings, – whose rule was paternal, – before the increasing light of reason had shown to its inhabitants the blessings of entire freedom. [. . .]

We ourselves differ as to beauty, – probably more than we do even in taste and smell, – whenever our ideas respecting it are deficient in clearness. It will not be easy to find a hundred men who would agree as to all the points of beauty in any one face, – I speak of those who have not thought profoundly on the subject. The handsomest man that I have seen in Italy was not the handsomest in the eyes of all, not even of those who prided themselves on being observant of the beauty of our sex. But those who have regarded and selected beauty as a worthy subject of reflection cannot differ as to the truly beautiful, for it is one only, and not manifold; and when they have studied it in the perfect statues of the ancients, they do not find, in the beautiful women of a proud and wise nation, those charms which are generally so much prized, – because they are not dazzled by the fairness of their skin. Beauty is felt by sense, but is recognized and comprehended by the understanding, which generally renders, and ought to render, sense less susceptible, but more correct. Most nations, however, and among them the most cultivated, not only of Europe, but of Asia and Africa, invariably agree as to the general form; consequently their ideas of it are not to be considered as arbitrarily assumed, although we are not able to account for them all.

Color assists beauty; generally, it heightens beauty and its forms, but it does not constitute it; just as the taste of wine is more agreeable, from its color, when drunk from a transparent glass, than from the most costly golden cup. Color, however, should have but little share in our consideration of beauty, because the essence of beauty consists, not in color, but in shape, and on this point enlightened minds will at once agree. As white is the color which reflects the greatest number of rays of light, and consequently is the most easily perceived, a beautiful body will, accordingly, be the more beautiful the whiter it is, just as we see that all figures in gypsum, when freshly formed, strike us as larger than the statues from which they are made. A negro might be called handsome, when the conformation of his face is handsome. A traveller assures us that daily association with negroes diminishes the disagreeableness of their color, and displays what is beautiful in them; just as the color of bronze and of the black and greenish basalt does not detract from the beauty of the antique heads. The beautiful female head in the latter kind of stone, in the villa Albani, would not appear more beautiful in white marble. The head of the elder Scipio, of

dark-greenish basalt, in the palace Rospigliosi, is more beautiful than the three other heads, in marble, of the same individual. These heads, together with other statues in black stone, will meet with approbation even from the unlearned, who view them as statues. It is manifest, therefore, that we possess a knowledge of the beautiful, although in an unusual dress and of a disagreeable color. But beauty is also different from pleasingness or loveliness. [...]

Wise men who have meditated on the causes of universal beauty have placed it in the harmony of the creature with the purposes of its being, and of the parts with each other and with the whole, because they have investigated it in the works of creation, and have sought to reach even the source of the highest beauty. But, as this is synonymous with perfection, of which humanity is not a fit recipient, our idea of universal beauty is still indefinite; and it is formed within us by single acquisitions of knowledge, which, when they are collected and united together, give us, if correct, the highest idea of human beauty, – which we exalt in proportion as we are able to elevate ourselves above matter. Since, moreover, this perfection has been bestowed by the Creator on all his creatures, in a degree suitable to them, and every idea originates from a cause which must be sought, not in the idea itself, but in something else, so the cause of beauty cannot be found *out* of itself, since it exists *in* all created things. From this circumstance, and – as all our knowledge is made up of ideas of comparison – from the impossibility of comparing beauty with anything higher than itself, arises the difficulty of a general and clear explanation of it.

The highest beauty is in God; and our idea of human beauty advances towards perfection in proportion as it can be imagined in conformity and harmony with that highest Existence which, in our conception of unity and indivisibility, we distinguish from matter. This idea of beauty is like an essence extracted from matter by fire; it seeks to beget unto itself a creature formed after the likeness of the first rational being designed in the mind of the Divinity. The forms of such a figure are simple and flowing, and various in their unity; and for this reason they are harmonious, just as a sweet and pleasing tone can be extracted from bodies the parts of which are uniform. [...]

From unity proceeds another attribute of lofty beauty, the absence of individuality; that is, the forms of it are described neither by points nor lines other than those which shape beauty merely, and consequently produce a figure which is neither peculiar to any particular individual, nor yet expresses any one state of the mind or affection of the passions, because these blend with it strange lines, and mar the unity. According to this idea, beauty should be like the best kind of water, drawn from the spring itself; the less taste it has, the more healthful it is considered, because free from all foreign admixture. As the state of happiness – that is, the absence of sorrow, and the enjoyment of content – is the very easiest state in nature, and the road to it is the most direct, and can be followed without trouble and without expense, so the idea of beauty appears to be the simplest and easiest, requiring no philosophical knowledge of man, no investigation and no expression of the passions of his soul.

Since, however, there is no middle state in human nature between pain and pleasure, even according to Epicurus, and the passions are the winds which impel our bark over the sea of life, with which the poet sails, and on which the artist soars, pure beauty alone cannot be the sole object of our consideration; we must place it also

in a state of action and of passion, which we comprehend in art under the term *Expression*. We shall, therefore, in the first place, treat of the shape of beauty, and in the second place, of expression.

The shape of beauty is either *individual*, – that is, confined to an imitation of one individual, – or it is a selection of beautiful parts from many individuals, and their union into one, which we call *ideal*, yet with the remark that a thing may be ideal without being beautiful. The form of the Egyptian figures, in which neither muscles, tendons, nor veins are indicated, is ideal, but still it shapes forth no beauty in them; neither can the drapery of Egyptian female figures – which can only be imagined, and consequently is ideal – be termed beautiful. [...]

The gymnasia and other places where the young exercised naked in athletic and other games, and which were the resort of those who desired to see beautiful youth, were the schools wherein the artist saw beauty of structure; and, from the daily opportunity of seeing it nude and in perfection, his imagination became heated, the beauty of the forms he saw became his own, and was ever present to his mind. At Sparta, even the young virgins exercised naked, or nearly so, in the games of the arena.

To each age, even as to the goddesses of the seasons, there belongs its peculiar beauty, but differing in degree. It is associated especially with youth, which it is the great effort of art to represent. Here, more than in manhood, the artist found the cause of beauty, in unity, variety, and harmony. The forms of beautiful youth resemble the unity of the surface of the sea, which at some distance appears smooth and still, like a mirror, although constantly in movement with its heaving swell. The soul, though a simple existence, brings forth at once, and in an instant, many different ideas; so it is with the beautiful youthful outline, which appears simple, and yet at the same time has infinitely different variations, and that soft tapering which is difficult of attainment in a column is still more so in the diverse forms of a youthful body. Among the innumerable kinds of columns in Rome, some appear pre-eminently elegant on account of this very tapering; of these I have particularly noticed two of granite, which I am always studying anew: just so rare is a perfect form, even in the most beautiful youth, which has a stationary point in our sex still less than in the female.

The forms of a beautiful body are determined by lines the centre of which is constantly changing, and which, if continued, would never describe circles. They are, consequently, more simple, but also more complex, than a circle, which, however large or small it may be, always has the same centre, and either includes others, or is included in others. This diversity was sought after by the Greeks in works of all kinds; and their discernment of its beauty led them to introduce the same system even into the form of their utensils and vases, whose easy and elegant outline is drawn after the same rule, that is, by a line which must be found by means of several circles, for all these works have an elliptical figure, and herein consists their beauty. The greater unity there is in the junction of the forms, and in the flowing of one out of another, so much the greater is the beauty of the whole.

From this great unity of youthful forms, their limits flow imperceptibly one into another, and the precise point of height of many, and the line which bounds them, cannot be accurately determined. This is the reason why the delineation of a youthful

body, in which everything is and is yet to come, appears and yet does not appear, is more difficult than that of an adult or aged figure. In the former of these two, the adult, nature has completed, and consequently determined, her work of formation; in the latter, she begins again to destroy the structure; in both, therefore, the junction of the parts is clearly visible. In youth, on the contrary, the conformation is, as it were, suspended between growth and maturity. To deviate from the outline in bodies having strongly developed muscles, or to strengthen or exaggerate the prominence of muscles or other parts, is not so great an error as the slightest deviation in youthful figures, in which even the faintest shadow, as it is commonly said, becomes a body, just as a rule, though shorter or narrower than the requisite dimensions, still has all the properties of a rule, but cannot be called so if it deviates from a straight line; whoever misses the centre-white has missed as much as though he had not hit the target at all. [...]

Book V

The most beautiful forms, thus selected, were, in a manner, blended together, and from their union issued, as by a new spiritual generation, a nobler progeny, of which no higher characteristic could be conceived than never-ending youth, – a conclusion to which the consideration of the beautiful must necessarily lead. For the mind, in rational beings, has an innate tendency and desire to rise above matter into the spiritual sphere of conceptions, and its true enjoyment is in the production of new and refined ideas. The great artists among the Greeks – who regarded themselves almost as creators, although they worked less for the understanding than for the senses – sought to overcome the hard resistance of matter, and, if possible, to endue it with life, with soul. This noble zeal on their part, even in the earlier periods of art, gave rise to the fable of Pygmalion's statue. For their hands produced those objects of devout respect, which, to inspire veneration, must necessarily appear to be images taken from a more elevated order of beings. The first founders of the religion – who were poets – attached to these images exalted ideas, and these in their turn excited the imagination to elevate her work above herself, and above sense. To human notions, what attribute could be more suitable to sensual deities, and more fascinating to the imagination, than an eternal youth and spring-time of life, when the very remembrance of youth which has passed away can gladden us in later years? It was conformable to their idea of the immutability of the godlike nature; and a beautiful youthful form in their deities awakened tenderness and love, transporting the soul into that sweet dream of rapture, in which human happiness – the object and aim of all religions, whether well or ill understood – consists. [...]

As the ancients had mounted gradually from human to divine beauty, each of the steps of beauty remained through which they passed in their ascent.

Near the divinities stand the Heroes and Heroines of fable. To the artist, the latter as well as the former were objects of beauty. In Heroes, that is, in men to whom antiquity attributed the highest excellence of human nature, he advanced even to the confines of the divine nature, without passing beyond them, and without blending the very nice distinctions which separated the two. Battus, on medals of Cyrene, might easily be made to represent a Bacchus, by a single expression of tender delight,

and an Apollo, by one trait of godlike nobleness. Minos, on coins of Gnosus, if it were not for a proud, regal look, would resemble a Jupiter, full of graciousness and mercy.

The artist shaped the forms of Heroes heroically, and gave to certain parts a preternatural development; placed in the muscles quickness of action and of motion; and in energetic efforts brought into operation all the motive powers of nature. The object which he sought to attain was variety in its utmost extent; and in this respect, Myron exceeded all his predecessors. It is visible even in the Gladiator, erroneously so called, of Agasias of Ephesus, in the villa Borghese, whose face is evidently copied after that of some particular individual. The serrated muscles on the sides, as well as others, are more prominent, active, and contractile than is natural. The same thing is yet more clearly seen, in the same muscles, in the Laocoön, – who is an ideally elevated being, – if this portion of the body be compared with the corresponding portion in deified or godlike figures, as the Hercules and Apollo of the Belvedere. The action of these muscles, in the Laocoön, is carried beyond truth to the limits of possibility; they lie like hills which are drawing themselves together, – for the purpose of expressing the extremest exertion in anguish and resistance. In the torso of Hercules deified, there is a high ideal form and beauty in these same muscles; they resemble the undulations of the calmed sea, flowing though elevated, and rising and sinking with a soft, alternate swell. In the Apollo, an image of the most beautiful of the gods, these muscles are smooth, and, like molten glass blown into scarce visible waves, are more obvious to touch than to sight.

In all these respects, beauty was uniformly the principal object at which the artist aimed.

* * *

Next to a knowledge of beauty, expression and action are to be considered as the points most essential to an artist, just as Demosthenes regarded action as the first, second, and third requisite in an orator. Action alone may cause a figure to appear beautiful; but it can never be considered so, if the action is faulty. An observance of propriety in expression and action ought, therefore, to be inculcated at the same time with the principles of beautiful forms, – because it is one of the constituents of grace. For this reason, the Graces are represented as the attendants of Venus, the goddess of beauty. Consequently the phrase, *to sacrifice to the Graces*, signifies among artists to be attentive to the expression and action of their figures.

In art, the term *expression* signifies imitation of the active and passive states of the mind and body, and of the passions as well as of the actions. In its widest sense it comprehends action; but in its more limited meaning, it is restricted to those emotions which are denoted by looks and the features of the face. Action relates rather to the movements of the limbs and the whole body; it sustains the expression. [...]

Expression, in its limited as well as more extended signification, changes the features of the face, and the posture, and consequently alters those forms which constitute beauty. The greater the change, the more unfavorable it is to beauty. On this account, stillness was one of the principles observed here, because it was regarded, according to Plato, as a state intermediate between sadness and gayety; and, for the same reason, stillness is the state most appropriate to beauty, just as it is

to the sea. Experience also teaches that the most beautiful men are quiet in manners and demeanor. In this view, even abstraction is required in an image not less than in him who designs it; for the idea of lofty beauty cannot be conceived otherwise than when the soul is wrapt in quiet meditation, and abstracted from all individuality of shape. Besides, a state of stillness and repose, both in man and beast, is that state which allows us to examine and discover their real nature and characteristics, just as one sees the bottom of a river or lake only when their waters are still and unruffled, and consequently even Art can express her own peculiar nature only in stillness.

Repose and equanimity, in their highest degree, are incompatible with action. The most elevated idea of beauty, therefore, can neither be aimed at, nor preserved, even in figures of the deities, who must of necessity be represented under a human shape. But the expression was made commensurate, as it were, with the beauty, and regulated by it. With the ancient artists, therefore, beauty was the chief object of expression, just as the cymbal guides all the other instruments in a band, although they seemingly overpower it. A figure may, however, be called beautiful even though expression should preponderate over beauty, just as we give the name of wine to a liquor of which the larger portion is water. Here we also see an indication of the celebrated doctrine of Empedocles relative to discord and harmony, by whose opposing actions the things of this world are arranged in their present situation. Beauty without expression might properly be termed insignificant, and expression without beauty, unpleasing; but, from the action of one upon the other, and the union of the two opposing qualities, beauty derives additional power to affect, to persuade, and to convince.

Repose and stillness are likewise to be regarded as a consequence of the propriety which the Greeks always endeavored to observe both in feature and action, insomuch that even a quick walk was regarded as, in a certain measure, opposed to their ideas of decorum. It seemed to involve a kind of boldness. Demosthenes reproaches Nicobulus with such a mode of walking; and he connects impudent talking with quick walking. In conformity to this mode of thinking, the ancients regarded slow movements of the body as characteristic of great minds. [. . .]

The Greek artists were convinced that, as Thucydides says, greatness of mind is usually associated with a noble simplicity. Even Achilles presents himself to us in this aspect; for, though prone to anger and inexorable in wrath, his character is ingenuous, and without dissimulation or falseness. The ancient artists accordingly modelled the faces of their heroes after the truth thus taught them by experience. No look of subtlety is there, nor of frivolity, nor craft, still less of scorn, but innocence is diffused over them, blended with the calmness of a trustful nature.

In representing heroes, the artist is allowed less license than the poet. The latter can depict them according to their times, when the passions were as yet unrestrained by social laws or the artificial proprieties of life, because the qualities ascribed to a man have a necessary relation to his age and standing, but none necessarily to his figure. The former, however, being obliged to select the most beautiful parts of the most beautiful conformations, is limited, in the expression of the passions, to a degree which will not conflict with the physical beauty of the figure which he models.

The truth of this remark is apparent in two of the most beautiful works of antiquity. One of them is a representation of the fear of death; the other, of extreme

suffering and pain. The daughters of Niobe, at whom Diana has aimed her fatal shafts, are represented in that state of indescribable anguish, their senses horror-struck and benumbed, in which all the mental powers are completely overwhelmed and paralyzed by the near approach of inevitable death. The transformation of Niobe into a rock, in the fable, is an image of this state of deathlike anguish; and for this reason Æschylus introduced her as a silent personage in his tragedy on this subject. A state such as this, in which sensation and reflection cease, and which resembles apathy, does not disturb a limb or a feature, and thus enabled the great artist to represent in this instance the highest beauty just as he has represented it; for Niobe and her daughters are beautiful according to the highest conceptions of beauty.

Laocoön is an image of the most intense suffering. It manifests itself in his muscles, sinews, and veins. The poison introduced into the blood, by the deadly bite of the serpents, has caused the utmost excitement in the circulation; every part of the body seems as if straining with agony. By this means the artist brought into action all the natural motive powers, and at the same time displayed the wonders of his science and skill. But in the representation of this intense suffering is seen the determined spirit of a great man who struggles with necessity and strives to suppress all audible manifestations of pain. [...]

9 Francesco Algarotti (1712–1764) ‘Of the Camera Obscura’ from *An Essay on Painting*

Algarotti was a wealthy, Venetian-born collector, connoisseur and man of letters. Following an education which combined science and culture, he spent his adult life in a succession of major European cities, involved with a variety of projects ranging from building up the art collection of the Elector of Saxony to publishing popular expositions of Newton's optics. In London his portrait was drawn by Jonathan Richardson; in Paris he stayed with Voltaire; in Prussia he was ennobled by Frederick the Great. Towards the end of his life he prepared a complete edition of his writings which, when published posthumously in Venice in the 1790s, ran to seventeen volumes. His *Saggio sopra la pittura* was published in Bologna in 1762. An English translation followed in 1764, dedicated to ‘The Society Instituted in London for Promoting Arts, Manufactures and Commerce’ (now known as the Royal Society of Arts). The book is essentially an instruction manual for the young artist, taking the reader in an easygoing but informed fashion through the conventionally recognized requirements of the practice: anatomy, perspective, colouring, drapery, expression and so forth. Algarotti's text is liberally sprinkled with references to the most eminent artists of the past and present, and draws on a wide range of theorists from Pliny and Leonardo to near contemporaries such as De Piles, Du Fresnoy and Le Brun. One chapter, however, is more innovative, combining as it does Algarotti's knowledge of classicist art theory with his enthusiasm for modern science, and in particular, optics. ‘Of the Camera Obscura’ forms chapter VI of Algarotti's *An Essay on Painting*, London: L. Davis and C. Reymers, 1764, pp. 60–6.

We may well imagine, that, could a young painter but view a picture by the hand of Nature herself, and study it at his leisure, he would profit more by it, than by the

most excellent performances by the hand of man. Now, nature is continually forming such pictures in our eye. The rays of light coming from exterior objects, after entering the pupil, pass through the crystalline humour, and being there refracted, in consequence of the lenticular form of that part, proceed to the retina, which lies at the bottom of the eye, and stamp upon it, by their union, the image of the object, towards which the pupil is directed. The consequence of which is, that the soul, by means as yet unknown to us, receives immediate intelligence of these rays, and comes to see the objects that sent them. But this grand operation of Nature, the discovery of which was reserved for our times, might have remained an idle amusement of physical curiosity, without being of the least service to the painter, had not means been happily found of imitating it. The machine, contrived for this purpose, consists of a lens and a mirror so situated, that the second throws the picture of any thing properly exposed to the first, and that too of a competent largeness, on a clean sheet of paper, where it may be seen and contemplated at leisure.

As this artificial eye, usually called a Camera Optica or Obscura, gives no admittance to any rays of light, but those coming from the thing whose representation is wanted, there results from them a picture of inexpressible force and brightness; and, as nothing is more delightful to behold, so nothing can be more useful to study, than such a picture. For, not to speak of the justness of the contours, the exactness of the perspective and of the chiaroscuro, which exceeds conception; the colours are of a vivacity and richness that nothing can excell; the parts, which stand out most, and are most exposed to the light, appear surprisingly loose and resplendent; and this looseness and resplendency declines gradually, as the parts themselves sink in, or retire from the light. The shades are strong without harshness, and the contours precise without being sharp. Wherever any reflected light falls, there appears, in consequence of it, an infinite variety of tints, which, without this contrivance, it would be impossible to discern. Yet there prevails such a harmony amongst all the colours of the piece, that scarce any one of them can be said to clash with another.

After all, it is no way surprising, that we should, by means of this contrivance, discover, what otherwise we might justly despair of ever being acquainted with. We cannot look directly at any object, that is not surrounded by so many others, all darting their rays together into our eyes, that it is impossible we should distinguish all the different modulations of its light and colours. At least we can only see them in so dull and confused a manner, as not to be able to determine any thing precisely about them. Whereas, in the Camera Obscura, the visual faculty is brought wholly to bear upon the object before it; and the light of every other object is, as it were, perfectly extinguished.

Another most astonishing perfection in pictures of this kind is the diminution of the size, and of the intenseness of light and colour, of the objects and all their parts, in proportion to their distance from the eye. At a greater distance the colours appear more faint, and the contours more obscure. The shades likewise are a great deal weaker in a less intense or more remote light. On the other hand, those objects, which are largest in themselves, or lie nearest to the eye, have the most exact contours, the strongest shades, and the brightest colours: all which qualities are requisite to form that kind of perspective, which is called aerial, as though the air between the eye and

external objects, not only veiled them a little, but in some sort gnawed, and preyed upon, them. This kind of perspective constitutes a principal part of that branch of painting, which regards the foreshortening of figures, and likewise the bringing them forward, and throwing them back in such a manner, as to make us lose sight of the ground upon which they are drawn. It is, in a word, this kind of perspective, from which, assisted by linear perspective, arise

Dolci cose a vedere, e dolci inganni

[Things sweet to see, and sweet deceptions].

Nothing proves this better than the Camera Obscura, in which nature paints the objects, which lie near the eye, as it were, with a hard and sharp pencil, and those at a distance with a soft and blunt one.

The best modern painters among the Italians have availed themselves greatly of this contrivance; nor is it possible they should have otherwise represented things so much to the life. It is probable, too, that several of the Tramontane Masters, considering their success in expressing the minutest objects, have done the same. Every one knows of what service it has been to Spagnoletto of Bologna, some of whose pictures have a grand and most wonderful effect. I once happened to be present where a very able master was shewn this machine for the first time. It is impossible to express the pleasure he took in examining it. The more he considered it, the more he seemed to be charmed with it. In short, after trying it a thousand different ways, and with a thousand different models, he candidly confessed, that nothing could compare with the pictures of so excellent and inimitable a master. Another, no less eminent, has given it as his opinion, that an academy, with no other furniture than the book of da Vinci, a critical account of the excellencies of the capital painters, the casts of the finest Greek statues, and the pictures of the Camera Obscura, would alone be sufficient to revive the art of painting. Let the young painter, therefore, begin as early as possible to study these divine pictures, and study them all the days of his life, for he never will be able sufficiently to contemplate them. In short, Painters should make the same use of the Camera Obscura, which Naturalists and Astronomers make of the Microscope and Telescope, for all these instruments equally contribute to make known, and represent Nature.

10 Gotthold Ephraim Lessing (1729–1781) from *Laocoön: An Essay on the Limits of Painting and Poetry*

The German dramatist, critic and philosopher Gotthold Ephraim Lessing was born in Kamenz, in Saxony. He studied theology for a short period in Leipzig before moving to Berlin where he wrote his first plays. He was one of the leading figures in the protest against the dominance of French taste and in his *Hamburg Dramaturgy* (1767–9) he sought to establish the superiority of Shakespeare to classical French tragedy. His important essay, *Laocoön*, first published in 1766, addresses the limits and possibilities inherent in the different media of poetry and the visual arts. His point of departure is a

disagreement with the German art historian, Johann Joachim Winckelmann (see IIIA5), over his interpretation of the antique sculpture, *Laocoön*, now in the Vatican. Against Winckelmann, Lessing argues that it was not a general refusal to depict suffering which led the artist to restrain Laocoön's cries, but a law of beauty specific to the visual arts. The constraints upon poetry and drama are different from those upon painting and sculpture. These differences, in turn, are traced back to differences in the media through which the respective arts operate. Since poetry uses words which follow one another in time, its proper subject-matter is actions or events. Painting and sculpture, however, work with shapes and surfaces which coexist in space, and their proper subject is objects or bodies. Painting and sculpture are restricted to a single, highly charged moment, whereas poetry and drama deal with sequences of events. Lessing struck to the heart of the doctrine of poetry and painting as sister arts, expressed in the motto, *ut pictura poesis*, and initiated a new concern with the expressive possibilities of the different media of artistic representation. He intended to complete the *Laocoön* with two further parts, devoted to music and dance, but left the work unfinished. *Laokoon: oder über die Grenzen der Malerei und Poesie* was first published in Berlin in 1766. The following excerpts are taken from the edition edited and translated by Edward Allen McCormick, Baltimore and London: Johns Hopkins University Press, 1984, pp. 3–5, 7–11, 12, 15–17, 19–20, 23–4, 78–9, 85–6, 91.

Preface

The first person to compare painting with poetry was a man of fine feeling who observed that both arts produced a similar effect upon him. Both, he felt, represent absent things as being present and appearance as reality. Both create an illusion, and in both cases the illusion is pleasing.

A second observer, in attempting to get at the nature of this pleasure, discovered that both proceed from the same source. Beauty, a concept which we first derive from physical objects, has general rules applicable to a number of things: to actions and thoughts as well as to forms.

A third, who examined the value and distribution of these general rules, observed that some of them are more predominant in painting, others in poetry. Thus, in the one case poetry can help to explain and illustrate painting, and in the other painting can do the same for poetry.

The first was the amateur, the second the philosopher, and the third the critic.

The first two could not easily misuse their feelings or their conclusions. With the critic, however, the case was different. The principal value of his observations depends on their correct application to the individual case. And since for every one really discerning critic there have always been fifty clever ones, it would have been a miracle if this application had always been made with the caution necessary to maintain a proper balance between the two arts.

If Apelles and Protogenes, in their lost writings on painting, confirmed and explained its laws by applying already established rules of poetry, we may be certain that they did so with the same moderation and accuracy with which the principles and lessons of painting are applied to eloquence and poetry in the works of Aristotle, Cicero, Horace, and Quintilian. It is the prerogative of the ancients never to have done too much or too little in anything.

But in many respects we moderns have considered ourselves far superior when we transformed their pleasant little lanes into highways, even though shorter and safer highways themselves become mere footpaths as they lead through wildernesses.

The brilliant antithesis of the Greek Voltaire¹ that painting is mute poetry and poetry a speaking painting was doubtless not to be found in any textbook. It was a sudden fancy – among others that Simonides had – and the truth it contains is so evident that one feels compelled to overlook the indefinite and untrue statements which accompany it.

The ancients, however, did not overlook them. In restricting Simonides' statement to the effect achieved by the two arts, they nevertheless did not forget to stress that, despite the complete similarity of effect, the two arts differed both in the objects imitated as well as in the manner of imitation (*ἕλξη καὶ τρόποις μιμήσεως*).

Still, many recent critics have drawn the most ill-digested conclusions imaginable from this correspondence between painting and poetry, just as though no such difference existed. In some instances they force poetry into the narrower limits of painting; in others they allow painting to fill the whole wide sphere of poetry. Whatever one is entitled to must be permitted to the other also; whatever pleases or displeases in one must necessarily please or displease in the other. And so, full of this idea, they pronounce the shallowest judgments with the greatest self-assurance and, in criticizing the work of a poet and a painter on the same subject, they regard the differences of treatment observed in them as errors, which they blame on one or the other, depending on whether they happen to prefer painting or poetry.

Indeed, this spurious criticism has to some degree misled even the masters of the arts. In poetry it has engendered a mania for description and in painting a mania for allegory, by attempting to make the former a speaking picture, without actually knowing what it could and ought to paint, and the latter a silent poem, without having considered to what degree it is able to express general ideas without denying its true function and degenerating into a purely arbitrary means of expression.

To counteract this false taste and these unfounded judgments is the principal aim of the following chapters. They were written as chance dictated and more in keeping with my reading than through any systematic development of general principles. Hence they are to be regarded more as unordered notes for a book than as a book itself.

* * *

Chapter One

The general and distinguishing characteristics of the Greek masterpieces of painting and sculpture are, according to Herr Winckelmann, noble simplicity and quiet grandeur, both in posture and in expression. 'As the depths of the sea always remain calm,' he says 'however much the surface may be agitated, so does the expression in the figures of the Greeks reveal a great and composed soul in the midst of passions.'

Such a soul is depicted in Laocöon's face – and not only in his face – under the most violent suffering. The pain is revealed in every muscle and sinew of his body, and one

can almost feel it oneself in the painful contraction of the abdomen without looking at the face or other parts of the body at all. However, this pain expresses itself without any sign of rage either in his face or in his posture. He does not raise his voice in a terrible scream, which Virgil describes his Laocoön as doing; the way in which his mouth is open does not permit it. Rather he emits the anxious and subdued sigh described by Sadolet. The pain of body and the nobility of soul are distributed and weighed out, as it were, over the entire figure with equal intensity. Laocoön suffers, but he suffers like the Philoctetes of Sophocles; his anguish pierces our very soul, but at the same time we wish that we were able to endure our suffering as well as this great man does.

Expressing so noble a soul goes far beyond the formation of a beautiful body. This artist must have felt within himself that strength of spirit which he imparted to his marble. In Greece artists and philosophers were united in one person, and there was more than one Metrodorus. Philosophy extended its hand to art and breathed into its figures more than common souls. . . .

The remark on which the foregoing comments are based, namely that the pain in Laocoön's face is not expressed with the same intensity that its violence would lead us to expect, is perfectly correct. It is also indisputable that this very point shows truly the wisdom of the artist. Only the ill-informed observer would judge that the artist had fallen short of nature and had not attained the true pathos of suffering.

But as to the reasons on which Herr Winckelmann bases this wisdom, and the universality of the rule which he derives from it, I venture to be of a different opinion.

* * *

High as Homer raises his heroes above human nature in other respects, he still has them remain faithful to it in their sensitiveness to pain and injury and in the expression of this feeling by cries, tears, or invectives. In their deeds they are beings of a higher order, in their feelings true men.

I know that we more refined Europeans of a wiser, later age know better how to govern our mouths and our eyes. Courtesy and propriety force us to restrain our cries and tears. The aggressive bravery of the rough, early ages has become in our time a passive courage of endurance. Yet even our ancestors were greater in the latter than the former. But our ancestors were barbarians. To master all pain, to face death's stroke with unflinching eye, to die laughing under the adder's bite, to weep neither at the loss of one's dearest friend nor at one's own sins: these are the traits of old Nordic heroism. Palnatoko decreed that his Jomsburghers were not to fear anything nor even so much as mention the word 'fear.'

Not so the Greek! He felt and feared, and he expressed his pain and grief. He was not ashamed of any human weakness, but it must not prevent him from attaining honor nor from fulfilling his duty. The Greek acted from principles whereas the barbarian acted out of his natural ferocity and callousness. In the Greek, heroism was like the spark hidden in the flint, which sleeps quietly as long as no external force awakens it, and robs it of its clarity or its coldness. In the barbarian, heroism was a bright, consuming, and ever-raging flame which devoured, or at least blackened, every other fine quality in him. When Homer makes the Trojans march to battle with wild cries, while the Greeks go in resolute silence, the commentators rightly observe

that the poet thereby intends to depict the former as barbarians and the latter as civilized peoples. [...]

It is worthy of note that among the few tragedies which have come down to us from antiquity there are two in which physical pain is not the least part of the misfortune that befalls the suffering heroes, Philoctetes and the dying Hercules. And Sophocles lets even the latter wail and moan, weep and cry out. Thanks to our well-mannered neighbors, those masters of propriety, a wailing Philoctetes or a bawling Hercules today would be the most ridiculous and unbearable figure on stage. One of their most recent poets has, to be sure, ventured on a Philoctetes, but did he dare to show his audience the *true* Philoctetes?

There is even a Laocoön among the lost plays of Sophocles. If only fate had saved this one for us! From the slight references of some of the ancient grammarians we cannot determine how the poet treated his subject. But of this much I am certain: he did not portray Laocoön as more stoical than Philoctetes and Hercules. Stoicism is not dramatic, and our sympathy is in direct proportion to the suffering of the object of our interest. If we see him bearing his misery with nobility of soul, he will, to be sure, excite our admiration; but admiration is only a cold sentiment whose barren wonderment excludes not only every warmer passion but every other clear conception as well.

I come now to my conclusion: if, according to the ancient Greeks, crying aloud when in physical pain is compatible with nobility of soul, then the desire to express such nobility could not have prevented the artist from representing the scream in his marble. There must be another reason why he differs on this point from his rival the poet, who expresses this scream with deliberate intention.

Chapter Two

Whether it be fact or fiction that Love inspired the first artistic effort in the fine arts, this much is certain: she never tired of guiding the hands of the old masters. Painting, as practiced today, comprises all representations of three-dimensional bodies on a plane. The wise Greek, however, confined it to far narrower limits by restricting it to the imitation of beautiful bodies only. The Greek artist represented only the beautiful, and ordinary beauty, the beauty of a lower order, was only his accidental subject, his exercise, his relaxation. The perfection of the object itself in his work had to give delight, and he was too great to demand of his audience that they be satisfied with the barren pleasure that comes from looking at a perfect resemblance, or from consideration of his skill as a craftsman. Nothing in his art was dearer to him or seemed nobler than its ultimate purpose.

* * *

... Among the ancients beauty was the supreme law of the visual arts. Once this has been established, it necessarily follows that whatever else these arts may include must give way completely if not compatible with beauty, and, if compatible, must at least be subordinate to it.

Let us consider expression. There are passions and degrees of passion which are expressed by the most hideous contortions of the face and which throw the whole body into such unnatural positions as to lose all the beautiful contours of its natural

state. The ancient artists either refrained from depicting such emotions or reduced them to a degree where it is possible to show them with a certain measure of beauty.

Rage and despair did not degrade any of their works. I venture to say that they never depicted a Fury. Wrath was reduced to seriousness. In poetry it was the wrathful Jupiter who hurled the thunderbolt; in art it was only the stern Jupiter.

Anguish was softened into sadness. Where this softening was impossible, where anguish would have been disparaging as well as distorting – what did Timanthes do? We know the answer from his painting of the sacrifice of Iphigenia: he imparted to each bystander the particular degree of sadness appropriate to him but concealed the face of the father, which should have shown the most intense suffering. Many clever things have been said about this. One critic, for instance, says that he had so exhausted himself in depicting the sorrowful faces of the bystanders that he despaired of his ability to give a still more sorrowful one to the father. Another says that by so doing he admitted that the anguish of a father in such circumstances is beyond expressing. For my part, I see no incapacity on the part of either the artist or his art. The intensity of the emotions intensifies the corresponding expression in the features of the face; the highest degree will cause the most extreme expression, and nothing is easier in art than to express this. But Timanthes knew the limits which the Graces had set for his art. He knew that the anguish appropriate to Agamemnon as the father would have to be expressed through distortions, which are always ugly. He went as far as he could in combining beauty and dignity with the expression of anguish. He would have preferred to pass over the ugly or to soften it, but since his composition did not permit him to do either, there was nothing left him but to veil it. What he might not paint he left to conjecture. In short, this concealment is a sacrifice that the artist has made to beauty; it is an example, not of how one pushes expression beyond the limits of art, but how one should subject it to the first law of art, the law of beauty.

If we apply this now to the Laocoön, the principle which I am seeking becomes apparent. The master strove to attain the highest beauty possible under the given condition of physical pain. The demands of beauty could not be reconciled with the pain in all its disfiguring violence, so it had to be reduced. The scream had to be softened to a sigh, not because screaming betrays an ignoble soul, but because it distorts the features in a disgusting manner. Simply imagine Laocoön's mouth forced wide open, and then judge! Imagine him screaming, and then look! From a form which inspired pity because it possessed beauty and pain at the same time, it has now become an ugly, repulsive figure from which we gladly turn away. For the sight of pain provokes distress; however, the distress should be transformed, through beauty, into the tender feeling of pity.

* * *

Chapter Three

As I have already said, art has been given a far wider scope in modern times. It is claimed that representation in the arts covers all of visible nature, of which the

beautiful is but a small part. Truth and expression are art's first law, and as nature herself is ever ready to sacrifice beauty for the sake of higher aims, so must the artist subordinate it to his general purpose and pursue it no farther than truth and expression permit. It is enough that truth and expression transform the ugliest aspects of nature into artistic beauty.

But even if we were willing to leave these ideas for the moment unchallenged as to their value, we would still have to consider, quite independently of these ideas, why the artist must nevertheless set certain restraints upon expression and never present an action at its climax.

The single moment of time to which art must confine itself by virtue of its material limitations will lead us, I believe, to such considerations.

If the artist can never make use of more than a single moment in ever-changing nature, and if the painter in particular can use this moment only with reference to a single vantage point, while the works of both painter and sculptor are created not merely to be given a glance but to be contemplated – contemplated repeatedly and at length – then it is evident that this single moment and the point from which it is viewed cannot be chosen with too great a regard for its effect. But only that which gives free rein to the imagination is effective. The more we see, the more we must be able to imagine. And the more we add in our imaginations, the more we must think we see. In the full course of an emotion, no point is less suitable for this than its climax. There is nothing beyond this, and to present the utmost to the eye is to bind the wings of fancy and compel it, since it cannot soar above the impression made on the senses, to concern itself with weaker images, shunning the visible fullness already represented as a limit beyond which it cannot go. Thus, if Laocoön sighs, the imagination can hear him cry out; but if he cries out, it can neither go one step higher nor one step lower than this representation without seeing him in a more tolerable and hence less interesting condition. One either hears him merely moaning or else sees him dead.

Furthermore, this single moment, if it is to receive immutable permanence from art, must express nothing transitory. According to our notions, there are phenomena, which we conceive as being essentially sudden in their beginning and end and which can be what they are only for a brief moment. However, the prolongation of such phenomena in art, whether agreeable or otherwise, gives them such an unnatural appearance that they make a weaker impression the more often we look at them, until they finally fill us with disgust or horror. La Mettrie, who had himself portrayed in painting and engraving as a second Democritus, seems to be laughing only the first few times we look at him. Look at him more often and the philosopher turns into a fop. His laugh becomes a grin. The same holds true for screaming. The violent pain which extorts the scream either soon subsides or else destroys the sufferer. When a man of firmness and endurance cries out he does not do so unceasingly, and it is only the seeming perpetuity of such cries when represented in art that turns them into effeminate helplessness or childish petulance. This, at least, the artist of the Laocoön had to avoid, even if screaming had not been detrimental to beauty, and if his art had been allowed to express suffering without beauty.

* * *

Chapter Four

I review the reasons given why the master of the Laocoön was obliged to exercise moderation in expressing physical pain and find that all of them have been derived from the special nature of the visual arts, their limitations, and their requirements. Hence any one of those causes could scarcely be applied to poetry.

Without investigating here the extent to which the poet is able to depict physical beauty, we may accept this much as unquestionable: since the whole infinite realm of perfection lies open to his description, this external form, beneath which perfection becomes beauty, can at best be only one of the least significant means by which he is able to awaken our interest in his characters. Often he ignores it entirely, being convinced that once his hero has won our favor his other qualities will either occupy us to such a point that we do not think of his physical form or, if we do think of it, we will be so captivated that we give him of our own accord if not a beautiful form, at least an ordinary one.

Least of all will he have to consider the sense of sight in any single trait that is not expressly intended to appeal to it. When Virgil's Laocoön screams, does it occur to anyone that a wide-open mouth is necessary in order to scream, and that this wide-open mouth makes the face ugly? Enough that *clamores horrendos ad sidera tollit*² has a powerful appeal to the ear, no matter what its effect on the eye! He who demands a beautiful picture here has failed to understand the poet.

Moreover, there is nothing to compel the poet to compress his picture into a single moment. He may, if he so chooses, take up each action at its origin and pursue it through all possible variations to its end. Each variation which would cost the artist a separate work costs the poet but a single pen stroke; and if the result of this pen stroke, viewed by itself, should offend the hearer's imagination, it was either anticipated by what has preceded or is so softened and compensated by what follows that it loses its individual impression and in combination achieves the best effect in the world. Thus, if it were really improper for a man to cry out in the violence of pain, what prejudice can this slight and transitory impropriety create in us against a man whose other virtues have already inclined us in his favor?

Virgil's Laocoön cries out, but this screaming Laocoön is the same man whom we already know and love as a prudent patriot and loving father. We do not relate his cries to his character, but solely to his unbearable suffering. It is this alone which we hear in them, and it was only by this means that the poet could convey it clearly to our senses.

* * *

Chapter Sixteen

But I shall attempt now to derive the matter from its first principles.

I reason thus: if it is true that in its imitations painting uses completely different means or signs than does poetry, namely figures and colors in space rather than articulated sounds in time, and if these signs must indisputably bear a suitable relation to the thing signified, then signs existing in space can express only objects

whose wholes or parts coexist, while signs that follow one another can express only objects whose wholes or parts are consecutive.

Objects or parts of objects which exist in space are called bodies. Accordingly, bodies with their visible properties are the true subjects of painting.

Objects or parts of objects which follow one another are called actions. Accordingly, actions are the true subjects of poetry.

However, bodies do not exist in space only, but also in time. They persist in time, and in each moment of their duration they may assume a different appearance or stand in a different combination. Each of these momentary appearances and combinations is the result of a preceding one and can be the cause of a subsequent one, which means that it can be, as it were, the center of an action. Consequently, painting too can imitate actions, but only by suggestion through bodies.

On the other hand, actions cannot exist independently, but must be joined to certain beings or things. Insofar as these beings or things are bodies, or are treated as such, poetry also depicts bodies, but only by suggestion through actions.

Painting can use only a single moment of an action in its coexisting compositions and must therefore choose the one which is most suggestive and from which the preceding and succeeding actions are most easily comprehensible.

Similarly, poetry in its progressive imitations can use only one single property of a body. It must therefore choose that one which awakens the most vivid image of the body, looked at from the point of view under which poetry can best use it. From this comes the rule concerning the harmony of descriptive adjectives and economy in description of physical objects.

* * *

Chapter Seventeen

But the objection will be raised that the symbols of poetry are not only successive but are also arbitrary; and, as arbitrary symbols, they are of course able to represent bodies as they exist in space. Examples of this might be taken from Homer himself. We need only to recall his shield of Achilles to have the most decisive instance of how discursively and yet at the same time poetically a single object may be described by presenting its coexistent parts.

I shall reply to this twofold objection. I call it twofold because a correct deduction must hold good even without examples; and, conversely, an example from Homer is of importance to me even when I am unable to justify it by means of deduction.

It is true that since the symbols of speech are arbitrary, the parts of a body may, through speech, be made to follow one another just as readily as they exist side by side in nature. But this is a peculiarity of speech and its signs in general and not as they serve the aims of poetry. The poet does not want merely to be intelligible, nor is he content – as is the prose writer – with simply presenting his image clearly and concisely. He wants rather to make the ideas he awakens in us so vivid that at that moment we believe that we feel the real impressions which the objects of these ideas would produce on us. In this moment of illusion we should cease to be conscious of the means which the poet uses for this purpose, that is, his words. This was the substance of the definition of a poetical painting given above. But the poet is always

supposed to paint, and we shall now see how far bodies with their coexistent parts adapt themselves to this painting.

How do we arrive at a clear conception of an object in space? We first look at its parts singly, then the combination of parts, and finally the totality. Our senses perform these various operations with such astonishing rapidity that they seem to us to be but one single operation, and this rapidity is absolutely necessary if we are to receive an impression of the whole, which is nothing more than the result of the conception of the parts and of their combination. Now let us assume that the poet takes us from one part of the object to the other in the best possible order; let us assume that he knows how to make the combination of these parts ever so clear to us; how much time would he use in doing this? That which the eye takes in at a single glance he counts out to us with perceptible slowness, and it often happens that when we arrive at the end of his description we have already forgotten the first features. And yet we are supposed to form a notion of the whole from these features. To the eye, parts once seen remain continually present; it can run over them again and again. For the ear, however, the parts once heard are lost unless they remain in the memory. And even if they do remain there, what trouble and effort it costs to renew all their impressions in the same order and with the same vividness; to review them in the mind all at once with only moderate rapidity, to arrive at an approximate idea of the whole!

* * *

Chapter Eighteen

[...] It remains true that succession of time is the province of the poet just as space is that of the painter.

It is an intrusion of the painter into the domain of the poet, which good taste can never sanction, when the painter combines in one and the same picture two points necessarily separate in time, as does Fra Mazzuoli when he introduces the rape of the Sabine women and the reconciliation effected by them between their husbands and relations, or as Titian does when he presents the entire history of the prodigal son, his dissolute life, his misery, and his repentance.

It is an intrusion of the poet into the domain of the painter and a squandering of much imagination to no purpose when, in order to give the reader an idea of the whole, the poet enumerates one by one several parts of things which I must necessarily survey at one glance in nature if they are to give the effect of a whole.

¹ Simonides of Ceos (died 469 BC).

IIIB

Aesthetics and the Sublime

1 Alexander Gottlieb Baumgarten (1714–1762) from *Reflections on Poetry*

The first use of the term 'aesthetics' in its modern sense is to be found in the concluding sections of the inaugural dissertation of Alexander Gottlieb Baumgarten, the *Meditationes philosophicae de nonnullis ad poema pertinentibus* (Philosophical Meditations on some Matters pertaining to Poetry), published in Latin in 1735. He was Professor of Philosophy at the University of Frankfurt an der Oder. His *Metaphysica* of 1739 and his *Ethica* of 1740 were widely used as textbooks and he played a considerable role in transmitting the tradition of philosophical rationalism associated with the work of Leibniz (see ID9) and Christian Wolff. Baumgarten's conception of a new science of aesthetics arises out of this tradition, whilst at the same time initiating an important revision in its most basic assumptions. Rationalism held that knowledge gained through the senses was a confused and imperfect form of knowing. It attached no intrinsic value to such knowledge other than as providing material for the sciences. Baumgarten sought to show, however, that cognition through the senses has its own significance and that the study of its perfection constituted an important area of enquiry subordinate to the established discipline of logic. The perfection of sensory knowledge is achieved in beauty and in the realization of works of art. In the *Meditationes* he restricted himself to the study of poetry, which he defines as 'perfect sensate discourse'. In its closing sections, however, he looks forward to a complete science of perception, or aesthetics, a project which he began but never completed with the publication of his *Aesthetica* in 1750 (see IIIB2). The following excerpts are taken from the translation of the *Meditationes*, published together with the original text, by Karl Aschenbrenner and William B. Holther as *Reflections on Poetry*, Berkeley and Los Angeles: University of California Press, 1954, pp. 38–9, 77–8.

* * *

§3. By **sensate representations** we mean representations received through the lower part of the cognitive faculty.

Since desire, so far as it derives from a confused representation of the good, is called sensate, and since, on the other hand, a confused representation, along with an obscure one, is received through the lower part of the cognitive faculty,

we can apply the same name to confused representations, in order that they may be distinguished from concepts distinct at all possible levels.

§4. By **sensate discourse** we mean discourse involving sensate representations.

Just as no philosopher attains to such profundity that he can see through all things, aided only by pure intellect, without becoming entangled somewhere or other in confused thinking, so, too, practically no discourse can be so purely scientific and intellectual that no sensate idea at all occurs in the whole context. Likewise, if one is especially looking for evidences of distinct thinking, one may find distinct representations here and there in sensate discourse; yet the discourse remains sensate, as the other remains abstract and intellectual.

§5. Connected sensate representations are to be apprehended from sensate discourse.

§6. The various parts of sensate discourse are: (1) sensate representations, (2) their interrelationships, (3) the words, or the articulate sounds which are represented by the letters and which symbolize the words.

§7. By **perfect sensate discourse** we mean discourse whose various parts are directed toward the apprehension of sensate representations.

§8. A sensate discourse will be the more perfect the more its parts favor the awakening of sensate representations.

§9. By **poem** we mean a perfect sensate discourse, by **poetics** the body of rules to which a poem conforms, by **philosophical poetics** the science of poetics, by **poetry** the state of composing a poem, and by **poet** the man who enjoys that state.

* * *

§115. Philosophical poetics is by §9 the science guiding sensate discourse to perfection; and since in speaking we have those representations which we communicate, philosophical poetics presupposes in the poet a lower cognitive faculty. It would now be the task of logic in its broader sense to guide this faculty in the sensate cognition of things, but he who knows the state of our logic will not be unaware how uncultivated this field is. What then? If logic by its very definition should be restricted to the rather narrow limits to which it is as a matter of fact confined, would it not count as the science of knowing things philosophically, that is, as the science for the direction of the higher cognitive faculty in apprehending the truth? Well, then. Philosophers might still find occasion, not without ample reward, to inquire also into those devices by which they might improve the lower faculties of knowing, and sharpen them, and apply them more happily for the benefit of the whole world. Since psychology affords sound principles, we have no doubt that there could be available a science which might direct the lower cognitive faculty in knowing things sensately.

§116. As our definition is at hand, a precise designation can easily be devised. The Greek philosophers and the Church fathers have already carefully distinguished between *things perceived* [αἰσθητὰ] and *things known* [νοητὰ]. It is entirely evident that they did not equate *things known* with things of sense, since they honored with this name things also removed from sense (therefore, images). Therefore, *things known* are to be known by the superior faculty as the object of logic; *things perceived* [are to be known by the inferior faculty, as the object] of the science of perception, or aesthetic.

* * *

2 Alexander Gottlieb Baumgarten (1714–1769) ‘Prolegomena’ to *Aesthetica*

Baumgarten published the first volume of his *Aesthetica* in 1750, and a second volume in 1758, but it remained uncompleted by the time of his death in 1769. It was to have two halves, dealing with theoretical and practical aesthetics respectively. The first half was then further subdivided into three parts – heuristics, methodology and semiotics – of which only the first five chapters on heuristics were ever published (of an intended six). The *Aesthetica* went through only one printing and few seem to have read Baumgarten’s Latin text at first hand. However, his principal ideas were widely disseminated by his students, including Georg Friedrich Meier, who produced a popularized German version even before the publication of the *Aesthetica* itself. The term ‘aesthetics’ is derived from the Greek *aisthēsis*, meaning ‘perception’ or ‘sensation’. Baumgarten begins by defining the new discipline of aesthetics as the ‘science of sensible knowledge’. As such, aesthetics forms a counterpart to the science of logic which brings clarity and coherence to the realm of thought. However, Baumgarten recognizes that the particular character of sensory knowledge lies in the richness and vividness of its representations. The perfection of sense cognition as this is realized in works of beauty is to be developed for its own sake. Whereas logic undertakes the abstract analysis of complex ideas into simple parts, aesthetics recognizes plenitude and complexity as valuable characteristics within its own domain. The ‘Prolegomena’ of the *Aesthetica* has been translated for this volume by Susan Halstead from a facsimile edition, Hildesheim: Georg Olms Verlagsbuchhandlung, 1961, pp. 1–5.

§1. Aesthetics (the theory of the liberal arts, the lower study of perception, the art of thinking in the fine style, the art of analogical reasoning) is the science of perception that is acquired by means of the senses.

§2. The natural condition of the lower cognitive faculties, developed only by use rather than training and culture, may be termed *natural aesthetics*, and divided, as natural logic generally is, into two types: the innate (as in a fine talent which is inborn) and the acquired, which in its turn is divided between teaching and practising.

§3. The most important uses of theoretical aesthetics (§1) as a support for natural aesthetics are, among others, these: (1) providing suitable material for those sciences which primarily depend upon perception by means of the intellect, (2) adapting

scientifically ascertained facts to anyone's level of comprehension, (3) improving knowledge and extending it beyond the current boundaries of what is known to us, (4) providing a sound basis for all study of culture and the liberal arts, and (5) giving a surpassing distinction to all matters pertaining to everyday life, all things being equal.

§4. From this proceed these special applications: (1) philological, (2) hermeneutical, (3) exegetical, (4) rhetorical, (5) homiletical, (6) poetical, (7) musical, etc.

§5. The following objections may be raised against our science (§1): (1) it is too extensive to be exhaustively treated in one short book or lecture. I reply by conceding this point, but anything is better than nothing. (2) It is the same as rhetoric and poetry. I reply that (a) it is more extensive, and (b) it embraces objects which both these disciplines have in common and share between themselves; considering this (and this is one convenient place to do so), any and every art may cultivate its own plot more successfully. (3) It is the same thing as criticism. I reply (a) there is also critical logic, (b) a certain type of criticism is an element of aesthetics, (c) for this a previous knowledge of the rest of aesthetics is almost indispensable, if one does not wish to discuss the matter simply on the basis of tastes in judging the excellence of thought, of spoken and written material.

§6. These objections may be raised against our science: (4) that impressions received from the senses, fantasies, emotional disturbances, etc., are unworthy of philosophers and beneath the scope of their consideration. I reply (a) that the philosopher is a man amongst men and it is not good for him to think that so great a part of human perception has nothing to do with him, (b) that the general theory of good thinking is here confused with particular practice and execution.

§7. Objection (5): Confusion is the mother of error. I reply (a) that it is an indispensable precondition for the discovery of truth, since nature does not make a leap from darkness into clarity of thought. Noon comes from night by way of dawn. And (b) for this very reason confusion too must receive attention, so that errors do not result as they so frequently do amongst the curious, (c) confusion should not be commended but perception corrected, inasmuch as some element of confusion still remains in it.

§8. Objection (6): Distinct perception is the highest form. I reply (a) that this is only valid for more important matters within the limited sphere of human thought, (b) the positing of one does not exclude the other, and (c) for that reason we proceed according to the clearly recognized basic rules of thought to that perception which has beauty as its goal, so that from it clear distinction may emerge more perfectly at some future time (§3, 7).

§9. Objection (7): It is to be feared that strictly rational perception may be disadvantaged by the cultivation of analogical thinking on the part of reason. I reply (a) that this argument belongs rather to those who seek to prove our position to be right, for they are in danger, whenever they seek composite perfection, of

urging caution and not persuading others to neglect true perfection. And (b) if the analogon neglects reason and rather becomes corrupted, it is no less harmful to logical thinking.

§10. Objection (8): Aesthetics is an art, not a science. I reply (a) that these fields are not the opposites of each other. How many subjects which were once only arts have now also become sciences? (b) Experience will demonstrate that our art can be subjected to proof; it is clear a priori, because psychology, etc. provide a sure foundation; and the uses mentioned in §3 and §4, amongst others, show that aesthetics deserves to be elevated to the rank of a science.

§11. Objection (9): Aestheticians are, like poets, born and not made. I reply with Horace, *Ars Poetica*, 408; Cicero, *De Oratore*, I. II: 60; Bilfinger, *In dilucid.*, §268; Breitinger, *Von den Gleichnissen*, p. 6: A more comprehensive theory, more commendable through the authority of reason, more exact, less confused, more certain, less unsure, is helpful to the born aesthetician. §3.

§12. Objection (10): The lower faculties, and the flesh, should be combated rather than aroused and strengthened. I reply (a) that the lower faculties require control and not tyranny, (b) that aesthetics, as far as this can be achieved by natural means, in fact leads them towards this condition by the hand, as it were, and (c) that the lower faculties, as long as they are corrupt, should not be aroused or strengthened by aestheticians, but rather directed by them, so that they should not become even further corrupted by inexpert practice, or lest the use of a talent bestowed by God be abolished on the easy pretext of avoiding its misuse.

§13. Our aesthetics, like logic its elder sister, is Part I: *theoretical*, with teaching in general and offering guidance concerning matters and thinking; *heuristics* (Chapter 1, 2) on clear order; *methodology* (Chapter 2, 3) on the expression of what is well thought out and ordered; *semiotics* (Chapter 3). Part II: *practical aesthetics*, concerned with practice in application to specific cases. In both cases, 'He who chooses his material with care will not lack verbal ability or clear order. Let the matter be your first concern, clear order your second, and, in the third place, pay due attention to expression' [Horace, *Epistles*, 2, 3, 40 ff.].

3 William Hogarth (1697–1764) from *The Analysis of Beauty*

Hogarth remains best known for his painted and engraved serial depictions of eighteenth-century social mores, *A Harlot's Progress* (1732), *A Rake's Progress* (1735) and *Marriage à la Mode* (1743). Largely self-taught as a painter, he began his career as an engraver, and was in business on his own account as early as 1720. Throughout his career Hogarth was deeply preoccupied by the need to maintain financial independence from aristocratic patrons. He was one of the prime movers in the campaign leading to the Copyright Act of 1735, which protected engravers for fourteen years after the initial publication of their work. Hogarth was also committed to the development of an English school of painting

independent of both continental and antique models. Partly as a result, his career was dogged by controversy, as he engaged variously with theorists of the Ideal, or with those who looked to royal patronage to underwrite the development of painting in England. Hogarth wrote much, and polemically, about Academies of art, about the status of art in England, and about his own career (see IVA2). His major theoretical statement, *The Analysis of Beauty*, was published in November 1753 to a mixed reception. Its arguments were critically discussed by fellow-artists, including Allan Ramsay and Joshua Reynolds (see IIB4 and 9), but it was also well enough regarded to go into German and Italian editions (in 1754 and 1761 respectively). In his preface, Hogarth claims that 'mere men of letters' (he probably had in mind figures such as Shaftesbury and Hutcheson), are incapable of grasping beauty in painting, and that practical knowledge is required for a proper treatment of the subject. His main claim is that grace is the property of compositions employing a 'serpentine line', and that even though this quality is to be found in the best works of Antiquity and the Renaissance, nonetheless the achievement of beauty in art arises from the study of nature, not the following of academic authority. The self-portrait he mentions, inclusive of the serpentine line, is now in the collection of the Tate Gallery, London. Hogarth's closing remark about the serpentine line mentions the Italian concept of *il poco piu*, 'the little more'. This notion, derived from music, was part of the discourse of 'grace' and the *je ne sais quoi* (see ID passim). Our selections are taken from the preface, the introduction, and chapters VII, IX and X of *The Analysis of Beauty*, edited with an Introduction and Notes by Ronald Paulson, New Haven and London: Yale University Press, 1997, pp. 1–6, 17–19, 41–2, 48–9, 50–6. We have included a small number of Hogarth's illustrations, retaining his original numbering.

Preface

If a preface was ever necessary, it may very likely be thought so to the following work; the title of which (in the proposals publish'd some time since) hath much amused, and raised the expectation of the curious, though not without a mixture of doubt, that its purport could ever be satisfactorily answered. For though beauty is seen and confessed by all, yet, from the many fruitless attempts to account for the cause of its being so, enquiries on this head have almost been given up; and the subject generally thought to be a matter of too high and too delicate a nature to admit of any true or intelligible discussion. Something therefore introductory ought to be said at the presenting a work with a face so entirely new; especially as it will naturally encounter with, and perhaps may overthrow, several long received and thorough establish'd opinions: and since controversies may arise how far, and after what manner this subject hath hitherto been consider'd and treated, it will also be proper to lay before the reader, what may be gathered concerning it, from the works of the ancient and modern writers and painters.

It is no wonder this subject should have so long been thought inexplicable, since the nature of many parts of it cannot possibly come within the reach of mere men of letters; otherwise those ingenious gentlemen who have lately published treatises upon it (and who have written much more learnedly than can be expected from one who never took up the pen before) would not so soon have been bewildr'd in their accounts of it, and oblig'd so suddenly to turn into the broad, and more beaten path of moral beauty; in order to extricate themselves out of the difficulties they seem to

have met with in this: and withal forced for the same reasons to amuse their readers with amazing (but often misapplied) encomiums on deceased painters and their performances; wherein they are continually discoursing of effects instead of developing causes; and after many prettinesses, in very pleasing language, do fairly set you down just where they first took you up; honestly confessing that as to GRACE, the main point in question, they do not even pretend to know any thing of the matter. And indeed how should they? when it actually requires a practical knowledge of the whole art of painting (sculpture alone not being sufficient) and that too to some degree of eminence, in order to enable any one to pursue the chain of this enquiry through all its parts: which I hope will be made to appear in the following work.

It will then naturally be asked, why the best painters within these two centuries, who by their works appear to have excelled in grace and beauty, should have been so silent in an affair of such seeming importance to the imitative arts and their own honour? to which I answer, that it is probable, they arrived at that excellence in their works, by the mere dint of imitating with great exactness the beauties of nature, and by often copying and retaining strong ideas of graceful antique statues; which might sufficiently serve their purposes as painters, without their troubling themselves with a farther enquiry into the particular causes of the effects before them. It is not indeed a little strange, that the great Leonardo da Vinci (amongst the many philosophical precepts which he hath at random laid down in his treatise on painting) should not have given the least hint of any thing tending to a system of this kind; especially, as he was cotemporary with Michael Angelo, who is said to have discover'd a certain principle in the trunk only of an antique stature, (well known from this circumstance by the name of Michael Angelo's Torso, or Back,) which principle gave his works a grandeur of gusto equal to the best antiques. Relative to which tradition, Lomazzo who wrote about painting at the same time, hath this remarkable passage:

'And because in this place there falleth out a certaine precept of *Michael Angelo* much for our purpose, I will not conceale it, leaving the farther interpretation and understanding thereof to the judicious reader. It is reported then that *Michael Angelo* upon a time gave this observation to the Painter *Marcus de Sciena* his scholler; *that he should alwaies make a figure Pyramidall, Serpentlike, and multiplied by one two and three.* In which precept (in mine opinion) the whole mysterie of the arte consisteth. For the greatest grace and life that a picture can have, is, that it expresse *Motion*: which the Painters call the *spirite* of a picture: Nowe there is no forme so fitte to expresse this *motion*, as that of the flame of fire, which according to *Aristotle* and the other Philosophers, is an elemente most active of all others: because the forme of the flame thereof is most apt for motion: for it hath a *Conus* or sharpe pointe wherewith it seemeth to divide the aire, that so it may ascende to his proper sphere. So that a picture having this forme will bee most beautifull.'

Many writers since Lomazzo have in the same words recommended the observing this rule also; without comprehending the meaning of it: for unless it were known systematically, the whole business of grace could not be understood.

Du Fresnoy, in his art of painting, says 'large flowing, gliding outlines which are in waves, give not only a grace to the part, but to the whole body; as we see in the Antinous, and in many other of the antique figures: a fine figure and its parts ought always to have a serpent-like and flaming form: naturally those sort of lines have I

know not what of life and seeming motion in them, which very much resembles the activity of the flame and of the serpent.' Now if he had understood what he had said, he could not, speaking of grace, have expressed himself in the following contradictory manner. – 'But to say the truth, this is a difficult undertaking, and a rare present, which the artist rather receives from the hand of heaven than from his own industry and studies.' But De Piles, in his lives of the painters, is still more contradictory, where he says, 'that a painter can only have it (meaning grace) from nature, and doth not know that he hath it, nor in what degree, nor how he communicates it to his works: and that grace and beauty are two different things; beauty pleases by the rules, and grace without them.'

All the English writers on this subject have echoed these passages; hence *Je ne sçai quoi*, is become a fashionable phrase for grace.

By this it is plain, that this precept which Michael Angelo deliver'd so long ago in an oracle-like manner, hath remain'd mysterious down to this time, for ought that has appear'd to the contrary. The wonder that it should do so will in some measure lessen when we come to consider that it must all along have appeared as full of contradiction as the most obscure quibble ever deliver'd at Delphos, because, *winding lines are as often the cause of deformity as of grace*. [...]

There are also strong prejudices in favour of straight lines, as constituting true beauty in the human form, where they never should appear. A middling connoisseur thinks no profile has beauty without a very straight nose, and if the forehead be continued straight with it, he thinks it is still more sublime. I have seen miserable scratches with the pen, sell at a considerable rate for only having in them a side face or two... The common notion that a person should be straight as an arrow, and perfectly erect is of this kind. If a dancing-master were to see his scholar in the easy and gracefully-turned attitude of the Antinous, he would cry shame on him, and tell him he looked as crooked as a ram's horn, and bid him hold up his head as he himself did.

The painters, in like manner, by their works, seem to be no less divided upon the subject than the authors. The French, except such as have imitated the antique, or the Italian school, seem to have studiously avoided the serpentine line in all their pictures, especially Anthony Coypel, history painter, and Rigaud, principal portrait painter to Lewis the 14th.

Rubens, whose manner of designing was quite original, made use of a large flowing line as a principle, which runs through all his works, and gives a noble spirit to them; but he did not seem to be acquainted with what we call the *precise line*; which hereafter we shall be very particular upon, and which gives the delicacy we see in the best Italian masters; but he rather charged his contours in general with too bold and S-like swellings.

Raphael, from a straight and stiff manner, on a sudden changed his taste of lines at sight of Michael Angelo's works, and the antique statues; and so fond was he of the serpentine line, that he carried it into a ridiculous excess, particularly in his draperies: though his great observance of nature suffer'd him not long to continue in this mistake.

Peter de Cortone form'd a fine manner in his draperies of this line.

We see this principle no where better understood than in some pictures of Corregio, particularly his Juno and Ixion: yet the proportions of his figures are sometimes such as might be corrected by a common sign painter.

Whilst Albert Durer, who drew mathematically, never so much as deviated into grace, which he must sometimes have done in copying the life, if he had not been fetter'd with his own impracticable rules of proportion.

But that which may have puzzled this matter most, may be, that Vandyke, one of the best portrait painters in most respects ever known, plainly appears not to have had a thought of this kind. For there seems not to be the least grace in his pictures more than what the life chanced to bring before him. [...]

Nor have the painters of the present times been less uncertain and contradictory to each other, than the masters already mentioned, whatever they may pretend to the contrary: of this I had a mind to be certain, and therefore, in the year 1745, published a frontispiece to my engraved works, in which I drew a serpentine line lying on a painter's pallet, with these words under it, THE LINE OF BEAUTY. [...]

Introduction

[...] I must confess, I have but little hopes of having a favourable attention given to my design in general, by those who have already had a more fashionable introduction into the mysteries of the arts of painting, and sculpture. Much less do I expect, or in truth desire, the countenance of that set of people, who have an interest in exploding any kind of doctrine, that may teach us to *see with our own eyes*. [...]

To those, then, whose judgments are unprejudiced, this little work is submitted with most pleasure; because it is from such that I have hitherto received the most obligations, and now have reason to expect most candour.

Therefore I would fain have such of my readers be assured, that however they may have been aw'd, and over-born by pompous terms of art, hard names, and the parade of seemingly magnificent collections of pictures and statues; they are in a much fairer way, ladies, as well as gentlemen, of gaining a perfect knowledge of the elegant and beautiful in artificial, as well as natural forms, by considering them in a systematical, but at the same time familiar way, than those who have been prepossess'd by dogmatic rules, taken from the performances of art only: nay, I will venture to say, sooner, and more rationally, than even a tolerable painter, who has imbibed the same prejudices.

The more prevailing the notion may be, that painters and connoisseurs are the only competent judges of things of this sort; the more it becomes necessary to clear up and confirm, as much as possible, what has only been asserted in the foregoing paragraph: that no one may be deterr'd, by the want of such previous knowledge, from entering into this enquiry.

The reason why gentlemen, who have been inquisitive after knowledge in pictures, have their eyes less qualified for our purpose, than others, is because their thoughts have been entirely and continually employ'd and incumber'd with considering and retaining the various *manners* in which pictures are painted, the histories, names, and characters of the masters, together with many other little circumstances belonging to

the mechanical part of the art; and little or no time has been given for perfecting the ideas they ought to have in their minds, of the objects themselves in nature: for by having thus espoused and adopted their first notions from nothing but *imitations*, and becoming too often as bigotted to their faults, as their beauties, they at length, in a manner, totally neglect, or at least disregard the works of nature, merely because they do not tally with what their minds are so strongly prepossess'd with. [...]

VII Of lines

[...] The constant use made of lines by mathematicians, as well as painters, in describing things upon paper, hath establish'd a conception of them, as if actually existing on the real forms themselves. This likewise we suppose, and shall set out with saying in general – That *the straight line*, and *the circular line*, together with their different combinations, and variations, &c. bound, and circumscribe all visible objects whatsoever, thereby producing such endless variety of forms, as lays us under the necessity of dividing, and distinguishing them into general classes; leaving the intervening mixtures of appearances to the reader's own farther observation.

First, [fig. 23] objects composed of straight lines only, as the cube, or of circular lines, as the sphere, or of both together, as cylinders and cones, &c.

Secondly, [fig. 24] those composed of straight lines, circular lines, and of lines partly straight, and partly circular, as the capitals of columns, and vases, &c.

Thirdly, [fig. 25] those composed of all the former together with an addition of the waving line, which is a line more productive of beauty than any of the former, as in flowers, and other forms of the ornamental kind: for which reason we shall call it the line of beauty.

Fourthly, [fig. 26] those composed of all the former together with the serpentine line, as the human form, which line hath the power of super-adding grace to beauty. Note, forms of most grace have least of the straight line in them.

It is to be observed, that straight lines vary only in length, and therefore are least ornamental.

That curved lines as they can be varied in their degrees of curvature as well as in their lengths, begin on that account to be ornamental.

That straight and curv'd lines join'd, being a compound line, vary more than curves alone, and so become somewhat more ornamental.

That the waving line, or line of beauty, varying still more, being composed of two curves contrasted, becomes still more ornamental and pleasing, insomuch that the hand takes a lively movement in making it with pen or pencil.

And that the serpentine line, by its waving and winding at the same time different ways, leads the eye in a pleasing manner along the continuity of its variety, if I may be allowed the expression; and which by its twisting so many different ways, may be said to inclose (tho' but a single line) varied contents; and therefore all its variety cannot be express'd on paper by one continued line, without the assistance of the imagination, or the help of a figure [see fig. 26]; where that sort of proportion'd, winding line, which will hereafter be call'd the precise serpentine line, or *line of grace*, is represented by a fine wire, properly twisted round the elegant and varied figure of a cone.

IX Of Composition with the Waving-Line

There is scarce a room in any house whatever, where one does not see the waving-line employ'd in some way or other. How inelegant would the shapes of all our moveables be without it? how very plain and unornamental the mouldings of cornices, and chimney-pieces, without the variety introduced by the *ogee* member, which is entirely composed of waving-lines.

Though all sorts of waving-lines are ornamental, when properly applied; yet, strictly speaking, there is but one precise line, properly to be called the line of *beauty*, which in the scale of them [fig. 49] is number 4: the lines 5, 6, 7, by their bulging too much in their curvature becoming gross and clumsy; and, on the contrary, 3, 2, 1, as they straighten, becoming mean and poor; as will appear in the next figure [50], where they are applied to the legs of chairs.

A still more perfect idea of the effects of the precise waving-line, and of those lines that deviate from it, may be conceived by the row of stays, figure [53], where number 4 is composed of precise waving-lines, and is therefore the best shaped stay. Every whale-bone of a good stay must be made to bend in this manner: for the whole stay, when put close together behind, is truly a shell of well-varied contents, and its surface of course a fine form; so that if a line, or the lace were to be drawn, or brought from the top of the lacing of the stay behind, round the body, and down to the bottom peak of the stomacher; it would form such a perfect, precise, serpentine-line, as has been shewn, round the cone, figure 26.—For this reason all ornaments obliquely contrasting the body in this manner, as the ribbons worn by the knights of the garter, are both genteel and graceful. The numbers 5, 6, 7, and 3, 2, 1, are deviations into stiffness and meanness on one hand, and clumsiness and deformity on the other. The reasons for which disagreeable effects, after what has been already said, will be evident to the meanest capacity.

It may be worth our notice however, that the stay, number 2, would better fit a well-shaped man than number 4; and that number 4, would better fit a well-form'd woman, than number 2; and when on considering them, merely as to their forms, and comparing them together as you would do two vases, it has been shewn by our principles, how much finer and more beautiful number 4 is, than number 2: does not this our determination enhance the merit of these principles, as it proves at the same time how much the form of a woman's body surpasses in beauty that of a man?

From the examples that have been given, enough may be gathered to carry on our observations from them to any other objects that may chance to come in our way, either animate or inanimate; so that we may not only *lineally* account for the ugliness of the toad, the hog, the bear and the spider, which are totally void of this waving-line, but also for the different degrees of beauty belonging to those objects that possess it.

X Of Compositions with the Serpentine-Line

The very great difficulty there is in describing this line, either in words, or by the pencil (as was hinted before, when I first mention'd it) will make it necessary for me to proceed very slowly in what I have to say in this chapter, and to beg the reader's patience whilst I lead him step by step into the knowledge of what I think the sublime in form, so remarkably display'd in the human body; in which, I believe, when he is once acquainted with the idea of them, he will find this species of lines to be principally concern'd.

First, then, let him consider fig. 56, which represents a straight horn, with its contents, and he will find, as it varies like the cone, it is a form of some beauty, merely on that account.

Next let him observe in what manner, and in what degree the beauty of this horn is increas'd, [in fig. 57], where it is supposed to be bent two different ways.

And lastly, let him attend to the vast increase of beauty, even to grace and elegance, in the same horn, [fig. 58], where it is supposed to have been twisted round, at the same time, that it was bent two different ways. [...]

I have chosen this simple example, as the easiest way of giving a plain and general idea of the peculiar qualities of these serpentine-lines, and the advantages of bringing them into compositions, where the contents you are to express, admit of grace and elegance.

And I beg the same things may be understood of these serpentine-lines, that I have said before of the waving-lines. For as among the vast variety of waving-lines that may be conceiv'd, there is but one that truly deserves the name of *the line of beauty*, so there is only one precise serpentine-line that I call *the line of grace*. Yet, even when they are made too bulging, or too tapering, though they certainly lose of their beauty and grace, they do not become so wholly void of it, as not to be of excellent service in compositions, where beauty and grace are not particularly design'd to be express'd in their greatest perfection.

Though I have distinguish'd these lines so particularly as to give them the titles of *the lines of beauty and grace*, I mean that the use and application of them should still be confined by the principles I have laid down for composition in general; and that they should be judiciously mixt and combined with one another, and even with those I may term *plain* lines, (in opposition to these) as the subject in hand requires. Thus the cornu-copia, [fig. 59], is twisted and bent after the same manner, as the last figure of the horn; but more ornamented, and with a greater number of other lines of the same twisted kind, winding round it with as quick returns as those of a screw. [. . .]

Almost all the muscles, and bones, of which the human form is composed, have more, or less of these kind of twists in them; and give in a less degree, the same kind of appearance to the parts which cover them, and are the immediate object of the eye: and for this reason it is that I have been so particular in describing these forms of the bent, and twisted, and ornamented horn.

There is scarce a straight bone in the whole body. Almost all of them are not only bent different ways, but have a kind of twist, which in some of them is very graceful; and the muscles annex'd to them, tho' they are of various shapes, appropriated to their particular uses, generally have their component fibres running in these serpentine-lines, surrounding and conforming themselves to the varied shape of the bones they belong to: more especially in the limbs. Anatomists are so satisfied of this, that they take a pleasure in distinguishing their several beauties. I shall only instance in the thigh-bone, and those about the hips.

The thigh-bone [fig. 62] has the waving and twisted turn of the horn, 58: but the beautiful bones adjoining, call'd the ossa innominata [fig. 60], have, with greater variety, the same turns and twists of that horn when it is cut; and its inner and outward surfaces are exposed to the eye.

How ornamental these bones appear, when the prejudice we conceive against them, as being part of a skeleton, is taken off, by adding a little foliage to them, may be seen in fig. [61],—such shell-like winding forms, mixt with foliage, twisting about them, are made use of in all ornaments; a kind of composition calculated merely to please the eye. Divest these of their serpentine twinings and they immediately lose all grace, and return to the poor gothic taste they were in an hundred years ago [fig. 63].

Fig. [64] is meant to represent the manner, in which most of the muscles, (those of the limbs in particular) are twisted round the bones, and conform themselves to their

length and shape; but with no anatomical exactness. As to the running of their fibres, some anatomists have compared them to skains of thread, loose in the middle, and tight at each end, which, when they are thus consider'd as twisted contrary ways round the bone, gives the strongest idea possible of a composition of serpentine-lines. [...]

I cannot be too long, I think, on this subject, as so much will be found to depend upon it; and therefore shall endeavour to give a clear idea of the different effect such anatomical figures have on the eye, from what the same parts have, when cover'd by the fat and skin; by supposing a small wire (that has lost its spring and so will retain every shape it is twisted into) to be held fast to the out-side of the hip and thence brought down the other side of the thigh obliquely over the calf of the leg, down to the outward angle (all the while press'd so close as to touch and conform itself to the shape of every muscle it passes over) and then to be taken off. If this wire be now examined it will be found that the general uninterrupted flowing twist, which the winding round the limbs would otherwise have given to it, is broke into little better than so many separate plain curves, by the sharp indentures it every where has receiv'd on being closely press'd in between the muscles.

Suppose, in the next place, such a wire was in the same manner twisted round a living well-shaped leg and thigh, or those of a fine statue; when you take it off you will find no such sharp indentures, nor any of those regular *engralings* (as the heralds express it) which displeas'd the eye before. On the contrary, you will see how *gradually* the changes in its shape are produced; how imperceptibly the different curvatures run into each other, and how easily the eye glides along the varied wavings of its sweep. To enforce this still further, if a line was to be drawn by a pencil exactly where these wires have been supposed to pass, the point of the pencil, in the muscular leg and thigh, would perpetually meet with stops and rubs, whilst in the others it would flow from muscle to muscle along the elastic skin, as pleasantly as the lightest skiff dances over the gentlest wave.

This idea of the wire, retaining thus the shape of the parts it passes over, seems of so much consequence, that I would by no means have it forgot; as it may properly be consider'd as one of the threads (or outlines) of the shell (or external surface) of the human form: and the frequently recurring to it will assist the imagination in its

conceptions of those parts of it, whose shapes are most intricately varied: for the same sort of observations may be made, with equal justice, on the shapes of ever so many such wires twisted in the same manner in ever so many directions over every part of a well made man, woman, or statue.

And if the reader will follow in his imagination the most exquisite turns of the chissel in the hands of a master, when he is putting the finishing touches to a statue; he will soon be led to understand what it is the real judges expect from the hand of such a master, which the Italians call, the little more, *Il poco piu*, and which in reality distinguishes the original master-pieces at Rome from even the best copies of them.

4 Allan Ramsay (1713–1784) ‘Dialogue on Taste’

A son of the Scottish poet Allan Ramsay, Ramsay the Younger rose to become the leading portraitist of his generation and Principal Painter to the King, George III. Throughout his career he made extended trips to Rome (1736–8, 1754–7, 1775–7 and 1782–4), but despite a thorough grounding in classical principles, his work from the mid-century onwards was characterized by a refreshing commitment to naturalism. As well as his royal commissions, he painted enduring portraits of leading intellectual figures of the day, including David Hume and Jean-Jacques Rousseau (both painted in 1766, and now in the collections of the Scottish National Portrait Gallery and the National Gallery of Scotland, Edinburgh, respectively). His *Dialogue on Taste* was composed during his third period in Rome, and was first published as a pamphlet in London in 1755. Set at the country seat of Lord Modish, it takes the form of a conversation between the slightly dim-witted and fashion-conscious aristocrat, his rather more acute wife Lady Modish, her sister Lady Harriot, and their no-nonsense friend Colonel Freeman. The discussion turns on a distinction between taste and judgement. Through his empirically minded protagonist Freeman, Ramsay argues that taste is subjective and beauty relative (against, amongst others, Shaftesbury and Hogarth, see IIB2 and IIB3). The reason for a broad consensus about what is or is not good in art – as opposed to food, drink, clothing, etc. – is that whereas the exercise of taste is purely subjective, in art there is an objective standard available, namely imitation. Thus, evaluating art is strictly speaking a matter of judgement, a mental operation involving comparison of the picture with its original, rather than of taste as such. For Ramsay, where non-imitative arts like music are concerned, subjective pleasure reigns, and dispute on that ‘must be no less absurd than when cookery is the subject of controversy’. Our extracts are taken from the text as printed in *The Investigator*, number CCCXXII, London: A. Millar, 1755, pp. 3–11, 28–9, 54–8.

LORD MODISH: And so you prefer HUDIBRAS to VIRGIL?

COL. FREEMAN: I do indeed, my Lord.

LORD MODISH: But why, my noble Colonel?

COL. FREEMAN: Because he gives me most pleasure.

LORD MODISH: Then allow me to tell you, George, you are with all your reading an absolute Goth, and have no manner of taste.

COL. FREEMAN: So you told me last night, my Lord, when I preferred Canary to Champagne.

LORD MODISH: No doubt, for that was just such another instance of your Gothickness.

COL. FREEMAN: I agree with your Lordship that the eases are very parallel, and for that reason I mention your last night's observation. The word taste originally belongs to the palate, and it is not amiss to have that always in view, when we suspect a misapplication of it in the way of metaphor. It is by taste, no doubt, that we are able to distinguish salt from sugar, and mustard from apple-pie, its proper office being upon all such occasions to inform us what is what. But allow me to ask your Lordship, why you said I had no taste in wine, when it was plain, by my preference of one of the bottles, that I could very well distinguish it from the rest.

LORD MODISH: You certainly now affect to misunderstand me. By saying you had no taste, I did not mean that you was not capable of distinguishing, but, according to the usual application of the phrase, that you had a bad taste, and preferred the worst.

COL. FREEMAN: This is, my Lord, an application of the word taste, that, however usual, somewhat deviates from its original and proper sense. For, according to that, good taste can signify no more than a greater than ordinary accuracy in determining, in certain cases, that two separate things are of the same or of different kinds, and when of different kinds in assigning the proper name to each. Take a man so endowed into your cellar, and without seeing the labels, he will tell you not only that this hogshead is Port and that Claret, but amongst the Clarets that this is of such a growth and such a year, that of such another. I am very sensible that your Lordship's application of the phrase is nevertheless usual: but if all the phrases that convey no distinct and uniform meaning were banished out of the world, we should be deprived, among the rest, of a great many that are very usual and fashionable. But, a propos of our last night's liquor, did you mean by the worst the least wholesome? If so, I am afraid my taste can hardly be defended.

LORD MODISH: No, faith; I believe the Champaign is the worst of the two in that respect. No; I meant that which had the worst flavour.

COL. FREEMAN: Then I suppose you think me insincere in my declaration of liking Canary.

LORD MODISH: I have known you too long, George, to lay insincerity to your charge. No; I make no doubt of your having really a very bad taste in your potations.

COL. FREEMAN: You mean, then, I dare say, that it is not your taste.

LORD MODISH: No; nor of any of your acquaintances, I'll be sworn.

COL. FREEMAN: So then the goodness or badness of one's taste is to be determined by the taste of the majority.

LORD MODISH: Certainly; and were it otherwise what confusion must ensue? for when men are to drink jovially together, it is highly reasonable that the few should yield in the choice of the liquor to the many.

COL. FREEMAN: My Lord, I will allow your consequence: But what necessity is there for this society in drink, by which the conformity becomes necessary? When soldiers are to attack the enemy, such an union must be absolutely necessary; else one platoon might retire whilst another advanced. It is no less necessary where more pacific people are met to dance country dances; else the man might be footing corners whilst his partner was figuring in. Unless all fight and dance with one accord, the purposes of fighting and dancing would be entirely frustrated. But

there is nothing in the nature of drinking, that hinders it from being performed as effectually, and to as good purpose, by a single person, as by one that has thirty legions at his command. When you can make it appear that a man ought to take physic because his companion is sick, or to drink because he is dry, it may then appear reasonable in him to drink of a particular kind of liquor because his companions happen to be pleased with the flavour of it. An extraordinary stretch of complaisance, from which no person seems to reap any advantage. For my own part, I profess myself an entire friend to toleration and liberty of conscience, and think it little better than popery and the inquisition to compel any man to swallow what goes against his stomach, on pretence of preserving unity in public drinking.

LORD MODISH: Thou art an odd fellow, George, that is certain.

COL. FREEMAN: I am indeed, my Lord; for I always deliver my own sentiments, and in my own words.

LORD MODISH: So then you reckon religion and drinking to be of the same nature. I think I have known you sometimes more lucky in your comparisons.

COL. FREEMAN: I don't pretend, my Lord, that the parallel will hold in every respect; but with regard to the subject of our present conversation they are certainly very much akin: being both matters of private concern and advantage only; and, of course, the objects only of taste or private opinion. But when I speak of religion, I would be understood of what is speculative and ritual, and not at all of the moral duties: So when I speak of drinking, I mean drinking for pleasure, without taking any of its medicinal effects into consideration, for as by these society may be affected, they are very properly the objects of general concern and enquiry.

LORD MODISH: Then you don't allow the moral duties to be the objects of taste. My Lord Shaftesbury is of a very different opinion.

COL. FREEMAN: That may be; but his Lordship stands not for divine authority with me. I know, my Lord, that there has been much unfortunate pains employed, by many authors from Plato down to Sir Harry Beaumont, in order to confound the objects of judgment with those of taste and feeling; than which nothing can be more vulgar and unphilosophical.

LORD MODISH: I fancy it is not an easy matter to separate them; and, as I know you have turned your mind pretty much to such enquiries, I should be glad to know what touchstone you recommend for that purpose.

COL. FREEMAN: It does not appear to me so difficult as it seems to those refined philosophers; and thus I distinguish them. Whatever has a rule or standard to which it may be referred, and is capable of comparison, is not the object of taste, but of reason and judgment. The proper objects of taste or feeling are such as are relative to the person only who is actuated by them, who is the sole judge whether those feelings be agreeable or otherwise; and being informed of this simple fact from himself, no farther consequence can be drawn from it, neither does it admit of any dispute. Thus when a man tells me that venison eats better with currant than with gravy sauce, he only informs me of his private opinion concerning it. It admits of no reasoning, pro or con. There it must rest, and he must have the like patience to hear me, in my turn, declare that gravy sauce is far before currant; and this without making any reply, if he has a grain of sense. It is quite otherwise when either he or I assert that Westminster hall is longer than Westminster bridge, or

that oak is specifically heavier than copper; for in each of those cases there is a standard to apply, to wit, a foot rule in one case, and a pair of scales in the other, which entirely exclude opinion from having any share in the debate. With regard to one thing's being comparatively better than another, there is likewise a standard of another kind, which leaves the preference to be decided by the judgment; and that is the relation which such things bear to the use for which they are both supposed to be intended. As for instance, if it should become the subject of enquiry which of two swords is the best, the intention of fighting being supposed, the preference will be reasonably given to that which by its superior strength, lightness, sharpness, and perhaps length, is the fittest for fight. If for the same purpose the comparison happens between a sword and a pair of scissars, the preference will no doubt fall to the sword for very obvious reasons. But vary the circumstances of the intended combat, and explain that it is not to be fought in a field, but in a post chaise or a centry box, and you will be obliged to rejudge the cause by a new standard, which will infallibly declare a pair of scissars to be a more fatal, and consequently a better, weapon than any Toledo in the world. It is possible, by thus supposing certain circumstances, to bring the most different and most remote objects in nature to be compared by a common standard; but where this is not provided, reason must be pleased to leave the bench, and refer the matter entirely to taste, or private inclination. [...]

LORD MODISH: I must own, Colonel, that the notion of an universal standard for the beauty of natural objects, would be very contradictory to that almost self-evident truth, that whatever is is right; since in the great variety of forms which God has contrived, the benign end of pleasing would have been frustrated, if he had not ordained a like variety to exist in the apprehensions and feelings of different men and different animals concerning those things.

COL. FREEMAN: It is most certainly so, my Lord; and it is surprizing that so many ingenious men should have lost their time in a search, the vanity of which is so obvious. Hogarth owns that his line of beauty and grace is not to be seen in a toad; which if true, ought to have convinced him, either that there was no such line, or universal receipt for beauty; or else that he had not yet hit upon it: since it hardly admits of a doubt, that a blooming she toad is the most beautiful sight in the creation, to all the crawling young gentlemen of her acquaintance; and that her crawl, or as they may possibly call it, her *pas grave*, is far before the minuet step, with all its wavings. An analysis or dissection can never be begun of any subject till the subject itself is ascertained, and consequently no analysis can be made of abstract beauty, nor of any abstraction whatsoever. Till a real something is discovered, which we are sure by experience is universally the source of pleasure, any attempt to discover the universal principle of pleasure by analysis must be fruitless; and the philosopher who engages in such a business, after finding that he has been gravely measuring a dream with a pair of compasses, will probably return at last to the *je ne scay quoy*, upon which he had at first disdainfully turned his back. [...]

LORD MODISH: I begin to be afraid that taste, at last, must content himself with ruling over the finer arts. There I think you will hardly try to pull him from his throne.

COL. FREEMAN: What arts does your Lordship comprehend under that title?

LORD MODISH: Musick, poetry, and painting; or, as they call them, the sister arts,

COL. FREEMAN: I know they are often so called; and indeed there is so great a likeness betwixt two of them, poetry and painting, that their sisterhood will be readily allowed: but betwixt musick and painting there is no likeness at all; and I am apt to suspect that musick passes for the sister of poetry, rather from their being often seen in company, than from any resemblance they bear to each other. For this reason, when I examine how far taste is concerned in these arts, I shall consider musick by itself. But either the distinction betwixt taste and judgment, which I gave your Lordship some time ago, is false, or else taste is totally excluded from being a determiner in works of art, and must leave that talk for judgment to perform. An art has been thus defined by one of the most sagacious of the ancients, *a system of rules acquired by study, and reduced to practice, for some usefull purpose.* Now wherever there is a rule or rules, by which any work is supposed to be conducted, that rule, being known, must serve equally for a standard to those who would determine with propriety concerning its merit or degree of excellence. An art, then, and whatever pretends to a standard, is an object of judgment and not of taste. As to musick, it is certainly an art, so far as geometry is concerned in it; but as the mathematical part of musick is totally unknown to 999 in a thousand of those who set up for connoisseurs in musick, including the performers, we may venture to say that it is, with regard to them, no art at all. These virtuosos, therefore, have nothing but their own taste, that is, their own private liking, to set up for a standard, or, what is little more mathematical, the liking which those of their club, city, or nation have acquired by habit, that is, by the daily repetition of a certain strain of musick. What disputes therefore happen upon that subject must be no less absurd, than when cookery is the subject of controversy. With regard to the sister arts of painting and poetry, the case is very different: for in these arts there is not only a standard, but one so level to the common sense of mankind, that the most ignorant are acquainted with it; and, if it is unknown or mistaken by any, it is by the half-learned, who from their own conceit, or a respect for the authority of coxcombs, have tried to undervalue common sense, in order to substitute something which they thought better, in its stead.

LORD MODISH: There is no doubt, Colonel, that there are rules for poetry and painting, and that there have been many ingenious books written both in prose and verse concerning these rules. But I fancy they are not so universally known as you would have us believe.

COL. FREEMAN: Pardon me, my Lord; I have reason to be convinced by a thousand experiments, that the leading principle of criticism in poetry and painting, and that of all the learned principles which is the most unexceptionably true, is known to the lowest and most illiterate of the people. Those experiments are easily made. Your Lordship has only to hide yourself behind the screen in your drawing-room, and order Mrs. Hannah to bring in one of your tenant's daughters, and I will venture to lay a wager that she shall be struck with your picture by La Tour, and no less with the view of your seat by Lambert, and shall, fifty to one, express her approbation by saying, they are vastly natural. When she has said this, she has shewn that she knew the proper standard, by which her approbation was to be directed, as much, at least, as she would have done, if she had got Aristotle by heart

and all his commentators. He has defined those arts, arts of imitation, and his definition, though often obscured and confounded by more modern connoisseurs, has never been contradicted by any. The same country girl, who applauds the exact representation of a man and a house which she has seen, will, for the same reason, be charmed with Hogarth's march to Finchly, as that is a representation, though not of persons, yet of general manners and characters, with which we may suppose her to be acquainted. And if she is less struck with the historical pictures of distant ages and countries, though equally well painted, it is not because her critical standard is not equally applicable to them, but because the subject and manners, there meant to be represented, are to her unknown, and must pass with as little observation and remark as a good portrait of a person whom she had never seen. In all this I see no pretension taste has to be consulted. It requires first eyes to see, and then judgment to compare the exhibited image with that of the absent object, which is stored up in the remembrance, and is plainly a reflective and compound operation of the mind. It is indeed so quick and instantaneous, that it often passes for a simple feeling or sentiment; and is sometimes mentioned as such by criticks of no mean reputation, for want of having considered the nature of the mental faculties with that accuracy which they deserve. The general standard of poetry is exactly the same, and equally obvious with that of painting, and any experiment you make in that art upon a farmer's daughter, will be found to have a like event.

5 David Hume (1711–1776) 'Of the Standard of Taste'

The Scottish essayist, philosopher and historian David Hume was born in Edinburgh into a Calvinist family. He attended Edinburgh University where he studied classics, mathematics and philosophy. His *Treatise of Human Nature* was composed in his early twenties at La Flèche in France, but failed to make any impact. According to Hume's own account of his life, it 'fell dead-born from the press'. However, in 1748 he published a more popular and lively account of his ideas, *An Enquiry concerning Human Understanding*, which received a much greater measure of success. Hume sought to extend the scientific understanding of the natural world into a new domain of inquiry – human nature. The 'science of man' should be founded on experience and observation. It consisted of three parts, devoted to the 'understanding', the 'passions', and 'morals'. Hume was one of the consummate stylists of the eighteenth century, and his essays on moral, literary and political subjects were warmly received both in Britain and on the Continent. His essay 'Of the Standard of Taste' has long been recognized as one of the most important contributions to the subject. Though strongly influenced by Hutcheson's doctrine of an 'inner sense' of beauty (see IIB7), Hume maintains that we must first 'pave the way' if we are to experience the right sensation. The sentiments which arise in us in answer to works of art are educable and responsive to reasoning. Indeed, in matters of taste we should recognize the superiority of those who have the most refined powers of discrimination and the greatest practice in judging works of art. 'Of the Standard of Taste' was first published in 1757 as one of Hume's *Four Dissertations*. It was then incorporated in volume 1 of the 1758 edition of his *Essays and Treatises on Several Subjects*, 'Essays, Moral, Political, and Literary'. We have used the edition edited by Eugene F. Miller, based on the posthumous 1777 edition, which

incorporates all of Hume's changes and corrections, *Essays, Moral, Political, and Literary*, Indianapolis: Liberty Classics, 1985, pp. 226-7, 229-44.

The great variety of Taste, as well as of opinion, which prevails in the world, is too obvious not to have fallen under every one's observation. Men of the most confined knowledge are able to remark a difference of taste in the narrow circle of their acquaintance, even where the persons have been educated under the same government, and have early imbibed the same prejudices. But those, who can enlarge their view to contemplate distant nations and remote ages, are still more surprized at the great inconsistency and contrariety. We are apt to call *barbarous* whatever departs widely from our own taste and apprehension: But soon find the epithet of reproach retorted on us. And the highest arrogance and self-conceit is at last startled, on observing an equal assurance on all sides, and scruples, amidst such a contest of sentiment, to pronounce positively in its own favour.

As this variety of taste is obvious to the most careless enquirer; so will it be found, on examination, to be still greater in reality than in appearance. The sentiments of men often differ with regard to beauty and deformity of all kinds, even while their general discourse is the same. There are certain terms in every language, which import blame, and others praise; and all men, who use the same tongue, must agree in their application of them. Every voice is united in applauding elegance, propriety, simplicity, spirit in writing; and in blaming fustian, affectation, coldness, and a false brilliancy: But when critics come to particulars, this seeming unanimity vanishes; and it is found, that they had affixed a very different meaning to their expressions. In all matters of opinion and science, the case is opposite: The difference among men is there oftener found to lie in generals than in particulars; and to be less in reality than in appearance. An explanation of the terms commonly ends the controversy; and the disputants are surprized to find, that they had been quarrelling, while at bottom they agreed in their judgment.

* * *

It is natural for us to seek a *Standard of Taste*; a rule, by which the various sentiments of men may be reconciled; at least, a decision, afforded, confirming one sentiment, and condemning another.

There is a species of philosophy, which cuts off all hopes of success in such an attempt, and represents the impossibility of ever attaining any standard of taste. The difference, it is said, is very wide between judgment and sentiment.

All sentiment is right; because sentiment has a reference to nothing beyond itself, and is always real, wherever a man is conscious of it. But all determinations of the understanding are not right; because they have a reference to something beyond themselves, to wit, real matter of fact; and are not always conformable to that standard. Among a thousand different opinions which different men may entertain of the same subject, there is one, and but one, that is just and true; and the only difficulty is to fix and ascertain it. On the contrary, a thousand different sentiments, excited by the same object, are all right: Because no sentiment represents what is really in the object. It only marks a certain conformity or relation between the object and the organs or faculties of the mind; and if that conformity did not really exist, the sentiment could never possibly have being. Beauty is no quality in things themselves:

It exists merely in the mind which contemplates them; and each mind perceives a different beauty. One person may even perceive deformity, where another is sensible of beauty; and every individual ought to acquiesce in his own sentiment, without pretending to regulate those of others. To seek the real beauty, or real deformity, is as fruitless an enquiry, as to pretend to ascertain the real sweet or real bitter. According to the disposition of the organs, the same object may be both sweet and bitter; and the proverb has justly determined it to be fruitless to dispute concerning tastes. It is very natural, and even quite necessary, to extend this axiom to mental, as well as bodily taste; and thus common sense, which is so often at variance with philosophy, especially with the sceptical kind, is found, in one instance at least, to agree in pronouncing the same decision.

But though this axiom, by passing into a proverb, seems to have attained the sanction of common sense; there is certainly a species of common sense which opposes it, at least serves to modify and restrain it. Whoever would assert an equality of genius and elegance between OGILBY¹ and MILTON, or BUNYAN and ADDISON, would be thought to defend no less an extravagance, than if he had maintained a mole-hill to be as high as TENERIFFE, or a pond as extensive as the ocean. Though there may be found persons, who give the preference to the former authors; no one pays attention to such a taste; and we pronounce without scruple the sentiment of these pretended critics to be absurd and ridiculous. The principle of the natural equality of tastes is then totally forgot, and while we admit it on some occasions, where the objects seem near an equality, it appears an extravagant paradox, or rather a palpable absurdity, where objects so disproportioned are compared together.

It is evident that none of the rules of composition are fixed by reasonings *a priori*, or can be esteemed abstract conclusions of the understanding, from comparing those habitudes and relations of ideas, which are eternal and immutable. Their foundation is the same with that of all the practical sciences, experience; nor are they any thing but general observations, concerning what has been universally found to please in all countries and in all ages. Many of the beauties of poetry and even of eloquence are founded on falsehood and fiction, on hyperboles, metaphors, and an abuse or perversion of terms from their natural meaning. To check the sallies of the imagination, and to reduce every expression to geometrical truth and exactness, would be the most contrary to the laws of criticism; because it would produce a work, which, by universal experience, has been found the most insipid and disagreeable. But though poetry can never submit to exact truth, it must be confined by rules of art, discovered to the author either by genius or observation. If some negligent or irregular writers have pleased, they have not pleased by their transgressions of rule or order, but in spite of these transgressions: They have possessed other beauties, which were conformable to just criticism; and the force of these beauties has been able to overpower censure, and give the mind a satisfaction superior to the disgust arising from the blemishes. ARIOSTO pleases; but not by his monstrous and improbable fictions, by his bizarre mixture of the serious and comic styles, by the want of coherence in his stories, or by the continual interruptions of his narration. He charms by the force and clearness of his expression, by the readiness and variety of his inventions, and by his natural pictures of the passions, especially those of the gay and amorous kind: And

however his faults may diminish our satisfaction, they are not able entirely to destroy it. Did our pleasure really arise from those parts of his poem, which we denominate faults, this would be no objection to criticism in general: It would only be an objection to those particular rules of criticism, which would establish such circumstances to be faults, and would represent them as universally blameable. If they are found to please, they cannot be faults; let the pleasure, which they produce, be ever so unexpected and unaccountable.

But though all the general rules of art are founded only on experience and on the observation of the common sentiments of human nature, we must not imagine, that, on every occasion, the feelings of men will be conformable to these rules. Those finer emotions of the mind are of a very tender and delicate nature, and require the concurrence of many favourable circumstances to make them play with facility and exactness, according to their general and established principles. The least exterior hindrance to such small springs, or the least internal disorder, disturbs their motion, and confounds the operation of the whole machine. When we would make an experiment of this nature, and would try the force of any beauty or deformity, we must choose with care a proper time and place, and bring the fancy to a suitable situation and disposition. A perfect serenity of mind, a recollection of thought, a due attention to the object; if any of these circumstances be wanting, our experiment will be fallacious, and we shall be unable to judge of the catholic and universal beauty. The relation, which nature has placed between the form and the sentiment, will at least be more obscure; and it will require greater accuracy to trace and discern it. We shall be able to ascertain its influence not so much from the operation of each particular beauty, as from the durable admiration, which attends those works, that have survived all the caprices of mode and fashion, all the mistakes of ignorance and envy.

The same HOMER, who pleased at ATHENS and ROME two thousand years ago, is still admired at PARIS and at LONDON. All the changes of climate, government, religion, and language, have not been able to obscure his glory. Authority or prejudice may give a temporary vogue to a bad poet or orator; but his reputation will never be durable or general. When his compositions are examined by posterity or by foreigners, the enchantment is dissipated, and his faults appear in their true colours. On the contrary, a real genius, the longer his works endure, and the more wide they are spread, the more sincere is the admiration which he meets with. Envy and jealousy have too much place in a narrow circle; and even familiar acquaintance with his person may diminish the applause due to his performances: But when these obstructions are removed, the beauties, which are naturally fitted to excite agreeable sentiments, immediately display their energy; and while the world endures, they maintain their authority over the minds of men.

It appears then, that, amidst all the variety and caprice of taste, there are certain general principles of approbation or blame, whose influence a careful eye may trace in all operations of the mind. Some particular forms or qualities, from the original structure of the internal fabric, are calculated to please, and others to displease; and if they fail of their effect in any particular instance, it is from some apparent defect or imperfection in the organ. A man in a fever would not insist on his palate as able to decide concerning flavours; nor would one, affected with the jaundice, pretend to

give a verdict with regard to colours. In each creature, there is a sound and a defective state; and the former alone can be supposed to afford us a true standard of taste and sentiment. If, in the sound state of the organ, there be an entire or a considerable uniformity of sentiment among men, we may thence derive an idea of the perfect beauty; in like manner as the appearance of objects in day-light, to the eye of a man in health, is denominated their true and real colour, even while colour is allowed to be merely a phantasm of the senses.

Many and frequent are the defects in the internal organs, which prevent or weaken the influence of those general principles, on which depends our sentiment of beauty or deformity. Though some objects, by the structure of the mind, be naturally calculated to give pleasure, it is not to be expected, that in every individual the pleasure will be equally felt. Particular incidents and situations occur, which either throw a false light on the objects, or hinder the true from conveying to the imagination the proper sentiment and perception.

One obvious cause, why many feel not the proper sentiment of beauty, is the want of that *delicacy* of imagination, which is requisite to convey a sensibility of those finer emotions. This delicacy every one pretends to: Every one talks of it; and would reduce every kind of taste or sentiment to its standard. But as our intention in this essay is to mingle some light of the understanding with the feelings of sentiment, it will be proper to give a more accurate definition of delicacy, than has hitherto been attempted. And not to draw our philosophy from too profound a source, we shall have recourse to a noted story in *DON QUIXOTE*.

It is with good reason, says *SANCHO* to the squire with the great nose, that I pretend to have a judgment in wine: This is a quality hereditary in our family. Two of my kinsmen were once called to give their opinion of a hogshead, which was supposed to be excellent, being old and of a good vintage. One of them tastes it; considers it; and after mature reflection pronounces the wine to be good, were it not for a small taste of leather, which he perceived in it. The other, after using the same precautions, give also his verdict in favour of the wine; but with the reserve of a taste of iron, which he could easily distinguish. You cannot imagine how much they were both ridiculed for their judgment. But who laughed in the end? On emptying the hogshead, there was found at the bottom, an old key with a leathern thong tied to it.

The great resemblance between mental and bodily taste will easily teach us to apply this story. Though it be certain, that beauty and deformity, more than sweet and bitter, are not qualities in objects, but belong entirely to the sentiment, internal or external; it must be allowed, that there are certain qualities in objects, which are fitted by nature to produce those particular feelings. Now as these qualities may be found in a small degree, or may be mixed and confounded with each other, it often happens, that the taste is not affected with such minute qualities, or is not able to distinguish all the particular flavours, amidst the disorder, in which they are presented. Where the organs are so fine, as to allow nothing to escape them; and at the same time so exact as to perceive every ingredient in the composition: This we call delicacy of taste, whether we employ these terms in the literal or metaphorical sense. Here then the general rules of beauty are of use; being drawn from established models, and from the observation of what pleases or displeases, when presented singly and in a high degree: And if the same qualities, in a continued composition and

in a smaller degree, affect not the organs with a sensible delight or uneasiness, we exclude the person from all pretensions to this delicacy. To produce these general rules or avowed patterns of composition is like finding the key with the leathern thong; which justified the verdict of SANCHO'S kinsmen, and confounded those pretended judges who had condemned them. Though the hogshead had never been emptied, the taste of the one was still equally delicate, and that of the other equally dull and languid: But it would have been more difficult to have proved the superiority of the former, to the conviction of every by-stander. In like manner, though the beauties of writing had never been methodized, or reduced to general principles; though no excellent models had ever been acknowledged; the different degrees of taste would still have subsisted, and the judgment of one man been preferable to that of another; but it would not have been so easy to silence the bad critic, who might always insist upon his particular sentiment, and refuse to submit to his antagonist. But when we show him an avowed principle of art; when we illustrate this principle by examples, whose operation, from his own particular taste, he acknowledges to be conformable to the principle; when we prove, that the same principle may be applied to the present case, where he did not perceive or feel its influence: He must conclude, upon the whole, that the fault lies in himself, and that he wants the delicacy, which is requisite to make him sensible of every beauty and every blemish, in any composition or discourse.

It is acknowledged to be the perfection of every sense or faculty, to perceive with exactness its most minute objects, and allow nothing to escape its notice and observation. The smaller the objects are, which become sensible to the eye, the finer is that organ, and the more elaborate its make and composition. A good palate is not tried by strong flavours; but by a mixture of small ingredients, where we are still sensible of each part, notwithstanding its minuteness and its confusion with the rest. In like manner, a quick and acute perception of beauty and deformity must be the perfection of our mental taste; nor can a man be satisfied with himself while he suspects, that any excellence or blemish in a discourse has passed him unobserved. In this case, the perfection of the man, and the perfection of the sense or feeling, are found to be united. A very delicate palate, on many occasions, may be a great inconvenience both to a man himself and to his friends: But a delicate taste of wit or beauty must always be a desirable quality; because it is the source of all the finest and most innocent enjoyments, of which human nature is susceptible. In this decision the sentiments of all mankind are agreed. Wherever you can ascertain a delicacy of taste, it is sure to meet with approbation; and the best way of ascertaining it is to appeal to those models and principles, which have been established by the uniform consent and experience of nations and ages.

But though there be naturally a wide difference in point of delicacy between one person and another, nothing tends further to encrease and improve this talent, than *practice* in a particular art, and the frequent survey or contemplation of a particular species of beauty. When objects of any kind are first presented to the eye or imagination, the sentiment, which attends them, is obscure and confused; and the mind is, in a great measure, incapable of pronouncing concerning their merits or defects. The taste cannot perceive the several excellencies of the performance; much less distinguish the particular character of each excellency, and ascertain its quality

and degree. If it pronounce the whole in general to be beautiful or deformed, it is the utmost that can be expected; and even this judgment, a person, so unpractised, will be apt to deliver with great hesitation and reserve. But allow him to acquire experience in those objects, his feeling becomes more exact and nice: He not only perceives the beauties and defects of each part, but marks the distinguishing species of each quality, and assigns it suitable praise or blame. A clear and distinct sentiment attends him through the whole survey of the objects; and he discerns that very degree and kind of approbation or displeasure, which each part is naturally fitted to produce. The mist dissipates, which seemed formerly to hang over the object: The organ acquires greater perfection in its operations; and can pronounce, without danger of mistake, concerning the merits of every performance. In a word, the same address and dexterity, which practice gives to the execution of any work, is also acquired by the same means, in the judging of it.

So advantageous is practice to the discernment of beauty, that, before we can give judgment on any work of importance, it will even be requisite, that that very individual performance be more than once perused by us, and be surveyed in different lights with attention and deliberation. There is a flutter or hurry of thought which attends the first perusal of any piece, and which confounds the genuine sentiment of beauty. The relation of the parts is not discerned: The true characters of style are little distinguished: The several perfections and defects seem wrapped up in a species of confusion, and present themselves indistinctly to the imagination. Not to mention, that there is a species of beauty, which, as it is florid and superficial, pleases at first; but being found incompatible with a just expression either of reason or passion, soon palls upon the taste, and is then rejected with disdain, at least rated at a much lower value.

It is impossible to continue in the practice of contemplating any order of beauty, without being frequently obliged to form *comparisons* between the several species and degrees of excellence, and estimating their proportion to each other. A man, who has had no opportunity of comparing the different kinds of beauty, is indeed totally unqualified to pronounce an opinion with regard to any object presented to him. By comparison alone we fix the epithets of praise or blame, and learn how to assign the due degree of each. The coarsest daubing contains a certain lustre of colours and exactness of imitation, which are so far beauties, and would affect the mind of a peasant or Indian with the highest admiration. The most vulgar ballads are not entirely destitute of harmony or nature; and none but a person, familiarized to superior beauties, would pronounce their numbers harsh, or narration uninteresting. A great inferiority of beauty gives pain to a person conversant in the highest excellence of the kind, and is for that reason pronounced a deformity: As the most finished object, with which we are acquainted, is naturally supposed to have reached the pinnacle of perfection, and to be entitled to the highest applause. One accustomed to see, and examine, and weigh the several performances, admired in different ages and nations, can alone rate the merits of a work exhibited to his view, and assign its proper rank among the productions of genius.

But to enable a critic the more fully to execute this undertaking, he must preserve his mind free from all *prejudice*, and allow nothing to enter into his consideration, but the very object which is submitted to his examination. We may observe, that every

work of art, in order to produce its due effect on the mind, must be surveyed in a certain point of view, and cannot be fully relished by persons, whose situation, real or imaginary, is not conformable to that which is required by the performance. An orator addresses himself to a particular audience, and must have a regard to their particular genius, interests, opinions, passions, and prejudices; otherwise he hopes in vain to govern their resolutions, and inflame their affections. Should they even have entertained some prepossessions against him, however unreasonable, he must not overlook this disadvantage; but, before he enters upon the subject, must endeavour to conciliate their affection, and acquire their good graces. A critic of a different age or nation, who should peruse this discourse, must have all these circumstances in his eye, and must place himself in the same situation as the audience, in order to form a true judgment of the oration. In like manner, when any work is addressed to the public, though I should have a friendship or enmity with the author, I must depart from this situation; and considering myself as a man in general, forget, if possible, my individual being and my peculiar circumstances. A person influenced by prejudice, complies not with this condition; but obstinately maintains his natural position, without placing himself in that point of view, which the performance supposes. If the work be addressed to persons of a different age or nation, he makes no allowance for their peculiar views and prejudices; but, full of the manners of his own age and country, rashly condemns what seemed admirable in the eyes of those for whom alone the discourse was calculated. If the work be executed for the public, he never sufficiently enlarges his comprehension, or forgets his interest as a friend or enemy, as a rival or commentator. By this means, his sentiments are perverted; nor have the same beauties and blemishes the same influence upon him, as if he had imposed a proper violence on his imagination, and had forgotten himself for a moment. So far his taste evidently departs from the true standard; and of consequence loses all credit and authority.

It is well known, that in all questions, submitted to the understanding, prejudice is destructive of sound judgment, and perverts all operations of the intellectual faculties: It is no less contrary to good taste; nor has it less influence to corrupt our sentiment of beauty. It belongs to *good sense* to check its influence in both cases; and in this respect, as well as in many others, reason, if not an essential part of taste, is at least requisite to the operations of this latter faculty. In all the nobler productions of genius, there is a mutual relation and correspondence of parts; nor can either the beauties or blemishes be perceived by him, whose thought is not capacious enough to comprehend all those parts, and compare them with each other, in order to perceive the consistence and uniformity of the whole. Every work of art has also a certain end or purpose, for which it is calculated; and is to be deemed more or less perfect, as it is more or less fitted to attain this end. The object of eloquence is to persuade, of history to instruct, of poetry to please by means of the passions and the imagination. These ends we must carry constantly in our view, when we peruse any performance; and we must be able to judge how far the means employed are adapted to their respective purposes. Besides, every kind of composition, even the most poetical, is nothing but a chain of propositions and reasonings; not always, indeed, the justest and most exact, but still plausible and specious, however disguised by the colouring of the imagination. The persons introduced in tragedy and epic poetry, must be

represented as reasoning, and thinking, and concluding, and acting, suitably to their character and circumstances; and without judgment, as well as taste and invention, a poet can never hope to succeed in so delicate an undertaking. Not to mention, that the same excellence of faculties which contributes to the improvement of reason, the same clearness of conception, the same exactness of distinction, the same vivacity of apprehension, are essential to the operations of true taste, and are its infallible concomitants. It seldom, or never happens, that a man of sense, who has experience in any art, cannot judge of its beauty; and it is no less rare to meet with a man who has a just taste without a sound understanding.

Thus, though the principles of taste be universal, and nearly, if not entirely the same in all men; yet few are qualified to give judgment on any work of art, or establish their own sentiment as the standard of beauty. The organs of internal sensation are seldom so perfect as to allow the general principles their full play, and produce a feeling correspondent to those principles. They either labour under some defect, or are vitiated by some disorder; and by that means, excite a sentiment, which may be pronounced erroneous. When the critic has no delicacy, he judges without any distinction, and is only affected by the grosser and more palpable qualities of the object: The finer touches pass unnoticed and disregarded. Where he is not aided by practice, his verdict is attended with confusion and hesitation. Where no comparison has been employed, the most frivolous beauties, such as rather merit the name of defects, are the object of his admiration. Where he lies under the influence of prejudice, all his natural sentiments are perverted. Where good sense is wanting, he is not qualified to discern the beauties of design and reasoning, which are the highest and most excellent. Under some or other of these imperfections, the generality of men labour; and hence a true judge in the finer arts is observed, even during the most polished ages, to be so rare a character: Strong sense, united to delicate sentiment, improved by practice, perfected by comparison, and cleared of all prejudice, can alone entitle critics to this valuable character; and the joint verdict of such, wherever they are to be found, is the true standard of taste and beauty.

But where are such critics to be found? By what marks are they to be known? How distinguish them from pretenders? These questions are embarrassing; and seem to throw us back into the same uncertainty, from which, during the course of this essay, we have endeavoured to extricate ourselves.

But if we consider the matter aright, these are questions of fact, not of sentiment. Whether any particular person be endowed with good sense and a delicate imagination, free from prejudice, may often be the subject of dispute, and be liable to great discussion and enquiry: But that such a character is valuable and estimable will be agreed in by all mankind. Where these doubts occur, men can do no more than in other disputable questions, which are submitted to the understanding: They must produce the best arguments, that their invention suggests to them; they must acknowledge a true and decisive standard to exist somewhere, to wit, real existence and matter of fact; and they must have indulgence to such as differ from them in their appeals to this standard. It is sufficient for our present purpose, if we have proved, that the taste of all individuals is not upon an equal footing, and that some men in general, however difficult to be particularly pitched upon, will be acknowledged by universal sentiment to have a preference above others.

But in reality the difficulty of finding, even in particulars, the standard of taste, is not so great as it is represented. Though in speculation, we may readily avow a certain criterion in science and deny it in sentiment, the matter is found in practice to be much more hard to ascertain in the former case than in the latter. Theories of abstract philosophy, systems of profound theology, have prevailed during one age: In a successive period, these have been universally exploded: Their absurdity has been detected: Other theories and systems have supplied their place, which again gave place to their successors: And nothing has been experienced more liable to the revolutions of chance and fashion than these pretended decisions of science. The case is not the same with the beauties of eloquence and poetry. Just expressions of passion and nature are sure, after a little time, to gain public applause, which they maintain for ever. ARISTOTLE, and PLATO, and EPICURUS, and DESCARTES, may successively yield to each other: But TERENCE and VIRGIL maintain an universal, undisputed empire over the minds of men. The abstract philosophy of CICERO has lost its credit: The vehemence of his oratory is still the object of our admiration.

Though men of delicate taste be rare, they are easily to be distinguished in society, by the soundness of their understanding and the superiority of their faculties above the rest of mankind. The ascendant, which they acquire, gives a prevalence to that lively approbation, with which they receive any productions of genius, and renders it generally predominant. Many men, when left to themselves, have but a faint and dubious perception of beauty, who yet are capable of relishing any fine stroke, which is pointed out to them. Every convert to the admiration of the real poet or orator is the cause of some new conversion. And though prejudices may prevail for a time, they never unite in celebrating any rival to the true genius, but yield at last to the force of nature and just sentiment. Thus, though a civilized nation may easily be mistaken in the choice of their admired philosopher, they never have been found long to err, in their affection for a favourite epic or tragic author.

But notwithstanding all our endeavours to fix a standard of taste, and reconcile the discordant apprehensions of men, there still remain two sources of variation, which are not sufficient indeed to confound all the boundaries of beauty and deformity, but will often serve to produce a difference in the degrees of our approbation or blame. The one is the different humours of particular men; the other, the particular manners and opinions of our age and country. The general principles of taste are uniform in human nature: Where men vary in their judgments, some defect or perversion in the faculties may commonly be remarked; proceeding either from prejudice, from want of practice, or want of delicacy; and there is just reason for approving one taste, and condemning another. But where there is such a diversity in the internal frame or external situation as is entirely blameless on both sides, and leaves no room to give one the preference above the other; in that case a certain degree of diversity in judgment is unavoidable, and we seek in vain for a standard, by which we can reconcile the contrary sentiments.

* * *

¹ John Ogilby (1600–76) published verse translations of Homer and Virgil and of *Aesop's Fables*.

6 Edmund Burke (1729–1797) from *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and the Beautiful*

Edmund Burke was born in Ireland and was educated at Trinity College, Dublin. In 1750 he went to London to study for the Bar, but subsequently abandoned a career in law for literary work. His *Philosophical Inquiry into the Origin of our Ideas of the Sublime and the Beautiful* was published in 1757 when the author was just 28 years old. It was an enormous popular success both in Britain and on the Continent, where it influenced figures such as Lessing (IIIA10) and Kant (VA10). The subject of the sublime had already been addressed by Addison (IIB4) and Richardson (IIB9) and was a fashionable topic by the time Burke took it up. However, Burke's lively and vigorous style, and the wide range of his interests, helped to establish the sublime as a key category of eighteenth-century aesthetics. Burke shares Hutcheson's insistence on the immediacy of our aesthetic responses (see IIB7), but extends his investigation to include a much wider range of emotional and affective states. Much of the *Inquiry* is given over to identifying and categorizing the different emotions attendant on the sublime and the beautiful. Whereas beauty gives rise to a positive pleasure, the sublime depends upon the 'removal or diminution of pain', which he terms 'delight'. We can take pleasure in what terrifies or overwhelms us, as long as we know ourselves at a safe distance from actual harm. Burke criticizes Berkeley's claim that beauty is connected to an object's fitness or usefulness (see IIB8), arguing that if this were the case, the 'wedge-like snout of a swine', which is so well adapted to digging, must be considered beautiful. It is not rational reflection, but rather the intrinsic properties of the object which 'cause' in us the corresponding emotions. Just as the sublime belongs to what is vast, rugged, gloomy, and negligent, beauty belongs to what is small, smooth, light, and delicate. We have used the edition edited by Adam Phillips, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and the Beautiful*, Oxford and New York: Oxford University Press, 1990, pp. 36–7, 53–6, 59–61, 66–8, 75, 83–6, 95–7, 102–4, 113–14. For criticism of Burke's ideas by Mary Wollstonecraft see IVB6.

Of the Sublime

Whatever is fitted in any sort to excite the ideas of pain, and danger, that is to say, whatever is in any sort terrible, or is conversant about terrible objects, or operates in a manner analogous to terror, is a source of the *sublime*; that is, it is productive of the strongest emotion which the mind is capable of feeling. I say the strongest emotion, because I am satisfied the ideas of pain are much more powerful than those which enter on the part of pleasure. Without all doubt, the torments which we may be made to suffer, are much greater in their effect on the body and mind, than any pleasures which the most learned voluptuary could suggest, or than the liveliest imagination, and the most sound and exquisitely sensible body could enjoy. Nay I am in great doubt, whether any man could be found who would earn a life of the most perfect satisfaction, at the price of ending it in the torments, which justice inflicted in a few hours on the late unfortunate regicide in France. But as pain is stronger in its operation than pleasure, so death is in general a much more affecting idea than

pain; because there are very few pains, however exquisite, which are not preferred to death; nay, what generally makes pain itself, if I may say so, more painful, is, that it is considered as an emissary of this king of terrors. When danger or pain press too nearly, they are incapable of giving any delight, and are simply terrible; but at certain distances, and with certain modifications, they may be, and they are delightful, as we every day experience. The cause of this I shall endeavour to investigate hereafter.

* * *

Of the passion caused by the Sublime

The passion caused by the great and sublime in *nature*, when those causes operate most powerfully, is Astonishment; and astonishment is that state of the soul, in which all its motions are suspended, with some degree of horror. In this case the mind is so entirely filled with its object, that it cannot entertain any other, nor by consequence reason on that object which employs it. Hence arises the great power of the sublime, that far from being produced by them, it anticipates our reasonings, and hurries us on by an irresistible force. Astonishment, as I have said, is the effect of the sublime in its highest degree; the inferior effects are admiration, reverence and respect.

Terror

No passion so effectually robs the mind of all its powers of acting and reasoning as fear. For fear being an apprehension of pain or death, it operates in a manner that resembles actual pain. Whatever therefore is terrible, with regard to sight, is sublime too, whether this cause of terror, be endued with greatness of dimensions or not; for it is impossible to look on any thing as trifling, or contemptible, that may be dangerous. There are many animals, who though far from being large, are yet capable of raising ideas of the sublime, because they are considered as objects of terror. As serpents and poisonous animals of almost all kinds. And to things of great dimensions, if we annex an adventitious idea of terror, they become without comparison greater. A level plain of a vast extent on land, is certainly no mean idea; the prospect of such a plain may be as extensive as a prospect of the ocean; but can it ever fill the mind with any thing so great as the ocean itself? This is owing to several causes, but it is owing to none more than this, that the ocean is an object of no small terror. Indeed terror is in all cases whatsoever, either more openly or latently the ruling principle of the sublime. [. . .]

Obscurity

To make any thing very terrible, obscurity seems in general to be necessary. When we know the full extent of any danger, when we can accustom our eyes to it, a great deal of the apprehension vanishes. Every one will be sensible of this, who considers how greatly night adds to our dread, in all cases of danger, and how much the notions of ghosts and goblins, of which none can form clear ideas, affect minds, which give credit to the popular tales concerning such sorts of beings. Those despotic governments, which are founded on the passions of men, and principally upon the passion

of fear, keep their chief as much as may be from the public eye. The policy has been the same in many cases of religion. Almost all the heathen temples were dark. Even in the barbarous temples of the Americans at this day, they keep their idol in a dark part of the hut, which is consecrated to his worship. For this purpose too the druids performed all their ceremonies in the bosom of the darkest woods, and in the shade of the oldest and most spreading oaks. [...]

Of the difference between Clearness and Obscurity with regard to the passions

It is one thing to make an idea clear, and another to make it *affecting* to the imagination. If I make a drawing of a palace, or a temple, or a landscape, I present a very clear idea of those objects; but then (allowing for the effect of imitation which is something) my picture can at most affect only as the palace, temple, or landscape would have affected in the reality. On the other hand, the most lively and spirited verbal description I can give, raises a very obscure and imperfect *idea* of such objects; but then it is in my power to raise a stronger *emotion* by the description than I could do by the best painting. This experience constantly evinces. The proper manner of conveying the *affections* of the mind from one to another, is by words; there is a great insufficiency in all other methods of communication; and so far is a clearness of imagery from being absolutely necessary to an influence upon the passions, that they may be considerably operated upon without presenting any image at all, by certain sounds adapted to that purpose; of which we have a sufficient proof in the acknowledged and powerful effects of instrumental music. In reality a great clearness helps but little towards affecting the passions, as it is in some sort an enemy to all enthusiasms whatsoever.

* * *

Power

Besides these things which *directly* suggest the idea of danger, and those which produce a similar effect from a mechanical cause, I know of nothing sublime which is not some modification of power. And this branch rises as naturally as the other two branches, from terror, the common stock of every thing that is sublime. The idea of power at first view, seems of the class of these indifferent ones, which may equally belong to pain or to pleasure. But in reality, the affection arising from the idea of vast power, is extremely remote from that neutral character. For first, we must remember, that the idea of pain, in its highest degree, is much stronger than the highest degree of pleasure; and that it preserves the same superiority through all the subordinate gradations. From hence it is, that where the chances for equal degrees of suffering or enjoyment are in any sort equal, the idea of the suffering must always be prevalent. And indeed the ideas of pain, and above all of death, are so very affecting, that whilst we remain in the presence of whatever is supposed to have the power of inflicting either, it is impossible to be perfectly free from terror. Again, we know by experience, that for the enjoyment of pleasure, no great efforts of power are at all necessary; nay we know, that such efforts would go a great way towards destroying our satisfaction: for pleasure must be stolen, and not forced upon us; pleasure follows the will; and

therefore we are generally affected with it by many things of a force greatly inferior to our own. But pain is always inflicted by a power in some way superior, because we never submit to pain willingly. So that strength, violence, pain and terror, are ideas that rush in upon the mind together. Look at a man, or any other animal of prodigious strength, and what is your idea before reflection? Is it that this strength will be subservient to you, to your ease, to your pleasure, to your interest in any sense? No; the emotion you feel is, lest this enormous strength should be employed to the purposes of rapine and destruction. That power derives all its sublimity from the terror with which it is generally accompanied, will appear evidently from its effect in the very few cases, in which it may be possible to strip a considerable degree of strength of its ability to hurt. When you do this, you spoil it of every thing sublime, and it immediately becomes contemptible. An ox is a creature of vast strength; but he is an innocent creature, extremely serviceable, and not at all dangerous; for which reason the idea of an ox is by no means grand. A bull is strong too; but his strength is of another kind; often very destructive, seldom (at least amongst us) of any use in our business; the idea of a bull is therefore great, and it has frequently a place in sublime descriptions, and elevating comparisons. Let us look at another strong animal in the two distinct lights in which we may consider him. The horse in the light of an useful beast, fit for the plough, the road, the draft, in every social useful light the horse has nothing of the sublime; but is it thus that we are affected with him, *whose neck is clothed with thunder, the glory of whose nostrils is terrible, who swalloweth the ground with fierceness and rage, neither believeth that it is the sound of the trumpet?* In this description the useful character of the horse entirely disappears, and the terrible and sublime blaze out together. We have continually about us animals of a strength that is considerable, but not pernicious. Amongst these we never look for the sublime: it comes upon us in the gloomy forest, and in the howling wilderness, in the form of the lion, the tiger, the panther, or rhinoceros. Whenever strength is only useful, and employed for our benefit or our pleasure, then it is never sublime; for nothing can act agreeably to us, that does not act in conformity to our will; but to act agreeably to our will, it must be subject to us; and therefore can never be the cause of a grand and commanding conception. The description of the wild ass, in Job, is worked up into no small sublimity, merely by insisting on his freedom, and his setting mankind at defiance; otherwise the description of such an animal could have had nothing noble in it. *Who hath loosed (says he) the bands of the wild ass? whose house I have made the wilderness, and the barren land his dwellings. He scorneth the multitude of the city, neither regardeth he the voice of the driver. The range of the mountains is his pasture.*

* * *

Vastness

Greatness of dimension, is a powerful cause of the sublime. This is too evident, and the observation too common, to need any illustration; it is not so common, to consider in what ways greatness of dimension, vastness of extent, or quantity, has the most striking effect. For certainly, there are ways, and modes, wherein the same quantity of extension shall produce greater effects than it is found to do in others. Extension is either in length, height, or depth. Of these the length strikes least; an

hundred yards of even ground will never work such an effect as a tower an hundred yards high, or a rock or mountain of that altitude. I am apt to imagine likewise, that height is less grand than depth; and that we are more struck at looking down from a precipice, than at looking up at an object of equal height, but of that I am not very positive. A perpendicular has more force in forming the sublime, than an inclined plane; and the effects of a rugged and broken surface seem stronger than where it is smooth and polished. It would carry us out of our way to enter in this place into the cause of these appearances; but certain it is they afford a large and fruitful field of speculation. However, it may not be amiss to add to these remarks upon magnitude; that, as the great extreme of dimension is sublime, so the last extreme of littleness is in some measure sublime likewise; when we attend to the infinite divisibility of matter, when we pursue animal life into these excessively small, and yet organized beings, that escape the nicest inquisition of the sense, when we push our discoveries yet downward, and consider those creatures so many degrees yet smaller, and the still diminishing scale of existence, in tracing which the imagination is lost as well as the sense, we become amazed and confounded at the wonders of minuteness; nor can we distinguish in its effect this extreme of littleness from the vast itself. For division must be infinite as well as addition; because the idea of a perfect unity can no more be arrived at, than that of a compleat whole to which nothing may be added.

Infinity

Another source of the sublime, is *infinity*; if it does not rather belong to the last. Infinity has a tendency to fill the mind with that sort of delightful horror, which is the most genuine effect, and truest test of the sublime. There are scarce any things which can become the objects of our senses that are really, and in their own nature infinite. But the eye not being able to perceive the bounds of many things, they seem to be infinite, and they produce the same effects as if they were really so. We are deceived in the like manner, if the parts of some large object are so continued to any indefinite number, that the imagination meets no check which may hinder its extending them at pleasure.

Whenever we repeat any idea frequently, the mind by a sort of mechanism repeats it long after the first cause has ceased to operate. After whirling about; when we sit down, the objects about us still seem to whirl. After a long succession of noises, as the fall of waters, or the beating of forge hammers, the hammers beat and the water roars in the imagination long after the first sounds have ceased to affect it; and they die away at last by gradations which are scarcely perceptible. If you hold up a strait pole, with your eye to one end, it will seem extended to a length almost incredible. Place a number of uniform and equidistant marks on this pole, they will cause the same deception, and seem multiplied without end. The senses strongly affected in some one manner, cannot quickly change their tenor, or adapt themselves to other things; but they continue in their old channel until the strength of the first mover decays. This is the reason of an appearance very frequent in madmen; that they remain whole days and nights, sometimes whole years, in the constant repetition of some remark, some complaint, or song; which having struck powerfully on their disordered imagination, in the beginning of their phrensy, every repetition reinforces it with

new strength; and the hurry of their spirits, unrestrained by the curb of reason, continues it to the end of their lives.

* * *

Colour considered as productive of the Sublime

Among colours, such as are soft, or cheerful, (except perhaps a strong red which is cheerful) are unfit to produce grand images. An immense mountain covered with a shining green turf, is nothing in this respect, to one dark and gloomy; the cloudy sky is more grand than the blue; and night more sublime and solemn than day. Therefore in historical painting, a gay or gaudy drapery, can never have a happy effect: and in buildings, when the highest degree of the sublime is intended, the materials and ornaments ought neither to be white, nor green, nor yellow, nor blue, nor of a pale red, nor violet, nor spotted, but of sad and fuscous colours, as black, or brown, or deep purple, and the like. Much of gilding, mosaics, painting or statues, contribute but little to the sublime. This rule need not be put in practice, except where an uniform degree of the most striking sublimity is to be produced, and that in every particular; for it ought to be observed, that this melancholy kind of greatness, though it be certainly the highest, ought not to be studied in all sorts of edifices, where yet grandeur must be studied; in such cases the sublimity must be drawn from the other sources; with a strict caution however against any thing light and riant; as nothing so effectually deadens the whole taste of the sublime.

* * *

Of Beauty

It is my design to consider beauty as distinguished from the sublime; and in the course of the enquiry, to examine how far it is consistent with it. But previous to this, we must take a short review of the opinions already entertained of this quality; which I think are hardly to be reduced to any fixed principles; because men are used to talk of beauty in a figurative manner, that is to say, in a manner extremely uncertain, and indeterminate. By beauty I mean, that quality or those qualities in bodies by which they cause love, or some passion similar to it. I confine this definition to the merely sensible qualities of things, for the sake of preserving the utmost simplicity in a subject which must always distract us, whenever we take in those various causes of sympathy which attach us to any persons or things from secondary considerations, and not from the direct force which they have merely on being viewed. I likewise distinguish love, by which I mean that satisfaction which arises to the mind upon contemplating any thing beautiful, of whatsoever nature it may be, from desire or lust; which is an energy of the mind, that hurries us on to the possession of certain objects, that do not affect us as they are beautiful, but by means altogether different. We shall have a strong desire for a woman of no remarkable beauty; whilst the greatest beauty in men, or in other animals, though it causes love, yet excites nothing at all of desire. Which shews that beauty, and the passion caused by beauty, which I call love, is different from desire, though desire may sometimes operate along with it; but it is to this latter that we must attribute those violent and tempestuous passions,

and the consequent emotions of the body which attend what is called love in some of its ordinary acceptations, and not to the effects of beauty merely as it is such.

Proportion not the cause of Beauty in Vegetables

Beauty hath usually been said to consist in certain proportions of parts. On considering the matter, I have great reason to doubt, whether beauty be at all an idea belonging to proportion. Proportion relates almost wholly to convenience, as every idea of order seems to do; and it must therefore be considered as a creature of the understanding, rather than a primary cause acting on the senses and imagination. It is not by the force of long attention and enquiry that we find any object to be beautiful; beauty demands no assistance from our reasoning; even the will is unconcerned; the appearance of beauty as effectually causes some degree of love in us, as the application of ice or fire produces the ideas of heat or cold. To gain something like a satisfactory conclusion in this point, it were well to examine, what proportion is; since several who make use of that word, do not always seem to understand very clearly the force of the term, nor to have very distinct ideas concerning the thing itself. Proportion is the measure of relative quantity. Since all quantity is divisible, it is evident that every distinct part into which any quantity is divided, must bear some relation to the other parts or to the whole. These relations give an origin to the idea of proportion. They are discovered by mensuration, and they are the objects of mathematical enquiry. But whether any part of any determinate quantity be a fourth, or a fifth, or a sixth, or a moiety of the whole; or whether it be of equal length with any other part, or double its length, or but one half, is a matter merely indifferent to the mind; it stands neuter in the question: and it is from this absolute indifference and tranquillity of the mind, that mathematical speculations derive some of their most considerable advantages; because there is nothing to interest the imagination; because the judgment sits free and unbiassed to examine the point. All proportions, every arrangement of quantity is alike to the understanding, because the same truths result to it from all; from greater, from lesser; from equality and inequality. But surely beauty is no idea belonging to mensuration; nor has it any thing to do with calculation and geometry. If it had, we might then point out some certain measures which we could demonstrate to be beautiful, either as simply considered, or as related to others; and we could call in those natural objects, for whose beauty we have no voucher but the sense, to this happy standard, and confirm the voice of our passions by the determination of our reason. But since we have not this help, let us see whether proportion can in any sense be considered as the cause of beauty, as hath been so generally, and by some so confidently affirmed.

* * *

Fitness not the cause of Beauty

It is said that the idea of utility, or of a part's being well adapted to answer its end, is the cause of beauty, or indeed beauty itself. If it were not for this opinion, it had been impossible for the doctrine of proportion to have held its ground very long; the world would be soon weary of hearing of measures which related to nothing, either of a

natural principle, or of a fitness to answer some end; the idea which mankind most commonly conceive of proportion, is the suitableness of means to certain ends, and where this is not the question, very seldom trouble themselves about the effect of different measures of things. Therefore it was necessary for this theory to insist, that not only artificial, but natural objects took their beauty from the fitness of the parts for their several purposes. But in framing this theory, I am apprehensive that experience was not sufficiently consulted. For on that principle, the wedge-like snout of a swine, with its tough cartilage at the end, the little sunk eyes, and the whole make of the head, so well adapted to its offices of digging, and rooting, would be extremely beautiful. The great bag hanging to the bill of a pelican, a thing highly useful to this animal, would be likewise as beautiful in our eyes. The hedgehog, so well secured against all assaults by his prickly hide, and the porcupine with his missile quills, would be then considered as creatures of no small elegance. There are few animals, whose parts are better contrived than those of a monkey; he has the hands of a man, joined to the springy limbs of a beast; he is admirably calculated for running, leaping, grappling, and climbing: and yet there are few animals which seem to have less beauty in the eyes of all mankind. I need say little on the trunk of the elephant, of such various usefulness, and which is so far from contributing to his beauty. How well fitted is the wolf for running and leaping? how admirably is the lion armed for battle? But will any one therefore call the elephant, the wolf, and the lion, beautiful animals? I believe nobody will think the form of a man's legs so well adapted to running, as those of an horse, a dog, a deer, and several other creatures; at least they have not that appearance: yet I believe a well-fashioned human leg will be allowed far to exceed all these in beauty. If the fitness of parts was what constituted the loveliness of their form, the actual employment of them would undoubtedly much augment it; but this, though it is sometimes so upon another principle, is far from being always the case. A bird on the wing is not so beautiful as when it is perched; nay, there are several of the domestic fowls which are seldom seen to fly, and which are nothing the less beautiful on that account; yet birds are so extremely different in their form from the beast and human kinds, that you cannot on the principle of fitness allow them any thing agreeable, but in consideration of their parts being designed for quite other purposes. I never in my life chanced to see a peacock fly; and yet before, very long before I considered any aptitude in his form for the aerial life, I was struck with the extreme beauty which raises that bird above many of the best flying fowls in the world; though for any thing I saw, his way of living was much like that of the swine, which fed in the farmyard along with him. The same may be said of cocks, hens, and the like; they are of the flying kind in figure; in their manner of moving not very different from men and beasts. To leave these foreign examples; if beauty in our own species was annexed to use, men would be much more lovely than women; and strength and agility would be considered as the only beauties. But to call strength by the name of beauty, to have but one denomination for the qualities of a Venus and Hercules, so totally different in almost all respects, is surely a strange confusion of ideas, or abuse of words. The cause of this confusion, I imagine, proceeds from our frequently perceiving the parts of the human and other animal bodies to be at once very beautiful, and very well adapted to their purposes; and we are deceived by a sophism, which makes us take that for a cause which is only a

concomitant; this is the sophism of the fly; who imagined he raised a great dust, because he stood upon the chariot that really raised it. The stomach, the lungs, the liver, as well as other parts, are incomparably well adapted to their purposes; yet they are far from having any beauty. Again, many things are very beautiful, in which it is impossible to discern any idea of use. And I appeal to the first and most natural feelings of mankind, whether on beholding a beautiful eye, or a well-fashioned mouth, or a well-turned leg, any ideas of their being well fitted for seeing, eating, or running, ever present themselves. What idea of use is it that flowers excite, the most beautiful part of the vegetable world? It is true, that the infinitely wise and good Creator has, of his bounty, frequently joined beauty to those things which he has made useful to us; but this does not prove that an idea of use and beauty are the same thing, or that they are any way dependent on each other.

* * *

The real cause of Beauty

Having endeavoured to shew what beauty is not, it remains that we should examine, at least with equal attention, in what it really consists. Beauty is a thing much too affecting not to depend upon some positive qualities. And, since it is no creature of our reason, since it strikes us without any reference to use, and even where no use at all can be discerned, since the order and method of nature is generally very different from our measures and proportions, we must conclude that beauty is, for the greater part, some quality in bodies, acting mechanically upon the human mind by the intervention of the senses. We ought therefore to consider attentively in what manner those sensible qualities are disposed, in such things as by experience we find beautiful, or which excite in us the passion of love, or some correspondent affection.

Beautiful objects small

The most obvious point that presents itself to us in examining any object, is its extent or quantity. And what degree of extent prevails in bodies, that are held beautiful, may be gathered from the usual manner of expression concerning it. I am told that in most languages, the objects of love are spoken of under diminutive epithets. It is so in all the languages of which I have any knowledge. In Greek the *lov*, and other diminutive terms, are almost always the terms of affection and tenderness. These diminutives were commonly added by the Greeks to the names of persons with whom they conversed on terms of friendship and familiarity. Though the Romans were a people of less quick and delicate feelings, yet they naturally slid into the lessening termination upon the same occasions. Anciently in the English language the diminishing *ling* was added to the names of persons and things that were the objects of love. Some we retain still, as *darling*, (or *little dear*) and a few others. But to this day in ordinary conversation, it is usual to add the endearing name of *little* to every thing we love; the French and Italians make use of these affectionate diminutives even more than we. In the animal creation, out of our own species, it is the small we are inclined to be fond of; *little birds*, and some of the smaller kinds of beasts. A great beautiful thing, is a manner of expression scarcely ever used; but that of a great ugly thing, is very

common. There is a wide difference between admiration and love. The sublime, which is the cause of the former, always dwells on great objects, and terrible; the latter on small ones, and pleasing; we submit to what we admire, but we love what submits to us; in one case we are forced, in the other we are flattered into compliance. In short, the ideas of the sublime and the beautiful stand on foundations so different, that it is hard, I had almost said impossible, to think of reconciling them in the same subject, without considerably lessening the effect of the one or the other upon the passions. So that attending to their quantity, beautiful objects are comparatively small.

Smoothness

The next property constantly observable in such objects is *Smoothness*. A quality so essential to beauty, that I do not now recollect any thing beautiful that is not smooth. In trees and flowers, smooth leaves are beautiful; smooth slopes of earth in gardens; smooth streams in the landscape; smooth coats of birds and beasts in animal beauties; in fine women, smooth skins; and in several sorts of ornamental furniture, smooth and polished surfaces. A very considerable part of the effect of beauty is owing to this quality; indeed the most considerable. For take any beautiful object, and give it a broken and rugged surface, and however well formed it may be in other respects, it pleases no longer. Whereas let it want ever so many of the other constituents, if it wants not this, it becomes more pleasing than almost all the others without it. This seems to me so evident, that I am a good deal surprised, that none who have handled the subject have made any mention of the quality of smoothness in the enumeration of those that go to the forming of beauty. For indeed any ruggedness, any sudden projection, any sharp angle, is in the highest degree contrary to that idea.

* * *

The Sublime and Beautiful compared

On closing this general view of beauty, it naturally occurs, that we should compare it with the sublime; and in this comparison there appears a remarkable contrast. For sublime objects are vast in their dimensions, beautiful ones comparatively small; beauty should be smooth, and polished; the great, rugged and negligent; beauty should shun the right line, yet deviate from it insensibly; the great in many cases loves the right line, and when it deviates, it often makes a strong deviation; beauty should not be obscure; the great ought to be dark and gloomy; beauty should be light and delicate; the great ought to be solid, and even massive. They are indeed ideas of a very different nature, one being founded on pain, the other on pleasure; and however they may vary afterwards from the direct nature of their causes, yet these causes keep up an eternal distinction between them, a distinction never to be forgotten by any whose business it is to affect the passions. In the infinite variety of natural combinations we must expect to find the qualities of things the most remote imaginable from each other united in the same object. We must expect also to find combinations of the same kind in the works of art. But when we consider the power of an object upon our passions, we must know that when any thing is intended to affect the mind by the

force of some predominant property, the affection produced is like to be the more uniform and perfect, if all the other properties or qualities of the object be of the same nature, and tending to the same design as the principal;

*If black, and white blend, soften, and unite,
A thousand ways, are there no black and white?*

If the qualities of the sublime and beautiful are sometimes found united, does this prove, that they are the same, does it prove, that they are any way allied, does it prove even that they are not opposite and contradictory? Black and white may soften, may blend, but they are not therefore the same. Nor when they are so softened and blended with each other, or with different colours, is the power of black as black, or of white as white, so strong as when each stands uniform and distinguished.

* * *

7 Charles-Louis de Secondat, Baron de Montesquieu (1689–1755) 'An Essay on Taste'

Born into the French nobility, Montesquieu embarked on a legal and political career, but after about the age of 30 he turned increasingly to writing. *The Spirit of Laws*, his major work in the field of political and legal theory, was published in 1750, and led to his being regarded as the Newton of the social sciences. He had been at the centre of intellectual life in Paris since the success of his *Persian Letters*, a satire on the age of Louis XIV, published in 1721. He was elected to the Académie Française in 1727. In the late 1720s and early 1730s he travelled throughout Europe, visiting Vienna, Hungary, Germany and Holland, but with particularly extended stays in Italy and England. Towards the end of his life he enjoyed international fame (or notoriety in some quarters: the *Spirit of Laws* was placed on the *Index Librorum Prohibitorum* by the Vatican in 1751), and he was accordingly invited in 1753 to contribute to the *Encyclopédie* (see III C7–9). D'Alembert had asked him to write on democracy and despotism, but feeling he had already said all he had to say on those subjects, Montesquieu wrote instead on Taste. The *Essai sur le goût* was his last work. For Montesquieu, taste is a faculty by which we derive pleasure from the perception of certain objects or actions, including works of art. He investigates why and how these things produce pleasure and concludes that it is to do with the combinations of order and variety they present to the contemplating mind. Along with two other French 'Dissertations' by D'Alembert and Voltaire, Montesquieu's 'Essay on Taste' was translated and published as an addition to Alexander Gerard's *An Essay on Taste*, London and Edinburgh: A. Millar, 1759, pp. 257–314. Our extracts are from pp. 257–60 and 272–85 of this edition.

The constitution of human nature in it's present state, opens to the mind three different sources of pleasure; one in it's internal faculties and essence, another in it's union with the body, and a third in those impressions and prejudices, that are the result of certain institutions, customs, and habits.

These different pleasures of the mind constitute the proper objects of taste, those objects which we term beautiful, good, agreeable, natural, delicate, tender, graceful,

elegant, noble, grand, sublime, and majestic, as also the qualities to which we give the name of *Je ne sçai quoi*. When, for instance, the pleasure we enjoy in the contemplation of any object is accompanied with a notion of it's utility to us, we call that object good; but when an object appears merely agreeable, without being advantageous, we then term it beautiful. [...]

Let us then turn the eye of the mind upon itself, examine it's inward frame, consider it in it's actions, and it's passions, and contemplate it in it's pleasures in which it's true nature is best discovered. It derives pleasure from poetry, painting, sculpture, architecture, musick, dancing, in a word, from the various productions of nature and art. Let us, therefore, inquire into the reasons that render these objects pleasing, as also into the manner of their operation, and the times and circumstances in which they produce their agreeable effects, and thus give an account of our various feelings. This will contribute to the formation of taste, which is nothing more than the faculty of discovering with quickness and delicacy the degree of pleasure, which we should receive from each object that comes within the sphere of our perceptions.

* * *

Concerning the pleasures, which arise from order.

It is not sufficient to exhibit to the mind a multiplicity of objects; it is farther requisite that they be exhibited with order and arrangement, for then it retains what it has seen, and also forms to itself some notion of what is to follow. One of the highest mental pleasures is that which we receive from a consciousness of the extent of our views, and the depth of our penetration; but in a production void of order this pleasure is impeded; the mind, desirous to supply from its own ideas this want of regularity, is perplexed in the vain attempt; it's plan mingles itself with that which the author of the work had formed, and this produces a new confusion. It retains nothing, foresees nothing; it is dejected by the confusion that reigns in it's ideas, and by the comfortless void that succeeds the abundance and variety of it's vain recourses. It's fatigue is without it's effect, and efforts are unsuccessful. Hence the judicious artist always introduces a certain order, even amidst confusion, where confusion is not the main object, the principal thing to be expressed. Hence the painter throws his figures into groups; and when he draws a battle, represents, as it were, in the front of his piece, the principal objects which the eye is to distinguish, and casts at a distance, by the magick of perspective, the groups where confusion and disorder reign.

Concerning the pleasure that arises from variety.

If order be thus necessary in all sorts of productions, variety is no less so; without variety the mind falls into a lifeless inactivity and languor; for similar objects appear to it as if they were wholly the same; so that if a part of a piece of painting was disclosed to our view, which carried a striking resemblance of another part of the same piece that we had already seen, this second part would be really a new object without appearing such, and would be contemplated without the least sensation of

pleasure. The beauties we discern in the productions of art, as well as in the works of nature, consisting entirely in the pleasure they administer, it is necessary so to modify these beauties as to render them the means of diversifying our pleasures as far as is possible. We must employ our industry in offering to the eye of the mind objects which it has not as yet seen, and in exciting within it feelings different from those which it may have already experienced.

Thus History pleases by the variety of facts and relations which it contains; Romance by the variety of prodigies it invents; and Dramatic Poetry by the variety of passions which it excites. Thus also they who are well versed in the art of education endeavour to introduce as much diversity as they can amidst that tedious uniformity which is inseparable from a long course of instruction.

Uniformity carried on to a certain length renders every thing insupportable. The same arrangement of periods continued for a long time fatigues in a piece of eloquence. The same numbers and cadences become extremely tedious in a long poem. If the accounts given of the famous Vista or alley that extends from Moscow to Petersburg be true, the traveller, pent up between these two seemingly endless rows of trees, must feel the most disagreeable lassitude and satiety in the continuance of such a dull uniformity. Nay, even prospects which have the charm of variety, cease to please, if they be repeated without much alteration, and are for a long time present to the mind. Thus the traveller, who has been long wandering through the Alps, will descend satiated with the most extensive views, the most romantick and delightful landscapes.

The human mind loves variety, and the reason is, as we have already observed, that it is naturally framed for contemplation and knowledge. If then the love of variety is subordinate and adapted to the attainment of knowledge, it is requisite, that variety, whether in the productions of nature or art, be such as will facilitate knowledge; or, in other words, an object must be sufficiently simple to be perceived with ease, and sufficiently diversified to be contemplated with pleasure.

There are certain objects, which have the appearance of variety, without the reality; and others, that seem to be uniform, but are, in effect, extremely diversified.

The Gothic architecture appears extremely rich in point of variety, but its ornaments fatigue the eye by their confusion and minuteness. Hence we cannot easily distinguish one from the other, nor fix our attention upon any one object, on account of the multitude that rush at once upon the sight; and thus it happens that this kind of architecture displeases in the very circumstances that were designed to render it agreeable.

A Gothic structure is to the eye what a riddle is to the understanding; in the contemplation of its various parts and ornaments the mind perceives the same perplexity and confusion in its ideas, that arise from reading an obscure poem.

The Grecian architecture, on the contrary, appears uniform; but as the nature, and the number also of its divisions are precisely such as occupy the mind without fatiguing it, it has consequently that degree of variety, that is pleasing and delightful.

Greatness in the whole of any production requires of necessity the same quality in the parts. Gigantic bodies must have bulky members; large trees must have large branches, &c. Such is the nature of things.

The Grecian architecture, whose divisions are few, but grand and noble, seems formed after the model of the great and the sublime. The mind perceives a certain majesty which reigns through all it's productions.

Thus the painter distributes the figures, that are to compose his work, into various groups; and in this he follows nature and truth, for a crowd is almost always divided into separate companies. In the same manner in every complex piece of painting we see the lights and shades distributed into large masses, which strike the eye at a distance, before the whole composition is distinctly perceived.

Concerning the pleasure that arises from symmetry.

We have already observed that variety is pleasing to the human mind; and we must farther remark, that a certain degree of Symmetry produces also an agreeable effect, and contributes to the beauty of the greatest part of those complex productions, which we behold with admiration and delight. How shall we reconcile this seeming contradiction! It will vanish if we attend to the following observations.

One of the principal causes of the pleasure, which the mind receives in the contemplation of the various objects that are presented to it, is the facility with which it perceives them. Hence Symmetry is rendered agreeable, as it's similar arrangements relieve the mind, aid the quickness of it's comprehension, and enable it, upon a view of the one half of an object, to form immediately an idea of the whole.

Upon this observation is founded the following general rule, That where Symmetry is thus useful to the mind, by aiding it's comprehension, and facilitating it's operations and it's perceptions, there it is, and must always be agreeable; but where it does not produce this effect, it becomes flat and insipid, because, without any good purpose, it deprives an object of that variety to which nature has given superior charms. In those objects which are viewed successively, variety is requisite, because they are distinctly perceived without the least difficulty. On the contrary, where a multitude of objects are presented to us in one point of view, and rush in at once upon the eye, there Symmetry is necessary to aid us in forming quickly an idea of the whole. Thus Symmetry is observed in the front of a building, in a parterre, in a temple; and there it pleases extremely for the reason now mentioned, it's aiding the mind to take in immediately the whole object without pain, perplexity, or confusion.

The object which the mind views not successively, but, as it were, by one effort, must be simple and one; all it's parts must unite in forming one design, and must relate to one end. This is another consideration, that renders symmetry pleasing, as it alone properly constitutes what we call a whole, or the effect of a variety of parts that center in one general design.

There is yet another consideration that pleads in favour of symmetry, and that is the desire, so natural to the mind, of seeing every thing finished and brought to perfection. In all complex objects there must be a sort of counterbalance, or equilibrium between the various parts that terminate in one whole; and an edifice only with one wing, or with one wing shorter than the other, would be as unfinished and imperfect a production as a body with only one arm, or with two of unequal length.

Concerning contrasts.

If the mind takes pleasure in symmetry, it is also agreeably affected by contrasts. This requires explication, and a few examples will serve for that purpose.

If painters and sculptors, in obedience to the directions of nature, are careful to observe a certain symmetry in their compositions; the same nature requires that the attitudes which they represent should contrast each other; and thus exhibit an agreeable variety, a pleasing opposition to the eye of the spectator. One foot placed precisely in the same position with the other, or any two of the corresponding parts of the body placed exactly in the same direction, disgust a judicious observer, because this studied symmetry produces a perpetual and insipid sameness of attitude, such as we observe in the Gothic figures, which all resemble each other in this respect. Besides, this uniformity of attitude is contrary to our natural frame and constitution; nature has not designed that we should imitate in our gestures the stupid uniformity that is observable in the Indian Pagods: no; she has given us the power of self-motion and consequently the liberty of modifying our air and our posture as we please. And if stiffness and affectation be unsupportable in the human form, can they be pleasing in the productions of art?

The attitudes therefore, particularly of such figures as are represented in sculpture, must be contrasted in order to give them an agreeable air of variety and ease. What renders this more especially necessary in sculpture is, that of all the arts it is naturally the most cold and lifeless, and can only affect and enflame by the force of it's contrasts and the boldness of it's postures.

But as, according to an observation already made, the variety which the Gothic architects were studious to introduce into their structures gave them an insipid air of uniformity; so has it happened that the variety, which other artists proposed effectuating by the means of contrasts, has degenerated also into a vicious symmetry. [...]

Several painters have fallen into this vicious custom of multiplying contrasts beyond measure in all their compositions, so that the view of one single figure will enable the acute observer to guess at the disposition of all those that are contiguous to it. This perpetual study of diversity produces uniformity, as has been observed above. Besides, this passion for multiplying contrasts has no example in nature, which operates, on the contrary, with a seeming disorder, void of all affectation, and, so far from giving to all bodies a determinate and uniform motion, gives to a great number no motion at all. The hand of nature diversifies truly her multifarious productions; some bodies she holds in repose, while she impresses upon others an infinite variety of tendencies and movements.

If the merely intellectual faculties of our nature determine us to take pleasure in variety, our feeling powers are not less agreeably affected by it. The mind cannot long bear the same objects, the same pleasures, the same situations, if I may use that term, because it is united to a body to which they are insupportable. The activity of the mind, and it's sensations and feelings depend upon the course of the animal spirits that circulate in the nerves; there are, of consequence, two circumstances that suspend their vigour, viz. the lassitude of the nerves, and the dissipation of the animal spirits, or their entire cessation.

Thus every thing fatigues us after a certain time; this, at least, is undoubtedly true with respect to those pleasures that are extremely intense; we quit them always with the same satisfaction with which we embraced them; the fibres which were their instruments have need of repose; we must therefore employ others that are in a condition to serve us, and thus distribute equally to the various parts of our frame the functions they are to perform in rendering us active and happy.

The soul finds it's vigour exhausted by any long and intense feeling. But to be destitute of sentiment or feeling, is to fall into a void which sinks and overwhelms our better part. We remedy this disorder, or rather prevent this disagreeable alternative by diversifying the modifications and pleasures of the mind, and then it feels without weariness.

8 Voltaire (François-Marie Arouet, 1694–1778) 'Essay on Taste'

Voltaire was born in Paris and educated by the Jesuits. After study of the law he turned to writing and pursued a prominent and turbulent career as critic, dramatist, novelist, aesthete and *philosophe*. He combined a relatively conservative taste in art with a powerful commitment to the righting of social injustices. Rewards for his work included periods of imprisonment and exile at one extreme, and at the other the patronage of Frederick the Great of Prussia and an appointment as royal historiographer to the French court. Like Jean-Jacques Rousseau, he contributed substantially to the intellectual background of the French Revolution. In his 'Essay on Taste', Voltaire distinguishes between a merely physical taste, such as the preference for one flavour over another, which he calls 'fancy', and what he refers to as 'intellectual taste'. This latter has for him an objective aspect, such that it can be true or false. It is salutary to note that, revolutionary liberalism notwithstanding, from Voltaire's point of view as expressed in the present essay, 'taste' is an entirely Eurocentric attribute. Voltaire's 'Essay on Taste', like that by Montesquieu (III B7), was translated into English and published as a supplement to Alexander Gerard's *Essay on Taste*, Edinburgh and London: A. Millar, 1759, pp. 213–22. Our extract is from pp. 218–22 of this edition.

[...] It is a common saying, that there is no disputing about tastes: And if by taste here be understood the palate, which loaths certain aliments and relishes others, the maxim is just; because it is needless to dispute about what cannot be corrected, or to attempt reforming the constitution and mechanism of organs merely corporeal. But the maxim is false and pernicious, when applied to that intellectual taste, which has for it's objects the arts and sciences. As these objects have real charms, so there is in reality a good taste which perceives them, and a bad one which perceives them not; and there are certain methods, by which we may often correct those mental defects which produce a depraved *taste*. But it must be granted, at the same time, that there are certain phlegmatick spirits, which nothing can enflame, and also certain distorted intellects, which it is impossible to rectify; with such therefore, it is in vain to dispute about tastes, because they have none at all.

In many things Taste seems to be of an arbitrary nature, and without any fixed or uniform direction, such as in the choice of dress and equipage, and in every thing that

does not come within the circle of the finer arts. In this low sphere it should be distinguished, methinks, by the name of fancy; for it is fancy rather than taste, that produces such an endless variety of new and contradictory modes.

The taste of a nation may degenerate and become extremely depraved; and it almost always happens that the period of it's perfection is the forerunner of it's decline. Artists through the apprehension of being regarded as mere imitators, strike out into new and uncommon paths, and turn aside from the beautiful simplicity of nature, which their predecessors invariably kept in view. In these efforts there is a certain degree of merit, which arises from industry and emulation, and casts a veil over the defects which accompany their productions. The publick, fond of novelty, applauds their invention; but this applause is soon succeeded by satiety and disgust. A new set of artists start up, invent new methods to please a capricious taste, and depart still further from nature than those who first ventured from it's paths into the wilds of fancy. Thus the taste of a people degenerates into the grossest corruption. Overwhelmed with new inventions, which succeed and efface each other with incredible rapidity, they scarcely know where they are, and cast back their eager and anxious desires towards the period, when true taste reigned under the empire of nature. But they implore it's return in vain; that happy period cannot be recalled, it deposits however in the custody of certain choice spirits the sublime pleasures of true taste, which they cherish and enjoy in their little circle, remote from the profane eye of the depraved and capricious multitude.

There are vast countries, where taste has not yet been able to penetrate. Such are those uncultivated wastes, where civil society has never been brought to any degree of perfection, where there is little intercourse between the sexes, and where all representations of living creatures in painting and sculpture are severely prohibited by the laws of religion. Nothing renders the mind so narrow, and so little, if I may use that expression, as the want of social intercourse; this confines it's faculties, blunts the edge of genius, damps every noble passion, and leaves in a state of languor and inactivity every principle, that could contribute to the formation of true taste. Besides, where several of the finer arts are wanting, the rest must necessarily languish and decay, since they are inseparably connected together, and mutually support each other. This is one reason, why the Asiatics have never excelled in any of the arts, and hence also it is that true taste has been confined to certain countries in Europe.

9 Joshua Reynolds (1723–1792) Letters to 'The Idler'

Joshua Reynolds enjoyed the grandest career that English art has had to offer. The Founder-President of the Royal Academy, he dominated the scene for thirty years, and the *Discourses* he delivered annually to that institution have a deserved place in the forefront of the literature of art (see IVA7). Reynolds was at the heart of a group which, in effect, constituted the component of the Enlightenment in England: Burke, Goldsmith, Gibbon, Garrick among others, and, first among equals, Samuel Johnson. These early papers took the form of Letters contributed to 'The Idler' in 1759. 'The Idler' was a weekly series of essays appearing every Saturday in the *Universal Chronicle*, the vast majority of them written by Johnson. The concept of the detached observer implicit in the title marks

an interesting prefiguration of the idea of the *flâneur*, which would come to play such an important role in the constitution of the mid-nineteenth century avant-garde (see *Art in Theory 1815–1900* III D7, 8). The 'Idler' essays were Reynolds' first published literary works. He begins by disparaging a petty adherence to rules in art, both in making it and judging it, although Rule as such is not his target, merely its mechanical following. (His foolish connoisseur's invocation of a 'flowing line of grace and beauty' is assumed to have been a dig at Hogarth – see III B3.) In his second letter he again criticizes the mechanic aspect of art, this time with regard to imitation, and emphasizes instead the need of Grand Style if painting is to maintain its place as a liberal art. The third letter is a meditation on beauty, which it defines as a product of generality rather than particularity (and thus celebrates the Italian school at the expense of the Dutch) while simultaneously conceding a measure of cultural relativity. The extracts are taken from the letters as reprinted in Reynolds' *Discourses*, edited with an introduction and notes by Pat Rogers, Harmondsworth: Penguin Classics, 1992, Appendix B, pp. 347–58.

The Idler Number 76 *Saturday, September 29 1759*

Sir,

I was much pleased with your ridicule of those shallow Criticks, whose judgement, though often right as far as it goes, yet reaches only to inferior beauties; and who, unable to comprehend the whole, judge only by parts, and from thence determine the merit of extensive works. But there is another kind of Critick still worse, who judges by narrow rules, and those too often false, and which though they should be true, and founded on nature, will lead him but a very little way towards the just estimation of the sublime beauties in works of Genius; for whatever part of an art can be executed or criticised by rules, that part is no longer the work of Genius, which implies excellence out of the reach of rules. For my own part, I profess myself an Idler, and love to give my judgement, such as it is, from my immediate perceptions, without much fatigue of thinking; and I am of opinion, that if a man has not those perceptions right, it will be vain for him to endeavour to supply their place by rules; which may enable him to talk more learnedly, but not to distinguish more acutely. Another reason which has lessened my affection for the study of Criticism is, that Criticks, so far as I have observed, debar themselves from receiving any pleasure from the polite arts, at the same time that they profess to love and admire them: for these rules being always uppermost, give them such a propensity to criticise, that instead of giving up the reins of their imagination into their author's hands, their frigid minds are employed in examining whether the performance be according to the rules of art.

To those who are resolved to be Criticks in spite of nature, and at the same time have no great disposition to much reading and study, I would recommend to assume the character of Connoisseur, which may be purchased at a much cheaper rate than that of a Critick in poetry. The remembrance of a few names of Painters, with their general characters, and a few rules of the Academy, which they may pick up among the Painters, will go a great way towards making a very notable Connoisseur.

With a Gentleman of this cast, I visited last week the Cartoons at Hampton-Court; he was just returned from Italy, a Connoisseur, of course, and of course his mouth

full of nothing but the Grace of Raffaele, the Purity of Domenichino, the Learning of Poussin, the Air of Guido, the greatness of Taste of the Caraccis, and the Sublimity and grand Contorno of Michael Angelo; with all the rest of the cant of Criticism, which he emitted with that volubility which generally those orators have, who annex no ideas to their words.

As we were passing through the rooms, in our way to the Gallery, I made him observe a whole length of Charles the First, by Vandyck, as a perfect representation of the character as well as the figure of the man: He agreed it was very fine, but it wanted spirit and contrast, and had not the flowing line, without which a figure could not possibly be graceful. When we entered the Gallery, I thought I could perceive him recollecting his Rules by which he was to criticise Raffaele. I shall pass over his observation of the boats being too little, and other criticisms of that kind, till we arrived at *St Paul preaching*. 'This,' says he, 'is esteemed the most excellent of all the Cartoons: what nobleness, what dignity there is in that figure of St Paul! and yet what an addition to that nobleness could Raffaele have given, had the art of Contrast been known in his time; but above all, the flowing line, which constitutes Grace and Beauty. You would not then have seen an upright figure standing equally on both legs, and both hands stretched forward in the same direction, and his drapery, to all appearance, without the least art of disposition.' [...]

I shall trouble you no longer with my friend's observations, which, I suppose, you are now able to continue by yourself. It is curious to observe, that at the same time that great admiration is pretended for a name of fixed reputation, objections are raised against those very qualities by which that great name was acquired.

These Criticks are continually lamenting that Raffaele had not the Colouring and Harmony of Rubens, or the Light and Shadow of Rembrandt, without considering how much the gay harmony of the former, and affectation of the latter, would take from the Dignity of Raffaele; and yet Rubens had great Harmony, and Rembrandt understood Light and Shadow; but what may be an excellence in a lower class of Painting, becomes a blemish in a higher; as the quick, sprightly turn, which is the life and beauty of epigrammatick compositions, would but ill suit with the majesty of heroic Poetry.

To conclude; I would not be thought to infer from any thing that has been said, that Rules are absolutely unnecessary, but to censure scrupulosity, a servile attention to minute exactness, which is sometimes inconsistent with higher excellence, and is lost in the blaze of expanded genius. [...]

The Idler Number 79 *Saturday, October 20 1759*

Your acceptance of a former letter on Painting, gives me encouragement to offer a few more sketches on the same subject.

Amongst the Painters and the writers on Painting, there is one maxim universally admitted and continually inculcated. *Imitate Nature*, is the invariable rule; but I know none who have explained in what manner this rule is to be understood; the consequence of which is, that every one takes it in the most obvious sense, – that objects are represented naturally, when they have such relief that they seem real. It may appear strange, perhaps, to hear this sense of the rule disputed; but it must be

considered, that if the excellency of a Painter consisted only in this kind of imitation, Painting must lose its rank, and be no longer considered as a liberal art, and sister to Poetry; this imitation being merely mechanical, in which the slowest intellect is always sure to succeed best; for the Painter of genius cannot stoop to drudgery, in which the understanding has no part; and what pretence has the art to claim kindred with Poetry, but by its power over the imagination? To this power the Painter of genius directs his aim; in this sense he studies Nature, and often arrives at his end, even by being unnatural, in the confined sense of the word.

The grand style of Painting requires this minute attention to be carefully avoided, and must be kept as separate from it as the style of Poetry from that of History. Poetical ornaments destroy that air of truth and plainness which ought to characterise History; but the very being of Poetry consists in departing from this plain narration, and adopting every ornament that will warm the imagination. To desire to see the excellencies of each style united, to mingle the Dutch with the Italian School, is to join contrarieties which cannot subsist together, and which destroy the efficacy of each other. The Italian attends only to the invariable, the great and general ideas which are fixed and inherent in universal Nature; the Dutch, on the contrary, to literal truth and a minute exactness in the detail, as I may say, of Nature modified by accident. The attention to these petty peculiarities is the very cause of this naturalness so much admired in the Dutch pictures, which, if we suppose it to be a beauty, is certainly of a lower order, that ought to give place to a beauty of a superior kind, since one cannot be obtained but by departing from the other.

If my opinion were asked concerning the works of Michael Angelo, whether they would receive any advantage from possessing this mechanical merit, I should not scruple to say, they would lose, in a great measure, the effect which they now have on every mind susceptible of great and noble ideas. His works may be said to be all genius, and soul; and why should they be loaded with heavy matter, which can only counteract his purpose by retarding the progress of the imagination?

If this opinion should be thought one of the wild extravagances of enthusiasm, I shall only say, that those who censure it are not conversant in the works of the great Masters. It is very difficult to determine the exact degree of enthusiasm that the arts of Painting and Poetry may admit. There may perhaps be too great an indulgence, as well as too great a restraint of imagination; and if the one produces incoherent monsters, the other produces what is full as bad, lifeless insipidity. An intimate knowledge of the passions and good sense, but not common sense, must at last determine its limits. It has been thought, and I believe with reason, that Michael Angelo sometimes transgressed those limits; and I think I have seen figures by him, of which it was very difficult to determine, whether they were in the highest degree sublime or extremely ridiculous. Such faults may be said to be the ebullition of Genius; but at least he had this merit, that he never was insipid; and whatever passion his works may excite, they will always escape contempt.

What I have had under consideration is the sublimest style, particularly that of Michael Angelo, the Homer of Painting. Other kinds may admit of this naturalness, which of the lowest kind is the chief merit; but in Painting, as in Poetry, the highest style has the least of common nature. [. . .]

The Idler Number 82 *Saturday, November 10 1759*

Discoursing in my last letter on the different practice of the Italian and Dutch Painters, I observed that 'the Italian Painter attends only to the invariable, the great, and general ideas, which are fixed and inherent in universal nature.'

I was led into the subject of this letter by endeavouring to fix the original cause of this conduct of the Italian Masters. If it can be proved that by this choice they selected the most beautiful part of the creation, it will show how much their principles are founded on reason, and, at the same time, discover the origin of our ideas of beauty.

I suppose it will be easily granted, that no man can judge whether any animal be beautiful in its kind, or deformed, who has seen only one of that species; this is as conclusive in regard to the human figure; so that if a man, born blind, were to recover his sight, and the most beautiful woman were brought before him, he could not determine whether she was handsome or not; nor if the most beautiful and most deformed were produced, could he any better determine to which he should give the preference, having seen only those two. To distinguish beauty, then, implies the having seen many individuals of that species. If it is asked, how is more skill acquired by the observation of greater numbers? I answer, that, in consequence of having seen many, the power is acquired, even without seeking after it, of distinguishing between accidental blemishes and excrescences which are continually varying the surface of Nature's works, and the invariable general form which Nature most frequently produces, and always seems to intend in her productions.

Thus amongst the blades of grass or leaves of the same tree, though no two can be found exactly alike, the general form is invariable: a Naturalist, before he chose one as a sample, would examine many; since if he took the first that occurred, it might have, by accident or otherwise, such a form as that it would scarce be known to belong to that species; he selects as the Painter does, the most beautiful, that is, the most general form of nature.

Every species of the animal as well as the vegetable creation may be said to have a fixed or determinate form, towards which Nature is continually inclining, like various lines terminating in the centre; or it may be compared to pendulums vibrating in different directions over one central point: and as they all cross the centre, though only one passes through any other point, so it will be found that perfect beauty is oftener produced by nature than deformity; I do not mean than deformity in general, but than any one kind of deformity. To instance in a particular part of a feature; the line that forms a ridge of the nose is beautiful when it is straight; this then is the central form, which is oftener found than either concave, convex, or any other irregular form that shall be proposed. As we are then more accustomed to beauty than deformity, we may conclude that to be the reason why we approve and admire it, as we approve and admire customs and fashions of dress for no other reason than that we are used to them; so that though habit and custom cannot be said to be the cause of beauty, it is certainly the cause of our liking it; and I have no doubt but that if we were more used to deformity than beauty, deformity would then lose the idea now annexed to it, and take that of beauty: as if the whole world should

agree, that *yes* and *no* should change their meaning; *yes* would then deny, and *no* would affirm.

Whoever undertakes to proceed further in this argument, and endeavours to fix a general criterion of beauty respecting different species, or to show why one species is more beautiful than another, it will be required from him first to prove that one species is really more beautiful than another. That we prefer one to the other, and with very good reason, will be readily granted; but it does not follow from thence that we think it a more beautiful form; for we have no criterion of form by which to determine our judgement. He who says a swan is more beautiful than a dove, means little more than that he has more pleasure in seeing a swan than a dove, either from the stateliness of its motions, or its being a more rare bird; and he who gives the preference to the dove, does it from some association of ideas of innocence which he always annexes to the dove; but if he pretends to defend the preference he gives to one or the other by endeavouring to prove that this more beautiful form proceeds from a particular gradation of magnitude, undulation of a curve, or direction of a line, or whatever other conceit of his imagination he shall fix on, as a criterion of form, he will be continually contradicting himself, and find at last that the great Mother of Nature will not be subjected to such narrow rules. Among the various reasons why we prefer one part of her works to another, the most general, I believe, is habit and custom; custom makes, in a certain sense, white black, and black white; it is custom alone determines our preference of the colour of the Europeans to the Ethiopians, and they, for the same reason, prefer their own colour to ours. I suppose no body will doubt, if one of their Painters were to paint the Goddess of Beauty, but that he would represent her black, with thick lips, flat nose, and woolly hair; and, it seems to me, he would act very unnaturally if he did not: for by what criterion will any one dispute the propriety of his idea! We indeed say, that the form and colour of the European is preferable to that of the Ethiopian; but I know of no other reason we have for it, but that we are more accustomed to it. It is absurd to say, that beauty is possessed of attractive powers, which irresistibly seize the corresponding mind with love and admiration, since that argument is equally conclusive in favour of the white and the black philosophers.

The black and white nations must, in respect of beauty, be considered as of different kinds, at least a different species of the same kind; from one of which to the other, as I observed, no inference can be drawn.

Novelty is said to be one of the causes of beauty. That novelty is a very sufficient reason why we should admire, is not denied; but because it is uncommon, it is therefore beautiful? The beauty that is produced by colour, as when we prefer one bird to another, though of the same form, on account of its colour, has nothing to do with the argument, which reaches only to form. I have here considered the word Beauty as being properly applied to form alone. There is a necessity of fixing this confined sense; for there can be no argument, if the sense of the word is extended to every thing that is approved. A rose may as well be said to be beautiful, because it has a fine smell, as a bird because of its colour. When we apply the word Beauty, we do not mean always by it a more beautiful form, but something valuable on account of its rarity, usefulness, colour, or any other property. A horse is said to be a beautiful

animal; but had a horse as few good qualities as a tortoise, I do not imagine that he would then be deemed beautiful.

A fitness to the end proposed, is said to be another cause of beauty; but supposing we were proper judges of what form is the most proper in an animal to constitute strength or swiftness, we always determine concerning its beauty, before we exert our understanding to judge of his fitness.

From what has been said, it may be inferred, that the works of Nature, if we compare one species with another, are all equally beautiful, and that preference is given from custom or some association of ideas; and that, in creatures of the same species, beauty is the medium or centre of all its various forms.

To conclude, then, by way of corollary: if it has been proved that the Painter, by attending to the invariable and general ideas of Nature, produce beauty, he must, by regarding minute particularities, and accidental discriminations, deviate from the universal rule, and pollute his canvass with deformity.

10 Edward Young (1683–1765) from *Conjectures on Original Composition*

Young was a poet and dramatist as well as a writer on the arts. He was best known in his lifetime for the long poem he wrote on death, called *The Complaint, or Night Thoughts* (1742–5). He knew Samuel Johnson well, and was also a friend of Joshua Reynolds' father. His *Conjectures on Original Composition*, which had some success in Europe as well as England, were addressed to another of his literary friends, the novelist Samuel Richardson. The notion of originality was becoming fashionably controversial in the mid-eighteenth century. At this time, the unquestioning invocation of rules and decorum laid down in the Renaissance and Antiquity began to be moderated by the more individualistic spirit which would ultimately give rise to Romanticism. In some of his early *Discourses* Reynolds appears to take issue quite directly with Young's celebration of originality. The *Conjectures on Original Composition in a Letter to the Author of Sir Charles Grandison* [i.e. Richardson] were published in London in 1759. The selections are from the facsimile edition, Leeds: Scholar Press, 1966, pp. 9–13, 17–20, 48–56, 71–5.

[...] The mind of a man of Genius is a fertile and pleasant field, pleasant as Elysium, and fertile as Tempe; it enjoys a perpetual Spring. Of that Spring, Originals are the fairest Flowers: Imitations are of quicker growth, but fainter bloom. Imitations are of two kinds; one of Nature, one of Authors: The first we call Originals, and confine the term Imitation to the second. I shall not enter into the curious enquiry of what is, or is not, strictly speaking, Original, content with what all must allow, that some Compositions are more so than others; and the more they are so, I say, the better. Originals are, and ought to be, great Favourites, for they are great Benefactors; they extend the Republic of Letters, and add a new province to its dominion: Imitators only give us a sort of Duplicates of what we had, possibly much better, before; increasing the mere Drug of books, while all that makes them valuable, Knowledge and Genius, are at a stand. The pen of an Original Writer, like Armida's wand, out of a barren waste calls a blooming spring: Out of that blooming spring an Imitator is a

transplanter of Laurels, which sometimes die on removal, always languish in a foreign soil.

But suppose an Imitator to be most excellent (and such there are), yet still he but nobly builds on another's foundation; his Debt is, at least, equal to his Glory; which therefore, on the ballance, cannot be very great. On the contrary, an Original, tho' but indifferent (its Originality being set aside,) yet has something to boast; it is something to say with him in Horace,

Meo sum Pauper in œre;

['I am poor in money.']

and to share ambition with no less than Cæsar, who declared he had rather be the First in a Village, than the Second at Rome.

Still farther: An Imitator shares his crown, if he has one, with the chosen Object of his Imitation; an Original enjoys an undivided applause. An Original may be said to be of a vegetable nature; it rises spontaneously from the vital root of Genius; it grows, it is not made: Imitations are often a sort of Manufacture wrought up by those Mechanics, Art, and Labour, out of pre-existent materials not their own.

Again: We read Imitation with somewhat of his languor, who listens to a twice-told tale: Our spirits rouse at an Original; that is a perfect stranger, and all throng to learn what news from a foreign land: And tho' it comes, like an Indian Prince, adorned with feathers only, having little of weight; yet of our attention it will rob the more Solid, if not equally New: Thus every Telescope is lifted at a new-discovered star; it makes a hundred Astronomers in a moment, and denies equal notice to the sun. But if an Original, by being as excellent, as new, adds admiration to surprize, then are we at the Writer's mercy; on the strong wing of his Imagination, we are snatched from Britain to Italy, from Climate to Climate, from Pleasure to Pleasure; we have no Home, no Thought, of our own; till the Magician drops his Pen: And then falling down into ourselves, we awake to flat Realities, lamenting the change, like the Beggar who dreamt himself a Prince. [...]

But why are Originals so few? not because the Writer's harvest is over, the great Reapers of Antiquity having left nothing to be gleaned after them; nor because the human mind's teeming time is past, or because it is incapable of putting forth unprecedented births; but because illustrious Examples engross, prejudice, and intimidate. They engross our attention, and so prevent a due inspection of ourselves; they prejudice our Judgment in favour of their abilities, and so lessen the sense of our own; and they intimidate us with the splendor of their Renown, and thus under Diffidence bury our strength. Nature's Impossibilities, and those of Diffidence, lie wide asunder.

Let it not be suspected, that I would weakly insinuate any thing in favour of the Moderns, as compared with antient Authors; no, I am lamenting their great Inferiority. But I think it is no necessary Inferiority; that it is not from divine Destination, but from some cause far beneath the moon: I think that human Souls, thro' all periods, are equal; that due care, and exertion, would set us nearer our immortal Predecessors than we are at present; and he who questions and confutes this, will show abilities not a little tending toward a proof of that Equality, which he denies.

After all, the first Ancients had no Merit in being Originals: They could not be Imitators. Modern Writers have a Choice to make; and therefore have a Merit in their power. They may soar in the Regions of Liberty, or move in the soft Fetters of easy Imitation; and Imitation has as many plausible Reasons to urge, as Pleasure had to offer to Hercules. Hercules made the Choice of an Hero, and so became immortal.

Yet let not Assertors of Classic Excellence imagine, that I deny the Tribute it so well deserves. He that admires not antient Authors, betrays a secret he would conceal, and tells the world, that he does not understand them. Let us be as far from neglecting, as from copying, their admirable Compositions: Sacred be their Rights, and inviolable their Fame. Let our Understandings feed on theirs; they afford the noblest nourishment: But let them nourish, not annihilate, our own. When we read, let our Imagination kindle at their Charms; when we write, let our Judgment shut them out of our Thoughts; treat even Homer himself, as his royal Admirer was treated by the Cynic; bid him stand aside, nor shade our Composition from the beams of our own Genius; for nothing Original can rise, nothing Immortal can ripen, in any other Sun. [...]

As great, perhaps, greater than those mentioned (presumptuous as it may sound) may, possibly, arise; for who hath fathomed the mind of man? Its bounds are as unknown, as those of the creation; since the birth of which, perhaps, not One has so far exerted, as not to leave his Possibilities beyond his Attainments, his Powers beyond his Exploits. Forming our judgments, altogether by what has been done, without knowing, or at all inquiring, what possibly might have been done, we naturally enough fall into too mean an opinion of the human mind. If a sketch of the divine Iliad before Homer wrote, had been given to mankind, by some superior being, or otherwise, its execution would, probably, have appeared beyond the power of man. Now, to surpass it, we think impossible. As the First of these opinions would evidently have been a mistake, why may not the Second be so too? Both are founded on the same bottom; on our ignorance of the possible dimensions of the mind of man.

Nor are we only ignorant of the dimensions of the human mind in general, but even of our own. That a Man may be scarce less ignorant of his own powers, than an Oyster of its pearl, or a Rock of its diamond; that he may possess dormant, unsuspected abilities, till awakened by loud calls, or stung up by striking emergencies; is evident from the sudden eruption of some men, out of perfect obscurity, into publick admiration, on the strong impulse of some animating occasion; not more to the world's great surprize, than their own. Few authors of distinction but have experienced something of this nature, at the first beamings of their yet unsuspected Genius on their hitherto dark Composition: The writer starts at it, as at a lucid Meteor in the night; is much surprized; can scarce believe it true. During his happy confusion, it may be said to him, as to Eve at the Lake,

*What there thou seest, fair creature
is thyself.*

Milt.

Genius, in this view, is like a dear Friend in our company under disguise; who, while we are lamenting his absence, drops his mask, striking us, at once, with equal surprize and joy. [...]

Since it is plain that men may be strangers to their own abilities; and by thinking meanly of them without just cause, may possibly lose a name, perhaps, a name immortal; I would find some means to prevent these Evils. Whatever promotes Virtue, promotes something more, and carries its good influence beyond the moral man: To prevent these evils, I borrow two golden rules from Ethics, which are no less golden in Composition, than in life. 1. Know thyself; 2dly, Reverence thyself. [...]

Therefore dive deep into thy bosom; learn the depth, extent, bias, and full fort of thy mind; contract full intimacy with the Stranger within thee; excite, and cherish every spark of Intellectual light and heat, however smothered under former negligence, or scattered through the dull, dark mass of common thoughts; and collecting them into a body, let thy Genius rise (if a Genius thou hast) as the sun from Chaos; and if I should then say, like an Indian, worship it, (though too bold) yet should I say little more than my second rule enjoins, (*viz.*) Reverence thyself.

That is, let not great Examples, or Authorities, browbeat thy Reason into too great a diffidence of thyself: Thyself so reverence as to prefer the native growth of thy own mind to the richest import from abroad; such borrowed riches make us poor. The man who thus reverences himself, will soon find the world's reverence to follow his own. His works will stand distinguished; his the sole Property of them; which Property alone can confer the noble title of an Author; [...]

This is the difference between those two Luminaries in Literature, the well-accomplished Scholar, and the divinely-inspired Enthusiast; the First is, as the bright morning star; the Second, as the rising sun. The writer who neglects those two rules above will never stand alone; he makes one of a group and thinks in wretched unanimity with the throng: Incumbered with the notions of others, and impoverished by their abundance, he conceives not the least embryo of new thought; opens not the least vista thro' the gloom of ordinary writers, into the bright walks of rare Imagination, and singular Design; while the true Genius is crossing all publick roads into fresh untrodden ground; he, up to the knees in Antiquity, is treading the sacred footsteps of great examples, with the blind veneration of a bigot saluting the papal toe; comfortably hoping full absolution for the sins of his own understanding, from the powerful charm of touching his idol's Infallibility.

Such meanness of mind, such prostration of our own powers, proceeds from too great admiration of others. Admiration has, generally, a degree of two very bad ingredients in it; of Ignorance, and of Fear; and does mischief in Composition, and in Life. [...]

If thoughts of this nature prevailed; if Antients and Moderns were no longer considered as masters and pupils, but as hard-match'd rivals for renown; then moderns, by the longevity of their labours, might, one day, become antients themselves: And old Time, that best weigher of merits, to keep his balance even, might have the golden weight of an Augustan age in both his scales: Or rather our scale might descend; and antiquity's (as a modern match for it strongly speaks) might kick the beam. [...]

What a rant, say you, is here? – I partly grant it: Yet, consider, my Friend! knowledge physical, mathematical, moral, and divine, increases; all arts and sciences are making considerable advance; with them, all the accommodations, ornaments,

delights, and glories of human life; and these are new food to the Genius of a polite writer; these are as the root, and composition, as the flower; and as the root spreads, and thrives, shall the flower fail? As well may a flower flourish, when the root is dead. It is Prudence to read, Genius to relish, Glory to surpass, antient authors; and Wisdom to try our strength in an attempt in which it would be no great dishonour to fail.

11 Charles François Tiphaigne de la Roche (1722–1774) from *Giphantia*

Tiphaigne de la Roche was a French doctor and author who wrote a number of scientific treatises as well as several novels. His fantastic tale *Giphantie* was published in Paris in 1760 (though the title-page says Babylon, a frequent ploy to evade censorship). It was translated into English the following year as *Giphantia*. *Giphantie*, which is an anagram of the author's own name, purports to be the memoirs of a traveller who journeys through the world, passing through many strange lands and observing their inhabitants (not unlike Swift's Gulliver, whose *Travels* were published in 1726). *Giphantia* itself was a fertile island in the desert 'given to the elementary spirits the day before the Garden of Eden was allotted to the parent of mankind' (p. 15). The Prefect of *Giphantia* conducts the author on a tour of the country and provides him with a magical rod and a mirror which enable him to see into every part of the world. He is then taken down a flight of stairs and along a tunnel before being brought into the light again. What follows amounts to a remarkable imaginative anticipation of the process of photography, almost eighty years before it was actually realized (see also VIIA5). We reprint chapter XVII, 'The Storm' from *Giphantia: or A View of What has Passed, What is now Passing, and, during the Present Century, what Will Pass in the World*, London: Robert Horsfield, 1761, pp. 93–8.

Some paces from the noisy globe, the earth is hollowed, and there appears a descent of forty or fifty steps of turf; at the foot of which there is a beaten subterraneous path. We went in; and my guide, after leading me through several dark turnings, brought me at last to the light again.

He conducted me into a hall of a middling size, and not much adorned, where I was struck with a sight that raised my astonishment. I saw, out of a window, a sea which seemed to me to be about a quarter of a mile distant. The air, full of clouds, transmitted only that pale light which forebodes a storm: the raging sea ran mountains high, and the shore was whitened with the foam of the billows which broke on the beach.

By what miracle (said I to myself) has the air, serene a moment ago, been so suddenly obscured? By what miracle do I see the ocean in the center of Africa? Upon saying these words, I hastily ran to convince my eyes of so improbable a thing. But in trying to put my head out of the window, I knocked it against something that felt like a wall. Stunned with the blow, and still more with so many mysteries, I drew back a few paces.

Thy hurry (said the Prefect) occasions thy mistake. That window, that vast horizon, those thick clouds, that raging sea, are all but a picture.

From one astonishment I fell into another: I drew near with fresh haste; my eyes were still deceived, and my hand could hardly convince me that a picture should have caused such an illusion.

The elementary spirits (continued the Prefect) are not so able painters as naturalists; thou shalt judge by their way of working. Thou knowest that the rays of light, reflected from different bodies, make a picture and paint the bodies upon all polished surfaces, on the retina of the eye, for instance, on water, on glass. The elementary spirits have studied to fix these transient images: they have composed a most subtile matter, very viscous, and proper to harden and dry, by the help of which a picture is made in the twinkle of an eye. They do cover with this matter a piece of canvas, and hold it before the objects they have a mind to paint. The first effect of the canvas is that of a mirrour; there are seen upon it all the bodies far and near, whose image the light can transmit. But what the glass cannot do, the canvas, by means of the viscous matter, retains the images. The mirrour shows the objects exactly; but keeps none; our canvases show them with the same exactness, and retains them all. This impression of the images is made the first instant they are received on the canvas, which is immediately carried away into some dark place; an hour after, the subtile matter dries, and you have a picture so much the more valuable, as it cannot be imitated by art nor damaged by time. We take, in their purest source, in the luminous bodies, the colours which painters extract from different materials, and which time never fails to alter. The justness of the design, the truth of the expression, the gradation of the shades, the stronger or weaker strokes, the rules of perspective, all these we leave to nature, who, with a sure and never-erring hand, draws upon our canvases images which deceive the eye and make reason to doubt, whether, what are called real objects, are not phantoms which impose upon the sight, the hearing, the feeling, and all the senses at once.

The Prefect then entered into some physical discussions, first, on the nature of the glutinous substance which intercepted and retained the rays; secondly, upon the difficulties of preparing and using it; thirdly, upon the struggle between the rays of light and the dried substance; three problems, which I propose to the naturalists of our days, and leave to their sagacity.

Mean while, I could not take off my eyes from the picture. A sensible spectator, who from the shore beholds a tempestuous sea, feels not more lively impressions: such images are equivalent to the things themselves.[...]

12 Johann Georg Hamann (1730–1788) *from Aesthetica in nuce*

Hamann cut a strange figure in the Age of Reason, significantly at odds with most of his contemporaries in the German Enlightenment. Born and educated at Königsberg in East Prussia, he was based there again from 1759 onwards. But in between there occurred the decisive spiritual event of his life. He worked in commerce after university, and in 1757 went on a business trip to London. A worldly period there was interrupted by religious conversion to a mystical kind of Christianity, and it was this that gave his subsequent writing its distinctive character. These writings include esoteric linguistics (*Crusades of the Philologist* 1762) and an attack on the work of Kant (*Metacritique on the Purism of Reason*

1781). *Aesthetica in nuce* (Aesthetics in a Nutshell), his principal statement on poetry and literature, appeared in 1762, with the subtitle 'A rhapsody in cabbalistic prose'. Opposed to the dominance of Reason during the Enlightenment period, he emphasized the dimension of the pre-rational, the senses and the emotions: qualities which made him an influential figure upon the *Sturm und Drang* movement, and latterly on the German Romantics. Hamann adopted a dense, elliptical, deliberately non-rationalistic style, the opacity of which does not seem to have impeded his impact on the Romantic generation, though it acts as an undeniable obstacle to any subsequent non-specialist appreciation of his work. The short passages selected here demonstrate his claims for poetry and the language of the emotions over rationalistic, scientific analysis and the pretensions of academic learning. Elsewhere in the text, Hamann attacks Winckelmann and Lessing, but in the present selection the particular target of his criticism is Voltaire, and the effects of the French Enlightenment in general. Our selection is taken from 'Aesthetica in nuce', translated by Joyce P. Crick, in *German Aesthetic and Literary Criticism: Winckelmann, Lessing, Hamann, Herder, Schiller, Goethe*, edited and introduced by H. B. Nisbet, Cambridge and London: Cambridge University Press, 1985, pp. 140–50; our extracts are taken from pp. 141 and 144–7. We have retained six of the editor's explanatory footnotes.

Poetry is the mother-tongue of the human race; even as the garden is older than the ploughed field, painting than script; as song is more ancient than declamation; parables older than reasoning; barter than trade. A deep sleep was the repose of our farthest ancestors; and their movement a frenzied dance. Seven days they would sit in the silence of deep thought or wonder; – and would open their mouths to utter winged sentences.

The senses and passions speak and understand nothing but images. The entire store of human knowledge and happiness consists in images. [...]

Bacon represented mythology as a winged boy of Aeolus, the sun at his back, and with clouds for his footstool, fleeting away the time piping on a Grecian flute.

But Voltaire, High Priest in the Temple of Taste, can draw conclusions as compellingly as Caiaphas, and thinks more fruitfully than Herod. For if our theology is not worth as much as mythology, then it is simply impossible for us to match the poetry of the Heathens, let alone excel it¹ – which would be most appropriate to our duty and to our vanity. But if our poetry is worthless, our history will look leaner than Pharaoh's kine; but fairy-tales and court gazettes will take the place of our historians. And it is not worth the trouble of thinking of philosophy; all the more systematic calendars instead! – more than spider-webs in a ruined castle. Every idle fellow who can just about manage dog-Latin or Switzer-German, but whose name is stamped by the whole number M or half the number of the academic beast² is a blatant liar, and the benches and the clods sitting on them would have to cry 'outrage!' if the former only had ears, and the latter, ironically called listeners, only exercised their ears to listen with [...]

Nature works through the senses and the passions. But whoso maims these instruments, how can he feel? Are crippled sinews fit for movement?

Your lying, murderous philosophy has cleared Nature out of the way, and why do you demand that we should imitate her? – So that you can renew the pleasure by murdering the young students of Nature too.

Verily, you delicate critics of art, go on asking what is truth, and make for the door, because you cannot wait for an answer to this question. Your hands are always washed, whether you are about to eat bread, or whether you have just pronounced a death-sentence. Do you not also ask: what means did you employ to clear Nature out of the way? Bacon accuses you of flaying her with your abstractions. If Bacon is a witness to the truth, well then, stone him — and cast clods of earth or snowballs at his shade —

If one single truth, like the sun, prevaieth, it is day. But if you behold instead of this One truth, as many as the sands of the seashore; and here close by, a little light which excels in brightness a whole host of suns; that is a night beloved of poets and thieves. The poet at the beginning of days is the same as the thief at the end of days.

All the colours of the most beautiful world grow pale if once you extinguish that light, the firstborn of Creation. If the belly is your god, then even the hairs on your head are under his guardianship. Every created thing becomes alternately your sacrifice and your idol. Cast down against its will, but hoping still, it groans beneath your yoke, or at your vanity; it does its best to escape your tyranny, and longs even in the most passionate embrace for that freedom with which the beasts paid Adam homage, when GOD brought them unto man to see what he would call them; for whatsoever man would call them, that was the name thereof.

This analogy of man to the Creator endows all creatures with their imprint and their stamp, on which faithfulness and faith in all Nature depends. The more vividly this idea of the image of the invisible GOD dwells in our heart, the more able we are to perceive his loving-kindness in his creatures; and to taste, and see it and grasp it with our hands. Every impression of Nature in man is not only a memorial, but also a warrant of fundamental truth: who is the LORD. Every counter-effect of man in GOD's created world is charter and seal that we partake of the divine nature, and that we are his offspring.

Oh for a muse like a refiner's fire, and like a fuller's soap!—She will dare to purify the natural use of the senses from the unnatural use of abstractions, which distorts our concepts of things, even as it suppresses the name of the Creator and blasphemes against Him. [...] Behold, the scribes of worldly wisdom, great and small, have overwhelmed the text of Nature, like the Great Flood. Were not all its beauties and riches bound to turn into water? But you perform far greater miracles than ever delighted the gods, with oak-trees and pillars of salt, with petrifications, alchemical transformations and fables, to convince the human race. You make Nature blind, that she might be your guide! Or rather, you have with your Epicureanism³ put out the light of your own eyes, that you might be taken for prophets who spin your inspirations and expositions out of your own heads. Oh, you would have dominion over Nature, and you bind your own hands and feet with your Stoicism,⁴ that you may warble all the more movingly in your Poetic Miscellanies at the diamond fetters of fate.

If the passions are limbs of dishonour, do they therefore cease to be weapons of virility? Have you a wiser understanding of the letter of reason than that allegorical chamberlain of the Alexandrian Church had of the letter of the

Scriptures when he castrated himself in order to reach heaven?⁵ The prince of this aeon takes his favourites from among the greatest offenders against themselves; his court fools are the worst enemies of Nature in her beauty; true, she has Corybants and Gauls as her pot-bellied priests, but *esprits forts* as her true worshippers.⁶ [...]

Why should I paraphrase *one* word for you with an infinity of them, you readers whose estate, honour, and dignity make you so ignorant? For they can observe for themselves the phenomena of passion everywhere in human society; even as everything, however remote, can touch our hearts in a particular direction; even as each individual feeling extends over the range of all external objects; even as we can make the most general instances our own by applying them to ourselves personally, and expand any private circumstance into the public spectacle of heaven and earth. Each individual truth grows into the foundation of a design more miraculously than the fabled cow-hide grew into the extent of a state, and a plan greater than the hemisphere comes together in the focus of perception. In short, the perfection of the design, the strength of the execution – the conception and birth of new ideas and new expressions – the labour and the rest of the wise man, the consolation and the loathing he finds in them, lie hidden from our senses in the fruitful womb of the passions. [...]

¹ A reference to the *querelle des anciens et des modernes*.

² Typically oblique reference to the academic degrees of Master (M) and Doctor (D, the Roman numeral for 500, and half of M or 1,000).

³ A reference to such secular philosophers and freethinkers of the Enlightenment as Gassendi, La Mettrie, and Frederick the Great (who much admired the Epicurean philosophy of Lucretius).

⁴ A reference to modern scientific determinism, as a counterpart to the determinism of the ancient Stoics.

⁵ An allusion to Matthew 19:12 and to the Church Father Origen (c.185–c.254), who castrated himself for the sake of religion.

⁶ The 'prince of this aeon' is Frederick the Great; the 'court fools', 'Gauls', and *esprits forts* are the French freethinkers (La Mettrie, Voltaire, etc.) with whom Frederick associated.

13 Anton Raphael Mengs (1728–1779) from *Reflections upon Beauty and Taste in Painting*

Mengs was born in Bohemia, and his childhood was spent in Dresden. By the age of 21 he had already had two extended stays in Italy, his first between the ages of 12 and 16. He studied antique and Renaissance works, and back in Dresden in the early 1750s, built a career as a portraitist. One of the formative moments of his career came in 1755, when he met Winckelmann, while on a third trip to Rome. Winckelmann profoundly influenced Mengs' views on Antiquity and the theory of art, and for his part, believed the painter to be 'the greatest artist of his own and probably of the coming age also... like a phoenix new-born out of the ashes of the first Raphael' (Winckelmann, 1968, p. 297). Mengs' artistic reputation has not survived as high as this, but in his day he was regarded as one of the foremost painters in Europe. In the second half of the 1750s he was in Rome and Naples, where he undertook major mural commissions as well as portraits of the royal family. In 1761 he was summoned by Charles III to the court in Madrid (see IVA4). His most extended work of art theory was composed around this time in the form of a handbook for painters,

the *Gedanken über die Schönheit und über den Geschmack in der Malerei*, dedicated to Winckelmann and published in Zurich in 1762. Mengs argues that beauty is a visible manifestation of perfection. Since true perfection is divine and cannot be found in nature or mankind, neither can beauty in its fullest sense. However, despite the fact that art's supposed business is to imitate nature, it can surpass it in respect of beauty by synthesizing particulars into an ideal. Perhaps the most interesting implication of Mengs' argument is that the purpose of art lies not in the fidelity of imitation as such, but in the achievement of this harmonious ordering of pictorial elements, akin to words in a poem or sounds in a musical composition. Our extracts are taken from the English translation, published as *Reflections upon Beauty and Taste in Painting in The Works of Anthony Raphael Mengs*, by the Chevalier Don Joseph Nicholas D'Azara, London: R. Faulder 1796, pp. 7 and 14–25.

Explanation of beauty.

Since perfection is not allotted to mankind, and is only to be found in God, and as nothing is comprehensible to our nature except that which falls under the conviction of the senses; thus the Omnipotent has thought fit to imprint a visible idea of that perfection, which is what we call beauty.

This Beauty is found in all things, whenever our ideas and intellectual senses cannot carry the imagination beyond the perfection which we behold in the thing created.[...]

The effects of beauty.

Beauty consists in the perfection of matter according to our ideas. Since God alone is perfect, Beauty is for that reason a thing divine. The more beautiful a thing is, the more it is animated. Beauty is the soul of matter. As the soul of man is the cause of his being, thus also is Beauty the soul of figures; and that which is not beautiful is like death in man. This Beauty has a power which delights and enchants; and being of a spirit, moves the soul of man, encreases, if we may so say, its strength, and makes it in some moments forget that it is confined within the narrow centre of the body. From this is derived the attractive power of Beauty. As soon as the eye beholds a beautiful object, the soul is awakened, and wishes to unite itself with it; man therefore seeks to approach, and accost it. Beauty transports the senses of man beyond what is human: all is changed and in commotion in him; so much so, that if the enthusiasm is of some duration he falls silently into a kind of sadness: then it is that the soul of man is no more than the mere appearance of perfection.

Nature has for that reason produced many gradations of Beauty, in order to hold the human spirit, by the variety, in equal and continued commotion. Beauty attracts every one, because its power is uniform, and sympathetic with the soul of man. He who seeks it, finds it in every thing and every where, since it is the light of all matter, and the similitude of the same Divinity.

It would be possible to find perfection in nature, although it is not found there.

Although Beauty is never found in Nature in a degree truly perfect, one ought not therefore to believe, that properly it is not there to be found, and that to wish to imitate it one has to transgress the laws of truth. Nature has made all things in such a manner, that every thing may be perfect according to its destiny; but since perfection participates so much of Divinity, for that reason few things in Nature are found perfect, and many things imperfect. The perfect is that which one sees full of reason; and since each figure has only one centre, or middle point, thus has also all Nature, in every kind, one only centre, in which is contained all the perfection of its circumference. The Centre is a sole point, and in the circumference of the figure it comprehends an infinity of points, which are all imperfect in comparison to that of the centre. As among stones, one only kind is perfect, which is the diamond, among all metals only gold, and among animated creatures here below is man alone; thus there is likewise a distinction in each species apart, and few are those which are truly perfect. Since man does not originate of himself, but depends first to see the light, and then to take his form from extraneous accidents, thus it is almost impossible that he should be perfectly beautiful. That man is scarce ever to be found who is not subject to passions, which, in a lesser or greater degree affect his being; nor is there to be found one who has not his predilectual, and predominant affections. The human body has all these affections, and passions, in different parts, on which they operate and influence particularly. The same happens in women, who, scarce gravid, are tormented and oppressed by their passions and affections, even to the injury of their health, and that of the infant which they bear; from whence the soul of the embryo is not at liberty to finish the formation of its body to perfection; for if it could operate without impediment, it would form the body certainly perfect, and in consequence beautiful. This is the motive by which, from the beauty and body of a person one judges of his strength, and of the quality of his spirit, forming easily a good opinion of him who is beautiful and well made; but because the soul is thus impeded in the womb, we see but few persons born beautiful. What contributes besides to this is, the diversity of people, of climate, of passions, and of vices which predominate in different countries, and are the cause why entire nations are distinguishable by their aspect. To prove that we should otherwise find man a perfect Beauty is deducted from this, that almost every one has some parts of his body beautiful, and these parts are more conformable than the others to the utility and object of the whole structure. Man therefore would be beautiful, if the accidents which are natural to him did not spoil him. I speak of man in being the part of all Nature, in which, more than in any other appears true Beauty.

Art can surpass nature in beauty.

The Art of painting is said to be an imitation of Nature; from whence it appears, that in its perfection it ought to be inferior to it; but this subsists conditionally. There are things in Nature which Art cannot entirely imitate, and where the one appears feeble

and weak in comparison to the other, as, for instance, in imitating light or darkness. To the contrary Art has one thing very important, in which it by far surpasses Nature, which is in Beauty. Nature, in its productions, is subject to a variety of accidents; Art therefore operates freely, since it avails itself of materials entirely flexible, and which nothing resists. The Art of Painting is, to choose of all the subjects of Nature, the most beautiful, gathering, and placing together the materials of different places, and the beauty of various persons: to the contrary, for instance, Nature, to form man, is constrained to take the material part of the mother only, subject to all its accidents; from whence it is visible that a portrait might be more beautiful than man in Nature. Whenever is there found united in one man, greatness of soul, harmony and proportion of the body; a virtuous mind, and members pliant and robust? And what man finds himself in such a perfect state of health, as never to be agrieved by his occupations, employments, and pursuits? But in Painting, one can unite and express every good quality of him: it is sufficient to observe, and to express, exactness in the design, grandeur in the figure, ease in the posture, beauty in the members, force in the breast, agility in the legs, strength in the shoulders and arms, sincerity on the front and brow, prudence in the eyes, health on the cheek, and grace and loveliness on the lips; carrying itself thus throughout all the parts, from the greatest to the smallest, as much in the figure of man, as in that of woman, and by adapting these modifications according to the diversity of their aspects and expressions, one may see that Art can easily surpass Nature; for since no flower produces honey from every part, the Bee visits that only from which it can extract the richest sweets; thus can also the skilful painter gather from all the creation the best and most beautiful parts of nature, and produce by this Artifice the greatest expression and sweetness.

That by a good choice one may meliorate the things in Nature, becomes clear from the two charming and agreeable arts of Poetry and Music. The latter of which is not more than a collection of all the tones which are found in Nature, put in measure, and which from a good choice receives a motive, and acquires a spirit capable of moving the soul of man; and this spirit is called Harmony. Thus, therefore, Poetry is no more than the ordinary discourse of men; by whom is put in measured order, first the sentiments, and then the words; and by a choice of the most sonorous and grateful of these and by means of a kind of harmony, is found the measure of the syllable. Then, since Music and Poetry have a force infinitely greater than that of tones and words mixed together without any order, thus, therefore, Painting, worthy sister of the same Arts, receives from the order in which it is placed, and from the good choice which refuses that which is superfluous, and insignificant, an additional force, or one might say its whole being. [...]

This is what I have wished to say of Beauty, which is therefore the formed and visible perfection of Matter; because absolute perfection is a spirit invisible. The perfection of Matter consists in its conformity with our ideas, the which likewise consist in the cognition of its destiny. A thing is perfect when it expresses an idea conformable to itself. Perfections are distributed in Nature like so many offices. That thing which is most capable, and best adapted to fill its office, is in its kind the most perfect; for this reason also, that which is ugly sometimes becomes beautiful on account of the character it represents. That thing which has only one motive

conformable to its being, is of a higher rank of Beauty than that which has more spirit, and is more sublime than that which has more matter. The spiritual has the power to administer its perfection to the material, which can receive it. It is therefore necessary that the virtuoso who would wish to produce any thing beautiful, should propose to rise gradually from matter; to attempt nothing without reason, nothing superfluous, and nothing which is lifeless, or without expression, since that destroys every thing in which it enters: his genius ought to seek to give perfection to matter, by means of a good choice. Genius is the Reason of Painters: this Reason ought to have an empire over Matter, and its principal diligence ought to be to determine the motives of things, and to follow in an entire work one principal motive, so that it may appear one motive only, the which should be distributed even in the smallest parts of matter. It is then necessary that he chooses the best adapted parts of Nature, to render clear and intelligible his idea to those who view it. As nature has distributed her perfections in different degrees, thus ought likewise the painter in giving different things their significations, apply different expressions; but all should be directed towards the principle signification; then the spectator distinguishes in each the idea, and in the whole together the motive of the work, which he will praise as perfect, when the quality of the materials of each part is conformable to his ideas; then it is that his affection will be moved by the beauty which appears in all its parts; because each part, having its motive and spirit, all the work will be full of it, and for that reason will please, and will have the highest degree of perfection.

As the Creator of Nature has given a perfection to every thing, and has made all Nature to appear beautiful, admirable, and worthy of him; thus ought also the painter to apply, and leave in each expression, and from each little stroke of the pencil, a countersign of his genius and wisdom, to the end that his work may be ever esteemed as worthy of a rational being.

14 Voltaire (François-Marie Arouet, 1694–1778) ‘Beautiful, beauty’ from *Philosophical Dictionary*

Voltaire's definition of the beautiful is taken from his characteristically sceptical *Dictionnaire philosophique*, published in Paris in 1764. His argument that beauty is ever in the eye of the beholder is presented as a caution against lengthy metaphysical speculations and universal aesthetic theories. He may also have intended a reference to Diderot's article ‘Beau’ (Beauty), widely acclaimed in 1752 on its publication in the second volume of the *Encyclopédie*, and subsequently reprinted in separate form as ‘Traité du beau’ (1772). The following translation has been made for the present volume by Katerina Deligiorgi from the reprint of the *Dictionnaire philosophique* in *Les Oeuvres complètes de Voltaire*, vol. 35, Oxford: Voltaire Foundation, 1994, pp. 407–10. (For previous material on Voltaire, see IIIB8.)

Beautiful, Beauty

Ask a toad what is beauty, the greatly beautiful, the *to kalon*? He will reply that it is a female toad with two big round eyes coming out of its little head, a large flat mouth, a

yellow belly and a brown back. Ask a Negro from Guinea and for him the beautiful is oily black skin, deep-set eyes and a broad nose.

Ask the devil and he will tell you that the beautiful is a pair of horns, four claws and a tail. Ask, finally, the philosophers and they will reply with a torrent of abstraction; they seek something conforming with the archetypal essence of the beautiful, with the *to kalon*.

One day I was watching a tragedy in the company of a philosopher. He was saying: 'How beautiful that is!' 'What do you find beautiful in it?' I asked. 'The fact that the author has attained his aim,' he replied. The following day, he took some medicine which did him a great deal of good. 'It has attained its aim,' I said, 'What a beautiful medicine!' He understood that we cannot call a medicine beautiful and that in order to give something this name it must produce in us a feeling of admiration and pleasure. He agreed that the tragedy had inspired in him these two feelings and that therein lies the *to kalon*, the beautiful.

On a trip to England, we saw a performance of the same play, perfectly translated: it made everybody in the audience yawn. 'Oh!' he said, 'The *to kalon* is not the same for the English and the French.' After considerable reflection, he concluded that the beautiful is often very relative, just as what is decent in Japan is indecent in Rome and what is fashionable in Paris is not in Peking. Thus he saved himself the trouble of having to compose a long treatise on the beautiful.

15 Thomas Reid (1710–1796) 'Of Taste' from *Essays on the Intellectual Powers of Man*

Born in Kincardineshire in central Scotland, Reid went on to study philosophy at Aberdeen University. For over a decade he was a Presbyterian minister before taking up academic posts, first in Aberdeen, and later as Professor of Moral Philosophy at the University of Glasgow. His main enterprise was to discover a way out of the consequences of Hume's scepticism, which he achieved through a reliance on common sense and the suppositions implied by our ordinary use of language: a position which has won favour in twentieth-century Anglo-American philosophy. His *Essays on the Intellectual Powers of Man* were first published in 1785. The long essay 'Of Taste' discussed, among other things, 'Novelty', 'Grandeur' and 'Beauty'; the present extracts are taken from the first section, 'Of Taste in General'. In conformity with his wider philosophical position, Reid appeals to our ordinary use of language to argue that beauty is a property of the objects we ascribe it to, and not a mere feature of the subjective workings of the mind. Hence Taste, the faculty of mind with which we apprehend beauty, also has an objective aspect: it can be true or false, accurate or misguided. In contrast to Ramsay (see IIIB4), Reid conceives of taste as a matter of judgement, and not as distinct from it. Our selection has been made from 'Of Taste' as reprinted in the expanded edition of Reid's writings, *Essays on the Powers of the Human Mind*, 3 volumes, Edinburgh: Bell & Bradfute, 1803, pp. 495–567. Our extracts are from pp. 495–6, 500–4.

That power of the mind by which we are capable of discerning and relishing the beauties of Nature, and whatever is excellent in the fine arts, is called *taste*.

The external sense of taste, by which we distinguish and relish the various kinds of food, has given occasion to a metaphorical application of its name to this internal power of the mind, by which we perceive what is beautiful, and what is deformed or defective in the various objects that we contemplate.

Like the taste of the palate, it relishes some things, is disgusted with others; with regard to many, is indifferent or dubious, and is considerably influenced by habit, by associations, and by opinion. These obvious analogies between external and internal taste, have led men, in all ages, and in all or most polished languages, to give the name of the external sense to this power of discerning what is beautiful with pleasure, and what is ugly and faulty in its kind with disgust. [. . .]

The taste of the palate may be accounted most just and perfect, when we relish the things that are fit for the nourishment of the body, and are disgusted with things of a contrary nature. The manifest intention of Nature in giving us this sense, is, that we may discern what it is fit for us to eat and to drink, and what it is not. Brute animals are directed in the choice of their food merely by their taste. Led by this guide, they choose the food that Nature intended for them, and seldom make mistakes, unless they be pinched by hunger, or deceived by artificial compositions. In infants likewise the taste is commonly sound and uncorrupted, and of the simple productions of Nature they relish the things that are most wholesome.

In like manner, our internal taste ought to be accounted most just and perfect, when we are pleased with things that are most excellent in their kind, and displeased with the contrary. The intention of Nature is no less evident in this internal taste than in the external. Every excellence has a real beauty and charm that makes it an agreeable object to those who have the faculty of discerning its beauty; and this faculty is what we call a good taste.

A man, who, by any disorder in his mental powers, or by bad habits, has contracted a relish for what has no real excellence, or what is deformed and defective, has a depraved taste, like one who finds a more agreeable relish in ashes or cinders than in the most wholesome food. As we must acknowledge the taste of the palate to be depraved in this case, there is the same reason to think the taste of the mind depraved in the other.

There is therefore a just and rational taste, and there is a depraved and corrupted taste. For it is too evident, that, by bad education, bad habits, and wrong associations, men may acquire a relish for nastiness, for rudeness, and ill breeding, and for many other deformities. To say that such a taste is not vitiated, is no less absurd than to say, that the sickly girl who delights in eating charcoal and tobacco-pipes, has as just and natural a taste as when she is in perfect health.

The force of custom, of fancy, and of casual associations, is very great both upon the external and internal taste. An Esquimaux can regale himself with a draught of whale-oil, and a Canadian can feast upon a dog. A Kamschatkadale lives upon putrid fish, and is sometimes reduced to eat the bark of trees. The taste of rum, or of green tea, is at first as nauseous as that of ipecacuanha, to some persons, who may be brought by use to relish what they once found so disagreeable.

When we see such varieties in the taste of the palate produced by custom and associations, and some perhaps by constitution, we may be the less surprised that the same causes should produce like varieties in the taste of beauty; that the African

should esteem thick lips and a flat nose; that other nations should draw out their ears, till they hang over their shoulders; that in one nation ladies should paint their faces, and in another should make them shine with grease.

Those who conceive that there is no standard in nature by which taste may be regulated, and that the common proverb, *That there ought to be no dispute about taste*, is to be taken in the utmost latitude, go upon slender and insufficient ground. The same arguments might be used with equal force against any standard of truth.

Whole nations by the force of prejudice are brought to believe the grossest absurdities; and why should it be thought that the taste is less capable of being perverted than the judgment? It must indeed be acknowledged, that men differ more in the faculty of taste than in what we commonly call judgment; and therefore it may be expected that they should be more liable to have their taste corrupted in matters of beauty and deformity, than their judgment in matters of truth and error.

If we make due allowance for this, we shall see that it is as easy to account for the variety of tastes, though there be in nature a standard of true beauty, and consequently of good taste; as it is to account for the variety and contrariety of opinions, though there be in nature a standard of truth, and consequently of right judgment.

Nay, if we speak accurately and strictly, we shall find, that, in every operation of taste, there is judgment implied.

When a man pronounces a poem or a palace to be beautiful, he affirms something of that poem or that palace; and every affirmation or denial expresses judgment. For we cannot better define judgment, than by saying that it is an affirmation or denial of one thing concerning another. I had occasion to show, when treating of judgment, that it is implied in every perception of our external senses. There is an immediate conviction and belief of the existence of the quality perceived, whether it be colour, or sound, or figure; and the same thing holds in the perception of beauty or deformity.

If it be said that the perception of beauty is merely a feeling in the mind that perceives, without any belief of excellence in the object, the necessary consequence of this opinion is, that when I say Virgil's *Georgics* is a beautiful poem, I mean not to say any thing of the poem, but only something concerning myself and my feelings. Why should I use a language that expresses the contrary of what I mean?

My language, according to the necessary rules of construction, can bear no other meaning but this, that there is something in the poem, and not in me, which I call beauty. Even those who hold beauty to be merely a feeling in the person that perceives it, find themselves under a necessity of expressing themselves, as if beauty were solely a quality of the object, and not of the percipient.

No reason can be given why all mankind should express themselves thus, but that they believe what they say. It is therefore contrary to the universal sense of mankind, expressed by their language, that beauty is not really in the object, but is merely a feeling in the person who is said to perceive it. Philosophers should be very cautious in opposing the common sense of mankind; for, when they do, they rarely miss going wrong.

III C

The Practice of Criticism

1 Etienne La Font de Saint-Yenne (1688–1771) from *Reflections on some Causes of the Present State of Painting in France*

La Font was a courtier who had been a member of the Academy in Lyons before coming to Paris. Apart from some work on designs for tapestries, his experience of art was that of an amateur. He had seen collections of art in Flanders and Holland and had been friendly with the painter François Lemoyne while at Versailles between 1729 and 1737. However he may have been prompted, he had formed strong views on the current state of French painting. He believed there had been a decline in civic standards and in public life, and he saw the arts as implicated. The platform he chose for the expression of these views was an extensive review of the 1746 Salon, published the following year. This was a remarkable publication in several respects. The first was in claiming the right of the amateur critic to intervene in a debate about the maintenance of standards which the professionals of the Académie Royale had conducted as a virtual monopoly for the past century. The second was in doing so in the name of the public (albeit the public La Font had in mind would not have extended far down the social ladder). The third was in levelling an accusation of decadence at the painters of his own time, whose work he compared unfavourably with the art of the Old Masters and of the seventeenth century. And finally La Font's publication was remarkable in the explanation offered for this decadence. Serious painting had been displaced from the walls of the fashionable by a vogue for mirrors and rococo plasterwork. This was the unkindest cut of all, for it implied that the remedy was out of the painters' own hands. In effect he was looking not simply for a return to previous standards on the part of the painters themselves, but for a redirection in the relationship between painting and public life, which would have to come from the state. Among other recommendations, he suggested that the Louvre should be opened as a public picture gallery where the royal collections could be displayed for the benefit of young artists and for the education of amateurs. Two years later, in a text with the telling title, *L'Ombre du grand Colbert*, he expressed his dismay at the condition into which the Louvre had been allowed to decline. La Font's *Reflections* had two immediate consequences. The first was to provoke further publications, some written in defence of the Academy and of judgements approved by the state (see III C2), others joining what had rapidly become a public controversy (see III C3). The second and more long-term consequence was to initiate a pattern of extensive Salon reviews by critics independent of the Academy, to which writers as distinguished as Denis Diderot (III C12–14), Stendhal (see *Art in Theory 1815–1900*, IA4), Heinrich Heine (see *Art*

in Theory 1815–1990, IA14, IIA7), Charles Baudelaire (see *Art in Theory 1815–1900*, IIC9, IID13, IID6), Théophile Thoré (see *Art in Theory 1815–1900*, IIA12, IIB11, IIC9) and Emile Zola (see *Art in Theory 1815–1900*, IVA6) were to contribute over the next 120 years. La Font's Salon was originally published anonymously as *Réflexions sur quelques causes de l'état présent de la peinture en France. Avec un examen des principaux Ouvrages exposés au Louvre le mois d'Août 1746*, The Hague: Jean Neaulme, 1747. Our text is taken from the opening section of the work, pp. 1–24 of this edition, which contains La Font's more general observations. The translation is by Belinda Thomson, made originally for the Open University, with passages omitted from that version translated for the present volume by Christopher Miller.

Love of painting and the fine arts and zeal for their advancement are the only motives that have led to the publication of these sentiments concerning the works exhibited this year at the Louvre. There is no intention whatever of presenting them as verdicts. Nothing could be more absurd, in our view, than to seek to subordinate others' opinions to our own. At the same time, the progress of the arts, and indeed of literature, might, we felt, be much assisted if certain reflections were put forward, reflections critical but modest, devoid alike of passion and of personal interest, which might enable authors to perceive their failings, and encourage them to attain still greater perfection.

An exhibited picture is the same as a book on the day of publication, and as a play performed in the theatre: everyone has the right to make his own judgement. We have gathered together the judgements of the public which showed the greatest amount of agreement and fairness, and we now present *them*, and not at all our own judgement, to the artists, in the belief that this same public whose judgements are so often bizarre and unjustly damning or hasty rarely errs when all its voices unite on the merit or weakness of any particular work.

It is by taking scrupulous pains and with the genuine intention of offending no-one that we present the judgements of discerning connoisseurs, men enlightened by principles and still more by that natural light that we call feeling, because it makes one feel from the first glance the dissonance or the harmony of a work; indeed it is this feeling which is the basis of taste, I mean of that steady and unalterable taste for true beauty which can almost never be acquired where it is not the endowment of a fortunate birth.

Few artists will attain a reputation of the first order without the help of advice and criticism, not only from their colleagues most of whom only judge the beauties and faults of their art in relation to a cold, dry set of rules or by a routine of comparison with their own often dull and repetitive style, but also from a disinterested and enlightened spectator who, although not a practising painter himself, judges with natural taste and without a servile adherence to the rules. These are the people one cannot consult too frequently about the suitability of the tones, the choice of the details and their particular and general effects and about the harmony of that beautiful whole which charms the eye.

A number of painters have not yet arrived at the reputation of first order to which I referred, because they are wanting in their choice of subjects. This is a peril frequently incurred by painters who have only a limited knowledge of history. The

same risk is run by those who, overestimating their abilities and blind to the limits of their talent, seek pre-eminence in every genre. Some are motivated by overweening vanity, others by base envy of the successes reaped by their colleagues in genres other than their own. How many authors have been seduced by this odious daughter of pride, this jealousy so contemptible in a man of genius, into undertaking all kinds of subjects and passing themselves off as universal geniuses! One of the foremost minds of the previous century [Monsieur de Fontenelle], who has lived to adorn the present one, has distinguished himself in every genre; in doing so, he has inspired many inferior imitators, who might themselves have been models, had they but had the wit to confine themselves to their spheres of competence.

I return to the choice of subject, on which the success of a painting frequently depends. Though history sacred and profane, along with fable, affords an almost infinite number of subjects, every day we see indolent authors, born to plagiarism, restrict themselves to such as have been treated over and over again. Are they unaware that our minds are swayed by novelty? That it frequently does duty for merit in our writings? It is given only to the most vast and penetrating genius to discover a host of new and interesting circumstances in subjects that the vulgar mind perceives as exhausted. When these circumstances are linked to the principal action, and presented under new and ingenious aspects, they can rejuvenate apparently worn-out subjects, by the choice of a more striking moment and a new interest. In painting as in poetry, an author must choose his subject according to his strengths, or he will fall into the error of certain painters, who flatter themselves that they can disguise with the charms of novelty subjects long since defunct. Their imagination fails them; no new beauty distinguishes their compositions. They seek, nonetheless, to maintain a well-deserved reputation for intelligence – on which they pride themselves. They are too sensible to add irrelevant episodes, especially in subjects sacred or of inviolable historicity. Instead, they weaken the essential action, and substitute violent or exaggerated attitudes; they impart to faces, and particularly to the eyes, an exaggerated expression, whose grimacing effect is as offensive in the sacred as it is comical in the profane.

Of all the genres of painting, history is without question the most important. The history painter alone is the painter of the soul, the others only paint for the eye. He alone can bring into play that enthusiasm, that divine spark which makes him conceive his subjects in a powerful, sublime manner; he alone can create heroes for posterity, through the great actions and the virtues of the famous men he presents; so the public does not coldly read about but actually sees the performers and their deeds. Who does not know the advantage the faculty of sight has over all the others, and the power it has over our soul to bring about the deepest, most sudden impression?

But where shall our young pupils find the heat and fire of those eloquent expressions, the source of those great ideas, of those striking or interesting features that characterize true history painting? Why, in the same sources that have always been drawn upon by our greatest poets. In the great writers of Antiquity: in the *Iliad* and *Odyssey* of Homer, so rich in sublime images; in the *Aeneid*, so rich in heroic actions, pathetic narratives and grand sentiments; in Horace's *Ars Poetica*, an inexhaustible treasure of good sense for arranging the composition of an epic or tragic painting, and

in Despréaux¹ his imitator; in Tasso,² in Milton. These are the men who have unlocked the human heart and known how to read it, to render its troubles, its rages, its torments for us with an eloquence and truth which both teach us and fill us with pleasure.

What if the history painter is religious and wishes to devote his brush to subjects of piety? What an abundant source of great events, supernatural and yet true and respectable, of majestic pathos is to be found in our sacred books, and above all in the five great prophets, Isaiah, Ezekiel, Jeremiah, Daniel, and the Prophet King. . . .

Everyone knows the perfect relationship the painter has with the poet. He will lack passion and life, and his inspiration will quickly cool unless he fires it by repeated intercourse with those great men I have just spoken of. When I advise such study for our history painters, I presume it to have been preceded and backed up by the study of our most famous painters in this genre, both past and present. Raphael, Domenichino, the Carracci, Giulio Romano, Pietro da Cortona, etc., and closer to home, Rubens, Poussin, Le Sueur, Le Brun, [Antoine] Coypel, Le Moine in his ceiling at Versailles, which is a masterpiece of art and comparable to the most beautiful of its kind, both in France and in Italy: in short all the excellent works whose economy, arrangement, effects produced by skilled composition he will have had to consider deeply, and to copy the pieces most admired for their drawing or colour. Without a plentiful collection of this excellent material, he will never manage to construct the solid and durable edifice of a great reputation.

After having given history painters the standing and praise they deserve, would that I could lavish praise on those of today, and raise them, or at least compare them to those of the last century! O blessed century, when the progress and perfection in all the Arts made France a rival to Italy! I am, however, far from thinking that France's genius has been extinguished or her vigour lost. The celebrated painters of our school I have just mentioned, who raised the century of Louis XIV to the level of Leo X³ in the Fine Arts, and surpassed it even by the great number, would still find admirers today, were it not that the taste of the nation has greatly changed, and had there not been, to accompany the upheavals that passing years and the sway of novelty necessarily bring to States and minds, an excessive taste for ornamentation, the success of which has been extremely harmful to painting.

An account of the effects of mirrors, which form pictures in which the imitation is so perfect, that our eyes have an illusion equal to nature, would sound like a fairy-tale and a figment of the imagination, if the reality was not already too well known to us; these mirrors which were comparatively rare in the last century and are extremely abundant in this have dealt a fatal blow to art, and have been one of the principal causes of its decline in France, banishing the great history subjects which were its triumph from their former positions and monopolizing the decoration of salons and galleries. I admit that the miraculous-sounding advantages of these mirrors deserved the fashionable success they have had, in many respects. Breaking through walls to enlarge apartments and adjoin others to them; reflecting the rays of light from the sun or from candles with increased brilliance; how could man, the born enemy of darkness and everything suggesting its horror, prevent himself loving a form of embellishment which brightens as well as lightens his room and which, while deceiving his eyes, does not deceive him as to the genuine pleasure he receives?

How could he prefer to it the ideal beauties of painting which is often dark, where the enjoyment depends solely upon the illusion to which one must submit, and which often has no effect on the vulgar or ignorant man?

We should not then be surprised by the rapid success of a discovery so favourable to the general pleasure and to the particular taste of a nation greedy for all that is sparkling and new, although its charms are strictly material and entirely limited to the delight of the eye. Everything possible has been done to perfect its manufacture and to increase their number *ad infinitum*.⁴ But since it was impossible to entirely line the walls of large apartments with mirrors, either because of the considerable cost involved or lest such uniformity should have led to surfeit, the idea came about of filling the intervals with panels, sometimes enriched with gilding and coated with colour varnishes; the brilliance and polish of these attractive varnishes being the next best means, after mirrors, of reflecting light.

And so the science of the brush has been forced to yield to the brilliance of glass; its abundance and the mechanical facility of its perfection have banished the finest of the arts from our apartments; the only refuge left to it being to fill in a few miserable gaps, overdoors, overmantels and the tops of a few pier-glasses reduced in height for the sake of economy.⁵ In this way, restricted by lack of space to paltry little subjects which are in any case far above eye level, painting is reduced in these large rooms, to cold, insipid, totally uninteresting representations: the four Elements, the Seasons, the Senses, the Arts, the Muses and other commonplaces which are the triumph of the plagiarist journeyman painter, requiring neither genius nor imagination, pitifully worked and reworked for more than twenty years in a hundred thousand ways.

I ought to pass over in silence, for the honour of this fine art, the unworthy places in which painting has taken refuge since its expulsion from our apartments. Could our fathers have foreseen that one day art lovers would come to admire the beauties of a skilful brush in such vile hovels, in dusty sheds and filthy coach-houses? Nothing is more true, nevertheless, than that up until the time when *camaieux*⁶ became the most popular form of carriage decoration, for several years one saw in their place paintings, of a price and quality superior to, or at least equal to those decorating the apartments of the masters of those houses. These paintings were only brought out of their shameful stores to be dragged through the streets, to suffer the ravages of the mud, to be defenselessly exposed every day to the danger of being knocked to pieces by the dirtiest rubbish-wagons, by carts, or by the innumerable hazards of the public highway, unavoidable in such a large city. What must foreigners find the most incomprehensible: our shameful disregard and ridiculous abuse of this fine art, or the excess and eccentricity of our ornament, carried to such a high degree of extravagance?

For mythological and historical subjects, there did remain one fruitful area, favourable to the painter whose great talent lay in illusionism and foreshortening, which gave full scope to the magical art of perspective – and that was the ceiling. But, accustomed to the brilliance of mirrors – which unfortunately have so far been impossible to install in new ceilings, where, I am quite convinced, I shall one day see them admired, the public rejected embellishments of an intellectual character, requiring some consideration and knowledge, in favour of the material whiteness of

plaster carved into filigree work at the base of the coving and in the corners and at the central point carved into ornaments of the same substance, often gilded, sometimes painted, imperceptible grotesques for the most part, that Voltaire so aptly criticized in his *Temple du Goût*:⁷

I will cover ceilings, canopies, covings with a hundred singerie⁸ carefully worked,
An inch or two large so they can be seen from afar.

And elsewhere:

The whole thing glazed, varnished, whitewashed, gilded;
And admired, for sure, by idle gazers.

These, then, are the main causes of the present decline in painting; I am in no doubt that they have forced several pupils, into whose hands the gods had placed paint-brushes, to abjure their talent and abandon themselves, like our writers have done to works of wit, to the futile subjects of fashion and of the day; or else to the most lucrative genre of this art, which is, and has been for several years, the portrait.

A painter today, obstinately attached to history painting through the elevation of his thoughts and the nobility of his expressions, will see himself reduced to a few works for churches, for the Gobelins,⁹ or to a very small number of easel paintings which have been almost entirely banished from decorative schemes because, it is said, they spoil the silk tapestries whose lustre and uniformity is at present preferred to the skilful variations of the brush and to all the products of the imagination. What resource will be left to the history painter if he is not in a position to feed his family on more solid fare than glory? He will sacrifice his personal tastes and natural talents to his needs, in order not to see his fortunes waning, despite his skill and efforts, in contrast to the rapid financial gains made by his colleagues the portrait painters, especially those working in pastel. He will suppress his inner callings and divert his brush from the path to glory to follow that of material well-being. He will, in all honesty, suffer for a time to see himself forced to flatter a simpering, often misshapen or aged face, which almost always lacks physiognomy; reproducing obscure, characterless people, without name, without position, without merit; people who are often despised, sometimes even hateful, or at the very least indifferent to the public, to their posterity, even to their heirs who will abandon their features to the dust of the attic and the teeth of mice; or who will coldly watch them pass from an auction sale to hang in furnished rooms and render the householder more illustrious. We should not then be surprised that today the portrait is the genre of painting in readiest supply, the most cultivated and the most advantageous to even the most mediocre talent. Its credit is of long standing, and based on several good reasons.

Although the present widespread taste for the beauties of a damask tapestry,¹⁰ picked up by richly gilded and attractively sculpted frames, has banished history paintings from apartments, as if they were boring and superfluous ornaments, portraits have managed to replace them and secure from the caprices of fashion an exception in their favour.

Self-love, whose rule is even more imperious than that of fashion, has had the art of presenting to the eyes, of ladies especially, mirrors of themselves that are all the more beguiling for being false and which, for that reason, are preferred by most people to real mirrors which are too truthful. In effect, what sight can be compared, either for a real or for an imaginary beauty, to that of eternally seeing herself endowed with the grace and the cup of Hebe, the goddess of youth? Or to that of displaying every day, beneath the apparel of Flora, the budding charms of spring of which she is the image? Then again, seeing herself decked out with the attributes of the goddess of the forests, a quiver on her back, her hair attractively dishevelled, an arrow in her hand, how could she not believe herself to be the rival of that charming god who wounds all hearts?¹¹ [. . .]

This is how a taste for divine disguises is suddenly kindled in the majority of women. The immediate success won by pretty women makes a strong impression – be it envy or jealousy – on the less well endowed. They eagerly seek the agent of this metamorphosis, and hasten to his door. He finds it easy to persuade them of his miraculous capacities, of which they are more convinced than he. A list of the members of the celestial court is presented. The divinity is chosen, sketched, completed. Finally, it makes its entry into the temple where it is to be adored; it has no sooner arrived than applause is universal, and everyone exclaims ‘It’s you to a T! Only speech is lacking!’ It is no small lack. How else is the divinity to explain who she is? The ecstasy and delight are completed by that of the painter, who returns to his studio famous, admired, and well paid.

These few light-hearted reflections will not, I think, lead to my impeachment by today’s practitioners of this genre, nor weary the public of their talents. While they are able to flatter their originals with sufficient skill to persuade them that they do nothing of the kind, the vanity of either sex is a sure warrant of their continued success and more than average prosperity.

To the latter must be attributed the emulation and superabundant production that we daily encounter in this genre. Messieurs Nattier, Tocqué, La Tour, Aved, Nonotte and many others (not to mention the older masters whose reputation is already made) will perhaps console us for the loss of such as Rigaud, Largillière and de Troye. In all of these we find an agreeable touch, vivid and truthful flesh tones, and particularly fine imitation of fabrics of all kinds. Certain of them also exhibit a fine ordering of the composition, along with a mastery of local colour, details and the distribution of the parts of the background.

¹ Despreaux: Nicolas Boileau-Despréaux (1636–1711). Playwright, poet and theorist. Boileau’s *Art poétique* (1674) was based on Horace’s *Ars Poetica* and laid down many of the principles on which French literary classicism was based.

² Torquato Tasso (1544–95). Italian poet. . . . his best-known works are the narrative poem *Rinaldo* (1562) and the epic poem *Gerusalemme Liberata* (1574).

³ Leo X’s papacy, 1513–21, coincided with high points in the careers of Raphael and Michelangelo.

⁴ Whereas at Versailles’ Galerie de Glaces several sheets of mirror had been needed to fill the enormous frames, by the mid-eighteenth century the technique of making large mirrors had been mastered.

⁵ Panelling and mirrors tended to form the main part of eighteenth-century wall decoration, but an architect would leave a number of clearly defined spaces, above doorways, mirrors and mantelpieces to be filled with suitable paintings.

- ⁶ Camaieux: a type of painting used particularly in interior decoration, made up of different tones of the same colour.
- ⁷ Voltaire's *Temple du Gôût*, c. 1732, was an essay in criticism composed in verse and prose which attacked all that was false or feeble in the arts – in particular, the Rococo.
- ⁸ Singeries: a form of grotesque ornamentation incorporating monkeys into the design.
- ⁹ Gobelins: the royal Gobelins tapestry factory was set up by Colbert in 1667, during the reign of Louis XIV. It depended upon painters for its designs. Technical advances made in the eighteenth century enabled weavers to make tapestries resemble paintings more and more closely.
- ¹⁰ Silk tapestries – damasks – imported from the Orient, were becoming a fashionable form of wall covering.
- ¹¹ Flattering portraits of aristocratic ladies dressed up to look like goddesses were popularized by such painters as J.-M. Nattier (1685–1766) and L.-M. Van Loo (1707–71). They inherited the genre from N. Largillière (1656–1746).

2 Abbé Jean-Bernard Le Blanc (1707–1781) from 'Letter on the Exhibition of Works of Painting, Sculpture etc., of 1747, and in general on the utility of such exhibitions'

Though he had taken holy orders, the Abbé Le Blanc pursued a career as a writer and critic in Paris. Through the patronage of Mme de Pompadour he gained the position of Historiographer of the Royal Buildings (the department of government responsible for administration of the arts), devoting himself thenceforth to the defence of state patronage and of official policy on the arts. His letter on the 1747 Salon exhibition was the first of two lengthy publications written to disparage La Font de Saint-Yenne (see III C1) and to support the prevailing policy of the Academy. The second was published in 1753 as *Observations sur les ouvrages de l'Académie de peinture et de sculpture*. In the present text Le Blanc's tactic is to condescend to La Font's apparent good intentions and patriotic zeal, while effectively damning him for naivety and inexperience in matters of judgement. What is unwittingly revealed is the concern that La Font must have caused in claiming to speak on behalf of a significant public. It is this claim, above any other, that Le Blanc seeks to undermine, accusing La Font of self-deception brought about by self-importance. He further objects to the very thoroughness of La Font's survey of the works on exhibition, and to the relative indiscriminateness of his praise. Reading between the lines, we can assume that, prompted or not, Le Blanc was speaking on behalf of those senior members of the Academy who were accustomed to being singled out for special attention, and who may have felt affronted at being assessed on level terms with their juniors. An experienced critic, he implies, should *know* which are the artists to praise. Le Blanc's text was originally published as *Lettre sur l'exposition des ouvrages de peinture, sculpture, etc., de l'Année 1747, Et en général sur l'utilité de ces sortes d'Expositions*, Paris, 1747. The following translation has been taken from pp. 1–20 of this edition and has been made for the present volume by Christopher Miller. (See also III C3.)

Since you desire it, I am delighted to write and tell you what I think of the criticism that made last year's Salon an object of curiosity for the public.¹ In doing so, my only goal is to disabuse those who, being anxious to learn, read in good faith, and believe what they read because it is printed. I shall also tell you my opinion of the pictures exhibited this year in the Galerie d'Apollon and the Salon du Louvre; then I shall talk about the benefit that the public, and more particularly, painters, can derive from such exhibitions. I take this opportunity to convey to you some *Reflections on*

Painting, which will, I hope, please both those who profess this excellent art and those anxious to know something about it. [...]

I come now to the little work containing an *Examination of the Pictures* of last year's Salon, which so fluttered the painters. You know and like painting, and therefore strongly approved the author's intentions; but you were far from happy with his execution. You accuse him of presenting his own prejudices as the verdict of the public. You condemn him for lamenting the decadence of painting in France, whereas readers who have only his detailed encomiums of the various academicians to go by, must inevitably conclude that French painting is thriving as never before. When, you ask, have we ever had so many painters worthy of the name as are admitted to his catalogue? What trust can we place in an author who contradicts himself so clearly? How can his panegyrics and jeremiads be reconciled? Painting, like poetry, has its Despréaux and its Cottins. How can a sentient man place both on the same footing?

Allow me, Monsieur, to accuse *you* of being too hard on this author. His work is difficult to defend overall, but it is, in many respects, excusable; I am convinced his intentions were good. In anyone who writes, as he does, out of no other motive than love of the fine arts and zeal for their advancement, one must pardon much. Let us be grateful for his undertaking; though he is more amateur than connoisseur, he is, at least, a citizen zealous for the glory of the fatherland. Those who, like him, attend to the common good, should never be discouraged; praiseworthy though his attitude be, it is not often encountered in this country.

Your criticisms of his style seem to me entirely unfounded. He has indeed, though rarely, made use of technical terms. Though familiar to the practitioner, these do not convey to the general reader the precise idea to which they refer. The adepts have their own language; unless one writes exclusively for them, it should be used as little as possible; few readers are likely to understand it, and most are sure to hate it. Like you, I reprove the use, in a book written for everyone, of words confined to painters and amateurs; it is an affectation. But I do not find it as noticeable in the author of the *Examination* as you do. Certain writers about art are prone to this vice, in particular, those who seek less to instruct than to parade the very limited knowledge they have acquired. By this means, so they flatter themselves, the average reader will be convinced that they understand what, in fact, they do not. In the arts, *semi-connoisseurs* are worse than the completely ignorant; they stock their memories with all these terms, and, unable to use them correctly, apply them at random. They are like Sganerelle, who takes his admirers for simpletons, because they cannot understand what he says. But the more intelligent reader, wearied rather than deceived, laughs them to scorn.

Monsieur Coypel, whose paintings and writings are notable for their wit and veracity, offers, in his *Dialogue sur la connaissance de la peinture* [Dialogue on Discernment in Painting, 1732], a very telling portrait of one of these absurd characters. 'See,' he has him say, 'what authority in the eyebrows! The contrasts in the brow, all full-pigment, then the *pentimenti* in thick creamy strokes, piff, paff, piff! Ah, they could really hold a brush, those fellows! And what a finish to it, eh? Ah, Monsieur, splendid! Quite splendid.' What on earth can you say to rubbish like that? Not a word; you're confounded, but not convinced.

Félibien, in his *Entretiens sur les vies des Peintres* [Conversations on the Lives of the Painters], very properly used technical language to teach the rudiments of painting; but he wrote principally as a master addressing other artists. Necessity in his case prescribed what in others is affectation. Monsieur l'Abbé du Bos has subsequently treated almost the same subject, and he carefully avoided all the words that men of the world (his intended audience) might fail to grasp. Yet his discussion of the various departments of painting is clear and intelligent. The very precepts he lays down for poets and painters are within the grasp of any reader endowed with common sense. Those who would appeal to persons of taste must follow his example. A man of talent can, if he must, speak of an art without recourse to its terminology. It is not difficult to convey what you know well.

Such a talent does, though, require two rare things, knowledge and wit, whereas the desire to kick up a stir is common; as common, indeed, as talent is rare. Many authors are neither better-informed nor more intelligent than the average; they just want to write a book.

As to the mistakes, if any, made by the author of these new *Reflections on Painting*, their source is clear. People often suppose that they speak for the public; with the best faith in the world, they attribute to the public the sentiments of themselves or their friends. It is a consequence of vanity. The most common error men make is to suppose that all right-thinking persons necessarily think as they do. More intolerable is the vanity of those who, believing that they alone see things in the proper light, must always be prescribing for others' tastes.

Any writer seeking credit for his views lays claim to the authority of the public; but as there is more than one society, so there is more than one public, and everyone cites their own. Only the public, they say, can decide; but the infallible arbiter thus cited is merely the public one knows. So it is not surprising that the reader is sometimes misinformed about its judgements. Here, the misleading author is often more deserving of pity than criticism; he is entangled in the errors he propounds.

In justice to the author of *Reflections on Painting*, he did, I believe, conceive himself to be 'scrupulously respectful'; he truly intended 'no offence to anyone' in citing those he believed were 'judicious connoisseurs'. Everything bespeaks his sincerity and his love of the arts. Indeed, certain of our artists could do worse than follow the sage advice he bestows on them.

He believed himself duty-bound to speak of all the pictures exhibited in the Louvre; perhaps out of the kindness of his heart, he felt that he owed a garland of praise to each of the painters. Ardently though one desires the glory of the arts, one prefers to make no enemies; in his own words, one at least *intends* 'no offence to anyone' . . . But the enlightened public is not so tender-hearted; it exercises its rights as a sovereign judge, and bestows its votes on those who merit them. Implacable or indulgent, it judges equitably. It may, in a work where beauty prevails, pardon certain weaknesses; where talent is lacking, on the other hand, it has no regard for rules coldly observed. In short, where no praise is deserved, it bestows none.

At one time, there was but a single paper, whose uninterrupted prerogative it was to lavish, in the name of the public, its debased praises on authors and artists of every kind. Its very frivolity excused it. Today, people complain that the most serious journals, which might be of the greatest service, do no otherwise. There is, doubtless,

nothing immoral about this tendency to praise good and bad indiscriminately, but it is very bad for literature and art. The author of *Reflections on Painting* seems to have realized this; praise can seem insipid, and he seasons his with critical remarks. Despite his circumspection, some of these are rather tart, and though he tries always to be just, some of his remarks are not.

Generally speaking, it is the way in which he distributes praise and blame that sets him furthest from public opinion. The principal weakness of his work is to praise and criticize every painter in succession, and, as it were, in the same degree. The non-connoisseur relying on the author's verdicts can hardly guess which are the eminent painters in any genre; since they cannot all be eminent, he may believe that none are, and this is quite wrong. The effect that the work may have abroad, should any copies leave the country, is something the author should have thought of. The first-class painters, like Monsieur Boucher and Monsieur Natoire, may rightly reproach him with exaggerating any putative defects in their style, and failing to convey their real excellence. By thus balancing his praise and blame of each painter's works, he seems to place them all on the same footing, and thus departs from both truth and public opinion. Like praise, criticism cannot be universal; he who deserves no praise merits no reproof. Félibien, in the preface to his *Entretiens sur les vies des peintres* [Conversations on the Lives of the Painters], says 'One cannot, I think, demonstrate either the abilities of a worker or the beauty of his work, without pointing to both the good and the bad; objection to one part of it in some measure shows one's esteem for the rest.' For that, though, there must be some parts worthy of admiration. Among those who cannot resist writing books, many should be passed over in silence, without so much as a reproach. There are men who paint, who are yet not painters. It would be churlish, indeed barbaric, to signal, and more so to name, the unfortunates of whom this is true. The public must make up its own mind; only that estimable judge can pronounce such implacable verdicts. On the other hand, habitual encomiasts need to lay hold of the idea that when everyone is praised, no one is.

The author evidently sought to give everyone his due, and is widely thought to have failed; persons of discernment blame him for according too much to some and too little to others. One should not delude oneself, that one can judge equitably of persons and genres against which one is prejudiced; injustice is in that case unavoidable. I shall not cite the painters whom he has over-praised; they would be mortified if I did, and such is not my intention. But it is true that everyone was surprised at the injustice that he did to some, in particular those whom I have just named, whose long-standing reputations should have given the author of the *Reflections* pause. If a painter lacks certain qualities, one should dwell on those he has. Poussin is not so great a colourist as Rubens, but does anyone dare to suggest that he is not a great painter? The author of the *Reflections* seems, as yet, unaware of the many talents needed to paint a fine portrait, which seems to him a negligible genre. Titian and Van Dyke thought otherwise. In no department of painting can one excel without outstanding talent. The author of the *Examination* was wrong to understate the merits of a portrait painter who consoles us for the loss of Rigaut, and whose name is already spoken throughout Europe. A painter who excels all others in his genre should not be relegated to the crowd. [...]

Our author allocates praise and blame to every painter as he thinks fit, and this method has another drawback, one that he did not, perhaps, foresee: he has contented neither the public nor the individual. Unjustified eulogies repel the public, and individuals resent the most justified critique. These are truths confirmed by experience. It is a commonplace that the most mediocre artists and authors are often excessively vain. Most of those discussed in his work have complained bitterly of the treatment they received, and a number of them, as we said, had reason to. The author pointed out faults that no one could miss, while praising beauties entirely lacking in the paintings where he discovered them; I feel sure that the artists who least deserved his praise felt more resentment at the former than gratitude at the latter. True, they should not; but such is the nature of mankind. What one bestows on vanity, it takes as its due, while detraction is perceived as injustice.

¹ Réflexions sur quelques causes de l'état présent de la Peinture en France, avec un Examen des principaux Ouvrages exposés au Louvre le mois d'Août 1747 [IIIC1].

3 Louis-Guillaume Baillet de Saint-Julien (active 1748–1783) from 'Letter on Painting, Sculpture and Architecture, With an Examination of the Principal Works Exhibited at the Louvre in August 1748'

Baillet de Saint-Julien's review of the 1748 Salon was written in explicit acknowledgement of the commentaries offered by La Font and Le Blanc on the 1746 and 1747 Salons respectively (see III C1 and 2). Significantly, he distinguishes between the acclaim accorded to certain works by an indiscriminating public and the judgements of connoisseurs – those 'able to justify the praise they award'. Like Le Blanc, he credits La Font for his patriotism, but admonishes him for his inexperience. (Since the paintings and sculptures shown in the 1746 Salon are now 'lost to sight', the only specific works on which he takes issue with the *Reflections* are three architectural works available to view in Paris.) On the other hand, he questions Le Blanc's assumption that one can be a competent connoisseur without a practical knowledge of painting, flaunting his own reading of Du Fresnoy (see IC4), Du Bos (IIB6) and Félibien (IB9, 10) to strengthen his case. Baillet's review is marked by the interest he shows in landscape painting endowed with naturalistic atmosphere. He was to comment regularly on the Salons over the next nine years and to pay an unusual degree of attention to those artists who worked in genres other than history painting, among them Chardin, Vernet and Oudry. The review was originally published as *Lettre sur la peinture, sculpture et architecture, Avec un examen des principaux Ouvrages exposés au Louvre au mois d'Août*, Paris, 1748, dedicated to M. ***. Our excerpt is taken from pp. 1–6 and 66–71 of this edition, translated for the present volume by Christopher Miller.

To Monsieur . . .

You have good reason, Monsieur, to regret the fact that you were forced to leave Paris almost immediately after the opening of the Salon; a week was indeed too short a time for you to admire at your ease the many beautiful things that it contained. But far away as you are now, your memories of the Salon must, I think, be pleasant ones, since you ask for an account of the public's view of the works currently exhibited

there. If it were only a matter of informing you which works have earned the greatest general approval, I could easily make you happy. In this respect, paintings and sculpture are like plays. When one sees the public hastening to a comedy or tragedy, hears it lavish on the performance such spontaneous applause as seems wrung from it by the sustained nobility of the characters, the interest of the situations and the beauty of the catastrophe, this flattering unanimity is a reliable guarantee of its worth.

Something similar is true if, on entering the Salon, one is struck by a picture's coloration, captivated by its draughtsmanship and enchanted by the elegance of its composition; the allure it exerts so pleasantly is a sure sign that our preference is rightly bestowed. The public is not easy to deceive; its sole guide is feeling, and by feeling one is rarely deceived.

If, therefore, you simply wish to know which works of painting and sculpture were most favourably received by the public, I would answer: those which you yourself saw the public show the greatest enthusiasm for.

But you require something more. You wish me to expound the views of that estimable portion of the public, the connoisseurs: persons apprised of the principles of art, and able to justify the praise that they award, in whom feeling is refined and justified by intellect. You could hardly have caught me at a more favourable moment. I have spent the last few days at a gathering of connoisseurs, whose exact, weighty and impartial judgements seemed entirely to merit that title. To meet your request, I need only repeat exactly what I heard.

The merits of the works exhibited this year were much discussed, and comparison with those of preceding Salons occasioned a critical review of the two brochures about this distributed last year. You know the ones I mean: one is entitled *Reflections on Certain Causes of the Current State of Painting in France*, the other *Letter on Painting*.

Here, then, are the observations made at my gathering; I have only the merit of writing them down. They will interest you particularly for the light they cast on observations about works in the current Salon, for which they offer a kind of preparation. To set these different purposes in order, I shall divide my letter into three parts. The first will constitute a response to the *Reflections on Certain Causes of the Current State of Painting in France*.

The second will contain some critical notes on Monsieur l'Abbé Le Blanc's *Letter on Painting*.

Finally, the third part will comprise an examination of the main works of painting and sculpture exhibited at the Salon this year.

Response to the Reflections on Certain Causes of the Current State of Painting in France

There is little sign in the *Reflections* that the author is well acquainted with the subject that he has undertaken. But one is bound to praise his zealous assault on the various abuses that so lower the nation in the eyes of foreigners.

For example, nothing could be more apt than his remark on the ruinous state in which the old Louvre has been left – that rich monument of architecture, which would be worthy of Rome itself, were it complete.

The general principles of *Sieur L.F.* thus met with approval, but they do not seem to have informed his specific criticisms. I shall not record his views on many things now lost to sight, as a discussion of them would, by definition, be tedious. It would simply be a good thing if he went as often as possible to the Salon, there to acquire the knowledge that he lacks, by the aid of an eye alien, impartial and discerning. Thus, confining myself to what anyone can now see, I shall speak of three major works of architecture that the author has excessively praised or scorned. They are first *M. Bouchardon's* fountain in rue de Grenelle; second the church of Saint-Louis-du-Louvre; and third that of Saint-Sulpice.

* * *

The particular sentiments of *Monsieur l'Abbé Le Blanc* on the acquisition of knowledge in painting and the selection of subjects to paint

According to this author, one can quite reasonably assess a painting using nothing more than 'a pair of eyes and a little practice'. To refute this system, one has only to contrast it with his other statements. We shall not easily be convinced that nothing more than 'eyes' and 'practice' are required, as he puts it, to discern 'whether the sentiment expressed by each figure is well observed. Whether their various attitudes are natural. Whether those in the middle ground are, in terms of degradation of light and of scale, where they should be in order to maintain the illusion.' No, say what he will, it requires more than eyes and practice to discern all this, even in those who do not aspire to be either authors or amateurs.

He who judges a painting, must, as it were, have in common with the painter everything of a speculative nature, and differ only in the matter of application.

It is therefore insufficient to know that painting is in general the art of imitation of all visible things through line and colour on a flat surface. He must also know the general principles of the three parts of painting, which are drawing, colour and composition.

He must be apprised that drawing requires knowledge of perspective, by means of which the outlines of objects can be accurately rendered. A knowledge of anatomy is also required, as least as far as this concerns the movements allowed by the bones and the functions performed by the muscles. Lastly, he needs to know that nature does not always afford perfect models, and one must therefore choose carefully the forms of beauty one finds in it; this is done by studying fine proportions in the ablest masters, and above all in Antiquity, where examples are most commonly found.

He should be apprised that colour is divided into parts: that is, local colour, which is nothing more than accurately reproducing the colour proper to any object, and *chiaroscuro*, which consists in the accurate distribution of light and shade, in relation not only to individual objects but to the work in general. 'By this consonance and affinity, skin tone should be neatly set off by draperies, and the draperies by one

another; the figures should harmonize with both one another, the landscape and the distance. In short, everything should appear so artfully connected that the whole painting seems to have been painted at one and the same time, and, as it were, from the same palette' (Félibien: *Conversations on Painters*).

He should also know that there is a mixed element, which combines drawing and colour. This is 'the art of disappearance' or aerial perspective, by means of which objects seem to grow more distant from the spectator; their scale is reduced and their colours are degraded in proportion to the place they occupy in the painting.

Finally, composition: the last and most important part of painting,¹ which requires such passion and knowledge in the painter. Anyone wishing to judge a painting at all sensibly must at least be acquainted with the essential points of composition. For example, unity of place must be scrupulously observed. One cannot attain the right effect in a painting if more than a certain number of groups is represented. The main protagonist must dominate all the others, and catch the eye before any of the others. The positions of all the figures must be natural; their attitudes must be agreeably contrasted, and their bearing and character properly rendered, as must the objects accessory to the subject.

Such then is the knowledge of painting and its various component parts that one should bring to the Salon if one comes not as a simple spectator, but as a judge. Our famous artists have spent many years working hard to perfect their art, and it would be a great shame if they had blindly to submit to the verdict of the ignorant; if those lacking all principles, and knowing no other counsel than that 'of their eyes, and some practice (a little more, or a little less) in looking at pictures' were set up as their judges.

Another sentiment expressed by Monsieur l'Abbé Le Blanc seems likewise doomed to oblivion, since it appears to proscribe any flight of imagination on the part of the painter. It is this: 'Nature should only ever be painted in a state of perfect repose.' [...]

But did Monsieur l'Abbé Le Blanc not realize that his system contains its own contradiction? To prove that nature should be painted only in repose, he cites the example of landscape painting; these pieces are much more widely liked, he says, than action pictures. This is because one sees nature in repose in the landscape, and the verisimilitude so dear to his heart is consequently not violated, or so he says, whereas in other paintings it is. But this example proves just the contrary. For if ever a subject had the potential for action and variety, it is landscape, where one cannot imagine nature remaining the same even for an instant. The landscape alters and varies with every refraction of the sunlight that illuminates it. Now we see nature bright and luminous; everything gives way before the brilliance of the sun. A moment later a storm blows up, the sky darkens, and the houses that were lacklustre before grow luminous compared with the clouds. Supposing the sky now clears, and you try to seize the moment, capturing the splendid ray of light illuminating the depths of the landscape; the foreground, meanwhile, is in shadow, and the objects in the background accordingly look distant. But no; a cloud intercepts the ray and transforms the effect. It flies in the face of probability to suppose nature in repose in a landscape; that would require something utterly impossible, immutable light.

¹ See *The Art of Painting* by C. A. du Fresnoy, and the *Critical Reflections on Poetry and Painting* by Monsieur l'Abbé Dubos, one of the very best books that a painter can consult for composition.

4 Anne-Claude-Philippe de Tubières, Comte de Caylus (1692–1765) 'On Composition'

This lecture on composition was originally delivered at the Académie Royale des Beaux-Arts on 5 September 1750. (For previous lectures by Caylus, see texts IIA11, 12.) As Michael Fried has argued, an increasing interest in the unity and independence of compositions was significant of the growing independence of the painted 'tableau' in mid-eighteenth-century France (Fried 1980). (For Shaftesbury's earlier thoughts on the composition of a 'Tablature', see IIB3.) In a longer view, the idea of composition that Caylus here proposes foreshadows later attempts to identify expressive content and aesthetic experience with the total form of the work of art, and to equate unity with instantaneousness. (See, for instance, the sense given to composition in Henri Matisse's 'Notes of a Painter', or the concept of 'significant form' advanced by Clive Bell in 1914; *Art in Theory 1900–2000*, I B6, 16.) To this end Caylus distinguishes between 'ordinary composition', which may be organized according to rules, and the composition of genius. When it comes to defining the latter, however, he is reliant, as all subsequent writers were to be, upon a combination of circular argument – the composition of genius is recognized by its ineffable effect upon the mind of the observer – with appeals to an established canon. In the second part of his lecture, omitted here, Caylus considers certain works by Raphael as exemplary of genius in composition. The lecture is published in Comte de Caylus, *Vies d'artistes du XVIIIe siècle, Discours sur la peinture et la sculpture, Salons de 1751 et de 1753 – Lettre à Lagrenée*, ed. A Fontaine, Paris: Librairie Renouard, H. Laurens, 1910, pp. 160–74. Our excerpt is taken from pp. 160–6 of this edition, translated for the present volume by Christopher Miller.

Generally speaking, composition is the poetry of painting, and, more precisely, this poetry is the expression of genius at the service of its object. So complete and extensive is the precision required for such expression that the difficulty is only too apt to prove deterrent. Yet it has no other principle than that of genius combined with good sense; what the one produces with passion and abundance, the other, consistently logical, moderates and retrenches. Expression both general and particular must then, as a consequence of this same principle, be completely concealed, invisible behind the simplest, most natural and unaffected appearance.

This is not the only difficulty such poetry must overcome; for its object is a single instant, to which everything must relate and contribute so perfectly, that adulteration of this relation is inexcusable, and even the most clement eye cannot but condemn it. The moment the latter perceives the painting, it must grasp it in its entirety, and nothing is more painful to it than to be detained by some insignificant trifle that disrupts the order and propriety of the work. The eye must, in short, be instructed, attracted and captivated. The requirement that these impressions be imparted at first glance derives not from any self-imposed law, but from the essence of painting: from one mind's duty at that instant to speak directly to another.

Sublime composition arises from the mind, and no rules can be given for it; there are general rules that apply to ordinary composition, and which are known to everyone. Yet both are merely a means by which the painter inscribes and renders the impression made on him by a story or action. To this means he brings the assistance of all that he has perceived in nature, in which everything is grouped and composed. It must be confessed that the composition of which I speak is susceptible of indefinable distinctions that pertain to the mind alone. Before we proceed further, allow me the following consideration.

Mankind has never begun by making rules for a thing before it was invented; instead, they have taken for rules, especially in the various departments of poetry, the productions of the first genius to appear. Study and meditation on these productions then gave rise to the rules of epic and of all the other genres of poetry. There is no doubt that the mind proceeded similarly in painting. Homer was preceded by Giotto and Perugino, now, it is true, unknown; but Homer appeared and was imitated by Virgil, and more recently by Tasso, Milton and many others. Finally, the successors of these first geniuses of poetry and painting have been deemed great men insofar as their procedure suggests that they would have invented their art, had they come first.

At all events, such reflections – this form of imitation drawing on Homer or Raphael – have in some sense established themselves as rules of composition for both painters and poets. But they cannot impart genius, and should not be considered on a par with those governing chiaroscuro and draughtsmanship. The latter exist, and are based on the imitation of nature; it may even be said that they are intimately linked to composition. To conclude, one can become a poet without Homer and a painter without Raphael, but these great men should always be present to the minds of those who devote themselves to the furtherance of their talents.

On this subject, then, what I have to say amounts to little more than examining the abuse of this operation of the mind, and of the very high proportion of even the greatest masters who have offended against painting (or rather poetry). To this end, I will necessarily cite examples of a kind that we cannot bring to mind too often.

My project is the following: having first analysed, or rather described composition in its common and practical form, such as it has been utilized by all painters since the renaissance of the arts, I shall turn to the composition of genius. Only the latter can lead the painter to the sublime, making him the equal of the greatest poets and even, perhaps, in certain respects, their superior, a pre-eminence that not everyone admits. The conclusions to be drawn will therefore emerge clearly enough from the criticism and the praise that I bestow, while acting as a constant reminder of the true object and sublimity of this great art. I hope that this method will allow me to demonstrate these great truths, and persuade the reader that, especially in noble and heroic subjects, they should never be lost to sight; and though all possible compositions are subject to this same propriety, I have confined myself to the latter, since they are the most difficult and encompass all others.

Ordinary composition is for the most part what one might call a geometrical reminiscence, insofar as it follows in the most obvious way from certain rules, and is, in a sense, subordinate to the prevailing taste. It is all too commonly encountered; it grates on the mind, and the reproach to which it leaves painting open brings the latter into disrepute; for every tradition, even the most famous Italian schools,

abounds with such paintings. They are much praised and highly valued, but this is no reason why we should neglect the attentions art, by its very nature, requires.

In every national school, then, composition, or rather grouping, is undertaken in this way: a figure is found, appropriate and striking in its development and the beauties it elicits by contrast; this is made the dominant figure, and from it all others derive. This figure may be accurately represented by the mechanical standards of art, and yet its movement will be too emphatic, or its stillness inappropriate; in short, its overall attitude may very easily fail to suit the subject intended. No matter: the figure is handsome, notions of suitability that might constitute an impediment are set aside, and laziness activates certain motives in us with complete success. So far from being guided by the spirit of the subject, which is the only means by which truth may be attained, we do all that we can to make this figure fit the subject.

Whatever the figure, we retain it. Our only thought is to patch up the holes; we do not see them as holes, as infractions of rules that we have adopted. And we succeed in patching things up with draperies or other foreign bodies, for the most part introduced without the slightest necessity; or, what is worse, with frigid figures or heads of which neither the development nor the action is clear. Examples from any country could be cited to authorize these capital sins, which are committed without the slightest remorse.

Light is distributed, directed and more or less recalled, depending on one's needs; we are not afraid to extend it beyond the limits set by nature, and we forget that it must be weightless and subject to degradation. The pyramid has been constructed, the figures are contrasted; true, certain of them lie in the foreground, often facing away from the one that they should be looking at, while others in the middle ground are arranged or inclined so that they lead to the main figure. In short, the chain of connection is consistent, but it is made without regard for the median emotions, or more exactly, the emotions that should be felt by the second-order or accessory figures who must be made to take part in the event. Yet the richness of a subject lies precisely in these secondary figures, since they enrich the dominant figure, and are a source of charm when the admiration of the first glance is complete, and the eye seeks to discover in the painting's details a justification for more general admiration. But let us turn back to our picture.

The surface of the painting is divided to encourage the glance to wander and to create contrasts of richness, but in doing so no regard has been shown for the nature of the land or the buildings placed on it, and these things are never a matter of indifference.

This composition once established, a drawing is made after nature, but in the studio, where the light and background are unvarying. More, each individual part receives due study, though the natural models selected for these are rather undifferentiated and their suitability more a matter of community of age than anything else. Finally, when everything has been prepared in this fashion, we paint the heads; they go together nicely, the contrast of their general position has been carefully considered; but they are expressive of no passion, there is no trace of character in them, they are just heads; they have eyes, noses and mouths, but absolutely no relation to the poetry or expression that the mind always begins by looking for in the dominant parts. We think well of ourselves if we have drawn some pretty women; but the forms

of the faces and the attitudes of the heads could equally well appear in a completely different scene. And this criticism would continue to apply, even if it were not true that prettiness is only ever fitting in pastoral scenes, and that noble subjects require beauty; you know as well as I do, gentlemen, that beauty is found only in grand forms. In short, approximation in the heads is unforgivable, and the severity required in studying them is the more valuable in that a general exactitude inevitably follows.

Let us not lose sight of our work. Having dealt thus with the women, we weigh down the heroes, loading them with muscle, and forgetting that as princes or demigods they must be several degrees more beautiful and better proportioned than other men, and invariably more delicate. At all events, the flesh tones are silky, the draperies are true to life and appropriately coloured; care has been taken to divide them up to enhance the overall effect and to create passage work. Now the harmony is perfectly comprehended and observed; the site of the action looks as it was intended it should, that is, such as the needs of the action require, in terms of light, harmony and effect. Often enough, the scene's horizon has been raised or lowered to an absurd degree, if it is a landscape; or extreme licence has been taken with the construction of a piece of architecture, whose surfaces are perfectly implausible, and whose overall mass and profile alike show no regard for perspective; local colour and aerial perspective have been neglected. No matter; this place seems to the author at once accurately rendered and appropriately coloured. And one cannot even contradict him in relation to his picture, as one might relative to truth in nature. Everything, then, is finished, and we think that we have made a picture, and indeed, in several ways, we may justifiably claim to have done so. We present the said work: it is admired, since the public does not invariably judge equitably at the first glance. And lastly, the author is content with his payment.

That, I think, is all that one could desire in terms of care taken and approbation received; yet one might also say that all these details have not produced a painting so much as a more or less extensive agglomeration of the parts of painting. The reasons why it is not a painting are as follows: first, it is lacking in genius at the service of an object; secondly, it is devoid of that accuracy of expression required if one is to communicate with the mind; thirdly, there is no hint of the unity by which one should be struck in even the smallest details; fourthly, the essence of the composition has not, it might be said, been clearly presented, and so nothing has been done for the subject.

In a word, if the painting that I have described is sought out and admired, its colour, draughtsmanship, or harmony, as I have already said, must have constituted its attraction. But, given that painting is so extensive and lofty an art, would a painter of burning passion, full of the spirit of painting, be satisfied with praises based merely on components of that art? Commendable as these parts may be, they are merely ancillary. No; he will find the parts in themselves mediocre; painting demands more of those who devote their lives to practising it, and are so strongly motivated to bring its every perfection to light.

Far from granting men knowledge of their faults and limitations, nature seems rather to have blinded them to what concerns themselves; though jealousy and criticism give them the most penetrating insight into the works of their colleagues.

Any painter can therefore make use of these reflections in relation to paintings already in existence, and if ever he should turn his gaze on himself, as justice requires, and apply to his own works the remarks that he has made along these lines, he will soon attain perfection; that is, he will contrive to unite the other parts of art with those very properly demanded by mind and common sense. Many men who have brought habit into nature itself, and draw a muscle not because they see it, but because they imagine it must be there or thereabouts (all of which they do in order to produce a clear and structured drawing), many such men will, I say, tell me, out of indolence or vanity, that these procedures in art will necessarily result in frigidity. Far be it from me to speak at length of that subject, and take the part of anything so inimical, in general and in particular, to any species of poetry whatsoever. But accuracy and truth of expression should be and are as far removed from frigidity as they are from exaggeration. Finally, it should be remembered that, while recommending them both, I have taken care never to set genius and good sense at variance.

There can be no doubt, gentlemen, that the observations I have taken the liberty of imparting to you concern the most difficult part of art. But, since they undoubtedly afford considerable satisfaction to their author, and redound to the greater praise of painting, one can hardly bear them too often in mind, nor too often recommend to one's friends the reflection and attention they deserve.

5 Abbé Marc-Antoine Laugier (1713–1769) *from Essay on Architecture*

Laugier was a Jesuit priest and an amateur observer of the art of architecture. The avowed aim of his treatise was to raise the level of relevant discussion and theory and to establish what he regarded as the authentic tradition, as founded by the Greeks, copied by the Romans, continued in the Italian Renaissance by Bramante, Michelangelo and Vignola, and graced in the previous century by the architect and theorist Claude Perrault. He was opposed to eclecticism and shared the widespread opinion of the time that Gothic architecture was barbaric. The *Essay* offers both an exposition of the elements of classical architecture and a critique of current practice in France. Laugier thus brought to discussion of architecture in the 1750s both the kind of informed and instructive categorization typical of contributions to the *Encyclopédie*, and the kind of independent critical voice that La Font de Saint-Yenne had exercised regarding the Salon (see III C1). Like La Font, but unlike the Encyclopedists in general, he looked back to the age of Louis XIV as a relative high point in the arts. In his 'On German Architecture' (VA4) Goethe was to take issue with Laugier, objecting to the rigidity of his classicism and his dismissal of the Gothic, and questioning his equation of the primitive dwelling with the origins of the Greek architectural system. Laugier's text was originally published as *Essai sur l'architecture*, Paris: Chez Duchesne, 1753. A second edition was published two years later. Our excerpts are taken from the English translation of the first edition, London: T. Osborne and Shipton, 1755, pp. 1–10.

Preface

We have various treatises of Architecture, which explain with sufficient exactness the measures and proportions which enter into the detail of the different orders, and

which furnish models for all kind of buildings. We have not as yet any work, which establishes in a solid manner the principles of it, which manifests the true spirit of it, or which proposes rules proper to direct the talent and to fix the taste. It appears to me that in those arts that are not purely mechanical, it is not sufficient to know how to work only, we ought to learn how to think upon them. An artist ought to give a reason for everything he does. For this end he has occasion for fixt principles to determine his judgement and justify his choice so that he may tell if a thing be good or bad, not purely by instinct, but by reasoning, and as a man instructed in the fine paths of beauty.

Observations have been carried to a great extent in all the liberal arts: abundance of people of talents have applied themselves to make us sensible of the delicacies of them. They have wrote very learnedly of poetry, painting and music. The mysteries of these ingenious arts have been so nicely examined, that there remains very few discoveries to be made in them. There are such judicious criticisms and reflected precepts of them, that determine their real beauties. Imagination has put them on the way, and served as reins to restrain them in their proper limits. The just rate is fixed upon the merit of their sallies and the disorders of their wandrings. If we want good poets, good painters or good musicians, it could not be for want of theory, it would be the defect of their talents.

Architecture alone has hitherto been abandoned to the caprice of Architects, which have given us precepts of it without discernment. They have determined its rules at hazard upon the bare inspection of ancient buildings. They have copied their defects with the same scruples as their beauties, wanting principles to distinguish their difference, they have imposed on themselves the obligation of confounding them – vile imitators of all that has been declared legitimate: limiting all their inquiries by consulting the fact, they have wrongfully concluded the right, and their lessons have only been a fountain of errors.[. . .]

It is then to be wished that some great architect may undertake to protect Architecture from the caprice of opinions, in discovering to us the fixt and determined laws thereof. Every art, all sciences have a determined object. To arrive at this object, all the paths cannot be equally good, there is but one that leads directly to the end, and it is that road only that we ought to be acquainted with. In all things there is but one manner of doing well. What then is this art? but that established manner upon evident principles, and applied to the object by invariable principles.

In expectation that some one much more able then myself, may undertake to clear up this chaos of the rules of Architecture, that none of them may remain hereafter, but for which a solid reason may be given. I am endeavouring to produce an inconsiderable ray of light for that end. In considering with attention our great and fine edifices, my soul hath experienced various impressions. Sometimes the charm was so strong that it produced in me a pleasure mixed with transport and enthusiasm: at other times without being so lively drawn away, I found myself employed in an agreeable manner; it was indeed a less pleasure, but nevertheless a true pleasure. Often I remained altogether insensible; often also I was surfeited, shocked, and mutinied. I reflected a long time upon all these different effects. I repeated my observations until I was assured that the same objects always made the same impressions upon me. I have consulted the taste of others, and putting them to the

same proof, I found in them all my sensibilities more or less lively, according as their souls had received from nature a less or greater degree of heat. From thence I concluded first that there were in Architecture essential beauties independent of the habitude of the senses, or of the agreement of them. Secondly, that the composition of a piece of Architecture was as all the operations of the mind, susceptible of coldness or vivacity, of exactness and disorder. Thirdly, that there should be for this art as for all others a talent which is not acquired, a measure of genius that is given by nature, and that this talent, this genius, ought nevertheless to be subjected and confined by laws.

In meditating always more upon the various impressions that the different compositions of Architecture made upon me, I was desirous of searching into the cause of their effect. I have called upon self for an account of my own sentiments. I was willing to know why such a thing ravished me, another only pleased me; this was without agreements; that were to me insupportable. This inquiry at first presented to me nothing but darkness and uncertainties. I was not discouraged, I have fathomed the abyss, until I believed I had discovered the bottom. I have not ceased to interrogate my soul until it had rendered me a satisfactory answer. All at once it has given to my eyes a great light. I have beheld distinct objects, where before I could not see anything but mists and clouds: I have seized these objects with ardour, and in making use of their light I have discovered by little and little my doubts to disappear, my difficulties to vanish, and I am at last able to demonstrate to myself, by principles and consequences, the necessity of all the effects; the causes of which I was ignorant. [...]

Introduction

Architecture of all the useful arts is that which requires the most distinguished talents, as well as the most extensive knowledge. Perhaps as much genius, spirit and taste is required therein as for the forming a Painter or a Poet of the first rank. It is a great mistake to think that mechanism only is required; that all is confined to laying foundations, and building walls, all according to rules; the practice of which supposes eyes accustomed to judge of a line, and hands to manage the travel.

When we speak of the art of building, of the confused heaps of troublesome rubbish, of heaps of shapeless materials, dangerous scaffolds, a frightful game of machines, a multitude of ragged labourers; this is all that presents itself to the imagination of the vulgar, it is the rind, the least agreeable of any art, the ingenious mysteries of which are understood by few, and excite the admiration of all who discern them. Therein are discovered inventions, the boldness of which intimates an extensive and most fruitful genius. Proportions, the use of which declares a severe and systematic precision. Ornaments, the elegance of which discloses a most excellent and delicate thought. Whoever is capable of discerning such a variety of beauties, far from confounding architecture with the lesser arts, will be tempted to place it in the rank of the most profound sciences.

The sight of an edifice, built with all the perfection of art, creates a pleasure and enchantment, which becomes irresistible. This view raises in the soul noble and most affecting ideas. We experience therein that sweet emotion, and that agreeable trans-

port that such works excite, which bear the impression of true superiority of genius. A fine building speaks most eloquently for its architect. Mons. Perrault in his writings only appears a knowing man; the colonade of the Louvre determines him the great one.

Architecture owes all that is perfect in it to the Greeks, a free nation, to which it was reserved not to be ignorant of any thing in the arts and sciences. The Romans, worthy of admiring, and capable of copying the most excellent models that the Greeks helped them to, were desirous there to join their own, and did no less than show the whole universe, that when perfection is arrived at, there only remains to imitate or decay.

The barbarity of succeeding ages having buried the liberal arts under the ruins of that empire, which alone retained its taste and principles, created a new system of Architecture, wherein unskilful proportions, ornaments ridiculously connected and heaped together, presented stones as paper work, unformed, ridiculous, and superfluous. This modern architecture hath been but too long the delight of all Europe. Most of our great churches are unfortunately destined to preserve the traces of it to the remotest posterity. To say the truth, with numberless blemishes, this architecture hath had some beauties, and altho' there governs in its most magnificent productions a heavy and gross spirit of invention, we may yet admire the bold traces, the delicacy of the chisel, the majestic and disengaged air that one beholds in certain pieces, which through all their ways have something forlorn and inimitable. But at length more happy genius's discovered from the ancient monuments proofs of the universal wandrings, and also resources to return from them; made to taste the wonders that had in vain been exposed to every eye for so many ages. They meditated on the reports of them, they imitated their skill, and by the force of inquiry, examination, and trial, they again revived the study of good rules, and re-established Architecture in all its rights. They abandoned the ridiculous geugaws of the Goths and Arabians, and substituted in their room manly and elegant appearances of the Doric, Ionic and Corinthian. The French slow of invention, but quick to improve happy imaginations, envied Italy the glory of reviving the magnificent creations of Greece. Every place is full now of monuments that attest the ardour, that established the success of our fathers emulation. We have had our Bramanti, our Michael Angelos, our Vigniolis. The past age, an age where in regard to talents, nature amongst us, hath displayed, and perchance exhausted, all its fruitfulness. The past age has produced in feats of Architecture performers worthy of the best times. But at the moment that we arrive at perfection, as if barbarity had not lost all its rights with us, we are fallen again into the base and defective: every thing seems to threaten at last an entire downfall.

This danger that approaches every day nearer, which may yet be prevented, engages me to propose herein modestly my reflections upon an art for which I have always had the greatest love. In the design I propose, I am not moved by the passion of censure; a passion I detest; nor by the desire of telling new things, a desire I think at least frivolous. Full of esteem for our artists, many of whom are of known abilities: I confine myself to communicate to them my ideas and my doubts, of which I desire them to make a serious examination. If I bring to mind real abuses, as certain usages universally received amongst them, I do not pretend that they should refer themselves to my opinion only, which I submit frankly to their critical judgment. I

only request, they will divest themselves of certain prejudices too common, and always hurtful to the progress of the arts.

Don't let them say that not being of their profession I cannot speak of it with sufficient knowledge: it is assuredly the most vain of difficulties. We daily judge of tragedies without having ever made verses. The knowledge of rules is not prohibited to any body, altho' the execution is given but to some. Let them not oppose me with respectable authorities, without being infallible. It would undo all only to judge of what ought to be by what is. The greatest have sometimes erred. It is not therefore a sure means of avoiding error to take always their example for a rule. Don't let them interrupt me by pretended impossibilities: idleness finds many of them, when reason sees none. I am persuaded that those of our architects that have a true zeal for the perfection of their art, will accept of my good-will. They will find, perchance in this writing, reflections that had escaped them. If they make a solid judgement of them they will not disdain to make use of them: this is all I ask of them. [. . .]

Chapter I.

General principles of Architecture.

It is with Architecture as with all other arts; its principles are founded upon simple nature, and in the proceedings of this are clearly shown the rules of that. Let us consider man in his first origin without any other help, without other guide, than the natural instinct of his wants. He wants an abiding place. Near to a gentle stream he perceives a green turf, the growing verdure of which pleases his eye, its tender down invites him, he approaches, and softly extended upon this enameled carpet, he thinks of nothing but to enjoy in peace the gifts of nature: nothing he wants, he desires nothing; but presently the Sun's heat which scorches him, obliges him to seek a shade. He perceives a neighbouring wood, which offers to him the coolness of its shades: he runs to hide himself in its thickets and behold him there content. In the mean time a thousand vapours raised by chance meet one another, and gather themselves together; thick clouds obscure the air, a frightful rain throws itself down as a torrent upon this delicious forest. The man badly covered by the shade of these leaves, knows not how to defend himself from this invading moisture that penetrates on every part. A cave presents itself to his view, he slides into it, and finding himself dry applauds his discovery. But new defects make him dislike his abode, he sees himself in darkness, he breathes an unhealthful air; he goes out of it resolved to supply by his industry the inattentions and neglects of nature. The man is willing to make himself an abode which covers but not buries him. Some branches broken down in the forest are the proper materials for his design. He chooses four of the strongest, which he raises perpendicularly and which he disposes into a square. Above he puts four others across, and upon these he raises some that incline from both sides. This kind of roof is covered with leaves put together, so that neither the sun nor the rain can penetrate therein; and now the man is lodged. Indeed cold and heat will make him sensible of their inconveniences in his house, open on every part; but then he will fill up between the space of the pillars, and will then find himself secure. Such is the step of simple nature: It is to the imitation of her proceedings, to

which art owes its birth. The little rustic cabin that I have just described, is the model upon which all the magnificences of architecture have been imagined, it is in coming near in the execution of the simplicity of this first model, that we avoid all essential defects, that we lay hold on true perfection. Pieces of wood raised perpendicularly give us the idea of columns. The horizontal pieces that are laid upon them, afford us the idea of entablatures. In fine the inclining pieces which form the roof give us the Idea of the pediment. See then what all the masters of art have confessed. But then we ought here to be very much on our guard. Never principle was more fruitful in consequences. It is easy from hence to distinguish the part that enters essentially into the composition of an order of architecture, from those which are introduced only by necessity, or which have not been added thereto but by caprice. It is in the essential parts that all the beauties consist; in the part, added thereto by caprice, consist all the defects [...].

6 Jean-Baptiste de La Curne de Sainte-Palaye (1696–1781) ‘Letter to M. de Bachaumont on Taste in the Arts and Letters’

La Curne de Sainte-Palaye was born in Auxerre in France and made his name as the discoverer and publicist of neglected national documents, such as the *Chroniques de Saint Denis* and the *Vie de Charlemagne*, which he found in the archives of the monastery of Saint-Yves. He stimulated a new appreciation of the literature of the Middle Ages and wrote important studies on the history of the French language. He was also an influential connoisseur and critic. His ‘Letter to M. de Bachaumont’ stages a familiar form of argument between the ‘sister arts’ of poetry and painting. La Curne accords himself the role of *littérateur* and antiquary, enraptured by the beauties of a Greek epigram, while his friend M. de Bachaumont is addressed as a lover of art, devoted to his portfolio of drawings by Raphael, Michelangelo and the Carracci, his Egyptian sculpture and his Etruscan vase. (Louis Petit de Bachaumont was a prominent and wealthy connoisseur and collector, whose own *Essai sur la peinture, la sculpture et l’architecture* was also published in 1751.) The particular interest of La Curne’s text lies in the account of his own awakening to the feelings aroused by works of art. This is effected by a visit to Eustace Le Sueur’s paintings of the Life of St Bruno in the Charterhouse of Paris, painted between 1645 and 1648 (now in the Louvre, Paris). The implication of the ‘letter’ is that good taste in all the arts may be identified with a quality of simplicity and purity of means. *Lettre de M. de S. P. à M. de B. sur le bon goût dans les arts & dans les lettres* was originally published in Paris in 1751. Our text is taken from the facsimile reprint of this edition, Geneva: Minkoff, 1972, pp. 1–10, translated for the present volume by Christopher Miller.

You, Sir, love the arts, and I literature. These tastes differ little, and I have often noticed how similarly we feel the things that affect us. Yet it has often happened, when we mutually confide our private thoughts, that each considers the other somewhat fantastical. This I confess; you will be no less sincere with me. You have sometimes found me reading a fat volume, full of Greek, which I called the *Anthology*; I was in ecstasies over a Greek epigram, and was tireless in my praise of the beauties I perceived in it. What man is so sterile as to wax laconic when he speaks of his passion? These beauties seemed to you utterly insipid. [...] I could not help but

notice this, though you tried hard to enthuse and appear of one mind with me; such are the deceptions practised among friends. It would be well, if none but such deceits were practised, and these more often! Men would the sooner recognize their errors, and hate each other less. After many words which convinced you not at all, you left my house shrugging your shoulders, and if you did not say, with Molière 'By my troth, the man is mad indeed,' you at least said: 'His judgement is impaired on certain topics.'

In either case, I was fully revenged when next I visited you; I found you at your fireside, contemplating a portfolio full of horribly torn sheets. I could see nothing on them but a monstrous scribbling of half-drawn figures, which looked to me like a sorcerer's book of spells, and which you, otherwise inclined, called 'the magic of the art of drawing'. What I thus scorned was nothing less than the work of Raphael, Michelangelo and the Carracci brothers, men whom I have so often heard you praise as immortal and divine. Whilst you put aside your habitual impassivity and expressed the most intense admiration, I remained stonily indifferent. I could not conceive how these unconnected lines carelessly and haphazardly drawn, these few pen-strokes hastily and randomly set down on paper, made such a strong impression on you; how, indeed they could convey to you what these clever people had intended, when, in the heat of composition, they had thus expressed their thoughts. Still less was I convinced that such trifling sketches should be dignified with the grave title of 'studies'.

You no doubt remember the Egyptian statuette which stood on your mantelpiece; what you would never have sold for all the gold in the world, generous to a fault, you ceded to the entreaties of a friend, and presented it to him. Your ape (as I then thought it) was squatting in a rather graceless posture, the head tolerably sketched out; the rest of it seemed to me as formless as those quaint little figures that idle country shepherds make with a knife and a piece of wood. The arms and legs sticking out of the corners of the figure were all stiff and dry, but you always exclaimed on the fine overall effect, its noble composition, and the precision and elegance of its proportions. It all seemed to you admirably outlined, the limbs well-fitting (forgive me, if the terms have not stuck in my memory); not a muscle was forgotten, and they were all at work. You even saw beneath the skin, and perceived the structure and action of the bones. [...] In your imagination, the statue became a masterpiece no less of anatomy and osteology than of sculpture. You supplied whatever the sculptor had omitted, as if he sought merely to suggest things, whereas I felt that he had no more thought of these things than I did.

You will still less have forgotten an Etruscan vase that was your pride and joy; you sacked an excellent valet, who unfortunately broke it. I was often startled by the eloquence – you never repeated yourself – with which you praised its beautiful form, its flowing harmonious outline, and a thousand other perfections of the kind. A few figures on the vase, such as we sometimes make by cutting them out of card or paper, you found, you said, ravishing in the naturalness of their attitudes, the regularity of their profiles and the magnificent simplicity of their garments. Often we have parted rather coldly, a little disappointed in one another.

Summer, and the walks that we took in the Charterhouse, reconciled us. When we entered the handsome cloisters, and meditated on those marvellous paintings of Le Sueur, we were rather more at one; you had a hundred and one things to tell me, and

I, though I had nothing to say myself, at least found nothing to contradict in what you said. I was almost always of the same mind; an intuition that I could not articulate made me think, I know not why, as you did. Nightfall would eventually part us, and leave me to my reflections.

Then I was no longer disappointed in you, but in myself. I was irritated that I could not, in my own eyes, justify a feeling whose principle remained a mystery to me, but whose intensity was not on that account diminished. In my impatience, I somewhat regretted the pleasure this feeling had given me.

As we often repeated our walks and visits to the cloister, the veil fell from my eyes, and I saw.

When I considered these incomparable pictures, which, more than any others, give me my idea of what Greek painting was like, and of the taste that they brought to the arts, as they did to purely intellectual works, I noticed that two or three figures in a cell, or in a landscape as simple as that cell, formed the whole of their subject. There were none of those forced attitudes, which nature disavows, and which the painter so unnecessarily includes, merely to show how well he draws; none of those exaggerated and invariably botched expressions, those draperies whose richness consists entirely in the bizarre superabundance of folds, and in superfluous ornaments; none of those fairy palaces reaching up into the inflamed heavens; no contrasts in the ordering of the groups, or in the arrangement of light and shade: no racketsy 'machinery'.

Our cloister shows a few solitary devotees standing, kneeling, or in other positions – each as the state of his soul dictates – in meditation, prayer, or in silent penitential or devotional exercises. A long white garment of serge covers these devotees from head to foot. Most of them have their hands covered by their sleeves; their arms are crossed or fall casually by their sides, as chance would have it, or perhaps as nature presented them to the artist; for he always studied Nature, and she will always be the only mistress of the arts and taste. A small number of colours enlivens the pictures, without any effect of false brilliance. Everything exudes extreme simplicity. The compositions seem to have presented themselves to the artist just as they are, and to have cost him no effort. Yet the more I considered them, the more they delighted me. I then began to think, that the more we discover the efforts that are made to move us, the less effective they are; and the better artifice is concealed from us, the more successfully it attracts and touches us. I next concluded, that the fewer the means employed to produce a particular effect, the greater the merit of its production, and the more willingly the spectator or reader receives the impression that we sought to impart. The simplicity of these means, which were, it seems, visible and accessible to all men (though they make so little use of them), is what has created masterpieces in every genre, as if to serve eternally as our models. Here then, is that much discussed thing, the sublime.

And since that time, Sir, I have had no further quarrel with your bulging portfolios, your sketches, your Egyptian statues, and your Etruscan vases. I confess that the gulf between our opinions is a result of my trying to begin, not at the beginning, but at the end. I wanted to penetrate the mysteries of painting, and I am the merest neophyte. Like many another, I looked without seeing. To bring me back to the truth, I needed things that were absolutely complete, and which left nothing to be desired; above all, works that spoke to the mind; I have found them. [...]

7 Denis Diderot (1713–1784) ‘Art’ from the *Encyclopédie*

In mid-eighteenth-century France the questioning of received dogma proceeded in the face of official censorship. This censorship was rigid insofar as the interests of religious and civil authority converged, and unpredictable where their powers diverged. In 1746 Diderot's book *Pensées philosophiques* (Philosophical Thoughts) was burned by decree of the Parlement of Paris on the grounds that the ideas it expressed were anti-Christian. Three years later the publication of his *Lettre sur les aveugles* (Letter on the Blind) led to a three-month period of imprisonment in Vincennes. In 1750 he published the prospectus for an ambitious encyclopaedia. The expressed aim of this work was ‘to collect all the knowledge scattered over the face of the earth, to present its general outlines and structure to the men with whom we live, and to transmit this to those who will come after us, so that the work of the past centuries may be useful to the following centuries, that our children, by becoming more educated, may at the same time become more virtuous and happier, and that we may not die without having deserved well of the human race.’ This optimistic belief in the power of knowledge and education to counter dogma and to produce virtue and happiness typifies what subsequently came to be called ‘the project of Enlightenment’. The *Encyclopédie* of 1751–76 was that project's definitive expression. Diderot and Jean Le Rond d'Alembert, a mathematician, had been involved in plans to produce a French translation of Ephraim Chambers' *Cyclopaedia, or Universal Dictionary of Arts and Sciences*, first published in England in 1728 (see IIA10). In the event they became the editors of a new and independent publication, coordinating the contributions of some 200 collaborators, named or unnamed according to the vagaries of religious opposition and state censorship as the work progressed over the course of twenty-five years to its final tally of seventeen folio volumes (followed by eleven volumes of plates and five further supplementary volumes). Besides Diderot and D'Alembert themselves, those known to have been involved as authors include the Marquis de Condorcet, Baron d'Holbach, Charles-Marie La Condamine, Jean-François Marmontel, Charles Montesquieu (see IIIB7), Jean-Jacques Rousseau (see IIIA 2,3), Jean-François Saint-Lambert (see IIIC8), Voltaire (see IIIB8, 14) and Claude-Henri Watelet (see IVA15). The *Encyclopédie* attracted some 4,000 subscribers in France, both representing and informing that professional middle class whose rise to the forefront of public life was to be decisively marked by the Revolution of 1789. Diderot's article on ‘Art’ serves to make clear that the Arts as the editors understood them were not restricted to the ‘Fine Arts’ of polite culture, but embraced all forms of productive activity and practice, as distinguished from the contemplative and observational activities of the ‘Sciences’. This was not an unaccustomed usage for the time. What was unusual was that anyone who concerned himself with the ‘mechanical arts’ should also be versed in the more refined problems and possibilities of painting and sculpture. The very breadth of the Encyclopaedists' interests and sympathies ensured that their writing would be challenging to the restricted artistic culture of the *ancien régime* – as Diderot's criticism was to prove after 1759, when he turned his full attention to the work exhibited in the Salon (see IIC12–14 and IVA11). ‘Art’ was originally published in the *Mercur de France* in 1751, attracting interest in advance of its inclusion in the first volume of the *Encyclopédie* later in the same year. Our version is taken from *Encyclopedia, Selections*, translated by N. S. Hoyt and T. Cassirer, Bobbs-Merrill, 1965, as reprinted in S. Eliot and B. Stern eds., *The Age of Enlightenment*, vol. 2, London: Ward Lock Educational in association with the Open University Press, 1979, pp. 144–53. (See also IIC12–14, IVA11.)

ART. Abstract metaphysical term. Men began by collecting observations on the nature, function, use and qualities of beings and their symbols. Then they gave the name of science or art to the center or focal point to which they linked the observations they had made, in order to create a system of instruments, or of rules which were all directed toward the same object. That is the most general meaning of art. To give an example: Men reflected on the usage and function of words and subsequently invented the word 'grammar.' Grammar is the name of a system of instruments and rules that relate to a specific object; this object is articulated sound. The same is true of the other arts and sciences.

Origin of the arts and sciences. In pursuit of his needs, luxury, amusement, satisfaction of curiosity, or other objectives, man applied his industriousness to the products of nature and thus created the arts and sciences. The focal points of our different reflections have been called 'science' or 'art' according to the nature of their 'formal' objects, to use the language of logic. If the object leads to action, we give the name of 'art' to the compendium of the rules governing its use and to their technical order. If the object is merely contemplated under different aspects, the compendium and technical order of the observations concerning this object are called 'science.' Thus metaphysics is a science and ethics is an art. The same is true of theology and pyrotechnics.

Speculative and practical aspects of an art. From the preceding it is evident that every art has its speculative and its practical aspect: the former consists in knowing the principles of an art, without their being applied, the latter in their habitual and unthinking application. It is difficult if not impossible to go far in the practice of an art without speculation, and, conversely, to have a thorough knowledge of the speculative aspects of an art without being versed in its practice. In every art there are many particulars concerning its material, its instruments, and its application which can only be learned through practice. It is the function of practice to present difficulties and phenomena, while speculation must explain the phenomena and solve the difficulties. Consequently, only an artist who can think logically can talk well about his art.

Division of the arts into liberal and mechanical arts. When men examined the products of the arts, they realized that some were primarily created by the mind, others by the hands. This is *part* of the cause for the preeminence that some arts have been accorded over others, and of the distinction between liberal and mechanical arts. This distinction, although it is quite justified, has led to bad consequences because it has given a low name to people who are very worthy and useful, and encouraged us in a certain natural laziness. We are all too inclined to believe that it is beneath the dignity of the human spirit to apply oneself diligently and continuously to specific and concrete experiments and objects, and that our mind forfeits its dignity when it descends to the study, let alone the practice, of the mechanical arts; the mind here stoops to questions in which research is laborious, reflection inglorious, and exposition difficult; such questions are dishonorable to deal with, countless in number, and of scarcely any value. *Minui majestatem mentis humanae, si in experimentis et rebus*

particularibus,¹ etc. (Bacon, *Novum Organum*). This prejudice has tended to fill the cities with useless spectators and with proud men engaged in idle speculation, and the countryside with petty tyrants who are ignorant, lazy, and disdainful. Such was not the thinking of Bacon, one of the foremost geniuses of England, nor of Colbert,² one of the greatest ministers of France, nor, in a word, of the right-thinking and sensible men of all times. Bacon considered the history of the mechanical arts the most important branch of true philosophy; therefore he certainly did not scorn its practice. Colbert considered the industry of the people and the founding of manufactures the most reliable resource of a kingdom. In the opinion of those who today can discern true worth, the state benefited no less from a man who filled France with engravers, painters, sculptors, and artists of all types, who wrested from the English the secret of the machine for producing hosiery, from the Genoese their velvet, from the Venetians their mirrors, than it benefited from those who vanquished the enemies of France and took their fortresses. In the eyes of a philosopher a sovereign may deserve more praise if he has encouraged men like Le Brun, Le Sueur, and Audran,³ if he has had the battles of Alexander painted and engraved, and the victories of our generals represented in tapestry, than he would for having gained those victories. Place on one side of the scales the actual advantages of the most sublime sciences and the most honored arts, and on the other side the advantages of the mechanical arts, and you will find that esteem has not been accorded to the one and to the other in just proportion to the benefits they bring. You will discover that far more praise has been heaped on those men who spend their time making us believe that we are happy, than on those who actually bring us happiness. How strangely we judge! We expect everyone to pass his time in a useful manner, and we disdain useful men.

General purpose of the arts. Man is only the minister or interpreter of nature: he can only understand or act insofar as he has knowledge of the beings that surround him, either by means of experiment or reflection. His bare hand can only achieve a small number of effects, however robust, tireless, and supple it may be; it succeeds in great enterprises only with the help of instruments and rules. The same is true of the understanding. It is as if instruments and rules provided additional muscles for the arms, and additional energy for the mind. The general purpose of any art, or of any system of instruments and rules concurring toward the same end, is to impress specific forms onto the basic element provided by nature. This element can be either matter, or spirit, or some function of the soul, or some product of nature. However, I shall devote most of my attention to the mechanical arts, particularly because other authors have written little about them. In these arts *man's power is limited to moving natural objects closer or farther away. Man is capable of everything or nothing, depending on whether it is or is not possible to bring objects closer or move them farther away* (see Bacon, *Novum Organum*).

* * *

Of the geometry of the arts. Everyone will readily agree that there are few artists who can dispense with the elements of mathematics. Yet here we have a paradox, although its truth is not immediately obvious: in many situations knowledge of these elements would actually hamper an artist if, in practice, the precepts of mathematics were not

corrected by an extensive knowledge of physical circumstances; such as location, position, irregular figures, materials and their qualities, elasticity, rigidity, friction, consistency, duration, as well as the effects of air, water, cold, heat, dryness, and so forth. It is clear that the elements of academic geometry constitute only the simplest and least complex elements of workshop geometry. There exists not one lever in nature that is the same as the one which Varignon⁴ presupposes in his propositions; there exists not one lever in nature whose factors can all be calculated. Among these factors we find a great number, some of them very essential in practice, which cannot even be subjected to the mathematical operations by which we determine the slightest discernible differences of quantity. Hence a man who knows only theoretical geometry is usually not skilful, and an artist who knows only experimental geometry is very limited as a worker. But, in my opinion, experience shows us that it is easier for an artist to get along without theoretical geometry than for any man to get along without some experimental geometry. In spite of calculus the entire subject of friction has remained the province of experimental and practical mathematics. It is remarkable how far we can go with only this mathematics. How many bad machines are suggested every day by men who imagine that levers, wheels, pulleys, and cables perform in a machine as they do on paper! Because they have not taken part in practical work, they have never learned the difference between the effects of the machine itself and of its section. We will add a second observation since the subject suggests it: there are machines that are successful on a small scale but not on a large scale. Of some others the opposite is true. I believe that the latter should include all the machines whose effect depends principally on the considerable weight of their component parts, on the force of reaction in a fluid, or on a great volume of elastic matter upon which these machines have to act. If one constructs them on a small scale, the weight of the parts is reduced to nothing, the reaction of the fluid is almost nonexistent, the forces on which one has counted disappear and the machine is ineffective. However, just as there is a point, if we may use the term, a limit that stands in relation to the size of the machine, where it ceases to be effective, there is another below or beyond which the potential of its mechanism does not produce its maximum effect. Every machine has, in the language of geometry, a *maximum* size. When we consider each part in relation to its most perfect functioning, it has a size that is determined by the other parts. Similarly, from the point of view of its most perfect functioning, the whole has a size determined by the machine, by its intended use, and by an infinity of other matters. But where, you will ask, is the limit in the dimensions of a machine, beyond or below which it is either too large or too small? Which is the actual and absolute size of an excellent watch, a perfect mill, or a ship of the best possible construction? To give us an approximate solution to these problems, we need the experimental and practical geometry of several centuries, assisted by the most subtle theoretical geometry. I am convinced that it is impossible to obtain any satisfactory result when these types of geometry are kept separate, and that it is very difficult to do so even when they are combined.

Of the language of the arts. I have found the language of the arts to be very imperfect for two reasons: the scarcity of proper nomenclature and the frequency of synonyms. Some tools have several different names while others have only the generic name

'engine' or 'machine,' without any additional name to distinguish them. At times an insignificant difference is enough to make artists invent specific names to substitute for the generic name. At other times a tool that is distinctive because of its form and use either has no name or is given the name of another tool with which it has nothing in common. One would wish for more attention to analogy of form and use. Geometers do not have as many names as they have figures, but in the arts a hammer, a pair of tongs, a bucket, a shovel, etc., have almost as many names as there are arts. A good part of the language changes from manufacture to manufacture. Yet I am convinced that the most unusual operations and the most complex machines could be explained by a rather small number of familiar, well-known terms, if it were decided to use technical terms only when they communicate a distinctive idea. What I am saying must carry conviction for anyone who considers that complex machines are only combinations of simple machines, that there are few simple machines, and that in the description of any operation all the movements can be reduced, without any significant error, to rectilinear and circular movements. It would be desirable if a good logician, well versed in the arts, undertook to describe the elements of a 'grammar of the arts.' For a first step he would have to determine the value of the correlatives 'big,' 'large,' 'average,' 'thin,' 'thick,' 'slight,' 'small,' 'light,' 'heavy,' etc. For this purpose one must seek a constant measure in nature or evaluate the height, width, and average force of man, and relate to it all indeterminate expressions of quantity, or at the least set up tables to which artists would be asked to make their language conform. The second step would be to decide on the differences and similarities between the form and the use of one instrument and another, between one operation and another, in order to determine when these should keep the same name and when they should be given different names. I do not doubt that anyone who undertakes this task will find it necessary to eliminate synonyms rather than to introduce new terms. I am also sure that it is more difficult to give a good definition of common terms, such as 'elegance' in painting, 'knot' in trimming, 'hollow' in several arts, than it is to explain the most complicated machines. It is the lack of precise definitions and the great number, not the diversity, of movements in various operations that makes it difficult to speak clearly about the arts. The only remedy for the second problem is to familiarize oneself with the objects: they are well worth the trouble whether we think of the advantages they bring us or of the fact that they do honor to the human mind. In what physical or metaphysical system do we find more intelligence, discernment, and consistency than in the machines for drawing gold or making stockings, and in the frames of the braid-makers, the gauze-makers, the drapers, or the silk workers? What mathematical demonstration is more complicated than the mechanism of certain clocks or the different operations to which we submit the fiber of hemp or the chrysalis of the silkworm before obtaining a thread with which we can weave? What projection is more beautiful, more subtle, and more unusual than the projection of a design onto the threads of a simple and from there onto the threads of a warp? What can conceivably be more subtle than the art of shadowing velvet? I could never enumerate all the marvels that amaze anyone who looks at factories, unless his eyes are closed by prejudice or stupidity.

I shall follow the example of the English philosopher and mention three inventions that were unknown to the ancients. It is to the shame of modern history and poetry

that the names of their inventors are scarcely known. I am speaking of the art of printing, the discovery of gunpowder, and the properties of the magnetic needle. What a revolution these discoveries have brought about in the republic of letters, in military art, and in seafaring! The magnetic needle has led our ships to the most remote regions, typographic characters have created enlightened communication between learned men of all countries and all future time, and gunpowder has occasioned all the architectural masterpieces that defend our frontiers as well as those of our enemies; these three arts have almost transformed the face of the earth.

Let us finally render artists the justice that is their due. The liberal arts have sung their own praise long enough; they should now raise their voice in praise of the mechanical arts. The liberal arts must free the mechanical arts from the degradation in which these have so long been held by prejudice, while royal protection must save them from the indigent state in which they still languish. The artisans have thought they deserved disdain because they were in fact disdained; let us teach them to think better of themselves, only then can we obtain more perfect products from them! We would wish that from the halls of the academies there would emerge a man who would go into the workshops, record everything noteworthy about the arts, and set it forth in a work that would induce the artists to read, the philosophers to think usefully, and the nobles to begin exercising their authority and their munificence in a useful manner.

If we may give some advice to learned men, we would suggest that they practice what they teach, namely not to judge too hastily nor to condemn an invention as useless because in its early stages it does not bring all the advantages that could be expected of it. [...]
